

Configuring Link Aggregation, MLT, SMLT, and vIST

Release 4.3
NN47500-503
Issue 01.01
March 2016

© 2016, Avaya, Inc.
All Rights Reserved.

Notice

While reasonable efforts have been made to ensure that the information in this document is complete and accurate at the time of printing, Avaya assumes no liability for any errors. Avaya reserves the right to make changes and corrections to the information in this document without the obligation to notify any person or organization of such changes.

Documentation disclaimer

"Documentation" means information published by Avaya in varying mediums which may include product information, operating instructions and performance specifications that Avaya may generally make available to users of its products and Hosted Services. Documentation does not include marketing materials. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of documentation unless such modifications, additions, or deletions were performed by Avaya. End User agrees to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation, to the extent made by End User.

Link disclaimer

Avaya is not responsible for the contents or reliability of any linked websites referenced within this site or documentation provided by Avaya. Avaya is not responsible for the accuracy of any information, statement or content provided on these sites and does not necessarily endorse the products, services, or information described or offered within them. Avaya does not guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty

Avaya provides a limited warranty on Avaya hardware and software. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya's standard warranty language, as well as information regarding support for this product while under warranty is available to Avaya customers and other parties through the Avaya Support website: <https://support.avaya.com/helpcenter/getGenericDetails?detailId=C20091120112456651010> under the link "Warranty & Product Lifecycle" or such successor site as designated by Avaya. Please note that if You acquired the product(s) from an authorized Avaya Channel Partner outside of the United States and Canada, the warranty is provided to You by said Avaya Channel Partner and not by Avaya.

"Hosted Service" means a hosted service subscription that You acquire from either Avaya or an authorized Avaya Channel Partner (as applicable) and which is described further in Hosted SAS or other service description documentation regarding the applicable hosted service. If You purchase a Hosted Service subscription, the foregoing limited warranty may not apply but You may be entitled to support services in connection with the Hosted Service as described further in your service description documents for the applicable Hosted Service. Contact Avaya or Avaya Channel Partner (as applicable) for more information.

Hosted Service

THE FOLLOWING APPLIES IF YOU PURCHASE A HOSTED SERVICE SUBSCRIPTION FROM AVAYA OR AN AVAYA CHANNEL PARTNER (AS APPLICABLE), THE TERMS OF USE FOR HOSTED SERVICES ARE AVAILABLE ON THE AVAYA WEBSITE, [HTTPS://SUPPORT.AVAYA.COM/LICENSEINFO](https://support.avaya.com/LicenseInfo) UNDER THE LINK "Avaya Terms of Use for Hosted Services" OR SUCH SUCCESSOR SITE AS DESIGNATED BY AVAYA, AND ARE APPLICABLE TO ANYONE WHO ACCESSES OR USES THE HOSTED SERVICE, BY ACCESSING OR USING THE HOSTED SERVICE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE DOING SO (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THE TERMS OF USE. IF YOU ARE ACCEPTING THE TERMS OF USE ON BEHALF A COMPANY OR OTHER LEGAL ENTITY, YOU REPRESENT THAT YOU HAVE THE AUTHORITY TO BIND SUCH ENTITY TO THESE

TERMS OF USE. IF YOU DO NOT HAVE SUCH AUTHORITY, OR IF YOU DO NOT WISH TO ACCEPT THESE TERMS OF USE, YOU MUST NOT ACCESS OR USE THE HOSTED SERVICE OR AUTHORIZE ANYONE TO ACCESS OR USE THE HOSTED SERVICE. YOUR USE OF THE HOSTED SERVICE SHALL BE LIMITED BY THE NUMBER AND TYPE OF LICENSES PURCHASED UNDER YOUR CONTRACT FOR THE HOSTED SERVICE, PROVIDED, HOWEVER, THAT FOR CERTAIN HOSTED SERVICES IF APPLICABLE, YOU MAY HAVE THE OPPORTUNITY TO USE FLEX LICENSES, WHICH WILL BE INVOICED ACCORDING TO ACTUAL USAGE ABOVE THE CONTRACT LICENSE LEVEL. CONTACT AVAYA OR AVAYA'S CHANNEL PARTNER FOR MORE INFORMATION ABOUT THE LICENSES FOR THE APPLICABLE HOSTED SERVICE, THE AVAILABILITY OF ANY FLEX LICENSES (IF APPLICABLE), PRICING AND BILLING INFORMATION, AND OTHER IMPORTANT INFORMATION REGARDING THE HOSTED SERVICE.

Licenses

THE SOFTWARE LICENSE TERMS AVAILABLE ON THE AVAYA WEBSITE, [HTTPS://SUPPORT.AVAYA.COM/LICENSEINFO](https://support.avaya.com/LicenseInfo), UNDER THE LINK "AVAYA SOFTWARE LICENSE TERMS (Avaya Products)" OR SUCH SUCCESSOR SITE AS DESIGNATED BY AVAYA, ARE APPLICABLE TO ANYONE WHO DOWNLOADS, USES AND/OR INSTALLS AVAYA SOFTWARE, PURCHASED FROM AVAYA INC., ANY AVAYA AFFILIATE, OR AN AVAYA CHANNEL PARTNER (AS APPLICABLE) UNDER A COMMERCIAL AGREEMENT WITH AVAYA OR AN AVAYA CHANNEL PARTNER. UNLESS OTHERWISE AGREED TO BY AVAYA IN WRITING, AVAYA DOES NOT EXTEND THIS LICENSE IF THE SOFTWARE WAS OBTAINED FROM ANYONE OTHER THAN AVAYA, AN AVAYA AFFILIATE OR AN AVAYA CHANNEL PARTNER; AVAYA RESERVES THE RIGHT TO TAKE LEGAL ACTION AGAINST YOU AND ANYONE ELSE USING OR SELLING THE SOFTWARE WITHOUT A LICENSE. BY INSTALLING, DOWNLOADING OR USING THE SOFTWARE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE INSTALLING, DOWNLOADING OR USING THE SOFTWARE (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THESE TERMS AND CONDITIONS AND CREATE A BINDING CONTRACT BETWEEN YOU AND AVAYA INC. OR THE APPLICABLE AVAYA AFFILIATE ("AVAYA").

Avaya grants You a license within the scope of the license types described below, with the exception of Heritage Nortel Software, for which the scope of the license is detailed below. Where the order documentation does not expressly identify a license type, the applicable license will be a Designated System License. The applicable number of licenses and units of capacity for which the license is granted will be one (1), unless a different number of licenses or units of capacity is specified in the documentation or other materials available to You. "Software" means computer programs in object code, provided by Avaya or an Avaya Channel Partner, whether as stand-alone products, pre-installed on hardware products, and any upgrades, updates, patches, bug fixes, or modified versions thereto. "Designated Processor" means a single stand-alone computing device. "Server" means a Designated Processor that hosts a software application to be accessed by multiple users. "Instance" means a single copy of the Software executing at a particular time: (i) on one physical machine; or (ii) on one deployed software virtual machine ("VM") or similar deployment.

License types

Designated System(s) License (DS). End User may install and use each copy or an Instance of the Software only on a number of Designated Processors up to the number indicated in the order. Avaya may require the Designated Processor(s) to be identified in the order by type, serial number, feature key, Instance, location or other specific designation, or to be provided by End User to Avaya through electronic means established by Avaya specifically for this purpose.

Heritage Nortel Software

"Heritage Nortel Software" means the software that was acquired by Avaya as part of its purchase of the Nortel Enterprise Solutions Business in December 2009. The Heritage Nortel Software is the software contained within the list of Heritage Nortel Products located at <https://support.avaya.com/LicenseInfo> under the link "Heritage

Nortel Products” or such successor site as designated by Avaya. For Heritage Nortel Software, Avaya grants Customer a license to use Heritage Nortel Software provided hereunder solely to the extent of the authorized activation or authorized usage level, solely for the purpose specified in the Documentation, and solely as embedded in, for execution on, or for communication with Avaya equipment. Charges for Heritage Nortel Software may be based on extent of activation or use authorized as specified in an order or invoice.

Copyright

Except where expressly stated otherwise, no use should be made of materials on this site, the Documentation, Software, Hosted Service, or hardware provided by Avaya. All content on this site, the documentation, Hosted Service, and the product provided by Avaya including the selection, arrangement and design of the content is owned either by Avaya or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. You may not modify, copy, reproduce, republish, upload, post, transmit or distribute in any way any content, in whole or in part, including any code and software unless expressly authorized by Avaya. Unauthorized reproduction, transmission, dissemination, storage, and or use without the express written consent of Avaya can be a criminal, as well as a civil offense under the applicable law.

Virtualization

The following applies if the product is deployed on a virtual machine. Each product has its own ordering code and license types. Note that each Instance of a product must be separately licensed and ordered. For example, if the end user customer or Avaya Channel Partner would like to install two Instances of the same type of products, then two products of that type must be ordered.

Third Party Components

“Third Party Components” mean certain software programs or portions thereof included in the Software or Hosted Service may contain software (including open source software) distributed under third party agreements (“Third Party Components”), which contain terms regarding the rights to use certain portions of the Software (“Third Party Terms”). As required, information regarding distributed Linux OS source code (for those products that have distributed Linux OS source code) and identifying the copyright holders of the Third Party Components and the Third Party Terms that apply is available in the products, Documentation or on Avaya’s website at: <https://support.avaya.com/Copyright> or such successor site as designated by Avaya. The open source software license terms provided as Third Party Terms are consistent with the license rights granted in these Software License Terms, and may contain additional rights benefiting You, such as modification and distribution of the open source software. The Third Party Terms shall take precedence over these Software License Terms, solely with respect to the applicable Third Party Components to the extent that these Software License Terms impose greater restrictions on You than the applicable Third Party Terms.

The following applies if the H.264 (AVC) codec is distributed with the product. THIS PRODUCT IS LICENSED UNDER THE AVC PATENT PORTFOLIO LICENSE FOR THE PERSONAL USE OF A CONSUMER OR OTHER USES IN WHICH IT DOES NOT RECEIVE REMUNERATION TO (i) ENCODE VIDEO IN COMPLIANCE WITH THE AVC STANDARD (“AVC VIDEO”) AND/OR (ii) DECODE AVC VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL ACTIVITY AND/OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE AVC VIDEO. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE [HTTP://WWW.MPEGLA.COM](http://www.mpegla.com).

Service Provider

THE FOLLOWING APPLIES TO AVAYA CHANNEL PARTNER’S HOSTING OF AVAYA PRODUCTS OR SERVICES. THE PRODUCT OR HOSTED SERVICE MAY USE THIRD PARTY COMPONENTS SUBJECT TO THIRD PARTY TERMS AND REQUIRE A SERVICE PROVIDER TO BE INDEPENDENTLY LICENSED DIRECTLY FROM THE THIRD PARTY SUPPLIER. AN AVAYA CHANNEL PARTNER’S HOSTING OF AVAYA PRODUCTS MUST BE AUTHORIZED IN WRITING BY AVAYA AND IF THOSE HOSTED PRODUCTS USE OR EMBED CERTAIN THIRD PARTY SOFTWARE, INCLUDING BUT NOT LIMITED TO MICROSOFT

SOFTWARE OR CODECS, THE AVAYA CHANNEL PARTNER IS REQUIRED TO INDEPENDENTLY OBTAIN ANY APPLICABLE LICENSE AGREEMENTS, AT THE AVAYA CHANNEL PARTNER’S EXPENSE, DIRECTLY FROM THE APPLICABLE THIRD PARTY SUPPLIER.

WITH RESPECT TO CODECS, IF THE AVAYA CHANNEL PARTNER IS HOSTING ANY PRODUCTS THAT USE OR EMBED THE G.729 CODEC, H.264 CODEC, OR H.265 CODEC, THE AVAYA CHANNEL PARTNER ACKNOWLEDGES AND AGREES THE AVAYA CHANNEL PARTNER IS RESPONSIBLE FOR ANY AND ALL RELATED FEES AND/OR ROYALTIES. THE G.729 CODEC IS LICENSED BY SIPRO LAB TELECOM INC. SEE WWW.SIPRO.COM/CONTACT.HTML. THE H.264 (AVC) CODEC IS LICENSED UNDER THE AVC PATENT PORTFOLIO LICENSE FOR THE PERSONAL USE OF A CONSUMER OR OTHER USES IN WHICH IT DOES NOT RECEIVE REMUNERATION TO: (I) ENCODE VIDEO IN COMPLIANCE WITH THE AVC STANDARD (“AVC VIDEO”) AND/OR (II) DECODE AVC VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL ACTIVITY AND/OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE AVC VIDEO. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION FOR H.264 (AVC) AND H.265 (HEVC) CODECS MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE [HTTP://WWW.MPEGLA.COM](http://WWW.MPEGLA.COM).

Compliance with Laws

Customer acknowledges and agrees that it is responsible for complying with any applicable laws and regulations, including, but not limited to laws and regulations related to call recording, data privacy, intellectual property, trade secret, fraud, and music performance rights, in the country or territory where the Avaya product is used.

Preventing Toll Fraud

“Toll Fraud” is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company’s behalf). Be aware that there can be a risk of Toll Fraud associated with your system and that, if Toll Fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Toll Fraud intervention

If You suspect that You are being victimized by Toll Fraud and You need technical assistance or support, call Technical Service Center Toll Fraud Intervention Hotline at +1-800-643-2353 for the United States and Canada. For additional support telephone numbers, see the Avaya Support website: <https://support.avaya.com> or such successor site as designated by Avaya.

Security Vulnerabilities

Information about Avaya’s security support policies can be found in the Security Policies and Support section of <https://support.avaya.com/security>.

Suspected Avaya product security vulnerabilities are handled per the Avaya Product Security Support Flow (<https://support.avaya.com/css/P8/documents/100161515>).

Downloading Documentation

For the most current versions of Documentation, see the Avaya Support website: <https://support.avaya.com>, or such successor site as designated by Avaya.

Contact Avaya Support

See the Avaya Support website: <https://support.avaya.com> for product or Hosted Service notices and articles, or to report a problem with your Avaya product or Hosted Service. For a list of support telephone numbers and contact addresses, go to the Avaya Support website: <https://support.avaya.com> (or such successor site as designated by Avaya), scroll to the bottom of the page, and select Contact Avaya Support.

Trademarks

The trademarks, logos and service marks (“Marks”) displayed in this site, the Documentation, Hosted Service(s), and product(s) provided by Avaya are the registered or unregistered Marks of Avaya, its affiliates, or other third parties. Users are not permitted to use such

Marks without prior written consent from Avaya or such third party which may own the Mark. Nothing contained in this site, the Documentation, Hosted Service(s) and product(s) should be construed as granting, by implication, estoppel, or otherwise, any license or right in and to the Marks without the express written permission of Avaya or the applicable third party.

Avaya is a registered trademark of Avaya Inc.

All non-Avaya trademarks are the property of their respective owners. Linux® is the registered trademark of Linus Torvalds in the U.S. and other countries.

Chapter 1: New in this document

Configuring Link Aggregation, MLT, SMLT, and vIST is a new document for Release 4.3 so all the features are new in this release. See *Release Notes* for a full list of features.

Chapter 2: Link Aggregation Control Protocol

This section provides the concepts and procedures you need to configure the Link Aggregation Control Protocol (LACP) to dynamically aggregate links as they become available to a trunk group.

Link aggregation overview

Link aggregation provides link level redundancy and increases load sharing. Use Link aggregation to bundle the ports into a port group, which is represented as one logical interface to the Media Access Control (MAC) layer.

The switch supports the following types of link aggregation:

- MultiLink Trunking (MLT)—a statically configured link bundling method. MLT is not standards based, but it interoperates with static link methods of other vendors.
- IEEE 802.3ad based link aggregation, through the Link Aggregation Control Protocol (LACP), dynamically aggregates links as they become available to a trunk group. Link Aggregation Control Protocol dynamically detects whether links can be aggregated into a link aggregation group (LAG) and does so after links become available. Link Aggregation Control Protocol also provides link integrity checking at Layer 2 for all links within the LAG.

Both MLT and IEEE 802.3ad based link aggregation are point-to-point functions.

The switch software offers LACP functionality layered with MLT. This document uses the term *MLT with LACP* to refer to this functionality.

Split MultiLink Trunking (SMLT)

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency by providing for the addition of failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use SMLT to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

For more information on SMLT, see [Split MultiLink Trunking](#) on page 38.

LACP with SMLT

You can use LACP on SMLT configurations. The switch provides modifications to the LACP in SMLT configurations. LACP-capable devices can connect to an SMLT aggregation pair.

*** Note:**

Virtual IST is not supported on LACP-enabled MLTs.

VLACP with SMLT

You can also configure Virtual LACP (VLACP) with an SMLT configuration. VLACP is a modification that provides end-to-end failure detection. VLACP is not a link aggregation protocol.

