Pinging a device	77
Tracing a route	77
Managing hardware inventory	78
Performance trending	78
Viewing network paths	79
MIB queries	81
Modifying SNMP version authentication	81
Viewing SNMP MIB data	82
Management Information Bases	85
List of alarms and events	87

New in this release

The following sections detail what's new in Nortel Visualization Performance and Fault Manager Fault and Performance Management (NN48014-700) for release 2.1.

Features

See the following sections for information about feature changes:

- ["Moving icons in the topology view" \(page 7\)](#)
- ["Addition of trends to the Application menu" \(page 7\)](#)
- ["Addition of the MLT/SMLT schematic layout to the detailed campus view" \(page 7\)](#)
- ["View discovery logs from the Web client" \(page 8\)](#)
- ["Addition of SNMP v3 to the MIB browser" \(page 8\)](#)
- ["Nortel legacy device discovery and monitoring" \(page 8\)](#)
- ["Avaya phone MIBs" \(page 8\)](#)
- ["Fixes from the 2.0 patch releases" \(page 8\)](#)

Moving icons in the topology view

The topology browser permits you to move icons, save the new layout, and share it for other users to see. For more information, see ["Central browser" \(page 17\)](#).

Addition of trends to the Application menu

Trends are performance graphs for devices or interfaces. For more information see ["Central browser" \(page 17\)](#) and ["Viewing discovery results in the Topology Viewer" \(page 54\)](#).

Addition of the MLT/SMLT schematic layout to the detailed campus view

The topology map is enhanced to keep the groups of devices participating in multi-link trunking (MLT)/Split multi-link trunking (SMLT) together on the campus detail view so that the SMLT configuration (triangle, square, or

mesh) is evident. The possible layouts are grouped at the core for 2, 4, or 6 switches showing the MLT/SMLT and IST links. For more information, see ["MLT/SMLT schematic layout" \(page 40\)](#).

View discovery logs from the Web client

In the previous release of VPFM, you viewed the discovery logs only from the Administrative client on the VPFM server (thick client). Now you can view the discovery logs from the Web client by clicking the Discovery log icon in the discovery browser. For more information, see ["Discovery Browser" \(page 45\)](#).

Addition of SNMP v3 to the MIB browser

The previous release supported SNMP v1 and v2 in the MIB browser. Although SNMP v3 protocol was supported for network discovery, it was not available from the SNMP MIB browser. For more information, see ["SNMP MIB browser" \(page 33\)](#).

Nortel legacy device discovery and monitoring

Discovery and monitoring support is available for Nortel legacy devices. For more information, see ["Nortel legacy device discovery and monitoring" \(page 41\)](#).

Avaya phone MIBs

This maintenance release loads new Avaya phone MIBs. Models 4610 and 4621, extension 7020 and 7021 are added.

Fixes from the 2.0 patch releases

All the fixes in VPFM patch releases 2.0.0.1 to 2.0.0.4 are integrated in this release.

Other information

See the following sections for information about changes that are not feature related:

- ["Network browser" \(page 9\)](#)
- ["Tool bar table" \(page 9\)](#)
- ["Customizing a layout" \(page 9\)](#)
- ["Moving icons" \(page 9\)](#)
- ["Map background controls" \(page 9\)](#)
- ["Addition of Nortel legacy devices" \(page 9\)](#)
- ["Entering credentials" \(page 9\)](#)
- ["Downloading Adobe plugin for Windows or Linux " \(page 9\)](#)
- ["Viewing with IE7" \(page 10\)](#)

Network browser

The Network Browser screen is updated. For more information, see ["Network Browser tools" \(page 14\)](#).

Tool bar table

The Network Browser tools table is updated. For more information, see ["Network Browser tools" \(page 14\)](#).

Customizing a layout

You can customize a layout, and save the layout under a new name. You can choose to share the layout with other users and let other users modify the layout, or keep it private. For more information, see ["Layout options" \(page 38\)](#).

Moving icons

You can select a layout from Hierarchical, Symmetrical, Circular, or User defined layouts and select the icon you want to move. For more information, see ["Moving an icon" \(page 58\)](#).

You can make a multiicon move, and save the layout as a user defined layout. For more information, see ["Layout options" \(page 38\)](#).

Map background controls

You can set the background image. For more information, see ["Map background controls" \(page 41\)](#).

Addition of Nortel legacy devices

Nortel legacy devices are added to the table listing the symbols used on the VPFM interface. For more information, see ["Central browser" \(page 17\)](#).

Entering credentials

You can view a multimedia demonstration about entering credentials for the devices which are not discovered. For more information, see ["Performing an initial discovery" \(page 46\)](#).

Downloading Adobe plugin for Windows or Linux

Procedures are added to download Adobe™ plugin for Windows or Linux. For more information, see ["Downloading Adobe plugin for Windows and Linux" \(page 58\)](#), ["Downloading Adobe plugin for Windows or Linux on a machine that has Internet access" \(page 59\)](#), and ["Downloading Adobe plugin for Windows or Linux on a machine that does not have Internet access" \(page 59\)](#).

Viewing with IE7

A procedure is added to obtain Adobe™ Flash and device trends. For more information, see "[Viewing with IE7](#)" (page 60).

VPFM and VPFM Lite

VPFM is available in two different versions: VPFM and VPFM-Lite. This section illustrates the feature differences between the two versions.

Users of VPFM-Lite can upgrade to VPFM with a license upgrade. For more information, see *Nortel Visualization Performance and Fault Manager—Installation* (NN48014-300).

VPFM features overview

The following table illustrates the feature differences between VPFM and VPFM-Lite.

Features and function	Supported by VPFM	Supported by VPFM-Lite
Heterogeneous Device Discovery: Standard	Yes	Yes
Discovery Boundary Constraints Options	Yes	No
Device (Status) View	Yes	Yes
L2 and L3 Topology Discovery: Standard	Yes	Yes
L2 and L3 Topology Discovery: Proprietary	Yes	Yes
L2 and L3 Topology Visualization	Yes	Yes
Campus Visualization	Yes	No
Application (L7) and Server Discovery	Yes	No
Application (L7) Visualization	Yes	No
VoIP Device Discovery	Yes	Yes
VoIP Topology Manager Visualization	Yes	No
Device Availability Monitoring	Yes	No
Inventory Viewer	Yes	Yes
Inventory Reporter	Yes	No
Inventory Exporting	Yes	No
Trap Receiver	Yes	Yes
Trap (Fault) Viewer /Acknowledgement	Yes	Yes

Features and function	Supported by VPFM	Supported by VPFM-Lite
Trap Forwarder	Yes	No
Trap Exporter	Yes	No
Syslog Viewer	Yes	Yes
Syslog Exporter	Yes	No
Link Status Propagation	Yes	Yes
Trap Historical Reporting, Retention, and Export	Yes	No
Event Correlation and Analysis	Yes	No
Event Forwarder	Yes	No
Fault Scripting and Event Handling	Yes	No
MIB Compiler and Browser	Yes	Yes
Nortel Icons for Nortel Devices	Yes	Yes
Device Performance Monitoring	Yes	Yes
LAG Performance Monitoring	Yes	No
Performance Trending and Graphing	Yes	No
Performance Thresholding (Arm /Re-arm thresholds)	Yes	No
Performance Data Exporting (HTML, CSV, XML)	Yes	No
Node Licensing (Managed Objects)	Yes	Yes
Default Scopes	Yes	Yes
Custom Scope Definitions	Yes	No
Ping Diagnostics Management	Yes	Yes
L2 Diagnostics Management	Yes	No
L3 Diagnostics Management	Yes	No
Microsoft System Center Operation Manager 2007 Integration	Yes	No
Custom HTTP /HTTPS /Application Launch	Yes	No
Web UI port definitions	Yes	Yes
HTTPS web client	Yes	Yes
Nortel RBAC Integration	Yes	Yes
Nortel SSO Integration	Yes	Yes
Device Credential Management	Yes	Yes
Nortel LSM Integration	Yes	Yes
Nortel NMS Application Integration	Yes	Yes
MySQL database support	Yes	Yes
Database Backup and Restore	Yes	Yes

Fault and performance fundamentals

This section provides information about the tools to manage and monitor faults and performance on the managed objects in VPFM.

Navigation

- ["Network Browser fundamentals" \(page 13\)](#)
- ["Event Browser" \(page 28\)](#)
- ["SNMP MIB browser" \(page 33\)](#)
- ["Availability Reports" \(page 35\)](#)
- ["Traps and syslogs" \(page 36\)](#)
- ["Top-N Reports" \(page 36\)](#)
- ["Event History Browser" \(page 38\)](#)
- ["Layout options" \(page 38\)](#)

- ["Map background controls" \(page 41\)](#)
- ["Nortel legacy device discovery and monitoring" \(page 41\)](#)

Network Browser fundamentals

This section provides an overview of the Network Browser.

The Network Browser enables you to view detailed information about the status of the managed objects in your network. The Network Browser provides the following tools for viewing network information:

- tool bar (top of the screen)
- navigation tree
- central browser
- property table

You can also use the Network Browser to access diagnostic tools, such as a ping utility, and to view inventory information. For more information, see ["Diagnostic tools" \(page 77\)](#).

