| igmp snooping                                                                                                                                   | Configures <i>Internet Group Management Protocol</i> (IGMP) snooping parameters. IGMP snooping is enabled by default. <p>IGMP establishes and maintains multicast group memberships for interested members. Multicasting allows a networked device to listen to IGMP network traffic and forward IGMP multicast packets to radios on which the interested hosts are connected. The device also maintains a map of the links that require multicast streams, there by reducing unnecessary flooding of the network with multicast traffic.</p> |

| querier                                                                                                                                                                                         | <p>Optional. Configures the IGMP querier parameters. This option is disabled by default.</p> <p>Enables IGMP querier. IGMP snoop querier keeps host memberships alive. It is primarily used in a network where there is a multicast streaming server and hosts subscribed to the server and no IGMP querier present. The access point, wireless controller, or service platform performs the IGMP querier role. An IGMP querier sends out periodic IGMP query packets. Interested hosts reply with an IGMP report packet. IGMP snooping is only conducted on wireless radios. IGMP multicast packets are flooded on wired ports. IGMP multicast packet are not flooded on the wired port. IGMP membership is also learnt on it and only if present, then it is forwarded on that port.</p> |
| address <IP>                                                                                                                                                                                    | <p>Optional. Configures the IGMP querier source IP address. ### 7.1.10.2.9 ipv6

► *bridge-vlan-mode commands*

Configures this VLAN bridge's IPv6 components

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```

ipv6 [dhcpv6|firewall|mld|nd]

ipv6 dhcpv6 trust

ipv6 firewall

ipv6 mld snooping {forward-unknown-multicast|mrouter|querier}

ipv6 mld snooping {forward-unknown-multicast}

ipv6 mld snooping {mrouter [interface|learn]}
ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}

ipv6 mld snooping {querier} {max-response-time|timer|version}
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry <60-300>|
version <1-2>}

ipv6 nd rguard

```

**Parameters**

- ipv6 dhcpv6 trust

|              |                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6         | Configures the VLAN bridge IPv6 parameters                                                                                                                                                                                                     |
| dhcpv6 trust | Enables the DHCPv6 trust option. When enabled all DHCPv6 responses are trusted on this bridge VLAN. This option is enabled by default. <ul style="list-style-type: none"> <li>• trust - Trusts DHCPv6 responses on this bridge VLAN</li> </ul> |

| firewall | Enables IPv6 firewall on this bridge VLAN. This option is enabled by default. Devices utilizing IPv6 addressing require firewall protection unique to IPv6 traffic. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the <i>neighbor discovery</i> (ND) protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters. Routers respond to such a request with a <i>router advertisement</i> (RA) packet that contains Internet layer configuration parameters. |

- ipv6 mld snooping {forward-unknown-multicast}

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mld snooping                                                                                                                                                                     | <p>Configures <i>Multicast Listener Discovery Protocol (MLD)</i> snooping parameters</p> <p>MLD snooping enables a access point, wireless controller, or service platform to examine MLD packets and make forwarding decisions based on the content. MLD is used by IPv6 devices to discover devices wanting to receive multicast packets destined for specific multicast addresses. MLD uses multicast listener queries and multicast listener reports to identify which multicast addresses have listeners and join multicast groups.</p> <p>MLD snooping caps the flooding of IPv6 multicast traffic on controller, service platform or access point VLANs. When enabled, MLD messages between hosts and multicast routers are examined to identify the hosts receiving multicast group traffic. The access point, wireless controller, or service platform forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces.</p> <p>This option is enabled by default.</p> |
| forward-unknown-multicast                                                                                                                                                        | <p>Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <code>no</code> | Disables or reverts the VLAN Ethernet bridge IPV6 parameters |
|-----------------|--------------------------------------------------------------|

### 7.1.10.2.10 l2-tunnel-broadcast-optimization

▶ *bridge-vlan-mode commands*

Enables broadcast optimization on this bridge VLAN. L2 Tunnel Broadcast Optimization prevents flooding of ARP packets over the virtual interface. Based on the learned information, ARP packets are filtered at the wireless controller level.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
l2-tunnel-broadcast-optimization
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#l2-tunnel-broadcast-optimization

rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#show context
bridge vlan 1
description "This is a description for the bridged VLAN"
l2-tunnel-broadcast-optimization
bridging-mode isolated-tunnel
ip arp trust
ip dhcp trust
ip igmp snooping
ip igmp snooping querier
ip igmp snooping mrouter interface ge2 ge1
ip igmp snooping querier version 2
ip igmp snooping querier max-response-time 24
ip igmp snooping querier timer expiry 100
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#
```

**Related Commands**

|           |                                           |
|-----------|-------------------------------------------|
| <i>no</i> | Disables L2 tunnel broadcast optimization |
|-----------|-------------------------------------------|

### 7.1.10.2.11 mac-auth

► *bridge-vlan-mode commands*

Enables source MAC authentication for Extended VLAN and tunneled traffic (MiNT and L2TPv3) on this bridge VLAN

**NOTE:** If enabling MAC authentication, ensure that an AAA policy is configured and for enforcing MAC Authentication.

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
mac-auth {attempts <1-5>|throttle <0-255>}
```

**Parameters**

- `mac-auth {attempts <1-5>|throttle <0-255>}`

|                  |                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-auth         | Enables MAC Authentication                                                                                                                                                                                                                     |
| attempts <1-5>   | Optional. Configures the maximum number of retries allowed for MAC authentication requests. <ul style="list-style-type: none"> <li>• &lt;1-5&gt; - Specify the maximum allowed authentication retries from 1 - 5. The default is 3.</li> </ul> |
| throttle <0-255> | Optional. Configures the throttle value for MAC authentication requests <ul style="list-style-type: none"> <li>• &lt;0-255&gt; - Specify the MAC authentication request throttle value from 0 -255. The default is 64.</li> </ul>              |

**Usage Guidelines Applying AAA Policy for MAC Authentication**

To enable MAC authentication,

- Create an AAA policy.  
`nx9500-6C8809(config)#aaa-policy MAC-Auth`
- Use the AAA policy on the device for MAC Authentication.  
`nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#mac-auth use aaa-policy MAC-Auth`
- In the bridge VLAN context, enable MAC Authentication,  
`nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth`
- Optionally, configure the following MAC Authentication parameters. If not specified, default values are applied.  
`nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth attempts 2`  
`nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth throttle 100`

**Usage Guidelines Enabling Fall-back Captive Portal Authentication**

To enable fall-back captive-portal authentication on the bridge VLAN,

- apply a captive-portal policy to the bridge VLAN.  
`nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#use captive-portal test`

- enable captive-portal authentication as the fall-back authentication mode.  
 nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#captive-portal-enforcement fall-back

**Example**

```

nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#mac-auth attempts 2
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#mac-auth throttle 80

nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#show context
bridge vlan 20
 mac-auth attempts 2
 mac-auth throttle 80
 ip igmp snooping
 ip igmp snooping querier
 ipv6 mld snooping
 ipv6 mld snooping querier
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#

```

**Related Commands**

|           |                                                                                        |
|-----------|----------------------------------------------------------------------------------------|
| <i>no</i> | Disables MAC authentication for Extended VLAN and Tunneled traffic on this bridge VLAN |
|-----------|----------------------------------------------------------------------------------------|

### 7.1.10.2.12 l2-tunnel-forward-additional-packet-types

▶ *bridge-vlan-mode commands*

Enables forwarding of *Wireless Network Management Protocol* (WNMP) packets across L2 tunnels. Under normal circumstances, if L2 tunnel broadcast optimization is enabled. WNMP packets are not forwarded across the L2 tunnels. Use this option to enable the forwarding of only WNMP packets.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
l2-tunnel-forward-additional-packet-types wnmnp
```

**Parameters**

None

**Example**

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-1)#l2-tunnel-forward-
additional-packet-types wnmnp

nx9500-6C8809(config-profile testNX9000-bridge-vlan-1)#show context
bridge vlan 1
l2-tunnel-broadcast-optimization

ip igmp snooping
ip igmp snooping querier
ipv6 mld snooping
ipv6 mld snooping querier
nx9500-6C8809(config-profile testNX9000-bridge-vlan-1)#
```

**Related Commands**

|           |                                                  |
|-----------|--------------------------------------------------|
| <i>no</i> | Disables WNMP packet forwarding across L2 tunnel |
|-----------|--------------------------------------------------|

### 7.1.10.2.13 no

► *bridge-vlan-mode commands*

Negates a command or reverts settings to their default. The no command, when used in the bridge VLAN mode, negates the VLAN bridge settings or reverts them to their default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [bridging-mode|captive-portal|captive-portal-enforcement|description|edge-vlan|firewall|http-analyze|ip|ipv6|l2-tunnel-broadcast-optimization|l2-tunnel-forward-additional-packet-types|mac-auth|stateful-packet-inspection-l2|tunnel|tunnel-over-level2|use]

 ipv6 mld snooping querier
nx9500-6C8809(config-profile TestProfileNX9500-bridge-vlan-20)#
```

### 7.1.10.2.14 stateful-packet-inspection-l2

▶ *bridge-vlan-mode commands*

Enables a *stateful packet inspection* (SPI) at the layer 2 firewall. SPI, also referred to as dynamic packet filtering, is a security feature that tracks the operating state and characteristics of network connections traversing it. It distinguishes legitimate packets for different types of connections, and only allows packets matching a known active connection to pass.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
stateful-packet-inspection-l2
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#stateful-packet-inspection-l2
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#
```

**Related Commands**

|           |                                                             |
|-----------|-------------------------------------------------------------|
| <i>no</i> | Disables stateful packet inspection at the layer 2 firewall |
|-----------|-------------------------------------------------------------|

### 7.1.10.2.15 tunnel

► *bridge-vlan-mode commands*

Enables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
tunnel [rate-limit|unknown-unicast]
```

```
tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
```

```
tunnel unknown-unicast
```

**Parameters**

- tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}

|                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|-----------|--------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge |
|-----------|--------------------------------------------------------------------------------------------------|

### 7.1.10.2.16 tunnel-over-level2

▶ *bridge-vlan-mode commands*

Enables extended VLAN (tunneled VLAN) traffic over level 2 MiNT links. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
tunnel-over-level2
```

**Parameters**

None

**Example**

```
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#tunnel-over-level2

rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#show context
bridge vlan 1
description "This is a description for the bridged VLAN"
l2-tunnel-broadcast-optimization
bridging-mode isolated-tunnel
tunnel-over-level2
ip arp trust
ip dhcp trust
ip igmp snooping
ip igmp snooping querier
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#
```

| <i>no</i> | Disables extended VLAN traffic over level 2 MiNT links |
|-----------|--------------------------------------------------------|

### 7.1.10.2.17 use

► *bridge-vlan-mode commands*

Associates a captive-portal, access control list (IPv4, IPv6, or MAC), and/or a URL filter with this bridge VLAN

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use [application-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|url-filter]

use application-policy <APP-POLICY-NAME>

use captive-portal <CAPTIVE-PORTAL-NAME>

use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/ipv6/MAC-ACCESS-LIST-NAME>

use url-filter <URL-FILTER-NAME>
```

**Parameters**

- use application-policy <APP-POLICY-NAME>

|                                          |                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| use application-policy <APP-POLICY-NAME> | Enforces application detection on this VLAN bridge <ul style="list-style-type: none"> <li>• &lt;APP-POLICY-NAME&gt; - Specify the application policy name (should be existing and configured).</li> <li>• For more information on application definitions and application policies, see <i>application</i> and <i>application-policy</i>.</li> </ul> |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- use captive-portal <CAPTIVE-PORTAL-NAME>

## 7.1.11 captive-portal

### ► Profile Config Commands

Configures captive portal advanced Web page uploads on this profile

A captive portal is a means of providing guests temporary and restrictive access to the controller managed wireless network. A captive portal provides secure authenticated controller access by capturing and re-directing a wireless user's Web browser session to a captive portal login page, where the user must enter valid credentials. Once the user is authenticated and logged into the controller managed network, additional agreement, welcome, and fail pages provide the administrator with options to control the captive portal's screen flow and user appearance.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
captive-portal page-upload count <1-20>
```

#### Parameters

- captive-portal page-upload count <1-20>

|              |                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page-upload  | Enables captive portal advanced Web page upload                                                                                                                                 |
| count <1-20> | Sets the maximum number of APs that can be uploaded concurrently <ul style="list-style-type: none"> <li>• &lt;1-20&gt; – Set a value from 1 - 20. The default is 10.</li> </ul> |

#### Example