VLACP implements link status control protocol at the port level. This mechanism periodically checks the end-to-end health of a point-to-point or end-to-end connection. You can run VLACP on single ports or on ports that are part of an MLT.

*** Note:**

Do not configure VLACP on LACP-enabled ports. VLACP does not operate properly with LACP.

Virtual Inter-Switch Trunk (vIST)

Split MultiLink Trunking provides subsecond failover when a switch fails. Virtual Inter-Switch Trunk (vIST) improves upon that Layer 2 and Layer 3 resiliency by using a virtualized IST channel through the SPBM cloud. The vIST channel carries the vIST control traffic and data traffic during an SMLT failover. This feature dramatically improves resiliency over other methods.

Because vIST uses a *virtual* channel and because IS-IS runs over it, vIST eliminates the potential single point of failure with a dedicated MLT. The vIST channel is always up as long as there is SPBM connectivity between the vIST peers.

*** Note:**

vIST interoperates between any two devices that support vIST, and the devices do not have to be of the same type.

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

For information on vIST configuration, see [Creating a virtual IST using CLI](#) on page 53 or [Creating a virtual IST using EDM](#) on page 64.

*** Note:**

Users may observe a momentary increase in activity when a MAC delete message is received from a peer. This is due to vIST engaging in MAC learning activities. This is a normal operational procedure.

MultiLink Trunking with LACP

MultiLink Trunking (MLT) with Link Aggregation Control Protocol (LACP) manages ports and port memberships to form a link aggregation group (LAG). Use Link Aggregation Control Protocol to gather one or more links to form a LAG, which a Media Access Control (MAC) client treats as a single link. Link Aggregation Control Protocol can dynamically add or remove LAG ports, depending on availability and state.

IEEE 802.3ad overview

The IEEE 802.3ad standard comprises service interfaces, the LACP, the Marker Protocol, link aggregation selection logic, a parser or multiplexer, frame distribution, and frame collection functions.

The following illustration shows the major functions of IEEE 802.3ad defined as multiple link aggregation.

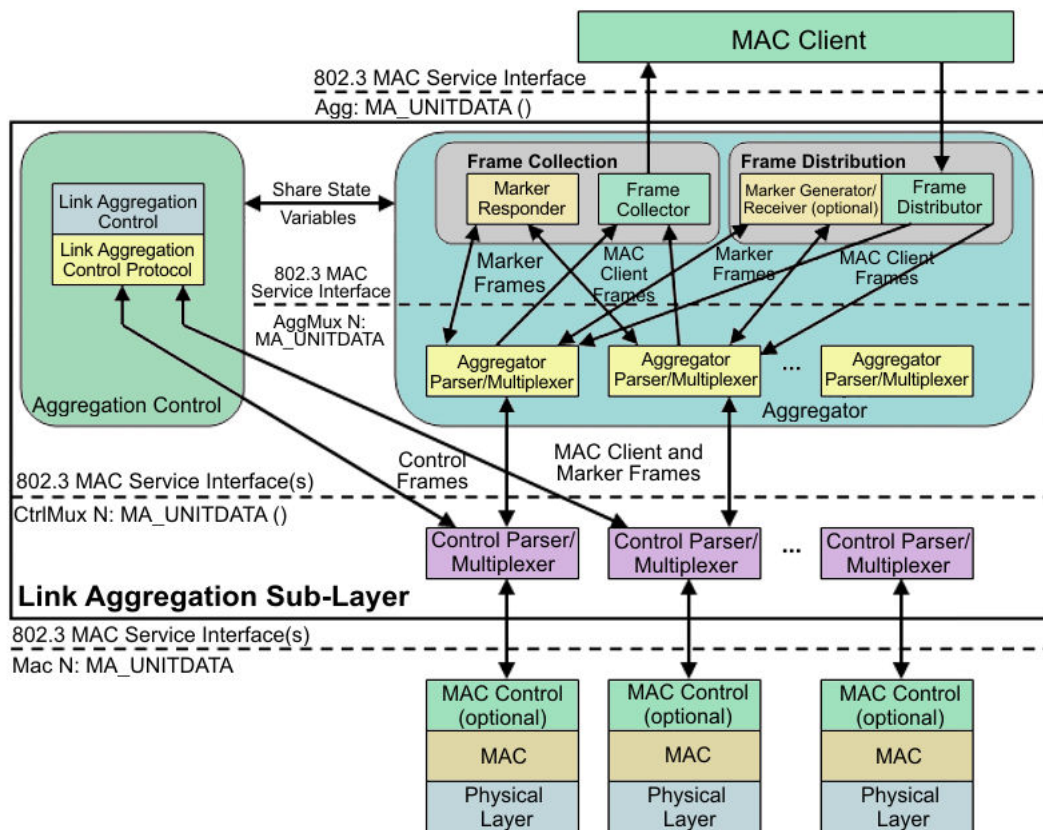

Figure 1: Link aggregation sublayer (according to IEEE 802.3ad)

The link aggregation sublayer comprises the following functions:

- frame distribution

This block takes frames submitted by the MAC client and sends them for transmission on the appropriate port based on a frame distribution algorithm employed by the Frame Distributor.

Frame distribution also includes an optional Marker Generator/Receiver used for the Marker Protocol. The switch only implements the Marker Receiver function. For more information about the frame distribution algorithm, see [MLT traffic distribution algorithm](#) on page 36.

- frame collection

This block passes frames received from the various ports to the MAC client. Frame collection also includes a Marker Responder used for the Marker Protocol.

- aggregator parser or multiplexers

During transmission operations, these blocks pass frame transmission requests from the Distributor, Marker Generator, and Marker Responder to the appropriate port.

During receive operations, these blocks distinguish among Marker Request, Marker Response, MAC Client Protocol Data Units (PDU), and pass the blocks to the appropriate entity (Marker Responder, Marker Receiver, and Collector, respectively).

- aggregator

The combination of frame distribution and collection, and aggregator parser or multiplexers.

- aggregation control

This block configures and controls link aggregation. It incorporates LACP for the automatic communication of aggregation capabilities between systems and automatic configuration of link aggregation.

- control parser/multiplexers

During transmission operations, these blocks pass frame transmission requests from the aggregator and Control entities to the appropriate port.

During receive operations, these blocks distinguish Link Aggregation Control Protocol Data Units (LACPDU) from other frames. The blocks pass, passing the LACPDU to the appropriate sublayer entity and all other frames to the aggregator.

802.3ad link aggregation principles

Use link aggregation to group ports together to form a link group to another device. Link groups increase aggregate throughput between devices and provide link redundancy.

Link aggregation employs the following principles and concepts:

- A MAC client communicates with a set of ports through an aggregator, which presents a standard IEEE 802.3 service interface to the MAC client. The aggregator binds to one or more ports within a system.
- The aggregator distributes frame transmissions from the MAC client to various ports, collects received frames from the ports, and transparently passes the frames to the MAC client.
- A system can contain multiple aggregators serving multiple MAC clients. A port binds to a single aggregator at a time. A MAC client is served by a single aggregator at a time.
- The Link Aggregation Control function binds ports to aggregators within a system. The control function aggregates links, binds the system ports to an appropriate aggregator, and monitors conditions to determine if a change in aggregation is needed. Network managers can manually provide link aggregation control by manipulating the link aggregation state variables (for example, keys). You can also use LACP to automatically determine, configure, bind, and monitor link aggregation.

- LACP uses peer exchanges across links to continually determine the aggregation capability of the links and provide the maximum level of aggregation capability between a pair of systems.
- Frame ordering is maintained for certain sequences of frame exchanges between MAC Clients. The distributor ensures that all frames of a conversation pass to a single port. The collector passes frames to the MAC client in the order they are received from the port. The collector can select frames received from the aggregated ports. Because the frames are not ordered on a single link, this guarantees that frame ordering is maintained for all conversations.
- Conversations move among ports within an aggregation for load balancing and for maintaining availability if a link fails.
- Each port is assigned a unique, globally administered MAC address.

After entities initiate frame exchanges within the link aggregation sublayer, the source address is the MAC address. An example of an entity that initiates frame exchanges is LACP and Marker Protocol exchanges.

- Each aggregator is assigned a unique, globally administered MAC address that is used from the perspective of the MAC client, both as a source address for transmitted frames and as the destination address for received frames. You can use one of the port MAC addresses in the associated LAG as the MAC address of the aggregator.

LACP configuration considerations

You can configure priorities, keys, modes, and timers for the LACP.

LACP priority

You can configure LACP priority at the system and port level as follows:

- Port priority—determines which ports are aggregated into a LAG that has more than eight ports configured to it.
- System priority—generates the switch ID after communicating with other systems. Use the default value. If you need to change it, first disable the LACP, and then enable it again after you change the value.

LACP keys

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

- Keys do not have to match between two LACP peers.

LACP timers

You can customize failover times by changing the LACP timer attributes (fast periodic time, slow periodic time, and aggregate wait time). Values are set by default to match the IEEE 802.3ad values. If you change the values, they must match on the ports participating in aggregation between two devices.

Changes to LACP timer values at the global level are reflected on all ports. However, you can change the LACP timer values for each port level. After you change an LACP timer globally, this

value is set on all ports. The global timer value overwrites the local port value irrespective of the LACP state. You must configure port values that differ from the global values.

The switch software uses the following LACP timers:

- fast periodic timer—200 to 20 000 milliseconds (ms); default 1000 ms
- slow periodic timer—10 000 to 30 000 ms; default 30000 ms
- aggregation-wait timer—200 to 2000; default 2000

You cannot aggregate a link if it does not receive an LACPDU for a period of $\text{timeout} \times \text{slow periodic time} = 3 \times 30 \text{ seconds} = 90 \text{ seconds}$. If you use the fast periodic time, the timeout period is $3 \times 1000 \text{ ms} = 3 \text{ seconds}$. You must make timer changes to all ports participating in link aggregation and to the ports on the partnering node.

Configuration changes to the LACP timers are not reflected immediately. Link Aggregation Control Protocol timers do not reset until the next time you restart LACP globally or on a port. This ensures consistency with peer switches.

After you enable LACP on a port, the timer values are set at the port level. You must toggle the LACP status after timer values change. This does not impact existing ports unless you toggle the LACP status on the port.

LACP modes

LACP uses two active and passive modes.

- Active mode—ports initiate the aggregation process. Active mode ports aggregate with other active mode ports or passive mode ports.
- Passive mode—ports participate in LACP but do not initiate the aggregation process. You must partner passive mode ports with active mode ports for aggregation to occur.

Important information and restrictions

This section contains important information and restrictions you must consider before you use the switch.

LACP with Simplified vIST/SPB NNI links

LACP is not recommended on SPB NNI MLT links or on the Simplified Virtual IST.

vIST VLAN IP addresses

Do not configure a Rendezvous Point (RP) or Bootstrap Router (BSR) on the vIST VLAN because you cannot ping them outside of the vIST VLAN subnet. When you enter the `ip pim enable` command on the vIST VLAN, the following message displays:

WARNING: Please do not use virtual IST VLAN IP address for BSR and RP related configurations, as unicast packets to virtual IST vlan IP address from outside of virtual IST vlan subnet will be dropped. Use Loopback or CLIP interface IP address for BSR and RP related configurations.

LACP configuration using CLI

This section describes how to configure and manage link aggregation using the Command Line Interface (CLI), including Link Aggregation Control Protocol (LACP), to increase the link speed and redundancy for higher availability.

MultiLink Trunking (MLT) with LACP manages switch ports and port memberships to form a link aggregation group (LAG). Configure LACP to allow dynamic bundling of physical ports to form a single logical channel.

You can describe the LACP in terms of link aggregation operations within a single system. You can configure a single piece of equipment so it contains more than one system (from the point of view of the link aggregation operation).

Before you begin

- Changes to LACP made at the global level overrides and resets all port level settings.

! **Important:**

After you globally configure the LACP system priority, it applies to all LACP-enabled aggregators and ports. After you enable the LACP on an aggregator or port, it uses the global system priority value.

- After you make a timer change, restart the LACP (globally or on the port) so the changes are consistent across the link.

! **Important:**

Configuration changes to LACP timers are not reflected immediately. LACP timers are not reset until the next time LACP is restarted globally or on a port. This action ensures consistency with peer switches.

- The switch does not support standby ports for LACP aggregation groups.

Configuring global LACP parameters

Configure LACP parameters globally. After you configure the LACP system priority globally, it applies to all LACP-enabled aggregators and ports. After you enable the LACP on an aggregator or a port, it uses the global system priority value.

The new global parameter configuration is in effect after the LACP is restarted globally or on each port.

About this task

! Important:

Changes made at the global level override and reset all port level settings.

Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```

2. Change the system priority:

```
lacp system-priority <0-65535>
```

3. Configure additional LACP parameters as required:

```
lacp enable [aggr-wait-time <200-2000>] [fast-periodic-time
<200-20000>] [slow-periodic-time <10000-30000>] [smlt-sys-
id<0x00:0x00:0x00:0x00:0x00:0x00>] [system-priority <0-65535> ] [timeout-
scale <2-10>]
```

If you do not configure the optional parameters, the system uses the default values.

Example

```
Switch(config)# lacp fast-periodic-time 2000
```

```
Switch(config)# lacp enable
```

Variable definitions

Use the data in the following table to use the `lacp` command.

Variable	Value
aggr-wait-time <200–2000>	Configures the aggregation wait time (in milliseconds) globally. The default value is 2000.
enable	Enables LACP globally. The default value is disabled.
fast-periodic-time <200–20000>	Configures the fast periodic time (in milliseconds) globally. The default value is 1000.
slow-periodic-time <10000–30000>	Configures the slow periodic time globally. The default value is 30000.
smlt-sys-id <0x00:0x00:0x00:0x00:0x00:0x00>	Configures the LACP system ID globally. Enter a MAC address in the following format: 0x00:0x00:0x00:0x00:0x00:0x00.
system-priority <0-65535>	Configures the LACP system priority globally. The default value is 32768.
timeout-scale <2-10>	Configures the timeout scale globally. The default value is 3.

Configuring LACP on a port

Configure LACP on a port to enable or disable LACP on the selected ports.

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

The minimum LACP configuration is as follows:

- Assign a given key to a set of ports.
- Assign the same key to an MLT with no members. The ports will automatically become MLT members.

Keys do not have to match between two LACP peers.

About this task

Important:

Changes made at the global level override and reset all port level settings.

A port can operate in active or passive mode. You can configure a port to be an individual link or an aggregated link.

Procedure

1. Enter Interface Configuration mode:

```
enable
configure terminal
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-
port]][,...]} or interface vlan <1-4059>
```

Note:

If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Assign an LACP key to a set of ports.

```
lacp key <1-512, defVal>
```

3. Change the LACP mode:

```
lacp mode <active|passive>
```

4. Change the port priority:

```
lacp priority <0-65535>
```

5. **(Optional)** Change the system priority:

```
lacp system-priority <0-65535>
```

6. Configure aggregation for the port:

```
lacp aggr-wait-time <200-2000>[aggregation enable]
```

If you do not configure the optional parameter, the system uses the default values.

7. Configure parameters for the partner device at the opposite end of the link:

* **Note:**

All the parameters beginning with **partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what's learned from the partner, there will be trace or log message.

```
lacp partner-key <0-65535>
```

```
lacp partner-port <0-65535>
```

```
lacp partner-port-priority <0-65535>
```

```
lacp partner-state <0-255 | 0x0-0xff>
```

```
lacp partner-system-id 0x00:0x00:0x00:0x00:0x00:0x00
```

```
lacp partner-system-priority <0-65535>
```

8. Configure additional LACP parameters as required:

```
lacp enable [fast-periodic-time <200-20000>] [slow-periodic-time  
<10000-30000>] [timeout-time <long|short>] [timeout-scale <2-10>]
```

If you do not configure the optional parameters, the system uses the default values.

Example

Configure LACP on ports 1/2 and 1/3:

```
Switch(config)# interface gigabitethernet 1/2-1/3
```

```
Switch(config-if)# lacp key 1 timeout short
```

```
Switch(config-if)# lacp aggregation enable
```

```
Switch(config-if)# lacp enable
```

Variable definitions

Use the data in the following table to use the **lacp** command.

* **Note:**

All the parameters beginning with **partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what is learned from the partner, there will be a trace or log message.