Navigation

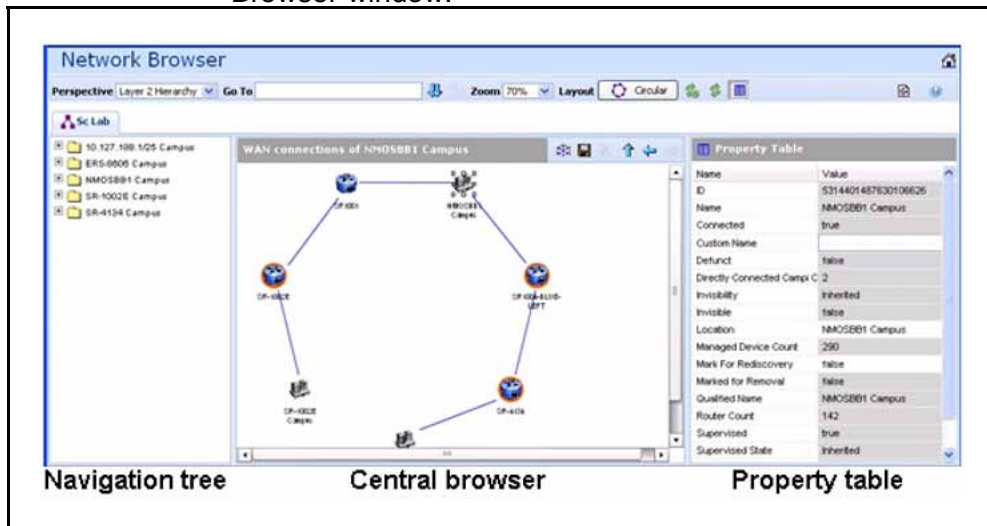

This section contains the following topics:

- "Network Browser tools" (page 14)
- "Tree browser" (page 15)
- "Central browser" (page 17)
- "Properties Table" (page 26)

Network Browser tools

This section provides an overview of the tools available in the Network Browser.

The following general controls are available at the top of the Network Browser window:

Tool	Description
Perspective	<p>The navigation tree changes and provides a different way to navigate the central browser view for each of the following options:</p> <ul style="list-style-type: none"> • Layer 2 hierarchy: In the central browser, you can navigate on the Layer 2 view of the network. The tree view lists campus, routers, switches, and border devices. • VLAN hierarchy: The tree view lists all the VLANs configured for each campus. The right-click menu on the VLAN lists the details of the VLAN in the central browser. • Layer 3 hierarchy: Lists all the subnets in the navigation tree. Expand on the items

Tool	Description
	<p>the tree view to view members; right-click to view details in the central browser.</p> <ul style="list-style-type: none"> • Device type: Lists the campus, devices, and interfaces in the navigation tree. Expand the items on the tree view to view details of the devices or interfaces; right-click the leaves of the tree to view details in the central browser. • Application: This perspective in the tree lists the voice applications and the operating systems in the network. Right-click the leaf item in the tree to view details in the central browser. • Scope: This perspective lists all predefined and user defined scopes. Select a leaf to view a table containing all the members in the scope. This option is very useful when a graphical view is too congested.
Go To	Allows you to view or search the schematic details of a device or element using its IP Address, DNS Name, or Management Name.
Layout	<p>The layout policies in the central browser are: hierarchical, symmetric, circular, and user defined.</p> <p>User defined layouts are layouts that the user can edit, share, or keep private.</p>
Zoom	Adjusts the level of zoom in the topology viewer so as to fit more or less of the topology in the window.
Auto Refresh	Controls auto-refresh on/off and interval of refresh if on.
Refresh	Refreshes the network browser contents.
Properties	Toggle to show/hide the Property Table panel.

Tree browser

This section provides an overview of the Tree Browser, located in the left panel of the Network Browser window.

The tree browser enables you to browse the contents of your network as a hierarchical tree with several perspectives to choose from.

The Tree Browser displays a tree that lists the entities within a domain. Left-clicking on '+' and '-' icons expands and contracts the tree folders. Expansion and selection of entities within the Tree Browser does not refresh the information displayed in the central browser, therefore the information displayed in the central browser may not reflect the node to which you navigate in the Tree Browser. To access the Tree Browser for a domain, the domain must be discovered by the server. If the domain of interest has not yet been discovered, you must discover (load) the domain. The information that displays in the Tree Browser depends on the perspective you select. The available perspectives are:

- Layer 2 Hierarchy - Lists domain elements according to their OSI layer 2 functions.
- VLAN Hierarchy - Lists the logical nodes that constitute a virtual LAN in each campus.
- Layer 3 Hierarchy - Lists domain elements according to their OSI layer 3 organization, that is, by their IP addresses.
- Device Types - List items as being campuses, devices (managed or unmanaged), or interfaces (including AAL5, ATM, Ethernet, PPP, and a number of others).
- Applications - Lists the supported applications that are visible to the VPFM Server. Applications are listed under the following categories: Operating System and Voice.
- Scopes - List all scopes defined for the domain enabling you to list domain elements according to a scope to which they belong. Left-clicking on a tree node causes the central browser panel to show the requested node in its network context and shows members of the scope in tabular form.

The Tree Browser also provides menu options. When you right-click a node in the tree browser, a menu displays enabling you to access information about the selected item. The options that are available for a given node vary based on its context. Several of the possible options are:

Backbone neighborhood – Displays the backbone neighborhood for the selected node.

Details – Displays details about the selected node.

MLT (Multi-Link Trunking) view – Displays an MLT view of the selected node.

Subnet map – Displays the subnet map for the selected node.

WAN connections – Displays WAN connections for the selected node.

Central browser

This section provides an overview of the central browser, located in the middle panel of the Network Browser. The central browser panel acts as Topology Viewer or Table Viewer based on the perspective being used.

The Topology Viewer provides a graphical display of the network topology, which enables you to visualize a network as a schematic of icons connected by lines.

The following tables list the right-click options available on the Topology Viewer, and describe the icons used.

The topology Viewer permits you to move icons, save the new layout, and share it for other users to see. The controls are provided in the bar on the right hand top, next to the navigation arrows. You can freeze a view (to stop movements), save a layout view, or delete a layout view. Initially, the view is in the freeze state. To move icons, click the freeze button and then select the icons to move. After you move the icons, you can save the view, and then you can make the view visible to other users by checking Share with other users, or you can keep the view private. You can enable a shared view for other users to edit, or enable the shared view as read only for other users to view.

When viewing scopes, the tree browser shows the scopes, and the central browser shows a table of all members of the scope.

The table view in the central browser displays groups of network elements in row/column form and provides information that is best shown in tabular format, such as processes running on a server, the databases running on a server, scope members, and listings the interfaces of a device.

The right-click options in the central browser topology view are: Application Menu, Setup, and Adobe™ flash options.

The following table describes the application menu options:

Menu option	Description
Backbone Neighborhood	Provides access to the backbone neighborhood schematic view for a selected domain element. This view, intended for improved viewing of domain elements in very large domains, expands the view to show domain elements that are connected by one hop to the selected domain element.

Menu option	Description
Diagnose	Enables you to perform diagnostic actions for the device (actions include Run Query, Browse MIB, ICMP Ping, Trace Route, SNMP Get, Walk MIB).
Go to Campus	Shifts view to the campus for the selected device.
Go to Circuit	Enables you to view the circuit associated with the selected device.
Interface Groups	Displays a table with information about the interface groups associated with the selected device. The interfaces on a given device are grouped based on slots.
Interfaces	Displays a table with information about the interfaces associated with the selected device. This lists all interfaces on a given network device.
Layer 2 Details	Displays the domain element details according to their OSI layer 2 functions.
Mark for Removal	Mark the device for removal from the next discovery.
MLT Schematic	Displays the MLT schematic for the selected device.
Physical Elements	Displays physical elements associated with the selected device.
Properties	Displays the Properties window for the selected device which shows the device's properties and associated values.
Show All	Displays all the properties and their associated values for the selected device in the Property Table.
Supervision Settings	Enables you to define the supervision settings for the selected device. Valid values include Inherit, Supervise, and Unsupervise.
Show Paths	Enables you to view the shortest network path between any two points in the network. Show Paths is not a live path trace. Although interfaces may be end-points, intermediate interfaces are not shown along paths. Only intermediate devices are shown.

Menu option	Description
Trends	Trends are performance graphs for devices or interfaces. The trends menu lists a collection of MITs that are configured and can be trended. For example, device CPU usage is a configured MIT that you can trend.
Color-Coding of Domain Elements	Domain elements displayed in the schematic diagram are colored based on the messages that relate to them.

The following table lists the symbols used on the VPFM interface. Symbols in blue denote a Nortel device, and symbols in grey denote a non-Nortel device.

Properties Table

This section provides an overview of the Properties Table, located in the Network Browser.

The Properties Table displays the variables (properties) and corresponding values for a selected domain element and enables you to edit settings for some of those variables. The properties that display vary based on the class of element. The standard properties that are shared by almost all network elements include:

- **Best Name** - The best name is determined via an algorithm that searches a series of names for a device. It first looks to any custom name defined by the user (see below) and then continues to search for

a DNS name, SNMP management name, WIN name, and IP address and selects the first of those names it finds a result for as the best name.

- Custom Name - Enables users to override the Best Name by specifying their own name for the element via this property. Note: When users do a discovery for the first time, no devices have a custom name and therefore it goes through the basic algorithm to find a best name.
- Invisibility - True/False. If invisible, will not appear in any schematics.
- Invisible - True/False/Inherit. Inherit by default except for campus element which have value false. The invisibility property inherits downwards by containment. So, set a campus invisible and all elements within will be invisible. Containment hierarchy is campus - device - interface.
- Mark for removal - This is referenced during the merge step of rediscoveries. Set this to true if the element is no longer in the network and you want to override the discovery engine's "keep missing equipment" policy. Note: If an element is still on the network, discovery will not remove it from the model.
- Supervised - Like invisibility, only governs whether or not element will be monitored for events.
- Supervised State - Like invisible, only governs whether or not element will be monitored for events.

You can change the name of a network device by editing the .xml file located at /knowledge/product/model/nameChoosers under the VPFM directory. The name values are represented by the following string in the xml file:

```
<propertyNames>
<string-list>
<string>managementName</string>
<string>dnsName</string>
<string>winsName</string>
<string>hostAddress</string>
</string-list>
</propertyNames>
```

This means that VPFM will first look for a non-null management name (sysName for SNMP devices), then a non-null dns name, then a non-null wins name, and lastly, it will use the host address of the device if no other name is defined. You can modify or create new files in this directory to customize the best name property. You can even create a separate xml file for each device type – Host, Router, Switch, and so on.

Event Browser

You can view messages for events in network that you manage using the Event Browser.

The Event Browser interprets the faults across the network, and displays the interpretation to the VPFM Administrator or the User. The interpretation is refined, diagnosed, analyzed and researched on the basis of every event.