```
nx9500-6C8809(config-profile-testNX9500)#captive-portal page-upload count 15

## 7.1.12 cdp

### ► Profile Config Commands

Enables *Cisco Discovery Protocol* (CDP), a proprietary data link layer network protocol implemented in Cisco networking equipment and used to share network information amongst different vendor wireless devices

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
cdp [holdtime|run|timer]
cdp [holdtime <10-1800>|run|timer <5-900>]
```

#### Parameters

- cdp [holdtime <10-1800>|run|timer <5-900>]

|                    |                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| holdtime <10-1800> | Specifies the holdtime after which transmitted packets are discarded <ul style="list-style-type: none"> <li>• &lt;10-1800&gt; - Specify a value from 10 - 1800 seconds. The default is 180 seconds.</li> </ul>      |
| run                | Enables CDP sniffing and transmit globally. This feature is enabled by default.                                                                                                                                     |
| timer <5-900>      | Specifies the interval, in seconds, between successive CDP packet transmission <ul style="list-style-type: none"> <li>• &lt;5-900&gt; - Specify a value from 5 - 900 seconds. The default is 60 seconds.</li> </ul> |

#### Example

```
rfs6000-37FABE(config profile-default-rfs6000)#cdp run
rfs6000-37FABE(config profile-default-rfs6000)#cdp holdtime 1000
rfs7000-37FABE(config profile-default-rfs6000)#cdp timer 900

## 7.1.13 cluster

### ► Profile Config Commands

Sets the cluster configuration

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
cluster [force-configured-state|force-configured-state-delay|handle-stp|master-priority|member|mode|name|radius-counter-db-sync-time]
```

```
cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|master-priority <1-255>]
```

```
cluster member [ip|vlan]
cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]
```

```
cluster mode [active|standby]
```

```
cluster name <CLUSTER-NAME>
```

```
cluster radius-counter-db-sync-time <1-1440>
```

#### Parameters

- cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|master-priority <1-255>]

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force-configured-state                | <p>Forces adopted APs to auto revert when a failed wireless controller or service platform (in a cluster) restarts</p> <p>When an active controller (wireless controller, or service platform) fails, a standby controller in the cluster takes over APs adopted by the failed active controller. If the failed active controller were to restart, it starts a timer based on the 'force-configured-state-delay' interval specified. At the expiration of this interval, the standby controller releases all adopted APs and goes back to a monitoring mode. If the active controller fails during this interval, the 'force-configured-state-delay' timer is stopped. The timer restarts as soon as the active controller comes back up.</p> <p>This feature is disabled by default.</p> |
| force-configured-state-delay <3-1800> | <p>Forces cluster transition to the configured state after a specified interval</p> <ul style="list-style-type: none"> <li>• &lt;3-1800&gt; – Specify a delay from 3 - 1800 minutes. The default is 5 minutes.</li> </ul> <p>This is the interval a standby controller waits before releasing adopted APs when a failed primary controller becomes active again.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| handle-stp                            | <p>Enables <i>Spanning Tree Protocol</i> (STP) convergence handling. This feature is disabled by default.</p> <p>In layer 2 networks, this protocol is enabled to prevent network looping. If enabled, the network forwards data only after STP convergence. Enabling STP convergence delays the redundancy state machine execution until the STP convergence is completed (the standard protocol value for STP convergence is 50 seconds). Delaying the state machine is important to load balance APs at startup.</p>                                                                                                                                                                                                                                                                   |

## 7.1.14 configuration-persistence

### ► Profile Config Commands

Enables configuration persistence across reloads. This option is enabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
configuration-persistence {auto|secure}
```

#### Parameters

- configuration-persistence {auto|secure}

|        |                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------|
| auto   | Optional. Assigns default value based on the device type                                            |
| secure | Optional. Ensures parts of a file that contain security information are not written during a reload |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#configuration-persistence secure

rfs6000-37FABE(config-profile-default-rfs6000)#show context

## 7.1.15 controller

### ► Profile Config Commands

Configures the WING controller (wireless controller or service platform) adoption settings

Adoption is the process a controller or service platform uses to discover available access points and/or peer controllers/service platforms, establish an association and provision the adopted device. Adoption settings are configurable and supported within a profile and applied to all devices supported by the profile.

Use this command to add a controller to a pool and group. This command also enables and disables adoption on controllers, and specifies the device types that can be adopted by a controller.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```

controller [adopted-devices|adoption|group|hello-interval|vlan|host]

controller adopted-devices [aps {controllers}|controllers {aps}|external-devices|
external-devices-monitoring-only]hel

controller adoption

controller [group <CONTROLLER-GROUP-NAME>|vlan <1-4094>]

## 7.1.16 critical-resource

### ► Profile Config Commands

Enables monitoring of resources critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses. When enabled, the system monitors these devices regularly and logs their status. Use this command to create a *critical resource monitoring* (CRM) policy.

A critical resource can be a gateway, AAA server, WAN interface, any hardware, or a service on which the stability of the network depends. Monitoring these resources is therefore essential. When enabled, this feature pings critical resources regularly to ascertain their status. If there is a connectivity issue, an event is generated stating a critical resource is unavailable. By default, there is no enabled critical resource policy and one needs to be created and implemented.

Critical resources can be monitored directly through the interfaces on which they are discovered. For example, a critical resource on the same subnet as an AP8132 access point can be monitored by its IP address. However, a critical resource located on a VLAN must continue to be monitored on that VLAN.

Critical resource monitoring can be enabled on service platforms, wireless controllers, and access points through their respective device profiles.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
critical-resource [<CR-NAME>|monitor|retry-count]

critical-resource <CR-NAME> [monitor|monitor-using-flows]

critical-resource <CR-NAME> monitor [direct|via]

critical-resource <CR-NAME> monitor direct [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/HOST-ALIAS-NAME>|arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>]} {<IP/HOST-ALIAS-NAME>|port [<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]}}

critical-resource <CR-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|pppoe1|vlan|wwan1]

critical-resource <CR-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/HOST-ALIAS-NAME>|arp-only [vlan <1-4094>|<VLAN-ALIAS-NAME>]} {<IP/HOST-ALIAS-NAME>|port [<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]}}

critical-resource <CR-NAME> monitor-using-flows [all|any] [criteria|dhcp|dns|sync-adoptees]

critical-resource <CR-NAME> monitor-using-flows [all|any] criteria [all|cluster-master|rf-domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>) {dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>}

critical-resource <CR-NAME> monitor-using-flows [all|any] dhcp vlan <1-4094> {dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>}
```

```
critical-resource <CR-NAME> monitor-using-flows [all|any] dns <IP/HOST-ALIAS-NAME>
{dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}

critical-resource <CR-NAME> monitor-using-flows [all|any] sync-adoptees criteria
[all|cluster-master|rf-domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-
NAME>]|dns <IP/HOST-ALIAS-NAME>) {dhcp [vlan <1-4094>|
<VLAN-ALIAS-NAME>]|dns <IP/HOST-ALIAS-NAME>}

critical-resource monitor interval <5-86400>

critical-resource retry-count <0-10>
```

**Parameters**

- critical-resource <CR-NAME> monitor direct [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/HOST-ALIAS-NAME>|arp-only [vlan <1-4094>|<VLAN-ALIAS-NAME>] {<IP/HOST-ALIAS-NAME>|port [<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]}}

|                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 7.1.17 crypto

### ► Profile Config Commands

Use the `crypto` command to define a system-level local ID for *Internet Security Association and Key Management Protocol* (ISAKMP) negotiation and to enter the ISAKMP policy, ISAKMP client, or ISAKMP peer command set.

The following table summarizes `crypto` configuration mode commands:

| Command                                   | Description                                                                        | Reference         |
|-------------------------------------------|------------------------------------------------------------------------------------|-------------------|
| <i>crypto</i>                             | Invokes commands used to configure ISAKMP policy, ISAKMP client, and ISAKMP peer   | <i>page 7-81</i>  |
| <i>crypto-auto-ipsec-tunnel-commands</i>  | Creates an auto IPsec VPN tunnel and enters its configuration mode                 | <i>page 7-87</i>  |
| <i>crypto-ikev1/ikev2-policy-commands</i> | Creates a <code>crypto</code> IKEv1/IKEv2 policy and enters its configuration mode | <i>page 7-94</i>  |
| <i>crypto-ikev1/ikev2-peer-commands</i>   | Creates a IKEv1/IKEv2 peer and enters its configuration mode                       | <i>page 7-103</i> |
| <i>crypto-map-config-commands</i>         | Creates a <code>crypto</code> map and enters its configuration mode                | <i>page 7-111</i> |
| <i>crypto-remote-vpn-client-commands</i>  | Creates a remote VPN client and enters its configuration mode                      | <i>page 7-136</i> |

### 7.1.17.1 crypto

#### ► crypto

Use the `crypto` command to define a system-level local ID for ISAKMP negotiation and enter the ISAKMP policy, ISAKMP client, or ISAKMP peer configuration mode.

A `crypto` map entry is a single policy that describes how certain traffic is secured. There are two types of `crypto` map entries: `ipsec-manual` and `ipsec-ike` entries. Each entry is given an index (used to sort the ordered list).

When a non-secured packet arrives on an interface, the `crypto` map associated with that interface is processed (in order). If a `crypto` map entry matches the non-secured traffic, the traffic is discarded.

When a packet is transmitted on an interface, the `crypto` map associated with that interface is processed. The first `crypto` map entry that matches the packet is used to secure the packet. If a suitable *Security Association* (SA) exists, it is used for transmission. Otherwise, IKE is used to establish a SA with the peer. If no SA exists (and the `crypto` map entry is “respond only”), the packet is discarded.

When a secured packet arrives on an interface, its *Security Parameter Index* (SPI) is used to look up a SA. If a SA does not exist (or if the packet fails any of the security checks), it is discarded. If all checks pass, the packet is forwarded normally.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
crypto [auto-ipsec-secure|enable-ike-uniqueids|ike-version|ikev1|ikev2|ipsec|
load-management|map|pki|plain-text-deny-acl-scope|remote-vpn-client]

crypto [auto-ipsec-secure|enable-ike-uniqueids|load-management]

crypto ike-version [ikev1-only|ikev2-only]

crypto ikev1 [dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-
3600>|peer <IKEV1-PEER>|policy <IKEV1-POLICY-NAME>|remote-vpn]

crypto ikev2 [cookie-challenge-threshold <1-100>|dpd-keepalive <10-3600>|

crypto map <CRYPTO-MAP-TAG> <1-1000> [ipsec-isakmp {dynamic}|ipsec-manual]

crypto pki import crl <TRUSTPOINT-NAME> URL <1-168>

crypto plain-text-deny-acl-scope [global|interface]
```

crypto remote-vpn-client

**Parameters**

- crypto [auto-ipsec-secure|enable-ike-uniqueids|load-management]

|                      |                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto-ipsec-secure    | Configures the Auto IPsec Secure parameter settings. For Auto IPsec tunnel configuration commands, see <a href="#">crypto-auto-ipsec-tunnel commands</a> . |
| enable-ike-uniqueids | Enables <i>Internet Key Exchange</i> (IKE) unique ID check<br>For more information on IKE unique IDs, see <a href="#">remotegw</a> .                       |
| load-management      | Configures load management for platforms using software cryptography                                                                                       |