Variable	Value
aggr-wait-time <200–2000>	Configures the aggregation wait time (in milliseconds) for this port. The default is 2000.
aggregation enable	Enables aggregation on the port, which makes it an aggregated link.
enable	Enables LACP for this port. The default is disabled.
fast-periodic-time <200–20000>	Configures the fast periodic time (in milliseconds) for this port. The default is 1000 ms.
key <1-512,defVal>	Configures the aggregation key for this port.
mode {active passive}	Configures the LACP mode to be active or passive.
partner-key <0–65535>	Configures the partner administrative key.
partner-port <0–65535>	Configures the partner administrative port value.
partner-port-priority <0–65535>	Configures the partner administrative port priority value.
partner-state <0-255 0x0-0xff>	Configures the partner administrative state bitmask. Specify the partner administrative state bitmap in the range 0x0–0xff. The bit to state mapping is Exp, Def, Dis, Col, Syn, Agg, Time, and Act. For example, to set the two partner-state parameters <ul style="list-style-type: none"> • Act = true • Agg = true specify a value of 0x05 (bitmap = 00000101).
partner-system-id <0x00:0x00:0x00:0x00:0x00:0x00>	Configures the partner administrative system ID. Specify a MAC address in the format 0x00:0x00:0x00:0x00:0x00:0x00.
partner-system-priority <0–65535>	Configures the partner administrative system priority value.
priority <0–65535>	Configures the port priority. The default value is 32768. To set this option to the default value, use the default operator with the command.
slow-periodic-time <10000-30000>	Configures the slow periodic time for this port. The default is 30000 ms. To set this option to the default value, use the default operator with the command.
system-priority <0-65535>	Configures the system priority for this port. The default is 32768.
timeout-scale <2-10>	Configures a timeout scale for this port. The default value is 3. The LACP timeout is equal to the slow periodic time or fast periodic time multiplied by the timeout-scale, depending how you configure the timeout-time variable.
timeout-time {long short}	Configures the timeout to either long or short.

Configuring LACP on an MLT

Configure an MLT with LACP to use the dynamic link aggregation function.

About this task

! Important:

Attach ports to an aggregator only if their system priorities are the same; otherwise, they are considered to be operating in two different switches. You can attach ports to an aggregator only if their keys are the same.

When you add a VLAN to a dynamic MLT, only the active ports of the MLT are added as port members of the VLAN. Ports configured with the same aggregation key, but not active, are not added to the VLAN. If these inactive ports become active later, the system does not automatically add them to the VLAN port member list.

You must add all inactive ports to the VLAN. If you do not add the inactive ports to the VLAN, when they become active later, hashing can result in choosing a newly active port for traffic forwarding. Because the port is not a port member of the VLAN, traffic will be dropped. When you add the VLAN to the MLT, also add the inactive aggregation ports to the VLAN. You may have to disable LACP on the inactive ports before you can add them to the VLAN. Because the ports are inactive, disabling LACP does not cause a traffic interruption.

Similarly when you remove a VLAN from a dynamic MLT, all active ports of the MLT are removed from the VLAN port member list but the inactive members are not removed. You must remove the inactive aggregation members from the VLAN.

If you later configure a port for the same aggregation, you must add this port to all VLANs that are members of the MLT.

Procedure

1. Enter MLT Interface Configuration mode:

```
enable
configure terminal
interface mlt <1-512>
```

2. Configure LACP on an MLT:

```
lacp enable [key <0-512>] [system-priority <0-65535>]
```

Example

Enable LACP and configure the LACP key on MLT 3:

```
Switch:1(config)# interface mlt 3
Switch:1(config-mlt)# lacp enable key 1281
```

Variable definitions

Use the data in the following table to use the `lacp` command.

Variable	Value
enable	Enables LACP on the MLT interface.

Table continues...

Variable	Value
key <0-512>	Configures the LACP aggregator key for a specific MLT. <ul style="list-style-type: none"> • 0-512 is the LACP actor admin key.
system-priority <0-65535>	Configures the LACP system priority for a specific MLT. <ul style="list-style-type: none"> • 0-65535 is the system priority.

Configuring LACP and private VLANs

About this task

Use the following procedure to configure Link Aggregation Control Protocol (LACP) on a private VLAN.

Procedure

1. Enter Interface Configuration mode:

```
enable
configure terminal
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]][,...]} or interface vlan <1-4059>
```

*** Note:**

If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Enable trunking:

```
encapsulation dot1q
```

3. Set private VLAN port type:

```
private-vlan [isolated|promiscuous|trunk]
```

Example

```
Switch:1(config)#interface GigabitEthernet 1/6
Switch:1(config-if)#encapsulation dot1q
Switch:1(config-if)#private-vlan promiscuous
Switch:1(config-if)#exit
```

```
Switch:1(config)#interface GigabitEthernet 1/37
Switch:1(config-if)#encapsulation dot1q
Switch:1(config-if)#private-vlan promiscuous
```

Viewing LACP configuration information

View LACP configuration information to determine the LACP parameters and to ensure your configuration is correct.

Procedure

1. View the global configuration:

```
show lacp
```

2. View LACP administrative information for the local device:

```
show lacp actor-admin interface [gigabitethernet]
```

OR

```
show lacp actor-admin interface gigabitethernet [vid <1-4059>]
[{{slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]
```

3. View LACP operational information for the actor device:

```
show lacp actor-oper interface [gigabitethernet]
```

OR

```
show lacp actor-oper interface gigabitethernet [vid <1-4059>]
[{{slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]
```

4. View LACP timer information:

```
show lacp extension interface [gigabitethernet]
```

5. View LACP interface configuration information

```
show lacp interface
```

OR

```
show lacp interface gigabitethernet [vid <1-4059>] [{{slot/port[/sub-
port]}[-slot/port[/sub-port]][,...]]
```

OR

```
show lacp interface mlt [<64-6399>]
```

OR

```
show lacp interface mlt [id<1-512>]
```

6. View LACP administrative information for the partner device:

```
show lacp partner-admin interface [gigabitethernet]
```

OR

```
show lacp partner-admin interface gigabitethernet [vid <1-4059>]
[{{slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]
```

7. View LACP operational information for the partner device:

```
show lacp partner-oper interface [gigabitethernet]
```

OR

```
show lacp partner-oper interface gigabitethernet [vid <1-4059>]
[{{slot/port[/sub-port]}[-slot/port[/sub-port]][,...]]
```

Example

```
Switch:1#show lacp
=====
                        Lacp Global Information
=====
      SystemId: a4:25:1b:50:60:00
      SmltSystemId: 00:00:00:00:00:00
      Lacp: disable
      system-priority: 32768
        timeout-admin: 3
      fast-periodic-time-admin: 1000
      slow-periodic-time-admin: 30000
      aggr-wait-time-admin: 2000
        timeout-oper: 3
      fast-periodic-time-oper: 1000
      slow-periodic-time-oper: 30000
      aggr-wait-time-oper: 2000
```

In the following example output, `aggr` indicates the port has become part of an aggregation. `indi` indicates individual.

```
Switch(config-if)# show lacp actor-admin interface gigabitethernet 1/1
=====
                        Actor Admin
=====
INDEX SYS  SYS      KEY  PORT  PORT  STATE
   Prio  ID
-----
1/1  32768  00:24:7f:9f:c0:00  1    0x114  32768  act short aggr
```

```
Switch(config-if)# show lacp partner-admin interface gigabitethernet 1/1
=====
                        Partner Admin
=====
INDEX SYS  SYS      KEY  PORT  PORT  STATE
   Prio  ID
-----
1/1  0      00:00:00:00:00:00  0    0x0    0      pas          long indi
```

Variable definitions

Use the data in the following table to use the `show lacp` command.

Variable	Value
actor-admin interface gigabitethernet [vid <1-4059>{slot/port[/sub-port][/-slot/port[/sub-port]] [...]}]	Shows LACP actor (or local) administrative information for all interfaces or the specified interface. <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. VLAN IDs 1 to 4059 are configurable. The system reserves VLAN IDs 4060 to 4094 for internal use. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. {slot/port[/sub-port][/-slot/port[/sub-port]] [...]} is the port or port list.
actor-oper interface gigabitethernet [vid <1-4059>[{slot/port[/sub-port][/-slot/port[/sub-port]] [...]}]	Shows LACP actor operational information for all interfaces or the specified interface. <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. VLAN IDs 1 to 4059 are configurable. The system reserves VLAN IDs 4060 to 4094 for internal use. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. {slot/port[/sub-port][/-slot/port[/sub-port]] [...]} is the port or port list.
extension interface gigabitethernet [vid <1-4059>[{slot/port[/sub-port][/-slot/port[/sub-port]] [...]}]	Shows LACP timer information for all interfaces or the specified interface. <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. VLAN IDs 1 to 4059 are configurable. The system reserves VLAN IDs 4060 to 4094 for internal use. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. {slot/port[/sub-port][/-slot/port[/sub-port]] [...]} is the port or port list.
interface [gigabitethernet [vid <1-4059> [{slot/port[/sub-port][/-slot/port[/sub-port]] [...]}] [mlt <64-6399>] [mlt id <1-128>]]	Shows all LACP port configuration information for all interfaces or the interface you specify. <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. VLAN IDs 1 to 4059 are configurable. The system reserves VLAN IDs 4060 to 4094 for internal use. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. {slot/port[/sub-port][/-slot/port[/sub-port]] [...]} is the port or port list. <64-6399> is the interface index of the mlt. <1-128> is the MLT ID.

Table continues...

Variable	Value
partner-admin interface[gigabitethernet] [vid <1-4059> [{slot/port[/sub-port]}/sub-port]] [...]]	Shows LACP partner administrative information for all interfaces or the specified interface. <ul style="list-style-type: none"> Specifies the VLAN ID in the range of 1 to 4059. VLAN IDs 1 to 4059 are configurable. The system reserves VLAN IDs 4060 to 4094 for internal use. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1. {slot/port[/sub-port]}/sub-port]] [...]] is the port or port list.

LACP configuration using EDM

MultiLink Trunking (MLT) with Link Aggregation Control Protocol (LACP) manages switch ports and port memberships to form a link aggregation group (LAG). Configure LACP to allow dynamic bundling of physical ports to form a single logical channel.

Important:

The switch does not support standby ports for LACP aggregation groups.

Configuring global LACP parameters

Use LACP parameters to manage switch ports and their port memberships to form link aggregation groups (LAG). Link Aggregation Control Protocol (LACP) can dynamically add or remove LAG ports, depending on their availability and states.

Procedure

- In the navigation pane, expand the following folders: **Configuration > VLAN**.
- Click **MLT/LACP**.
- Click the **LACP Global** tab.
- To enable LACP globally, select the **Enable** check box.

- Configure the remaining parameters as required.

! **Important:**

Configuration changes to the LACP timers are not effective immediately. Link Aggregation Control Protocol timers are not reset until the next time LACP is restarted globally or on a port. This ensures consistency with peer switches.

- Click **Apply**.

LACP Global field descriptions

Use the data in the following table to use the **LACP Global** tab.

Name	Description
Enable	Enables or disables LACP globally.
SystemPriority	Configures the system priority for all LACP enabled aggregators and ports. The default value is 32768.
FastPeriodicTime	Configures the number of milliseconds between periodic transmissions that use short timeouts. Sets this value to all LACP-enabled ports. The range is 200–20000. The default value is 1000.
FastPeriodicTimeOper	Displays the operating value of the fast periodic timer on the port. The default value is 1000.
SlowPeriodicTime	Configures the number of milliseconds between periodic transmissions that use long timeouts. All LACP enabled ports get the same value from this setting. The range is 10000–30000. The default value is 30000.
SlowPeriodicTimeOper	Displays the operating value of the slow periodic timer on the port. The default value is 30000.
AggrWaitTime	Configures the number of milliseconds to delay aggregation to allow multiple links to aggregate simultaneously. The range is 200–2000. The default value is 2000.
AggrWaitTimeOper	Displays the operating value of the aggregate wait timer on the port. The default value is 2000.
TimeoutScale	Configures the value used to calculate timeout time from the periodic time. All LACP-enabled ports get the same value from this setting. The range is 2–10.

Table continues...

Name	Description
	The default value is 3.
TimeoutScaleOper	Displays the operating value of the timeout scale on the port. The default value is 3.
SmltSysId	Specifies the LACP system ID for Split MultiLink Trunking (SMLT).

Configuring LACP parameters

Configure LACP parameters to manage LACP information.

About this task

 **Important:**

The switch does not support standby ports for LACP aggregation groups.

Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **LACP** tab.
4. Double-click a field to change the value.
You cannot edit grey-shaded fields in the table.
5. Click **Apply**.

LACP field descriptions

Use the data in the following table to use the **LACP** tab.

Name	Description
Index	The unique identifier the local system allocates to this aggregator. This attribute identifies an aggregator instance among the subordinate managed objects of the containing object. This value is read-only.
MACAddress	The six octet read-only value carrying the individual MAC address assigned to the aggregator.
ActorSystemPriority	The two octet read-write value indicating the priority value associated with the actor system ID. The default value is 32768.
ActorSystemID	The six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator.

Table continues...

Name	Description
	From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered. No distinction is made between the values of these parameters for an aggregator and the ports that are associated with it. The protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the both the aggregator and the port allow management of these parameters. The result permits a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation, which is useful in the configuration of equipment that has limited aggregation capability.
AggregateOrIndividual	Indicates whether the aggregator represents an aggregate (true) or an individual link (false).
ActorAdminKey	Specifies the current administrative value of the key for the aggregator, which is a 16-bit read-write value. The administrative key value can differ from the operational key value. This key needs to match the LAG key. The default value is 0.
ActorOperKey	Displays the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance.
PartnerSystemID	The six octet read-only MAC address value consisting of the unique identifier for the current protocol partner of this aggregator. A value of zero indicates that there is no known partner. If the aggregation is manually configured, the value is assigned by the local system.
PartnerSystemPriority	The two octet read-only value that indicates the priority value associated with the partner system ID. If the aggregation is manually configured, this system priority value is a value assigned by the local system.
PartnerOperKey	The current operational value of the key for the aggregator current protocol partner, which is a 16-bit read-only value. If the aggregation is manually configured, the value is assigned by the local system.

Configuring LACP on a port

Configure LACP on a port to enable LACP.

You must use the LACP keys to determine which ports are eligible for link aggregation. The LACP keys are defined by the ports after you configure the multilink trunk. You can aggregate the ports key that match the MLT key into that multilink trunk.

The minimum LACP configuration is as follows:

- Assign a given key to a set of ports.

- Assign the same key to an MLT with no members. The ports will automatically become MLT members.

Keys do not have to match between two LACP peers.

Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand the following folders: **Configuration > Edit > Port**.
3. Click **General**.
4. Click the **LACP** tab.
5. To enable LACP on the port, select the **AdminEnable** check box.
6. To assign an LACP key, configure the **ActorAdminKey** field.
7. Configure the remaining parameters as required.
8. Click **Apply**.

LACP field descriptions

Use the data in the following table to use the **LACP** tab.

All the parameters beginning with **Partner** are for debug purposes only. If you configure these commands locally and there is a mismatch with what is learned from the partner, there will be a trace or log message.

Name	Description
AdminEnable	Enables LACP status for the port. The default value is false.
OperEnable	Displays the operational status of LACP for the port. The default value is false.
FastPeriodicTime	Specifies the number of milliseconds between periodic transmissions using short timeouts for all LACP enabled ports. The range is 200–20000. The default value is 1000.
FastPeriodicTimeOper	Displays the operating value of the fast periodic timer on the port. The default value is 1000.
SlowPeriodicTime	Specifies the number of milliseconds between periodic transmissions using long timeouts for all LACP enabled ports. The range is 10000–30000. The default value is 30000.
SlowPeriodicTimeOper	Displays the operating value of the slow periodic timer on the port.

Table continues...

Name	Description
	The default value is 30000.
AggrWaitTime	<p>Specifies the number of milliseconds to delay aggregation to allow multiple links to aggregate simultaneously. The range is 200–2000.</p> <p>The default value is 2000.</p>
AggrWaitTimeOper	<p>Displays the operating value of the aggregate wait timer on the port.</p> <p>The default value is 2000.</p>
TimeoutScale	<p>Assigns the value used to calculate timeout time from the periodic time. Set this value to all LACP enabled ports. The range is 2–10.</p> <p>The default value is 3.</p>
TimeoutScaleOper	<p>Displays the operating value of the timeout scale on the port.</p> <p>The default value is 3.</p>
ActorSystemPriority	<p>Specifies the two octet read-write value indicating the priority value associated with the actor system ID. The range is 0–65535.</p> <p>The default value is 32768.</p>
ActorSystemID	<p>Displays the six octet read-write MAC address value used as a unique identifier for the system that contains this aggregator.</p> <p>From the perspective of the link aggregation mechanisms, only a single combination of actor system ID and system priority are considered, and no distinction is made between the values of these parameters for an aggregator and the ports that are associated with it; that is, the protocol is described in terms of the operation of aggregation within a single system. However, the managed objects provided for the aggregator and the port both allow management of these parameters. The result of this is to permit a single piece of equipment to be configured by management to contain more than one system from the point of view of the operation of link aggregation. This can be of particular use in the configuration of equipment that has limited aggregation capability.</p>
ActorAdminKey	<p>Specifies the current read-write administrative value of the key for the aggregator, which is a 16-bit value in the range of 0–65535. The administrative key value can differ from the operational key value. This key needs to match the LAG key.</p>

Table continues...