For information about event browser procedures, see ["Viewing Events" \(page 61\)](#)

The screenshot shows the Nortel Visualization Performance & Fault Manager (VPFM) Event Browser interface. The window title is 'Event Browser' and the header includes 'NORTEL VISUALIZATION PERFORMANCE & FAULT MANAGER' and 'admin | UCM | Logout'. Below the header is a 'Default Message Board' tab. The main area contains a table with the following columns: Ack, Pri, Correlation, Event Type, Sub, Domain, Subject, Received, and Rep. C. The table lists several events, including Discovery Complete, MLT Configuration Problem, and Self Configuration Change, with various details like domain names and timestamps.

Ack	Pri	Correlation	Event Type	Sub	Domain	Subject	Received	Rep. C
<input type="checkbox"/>	6		Discovery Complete Event		VPFM	VPFM	Friday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	4		MLT Configuration Problem		disc1	ERS-8606	Friday, November 1, 2010 1:00:00	2
<input type="checkbox"/>	4		MLT Configuration Problem		disc1	47.80.222.34	Friday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	6		Discovery Start Event		VPFM	VPFM	Friday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	6		Self Configuration Change Event		VPFM	Knownledge0	Friday, November 1, 2010 1:00:00	4
<input type="checkbox"/>	6		Self Configuration Change Event		VPFM	Knownledge0	Friday, November 1, 2010 1:00:00	2
<input type="checkbox"/>	6		Discovery Complete Event		VPFM	VPFM	Thursday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	4		MLT Configuration Problem		sandy	ERS-8606	Thursday, November 1, 2010 1:00:00	2
<input type="checkbox"/>	4		MLT Configuration Problem		sandy	47.80.222.34	Thursday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	6		Discovery Start Event		VPFM	VPFM	Thursday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	6		Self Configuration Change Event		VPFM	Knownledge0	Thursday, November 1, 2010 1:00:00	4
<input type="checkbox"/>	6		Server Started Event		VPFM	VPFM	Thursday, November 1, 2010 1:00:00	1
<input type="checkbox"/>	6		Unknown MT		VPFM	VPFM	Thursday, November 1, 2010 1:00:00	1

The Event Browser displays message boards (one per tab). Each message board can show messages for events taking place in the domains managed by the product. The Event Browser contains a single message board by default but you can create additional message boards as needed. You can configure individual message boards to provide different views of message activity. By default, a message board displays messages for all domains loaded on the server. However, you can filter message boards to achieve various display results. For example, to correspond to a specific scope or set of event types or to match specific criteria such as priority or event type.

Attention: Taking an action against a message affects the message in all the message boards in which it appears (for example, clearing a message clears it from all message boards). Event persistence depends on the event type and associated MITs. Some events do not persist on a server restart or monitoring restart, primarily Self Event, IP AvailabilityFailure, SNMPAgentFailure. The engine will re-evaluate and post these events if required.

You can control the messages on the message board by using the controls provided on the menu bar of the Event Browser window.

The following table describes the controls available to manage the messages on the Event Browser window:

Feature	Description
Add a new message board	Adds a message board.
Delete selected message board	Deletes the current board (second icon from the left).
Rename selected message board	Renames the current board.
Configure filter for selected message board	Displays message board filter options. Each message board can have its own filter.
Auto refresh	Allows you to specify the time interval at which message board information is refreshed. After you click Auto refresh, a window appears that allows you to select the appropriate refresh interval. If the auto refresh settings are different from the message board settings then they affect the entire Event Browser.
Refresh	Refreshes the message board. Refresh is not only for a single message board, it affects the entire Event Browser.
Export selected message board	Allows you to export the contents of the current message board as an XML file (with the applied filter). Exports the current message board and not the entire Event Browser content.
Message board operation	Allows you to Acknowledge, Unacknowledge, or Clear the message board.

Message detail

The Message Detail window shows the complete set of information pertaining to a received message.

You can view the Message Detail window by performing either one of the following:

- double-clicking on a message
- clicking the link in the Event Type column on a message board
- right-clicking on the message row, and then selecting the Message Detail

The following table describes the Message Detail window tabs.

Feature	Description
Message tab	Displays information about the basic event message, the event type description, and the annotations for any actions or responses that are executed. The Messages tab provides the message text, the date when the message was last updated, the event type, and the event ID associated with the message.
Attributes tab	Displays the Reason of the Event along with the subjectAddress which is the IP Address of the device where the event occurred. The available fields are context sensitive and will change depending on the type of event.
Annotation tab	Displays annotations that are associated with the message.
Related Messages tab	Displays a list of downstream events (subsequent messages related to the message of interest) and upstream events (preceding messages related to the message of interest). These lists identify the priority, correlation, event type, and other relevant information about the related messages. There are two mini-message boards that show the associated events.

Message Properties

A message board lists messages in rows with the columns representing the properties of the messages.

The following are the various properties for each message as shown in the message board.

Message Properties	Description
Ack (Acknowledged)	A check mark indicates that the message has been acknowledged. No check mark indicates the message has not been acknowledged.

Message Properties	Description
Pri (Priority)	<p>The integer corresponding to the priority of the event. All priorities are selected by default. The Initial event priority is configured in the monitored information types Configuration Editor. Valid priorities include the following:</p> <ul style="list-style-type: none"> • Red (critical) • Dark Orange (high) • Orange (medium) • Yellow (low) • Turquoise (warning) and • Green (information)
Annotations (pencil icon)	<p>The presence of an annotation is indicated by a pencil icon in this column. Click the pencil icon and the Message Detail box appears. Browse to the annotation tab. Click Annotation to add annotation to the message.</p> <p>The product annotates a message when it executes an action in response to an event, when a message is acknowledged, or when a message is unacknowledged.</p> <p>You can add notes to the messages by right-clicking a row, and then selecting Annotate.</p> <p>You can also add an annotation from the Annotation tab.</p>
Related messages (I icon)	<p>The I icon indicates if other message is associated with the current one.</p> <p>For example, two messages that are correlated are considered to be related. Related messages are listed in the Message Detail window.</p>
Correlation	<p>The name of message correlation definition applied to a message. A plus sign (+) appears in this column when there are related events for the message. When the plus sign (+) sign is clicked it shows related events (which are also shown in the message detail dialog box). This only appears while a fault is active.</p>
Event Type	The name of the event type.
Sub. (Sub-message count)	An integer count of other events in (correlated under) the line item.

Message Properties	Description
Domain	The name of the domain from which the event originates. The domain is always listed as Nortel VPFM for events about VPFM.
Subject	The subject associated with the event.
Received	The date and time of the first repetition of this event (to see the time of most recent repetition, you can view the details of the message).
Rep. (Repetition) Count	The number of times the message is posted. Messages are not received directly from source devices but are inferred by the KBM engine from a variety of sources and situations.
Summary	A brief description of the event.
Device	The device name associated with the event.
Source Address	The IP address from which the event originates.
Target Address	The IP address of the event subject.
Updated	Shows when the event was last updated.

Message filters

You access the filters panel by clicking the Filters icon in the menu bar of the Event Browser.

You can configure each message board in the Event Browser to show different message information. By default, a message board displays messages for all domains that are loaded on the server. Using this panel, you can filter each message board so that, among other things, it shows only those messages that correspond to a specific scope or set of event types, or by criteria such as priority or network.

The VPFM retains your changes with other preferences you have set for your user account. You can use the Save Settings command on the Domains page (access the Domains page by clicking the Network Discovery link of the Welcome page) to save your preferences preemptively, without waiting for the settings to be saved automatically when you exit the VPFM.

The following table describes the various types of filters you can apply to the messages on the message board.

Message Properties	Description
Priorities	Allows you to turn on or off viewing of each priority by selecting or deselecting the appropriate check boxes. The colors correspond to the following priority levels: <ul style="list-style-type: none"> • Red (critical) • Dark Orange (high) • Orange (medium) • Yellow (low) • Turquoise (warning) • Green (information)
Updated after	Allows you to only show events updated after a specified time.
Updated before	Allows you to only show events updated before a specified time.
Hide acknowledged	Allows you to show or hide acknowledged events (check box).
Scope	Allows you to show only events whose subject is a member of the selected scope.
Events	Allows you to show only events that are one of the set of checked events.

SNMP MIB browser

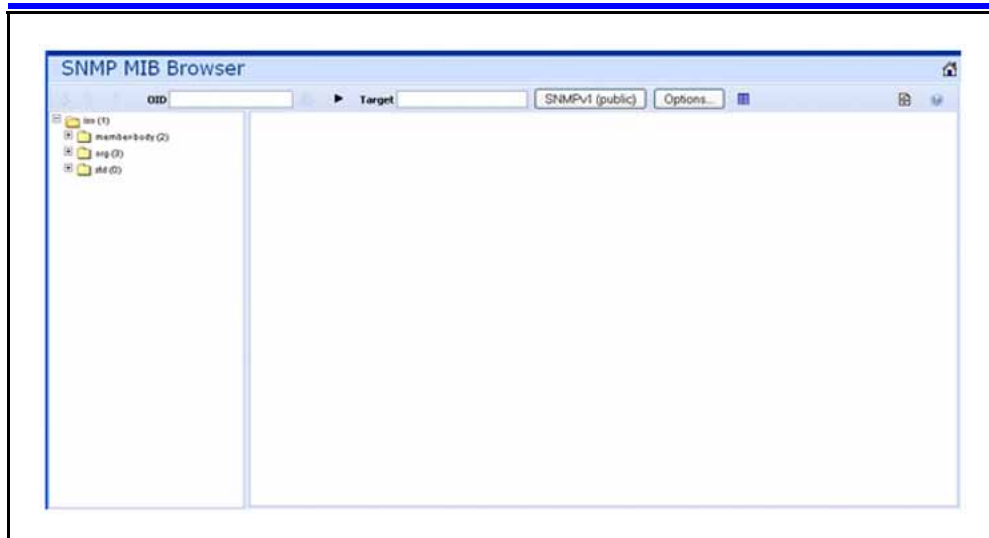

You can view information about SNMP MIBs in two ways.