- crypto ike-version [ikev1-only|ikev2-only]

|                                        |                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ike-version<br>[ikev1-only ikev2-only] | Selects and starts the IKE daemon <ul style="list-style-type: none"> <li>• ikev1-only - Enables support for IKEv1 tunnels only</li> <li>• ikev2-only - Enables support for IKEv2 tunnels only</li> </ul> |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- crypto ikev1 [dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-3600>|peer <IKEV1-PEER>|policy <IKEV1-POLICY-NAME>|remote-vpn]

|                               |                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ikev1                         | Configures the IKE version 1 parameters                                                                                                                                                                                                                                          |
| dpd-keepalive<br><10-3600>    | Sets the global <i>Dead Peer Detection</i> (DPD) keep alive interval from 10 - 3600 seconds. This is the interval between successive IKE keep alive messages sent to detect if a peer is dead or alive. The default is 30 seconds.                                               |
| dpd-retries <1-1000>          | Sets the global DPD retries count from 1 - 1000. This is the number of keep alive messages sent to a peer before the tunnel connection is declared as dead. The default is 5.                                                                                                    |
| nat-keepalive<br><10-3600>    | Sets the global NAT keep alive interval from 10 - 3600 seconds. This is the interval between successive NAT keep alive messages sent to detect if a peer is dead or alive. The default is 20 seconds.                                                                            |
| peer <IKEV1-PEER>             | Specify the name/Identifier for the IKEv1 peer. For IKEv1 peer configuration commands, see <a href="#">crypto-ikev1/ikev2-peer commands</a> .                                                                                                                                    |
| policy<br><IKEV1-POLICY-NAME> | Configures an ISKAMP policy. Specify the name of the policy.<br>The local IKE policy and the peer IKE policy must have matching group settings for successful negotiations.<br>For IKEv1 policy configuration commands, see <a href="#">crypto-ikev1/ikev2-policy commands</a> . |
| remote-vpn                    | Specifies the IKEv1 remote-VPN server configuration (responder only)                                                                                                                                                                                                             |

- crypto ikev2 [cookie-challenge-threshold <1-100>|dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-3600>|peer <IKEV2-PEER>|policy <IKEV2-POLICY-NAME>|remote-vpn]

|                                       |                                                                                                                                                            |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ikev2                                 | Configures the IKE version 2 parameters                                                                                                                    |
| cookie-challenge-threshold<br><1-100> | Starts the cookie challenge mechanism after the number of half open IKE SAs exceeds the specified limit. Specify the limit from 1 - 100. The default is 5. |
| dpd-keepalive<br><10-3600>            | Sets the global DPD keepalive interval from 10 - 3600 seconds. The default is 30 seconds.                                                                  |
| dpd-retries <1-100>                   | Sets the global DPD retries count from 1 - 100. The default is 5.                                                                                          |
| nat-keepalive<br><10-3600>            | Sets the global NAT keepalive interval from 10 - 3600 seconds. The default is 20 seconds.                                                                  |

### 7.1.17.2 crypto-auto-ipsec-tunnel commands

► *crypto*

Creates an auto IPsec VPN tunnel and changes the mode to auto-ipsec-secure mode for further configuration

Auto IPsec tunneling provides a secure tunnel between two networked peer controllers or service platforms and associated access points that are within a range of valid IP addresses. You can define which packets are sent within the tunnel, and how they are protected. When a tunneled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination or associated access point.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunneled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

The IKE protocol is a key management protocol used in conjunction with IPsec. IKE enhances IPsec by providing additional features, flexibility, and configuration simplicity for the IPsec standard. IKE enables secure communications without time consuming manual pre-configuration for auto IPsec tunneling.

```
rfs7000-37FABE(config-profile-default-rfs7000)#crypto auto-ipsec-secure
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#?
Crypto Auto IPSEC Tunnel commands:
 groupid Local/Remote identity and Authentication credentials for Auto
 IPsec Secure IKE negotiation
 ike-lifetime Set lifetime for ISAKMP security association
 ikev2 IKEv2 configuration commands
 ip Internet Protocol config commands
 no Negate a command or set its defaults
 remotegw Auto IPsec Secure Remote Peer IKE

```

The following table summarizes the crypto IPsec auto tunnel configuration mode commands:

| Command             | Description                                                                                                  | Reference                 |
|---------------------|--------------------------------------------------------------------------------------------------------------|---------------------------|
| <i>groupid</i>      | Specifies the identity string used for IKE authentication                                                    | <a href="#">page 7-88</a> |
| <i>ip</i>           | Enables the controller or service platform to uniquely identify APs and the hosts present in the AP's subnet | <a href="#">page 7-89</a> |
| <i>ike-lifetime</i> | Configures the IKE SA's key lifetime in seconds                                                              | <a href="#">page 7-90</a> |
| <i>ikev2</i>        | Enables the forced re-authentication of IKEv2 peer                                                           | <a href="#">page 7-91</a> |
| <i>remotegw</i>     | Defines the IKE version used for an auto IPsec tunnel using secure gateways                                  | <a href="#">page 7-92</a> |
| <i>no</i>           | Removes or reverts the crypto auto IPsec tunnel settings                                                     | <a href="#">page 7-93</a> |

### 7.1.17.2.1 groupid

▶ *crypto-auto-ipsec-tunnel commands*

Specifies the identity string used for IKE authentication

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
groupid <WORD> [psk|rsa]
groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]
```

**Parameters**

- groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]

|                                |                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WORD>                         | Specify a string not exceeding 64 characters. This is the group identity used for IKE exchange for auto IPsec secure peers. After providing a group ID, specify the authentication method used to authenticate peers on the auto IPsec secure tunnel. The options are: psk and rsa.                                                                                    |
| psk [0 <WORD> 2 <WORD> <WORD>] | Configures the <i>pre-shared key</i> (PSK) as the authentication type for secure peer authentication on the auto IPsec secure tunnel <ul style="list-style-type: none"> <li>• 0 &lt;WORD&gt; - Configures a clear text key</li> <li>• 2 &lt;WORD&gt; - Configures an encrypted key</li> <li>• &lt;WORD&gt; - Specify a string value from 8 - 21 characters.</li> </ul> |
| rsa                            | Configures the <i>Rivest-Shamir-Adleman</i> (RSA) key.<br>RSA is an algorithm for public key cryptography. It is the first algorithm known to be suitable for signing, as well as encryption. This is the default setting.                                                                                                                                             |

**NOTE:** Only one group ID is supported on the controller or service platform. All APs, controllers, and service platform must use the same group ID.

**Example**

```
rfs6000-37FABE (config-profile-default-rfs6000-crypto-auto-ipsec-secure) #groupid
testgroup@123 rsa

rfs6000-37FABE (config-profile-default-rfs6000-crypto-auto-ipsec-secure) #show
context
crypto auto-ipsec-secure
groupid testgroup@123 rsa
rfs6000-37FABE (config-profile-default-rfs6000-crypto-auto-ipsec-secure) #
```

### 7.1.17.2.2 ip

▶ *crypto-auto-ipsec-tunnel commands*

Enables the controller to uniquely identify APs and the hosts present in the AP's subnet. This allows the controller to correctly identify the destination host and create a dynamic site-to-site VPN tunnel between the host and the private network behind the controller.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip nat crypto
```

**Parameters**

- ip nat crypto

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip nat crypto | <p>Enables unique identification of APs and the hosts present in each AP's subnet</p> <p>Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. Further, the same subnet exists behind these APs.</p> <p>For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP 'A' is behind router '1'. And AP 'B' is behind router '2'. Both these APs have the same IP address (192.168.13.8). The subnet behind APs A and B is also the same (100.11.0/24). In such a scenario the controller fails to uniquely identify the hosts present in either AP's subnet.</p> <p>For more information, see <i>remotegw</i> and <i>crypto</i>.</p> |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58config-profile-testRFS4000-crypto-auto-ipsec-secure)#ip nat crypto
rfs4000-229D58config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context
crypto auto-ipsec-secure
remotegw ike-version ikev2 uniqueid
ip nat crypto
rfs4000-229D58config-profile-testRFS4000-crypto-auto-ipsec-secure)#
```

### 7.1.17.2.3 ike-lifetime

▶ *crypto-auto-ipsec-tunnel commands*

Configures the IKE SA's key lifetime in seconds

The lifetime defines how long a connection (encryption/authentication keys) should last, from successful key negotiation to expiration. Two peers need not exactly agree on the lifetime, though if they do not, there is some clutter for a superseded connection on the peer defining the lifetime as longer.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ike-lifetime <600-86400>
```

**Parameters**

- `ike-lifetime <600-86400>`

|                             |                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ike-lifetime<br><600-86400> | Sets the IKE SA's key lifetime in seconds <ul style="list-style-type: none"> <li>• &lt;600-86400&gt; - Specify a value from 600 - 86400 seconds. The default is 8600 seconds.</li> </ul> |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure) #ike-lifetime
800

rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure) #show context
crypto auto-ipsec-secure
 ike-lifetime 800
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure) #
```

### 7.1.17.2.4 ikev2

▶ *crypto-auto-ipsec-tunnel commands*

Enables the forced IKEv2 peer re-authentication. This option is disabled by default.

In most IPsec tunnel configurations, the lifetime of IKE SAs between peers is limited. Once the IKE SA key expires it is renegotiated. In such a scenario, the IKEv2 tunnel peers may or may not re-authenticate themselves. When enabled, IKE tunnel peers have to re-authenticate each time the IKE SA is renegotiated.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ikev2 peer reauth
```

**Parameters**

- ikev2 peer reauth

|                   |                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| ikev2 peer reauth | Enables IKEv2 peer re-authentication. When enabled, IKE tunnel peers are forced to re-authenticate each time the IKE key is renegotiated. |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure) #ikev2 peer reauth
```

### 7.1.17.2.5 remotegw

▶ *crypto-auto-ipsec-tunnel commands*

Defines the IKE version used for auto IPSEC tunnel negotiation with the IPsec remote gateway other than the controller

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}
```

**Parameters**

- remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remotegw ike-version | Configures the IKE version used for initiating auto IPsec tunnel with secure gateways other than the controller                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ikev1-aggr           | Aggregation mode is used by the auto IPsec tunnel initiator to set up the connection                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ikev1-main           | Main mode is used by the auto IPsec tunnel initiator to establish the connection                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ikev2                | IKEv2 is the preferred method when wireless controller/AP only is used                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| uniqueid             | <p>This keyword is common to all of the above parameters.</p> <ul style="list-style-type: none"> <li>• uniqueid - Optional. Enables the assigning of a unique ID to APs (using this profile) behind a router by prefixing the MAC address to the group ID</li> </ul> <p>Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP 'A' is behind router '1'. And AP 'B' is behind router '2'. Both these APs have the same IP address (192.168.13.8). In such a scenario, the controller fails to establish an Auto IPsec VPN tunnel to either APs, because it is unable to uniquely identify them.</p> <p>After enabling unique ID assignment, enable IKE unique ID check. For more information, see <i>crypto</i>.</p> |

**Example**

```
rfs6000-37FABE (config-profile-default-rfs6000-crypto-auto-ipsec-secure) #remotegw
ike-version ikev2 uniqueid

rfs6000-37FABE (config-profile-default-rfs6000-crypto-auto-ipsec-secure) #show
context

crypto auto-ipsec-secure
 remotegw ike-version ikev2 uniqueid
rfs6000-37FABE (config-profile-default-rfs6000-crypto-auto-ipsec-secure) #
```

### 7.1.17.2.6 no

▶ *crypto-auto-ipsec-tunnel commands*

Removes or resets this auto IPsec tunnel settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [groupid|like-lifetime|ikev2 peer reauth|ip nat crypto]
```

**Parameters**

- no <PARAMETERS>

---

|                 |                                                                                    |
|-----------------|------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this auto IPsec tunnel's settings based on the parameters passed |
|-----------------|------------------------------------------------------------------------------------|

---

**Example**

The following example shows the Auto IPsec VLAN bridge settings before the 'no' command is executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-crypto-auto-ipsec-secure)#show
context
crypto auto-ipsec-secure
 groupid testpassword@123 rsa
rfs6000-37FABE(config-profile-default-rfs6000-crypto-auto-ipsec-secure)#
rfs6000-37FABE(config-profile-default-rfs6000-crypto-auto-ipsec-secure)#no
groupid
```

The following example shows the Auto IPsec VLAN bridge settings after the 'no' command is executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-crypto-auto-ipsec-secure)#show
context
crypto auto-ipsec-secure
rfs6000-37FABE(config-profile-default-rfs6000-crypto-auto-ipsec-secure)#
```

### 7.1.17.3 crypto-ikev1/ikev2-policy commands

► *crypto*

Defines crypto-IKEv1/IKEv2 commands in detail

IKE protocol is a key management protocol standard used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE automatically negotiates IPSec SAs and enables secure communications without time consuming manual pre-configuration.

Use the (config) instance to configure IKEv1/IKEv2 policy configuration commands.

To navigate to the IKEv1/IKEv2 policy config instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto ikev1/ikev2 policy <IKEV1/IKEV2-
POLICY-NAME>

rfs7000-37FABE(config-profile-default-rfs7000)#crypto ikev1 policy ikev1-
testpolicy
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#?
Crypto IKEv1 Policy Configuration commands:
 dpd-keepalive Set Dead Peer Detection interval in seconds
 dpd-retries Set Dead Peer Detection retries count
 isakmp-proposal Configure ISAKMP Proposals
 lifetime Set lifetime for ISAKMP security association
 mode IKEv1 mode (main/aggressive)
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#

rfs7000-37FABE(config-profile-test-ikev2-policy-ikev2-testpolicy)#?
Crypto IKEv2 Policy Configuration commands:
 dpd-keepalive Set Dead Peer Detection interval in seconds
 isakmp-proposal Configure ISAKMP Proposals
 lifetime Set lifetime for ISAKMP security association
 no Negate a command or set its defaults
 sa-per-acl Setup single SA for all rules in the ACL (ONLY APPLICABLE
 FOR SITE-TO-SITE VPN)

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-test-ikev2-policy-ikev2-testpolicy)#
```

**NOTE:** IKEv2 being an improved version of the original IKEv1 design, is recommended in most deployments. IKEv2 provides enhanced cryptographic mechanisms, NAT and firewall traversal, attack resistance, etc.