Name	Description
ActorOperKey	Displays the current read-only operational value of the key for the aggregator. The operational key value can differ from the administrative key value. The meaning of particular key values is of local significance.
SelectedAggID	Displays the identifier value of the aggregator that this aggregation port has currently selected. Zero indicates that the aggregation port has not selected an aggregator, either because it is in the process of detaching from an aggregator or because there is no suitable aggregator available for it to select. This value is read-only.
AttachedAggID	Displays the identifier value of the aggregator to which this aggregation port is currently attached. Zero indicates that the aggregation port is not currently attached to an aggregator. This value is read-only.
ActorPort	Displays the port number locally assigned to the aggregation port. The port number is communicated in LACPDU as the Actor_Port. This value is read-only.
ActorPortPriority	Specifies the priority value assigned to this aggregation port. This 16-bit value is read-write in the range of 0–65535. The default value is 32768.
ActorAdminState	Specifies a string of eight bits, corresponding to the administrative values as transmitted by the actor in LACPDUs, by selecting check boxes. The values are <ul style="list-style-type: none"> • the first bit corresponds to bit 0 of Actor_State (LACP_Activity) (the default value) • the second bit corresponds to bit 1 (LACP_Timeout) • the third bit corresponds to bit 2 (Aggregation) • the fourth bit corresponds to bit 3 (Synchronization) • the fifth bit corresponds to bit 4 (Collecting) • the sixth bit corresponds to bit 5 (Distributing) • the seventh bit corresponds to bit 6 (Defaulted) • the eighth bit corresponds to bit 7 (Expired) These values allow administrative control over the values of LACP_Activity, LACP_Timeout, and aggregation. This attribute value is read-write.
ActorOperState	Displays a string of eight bits, corresponding to the current operational values of Actor_State as transmitted by the actor in LACPDUs. This attribute value is read-only.

Table continues...

Name	Description
	The default value is lacpActive.
PartnerAdminSystemPriority	<p>Specifies the current administrative value of the port number for the protocol partner. It is a 16-bit read-write value in the range of 0–65535. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation.</p> <p>The default value is 0.</p>
PartnerOperSystemPriority	<p>Displays a two octet read-only value indicating the operational value of priority associated with the partner system ID. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemPriority if there is no protocol partner.</p> <p>The default value is 0.</p>
PartnerAdminSystemID	<p>Specifies a six octet read-write MAC address value that represents the administrative value of the aggregation port protocol partners system ID. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminKey, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation.</p> <p>The default value is 00:00:00:00:00:00.</p>
PartnerOperSystemID	<p>Displays a six octet read-only MAC address value that indicates representing the current value of the aggregation port protocol partner system ID. A value of zero indicates that there is no known protocol partner. The value of this attribute can contain the manually configured value carried in PartnerAdminSystemID if there is no protocol partner.</p> <p>The default value is 00:00:00:00:00:00.</p>
PartnerAdminKey	<p>Specifies the current administrative value of the key for the protocol partner. It is a 16-bit read-write value in the range of 0–65535. The assigned value is used with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminPort, and PartnerAdminPortPriority to achieve manually configured aggregation.</p> <p>The default value is 0.</p>
PartnerOperKey	Displays the current operational value of the key for the aggregator current protocol partner. It is a 16-bit read-

Table continues...

Name	Description
	<p>only value. If the aggregation is manually configured, this value is assigned by the local system.</p> <p>The default value is 0.</p>
PartnerAdminPort	<p>Specifies the current administrative value of the port number for the protocol partner. It is a 16-bit read-write value in the range of 0–65535. The assigned value is used, along with the value of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPortPriority, to achieve manually configured aggregation.</p> <p>The default value is 0.</p>
PartnerOperPort	<p>Displays the operational port number assigned to this aggregation port by the aggregation port protocol partner. The value of this attribute can contain the manually configured value carried in AggPortPartnerAdminPort if there is no protocol partner. This 16-bit value is read-only.</p> <p>The default value is 0.</p>
PartnerAdminPortPriority	<p>Specifies the current administrative value of the port priority for the protocol partner. It is a 16-bit read-write value in the range of 0–65535. The assigned value is used with the values of PartnerAdminSystemPriority, PartnerAdminSystemID, PartnerAdminKey, and PartnerAdminPort to achieve manually configured aggregation.</p> <p>The default value is 0.</p>
PartnerOperPortPriority	<p>Displays the priority value assigned to this aggregation port by the partner. The value of this attribute can contain the manually configured value carried in PartnerAdminPortPriority if there is no protocol partner. This 16 bit value is read-only.</p> <p>The default value is 0.</p>
PartnerAdminState	<p>Specifies a string of eight bits, corresponding to the current administrative value of Actor_State for the protocol partner, by selecting check boxes. This attribute value is read-write. The assigned value is used to achieve manually configured aggregation.</p> <p>The default value is none.</p>
PartnerOperState	<p>Displays a string of eight bits, corresponding to the current values of Actor_State in the most recently received LACPDU transmitted by the protocol partner. In the absence of an active protocol partner, this value</p>

Name	Description
	can reflect the manually configured value PartnerAdminState. This attribute value is read-only. The default value is none.

Chapter 3: MultiLink Trunking and Split MultiLink Trunking

This section provides the concepts and procedures you need to configure MultiLink Trunking (MLT) and Split MultiLink Trunking (SMLT).

Link aggregation overview

Link aggregation provides link level redundancy and increases load sharing. Use Link aggregation to bundle the ports into a port group, which is represented as one logical interface to the Media Access Control (MAC) layer.

The switch supports the following types of link aggregation:

- MultiLink Trunking (MLT)—a statically configured link bundling method. MLT is not standards based, but it interoperates with static link methods of other vendors.
- IEEE 802.3ad based link aggregation, through the Link Aggregation Control Protocol (LACP), dynamically aggregates links as they become available to a trunk group. Link Aggregation Control Protocol dynamically detects whether links can be aggregated into a link aggregation group (LAG) and does so after links become available. Link Aggregation Control Protocol also provides link integrity checking at Layer 2 for all links within the LAG.

Both MLT and IEEE 802.3ad based link aggregation are point-to-point functions.

The switch software offers LACP functionality layered with MLT. This document uses the term *MLT with LACP* to refer to this functionality.

Split MultiLink Trunking (SMLT)

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency by providing for the addition of failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use SMLT to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

For more information on SMLT, see [Split MultiLink Trunking](#) on page 38.

LACP with SMLT

You can use LACP on SMLT configurations. The switch provides modifications to the LACP in SMLT configurations. LACP-capable devices can connect to an SMLT aggregation pair.

*** Note:**

Virtual IST is not supported on LACP-enabled MLTs.

VLACP with SMLT

You can also configure Virtual LACP (VLACP) with an SMLT configuration. VLACP is a modification that provides end-to-end failure detection. VLACP is not a link aggregation protocol.

VLACP implements link status control protocol at the port level. This mechanism periodically checks the end-to-end health of a point-to-point or end-to-end connection. You can run VLACP on single ports or on ports that are part of an MLT.

*** Note:**

Do not configure VLACP on LACP-enabled ports. VLACP does not operate properly with LACP.

Virtual Inter-Switch Trunk (vIST)

Split MultiLink Trunking provides subsecond failover when a switch fails. Virtual Inter-Switch Trunk (vIST) improves upon that Layer 2 and Layer 3 resiliency by using a virtualized IST channel through the SPBM cloud. The vIST channel carries the vIST control traffic and data traffic during an SMLT failover. This feature dramatically improves resiliency over other methods.

Because vIST uses a *virtual* channel and because IS-IS runs over it, vIST eliminates the potential single point of failure with a dedicated MLT. The vIST channel is always up as long as there is SPBM connectivity between the vIST peers.

*** Note:**

vIST interoperates between any two devices that support vIST, and the devices do not have to be of the same type.

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

For information on vIST configuration, see [Creating a virtual IST using CLI](#) on page 53 or [Creating a virtual IST using EDM](#) on page 64.

*** Note:**

Users may observe a momentary increase in activity when a MAC delete message is received from a peer. This is due to vIST engaging in MAC learning activities. This is a normal operational procedure.

Simplified Virtual-IST

Simplified Virtual-IST (vIST) is for conventional switch clustering deployments that use SMLT and not SPB. The Simplified vIST feature provides a single CLI command to enable the virtual IST for SMLT deployments.

- Simplified vIST is available for conventional multicast deployments with PIM and IGMP only when the boot flag (`spbm-config-mode`) is disabled.

! Important:

PIM is supported with Simplified vIST only, not with SPB vIST.

- When the `spbm-config-mode` boot flag is enabled (default setting), Simplified vIST is not available. This means that you continue to configure SPB/IS-IS for vIST as described in [Creating a virtual IST using CLI](#) on page 53 and [Creating a virtual IST using EDM](#) on page 64.
- Simplified vIST requires that the two vIST devices be directly connected.
- In Simplified vIST mode, LACP is not recommended on vIST MLT.

For information about configuring Simplified vIST with multicast, see *Configuring IP Multicast Routing Protocols*.

MultiLink Trunking

MultiLink Trunking (MLT) is a point-to-point connection that aggregates multiple ports to logically act like a single port with aggregated bandwidth. Grouping multiple ports into a logical link provides a higher aggregate on a switch-to-switch or switch-to-server application.

To include ports as trunk group members of an MLT, you must statically configure the ports.

MLT traffic distribution algorithm

You can use a multilink trunk to aggregate bandwidth between two switches. The MLT algorithms ensure that each packet in a flow does not arrive out of sequence, and that a flow always traverses the same link path.

The hashing algorithm for Layer 2 traffic is as follows:

Hash Key = [Destination MAC Address (48 bits), Source MAC Address(48 bits)]

For IPV4 traffic:

Hash Key = [Destination IP Address (32 bits), Source IP Address (32 bits)]

For non-IP traffic:

Hash Key = [Destination MAC Address (48 bits), Source MAC Address(48 bits)]

For Mac-In-Mac transit traffic:

Hash Key = [Source Port (8 bits), BackBone Destination MAC Address (48 bits), BackBone Source Mac Address (48 bits)]

- For IPv6 Traffic Hash Key = [Destination IPv6 Address (128 bits), Source IPv6 address (128 bits)]
- For non IP traffic, the MLT hashing algorithm is:

64-bit key = [Dst Mac (LSB 32 bits), Src Mac (LSB 32 bits)]

The 64-bit key result is used as an index to a table populated with active MLT ports repeated over 63 entries.

MultiLink trunking and autonegotiation interaction

To use MLT with the switch, you can have 1 Gb, 10 Gb, and 40 Gb ports running at different speeds. After you use MLT with LACP, LACP dynamically checks for proper speed on all port members. You do not need to have similar physical connection types. After you use autonegotiation with MLT and not LACP, you need to ensure that all ports run at the same speed.

MLT configuration rules

Multilink trunks adhere to the following rules. Unless otherwise stated, these rules also apply to MLT with LACP.

- MLT is supported on 1 Gigabit Ethernet (GbE), 10 GbE, and 40 GbE ports.
- Multilink trunk ports support mixed speed links, for example, one link can be 10Gb and another 1Gb. However, no weighting of traffic distribution occurs so if you mix links of different operational speeds, you can overload the lower speed link or underutilize a higher speed link.
This rule applies to multilink trunks only. MLT with LACP does not support different link speeds.
- All multilink trunk ports must be in the same Spanning Tree Group (STG) unless the port is tagged. Use tagging so ports can belong to multiple STGs, as well as multiple VLANs.
- After the port is made a member of MLT, it inherits the properties of the MLT and hence the STG properties are inherited from the VLAN associated with that MLT. After you remove the port from MLT or after you delete the MLT, the ports are removed from the MLT STG and added into the default STG.
- MLT is compatible with Multiple Spanning Tree Protocol (MSTP) (IEEE 802.1s) and Rapid Spanning Tree Protocol (RSTP) (IEEE 802.1w).
- Tagging (IEEE 802.1Q) is supported on a multilink trunk.

Multilink trunks have the following general features and requirements:

- Supports MLT groups with as many as 8 ports belonging to a single multilink trunk. For more information about the number of MLT groups supported for each hardware platform, see *Release Notes*.
- Apply filters individually to each port in a multilink trunk.

With MSTP or RSTP enabled, ports in the same multilink trunk operate as follows:

- The designated port sends the Bridge Protocol Data Unit (BPDU).
- The multilink trunk port ID is the ID of the lowest numbered port.
- If identical BPDUs are received on all ports, the multilink trunk mode is forwarding.

- If ports do not receive BPDUs on a port or BPDU and port tagging do not match, the individual port is taken offline.
- Path cost is inversely proportional to the active multilink trunk bandwidth.

MLT with LACP LAG rules

The Link Aggregation Group (LAG) adheres to the following rules:

- All LAG ports operate in full-duplex mode.
- All LAG ports operate at the same data rate.
- All LAG ports must belong to the same set of VLANs.
- Link aggregation is compatible with MSTP, and RSTP.
- Assign all LAG ports to the same MSTP or RSTP groups.
- You can configure a LAG with up to 24 ports, but only a maximum of 8 can be active at a time.
- After you configure a multilink trunk with LACP, you cannot add or delete ports or VLANs manually without first disabling LACP.

Split MultiLink Trunking

Split MultiLink Trunking (SMLT) is an option that improves Layer 2 and Layer 3 resiliency. The following sections discuss SMLT in more detail.

SMLT overview

Split MultiLink Trunking is an option that improves Layer 2 (bridged) resiliency by providing for the addition of switch failure redundancy with subsecond failover, on top of all standard MLT link failure protection and flexible bandwidth scaling functionality. Use Split MultiLink Trunking to connect a device that supports some form of link aggregation, be it a switch or a server, to two distinct separate SMLT endpoints or switches. These SMLT devices form a virtualized Switch Cluster through the SPBM cloud and are referred to as a Virtual Inter-Switch Trunk (vIST) Core Switch pair.

For information about Routed SMLT, see *Configuring IP Routing*.

You can form SMLT connections through single links from the Switch Cluster to the edge connection, standard MLTs, or MLTs with LACP. Optionally, SMLT links can have VLACP enabled as well. You can mix these various link connections. Within the same Switch Cluster, you can configure both SMLT and RSMLT to allow a mixture of both Layer 2 and Layer 3 VLANs.

Split MultiLink Trunking networks do not need to use RSTP or MSTP to enable loop-free triangle topologies because SMLT inherently avoids loops due to its superior enhanced link aggregation protocol. The loop-free link is accomplished by having two aggregation switches appear as a single device to edge switches, which dual-home to the aggregation switches. The aggregation switches interconnect using a Virtual Inter-Switch trunk (vIST), exchanging addressing and state information (permitting rapid fault detection and forwarding path modification). Split MultiLink Trunking is designed for Layer 2 network connectivity, but you can configure in Layer 3 networks by working with VRRP or RSMLT Layer 2 edge.

SMLT advantages

SMLT eliminates all single points of failure and creates multiple paths from all user access switches to the network core. In case of failure, SMLT recovers as quickly as possible using all capacity.

SMLT provides a transparent and interoperable solution that requires no modification on the part of the majority of existing user access devices.

SMLT improves the reliability of Layer 2 networks that operate between user access switches and the network center aggregation switch by providing:

- load sharing among all links
- fast failover in case of link failure
- elimination of single points of failure
- fast recovery in case of node failure
- transparent and interoperable solutions
- removal of MSTP and RSTP convergence issues

SMLT, MSTP, and RSTP

Networks designed to have user access switches dual-home to two aggregation switches, and have VLANs spanning two or more user access switches, experience the following design constraints:

- no load sharing exists over redundant links
- network convergence is slow in case of failure

With the introduction of SMLT, all dual-home Layer 2 frame-switched network devices with dual homes are no longer dependent on the MSTP or RSTP for loop detection. A properly designed SMLT network inherently does not have logical loops.

SMLT solves the spanning tree problem by combining two aggregation switches into one logical MLT entity, thus making it transparent to all types of edge switches. In the process, it provides quick convergence, while load sharing across all available trunks.

If you use STP mode on a switch that is in an SMLT configuration, you can experience traffic loss for 30 seconds if you change the port membership of the MLT, even if the port is in a down state. The traffic loss is because the convergence time for STP is 30 seconds. Use MSTP or RSTP on all switches in SMLT configurations.

SMLT topologies

The following are the three generic topologies in which you can deploy SMLT, depending on the resiliency and redundancy required:

- a triangle topology
- a square topology
- a full-mesh topology

SMLT and Virtual Inter-Switch Trunk (vIST)

The following illustration shows an SMLT configuration with a pair of switches as aggregation systems (E and F) and four separate switches as user access switches (A, B, C, and D).

*** Note:**

In the following figure, the pair of aggregation switches (E and F) are connected by a Virtual Inter-Switch Trunk (vIST). This means that although these two switches appear to be directly connected, they could be anywhere within the SPBM cloud.