- You can expand the tree structure on the left side of the SNMP MIB browser window and select a MIB.
- In the OID field, you can enter the OID of a MIB.

The MIB information appears in the right panel of the window.

For information about SNMP MIB browser procedures, see ["MIB queries" \(page 81\)](#).

The following figure is an example of the SNMP MIB browser page.

The following controls are available on the SNMP MIB browser page:

- get—retrieves the output for a selected MIB.
- Clear results area—clears the results of any present queries.
- Save last query results—Saves the results of the query as an XML file.
- OID—object text-based identifier for the MIB.
- get next—retrieves the output for the next MIB.
- target—view an SNMP MIB based on an IP address.
- Trace On/Off—toggles SNMP Query and Response tracing.
- SNMP version—Set the SNMP authentication.
- Options—adjusts the timeout value and retries.

The following figure shows the SNMP MIB Browser tool bar icons.

SNMP v3 MIB browser authentication

The SNMPv3 authentication permits the user to enter MD5 or SHA as protocols for authentication, and then select the privacy encryption keys of DES, 3DES, or AES128. The user also enters the authentication and privacy passwords. The MIB browser uses these credentials to browse the target machine. The authentication entered in the UCM device credentials is not used

The following is an example of the SNMPv3 authentication screen.

Availability Reports

You can view tabular reports on uptime and current availability of polled network elements using the Availability Reports Console.

You can poll using both SNMP get and ICMP ping. If a device does not have SNMP enabled, you can use ICMP ping to monitor the device for availability.

The following information about the selected domain, scope, and period is available:

- domain – a list of the domains for which you can view uptime and availability information.
- scope – the scope for which to show uptime and availability information.
- period – the time period during which you would like to view uptime and availability information.
- domain Element – the selected domain element.
- attempts – the number of attempts to connect to the selected domain element.
- failures – the number of failed attempts to connect to the selected domain element.
- up time – the total up time for the domain element.
- poll period – the poll period for the domain element.
- last poll status – the most recent poll status for the domain element.

When you select a domain element in the list, the variables for that domain element and associated values display in the right panel of the Monitoring Details Browser.

Traps and syslogs

VPFM supports the use of SNMPv1 traps and syslogs to monitor VPFM managed devices in your network. Traps and syslogs are unsolicited, automatic notifications sent by a network object after being triggered by a network event, based on the SNMP MIB-II standard. Traps and syslogs can be viewed in the Trap and Syslog Viewer. Traps can be generated internally by VPFM, or externally by network objects. If you have defined a MIT for a trap, it will become an event to be displayed in the event browser. If an event already exists for a given trap, the event count will be incremented by one every time a trap is received by VPFM.

Traps are turned into events to be displayed in the Event Browser to be used in debugging and troubleshooting. This is done through the Monitoring Details Browser.

Network objects must be individually configured to send traps and syslogs. This is done on the devices themselves. Devices must have SNMP enabled, they must have the IP address of the VPFM server, and the listening port of the VPFM configured (the default is 162 for traps, and 512 for syslogs). For information on configuring your network devices to send traps, consult the documentation for your device.

Certain events, such as IPAvailability Failure will disappear from the event browser if you restart the VPFM server or Monitoring. VPFM automatically evaluates and re-posts these as required.

Certain other events, such as a MLT/SMLT configuration warning, can appear the first time you run the discovery. These are warning messages alerting the operator about possible MLT/SMLT configuration problems. This can be, for example, that a port is configured as an SMLT port, but it is not connected to anything. Check if this is a real problem, and if it is not, delete it from the event browser.

Traps and syslogs can be viewed in the Traps and Syslog browser in VPFM.

For more information on configuring and viewing traps, syslogs, and events refer to *Nortel VPFM—Configuration (NN48014-500)*.

Top-N Reports

You can view the Top-N Reports browser page by clicking the link on the VPFM welcome page. The Top-N Reports page displays information about network elements from the selected Domain or Scope for the selected Type of Report.

Top-N Reports

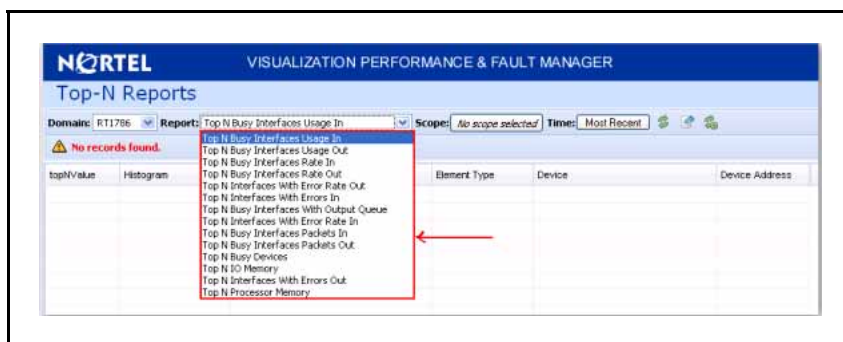

Domain: Newton LAN | Report: Top N Busy Devices | Scope: Multilayer Switches | Time: Most Recent

Data collected at Monday, March 09, 2009 1:08:05 PM

Cpu Busy	Histogram	Domain Element	Element Type	Device	Device Address
37.0%		sw4507-2	SNMPSwitchRouter	sw4507-2	172.16.67.1
33.0%		sw4507-1	SNMPSwitchRouter	sw4507-1	192.168.49.1
31.0%		sw4507-3	SNMPSwitchRouter	sw4507-3	192.168.48.3
30.0%		sw4507-4	SNMPSwitchRouter	sw4507-4	10.10.254.1
4.0%		dmz01	SNMPSwitchRouter	dmz01	137.134.5.2
3.0%		HQVR01.rocketsoftware.com	SNMPSwitchRouter	HQVR01.rocketsoftware.com	192.168.51.15
1.0%		HQVR02.rocketsoftware.com	SNMPSwitchRouter	HQVR02.rocketsoftware.com	192.168.51.16
1.0%		HQ-Support-SW01.rocketsoftware.com	SNMPSwitchRouter	HQ-Support-SW01.rocketsoftware.co	192.168.49.4

The following is a list of the available Top-N reports:

- Top N Busy Interfaces Usage In
- Top N Busy Interfaces Usage Out
- Top N Busy Interfaces Rate In
- Top N Busy Interfaces Rate Out
- Top N Interfaces With Error Rate Out
- Top N Interfaces With Error In
- Top N Busy Interfaces With Output Queue
- Top N Interfaces With Error Rate In
- Top N Busy Interfaces Packets In
- Top N Busy Interfaces Packets Out
- Top N Busy Devices
- Top N IO Memory
- Top N Interfaces With Errors Out
- Top N Processor Memory

For example, you can define a monitoring configuration to collect the Report Top-N Busy Devices for multilayer switches every 30 minutes. If this is the only monitoring configuration, then only one Top-N Report is

generated every 30 minutes and only for the scope multilayer switches. The reports created continue to collect, up to the limits defined by the data retention period specified in the monitoring configuration.

In order to collect data in the Top-N-Reports, you must have monitoring enabled.

Event History Browser

To access the Event History Browser page, log into VPFM welcome page and click the tools group displaying Event History Browser page. On the Event History Browser, you can view one or more tabs with each tab corresponding to a filter.

The Event History Browser keeps track of every event that occurs, based on the notifications received from the network. Since these events may have been cleared from the Event Browser, you can use the Event History Browser to view cleared events. The Event History Browser displays individual events; therefore, multiple events that are correlated into a single event on the Event Browser are displayed as individual events on the Event History Browser.

The following general controls are available in the Event Browser page:

- New Filter—Creates a new tab with a new filter.
- Create filter from selection—Creates a new tab with a new filter that is preset from current row values.
- Delete filter—Deletes the currently selected filter.
- Edit filter—Edits the currently selected filter.
- Refresh—Refreshes the data on the current or active filter.
- Purge configuration—To save disk space and remove event history records automatically, use the purge configuration settings. You can specify the maximum age in hours, days, or weeks. Alternately, you can specify the maximum number of records to keep. The most recent event history set by these configurations are retained, and the rest are purged.

Layout options

The Layout options enable you to choose between three schematic displays of the network topology. The following four layout options are available:

- Hierarchical—The hierarchical layout lays out the icons hierarchically.
- Symmetric—The symmetric layout lays out the icons with a tendency towards symmetry.

- Circular—The circular layout lays out the icons in a circle.
- User defined layout—You can move the icons by selecting one icon, or by drawing a dotted rectangle over a number of icons using the mouse (depress the left button, and left drag the mouse over the icons across the network schematic). After selecting the icons, hold the right mouse button down, move the icons, and then release the mouse button. After the icons are positioned, use the save control to save the layout under a new name. Click anywhere other than a selected icon to deselect.

Attention: You cannot move the icons if the freeze button is depressed.

For each type of schematic, the VPFM chooses a layout algorithm by default as follows:

Type of schematic	Layout algorithm
WAN view	Symmetric
Campus view	Hierarchical
Subnet view	Symmetric
Backbone Neighborhood	Hierarchical
Layer-2 Details	Hierarchical
Path Trace	Hierarchical
Application Dependency	Hierarchical

When a user modifies the layout algorithm for a particular schematic, the chosen algorithm becomes the default for that specific view. Other views within the same domain or other domains remain unaffected. View selections are shared by all users, so that a change by one user applies to all users.

Users share all predefined view selections. You can share user defined layouts only if you share the layout by checking Share with other users. After you change and share a layout, other users can view the layout.