The following table summarizes crypto IKEv1/iKEv2 configuration mode commands:

| Command                | Description                                                                                                  | Reference         |
|------------------------|--------------------------------------------------------------------------------------------------------------|-------------------|
| <i>dpd-keepalive</i>   | Sets DPD keep alive packet interval                                                                          | <i>page 7-96</i>  |
| <i>dpd-retries</i>     | Sets the maximum number of attempts for sending DPD keep alive packets (applicable only to the IKEv1 policy) | <i>page 7-97</i>  |
| <i>isakmp-proposal</i> | Configures ISAKMP proposals                                                                                  | <i>page 7-98</i>  |
| <i>lifetime</i>        | Specifies how long an IKE SA is valid before it expires                                                      | <i>page 7-100</i> |
| <i>mode</i>            | Sets the mode of the tunnels (applicable only to the IKEv1 policy)                                           | <i>page 7-101</i> |
| <i>no</i>              | Removes or reverts IKEv1/IKEv2 policy settings                                                               | <i>page 7-102</i> |

### 7.1.17.3.1 dpd-keepalive

▶ *crypto-ikev1/ikev2-policy commands*

Sets the DPD keep-alive packet interval

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
dpd-keepalive <10-3600>
```

**Parameters**

- dpd-keepalive <10-3600>

|           |                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <10-3600> | Specifies the interval, in seconds, between successive DPD keep alive packets. The IKE keep alive message is used to detect a dead peer on the remote end of the IPsec VPN tunnel. Specify the time from 10 - 3600 seconds. The default is 30 seconds. |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
dpd-keepalive 11

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-testpolicy)#show
context
crypto ikev1 policy testpolicy
 dpd-keepalive 11
 isakmp-proposal default encryption aes-256 group 2 hash sha
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-testpolicy)#
```

### 7.1.17.3.2 dpd-retries

▶ *crypto-ikev1/ikev2-policy commands*

Sets the maximum number of times DPD keep-alive packets are sent to a peer. Once this value is exceeded, without a response from the peer, the VPN tunnel connection is declared dead. This option is available only for the IKEv1 policy.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
dpd-retries <1-100>
```

**Parameters**

- dpd-retries <1-100>

|         |                                                                                                             |
|---------|-------------------------------------------------------------------------------------------------------------|
| <1-100> | Declares a peer dead after the specified number of retries. Specify a value from 1 - 100. The default is 5. |
|---------|-------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
dpd-retries 10

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
show context
crypto ikev1 policy testpolicy
 dpd-keepalive 11
 dpd-retries 10
 isakmp-proposal default encryption aes-256 group 2 hash sha
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
```

### 7.1.17.3.3 isakmp-proposal

► *crypto-ikev1/ikev2-policy commands*

Configures ISAKMP proposals and their parameters

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
isakmp-proposal <WORD> encryption [3des|aes|aes-192|aes-256] group [14|2|5] hash [aes-xcbc-mac|md5|sha|sha256]
```

**Parameters**

- isakmp-proposal <WORD> encryption [3des|aes|aes-192|aes-256] group [14|2|5] hash [aes-xcbc-mac|md5|sha|sha256]

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WORD>                                | Assigns the target peer (tunnel destination) a 32 character maximum name to distinguish it from others with a similar configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| encryption [3des aes aes-192 aes-256] | Configures the encryption method used by the tunneled peers to securely inter-operate <ul style="list-style-type: none"> <li>• 3des – Configures triple data encryption standard</li> <li>• aes – Configures AES (128 bit keys)</li> <li>• aes-192 – Configures AES (192 bit keys)</li> <li>• aes-256 – Configures AES (256 bit keys). This is the default setting.</li> </ul>                                                                                                                                                                                                                         |
| group [14 2 5]                        | Specifies the <i>Diffie-Hellman</i> (DH) group identifier used by VPN peers to derive a shared secret password without having to transmit. DH groups determine the strength of the key used in key exchanges. The higher the group number, the stronger and more secure the key. Options include 2, 5 and 14. <ul style="list-style-type: none"> <li>• 14 – Configures DH group 14</li> <li>• 2 – Configures DH group 2. This is the default setting.</li> <li>• 5 – Configures DH group 5</li> </ul>                                                                                                  |
| hash [aes-xcbc-mac md5 sha sha256]    | Specifies the hash algorithm used to authenticate data transmitted over the IKE SA. The hash algorithm specified here is used by VPN peers to exchange credential information. <ul style="list-style-type: none"> <li>• aes-xcbc-mac – Uses AES XCBC Auth hash algorithm. This option is applicable only to the IKEv2 policy configuration context.</li> <li>• md5 – Uses <i>Message Digest 5</i> (MD5) hash algorithm</li> <li>• sha – Uses <i>Secure Hash Authentication</i> (SHA) hash algorithm. This is the default setting.</li> <li>• sha256 – Uses Secure Hash Standard 2 algorithm</li> </ul> |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
isakmp-proposal testproposal encryption aes group 2 hash sha

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
show context
crypto ikev1 policy testpolicy
 dpd-keepalive 11
 dpd-retries 10
 isakmp-proposal default encryption aes-256 group 2 hash sha
 isakmp-proposal testproposal encryption aes group 2 hash sha
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
```

### 7.1.17.3.4 lifetime

▶ *crypto-ikev1/ikev2-policy commands*

Specifies how long an IKE SA (encryption/authentication keys) is valid. The value specified is the validity period of the IKE SA from successful key negotiation to expiration.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
lifetime <600-86400>
```

**Parameters**

- lifetime <600-86400>

|                      |                                                                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lifetime <600-86400> | Specifies how many seconds an IKE SA lasts before it expires. Set a time stamp from 600 - 86400 seconds. <ul style="list-style-type: none"> <li>• &lt;600-86400&gt; - Specify a value from 600 - 86400 seconds. The default is 86400 seconds.</li> </ul> |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
lifetime 655

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
show context
crypto ikev1 policy testpolicy
 dpd-keepalive 11
 dpd-retries 10
 lifetime 655
 isakmp-proposal default encryption aes-256 group 2 hash sha
 isakmp-proposal testproposal encryption aes group 2 hash sha
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
```

### 7.1.17.3.5 mode

▶ *crypto-ikev1/ikev2-policy commands*

Configures the IPSec mode of operation for the IKEv1 policy. This option is not available for IKEv2 policy.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
mode [aggressive|main]
```

**Parameters**

- mode [aggressive|main]

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode [aggressive main] | <p>Sets the mode of the tunnels</p> <ul style="list-style-type: none"> <li>• aggressive - Initiates the aggressive mode</li> <li>• main - Initiates the main mode</li> </ul> <p>If configuring the IKEv1 IPSec policy, define the IKE mode as either <i>main</i> or <i>aggressive</i>. In the aggressive mode, 3 messages are exchanged between the IPSec peers to setup the SA. On the other hand, in the main mode, 6 messages are exchanged. The default setting is main.</p> |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
mode aggressive

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
show context
crypto ikev1 policy testpolicy
 dpd-keepalive 11
 dpd-retries 10
 lifetime 655
 isakmp-proposal default encryption aes-256 group 2 hash sha
 isakmp-proposal testpraposal encryption aes group 2 hash sha
mode aggressive
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
```

### 7.1.17.3.6 no

► *crypto-ikev1/ikev2-policy commands*

Removes or reverts IKEv1/IKEv2 policy settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [dpd-keepalive|dpd-retries|isakmp-proposal <WORD>|lifetime|mode]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                |
|-----------------|--------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this IKEv1/IKEv2 policy settings based on parameters passed |
|-----------------|--------------------------------------------------------------------------------|

**Example**

The following example shows the IKEV1 Policy settings before the ‘no’ commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
show context
crypto ikev1 policy testpolicy
 dpd-keepalive 11
 dpd-retries 10
 lifetime 655
 isakmp-proposal default encryption aes-256 group 2 hash sha
 isakmp-proposal testproposal encryption aes group 2 hash sha
 mode aggressive
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#no
mode
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#no
dpd-keepalive
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#no
dpd-retries
```

The following example shows the IKEV1 Policy settings after the ‘no’ commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
show context
crypto ikev1 policy testpolicy
 lifetime 655
 isakmp-proposal default encryption aes-256 group 2 hash sha
 isakmp-proposal testproposal encryption aes group 2 hash sha
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-policy-ikev1-testpolicy)#
```

### 7.1.17.4 crypto-ikev1/ikev2-peer commands

#### ► *crypto*

Use the (config) instance to configure IKEv1/IKEv2 peer configuration commands. To navigate to the IKEv1/IKEv2 peer config instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto ikev1/ikev2 peer <IKEV1/IKEV2-
PEER-NAME>

rfs7000-37FABE(config-profile-default-rfs7000)#crypto ikev1 peer peer1
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#?
Crypto IKEV1 Peer Configuration commands:
 authentication Configure Authentication credentials
 ip Configure peer address/fqdn
 localid Set local identity
 no Negate a command or set its defaults
 remoteid Configure remote peer identity
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#

rfs7000-37FABE(config-profile-default-rfs7000)#crypto ikev2 peer peer1
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#?
Crypto IKEV2 Peer Configuration commands:
 authentication Configure Authentication credentials
 ip Configure peer address/fqdn
 localid Set local identity
 no Negate a command or set its defaults
 remoteid Configure remote peer identity
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
```

The following table summarizes crypto IPsec IKEv1/IKEv2 peer configuration mode commands:

| <b>Command</b>        | <b>Description</b>                                                                                                                                          | <b>Reference</b>  |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>authentication</i> | Configures a peer's authentication mode and the pre-shared key                                                                                              | <i>page 7-105</i> |
| <i>ip</i>             | Configures the peer's IP address                                                                                                                            | <i>page 7-106</i> |
| <i>localid</i>        | Configures a peer's local identity details                                                                                                                  | <i>page 7-107</i> |
| <i>remoteid</i>       | Configures a remote peer's identity details                                                                                                                 | <i>page 7-108</i> |
| <i>use</i>            | Associates an IKEv1 policy and IKEv2 policy with the IKEv1 and IKEv2 peer respectively                                                                      | <i>page 7-109</i> |
| <i>no</i>             | Negates a command or reverts settings to their default. The no command, when used in the ISAKMP policy mode, defaults the ISAKMP protection suite settings. | <i>page 7-110</i> |

### 7.1.17.4.1 authentication

► *crypto-ikev1/ikev2-peer commands*

Configures IKEv1/IKEv2 peer’s authentication mode and the pre-shared key

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
authentication [psk|rsa]

authentication psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote}

authentication rsa
```