Figure 2: SMLT aggregation switches and operations

You must connect SMLT aggregation switches through vIST. For example, user access switches B and C connect to the aggregation systems through multilink trunks split between the two aggregation systems. As shown above, the implementation of SMLT only requires two SMLT-capable aggregation switches.

Aggregation switches use vIST to do the following:

- Confirm that they are alive and exchange MAC address forwarding tables.
- Send traffic between single switches attached to the aggregation switches.
- Serve as a backup if one SMLT link fails.

Because SMLT requires vIST, use multiple links on vIST to ensure reliability and high availability. Use Gigabit Ethernet links for vIST connectivity to provide enough bandwidth for potential cross traffic.

For more information about vIST, see [Virtual interswitch trunk \(vIST\)](#) on page 9.

A vIST multilink trunk must contain at least two physical ports.

Other SMLT aggregation switch connections

The figure above includes end stations that connect to each of the switches. In this example, a, b1, b2, c1, c2, and d are clients and printers, while e and f are servers and routers.

User access switches B and C can use a method to determine which link of the multilink trunk connections to use to forward a packet, as long as the same link is used for a Source Address and Destination Address (SA/DA) pair. The packet is routed correctly regardless of whether B or C knows the DA. SMLT aggregation switches always send traffic directly to a user access switch, and only use vIST for traffic that they cannot forward in another, more direct way.

SMLT environment traffic flow rules

Traffic flow in an SMLT environment adheres to the following rules:

- If a packet is received from a vIST trunk port, it is not forwarded to an active SMLT group in order to prevent network loops.
- After a packet is received, the system performs a look-up on the forwarding database. If an entry exists, and if the entry was learned locally from the SMLT or through the vIST as a remote SMLT, it is forwarded to the local port (the packet must not be sent to the vIST for forwarding unless there is no local connection). Unknown and Broadcast packets flood out all ports that are members of this VLAN.
- For load sharing purposes in an SMLT configuration, the switch obeys the MLT traffic distribution algorithm.

SMLT traffic flow examples

The following traffic flow examples are based on the figure above.

Example 1: Traffic flow from a to b1 or b2

Assuming a and b1/b2 are communicating through Layer 2, traffic flows from A to switch E and is forwarded over its direct link to B. Traffic coming from b1 or b2 to a is sent by B on one of its multilink trunk ports.

B can send traffic from b1 to a on the link to switch E, and traffic from b2 to a on the link to F. In the case of traffic from b1, switch E forwards the traffic directly to switch A, while traffic from b2, which arrived at F, is forwarded across the vIST to E and then to A.

Example 2: Traffic flow from b1/b2 to c1/ c2

Traffic from b1/b2 to c1/c2 is always sent by switch B through its multilink trunk to the core. No matter at which switch E or F arrives at, it is sent directly to C through the local link.

Example 3: Traffic flow from a to d

Traffic from a to d (and d to a) is forwarded across vIST because it is the shortest path. The link is treated as a standard link; SMLT and vIST parameters are not considered.

Example 4: Traffic flow from f to c1/c2

Traffic from f to c1/c2 is sent out directly from F. Return traffic from c1/c2 passes through one active VRRP Master for each IP subnet. The traffic is passed across vIST if switch C sends it to E.

SMLT and vIST traffic flow example

In an SMLT environment, the two aggregation switches share the same forwarding database by exchanging forwarding entries using the vIST. The entry for 00:E0:7B:B3:04:00 is shown on node C as an entry learned on MLT-1, but because SMLT Remote is true, this entry was actually learned

from node B. On B, that same entry is shown as directly learned through MLT-1 because SMLT Remote is false.

The following illustration shows the network topology.

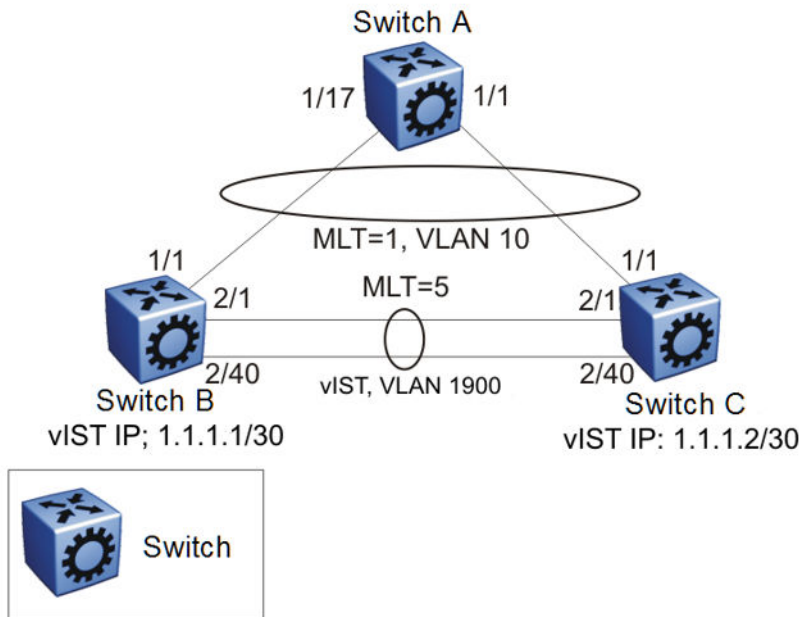

Figure 3: Network topology for traffic flow example

After a packet arrives at node C destined for 00:E0:7B:B3:04:00, if the SMLT Remote status is true, the switch tries to send the packet to MLT-1 rather than through vIST. Traffic rarely traverses vIST unless there is a failure. If this same packet arrives at B, it is then forwarded to MLT-1 on the local ports.

SMLT and LACP support

The switch fully supports IEEE 802.3ad LACP on MLTs and on a pair of SMLT systems.

With LACP the switch provides a standardized external link aggregation interface to third-party vendor IEEE 802.3ad implementations. This protocol extension provides dynamic link aggregation mechanisms. Only dual-home devices benefit from this enhancement.

Advantages of this protocol extension include the following:

- MLT peers and SMLT client devices can be both network switches and a type of server or workstation that supports link bundling through IEEE 802.3ad.
- Single link and multilink trunk solutions support dual-home connectivity for attached devices, so that you can build dual-home server farm solutions.

Supported SMLT/LACP scenarios

SMLT/IEEE link aggregation interaction supports all known SMLT scenarios in which an IEEE 802.3ad SMLT pair connects to SMLT clients, or in which two IEEE 802.3ad SMLT pairs connect to each other in a square or full-mesh topology.

Unsupported SMLT/LACP scenarios

Some of the unsupported SMLT/LACP scenarios include the following factors, which lead to failure:

- Incorrect port connections.
- Mismatched MLT IDs assigned to SMLT client. SMLT switches can detect if MLT IDs are not consistent. The SMLT aggregation switch, which has the lower IP address, does not allow the SMLT port to become a member of the aggregation thereby avoiding misconfigurations.
- The SMLT client switch does not have automatic aggregation enabled (LACP disabled). SMLT aggregation switches can detect that aggregation is not enabled on the SMLT client, thus no automatic link aggregation is established until the configuration is resolved.

SMLT and the Virtual Router Redundancy Protocol

Use Virtual Router Redundancy Protocol (VRRP) to have one active primary router for each IP subnet, with all other network VRRP interfaces operating in backup mode.

The VRRP has only one active routing interface enabled. Users that access switches aggregated into two SMLT switches send their shared traffic load (based on source and destination MAC or IP addresses) on all uplinks towards the SMLT aggregation switches.

Note:

A VRRP virtual IP address must not be the same as the VLAN IP address of the device

The VRRP is less efficient if you use it with SMLT. All other interfaces are in backup (standby) mode. In this case, all traffic is forwarded over the vIST link towards the primary VRRP switch. All traffic that arrives at the VRRP backup interface is forwarded, so there is not enough bandwidth on the vIST link to carry all the aggregated riser traffic. However, an enhancement to VRRP overcomes this issue by ensuring that the vIST trunk is not used in such a case for primary data forwarding.

SMLT and VRRP BackupMaster

The VRRP BackupMaster acts as an IP router for packets destined for the logical VRRP IP address. The system directly routes all traffic to the destined subnetwork and not through Layer 2 switches to the VRRP master. This avoids a potential limitation in the available vIST bandwidth.

To avoid potential frame duplication problems, you can only use the VRRP BackupMaster feature for SMLT on interfaces that you configure for SMLT. You cannot use VRRP BackupMaster with hubs to avoid frame duplication or on brouter or VLAN interfaces.

If you use an SMLT with routing on SMLT aggregation switches, use VRRP for default gateway redundancy. In a VRRP environment, one switch is active and the other is a backup. In an SMLT environment, you can enable the VRRP BackupMaster and use an active-active concept. The VRRP BackupMaster router routes traffic that is received on the SMLT VLAN and avoids traffic flow across the vIST. This provides true load-sharing abilities.

Follow these guidelines if you use VRRP BackupMaster with SMLT:

- The VRRP virtual IP address and the VLAN IP address cannot be the same.
- Configure the hold-down timer for VRRP to a value that is approximately one hundred and fifty percent of the Interior Gateway Protocol (IGP) convergence time to allow the IGP enough time to reconverge following a failure. For example, if OSPF takes 40 seconds to reconverge, configure the hold-down timer to 60 seconds.
- Enable hold-down times on both VRRP sides (Master and BackupMaster).

SMLT and SLPP

You can use Simple Loop Prevention Protocol (SLPP) to prevent loops in an SMLT network. SLPP focuses on SMLT networks but works with other configurations. Always use SLPP in an SMLT environment.

* Note:

If SLPP is used in a vIST environment, it must be enabled on both the vIST peers. Because, when an SLPP packet of a vIST peer is looped through UNI ports to the other device, that device will shut down its UNI port due to receiving SLPP packets from its peer. A device's own SLPP packets will go over a vIST connection but will not be forwarded by its vIST peer back onto its UNI ports.

For square and full-mesh configurations that use a routed core, create a separate core VLAN. Enable SLPP on the core VLAN and the square or full mesh links between switch clusters. This configuration detects loops created in the core and loops at the edge do not affect core ports. If you use RSMLT between the switch clusters, enable SLPP on the RSMLT VLAN. Because you enable SLPP only on one or two VLANs in the core, changing the RX threshold values will not be necessary.

The switch does not support SLPP in an SMLT that uses LACP.

The SLPP design is to shut down the port where the SLPP packets originate or to shut down the vIST peer switch port, after the counter reaches the threshold. A loop can still occur after ports are shut down. SLPP can shut down all SMLT ports on a triangle SMLT topology, which results in isolating the edge switch.

For more information about SLPP fundamentals and configuration, see *Configuring VLANs, Spanning Tree, and NLB*.

MLT and SMLT configuration considerations

Use the information in this section to understand the considerations and guidelines while configuring link aggregation into your network.

MLT with LACP configuration considerations

After you configure MLT with LACP, you must enable the aggregation parameter. After you enable the aggregation parameter, the LACP aggregator maps one-to-one to the specified multilink trunk.

The following lists the steps that are involved to configure MLT with LACP:

1. Assign a numeric key to the ports you want to include.
2. Configure the LAG for aggregation.
3. Enable LACP on the port.
4. Create an MLT and assign to it the same key as in step 1.

The multilink trunk with LACP only aggregates ports whose key matches its own.

The newly created MLT with LACP adopts the VLAN membership of its member ports after the first port is attached to the aggregator associated with this LAG. After a port detaches from an aggregator, the associated LAG port deletes the member from its list.

After a multilink trunk is configured with LACP, you cannot add or delete ports manually without first disabling LACP. You can add or remove VLANs to an MLT without manually disabling LACP. When you add or remove VLANs from an LACP-enabled MLT, follow the guidelines in the LACP for MLT procedures in this document.

To enable tagging on ports belonging to a LAG, disable LACP on the port and then enable tagging and LACP on the port.

If you enable Open Shortest Path First (OSPF) routing on a port, do not set the LACP periodic transmission timer to less than 1 second.

MLT with LACP and SMLT configuration considerations

You can configure Split MultiLink Trunking (SMLT) with MLT, or with MLT with LACP. Follow these guidelines while you configure SMLT with LACP:

- If you configure LACP for SMLT, you must configure the same LACP smlt-sys-id on both sides. After you configure the LACP system ID for SMLT, configure the same LACP smlt-sys-id on both aggregation switches to avoid loss of data. Configure the LACP smlt-sys-id to be the base MAC address of one of the aggregate switches, and include the MLT-ID. Configure the same system ID on both of the SMLT core aggregation switches.
- If you use LACP in an SMLT square configuration, the LACP ports must have the same keys for that SMLT LAG; otherwise, the aggregation can fail if a switch fails.
- If an SMLT aggregation switch has LACP enabled on some of its multilink trunks, do not change the LACP system priority.
- After you configure SMLT links, set the multicast packets per-second value to 6000 pps.
- To avoid unnecessary processing, do not enable LACP on vISTs. Use VLACP if an optical network between the SMLT core switches requires a failure detection mechanism.

Using the LACP smlt-sys-id enables you to use a third-party switch as a wiring closet switch in an SMLT configuration. This enhancement provides an option for the administrator to configure the SMLT Core Aggregation Switches to always use the system ID. In this way, the SMLT Core Aggregation Switch always uses the same LACP key regardless of the state of the SMLT Core Aggregation Switch neighbor (or the vIST link). Therefore no change in LAGs must occur on the attached device regardless of whether the device is a server or a third-party switch. This situation does not affect edge switches used in SMLT configurations. The actor system priority of LACP_DEFAULT_SYS_PRIO, the actor system ID the user configures, and an actor key equal to the MLT-ID are sent to the wiring closet switch. Configure the system ID to be the base MAC address of one of the aggregate switches along with its MLT-ID. The administrator must ensure that the same value for the system ID is configured on both of the SMLT Core Aggregation Switches.

Note:

The switch does not support Simple Loop Prevention Protocol (SLPP) in an LACP-SMLT environment.

You can configure the LACP smlt-sys-id used by SMLT core aggregation switches. After you set the LACP system ID for SMLT, configure the same LACP smlt-sys-id on both aggregation switches to avoid the loss of data.

The LACP System ID is the base MAC address of the switch, which is carried in Link Aggregation Control Protocol Data Units (LACPDU). If two links interconnect two switches that run LACP, each switch knows that both links connect to the same remote device because the LACPDUs originate

from the same System ID. If you enable the links for aggregation using the same key, LACP can dynamically aggregate them into an MLT LAG.

If SMLT is used between the two switches, they act as one logical switch. Both aggregation switches must use the same LACP System ID over the SMLT links so that the edge switch sees one logical LACP peer, and can aggregate uplinks towards the SMLT aggregation switches. This process automatically occurs over the vIST connection, where the base MAC address of one of the SMLT aggregation switches is chosen and used by both SMLT aggregation switches.

However, if the switch that owns that Base MAC address restarts, the vIST goes down, and the other switch reverts to using its own Base MAC address as the LACP System ID. This action causes all edge switches that run LACP to think that their links are connected to a different switch. The edge switches stop forwarding traffic on their remaining uplinks until the aggregation can reform (which can take several seconds). Additionally, after the restarted switch comes back on line, the same actions occur, thus disrupting traffic twice.

The solution to this problem is to statically configure the same LACP smlt-sys-id MAC address on both aggregation switches.

Note:

The SMLT ID is always the same as the MLT ID. For instance, both sides can have an MLT 10, but once SMLT is enabled on both sides it will function as an SMLT. Until SMLT is enabled on both peers however, it will function as a normal MLT.

MLT with LACP and Spanning Tree configuration considerations

Only the physical link state or its LACP peer status affects LACP module operation. After a link is enabled or disabled, an LACP module is notified. The MSTP or RSTP forwarding state does not affect LACP module operation. LACPDU's can be sent if the port is in an MSTP or RSTP blocking state.

Unlike legacy MultiLink trunks, configuration changes (such as speed and duplex mode) to a LAG member port are not applied to all member ports in the multilink trunks. The changed port is removed from the LAG and the corresponding aggregator, and the user is alerted that the configuration is created.

Important:

Link Aggregation Control Protocol, as defined by IEEE, is a protocol that exists between two bridge endpoints; therefore, the LACP PDUs are terminated at the next Server Provider (SP) interface.

LACP parameters configuration considerations

Link aggregation scaling

For more information about the latest scalability information, see *Release Notes*.

SMLT and VLACP configuration considerations

Use Virtual Link Aggregation Control Protocol (VLACP) for all SMLT access links configured as MultiLink Trunks to ensure both end devices can communicate. The switch does not support LACP and VLACP on the same links simultaneously.

VLACP for SMLT also protects against CPU failures by causing traffic to switch or reroute to the SMLT peer if the CPU fails or stops responding.