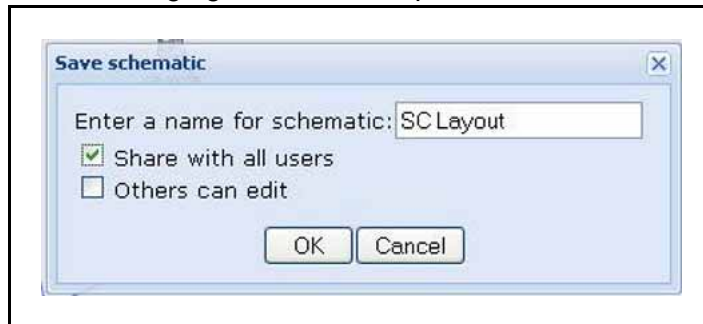

There are two types of layout plans:

- Global or VPFM defined
- User defined—layouts can be private or public

After you select a layout option, the selection you make overrides the settings that are described in the preceding table.

The predefined layout changes remain in effect until the VPFM restarts. If any two users choose different layouts for the same view at the same time, then the change made by the last user is saved.

The following figure is an example of the Save schematic screen.

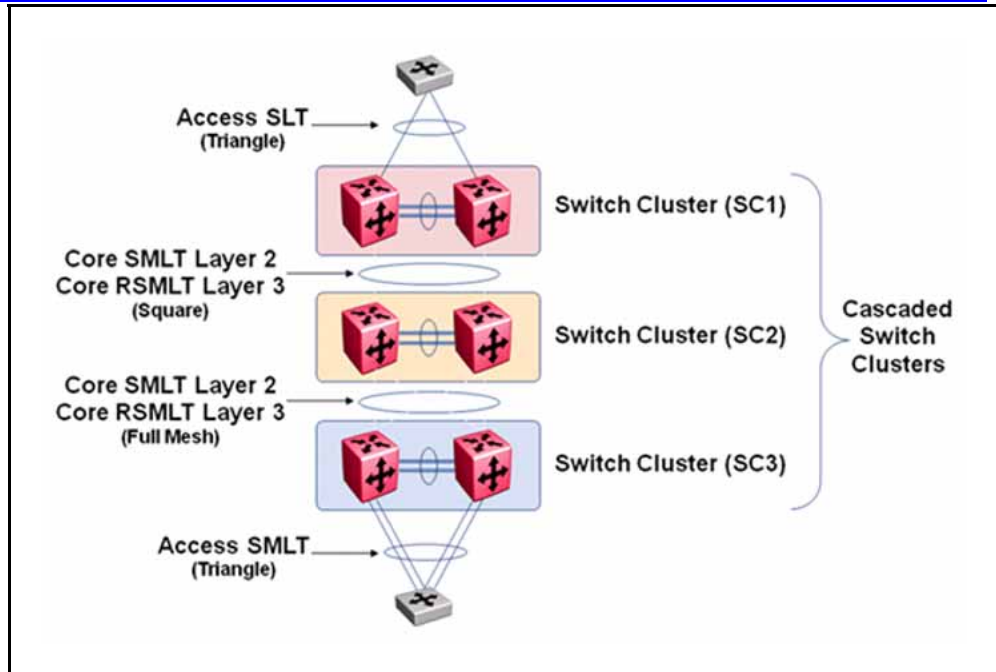

The first check box option permits you to share a user defined layout with other users. If you want to keep a layout private, do not check this box. If you change a layout with the same name as a previously saved layout, then saving it overwrites the private user defined layout.

Others can edit allows other users to modify the user defined layout. You can have two layouts with the same name, one public and one private.

MLT/SMLT schematic layout

The topology map is enhanced to keep the groups of devices participating in an MLT/SMLT together on the campus detail view so that the SMLT configuration (triangle, square, or mesh) is evident. The possible layouts are grouped at the core for 2, 4, or 6 switches showing the MLT/SMLT and IST links.

The following diagram illustrates the network topologies.

A number of edge switches connect to the core switches by simple or SMLT links. The layout does not make an attempt to keep the entire range of edge switches close, because the number of edge switches in a real network can be large and the topology map becomes congested if all edge switches are kept close. However, the user has the move icons feature to make customizations or adjustments to the automatic layout provided by VPFM.

Map background controls

Controls are provided on the white background to set a background image.

To set a background image, right-click the white background, and then choose Set Background from the menu. You can set background images with JPEG, GIFF, and PNG files. To save the background image, click on the **Save** button. The Save schematic window appears.

Nortel legacy device discovery and monitoring

The following list outlines the types of discovery support for Nortel legacy devices:

- Provides autodiscovery, classification, and mapping of Nortel legacy devices. For more information about the device list, see NNC4814-104 v. 03.01.
- Provides autodiscovery of legacy device interfaces and physical elements to the extent possible using preexisting discovery capabilities (for example, no support is added for new interface types or supplemental sources that can describe physical element information).

- Provides autodiscovery of networking protocol supported by legacy devices to the extent that legacy devices support IETF and Nortel-specific protocols that can be autodiscovered by MIB variable probes as is done for supported devices in VPFM 2.0 (for example, Link Layer Discovery Protocol (LLDP), and SONMP). These devices are classified as implementing said protocols by their automatic inclusion in the network browser and monitoring configurations.
- Proper model names for legacy devices appear in the Device Type perspective of the tree panel of the Network Browser.

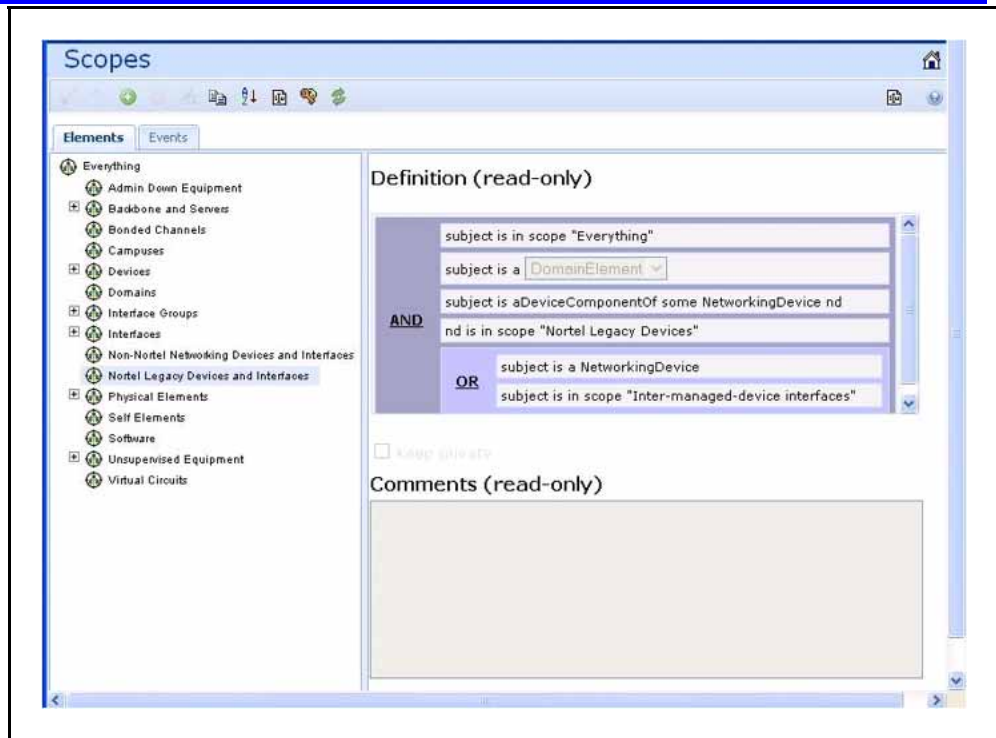

The following list outlines the types of monitoring support for Nortel legacy devices:

- Polled availability monitoring, and MIB2 performance monitoring of legacy devices and their interfaces.

Attention: Discovery of links connecting Nortel legacy devices is best effort for VPFM. Legacy device, enterprise specific MIB and Traps are not supported.

Monitoring support is accomplished in part by the addition of at least one new monitoring configuration and at least one new scope for legacy devices.

The following is an example of the Nortel legacy device scope.

Network Discovery

This section provides procedures for using the Network Discovery feature.

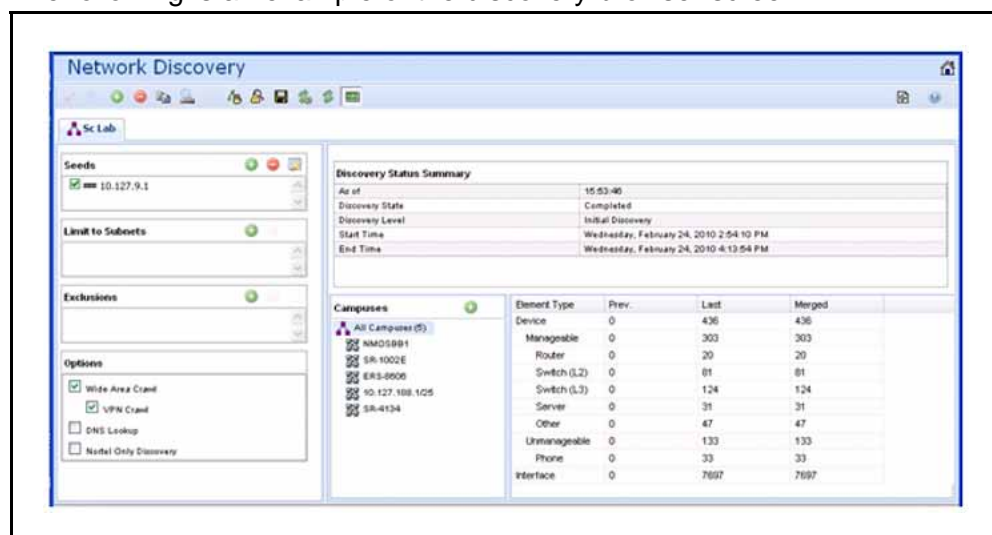

Navigation

- "Discovery Browser" (page 45)
- "Layer 3 subnet partitioning" (page 46)
- "Performing an initial discovery" (page 46)
- "Refreshing discovery status" (page 48)
- "Viewing discovery status summary" (page 48)
- "Performing a rediscovery" (page 50)

Discovery Browser

You can view the discovery logs from the Web client by clicking the discovery log icon in the discovery browser.

The following is an example of the discovery browser screen.

