VSP Operating System Software

Alarms (sorted by ID)

Sort by groups

ID	Alarm Description
0x00000001	[value]: out of memory
0x00000002	[value]: malloc failed!
0x00000003	portAddToSlotPollArr: Called with invalid Argument Slot [value]
0x00000004	alsClientRegister returns [value]
0x00000005	IGMP Loss Group Member:MemIpAddr:[value].[value].[value].[value],GrpAddr:[value].[value].[value].[value],src_port:[value],IfIndex:[value]
0x00000006	Port [value] is an access port
0x00000007	IP Interface removed, Delete Rsmlt Node Failed on IfIndex [value], potential memory Leak
0x00000008	IPX Interface removed, Delete Rsmlt Node Failed on Vlan [value], potential memory Leak
0x00000009	SMLT [value] Link is DOWN
0x0000000a	SMLT [value] Link is UP
0x0000000b	Unknown message type [value]
0x0000000c	unrecognized record type [value] from alsRead
0x0000000d	The Number of Ingress Records greater than configured threshold
0x0000000e	[value]: taskSpawn() failed
0x0000000f	SSH Server Disabled
0x00000010	smltProcIpRsmltMsg: set Peer Record fail for Vlan [value]
0x00000011	smltProcessMsgs: Received Unknown message type [value]
0x00000012	smltIstSessionUp
0x00000013	smltIstSessionDown
0x00000014	Range value starting with Zero would disable the parameter
0x00000015	alsWriteClientRecord() failed
0x00000016	cannot allocate filter index object
0x00000017	cannot allocate filter link list object
0x00000018	indexAdd() - failed adding
0x00000019	Link Down([value]/[value])
0x0000001a	Link Down([value]/[value]) due to excessive control frames
0x0000001b	Link Down([value]/[value]) due to ext-cp limit
0x0000001c	Link Down([value]/[value]) due to loop detect
0x0000001d	Link Down([value]/[value]) due to slpp
0x0000001e	Link Up([value]/[value])
0x0000001f	Password modified for user access level RO
0x00000020	Password modified for user access level RW

0x00000021 Password modified for user access level RWA
0x00000022 Password modified for user access level RWL1
0x00000023 Password modified for user access level RWL2
0x00000024 Password modified for user access level RWL3
0x00000025 Port [value] is a brouter port
0x00000026 Port [value] is a trunk port
0x00000027 Port [value] is a trunk port of mlt-[value]
0x00000028 [value]:ltrAlloc FAILED

0x00010878	Detected Chassis with online Switch Fabric modules count [value] or more.
0x00010879	Detected Chassis without second generation line card online.
0x0001087a	Detected mixed (regular and high speed) fan trays in the chassis.
0x0001087b	Mixed fan trays cleared.
0x0001087c	Chipset re-initialization request received for slot [value]
0x0001087d	Error reading progress register for Card [value]. Powering Card off.
0x0001087e	Allocating memory for sync events because pre-allocated memory is exhausted.
0x0001087f	Pre-allocated memory for sync events is now available.
0x00010880	No buffers available to sync events with Standby CP. Standby will generate a core file and restart.
0x00010881	Standby CPU restarting; buffers are now available
0x00010882	Power-supply and Fan modules airflow direction mismatch
0x00010883	Power-supply and Fan modules airflow direction ok
0x00010884	Power-supply and Fan modules airflow direction mismatch([value])
0x00010885	Power-supply in PSU[value] can cause undesired behavior. Replace with [value] or [value]
0x00010886	Power-supply in PSU[value] can cause undesired behavior. Replace with [value], [value], [value], or [value]
0x00010887	Power-supply in PSU[value] is not qualified for this chassis. Replace with [value], [value], [value], or [value]
0x00010888	Power-supply in PSU[value] is not qualified for this chassis. Replace with [value] or [value]
0x00010889	Temperature Sensor [value] ([value]) is ([value] C) close to critical automatic chassis power down temperature of ([value] C)
0x0001088a	System is running in configured standby mode
0x0001088b	Detected [value] module in slot [value]
0x0001088c	Detected removal of [value] module from slot [value]
0x0001088d	There are no switch fabric cards in the chassis that are operationally up. Module [value] in slot [value] will be reset.
0x0001088e	Module [value] in slot [value] removed from the chassis
0x0001088f	Module [value] in slot [value] is ready
0x00010890	Temperature Sensor [value] ([value]) critical temperature alarm cleared
0x00010891	Temperature Sensor [value] ([value]) overheat temperature alarm cleared
0x00010892	Temperature Sensor [value] ([value]) is ([value] C) has exceeded the alarm threshold temperature ([value] C)
0x00010893	USB monitor device failure
0x00010894	Power-supply in PSU[value] has insufficient power. Replace with an 800 Watt supply
0x00010895	Power-supply in PSU[value] has insufficient fan speed. Replace with a supply with at least 23K RPM fan.

0x00010896	Could not read fan tray seeprom from [value]
0x00010897	Magic Number found in fantray seeprom from [value] is not valid
0x00010898	Fan tray seeprom is blank from [value]
0x00010899	Slot [value] - Detected removal of [value] card without first powering slot down from CLI. Slot [value] will not be usable until next chassis reboot!
0x0001089a	Slot [value] (Module: [value]) has been powered off and initialization aborted. Slot is not usable until next chassis reboot due to prior unsupported card pull of [value] while powered on.
0x0001089b	Slot [value] - this slot is not usable until next chassis reboot due to prior unsupported card pull of [value] without first powering slot down from CLI.
0x0001089c	Chassis recovered from low power
0x0001089d	Master CP process in slot [value] failed
0x0001089e	System is forced to run in Warm-standby mode
0x0001089f	Failed to enable cpld events, reason [value] errno [value]
0x000108a0	Detected removal of [value] Power Supply from slot [value]
0x000108a1	Main process on card [value] is down, pushing a fail event into the state machine.
0x000108a2	[value]
0x000108a3	Chassis running without any fan modules.
0x000108a4	Chassis state with no fan modules is now cleared.
0x000108a5	Missing fan module in tray [value] is now cleared.