**Parameters**

- authentication psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote}

|                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>psk [0 &lt;WORD&gt;  2 &lt;WORD&gt;  &lt;WORD&gt;] {local remote}</pre> | <p>Configures the authentication mode as <i>pre-shared key</i> (PSK). The PSK is a string, 8 - 12 characters long. It is shared by both ends of the VPN tunnel connection. If using IKEv2, both a local and remote string must be specified for handshake validation at both ends (local and remote) of the VPN connection.</p> <ul style="list-style-type: none"> <li>• 0 &lt;WORD&gt; – Configures a clear text key</li> <li>• 2 &lt;WORD&gt; – Configures an encrypted key</li> <li>• &lt;WORD&gt; – Configures the pre-shared key</li> </ul> <p>The following keywords are available only in the IKEv2 peer configuration mode:</p> <ul style="list-style-type: none"> <li>• local – Optional. Uses the specified key for local peer authentication only</li> <li>• remote – Optional. Uses the specified key for remote peer authentication only</li> </ul> <p><b>Note:</b> In case the peer type is not specified, this string is used for authenticating both local and remote peers.</p> |
| <ul style="list-style-type: none"> <li>• authentication rsa</li> </ul>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <pre>rsa</pre>                                                               | <p>Configures the authentication mode as <i>Rivest, Shamir, and Adleman</i> (RSA) This is the default setting (for both IKEv1 and IKEv2).</p> <p>RSA is the first known public-key cryptography algorithm designed signing and encryption. If configuring the IKEv2 peer, the ‘rsa’ option allows you to enable authentication at both ends of the VPN connection (local and remote).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#authentication
rsa

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#authentication
psk 0 key@123456

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
 authentication psk 0 key@123456 local
 authentication psk 0 key@123456 remote
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#
```

### 7.1.17.4.2 ip

▶ *crypto-ikev1/ikev2-peer commands*

Sets the IP address or *Fully Qualified Domain Name* (FQDN) of the IPsec VPN peer used in the tunnel setup

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip [address <IP>|fqdn <WORD>]
```

**Parameters**

- ip [address <IP>|fqdn <WORD>]

|              |                                          |
|--------------|------------------------------------------|
| address <IP> | Specify the peer device's IP address.    |
| fqdn <WORD>  | Specify the peer device's FQDN hostname. |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#ip address
172.16.10.12

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
 ip address 172.16.10.12
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#ip address
192.168.10.6

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
 ip address 192.168.10.6
 authentication psk 0 test@123456 local
 authentication psk 0 test@123456 remote
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#
```

### 7.1.17.4.3 localid

▶ *crypto-ikev1/ikev2-peer commands*

Sets a IKEv1/IKEv2 peer’s local identity. This local identifier is used with this peer configuration for an IKE exchange with the target VPN IPsec peer.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
localid [address|autogen-uniqueid|dn|email|fqdn|string]
```

```
localid [address <IP>|autogen-uniqueid <WORD>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]
```

**Parameters**

- localid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

|                         |                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <IP>            | Configures the peer’s IP address. The IP address is used as local identity.                                                                                                                                                                                                                                                           |
| autogen-uniqueid <WORD> | Generates a localid using the device’s unique identity. The system prefixes the device’s unique identity to the string provided here. The device’s unique identity should be existing and configured. For more information on configuring a device’s unique identity, see <i>autogen-uniqueid</i> .<br>• <WORD> - Provide the string. |
| dn <WORD>               | Configures the peer’s distinguished name. (for example, "C=us ST=<state> L=<location> O=<organization> OU=<org unit>". The maximum length is 128 characters.                                                                                                                                                                          |
| email <WORD>            | Configures the peer’s e-mail address. The maximum length is 128 characters.                                                                                                                                                                                                                                                           |
| fqdn <WORD>             | Configures the peer’s FQDN. The maximum length is 128 characters.                                                                                                                                                                                                                                                                     |
| string <WORD>           | Configures the peer’s identity string. The maximum length is 128 characters. This is the default setting.                                                                                                                                                                                                                             |

**Example**

```
rfs6000-37FABE (config-profile-default-rfs6000-ikev1-peer-peer1)#localid email bob@examplecompany.com

rfs6000-37FABE (config-profile-default-rfs6000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
ip address 172.16.10.12
localid email bob@examplecompany.com
rfs6000-37FABE (config-profile-default-rfs6000-ikev1-peer-peer1)#
```

### 7.1.17.4.4 remoteid

▶ *crypto-ikev1/ikev2-peer commands*

Configures a IKEv1/IKEV2 peer's remote identity. This remote identifier is used with this peer configuration for an IKE exchange with the target VPN IPsec peer.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
remoteid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]
```

**Parameters**

- remoteid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

|               |                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <IP>  | Configures the remote IKEv1/IKEV2 peer's IP address. The IP address is used as the peer's remote identity.                                                         |
| dn <WORD>     | Configures the remote peer's distinguished name. For example, "C=us ST=<state> L=<location> O=<organization> OU=<org unit>". The maximum length is 128 characters. |
| email <WORD>  | Configures the remote peer's e-mail address. The maximum length is 128 characters.                                                                                 |
| fqdn <WORD>   | Configures a peer's FQDN. The maximum length is 128 characters.                                                                                                    |
| string <WORD> | Configures a peer's identity string. The maximum length is 128 characters.                                                                                         |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#remoteid dn
SanJose

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
 ip address 172.16.10.12
 remoteid dn SanJose
 localid email bob@examplecompany.com
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#remoteid address
157.235.209.63

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
 remoteid address 157.235.209.63
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#
```

### 7.1.17.4.5 use

▶ *crypto-ikev1/ikev2-peer commands*

Associates IKEv1/IKEv2 policy with the IKEv1/IKEv2 peer respectively

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use ikev1-policy <IKEV1-POLICY-NAME>
use ikev2-policy <IKEV2-POLICY-NAME>
```

**Parameters**

- use ikev1-policy <IKEV1-POLICY-NAME>

|                                      |                                                                                                                                                   |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| use ikev1-policy <IKEV1-POLICY-NAME> | Specify the IKEv1 policy name.<br>The local IKEv1 policy and the peer IKEv1 policy must have matching group settings for successful negotiations. |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

- use ikev2-policy <IKEV2-POLICY-NAME>

|                                      |                                                                                                                                                   |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| use ikev2-policy <IKEV2-POLICY-NAME> | Specify the IKEv2 policy name.<br>The local IKEv2 policy and the peer IKEv2 policy must have matching group settings for successful negotiations. |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#use ikev1-policy test-ikev1policy

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
 ip address 172.16.10.12
 remoteid dn SanJose
 localid email bob@examplecompany.com
 use ikev1-policy test-ikev1policy
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#use ikev2-policy test-ikev2policy

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
 remoteid address 157.235.209.63
 use ikev2-policy test-ikev2policy
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#
```

### 7.1.17.4.6 no

► *crypto-ikev1/ikev2-peer commands*

Removes or reverts IKEv1/IKEv2 peer settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [authentication|ip|localid|remoteid|use <IKEv1/IKEv2-POLICY-NAME>]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                             |
|-----------------|-----------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts IKEv1/IKEv2 peer settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------|

**Example**

The following example shows the Crypto IKEV1 peer1 settings before the ‘no’ commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
ip address 172.16.10.12
remoteid dn SanJose
localid email bob@examplecompany.com
use ikev1-policy test-ikev1policy
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#

rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#no localid
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#no remoteid
```

The following example shows the Crypto IKEV1 peer1 settings after the ‘no’ commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
ip address 172.16.10.12
use ikev1-policy test-ikev1policy
rfs6000-37FABE(config-profile-default-rfs6000-ikev1-peer-peer1)#
```

The following example shows the Crypto IKEV2 peer1 settings before the ‘no’ commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
remoteid address 157.235.209.63
use ikev2-policy test
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#
```

The following example shows the Crypto IKEV2 peer1 settings after the ‘no’ commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#no use ikev2-
policy

rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
remoteid address 157.235.209.63
rfs6000-37FABE(config-profile-default-rfs6000-ikev2-peer-peer1)#
```

### 7.1.17.5 crypto-map-config-commands

#### ► *crypto*

This section explains crypto map configuration mode commands in detail.

A crypto map entry is a single policy that describes how certain traffic is secured. There are two types of crypto map entries: ipsec-manual and ipsec-ike. Each entry is given an index (used to sort the ordered list).

IPSec VPN provides a secure tunnel between two networked peers. Administrators can define which packets are sent within the tunnel, and how they're protected. When a tunneled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunneled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

IKE is a key management protocol standard used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE automatically negotiates IPSec SAs, and enables secure communications without time consuming manual pre-configuration.

Use crypto maps to configure IPSec VPN SAs. Crypto maps combine the elements comprising IPSec SAs. Crypto maps also include transform sets. A transform set is a combination of security protocols, algorithms and other settings applied to IPSec protected traffic. One crypto map is utilized for each IPSec peer, however for remote VPN deployments one crypto map is used for all the remote IPSec peers.

Use the (config) instance to enter the crypto map configuration mode. To navigate to the crypto-map configuration instance, use the following commands:

In the device-config mode:

```
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
[ipsec-isakmp {dynamic}|ipsec-manual]
```

In the profile-config mode:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
[ipsec-isakmp {dynamic}|ipsec-manual]
```

There are three different configurations defined for each listed crypto map: site-to-site manual (ipsec-manual), site-to-site-auto tunnel (ipsec-isakmp), and remote VPN client (ipsec-isakmp dynamic). With site-to-site deployments, an IPSec tunnel is deployed between two gateways, each at the edge of two different remote networks. With remote VPN, an access point located at remote branch defines a tunnel with a security gateway. This facilitates the end points in the branch office to communicate with the destination endpoints (behind the security gateway) in a secure manner.

Each crypto map entry is given an index (used to sort the ordered list).

```
rfs6000-37FABE(config-profile-default-rfs6000)#crypto map map1 1 ipsec-manual
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#?
Manual Crypto Map Configuration commands:
 local-endpoint-ip Use this IP as local tunnel endpoint address, instead
 of the interface IP (Advanced Configuration)
 mode Set the tunnel mode
 no Negate a command or set its defaults
 peer Set peer
 security-association Set security association parameters
 session-key Set security session key parameters
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#
```

The following table summarizes crypto map configuration mode commands:

| Command                                                      | Description                                              | Reference         |
|--------------------------------------------------------------|----------------------------------------------------------|-------------------|
| <i>crypto-map auto-vpn-tunnel/remote-vpn-client instance</i> | Configures an auto site-to-site VPN or remote VPN client | <i>page 7-113</i> |
| <i>crypto-map ipsec-manual-instance</i>                      | Configures a manual site-to-site VPN                     | <i>page 7-127</i> |

### 7.1.17.5.1 crypto-map auto-vpn-tunnel/remote-vpn-client instance

#### ▶ crypto-map-config-commands

To navigate to the auto site-to-site VPN tunnel configuration instance, use the following command:

In the device-config mode:

```
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-
isakmp
```

In the profile-config mode:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
ipsec-isakmp

rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto map test 1 ipsec-isakmp
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#?
Site to Site Crypto Map Configuration commands:
 ip Internet Protocol config commands
 local-endpoint-ip Use this IP as local tunnel endpoint address, instead
 of the interface IP (Advanced Configuration)
 no Negate a command or set its defaults
 peer Add a remote peer
 pfs Specify Perfect Forward Secrecy
 security-association Security association parameters
 transform-set Specify IPSec transform to use
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

To navigate to the remote VPN client configuration instance, use the following command:

In the device-config mode:

```
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-
isakmp {dynamic}
```

In the profile-config mode:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
ipsec-isakmp {dynamic}

rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto map test 2 ipsec-isakmp
dynamic
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#?
Dynamic Crypto Map Configuration commands:
 local-endpoint-ip Use this IP as local tunnel endpoint address, instead
 of the interface IP (Advanced Configuration)
 modeconfig Set the mode config method
 no Negate a command or set its defaults
 peer Add a remote peer
 pfs Specify Perfect Forward Secrecy
 remote-type Set the remote VPN client type
 security-association Security association parameters
 transform-set Specify IPSec transform to use
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
```

```

do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

The following table lists the IPSec-Auto-VPN/Remote-VPN tunnel configuration commands:

| Command                     | Description                                                                                                                                                            | Reference                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>ip</i>                   | Enables this setting to utilize IP/Port NAT on the VPN tunnel. This command is applicable only to the site-to-site VPN tunnel.                                         | <a href="#">page 7-115</a> |
| <i>local-endpoint-ip</i>    | Uses the configured IP as local tunnel endpoint address, instead of the interface IP. This command is applicable to the site-to-site VPN tunnel and remote VPN client. | <a href="#">page 7-116</a> |
| <i>modeconfig</i>           | Configures the mode config method (pull or push) associated with the remote VPN client. This command is applicable only to the remote VPN client.                      | <a href="#">page 7-117</a> |
| <i>peer</i>                 | Configures the IKEv1 or IKEv2 peer for the VPN tunnel. This command is applicable to the site-to-site VPN tunnel and remote VPN client.                                | <a href="#">page 7-118</a> |
| <i>pfs</i>                  | Configures the <i>Perfect Forward Secrecy</i> (PFS) for the VPN tunnel. This command is applicable to the site-to-site VPN tunnel and remote VPN client.               | <a href="#">page 7-119</a> |
| <i>remote-type</i>          | Configures the remote VPN client type as either None or XAuth. This command is applicable only to the remote VPN client.                                               | <a href="#">page 7-120</a> |
| <i>security-association</i> | Defines this automatic VPN tunnel's IPSec SA settings. This command is applicable to the site-to-site VPN tunnel and remote VPN client.                                | <a href="#">page 7-121</a> |
| <i>transform-set</i>        | Applies a transform set (encryption and hash algorithms) to the VPN tunnel. This command is applicable to the site-to-site VPN tunnel and remote VPN client.           | <a href="#">page 7-123</a> |
| <i>use</i>                  | Applies an existing and configured IP access list to the VPN tunnel. This command is applicable to the site-to-site VPN tunnel and remote VPN client.                  | <a href="#">page 7-124</a> |
| <i>no</i>                   | Removes or reverts site-to-site VPN tunnel or remote VPN client settings                                                                                               | <a href="#">page 7-125</a> |

### 7.1.17.5.2 ip

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Enables this setting to utilize IP/Port NAT on this auto site-to-site VPN tunnel. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip nat crypto
```

**Parameters**

- ip nat crypto

|               |                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------|
| ip nat crypto | Enables this setting to utilize IP/Port NAT on the site-to-site VPN tunnel. This setting is disabled by default. |
|---------------|------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
 ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

### 7.1.17.5.3 local-endpoint-ip

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Uses the configured IP as local tunnel endpoint address, instead of the interface IP

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
local-endpoint-ip <IP>
```

#### Parameters

- local-endpoint-ip <IP>

|                        |                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| local-endpoint-ip <IP> | <p>Configures the local VPN tunnel's (site-to-site VPN tunnel or remote VPN client) endpoint IP address</p> <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the IP address. The specified IP address must be available on the interface.</li> </ul> |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

Site-to-site VPN tunnel:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#local-endpoint-ip 192.168.13.10
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
 local-endpoint-ip 192.168.13.10
 ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#local-endpoint-ip 157.235.204.62
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
 local-endpoint-ip 157.235.204.62
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

### 7.1.17.5.4 modeconfig

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Configures the mode config method (pull or push) associated with the remote VPN client

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
modeconfig [pull|push]
```

#### Parameters

- modeconfig [pull|push]

|                           |                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| modeconfig<br>[pull push] | Configures the mode config method associated with a remote VPN client. The options are: pull and push.<br><br>The mode (pull or push) defines the method used to assign a virtual IP. This setting is relevant for IKEv1 only, since IKEv2 always uses the configuration payload in pull mode. The default setting is push. |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

Remote VPN client:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#modeconfig pull

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
 modeconfig pull
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)
```

### 7.1.17.5.5 peer

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Configures the IKEv1 or IKEv2 peer for the auto site-to-site VPN tunnel or remote VPN client. The peer device can be specified either by its hostname or by its IP address. A maximum of three peers can be configured.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
peer <1-3> [ikev1|ikev2] <IKEv1/IKEv2-PEER-NAME>
```

#### Parameters

- peer <1-3> [ikev1|ikev2] <IKEv1/IKEv2-PEER-NAME>

|                         |                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| peer <1-3>              | Creates a new peer and configures the peer's priority level. Peer '1' is the primary peer, and peer '3' is redundant.                 |
| ikev1 <IKEv1-PEER-NAME> | Configures an IKEv1 peer <ul style="list-style-type: none"> <li>• &lt;IKEv1-PEER-NAME&gt; - Specify the IKEv1 peer's name.</li> </ul> |
| ikev2<IKEv2-PEER-NAME>  | Configures an IKEv2 peer <ul style="list-style-type: none"> <li>• &lt;IKEv2-PEER-NAME&gt; - Specify the IKEv2 peer's name.</li> </ul> |

#### Example

Site-to-site tunnel:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#peer 1 ikev2 ikev2Peer1
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
 peer 1 ikev2 ikev2Peer1
 local-endpoint-ip 192.168.13.10
 ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#peer 1 ikev1 RemoteIKEv1Peer1
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
 peer 1 ikev1 RemoteIKEv1Peer1
 local-endpoint-ip 157.235.204.62
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

### 7.1.17.5.6 pfs

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Configures *Perfect Forward Secrecy* (PFS) for the auto site-to-site VPN tunnel or remote VPN client

PFS is the key-establishment protocol, used to secure VPN communications. If one encryption key is compromised, only data encrypted by that specific key is compromised. For PFS to exist, the key used to protect data transmissions must not be used to derive any additional keys. Options include 2, 5 and 14. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
pfs [14|2|5]
```

#### Parameters

- pfs [14|2|5]

|              |                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pfs [14 2 5] | Configures PFS <ul style="list-style-type: none"> <li>• 14 - Configures D-H Group14 (2048-bit modp)</li> <li>• 2 - Configures D-H Group2 (1024-bit modp)</li> <li>• 5 - Configures D-H Group5 (1536-bit modp)</li> </ul> |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

Site-to-site VPN tunnel:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#pfs 5
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
peer 1 ikev2 ikev2Peer1
local-endpoint-ip 192.168.13.10
pfs 5
ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#pfs 14
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
peer 1 ikev1 RemoteIKEv1Peer1
local-endpoint-ip 157.235.204.62
pfs 14
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

### 7.1.17.5.7 remote-type

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Configures the remote VPN client type as either None or XAuth

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
remote-type [none|xauth]
```

#### Parameters

- remote-type [none|xauth]

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remote-type<br>[none xauth] | <p>Specify the remote VPN's client type</p> <ul style="list-style-type: none"> <li>• none - Configures remote VPN client with No XAUTH</li> <li>• xauth - Configures remote VPN client as using XAUTH (applicable only for IKEv1). This is the default setting.</li> </ul> <p>XAuth (extended authentication) provides additional authentication validation by permitting an edge device to request extended authentication information from an IPSec host. This forces the host to respond with additional authentication credentials. The edge device respond with a failed or passed message.</p> |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
Remote VPN client:
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
peer 1 ikev1 RemoteIKEv1Peer1
local-endpoint-ip 157.235.204.62
pfs 14
remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

### 7.1.17.5.8 security-association

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Defines the IPSec SA's (created by this auto site-to-site VPN tunnel or remote VPN client) settings

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
security-association [inactivity-timeout|level|lifetime]

security-association [inactivity-timeout <120-86400>|level perhost]
security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]
```

#### Parameters

- security-association [inactivity-timeout <120-86400>|level perhost]

|                                   |                                                                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inactivity-timeout<br><120-86400> | Specifies an inactivity period, in seconds, for this IPSec VPN SA. Once the set value is exceeded, the association is timed out. <ul style="list-style-type: none"> <li>• &lt;120-86400&gt; - Specify a value from 120 - 86400 seconds. The default is 900 seconds.</li> </ul> |
| level perhost                     | Specifies the granularity level for this IPSec VPN SA <ul style="list-style-type: none"> <li>• perhost - Sets the IPSec VPN SA's granularity to the host level</li> </ul>                                                                                                      |

- security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]

|                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lifetime<br>[kilobytes<br><500-2147483646> <br>seconds<br><120-86400>] | Defines the IPSec SA's lifetime (in kilobytes and/or seconds). Values can be entered in both kilobytes and seconds. Which ever limit is reached first, ends the security association. <ul style="list-style-type: none"> <li>• kilobytes &lt;500-2147483646&gt; - Defines volume based key duration. Specify a value from 500 - 2147483646 kilobytes. Select this option to define a connection volume lifetime (in kilobytes) for the duration of the IPSec VPN SA. Once the set volume is exceeded, the association is timed out. This option is disabled by default.</li> <li>• seconds &lt;120-86400&gt; - Defines time based key duration. Specify the time frame from 120 - 86400 seconds. Select this option to define a lifetime (in seconds) for the duration of the IPSec VPN SA. Once the set value is exceeded, the association is timed out. This option is disabled by default.</li> </ul> |
|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

Site-to-site tunnel:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1) #security-association inactivity-timeout 200
```

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1) #security-association level perhost
```

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1) #security-association lifetime kilobytes 250000
```

```

### 7.1.17.5.9 transform-set

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Applies a transform set (encryption and hash algorithms) to site-to-site VPN tunnel or remote VPN client. This command allows you to provide customized data protection for each crypto map can be customized with its own data protection and peer authentication schemes.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
transform-set <TRANSFORM-SET-TAG> {<TRANSFORM-SET-TAG>}
```

#### Parameters

- transform-set <TRANSFORM-SET-TAG> {<TRANSFORM-SET-TAG>}

|                                                                                |                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>transform-set &lt;TRANSFORM-SET- TAG&gt; &lt;TRANSFORM-SET- TAG&gt;</pre> | <p>Applies a transform set. The transform set should be existing and configured.</p> <ul style="list-style-type: none"> <li>• &lt;TRANSFORM-SET-TAG&gt; - Specify the transform set's name.</li> <li>• &lt;TRANSFORM-SET-TAG&gt; - Optional. Specify a second transform set. You can provide multiple, space-separated, transform set tags.</li> </ul> |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

Site-to-site VPN tunnel:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1) #transform-set
AutoVPN
```

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1) #show context
crypto map test 1 ipsec-isakmp
 security-association level perhost
 peer 1 ikev2 ikev2Peer1
 local-endpoint-ip 192.168.13.10
 pfs 5
 security-association lifetime kilobytes 250000
 security-association inactivity-timeout 200
 transform-set AutoVPN
 ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1) #
```

Remote VPN client:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2) #transform-set
RemoteVPN
```

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2) #show context
crypto map test 2 ipsec-isakmp dynamic
 peer 1 ikev1 RemoteIKEv1Peer1
 local-endpoint-ip 157.235.204.62
 pfs 14
 security-association lifetime seconds 10000
 transform-set RemoteVPN
 remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2) #
```

**7.1.17.5.10 use**

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Applies an existing and configured IP access list to the auto site-to-site VPN tunnel or remote VPN client. Based on the IP access list's settings traffic is permitted or denied across the VPN tunnel.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use ip-access-list <IP-ACCESS-LIST-NAME>
```

**Parameters**

- use ip-access-list <IP-ACCESS-LIST-NAME>

|                                         |                                  |
|-----------------------------------------|----------------------------------|
| ip-access-list<br><IP-ACCESS-LIST-NAME> | Specify the IP access list name. |
|-----------------------------------------|----------------------------------|

**Example**

Site-to-site VPN tunnel:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#use ip-access-list test

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
 use ip-access-list test
 security-association level perhost
 peer 1 ikev2 ikev2Peer1
 local-endpoint-ip 192.168.13.10
 pfs 5
 security-association lifetime kilobytes 250000
 security-association inactivity-timeout 200
 transform-set AutoVPN
 ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
rrfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#use ip-access-list test1

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
' crypto map test 2 ipsec-isakmp dynamic
 use ip-access-list test1
 peer 1 ikev1 RemoteIKEv1Peer1
 local-endpoint-ip 157.235.204.62
 pfs 14
 security-association lifetime seconds 10000
 transform-set RemoteVPN
 remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

### 7.1.17.5.11 no

▶ *crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Removes or reverts the auto site-to-site VPN tunnel or remote VPN client settings

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [ip|local-endpoint-ip|modeconfig|peer|pfs|remote-type|security-association|
transform-set|use]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this auto site-to-site/remote VPN settings based on the parameters passed |
|-----------------|---------------------------------------------------------------------------------------------|

#### Example

The following example shows the IPsec site-to-site VPN tunnel 'test' settings before the 'no' commands are executed:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
 use ip-access-list test
 security-association level perhost
 peer 1 ikev2 ikev2Peer1
 local-endpoint-ip 192.168.13.10
 pfs 5
 security-association lifetime kilobytes 250000
 security-association inactivity-timeout 200
 transform-set AutVPN
 ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#no use ip-
access-list
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#no security-
association level perhost
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#no ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#no pfs
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#no local-
endpoint-ip
```