Layer 3 subnet partitioning

The Layer 3 subnet partitioning feature is a discovery phase that you can execute prior to performing a normal network discovery. When you use the Layer 3 partitioning feature, the VPFM executes a discovery phase that takes as its starting input one or more large subnet seeds. From these seeds, the VPFM analyzes the network and produces generated router IP address seeds that you can use in the place of input subnets for the main discovery.

Performing an initial discovery

You can perform a discovery for the chosen domain. A discovery is a snapshot taken of part or all of a network. A single domain will usually have many discoveries made of it over time.

WATCH THE VIDEO 

Click the link below to view a multimedia demonstration about performing a discovery. <http://www31.nortel.com/webcast.cgi?id=8909>

Attention: The default discovery policy only discovers Nortel devices. This default must be edited for full discovery.

Prerequisites

- Log on to VPFM
- Configure domain discovery options including Seeds, Limit to Subnets, Exclusions, and Options. For information about how to configure a discovery, please see the procedures and multimedia demonstrations contained in *VPFM Configuration* (NN48014-500).

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Network Discovery link. The Network Discovery page appears.
2	Select the domain you want to discover.
3	From the menu bar, click the Discover button. A confirmation dialog box appears to confirm the discovery.

- 4 Select the appropriate merge policy that applies to your needs. The following options are available:
 - **Rediscover from scratch** – Does not retain information about equipment found in past discoveries and instead finds all equipment from scratch.
 - **Retain missing equipment if possible** - Retains information about equipment found in a past discovery that is not found upon rediscovery.
- 5 Click **OK** to start the discovery.

--End--

If discovery results seem incomplete or incorrect, check the following:

- Check to see if the credentials are added for the devices which are not discovered. For more information, see the section about entering device credentials in UCM Fundamentals (NN48014-100), or click on the link below to see the video about how to enter credentials.

WATCH THE VIDEO 

Click the link below to view a multimedia demonstration about entering credentials. <http://www31.nortel.com/webcast.cgi?id=8006>

Attention: You must add the credentials for the router seed for the discovery, and the credentials for all the devices in the network. For more information, click on the above link to see the video about how to add credentials.

- Check to see if the SNMP (V1 or v3) is enabled on the undiscovered device or devices.
- On some devices (for example Nortel VPN Routers), the IP address of the VPFM server must be configured in order for them to respond back to SNMP queries sent by VPFM.
- Ensure that a proper seed is used. An improper seed can occur if the device used as seed is not reachable from the VPFM server. If there are some devices separated by firewall, then you should provide a minimum of two seeds, as seeds for the routers from both sides of the firewall.
- Ensure correct discovery options are used. Make sure that WAN Crawl, VPN Crawl, DNS Lookup and Nortel Discovery are set correctly.

- Ensure that the License Node Count cap is not reached. If is reached, discovery stops before it completes and a corresponding error message is displayed.
- If a switch or AP is not discovered correctly and it is hanging off of an undiscovered core switch, troubleshoot undiscovered core switch before the edge.
- Check the discovery logs by clicking the button on the discovery browser tool bar. Take corrective action indicated by the logs. For example, if you see a SNMP time out, check the device using the MIB browser.

Refreshing discovery status

You can configure the discovery status of a domain to refresh or auto-refresh.

Prerequisites

- Log on to VPFM
- Add a domain.
- Configure domain discovery options including Seeds, Limit to Subnets, Exclusions, and Options.
- Perform an initial discovery.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Network Discovery link. The Network Discovery page displays.
2	On the Network Discovery page, click the Refresh button. The discovery status is refreshed.

--End--

Viewing discovery status summary

You can view the statistics about the discoveries you performed in the Discovery Status Summary box.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	Click the Network Discovery link. The Domains page displays.
2	On the Domains page, click the domain tab corresponding to the domain for which you want to select an option.
3	View the discovery statistics for the selected domain in the Discovery Status pane.
--End--	

Variable definitions

Variable	Value
As of	Read-only. The time (of client machine) at which the discovery status was refreshed.
Discovery State	Read-only. The latest status of the discovery process. Valid values are In Progress (the discovery process is still in progress), New Domain (the domain is not discovered) and Completed (the discovery process has finished).
Discovery Level	Read-only. The type of discovery that was performed. Valid values are Initial Discovery (the discovery was the first discovery of the network), Undiscovered (the discovery wasn't performed), and Full Rediscovery (the discovery was a rediscovery).
Start Time	Read-only. The server time at which the most recent discovery process initiated. This timestamp includes the time zone (GMT offset) of where the server is located.
End Time	Read-only. The server time at which the most recent discovery process completed. This timestamp includes the time zone (GMT offset) of where the server is located.

Variable	Value
Campus List	Read-only. A list of the campuses within your network that were included in the discovery. Individual campuses can be selected to display statistics for only that campus or All Campuses can be selected to display combined statistics (sum of all individual campuses) for all campuses within your network. For example, the values displayed in the Prev., Last, and Merged columns reflect values for either a single campus (if you select one campus) or the sum of all campuses if you select All Campuses. A campus is a location at which devices reside, such as an office, a building, or a set of buildings within a reasonably short distance of each other
Element Type	Read-only. The type of element that was discovered. Element types include: Access Router, Device, DSLAM, DSUCSU, Firewall, Interface, Manageable, Other, Phone, PLC, Printer/Server, Printer, Router, SAN Bridge, SAN Switch, Server, Switch (L2), Switch (L3), Switch/Router, Terminal Server, Unmanageable, VM Image, VPN Server, WAP
Prev (Preview)	Read-only. The number of each type of element that was discovered in the prior discovery.
Last	Read-only. The number of each type of element that was discovered in the most recent discovery.
Merged	Read-only. The sum of each type of element discovered in all discoveries taking into account the rediscovery policies used. The number of each type of element (the counts in each row) after the merge will differ based on the rediscovery policy used.

Performing a rediscovery

You can perform a discovery for the chosen domain. A discovery is a snapshot taken of part or all of a network. A single domain will usually have many discoveries made of it over time. Perform a rediscovery when you wish to have an updated snapshot. The options for a rediscovery are the same as for discovery.

Attention: The default discovery policy only discovers Nortel devices. This default must be edited for full discovery.

Prerequisites

- Log on to VPFM.
- Add a domain.
- Configure domain discovery options including Seeds, Limit to Subnets, Exclusions, and Options.
- Perform an initial discovery.

Procedure Steps

Step	Action
1	Click the Network Discovery link. The Network Browser page displays.
2	On the Network Browser page, click the Rediscover selected campus button. A confirmation dialog box appears.
3	Select the appropriate merge policy that applies to your needs. The following options are available: <ul style="list-style-type: none">• Rediscover from scratch—Does not retain information about equipment found in past discoveries and instead finds all equipment from scratch.• Retain missing equipment if possible—Retains information about equipment found in a past discovery that is not found upon rediscovery. This information is retained over three rediscoveries. If the equipment is missing three times it is automatically removed.
4	Click OK to start the rediscovery.

--End--

Viewing discovery results

This section provides procedures for viewing the results of a network discovery.

Navigation

- ["Viewing discovery results in the Tree Browser" \(page 53\)](#)
- ["Viewing discovery results in the Topology Viewer" \(page 54\)](#)

Viewing discovery results in the Tree Browser

Use the following procedure to view the results of a network discovery in the Tree Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser. The Network Browser page displays.
2	View the network elements in the Tree Browser, located on the left side of the page.
3	To view specific device types only, select a filter from the Perspectives drop-down menu.
4	Click the + and - icons to expand and contract the tree folders.

- 5 Left-click on a node to display it on the central panel, in its network context. Scopes are displayed in tabular form.
- 6 Click the Refresh icon to update the information displayed in the Details panel.
- 7 Right-click on a device. On the Application menu, select the type of information you want to view .

--End--

Variable definitions

Perspective	Description
Layer 2 Hierarchy	Lists domain elements according to their OSI layer 2 functions.
VLAN Hierarchy	Lists the logical nodes that constitute a virtual LAN in each campus.
Layer 3 Hierarchy	Lists domain elements according to their OSI layer 3 organization, that is, by their IP addresses.
Device Types	List items as being campuses, devices (managed or unmanaged), or interfaces (including AAL5, ATM, Ethernet, PPP, and a number of others).
Applications	Lists the supported applications that are visible to the VPFM Server. Applications are listed under the following categories: Operating System, VoIP, and Voice.
Scopes	List all scopes defined for the domain enabling you to list domain elements according to a scope to which they belong

Viewing discovery results in the Topology Viewer

The Topology Viewer allows you to view the Discovery Results. After completing a discovery, it shows discovered campus/campuses and WAN Links between them. You can double click on any campus icon to view its details. Double clicking on a device within the campus details will show the L2 view for that device. Double Clicking on an interface or an element which does not have further detailed views will display the properties associated with that element in a pop-up window.

The following navigation controls are available from the Topology Viewer:

- Up arrow - Moves the view up a level. For example, from campus view, the up button moves the view to WAN/Campuses.
- Back - Moves to the previous view.

- Forward - Moves to the next view.
- Freeze - Movement of icons are frozen.
- Save - Saves unsaved icon moves.
- Delete - Deletes a user defined layout.