The following table provides the recommended values for VLACP in an SMLT environment:

Table 1: Recommended VLACP values

Parameter	Value
SMLT access	
Timeout	Short
Timer	500ms
Timeout scale	5
VLACP MAC	01:80:C2:00:00:0F
SMLT core	
Timeout	Short
Timer	500ms
Timeout scale	5
VLACP MAC	01:80:C2:00:00:0F
vIST	
Timeout	Long
Timer	10000
Timeout scale	3
VLACP MAC	01:80:C2:00:00:0F

SMLT with NNI ports configuration considerations

If you want to modify SMLTs that contain NNI ports, do the modification during maintenance windows. Otherwise, if you create or delete SMLTs that contain NNI ports running MSTP, IS-IS adjacencies that connect to those ports can bounce even if the SMLT is not used.

MLT and private VLANs

The Switch supports private VLANs and E-Tree configuration. MLT and private VLANs operate as follows:

- When using static MLT, configure the private-vlan as part of the overall MLT configuration, not at the port member level. All ports in the MLT use the private VLAN type for that MLT.
- When using LACP, configure the private-vlan at the interface level.
- When the private VLAN port type is trunk, the MLT automatically becomes tagged.
- If there are other non-private VLANs using the MLT configured as isolated, the following message is displayed: `All non private VLANs using this interface will be removed once this mlt becomes isolated. Do you wish to continue (y/n) ?`
- If there are other non-private VLANs using the MLT configured as promiscuous, the following message is displayed: `All non private VLANs using this interface will be`

```
removed once this mlt becomes promiscuous. Do you wish to continue (y/n) ?
```

MLT and SMLT link aggregation configuration using the CLI

This section describes how to configure and manage link aggregation using the CLI, including MultiLink Trunking (MLT), to increase the link speed and redundancy for higher availability.

Configure link aggregation to provide link level redundancy and increase load sharing. MultiLink Trunking (MLT) is a link aggregation technology that you can use to group several physical Ethernet links into one logical Ethernet link to provide fault-tolerance and high-speed links between routers, switches, and servers. Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency.

Configuring MLT

Perform this procedure to create and configure an MLT.

Procedure

1. Enter Global Configuration mode:

```
enable  
configure terminal
```

2. Create an MLT:

```
mlt <1-512>
```

3. **(Optional)** Set the private VLAN type for the MLT:

```
mlt <1-512> private-vlan <isolated|promiscuous|trunk>
```

4. Add a VLAN to the MLT:

```
mlt <1-512> vlan <1-4059>
```

5. **(Optional)** Change the name of the MLT:

```
mlt <1-512> name WORD<0-20>
```

6. Enable trunking on the MLT:

```
mlt <1-512> encapsulation dot1q
```

7. Enable the MLT:

```
mlt <1-512> enable
```

8. Display the MLT configuration:

```
show mlt <1-512>
```

Example**Create MLT 40:**

```
Switch:1(config)# mlt 40
```

Set the private VLAN type for MLT 40 to isolated:

```
Switch:1(config)# mlt 40 private-vlan isolated
```

Add VLAN 10 to the MLT:

```
Switch:1(config)# mlt 40 vlan 10
```

Enable the MLT:

```
Switch:1(config)# mlt 40 enable
```

Display the MLT configuration:

```
Switch:1(config)# show mlt 40
```

```

```

Variable definitions

Use the data in the following table to use the `mlt` command.

Variable	Value
enable	Creates and enables a new MLT.
encapsulation dot1q	Enables trunking on the MLT.

Table continues...

Variable	Value
member {slot/port[/sub-port][-slot/port[/sub-port]] [,...]}	Adds ports to the MLT. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<1-512>	Specifies the MLT ID.
name WORD<0-20>	Configures the name for the MLT.
private-vlan {isolated promiscuous trunk}	Specifies a private VLAN type for the MLT.
vlan <1-4059>	Specifies a VLAN ID to add to the MLT.

Adding ports to an MLT LAG

Perform this procedure to add ports to an MLT LAG.

Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```

2. Add ports to an MLT LAG:

```
mlt <1-512> member {slot/port[/sub-port][-slot/port[/sub-port]]
[,...]}
```

Example

Add port 1/24 to MLT 40:

```
Switch:1(config)# mlt 40 member 1/24
```

Variable definitions

Use the data in the following table to use the `mlt` command.

Variable	Value
enable	Creates and enables a new MLT.
encapsulation dot1q	Enables trunking on the MLT.
member {slot/port[/sub-port][-slot/port[/sub-port]] [,...]}	Adds ports to the MLT. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of

Table continues...

Variable	Value
	slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.
<1-512>	Specifies the MLT ID.
name WORD<0-20>	Configures the name for the MLT.
private-vlan {isolated promiscuous trunk}	Specifies a private VLAN type for the MLT.
vlan <1-4059>	Specifies a VLAN ID to add to the MLT.

Removing ports from an MLT LAG

Remove ports from an MLT LAG.

About this task

Important:

Before removing a port member from an MLT, you must first disable the port. This ensures that the other side brings its corresponding port member down. This achieves parity on both sides and avoids traffic disruptions.

The shutdown port requires that you enter the interface GigabitEthernet configuration mode. However, to remove ports from an MLT LAG, you can enter any configuration mode.

Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable
configure terminal
interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}
```

Note:

If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Disable the ports:

```
shutdown port {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}
```

3. Remove ports from an MLT LAG:

```
no mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]] [, ...]}
```

Example

Remove port 1/24 from MLT 40:

```
Switch:1(config)# interface GigabitEthernet 1/2
```

```
Switch:1(config-if)# shutdown port 1/24
```

```
Switch:1(config-if)# no mlt 40 member 1/24
```

Variable definitions

Use the data in the following table to use the `mlt` command.

Variable	Value
<1-512>	Specifies which MLT to add the ports to.
{slot/port[/sub-port][/-slot/port[/sub-port]][,...]}	Specifies the ports to add to the MLT. Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

Creating an SMLT from an existing MLT

Create an SMLT from an existing MLT to split physical ports between two switches to improve resiliency and provide active load sharing.

Before you begin

- Create an MLT before you create a split in the MLT.

Procedure

1. Log on to the MLT Interface Configuration mode:

```
enable
```

```
configure terminal
```

```
interface mlt <1-512>
```

2. Create an SMLT from an existing MLT:

```
smlt
```

! Important:

If you want to remove SMLT configuration from the MLT on a vIST switch, first shut the SMLT MLT ports on its vIST peer.

Failure to perform this operation may lead to layer 2 loops.

! Important:

- If you are configuring SMLT with vIST, all the SMLT VLANs associated with vIST must have an I-SID.

Example

Create an SMLT on MLT 1:

```
Switch:1(config)#interface mlt 1
Switch:1(config-mlt)#smlt
```

Virtual interswitch trunk (vIST)

Creating a virtual IST

Use this procedure to create a virtual IST (vIST).

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

! Important:

- When you create a vIST, VLANs assigned to SMLT ports must have an I-SID assigned.
- If you assign a VLAN to an I-SID on one SMLT-BEB node, then you must create the same VLAN and assign it to the same I-SID on the peer SMLT-BEB node even if no devices are connected to this second node.
- The vIST VLAN must also be associated with an I-SID. You can use the same vIST VLAN in another part of your network, but the I-SID associated with the vIST VLAN must not be used anywhere else.

*** Note:**

Simplified Virtual-IST (vIST) is for non-SPB customers who use SMLT with legacy IST. Simplified VIST is available ONLY for legacy multicast deployments when the boot flag (`spbm-config-mode`) is disabled.

About this task

The following list provides an overview of the configuration steps:

- Enable SPBM and IS-IS globally.
- Configure SPBM and IS-IS.
- Configure an L2 VSN by assigning an I-SID to the C-VLAN, which is used by the vIST.

For information about SPBM and IS-IS, see *Configuring Fabric Connect*.

Procedure

1. Enter Global Configuration mode:

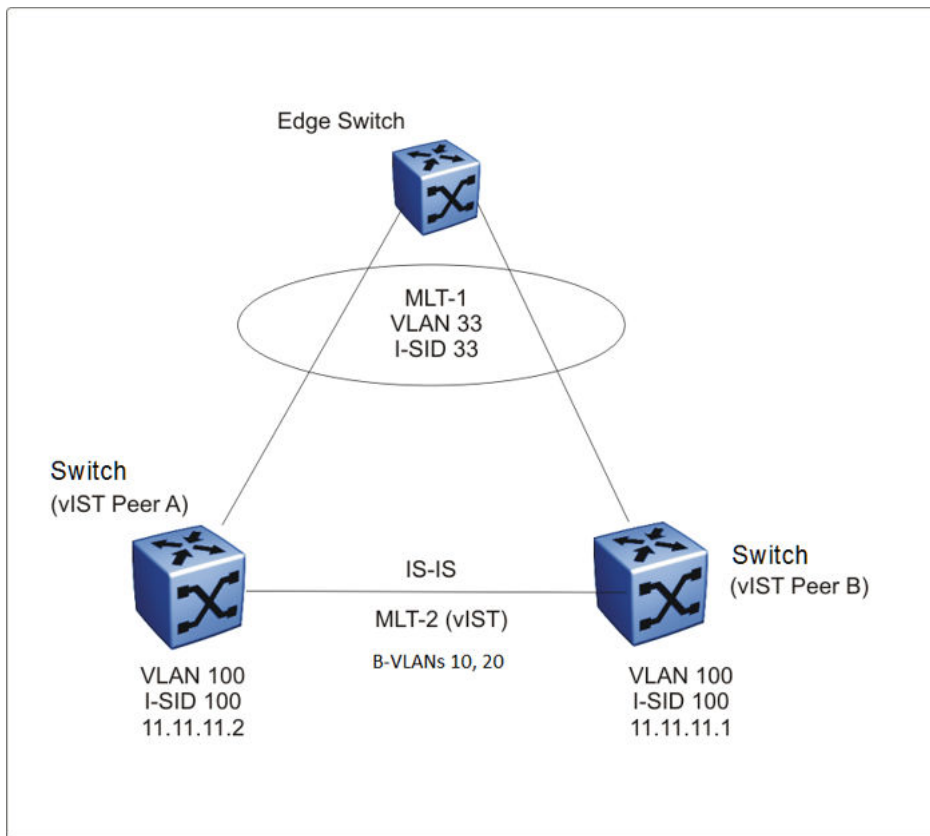

- ```
enable
configure terminal
```
2. Create a vIST:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```
  3. Verify your vIST configuration:

```
show virtual-ist
```

**Example**

The following figure uses Switch for the vIST peers, and the configuration example contains annotations (in parenthesis) to explain the configuration information.

**Figure 4: SMLT with vIST configuration example**

**\* Note:**

This configuration example is for vIST Peer B.

```
#

## Variable definitions

Use the data in the following table to use the `ist peer-ip` command.

| Variable  | Value                                                                                          |
|-----------|------------------------------------------------------------------------------------------------|
| <A.B.C.D> | Specifies the peer IP address—the IP address of the vIST VLAN on the other aggregation switch. |
| <1-4059>  | Specifies the VLAN ID for this vIST.                                                           |

## Editing a virtual IST

If you need to change the virtual IST (vIST) `peer-ip` or `vlan`, use this procedure to delete the vIST first.

### \* Note:

- You must disable IS-IS globally before deleting a vIST, and then re-enable it after creating a new vIST.
- You do not have to set the SMLT peer system ID or the virtual B-MAC to 0 before you change the vIST peer IP address or VLAN ID number.

### Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```
2. Disable IS-IS globally:

```
no router isis enable
```
3. Delete the vIST:

```
no virtual-ist peer-ip
```
4. Create a vIST:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```
5. Enable IS-IS globally:

```
router isis enable
```

## Configuring Simplified vIST in SMLT topologies

This procedure shows how to configure Simplified vIST in an SMLT environment. It includes steps to configure the following:

- Setting the boot config flag
- Configuring the vIST peer
- Enabling Simplified vIST

### Important:

When you enable Simplified vIST with the `virtual-ist enable` command, two VLANs are automatically created to support vIST. The VLAN IDs are: 4086 and 4087.

### Before you begin

SPBM must not be enabled on the vIST peers or any router that participates in the network.

### Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```

2. Disable the boot flag:

```
no boot config flags spbm-config-mode
```

The system responds with these messages:

```
Warning: Please save the configuration and reboot the switch for
this to take effect.
```

```
Warning: Please carefully save your configuration file before
rebooting the switch. Saving configuration file when spbm-config-
mode is changed to disable, removes SPBM configurations from the
configuration file.
```

3. Save the configuration, and then reboot the switch.

### Important:

Any change to the `spbm-config-mode` boot flag requires a reboot for the change to take effect.

4. Create the vIST VLAN:

```
vlan create <2-4059> type port-mstprstp <0-63>
interface vlan <1-4059>
ip address <A.B.C.D/X>
```

5. Configure the vIST peer address and VLAN:

```
virtual-ist peer-ip <A.B.C.D> vlan <1-4059>
```

### 6. Configure the SMLT MLT:

```
mlt <1-512> enable
mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
interface mlt <1-512>
smlt
```

### 7. Configure the vIST MLT:

```
mlt <1-512> enable
mlt <1-512> member {slot/port[/sub-port] [-slot/port[/sub-port]]
[,...]}
mlt <1-512> encapsulation dot1q
interface mlt <1-512>
virtual-ist enable
```

#### **Note:**

The **virtual-ist enable** command enables Simplified vIST and is only available when the **spbm-config-mode** boot flag is disabled.

### 8. Create a customer VLAN and assign the SMLT MLT ID:

```
vlan create <2-4059>
vlan mlt <1-4059> <1-512>
interface vlan <1-4059>
ip address <A.B.C.D/X>
```

### Example

```
enable
configure terminal
no boot config flags spbm-config-mode
```

Save the configuration and reboot the switch.

```
virtual-ist peer-ip 50.1.1.14 vlan 50

mlt 3 enable
mlt 3 member 1/35,1/36
interface mlt 3
smlt
exit
mlt 5 enable
mlt 5 member 2/15,2/17
mlt 5 encapsulation dot1q
interface mlt 5
virtual-ist enable
exit
```

```

vlan create 50 type port-mstprstp 0
interface vlan 50
ip address 50.1.1.15 255.255.255.0 1
exit
vlan create 100
vlan mlt 100 3
interface vlan 100
ip address 100.1.1.15 255.255.255.0 2
exit

```

---

## Viewing all ports configured for SMLT

View all ports for a SMLT to ensure the correct ports are configured.

### Procedure

1. Enter Privileged EXEC mode:  
enable
2. View all ports configured for SMLT:  
show smlt mlt

### Example

```
Switch:1#show smlt mlt
```

```

=====
 Mlt SMLT Info
=====
MLT ADMIN CURRENT
ID TYPE TYPE

1 smlt smlt
4 smlt smlt

```

## Variable definitions

Use the data in the following table to use the `show smlt` command.

| Variable | Value                                            |
|----------|--------------------------------------------------|
| mlt      | Displays SMLT information for the MLT interface. |

---

## Viewing information about collision errors

View information about collision errors to obtain information about collision errors in the specified MLT, or for all MLTs.

### Procedure

View information about collision errors:

```
show mlt error collision [<1-512>]
```

**Example**

```
Switch:1(config-mlt)#show mlt error collision 4

=====
 Mlt Collision Error
=====
MLT -----COLLISIONS-----
ID SINGLE MULTIPLE LATE EXCESSIVE

40 0 0 0 0
```

**Variable definitions**

Use the data in the following table to use the `show mlt error collision` command.

| Variable | Value                                              |
|----------|----------------------------------------------------|
| <1-512>  | Specifies the MLT ID. The value ranges from 1–512. |

**Viewing information about Ethernet errors**

View information about Ethernet errors to display information about the types of Ethernet errors sent and received by a specific MLT or all MLTs.

**About this task****! Important:**

The IMAC columns refer to internal MAC address errors.

**Procedure**

View information about Ethernet errors:

```
show mlt error main [<1-512>]
```

**Example**

```
Switch:1(config-mlt)#show mlt error main 40

=====
 Mlt Ethernet Error
=====
MLT ALIGN FCS IMAC IMAC CARRIER FRAMES SQETEST DEFER
ID ERROR ERROR TRNSMIT RECEIVE SENSE TOOLONG ERROR TRNSMSS

40 0 0 0 0 0 0 0 0
```

**Variable definitions**

Use the data in the following table to use the `show mlt error main` command.

| Variable | Value                                              |
|----------|----------------------------------------------------|
| <1-512>  | Specifies the MLT ID. The value ranges from 1–512. |

---

## MLT and SMLT link aggregation configuration using EDM

Configure link aggregation to provide link level redundancy and increase load sharing. MultiLink Trunking (MLT) is a link aggregation technology that you can use to group several physical Ethernet links into one logical Ethernet link to provide fault-tolerance and high-speed links between routers, switches, and servers. Split MultiLink Trunking (SMLT) is an option that improves Layer 2 (bridged) resiliency.