The following example shows the IPsec site-to-site VPN tunnel 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
 peer 1 ikev2 ikev2Peer1
 security-association lifetime kilobytes 250000
 security-association inactivity-timeout 200
 transform-set AutoVPN
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

The following example shows the IPsec remote VPN client 'test' settings before the 'no' commands are executed:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
 use ip-access-list test2
 peer 1 ikev1 RemoteIKEv1Peer1
 local-endpoint-ip 157.235.204.62
 pfs 14
 security-association lifetime seconds 10000
 transform-set RemoteVPN
 remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#

rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#no use ip-
access-list
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#no peer 1
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#no transform-set
```

The following example shows the IPsec remote VPN client 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
 local-endpoint-ip 157.235.204.62
 pfs 14
 security-association lifetime seconds 10000
 remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

### 7.1.17.5.12 crypto-map-ipsec-manual-instance

▶ *crypto-map-config-commands*

To navigate to the automatic IPsec manual VPN tunnel configuration instance, use the following command:

In the device-config mode:

```
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-manual
```

In the profile-config mode:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-manual

rfs4000-229D58 (config-device-00-23-68-22-9D-58)#crypto map test 3 ipsec-manual
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#3)#?
Manual Crypto Map Configuration commands:
 local-endpoint-ip Use this IP as local tunnel endpoint address, instead
 of the interface IP (Advanced Configuration)
 mode Set the tunnel mode
 no Negate a command or set its defaults
 peer Set peer
 security-association Set security association parameters
 session-key Set security session key parameters
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#3)#
```

The following table summarizes IPsec manual VPN tunnel configuration mode commands:

| Command                     | Description                                                                                                   | Reference         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|-------------------|
| <i>local-endpoint-ip</i>    | Uses the configured IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration) | <i>page 7-128</i> |
| <i>mode</i>                 | Sets the tunnel mode                                                                                          | <i>page 7-129</i> |
| <i>peer</i>                 | Sets the peer device's IP address                                                                             | <i>page 7-130</i> |
| <i>security-association</i> | Defines the lifetime (in kilobytes and/or seconds) of IPsec SAs created by a crypto map                       | <i>page 7-131</i> |
| <i>session-key</i>          | Defines encryption and authentication keys for a crypto map                                                   | <i>page 7-132</i> |
| <i>use</i>                  | Uses the configured IP access list                                                                            | <i>page 7-134</i> |
| <i>no</i>                   | Removes or reverts crypto map IPsec manual settings                                                           | <i>page 7-135</i> |

### 7.1.17.5.13 local-endpoint-ip

▶ *crypto-map-ipsec-manual-instance*

Uses the configured IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
local-endpoint-ip <IP>
```

**Parameters**

- local-endpoint-ip <IP>

|                        |                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| local-endpoint-ip <IP> | Uses the configured IP as local tunnel's endpoint address <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the IP address. The specified IP address must be available on the interface.</li> </ul> |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#local-endpoint-ip 172.16.10.3
```

### 7.1.17.5.14 mode

▶ *crypto-map-ipsec-manual-instance*

Sets the crypto map tunnel mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mode [transport|tunnel]
```

#### Parameters

- mode [transport|tunnel]

|                         |                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode [transport tunnel] | Sets the mode of the tunnel for this crypto map <ul style="list-style-type: none"> <li>• transport - Initiates transport mode</li> <li>• tunnel - Initiates tunnel mode (default setting)</li> </ul> |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#mode transport
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
mode transport
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#
```

**7.1.17.5.15 peer**▶ *crypto-map-ipsec-manual-instance*

Sets the peer device's IP address. This can be set for multiple remote peers. The remote peer can be an IP address.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
peer <IP>
```

**Parameters**

- peer <IP>

|           |                                                                                        |
|-----------|----------------------------------------------------------------------------------------|
| peer <IP> | Enter the peer device's IP address. If not configured, it implies respond to any peer. |
|-----------|----------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#peer 172.16.10.12
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
 peer 172.16.10.12
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#
```

### 7.1.17.5.16 security-association

▶ *crypto-map-ipsec-manual-instance*

Defines the lifetime (in kilobytes and/or seconds) of IPsec SAs created by this crypto map

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]
```

#### Parameters

- security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]

|                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lifetime<br>[kilobytes<br><500-2147483646> <br>seconds<br><120-86400>] | Values can be entered in both kilobytes and seconds. Which ever limit is reached first, ends the security association. <ul style="list-style-type: none"> <li>• kilobytes &lt;500-2147483646&gt; - Defines volume based key duration. Specify a value from 500 - 2147483646 bytes.</li> <li>• seconds &lt;120-86400&gt; - Defines time based key duration. Specify the time frame from 120 - 86400 seconds.</li> </ul> |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**NOTE:** This command is not applicable to the ipsec-manual crypto map.

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map2#2)#security-association lifetime seconds 123
```

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map2#2)#show context
Command not applicable to this crypto map
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map2#2)#
```

### 7.1.17.5.17 session-key

▶ *crypto-map-ipsec-manual-instance*

Defines encryption and authentication keys for this crypto map

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
session-key [inbound|outbound] [ah|esp] <256-4294967295>
session-key [inbound|outbound] ah <256-4294967295> [0|2|authenticator [md5|sha]]
<WORD>
session-key [inbound|outbound] esp <256-4294967295> [0|2|cipher [3des|aes|aes-192|
aes-256|des|esp-null]] <WORD> authenticator [md5|sha] <WORD>
```

**Parameters**

- session-key [inbound|outbound] ah <256-4294967295> [0|2|authenticator [md5|sha]] <WORD>

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| session-key [inbound outbound]       | Defines the manual inbound and outbound security association key parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ah <256-4294967295>                  | Configures <i>authentication header</i> (AH) as the security protocol for the security session <ul style="list-style-type: none"> <li>• &lt;256-4294967295&gt; - Sets the SPI for the security association from 256 - 4294967295</li> </ul> The SPI (in combination with the destination IP address and security protocol) identifies the security association.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#session-key
inbound esp 273 cipher esp-null authenticator sha 58768979

rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
peer 172.16.10.2
mode transport
session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#
```

### 7.1.17.5.18 use

▶ *crypto-map-ipsec-manual-instance*

Associates an existing IP access list with this crypto map. The ACL protects the VPN traffic.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use ip-access-list <IP-ACCESS-LIST-NAME>
```

**Parameters**

- use ip-access-list <IP-ACCESS-LIST-NAME>

|                                         |                                  |
|-----------------------------------------|----------------------------------|
| ip-access-list<br><IP-ACCESS-LIST-NAME> | Specify the IP access list name. |
|-----------------------------------------|----------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#use ip-access-list test

rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
 use ip-access-list test
 peer 172.16.10.12
 mode transport
 session-key inbound esp 273 0 cipher esp-null authenticator sha 5876897
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#
```

### 7.1.17.5.19 no

▶ *crypto-map-ipsec-manual-instance*

Removes or resets this crypto map's settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [local-endpoint-ip|mode|peer|security-association|session-key|use]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                           |
|-----------------|---------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this crypto map settings based on the parameters passed |
|-----------------|---------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
 use ip-access-list test
 peer 172.16.10.12
 mode transport
 session-key inbound esp 273 0 cipher esp-null authenticator sha 5876897
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#

rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#no use ip-access-
list
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#no peer
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#no mode

rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
 session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
rfs6000-37FABE(config-profile-default-rfs6000-cryptomap-map1#1)#
```

## 7.1.17.6 crypto-remote-vpn-client commands

### ▶ *crypto*

This section documents the IKEV2 remote VPN client configuration settings. Use this command to define the server resources used to secure (authenticate) a remote VPN connection with a target peer.

Use the profile-config instance to configure remote VPN client settings. To navigate to the remote-vpn-client configuration instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto remote-vpn-client
<DEVICE>(config-profile-<PROFILE-NAME>-crypto-ikev2-remote-vpn-client)#
```

**NOTE:** To configure remote VPN client settings on a device, on the device's configuration mode, use the *crypto > remote-vpn-client* command.  
For example: rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto remote-vpn-client

**NOTE:** The following configuration enables a access point to adopt to a controller over the remote VPN link:  
On a profile: rfs4000-229D58(config-profile-testRFS4000)#controller host <HOST-IP> remote-vpn-client

On a device: rfs4000-229D58(config-00-23-68-22-9D-58)#controller host <HOST-IP> remote-vpn-client

```
rfs4000-229D58(config)#profile rfs4000 testRFS4000
rfs4000-229D58(config-profile-testRFS4000)#

rfs4000-229D58(config-profile-testRFS4000)#crypto remote-vpn-client
rfs4000-229D58(config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#?
Crypto IKEV2 Remote Vpn Client Config commands:
 dhcp-peer Configure parameters for peers received via DHCP option
 no Negate a command or set its defaults
 peer Add a remote peer
 shutdown Disable remote vpn client
 transform-set Specify IPSec transform to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58(config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```

The following table summarizes crypto remote VPN client configuration mode commands:

| <b>Command</b>       | <b>Description</b>                                                     | <b>Reference</b>  |
|----------------------|------------------------------------------------------------------------|-------------------|
| <i>dhcp-peer</i>     | Configures DHCP peer's local ID and authentication settings            | <i>page 7-138</i> |
| <i>peer</i>          | Adds a remote IKEv2 peer                                               | <i>page 7-139</i> |
| <i>shutdown</i>      | Disables the remote VPN client                                         | <i>page 7-140</i> |
| <i>transform-set</i> | Associates an existing IPSec transform set with this remote VPN client | <i>page 7-141</i> |
| <i>no</i>            | Removes the remote VPN client settings                                 | <i>page 7-142</i> |

### 7.1.17.6.1 dhcp-peer

▶ *crypto-remote-vpn-client commands*

Configures DHCP peer’s local ID and authentication settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
dhcp-peer [authentication|localid]

dhcp-peer authentication [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]

dhcp-peer localid [autogen-uniqueid <WORD>|string <WORD>]
```

**Parameters**

- dhcp-peer authentication [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]

|                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dhcp-peer authentication psk [0 <WORD> 2 <WORD> <WORD>]                                                                   | Configures the DHCP peer’s authentication type as PSK <ul style="list-style-type: none"> <li>• 0 &lt;WORD&gt; - Configures a clear text authentication key</li> <li>• 2 &lt;WORD&gt; - Configures an encrypted authentication key</li> <li>• &lt;WORD&gt; - Provide a 8 - 21 character shared key password for DHCP peer authentication</li> </ul>                                                                                                                                                                                                                                                                        |
| dhcp-peer authentication rsa                                                                                              | Configures the DHCP peer’s authentication type as RSA. This is the default setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <ul style="list-style-type: none"> <li>• dhcp-peer localid [autogen-uniqueid &lt;WORD&gt; string &lt;WORD&gt;]</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| dhcp-peer localid [autogen-uniqueid <WORD> string <WORD>]                                                                 | Configures the DHCP peer’s localid using one of the following options: <ul style="list-style-type: none"> <li>• autogen-uniqueid - Generates a localid using the device’s unique identity. The system prefixes the device’s unique identity to the string provided here. The device’s unique identity should be existing and configured. For more information on configuring a device’s unique identity, see <i>autogen-uniqueid</i>.</li> <li>• &lt;WORD&gt; - Provide the string.</li> <li>• string - Uses the value provided here as the DHCP peer’s localid.</li> <li>• &lt;WORD&gt; - Provide the string.</li> </ul> |

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #dhcp-peer authentication psk 0 @123testing

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #show context
crypto remote-vpn-client
 dhcp-peer authentication psk 0 @123testing
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #
```

### 7.1.17.6.2 peer

▶ *crypto-remote-vpn-client commands*

Configures IKEv2 peers and assigns them priorities for utilization with remote VPN client connections. A maximum of three (3) peers can be added to support redundancy.