Use the following procedure to view the results of a network discovery in graphical format using the Topology Viewer.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser. The Network Browser page displays.
2	View the network elements in the Topology Viewer, located in the middle of the page. Use the arrows to move view of the topology to the left or right.
3	To view specific device types only, select a filter from the Perspectives drop-down menu.
4	Select a device for which you want to view detailed information.
5	Right-click on the selected device and select an option from the Application menu.
--End--	

Variable definitions

Menu option	Description
Backbone Neighborhood	Provides access to the backbone neighborhood schematic view for a selected domain element. This view, intended for improved viewing of domain elements in very large domains, expands the view to show domain elements that are connected by one hop to the selected domain element.
Diagnose	Enables you to perform diagnostic actions for the device (actions include Run Query, Browse MIB, ICMP Ping, Trace Route, SNMP Get, Walk MIB).
Go to Campus	Shifts view to the campus for the selected device. A campus is a location at which devices reside, such as an office, a building, or a set of buildings within a reasonably short distance of each other

Menu option	Description
Go to Circuit	Enables you to view the circuit associated with the selected device. A device is added to a circuit if Discovery finds entry for it, but no MAC address is found in the switch's Forwarding table.
Interface Groups	Displays a table with information about the interface groups associated with the selected device.
Interfaces	Displays a table with information about the interfaces associated with the selected device.
Layer 2 Details	Displays the domain element details according to their OSI layer 2 functions.
Mark for Removal	Mark the device for removal from the next discovery.
MLT Schematic	Displays the MLT schematic for the selected device.
Physical Elements	Displays physical elements associated with the selected device.
Properties	Displays the Properties window for the selected device which shows the device's properties and associated values.
Show All	Displays all the properties and their associated values for the selected device in the Property Table.
Supervision Settings	Enables you to define the supervision settings for the selected device. Valid values include Inherit, Supervise, and Unsupervise.
Show Paths	Enables you to view the shortest network path between any two points in the network. Show Paths is not a live path trace. Although interfaces may be end-points, intermediate interfaces are not shown along paths. Only intermediate devices are shown.
Trends	Trends are performance graphs for devices or interfaces. The trends menu lists a collection of MITs that are configured and can be trended. For example, device CPU usage is a configured MIT that you can trend.
Color-Coding of Domain Elements	Domain elements displayed in the schematic diagram are colored based on the messages that relate to them.

Viewing discovery results in the Properties Table

Use the following procedure to view discovery results using the Properties Table.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Network Browser link. The Network Browser page displays.
2	Select a network element.
3	Click the Show Properties button (top of the screen, third button from the right). The Properties Table displays details for the selected network element.
--End--	

Selecting a Layout

Perform the following procedure to select the layout algorithm in the combo box added to the Network Browser tool bar.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser . The Network Browser page appears.
2	View the network elements in the Topology Viewer, located in the middle of the page.
3	Select any one of the layout algorithm from the combo box to draw the schematic. There are three predefined layout options: Hierarchical, Symmetric, and Circular. You, or other users, can create multiple user defined layouts.
--End--	

Variable definitions

Variable	Value
Hierarchical	Enables the user to view the schematic or perspective hierarchically when selected.

Variable	Value
Symmetric	Enables the user to view the schematic or perspective symmetrically when selected.
Circular	Enables the user to view the schematic or perspective circularly when selected.
User defined	Enables the user to create and save user defined layouts by moving icons. User defined layouts can be shared with other users. Private user defined layouts are viewed only by the user who created them.

Moving an icon

Perform the following procedure to move an icon.

Procedure Steps

Step	Action
1	Go to the Network browser.
2	Select any layout from Hierarchical, Symmetrical, Circular, or User defined layouts that you can edit.
3	Click the Freeze button to unfreeze movement.
4	Select the icon you want to move.
5	Point over the icon, and then click and hold down the right mouse button.
6	Move the icon. The animation of the icon and attached links move.
7	Release the icon on the spot where you want the icon to be moved to.
8	To save the layout, click Save .
9	Check Share with other users or Edit able by other users, and then save the layout with a layout name. The new layout is saved and appears in the layout menu option.
--End--	

Downloading Adobe plugin for Windows and Linux

In the Network Browser, click the icon shown below to download the flash plug in. If you do not have an Internet connection on the machine, use a different mechanism to obtain the plug in, or connect from another machine.

The following figure is the icon you click to download plugin.

Downloading Adobe plugin for Windows or Linux on a machine that has Internet access

If your computer has internet access, perform the following procedure to download Adobe™ plugin for Windows or Linux.

Procedure Steps

Step	Action
1	Download the Adobe Flash Player from the following location: http://get.adobe.com/flashplayer/?promoid=DXJUU
2	Uncheck the Free McAfee© Security Scan Plus box.
3	Click Agree and install now.
--End--	

Downloading Adobe plugin for Windows or Linux on a machine that does not have Internet access

If your machine does not have internet access, perform the following procedure to download Adobe™ plugin for Windows or Linux.

Prerequisites

- file copy mechanism

Procedure Steps

Step	Action
1	Go to a computer that has Internet access, and go to the following location: http://get.adobe.com/flashplayer/?promoid=DXJUU
2	Click Different operating system or browser? .
3	From the next menu page, select the operating system, and then click Continue.
4	Select Save to disk. The file is saved to the desktop.

- 5 Copy the downloaded file to the VPFM machine using a file copy mechanism.
- 6 Follow the Adobe Flash Player installation instructions provided at the following location:
<http://www.adobe.com/products/flashplayer/productinfo/instructions>

--End--

Viewing with IE7

If Adobe™ Flash does not work with your browser, perform the following procedure to obtain Adobe Flash and device trends, and to allow IE7 to display the data.

Procedure Steps

Step	Action
1	In the tool bar, select Tools, Internet options, Security, and then Internet zone custom level.
2	Under ActiveX controls and plugins, set all 10 settings to enabled or prompt.
3	Set Scripting/active scripting to enabled.

--End--

Viewing Events

When traps are received by VPFM from network devices, they may be turned into events. The Events Browser allows you to monitor, acknowledge, and filter network events. Use the following procedures to customize the information displayed in the Events Browser.

Navigation

- ["Adding a message board" \(page 61\)](#)
- ["Sorting messages" \(page 62\)](#)
- ["Filtering messages" \(page 62\)](#)
- ["Exporting a message board" \(page 65\)](#)

Adding a message board

By default the Event Browser contains a single message board. You can create multiple message boards.

Add multiple message boards, by performing this procedure.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event Browser link. The Event Browser page appears.
2	Click the Add a New Message Board icon.
3	Type a name for the new message board in the Enter a name for the new board box.

- 4 Click **OK**. The new message board appears as a new tab in the Event Browser.

--End--

Sorting messages

Sort messages on the message board by performing this procedure.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event Browser link. The Event Browser page appears.
2	On the message board, click the arrow on of the column headings. A menu appears.
3	A list appears showing the Sort Ascending, Sort Descending, and Columns options.
4	Select Ascending or Descending to sort the messages in ascending or descending order.

--End--

Filtering messages

By default, a message board does not use filters, and displays all messages (regardless of attributes such as priority, scope, or context) for all domains that are loaded on the server.

Filter allows you to customize the display of the messages for a message board. You can filter individual message boards to show the messages that corresponds to a specific scope, set of event types, priority, network, or other criteria.

Attention: Filtering messages does not delete the messages that are not displayed. Filtering only omits messages not matching filter criteria from the set of messages appearing in the current message board.

Nortel provides a variety of methods for controlling message board content that allow you to configure powerful filters that allow only events meeting specific criteria. These include:

- Filtering by message priority
- Filtering by acknowledgement status
- Filtering by scope or event type

Filtering messages by priority

Use the following procedure to filter messages by priority.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event Browser link. The Event Browser page appears.
2	Click the Filters icon located at the top of the message board. The Msgs Board Filters window appears.
3	Select or clear the Priority check box to display or filter the messages.
4	Click OK .
--End--	

Variable definitions

Variable	Definition
Red	Displays the critical priority messages.
Dark Orange	Displays the high priority messages.
Orange	Displays the medium priority messages.
Yellow	Displays the low priority messages.
Turquoise	Displays the warning messages.
Green	Displays the information messages.

Filtering messages by scope or event type

Use the following procedure to filter messages by scope or event type.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event Browser link. The Event Browser page appears.
2	Click the Filters button located at the top of the Event Browser window. The Filters window appears.
3	Click the Scopes box and expand the scopes tree to locate the scopes you want to include in display.
4	Select the nodes you want to include in message display.
5	Expand the Event Types tree to locate the event types you want to include in display. Toggle the selection to include the event type or exclude the event type from display.
6	Click OK .

--End--

The Event Selection Tree is a tree that consists of items that can be expanded or closed. Each item also has a box next to it which can display one of three control states and can display one of many informational states. To cycle through the three control states, left-click three times on box or label. The control states are explicit inclusion, explicit exclusion, or inherit from parent. The control state is visually indicated by the border of the box: thick green for explicit inclusion; thick red for explicit exclusion; thin of varying color for inherit from parent.

Filtering messages by acknowledged status

Use the following procedure to filter messages by acknowledged status.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event Browser link. The Event Browser page appears.
2	Click the Filters icon located at the top of the Message Board. The Msgs Board Filters window appears.

- 3 Select the **Hide Acknowledged** box to hide acknowledged events.

--End--

Exporting a message board

You can export a message board and save the contents.

Prerequisites

- Log on to VPFM

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event Browser link. The Event Browser page appears.
2	Select the tab corresponding to the message board you want to export.
3	Click the Export button. An xml file opens in your browser with the contents of your exported message board.
4	Save this file to an appropriate location on your hard drive.

--End--

Viewing Event History Browser

This section provides procedures for using the Event History Browser.

Navigation

- ["Viewing Event History Browser" \(page 67\)](#)
- ["Adding a Filter in the Event History Browser" \(page 68\)](#)
- ["Creating a filter from selection in the Event History Browser" \(page 69\)](#)
- ["Cloning a Filter in the Event History Browser" \(page 69\)](#)
- ["Renaming a filter in the Event History Browser" \(page 70\)](#)
- ["Deleting a Filter in the Event History Browser" \(page 70\)](#)
- ["Editing a Filter in the Event History Browser" \(page 70\)](#)
- ["Configuring purge settings" \(page 71\)](#)
- ["Refreshing the Event History Browser" \(page 71\)](#)

Viewing Event History Browser

Perform the following procedure to view the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	View the toolbar on the Event Browser page, located on the top of the page. The page has eight buttons; New filter, Create Filter from selection, Clone Filter, Rename Filter, Delete Filter, Edit Filter, Configure, and Refresh.
3	Click the Refresh icon to refresh the data on the active tab.

- 4 The table displays the rows matching the filter. The columns correspond to the user-friendly columns in the events table.