---

### Adding a multilink or LACP trunk

Perform this procedure to add a multilink or LACP trunk.

#### About this task

##### Important:

Ensure that all ports that belong to the same MLT/LACP group use the same port speed, for example, 1 Gbit/s, even if autonegotiation is used. This requirement is not enforced by the software.

When you add a VLAN to a dynamic MLT, only the active ports of the MLT are added as port members of the VLAN. Ports configured with the same aggregation key, but not active, are not added to the VLAN. If these inactive ports become active later, the system does not automatically add them to the VLAN port member list.

You must add all inactive ports to the VLAN. If you do not add the inactive ports to the VLAN, when they become active later, hashing can result in choosing a newly active port for traffic forwarding. Because the port is not a port member of the VLAN, traffic will be dropped. When you add the VLAN to the MLT, also add the inactive aggregation ports to the VLAN. You may have to disable LACP on the inactive ports before you can add them to the VLAN. Because the ports are inactive, disabling LACP does not cause a traffic interruption.

Similarly when you remove a VLAN from a dynamic MLT, all active ports of the MLT are removed from the VLAN port member list but the inactive members are not removed. You must remove the inactive aggregation members from the VLAN.

If you later configure a port for the same aggregation, you must add this port to all VLANs that are members of the MLT.

#### Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **MultiLink/LACP Trunks** tab.
4. Click **Insert**.
5. In the **Id** box, type the ID number of the MLT.
6. In the **PortType** section, select **access** or **trunk**.
7. In the **Name** box, type a name for the MLT, or accept the default.

8. In the **PortMembers** box, click the (...) button.
9. In the **Port Editor: PortMembers** dialog box, select the desired ports.
10. Click **Ok**
11. In the **VlanIdList** box, click the (...) button,
12. In the **VlanIdList** dialog box, select the desired VLANs.
13. Click **Ok**.
14. In the **MltType** section, select the MLT type.
15. In the **Aggregatable** box, select **enable** or **disable**.
16. In the **PrivateVlanType** box, select **trunk**, **isolated**, or **promiscuous**.
17. Click **Insert**.

The MLT is added to the MultiLink/LACP Trunks tab in the MLT\_LACP box.

### MultiLink/LACP Trunks field descriptions

Use the data in the following table to use the **MultiLink/LACP Trunks** tab

| Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Id</b>          | Specifies a unique value for this MLT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>PortType</b>    | Specifies the value to access or trunk port.<br>If the aggregatable field is set to enable, this field is read-only.<br>The default value is access.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Name</b>        | Configures the name given to the MLT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>PortMembers</b> | Assigns ports to the MLT. MLT is supported on 1 Gigabit Ethernet (GbE), 10 GbE, and 40 GbE ports. All ports in an MLT must have the same settings for speed and duplex, but can have different media types. All untagged ports must belong to the same STG.<br><br>Up to eight same-type ports can belong to a single MLT.<br><br>If the aggregatable field is set to enable, this field becomes read-only.<br><br><b>!</b> <b>Important:</b><br><br>Ensure that all ports that belong to the same MLT/LACP group use the same port speed, for example, 1 Gbit/s, even if autonegotiation is enabled. |
| <b>VlanIdList</b>  | Indicates to which ports the VLANs belong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*Table continues...*

| Name                            | Description                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                                 | If the aggregation field is set to enable, this field is read-only.                                                                     |
| <b>MltType</b>                  | Specifies the type of MLT <ul style="list-style-type: none"> <li>• normalMLT (default)</li> <li>• istMLT</li> <li>• splitMLT</li> </ul> |
| <b>RunningType</b>              | Specifies the MLT running type.                                                                                                         |
| <b>IfIndex</b>                  | Specifies the interface of the trunk.                                                                                                   |
| <b>ClearLinkAggregate</b>       | Clears the link aggregate, disabling and reenabling the trunk.                                                                          |
| <b>DesignatedPort</b>           | Specifies the designated port of this trunk.                                                                                            |
| <b>Aggregatable</b>             | Enables or disables link aggregation.<br>The default value is disable.                                                                  |
| <b>AggOperState</b>             | Specifies the aggregation state of the trunk.                                                                                           |
| <b>AggTimeOfLastOperChange</b>  | Specifies the time value since the interface entered its current operational state.                                                     |
| <b>PeerPortMembersList</b>      | Specifies the peer ports connected to the local ports of this trunk.                                                                    |
| <b>EntryOwner</b>               | Defines the owner of the MLT.                                                                                                           |
| <b>DatapathProgrammingState</b> | Defines the datapath programming state of the MLT.                                                                                      |
| <b>PrivateVlanType</b>          | Specifies the type of private VLAN for the MLT.                                                                                         |

## Adding ports to an MLT

Add ports to an MLT to insert MultiLink/LACP trunks.

### Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **MultiLink/LACP Trunks** tab.
4. In the **PortMembers** column, double-click the field associated with the MLT to which you want to add ports to.
5. Select the port numbers to add, or click **All** to add all ports to the MLT.  
Up to 16 same-type ports can belong to a single MLT.
6. Click **Ok**.
7. Click **Apply**.

---

## Viewing trunks

Perform this procedure to view the MLT-based SMLT configuration.

### Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Click **SMLT**.
3. Click the **SMLT Info** tab.

## SMLT Info field descriptions

Use the data in the following table to use the **SMLT Info** tab.

| Name               | Description                               |
|--------------------|-------------------------------------------|
| <b>Id</b>          | Shows the MLT ID for this SMLT Read-only. |
| <b>MltType</b>     | Shows the MLT type of this trunk.         |
| <b>RunningType</b> | Shows the SMLT running type.              |

---

## Creating a virtual IST using EDM

vIST creates a virtualized channel through the SPBM cloud, and this channel connects two SMLT devices to form a virtualized Switch Cluster. Note that the SPBM cloud can consist of as few as two nodes.

### ! Important:

- When you create a vIST, VLANs assigned to SMLT ports must have an I-SID assigned.
- If you assign a VLAN to an I-SID on one SMLT-BEB node, then you must create the same VLAN and assign it to the same I-SID on the peer SMLT-BEB node even if no devices are connected to this second node.
- The vIST VLAN must also be associated with an I-SID. You can use the same vIST VLAN in another part of your network, but the I-SID associated with the vIST VLAN must not be used anywhere else."

### \* Note:

*Simplified* Virtual-IST (vIST) is for non-SPB customers who use SMLT with legacy IST. Simplified VIST is available ONLY for legacy multicast deployments when the boot flag (`spbm-config-mode`) is disabled.

For more information, see *Configuring IP Multicast Routing Protocols*.

### Before you begin

- Enable SPBM and IS-IS globally.

- Configure SPBM and IS-IS.
- Configure an L2 VSN by assigning an I-SID to the C-VLAN, which is used by the vIST.

For information about SPBM and IS-IS, see *Configuring Fabric Connect*.

### Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN > MLT/LACP**.
2. Click the **Virtual IST** tab.
3. In the **PeerIp** field, type the peer IP address.
4. In the **VlanId** field, enter a VLAN ID.
5. Click **Apply**.

### Virtual IST field descriptions

Use the data in the following table to help you configure the **Virtual IST** tab.

| Name                 | Description                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------|
| <b>SessionStatus</b> | Displays the status of the vIST session.                                                                 |
| <b>PeerIp</b>        | Specifies the peer IP address, which is the IP address of the vIST VLAN on the other aggregation switch. |
| <b>VlanId</b>        | Configures a vIST VLAN ID number.                                                                        |

## Editing a virtual IST

If you need to change the virtual IST **PeerIp** or **VlanId**, use this procedure to delete the vIST first.

### \* Note:

- You must disable IS-IS globally before deleting a vIST, and then re-enable it after creating a new vIST.
- You do not have to set the SMLT peer system ID or the virtual B-MAC to 0 before you change the virtual IST peer IP address or VLAN ID number.

### Procedure

1. Disable IS-IS globally.
  - a. In the navigation pane, expand the following folders: **Configuration > IS-IS > IS-IS**.
  - b. Click the **Globals** tab.
  - c. In the **AdminState** field, click **off**.
  - d. Click **Apply**.
2. Delete the vIST.
  - a. In the navigation pane, expand the following folders: **Configuration > VLAN > MLT/LACP**.

- b. Click the **Virtual IST** tab.
  - c. Click **Apply**.
3. Create a vIST:
  - a. In the navigation pane, expand the following folders: **Configuration > VLAN > MLT/LACP**.
  - b. Click the **Virtual IST** tab.
  - c. In the **PeerIp** field, enter the peer IP address.
  - d. In the **VlanId** field, enter a VLAN ID.
  - e. Click **Apply**.
4. Enable IS-IS globally.
  - a. In the navigation pane, expand the following folders: **Configuration > IS-IS > IS-IS**.
  - b. Click the **Globals** tab.
  - c. In the **AdminState** field, click **on**.
  - d. Click **Apply**.

---

## Configuring Simplified vIST in SMLT topologies

This procedure shows how to configure Simplified vIST in an SMLT environment. It includes steps to configure the following:

- Setting the boot config flag
- Configuring the vIST peer
- Enabling Simplified vIST

### **Important:**

When you enable Simplified vIST with the `virtual-ist enable` command, two VLANs are automatically created to support vIST. The VLAN IDs are: 4086 and 4087.

### **Before you begin**

SPBM must not be enabled on the vIST peers or any router participating in the network.

### **Procedure**

1. In the navigation pane, expand the following folders: **Configuration > Edit > Chassis**
2. Click the **Boot Config** tab.
3. Clear the **EnableSpbmConfigMode** to disable the boot flag.

The system responds with these messages:

Warning: Please save the configuration and reboot the switch for this to take effect.

Warning: Please carefully save your configuration file before rebooting the switch. Saving configuration file when `spbm-config-mode` is changed to `disable`, removes SPBM configurations from the configuration file.

4. Click **Apply**.
5. Save the configuration, and then reboot the switch.

 **Important:**

Any change to the **EnableSpbmConfigMode** boot flag requires a reboot for the change to take effect.

6. Configure the *SMLT* MLT:
  - a. Expand the following folders: **Configuration > VLAN**.
  - b. Click **MLT/LACP**.
  - c. Click the **MultiLink/LACP Trunks** tab.
  - d. Click **Insert**.
  - e. In the **Id** box, type the ID number of the MLT.
  - f. In the **PortType** section, select access or trunk.
  - g. In the **Name** box, type a name for the MLT, or accept the default.
  - h. In the **PortMembers** box, click the (...) button.
  - i. In the **Port Editor: PortMembers** dialog box, select the desired ports.
  - j. Click **Ok**.
  - k. In the **VlanIdList** box, click the (...) button.
  - l. In the **VlanIdList** dialog box, select the desired VLANs.
  - m. Click **Ok**.
  - n. In the **MltType** section, select `splitMLT`
  - o. Click **Insert**.
 

The switch adds the SMLT MLT to the MultiLink/LACP Trunks tab in the `MLT_LACP` box.
7. Configure the *vIST* MLT:
  - a. Repeat steps [6.a](#) on page 67 to [6.o](#) on page 67 to configure the MLT.
  - b. Click **virtualistMLT** to enable Simplified vIST.
  - c. Click **Insert**.

8. Create the *vIST* VLAN:
  - a. Expand the following folders: **Configuration > VLAN > VLANs**
  - b. In the **Basic** tab, click **Insert**.
  - c. In the **Id** box, enter an unused VLAN ID, or use the ID provided.
  - d. In the **MstpInstance** box, click the down arrow, and then choose an MSTI instance from the list.
  - e. In the **Type** box, select **byPort**.
  - f. In the **PortMembers** box, click the (...) button.
  - g. In the **Port Editor: PortMembers** dialog box, select the desired ports.
  - h. Click **OK**.
  - i. Click **Insert**.
  - j. Select the *vIST* VLAN from the list of VLANs, and then click **IP**.
  - k. Click **Insert**.
  - l. Configure the IP address for the *vIST* VLAN.
9. Repeat step 8 on page 68 to create an *SMLT* VLAN and assign the SMLT MLT ID to it. Do not use the *vIST* MLT ID.

---

## MLT configuration examples

This chapter contains configuration examples for configuring MultiLink Trunking (MLT) and MLT with Link Aggregation Control Protocol (LACP) using the Command Line Interface (CLI).

---

### MultiLink Trunking

This configuration example shows you how to create a multilink trunk and a Virtual Local Area Network (VLAN) between two switches.

The following illustration shows you an MLT within a VLAN used to carry user traffic.

**Figure 5: MLT within a VLAN**

## Switch A and B configuration

Configure MLT 10 on VLAN 100 on each device.

```
#
MLT CONFIGURATION
#
mlt 10 enable
interface mlt 10
exit
#
VLAN CONFIGURATION
#
vlan create 100 name VLAN-MLT-10 type port-mstprstp 1 color 1
vlan mlt 100 10
vlan members 100 1/1-1/4 portmember
```

## MLT and private VLANs

The Switch supports private VLANs and E-Tree configuration. MLT and private VLANs operate as follows:

- When using static MLT, configure the private-vlan as part of the overall MLT configuration, not at the port member level. All ports in the MLT use the private VLAN type for that MLT.
- When using LACP, configure the private-vlan at the interface level.
- When the private VLAN port type is trunk, the MLT automatically becomes tagged.
- If there are other non-private VLANs using the MLT configured as isolated, the following message is displayed: All non private VLANs using this interface will be removed once this mlt becomes isolated. Do you wish to continue (y/n) ?
- If there are other non-private VLANs using the MLT configured as promiscuous, the following message is displayed: All non private VLANs using this interface will be removed once this mlt becomes promiscuous. Do you wish to continue (y/n) ?

## MultiLink Trunking with Link Aggregation Control Protocol

This configuration example shows you how to configure and enable a multilink trunk with LACP.

You must configure all aggregatable ports to use the same aggregator key so they can form an MLT.

The following illustration shows you an MLT created with LACP within a VLAN used to carry user traffic.

Figure 6: MLT within a VLAN

The following procedures show you how to configure both switches.

### Switch A and B configuration

Configure the two devices to connect with MLT with LACP.

```
#
MLT CONFIGURATION
#

## MLT network topology and configuration reference

The following reference information contains examples of MLT network topology and configuration. The same topologies apply to MLT with LACP.

---

### Example 1: Switch-to-switch MLT

The following illustration shows two multilink trunks (MLT1 and MLT2) connecting three switches.

**Figure 7: Switch-to-switch multilink trunks configuration**

In this example, you can configure each trunk with multiple switch ports to increase bandwidth and redundancy. If traffic between switch-to-switch connections approaches single port bandwidth limitations, you can create a multilink trunk to supply the additional bandwidth required to improve performance, as well as providing physical link layer redundancy.

---

## Example 2: Switch-to-server MLT

In this example, File server 1 uses dual MAC addresses, with one MAC address for each Network Interface Card (NIC). No multilink trunk is configured on File server 1. File server 2 is a single MAC server (with a four-port NIC) configured as multilink trunk configuration MLT1.

The following illustration shows a typical switch-to-server multilink trunk configuration.

**Figure 8: Switch-to-server multilink trunk configuration**

In this example, one port on File server 1 is blocked and unused and File server 2 benefits from aggregated bandwidth on multilink trunk T1.

---

### Example 3: Client/Server MLT

In this example, both servers are connected directly to the switch. File server 2 is connected through multilink trunk MLT 1. The switch-to-switch connections are through MLT 2, MLT 3, and MLT 4. Clients access data from the servers (File server 1 and File server 2) and receive maximized bandwidth through MLT 1, MLT 2, MLT 3, and MLT 4.

The following illustration shows how you can use multilink trunks in a client/server configuration.

**Figure 9: Client/server multilink trunk configuration**

# Chapter 4: Virtual Link Aggregation Control Protocol

This section provides the concepts and procedures you need to configure the Virtual Link Aggregation Control Protocol (VLACP).

---

## Virtual Link Aggregation Control Protocol

Use Virtual Link Aggregation Control Protocol (VLACP) as an extension to LACP for end-to-end failure detection. VLACP is not a link aggregation protocol, it is a mechanism to periodically check the end-to-end health of a point-to-point connection. VLACP uses the Hello mechanism of LACP to periodically send Hello packets to ensure end-to-end communication. After Hello packets are not received, VLACP transitions to a failure state, which indicates a service provider failure and that the port is disabled.

The VLACP only works for port-to-port communications where there is a guarantee for a logical port-to-port match through the service provider. VLACP does not work for port-to-multipoint communications where there is no guarantee for a point-to-point match through the service provider. You can configure VLACP on a port.

You can also use VLACP with MLT to complement its capabilities and provide quick failure detection.

VLACP trap messages are sent to the management stations if the VLACP state changes. If the failure is local, the only traps that are generated are port linkdown or port linkup.

The Ethernet cannot detect end-to-end failures. Functions such as remote fault indication or far-end fault indication extend the Ethernet to detect remote link failures. A major limitation of these functions is that they terminate at the next Ethernet hop. They cannot determine failures on an end-to-end basis.

For example, in [Figure 10: Problem description \(1 of 2\)](#) on page 75, after the Enterprise networks connect the aggregated Ethernet trunk groups through a service provider network connection (for example, through a VPN), far-end failures cannot be signaled with Ethernet-based functions that operate end-to-end through the service provider network. The multilink trunk (between Enterprise switches S1 and S2) extends through the Service Provider (SP) network.

The following illustration shows an MLT running with VLACP. VLACP can operate end-to-end, but you can also use it as a point-to-point link.

**Figure 10: Problem description (1 of 2)**

In the following illustration, if the L2 link on S1 (S1/L2) fails, the link-down failure is not propagated over the SP network to S2 and S2 continues to send traffic over the failed S2/L2 link.

**Figure 11: Problem description (2 of 2)**

Use VLACP to detect far-end failures, which causes MLT to failover if end-to-end connectivity is not guaranteed for links in an aggregation group. VLACP prevents the failure scenario.

### VLACP timers and sub-100-ms core convergence

The switch software uses the following VLACP timers:

- fast periodic timer—100 to 20 000 ms; default 200 ms
- slow periodic timer—10 000 to 30 000 ms; default 30 000 ms

The switch software can attain sub-100-ms failover time. The VLACP fast periodic timer is reduced to a minimum value of 30 ms to enable sub-100-ms convergence (period of timeout x fast periodic timer = 3 x 30 ms = 90 ms). Sub-100-ms convergence guarantees ultra-fast convergence for critical business and multimedia applications.

Though you can configure the ports with a VLACP fast periodic timer of less than 30 ms, this configuration is not stable in scaled networks, and therefore not supported. Use VLACP with a fast periodic timer of 30 ms and a timeout of 3 as the fastest timers to achieve sub-100-ms failover.

### VLACP considerations

Use the information in this section to understand the considerations while configuring VLACP into your network.

- If a VLACP-enabled port does not receive a VLACP Data Unit (VLACPDU), it must enter the disabled state. There are occasions where a VLACP-enabled port does not receive a

VLACPDU but remains in the forwarding state. To avoid this situation, ensure that the VLACP configuration at the port level is consistent. You must either enable or disable both sides of the point-to-point connection.

You can configure VLACP on each port. The port can be either an individual port or an MLT member. VLACPDUs can be sent periodically on each port where VLACP is enabled to exchange VLACPDUs from an end-to-end perspective. If VLACPDUs are not received on a particular link, that link is taken down after the expiry timeout occurs (timeout scale x periodic time).

---

## VLACP configuration using CLI

Configure Virtual LACP (VLACP) to implement link status control protocol at the port level. VLACP detects end-to-end failures in the switch. Virtual LACP cannot interoperate with Link Aggregation Control Protocol (LACP).

---

### Configuring VLACP on a port

Configure VLACP on a port to ensure there is end-to-end reachability. VLACP uses the Hello mechanism of LACP to periodically send Hello packets to ensure there is an end-to-end approach. After Hello packets are not received, VLACP transitions to a failure state and disables the port.

#### About this task

##### Important:

Changes made at the global level override and reset all port level settings.

#### Procedure

1. Enter GigabitEthernet Interface Configuration mode:

```
enable

configure terminal

interface GigabitEthernet {slot/port[/sub-port] [-slot/port[/sub-
port]][, ...]}
```

##### Note:

If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port.

2. Configure optional parameters for the port. If you do not configure these parameters, the system uses the default values.
  - a. Configure the protocol identification for the port:

```
vlacp ethertype <1536-65535 | 0x600-0xffff> [funcmac-addr
0x00:0x00:0x00:0x00:0x00:0x00]
```

## b. Configure the fast or slow periodic times:

```
vlacp fast-periodic-time <100-20000> | slow-periodic-time
<10000-30000>
```

You can configure both parameters in the same command entry.

## c. Configure the timeout parameters:

```
vlacp timeout <long|short> timeout-scale <2-10>
```

You can configure both parameters in the same command entry.

## 3. Enable VLACP on a port:

```
vlacp enable
```

**Example**

Configure VLACP on port 1/1:

```
Switch:1# configure terminal
Switch:1# interface GigabitEthernet 1/2
Switch:1# vlacp fast-periodic-time 400 timeout short
Switch:1# vlacp enable
```

**Variable definitions**

Use the data in the following table to help you use the `vlacp` command.

| Variable                                     | Value                                                                                                                                                                                                                                                                                             |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable                                       | Enables VLACP for this port. The default is disabled.                                                                                                                                                                                                                                             |
| ethertype <1536-65535   0x600-0xffff>        | Configures the VLACP protocol identification for this port. Enter the type in decimal or hexadecimal format. The default is 0x8103.                                                                                                                                                               |
| fast-periodic-time <100-20000>               | Configures the fast periodic time (in milliseconds) for this port. The default is 200.                                                                                                                                                                                                            |
| funcmac-addr <0x00:0x00:0x00:0x00:0x00:0x00> | Configures the multicast MAC address used for the VLACPDU. Specify a MAC address in the format 0x00:0x00:0x00:0x00:0x00:0x00.                                                                                                                                                                     |
| slow-periodic-time <10000-30000>             | Configures the slow periodic time (in milliseconds) for a specific port type. The default is 30,000.                                                                                                                                                                                              |
| timeout {long short}                         | Configures the port to use the long or short timeout: <ul style="list-style-type: none"> <li>long sets the port to use the timeout-scale value multiplied by the slow periodic time.</li> <li>short sets the port to use the timeout-scale value multiplied by the fast periodic time.</li> </ul> |

*Table continues...*

| Variable             | Value                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | For example, if you specify a short timeout, set the timeout-scale value to 3, and the fast periodic time to 400 ms, the timer expires within 1000 to 1200 ms.<br>The default is long. |
| timeout-scale <2-10> | Configures a timeout scale for this port used to calculate the timeout. The default value is 3.                                                                                        |

## Viewing the VLACP port configuration

View the VLACP port configuration to show the port VLACP configuration.

### Procedure

View the VLACP port configuration for all interfaces:

```
show vlacp interface gigabitethernet [{slot/port[/sub-port]}[-slot/port[/sub-port]][, ...]] [vid <1-4059>]
```

### Example

```
Switch:1#show vlacp interface gigabitethernet
```

```
=====
 VLACP Information
=====
INDEX ADMIN OPER PORT FAST SLOW TIMEOUT TIMEOUT ETHER MAC
 ENABLED ENABLED STATE TIME TIME TIME SCALE TYPE ADDR

1/1 false false DOWN 200 30000 long 3 0x8103 01:80:c2:00:11:00
```

## Variable definitions

Use the data in the following table to use the **show vlacp interface gigabitethernet** command.

| Variable                                              | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {slot/port[/sub-port]}[-slot/port[/sub-port]][, ...]} | Specifies a port or list of ports to show only the VLACP information for those ports.<br><br>Identifies the slot and port in one of the following formats: a single slot and port (slot/port), a range of slots and ports (slot/port-slot/port), or a series of slots and ports (slot/port,slot/port,slot/port). If your platform supports channelization for 40 Gbps ports and the port is channelized, you must also specify the sub-port in the format slot/port/sub-port. |
| vid <1-4059>                                          | Specifies the VLAN ID in the range of 1 to 4059. VLAN IDs 1 to 4059 are configurable. The system reserves VLAN IDs 4060 to 4094 for internal use. VLAN ID 1 is the default VLAN and you cannot create or delete VLAN ID 1.                                                                                                                                                                                                                                                    |

---

## Enabling or disabling VLACP globally

Use VLACP as an extension to LACP for end-to-end failure detection. Enable or disable VLACP globally to reset the port level configuration. The default is disabled.

### About this task

#### Important:

Changes you make at the global level override and reset all port level settings.

### Procedure

1. Enter Global Configuration mode:

```
enable
configure terminal
```

2. Enable VLACP globally:

```
vlacp enable
```

3. Disable VLACP globally:

```
no vlapc enable
```

### Example

Enable VLACP globally:

```
Switch:1(config)# vlapc enable
```

---

## VLACP configuration using EDM

Configure Virtual LACP (VLACP) to implement link status control protocol at the port level. VLACP cannot interoperate with Link Aggregation Control Protocol (LACP).

---

## Enabling VLACP globally

Enable VLACP globally to detect for end-to-end failure. VLACP uses the Hello mechanism of LACP to periodically send Hello packets to ensure there is an end-to-end approach. After Hello packets are not received, the VLACP transitions to a failure state and the port is disabled.

### Procedure

1. In the navigation pane, expand the following folders: **Configuration > VLAN**.
2. Click **MLT/LACP**.
3. Click the **VLACP Global** tab.

4. Select the **VlACPEnable** check box.
5. Click **Apply**.

## VLACP Global field descriptions

Use the data in the following table to use the **VLACP Global** tab.

| Name               | Description                                      |
|--------------------|--------------------------------------------------|
| <b>VlACPEnable</b> | Enables VLACP globally. The default is disabled. |

---

## Configuring VLACP on a port

Enable VLACP on a port. VLACP periodically checks the end-to-end health of a point-to-point connection.

### Procedure

1. In the Device Physical View tab, select a port.
2. In the navigation pane, expand the following folders: **Configuration > Edit > Port**.
3. Click **General**.
4. Click the **VLACP** tab.
5. Select the **AdminEnable** check box.
6. Configure the remaining parameters as required.
7. Click **Apply**.

## VLACP field descriptions

Use the data in the following table to use the **VLACP** tab.

| Name                     | Description                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AdminEnable</b>       | Enables VLACP for the port. The default is disabled.                                                                                                                                                           |
| <b>OperEnable</b>        | Displays the operational status of VLACP for the port.<br>The default value is false.                                                                                                                          |
| <b>FastPeriodicTimer</b> | Specifies the number of milliseconds between periodic transmissions using short timeouts. Set all LACP enabled ports the same value from this setting. The range is 10–20000.<br>The default value is 200.     |
| <b>SlowPeriodicTimer</b> | Specifies the number of milliseconds between periodic transmissions using long timeouts. Set all LACP enabled ports the same value from this setting. The range is 10000–30000.<br>The default value is 30000. |

*Table continues...*

| Name                   | Description                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeout</b>         | Specifies the timeout control value. Specify long or short timeout.<br>The default value is long.                                                                                                                      |
| <b>TimeoutScale</b>    | Assigns the value used to calculate timeout time from the periodic time for all VLACP enabled ports. $\text{Timeout} = \text{PeriodicTime} \times \text{TimeoutScale}$ . The range is 2–10.<br>The default value is 3. |
| <b>EtherType</b>       | Specifies the VLACP protocol identification. The ID is in hexadecimal format.<br>The default value is 0x8103.                                                                                                          |
| <b>EtherMacAddress</b> | Specifies the multicast MAC address exclusively used for VLACPDUs.                                                                                                                                                     |
| <b>PortState</b>       | Displays the VLACP port state.                                                                                                                                                                                         |

# Glossary

|                                                              |                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>actor</b>                                                 | An LACP device at the near end of a link, which performs the action. The device at the far end of the link is called the partner. LACP compares the actor and partner information to determine what action to perform.                                                                                         |
| <b>Bridge Protocol Data Unit (BPDU)</b>                      | A data frame used to exchange information among the bridges in local or wide area networks for network topology maintenance.                                                                                                                                                                                   |
| <b>Interior Gateway Protocol (IGP)</b>                       | Distributes routing information between routers that belong to a single Autonomous System (AS).                                                                                                                                                                                                                |
| <b>Internet Control Message Protocol (ICMP)</b>              | A collection of error conditions and control messages exchanged by IP modules in both hosts and gateways.                                                                                                                                                                                                      |
| <b>interswitch trunking (IST)</b>                            | A feature that uses one or more parallel point-to-point links to connect two aggregation switches. The two aggregation switches use this channel to share information and operate as a single logical switch. Only one interswitch trunk can exist on each Split Multilink Trunking (SMLT) aggregation switch. |
| <b>Layer 2</b>                                               | Layer 2 is the Data Link Layer of the OSI model. Examples of Layer 2 protocols are Ethernet and Frame Relay.                                                                                                                                                                                                   |
| <b>Layer 3</b>                                               | Layer 3 is the Network Layer of the OSI model. An example of a Layer 3 protocol is Internet Protocol (IP).                                                                                                                                                                                                     |
| <b>Link Aggregation Control Protocol (LACP)</b>              | A network handshaking protocol that provides a means to aggregate multiple links between appropriately configured devices.                                                                                                                                                                                     |
| <b>Link Aggregation Control Protocol Data Units (LACPDU)</b> | Link aggregation control protocol data unit (LACPDU) is used for exchanging information among LACP-enabled devices.                                                                                                                                                                                            |
| <b>link aggregation group (LAG)</b>                          | A group that increases the link speed beyond the limits of one single cable or port, and increases the redundancy for higher availability.                                                                                                                                                                     |
| <b>load balancing</b>                                        | The practice of splitting communication into two (or more) routes or servers.                                                                                                                                                                                                                                  |

|                                               |                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>media</b>                                  | A substance that transmits data between ports; usually fiber optic cables or category 5 unshielded twisted pair (UTP) copper wires.                                                                                                                                                                                                                      |
| <b>Network Interface Card (NIC)</b>           | A network interface device (NID) in the form of a circuit card installed in an expansion slot of a computer to provide network access.                                                                                                                                                                                                                   |
| <b>packet loss</b>                            | Expressed as a percentage of packets dropped over a specified interval. Keep packet loss to a minimum to deliver effective IP telephony and IP video services.                                                                                                                                                                                           |
| <b>Protocol Data Units (PDUs)</b>             | A unit of data that is specified in a protocol of a specific layer and that consists of protocol-control information of the specific layer and possibly user data of that layer.                                                                                                                                                                         |
| <b>Simple Loop Prevention Protocol (SLPP)</b> | Simple Hello Protocol that prevents loops in a Layer 2 network (VLAN).                                                                                                                                                                                                                                                                                   |
| <b>Small Form Factor Pluggable (SFP)</b>      | A hot-swappable input and output enhancement component that allows gigabit Ethernet ports to link with other gigabit Ethernet ports over various media types.                                                                                                                                                                                            |
| <b>SMLT aggregation switch</b>                | One of two IST peer switches that form a split link aggregation group. It connects to multiple wiring closet switches, edge switches, or customer premise equipment (CPE) devices.                                                                                                                                                                       |
| <b>SMLT client</b>                            | A switch located at the edge of the network, such as in a wiring closet or CPE connecting to two SMLT aggregation switches. An SMLT client switch performs link aggregation but does not require Split MultiLink Trunking (SMLT) intelligence.                                                                                                           |
| <b>spanning tree</b>                          | A simple, fully-connected active topology formed from the arbitrary physical topology of connected bridged Local Area Network components by relaying frames through selected bridge ports. The protocol parameters and states that are used and exchanged to facilitate the calculation of the active topology and to control the bridge relay function. |
| <b>Spanning Tree Group (STG)</b>              | A collection of ports in one spanning-tree instance.                                                                                                                                                                                                                                                                                                     |
| <b>Split MultiLink Trunking (SMLT)</b>        | An extension to IEEE 802.1AX (link aggregation), provides nodal and link failure protection and flexible bandwidth scaling to improve on the level of Layer 2 resiliency.                                                                                                                                                                                |
| <b>trunk</b>                                  | A logical group of ports that behaves like a single large port.                                                                                                                                                                                                                                                                                          |
| <b>trunk port</b>                             | A port that connects to the service provider network such as the MPLS environment.                                                                                                                                                                                                                                                                       |

|                                                          |                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Datagram Protocol (UDP)</b>                      | In TCP/IP, a packet-level protocol built directly on the Internet Protocol layer. TCP/IP host systems use UDP for application-to-application programs.                                                                                                                         |
| <b>virtual IST (vIST)</b>                                | Virtual Inter-Switch Trunk (vIST) improves Layer 2 and Layer 3 resiliency by using a virtualized IST channel through the SPBM cloud. The vIST channel is always up as long as there is SPBM connectivity between the vIST peers.                                               |
| <b>Virtual Link Aggregation Control Protocol (VLACP)</b> | Virtual Link Aggregation Control Protocol (VLACP) is a Layer 2 handshaking protocol that can detect end-to-end failure between two physical Ethernet interfaces.                                                                                                               |
| <b>Virtual Router Redundancy Protocol (VRRP)</b>         | A protocol used in static routing configurations, typically at the edge of the network. This protocol operates on multiple routers on an IP subnet and elects a primary gateway router. When the primary router fails, a backup router is quickly available to take its place. |
| <b>wiring closet</b>                                     | A central termination area for telephone or network cabling or both.                                                                                                                                                                                                           |