--End--

Adding a Filter in the Event History Browser

Perform the following procedure to add a new filter in the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Click the New Filter icon. The Filter Editor dialog box appears.
3	Type a name for the filter that appears as the label for the tab.
4	Select the Last option to filter by age of the record. The interval integer and the units specified can be seconds, hours, days, or weeks.
5	Select the Between option to filter the records between two specific timestamps.
6	Select the Event Name to filter by event type.
7	Select the Subject Name (event subject) to filter by event type.
8	Click Ok . The new Filter appears as a new tab in the Event History Browser.

--End--

Variable definitions

Variable	Value
Filter	Specifies the name of the filter that appears as the label for the tab.
Last	Specifies an interval integer and the units: Seconds, Minutes, Hours, Days, or Weeks.
Between	Enables the user to filter records between two specific timestamps.

Variable	Value
Event Name	Enables the user to filter records by the event type.
Subject Name	Enables the user to filter records by the subject name.

Creating a filter from selection in the Event History Browser

Perform the following procedure to create a filter from selection in the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Click on the row which you want to be the selection for the new tab and then click on the Create Filter from selection icon
3	Click Ok .
--End--	

Cloning a Filter in the Event History Browser

Perform the following procedure to clone a filter in the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Select the filter you want to clone.
3	From the Event History Browser menu bar, click on the Clone Filter icon. Prompt dialog box appears.
4	Enter a new name for the cloned Filter.
5	Click Ok .
--End--	

Renaming a filter in the Event History Browser

Perform the following procedure to rename a filter in the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Select the filter you want to rename.
3	From the Event History Browser menu bar, click on the Rename Filter icon. Prompt dialog box appears.
4	Enter the new name.
5	Click Ok .

--End--

Deleting a Filter in the Event History Browser

Perform the following procedure to delete a filter in the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Select the filter you want to delete.
3	From the Event History Browser menu bar, click on the Delete Filter icon. A dialog box appears to confirm deletion.
4	Click Ok to confirm the deletion.

--End--

Editing a Filter in the Event History Browser

Perform the following procedure to modify the settings of the filter in the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Select the filter you want to edit.
3	Click the Edit Filter icon from the Event History browser menu bar. The Filter Editor dialog box appears.
4	Edit the settings as required.
5	Click Ok to save the changes.
--End--	

Configuring purge settings

Perform the following procedure to configure purge settings for the event history. VPFM automatically purges the event history according to these settings. For example, the event history can be purged at regular time intervals, by the number of records, or by the age of records.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Click the Purge Configuration icon.
3	Set the values for maximum records and maximum age for the purge to execute. Purging is executed at a fix period by either or both maximum number of records and maximum age of records.
4	VPFM executes purge periodically. Purge records are not retrievable by VPFM.
--End--	

Refreshing the Event History Browser

Perform the following procedure to refresh the Event History Browser.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click the Event History Browser link. The Event History Browser page appears.
2	Click Refresh icon on the Event History Browser page. The Event History Browser page is refreshed. Also when the user changes from one tab to another, the filter is refreshed automatically.

--End--

Viewing Reports

Perform the following procedures to view the reports.

Navigation

- ["Viewing a report" \(page 73\)](#)
- ["Exporting a report" \(page 74\)](#)
- ["Setting Auto refresh" \(page 74\)](#)

Viewing a report

Perform the following procedure to view the Top-N report.

Prerequisites

- Monitoring must be enabled.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Top-N Reports . The Top-N Reports page appears.
2	View the toolbar on the Top-N Reports page, located on the top of the page. The page has four selectors; Domain, Report, Scope, and Time.
3	Select the Domain in which the monitoring is occurring.
4	Select the type of the Top-N Report to display.
5	Select the Scope over which the report is collected.
6	Select Time for the age of the report. The exact time specified to the second corresponds to the exact time a report was collected.
7	The table displays the most recent iteration of a report or historical iterations of reports up to specified limits collected periodically.

- 8 Click the **Refresh** icon to update the information displayed.

--End--

Exporting a report

Perform the following procedure to export a report.

Prerequisites

- Monitoring must be enabled.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Top-N Reports . The Top-N Reports page appears.
2	View the toolbar on the Top-N Reports page, located on the top of the page. The page has four selectors; Domain, Report, Scope, and Time.
3	Select the Domain, Report, scope, and Time to view a report.
4	View the most recent iteration of a report or historical iterations of reports up to specified limits.
5	Click the Export button to export the data from the report currently on display to XML form.

--End--

Setting Auto refresh

Perform the following procedure to set Auto refresh.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Top-N Reports . The Top-N Reports page appears.
2	Click the Auto refresh icon from the tool-bar. The Select Auto refresh Interval dialog box appears.
3	Set the auto refresh interval time from the drop-down menu available.
4	Click Ok .

5 The Auto refresh is On and the time interval is set.

--End--

Diagnostic tools

You can use the Network Browser in VPFM to access diagnostic tools, such as ping and route trace.

Navigation

- ["Pinging a device" \(page 77\)](#)
- ["Tracing a route" \(page 77\)](#)
- ["Managing hardware inventory" \(page 78\)](#)
- ["Performance trending" \(page 78\)](#)
- ["Viewing network paths" \(page 79\)](#)

Pinging a device

Use this procedure to test connectivity to a device.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser. The Network Browser page displays.
2	In the Topology Viewer in the middle of the panel, select a device. If your network diagram is large, you may wish to filter the devices shown by selecting a perspective from the Perspective drop-down menu.
3	Right-click on the device. On the Application menu, select Diagnose.
4	Select ICMP Ping.
--End--	

Tracing a route

Use the following procedure to perform a route trace.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser. The Network Browser page displays.
2	In the Topology Viewer in the middle of the panel, select a device. If your network diagram is large, you may wish to filter the devices shown by selecting a perspective from the Perspective drop-down menu.
3	Right-click on the device. On the Application menu, select Diagnose.
4	Select Trace Route.

--End--

Managing hardware inventory

Use the following procedure to manage the hardware assets in your network.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser. The Network Browser page displays.
2	In the Topology Viewer in the middle of the panel, select a device. If your network diagram is large, you may wish to filter the devices shown by selecting a perspective from the Perspective drop-down menu.
3	Right-click on a device. On the Application menu, select Physical Elements to view information about the physical elements, such as fans and chassis, associated with the selected device.

--End--

Performance trending

VPFM allows you to view performance trends of network objects. Available trends are context sensitive, depending on the selected device. Use the following procedure to view a performance trending chart.

Trend charts have the following controls available:

- Interval - The interval (number and unit) displayed on the x-axis of the chart.

- Past/Current Time - If this option is selected, the user can then select from a dropdown of either past or current time.
- Export - Exports the trend data
- Refresh - Refreshes the current trend chart.

Prerequisites

- you must configure a monitoring agent and enable monitoring. For more information, see *Nortel Visualization Performance and Fault Manager—Configuration* (NN48014-500).
- trending information is only available after MITs have been created.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser. The Network Browser page displays.
2	In the Topology Viewer in the middle of the panel, select a device. If your network diagram is large, you may wish to filter the devices shown by selecting a perspective from the Perspective drop-down menu.
3	Right-click on the device. On the Application menu, select Trends.
4	Select the Trend Chart that you want to view.
--End--	

Viewing network paths

Perform this procedure to view the network paths between any two points in the network.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, click Network Browser . The Network Browser page appears.
2	Locate the device or interface you want to find the path between two points.
3	Right-click the device or interface icon.
4	On the Application menu, select Show Paths . The Select path endpoint dialog appears.

- 5 From the **Select path endpoint** dialog box, find and select the other end-point (device or interface).
A schematic showing all the paths between the two end-points is displayed.

--End--

MIB queries

This section provides information about using the MIB query tool in VPFM.

Navigation

- ["Modifying SNMP version authentication" \(page 81\)](#)
- ["Viewing SNMP MIB data" \(page 82\)](#)

Modifying SNMP version authentication

You can customize SNMP authentication for MIBs.

Prerequisites

- Log on to VPFM.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, select SNMP MIB browser .
2	From the list of MIBs in left pane, select the MIB for which you want to view the information.
3	Click the SNMP version button . The Authentication window opens.
4	Modify the appropriate fields based on the SNMP version.

--End--

Variable definitions

Variable	Value
SNMP Version	The SNMP version for the authentication.

Variable	Value
Community	The SNMP community for the authentication: SNMPv1, SNMPv2c, or SNMPv3. If SNMPv1 or SNMPv2c, then only the community string needs to be specified. If SNMPv3, then authorization and privacy can be used for additional security.
Auth Protocol	The encryption algorithm to be used: none, MD5, or SHA. (SNMPv3 only)
Privacy Protocol	The encryption algorithm to be used: none, DES 3DES, or AES128. (SNMPv3 only)
Username	The user name for the authentication. (SNMPv3 only)
Auth Password	An encrypted password for gaining access to the device. (SNMPv3 only)
Privacy Password	A password used to decrypt data sent to and returned from the device. (SNMPv3 only)
Trace On/Off	Prints the Query & Response to the SNMP query in HEX & ASCII formats. This can be used for troubleshooting, debugging, and MIB implementation.
Clear Results	Clears the MIB query results
Save Last Query	Saves the last SNMP MIB query

Viewing SNMP MIB data

You can do an SNMP MIB query on the MIBs in your system using the SNMP MIB browser.

Prerequisites

- Log on to VPFM.

Procedure Steps

Step	Action
1	From the VPFM Welcome page, select SNMP MIB browser .
2	In the Target field, type the IP address for the MIB you want view.
3	From the list of MIBs in left pane, select the MIB for which you want to view the information.
	OR
	In the OID field, type the object identifier for the MIB you want to view.

- 4 Select SNMP version v1, v2c, or v3. If you choose v3, enter the authentication variables as shown in the preceding variable definitions table.
- 5 Click the **Get** button to retrieve the output for the MIB.
The information appears in the right panel.
- 6 If you want to see the next MIB in the list, click the **Get next** button.
- 7 If you want to save the MIB information, click the **Save last query results** button.

--End--