IKEv2 uses an initial handshake in which VPN peers negotiate cryptographic algorithms, mutually authenticate, and establish a session key, creating an IKE-SA. Additionally, a first IPsec SA is established during the initial SA creation. All IKEv2 messages are request/response pairs. It is the responsibility of the side sending the request to retransmit if it does not receive a timely response.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
peer <1-3> ikev2 <IKEV2-PEER-NAME>
```

**Parameters**

- peer <1-3> ikev2 <IKEV2-PEER-NAME>

|                            |                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| peer <1-3>                 | Adds a IKEv2 peer. You can add maximum of three (3) peers to achieve redundancy. <ul style="list-style-type: none"> <li>• &lt;1-3&gt; - Specify a priority level for the peer from 1 - 3 (1 = primary, 2 = secondary, and 3 = redundant).</li> </ul> |
| ikev2<br><IKEV2-PEER-NAME> | Specify the IKEv2 peer's name.<br><b>Note:</b> The peer should be existing and configured. To configure an IKEv2 peer use the <i>crypto &gt; ikev2 &gt; peer &gt; &lt;IKEv2-PEER-NAME&gt;</i> command.                                               |

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #peer
1 ikev2 ikev2Peer1

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #peer 2
ikev2 ikev2Peer2

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #show
context
crypto remote-vpn-client
 peer 1 ikev2 ikev2Peer1
 peer 2 ikev2 ikev2Peer2
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #
```

### 7.1.17.6.3 shutdown

#### ▶ *crypto-remote-vpn-client commands*

Disables remote-vpn-client on this profile or device. Remote VPN client feature is enabled by default.

To enable a disabled remote VPN client execute the *no > shutdown* command.

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
shutdown
```

#### **Parameters**

None

#### **Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #
shutdown
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #
```

### 7.1.17.6.4 transform-set

▶ *crypto-remote-vpn-client commands*

Specifies the IPsec Transform set to use with this remote VPN client. A transform set is a combination of security protocols, algorithms, and other settings applied to IPsec protected client traffic.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
transform-set <IPSEC-XFORM-TAG> {<IPSEC-XFORM-TAG>}
```

**Parameters**

- transform-set <IPSEC-XFORM-TAG> {<IPSEC-XFORM-TAG>}

|                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>transform-set &lt;IPSEC-XFORM- TAG&gt; &lt;IPSEC-XFORM- TAG&gt;</pre> | <p>Associates an IPsec Transform (should be existing and configured) set with this remote VPN client. You can optionally associate more than one transform set with this remote VPN client configuration. List the transform set tags separated by a space.</p> <p><b>Note:</b> To configure a transform-set, use the <i>crypto &gt; ipsec &gt; transform-set</i> command in the profile or device configuration mode.</p> |
|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-
client)#transform-set TransformSet1

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show
context
crypto remote-vpn-client
peer 1 ikev2 ikev2Peer1
transform-set TransformSet1
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```

### 7.1.17.6.5 no

▶ *crypto-remote-vpn-client commands*

Removes the remote VPN client settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [dhcp-peer|peer <1-3>|shutdown|transform-set]
no dhcp-peer [authentication|localid]
no peer <1-3>
no shutdown
no transform-set
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                  |
|-----------------|----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this remote VPN client settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client) #show
context
crypto remote-vpn-client
 peer 1 ikev2 peer5

## 7.1.18 database

### ► Profile Config Commands

Backs up captive-portal and/or NSight database to a specified location and file. When applied to devices, this profile will enable the back up of the specified database. This command also enables you to configure a low-disk-space threshold value.

These parameters can also be configured in the device configuration context of an NX95XX series service platform.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
database [backup|low-disk-space-threshold]
database backup database [captive-portal|nsight] <URL>
database low-disk-space-threshold <10-50>
```

#### Parameters

- database backup database [captive-portal|nsight] <URL>

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database backup<br>database<br>[captive-portal <br>nsight] | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup. <ul style="list-style-type: none"> <li>• database - Selects the database to backup</li> <li>• captive-portal - Backs up captive portal database</li> <li>• nsight - Backs up NSight database</li> </ul> After specifying the database type, configure the destination location and file name. |
| <URL>                                                      | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats:<br>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz<br>sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz<br>tftp://<hostname IP>[:port]/path                                                                                        |

- database low-disk-space-threshold <10-50>

|                                                   |                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database low-disk-<br>space-threshold <10-<br>50> | Configures the low disk space threshold for syslog warning. Once the threshold value configured here is reached a syslog warning is sent. <ul style="list-style-type: none"> <li>• &lt;10-50&gt; - Specify the threshold from 10 - 50. The default is 30.</li> </ul> |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testNX9500)#database backup database nsight ftp://
anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

## 7.1.19 device-onboard

► *Profile Config Commands*

Configures the logo image file name and title displayed on the EGuest device-onboarding portal. The EGuest UI can be accessed only by vendor-admin users.

**NOTE:** Vendor admin users are configured in the Management policy context. For more information, see *user*.

**Supported in the following platforms:**

- Service Platforms – NX9500, NX9510, NX9600, VX9000

**Syntax**

```
device-onboard [logo|title] <WORD>
```

**Parameters**

- device-onboard [logo|title] <WORD>

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>device-onboard [logo title] &lt;WORD&gt;</pre> | <p>Configures the logo and page title displayed on the device-onboarding portal</p> <ul style="list-style-type: none"> <li>• logo – Specify the logo image file name. Note, logo image dimensions must not exceed 109 pixel and 52 pixel in width and height respectively.</li> <li>• title – Specify the UI portal title. Note, the title should not exceed 32 characters in length.</li> </ul> <p>The following keyword is common to both of the above parameters:</p> <ul style="list-style-type: none"> <li>• &lt;WORD&gt; – Specify the logo image file name/page title.</li> </ul> |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
Split-EG-Server(config-device-00-0C-29-09-3C-CC)#device-onboard logo extremenetworks.png
```

```
Split-EG-Server(config-device-00-0C-29-09-3C-CC)#device-onboard title EXTREME NETWORKS ONBOARDING UI
```

```
Split-EG-Server(config-device-00-0C-29-09-3C-CC)#show context include-factory | include device-onboard
 device-onboard title EXTREME NETWORKS ONBOARDING UI
 device-onboard logo extremenetworks.png
Split-EG-Server(config-device-00-0C-29-09-3C-CC)#
```

Following example shows a Management Policy, vendor-admin user configuration:

```
EC-NOC(config-management-policy-EGuest)#show context include-factory | include user
 user onboard-user password 1
 1d5e9d60425bde727261b66b5e7eb0236058e7aae45225961ce7b872ea238240 role vendor-admin group Samsung,Philips,Nest1,Orbit1
EC-NOC(config-management-policy-EGuest)#
```

## 7.1.20 device-upgrade

### ► Profile Config Commands

Configures device firmware upgrade settings on this profile

Administrators can customize profiles with unique device configuration file and firmware upgrade support. In a clustered environment, operations performed on one device are propagated to each member of the cluster and then onwards to devices managed by each cluster member. The number of concurrent device upgrades and their start times can be customized to ensure a sufficient number of devices remain in duty while upgrades are administered to others.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
device-upgrade [add-auto|auto|count|persist-images]
```

```
device-upgrade add-auto [(ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600)]
```

```
device-upgrade auto { (ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600) }
```

```
device-upgrade count <1-128>
```

```
device-upgrade persist-images
```

#### Parameters

- device-upgrade add-auto[(ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600)]

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device-upgrade add-auto | <p>Configures a list of devices types for automatic firmware upgrade</p> <p>This command specifies the types of devices that can be automatically upgraded (if enabled). To enable automatic device firmware upgrade, use the 'auto' command. When enabled, access points, wireless controllers, and service platforms, using this profile, will automatically upgrade firmware on adopted devices that match the specified device types.</p> |
| [<DEVICE-TYPE>]         | <p>Specifies the type of devices to be upgraded. Select the device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, VX9000.</p> <p><b>Note:</b> Multiple device types can be added to the add-auto list.</p>                                                          |

- `device-upgrade auto { (ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600) }`

|                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device-upgrade auto                                                                                 | Enables automatic firmware upgrade on specified device types. When used along with the add-auto command, the auto command allows access points, wireless controllers, and service platforms to automatically upgrade firmware on adopted devices matching the specified device types.                                                                                                                                                                                       |
| <DEVICE-TYPE>                                                                                       | Optional. Specifies the type of device to be lined up for automatic firmware upgrade. ## 7.1.21 diag

### ► Profile Config Commands

Enables looped packet logging. When enabled, devices, using this profile, start logging looped packets to a separate queue. This option is disabled by default.

Looped packet logging can also be enabled in the device configuration context.

**NOTE:** To view logged looped packets, execute the `service > show > diag > pkts` command. For more information, see [service](#).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
diag pkts
```

#### Parameters

- `diag pkts`

|           |                               |
|-----------|-------------------------------|
| diag pkts | Enables looped packet logging |
|-----------|-------------------------------|

#### Example

```
nx9500-6C8809(config-profile-default-nx75xx)#diag pkts

nx9500-6C8809(config-profile-default-nx75xx)#show context include-factory |
include diag
diag pkts
nx9500-6C8809(config-profile-default-nx75xx)#
```

#### Related Commands

|-----------|--------------------------------|
| <i>no</i> | Disables looped packet logging |
|-----------|--------------------------------|

## 7.1.22 dot1x

### ► Profile Config Commands

Configures 802.1x standard authentication controls

Dot1x (or 802.1x) is an IEEE standard for network authentication. It enables media-level (layer 2) access control, providing the capability to permit or deny connectivity based on user or device identity. Dot1x allows port-based access using authentication. An dot1x enabled port can be dynamically enabled or disabled depending on user identity or device connection.

Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Before authentication, the endpoint is unknown, and traffic is blocked. Upon authentication, the endpoint is known and traffic is allowed. The controller or service platform uses source MAC filtering to ensure only the authenticated endpoint is allowed to send traffic.

*Dot1x authentication capabilities is supported on the following platforms:*

#### Supported in the following platforms:

- Access Points — AP6511, AP6521, AP6522, AP6562, AP7161, AP7502, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432
- Wireless Controllers — RFS4000, RFS6000, NX5500, NX7500

*Dot1x supplicant capabilities is supported on the following platforms:*

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, NX5500, NX7500

#### Syntax

```
dot1x [guest-vlan|holdtime|system-auth-control|use]

dot1x holdtime <0-600>
dot1x system-auth-control
dot1x guest-vlan supplicant
dot1x use aaa-policy <AAA-POLICY-NAME>
```

#### Parameters

- dot1x system-auth-control

|                     |                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| system-auth-control | Enables system auth control. Enables dot1x authorization globally for the controller. This feature is disabled by default. |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|

- dot1x holdtime <0-600>

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| holdtime <0-600> | <p>Configures a holdtime value. This is the interval after which an authentication attempt is ignored or failed.</p> <ul style="list-style-type: none"> <li>• &lt;0-600&gt; – Specify a value from 0 - 600 seconds. A value of '0' indicates no holdtime. The default is 600 seconds or 10 minutes.</li> </ul> <p>Adding a hold time at startup allows time for the network to converge before receiving or transmitting 802.1x authentication packets.</p> |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `dot1x guest-vlan supplicant`

|            |                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------|
| guest-vlan | Configures guest VLAN and supplicant behavior<br>This feature is disabled by default.                                         |
| supplicant | Allows 802.1x capable supplicant to enter guest VLAN. When enabled, this is the VLAN that supplicant's traffic is bridged on. |

- `dot1x use aaa-policy <AAA-POLICY-NAME>`

|                                  |                                                                                                                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| use aaa-policy <AAA-POLICY-NAME> | Associates a specified 802.1x AAA policy (for MAC authentication) with this access point profile <ul style="list-style-type: none"> <li>• &lt;AAA-POLICY-NAME&gt; - Specify the AAA policy name. Once specified, this AAA policy is utilized for authenticating user requests.</li> </ul> |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-profile-test-nx5500)#dot1x use aaa-policy OnBoarding

## 7.1.23 dpi

### ► Profile Config Commands

Enables *Deep Packet Inspection* (DPI) on this profile. DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

This command is also available in the device configuration mode.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532, AP7602, AP7612, AP7622, AP7632, AP7662
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```

dpi {custom-app|logging|metadata}

dpi {custom-app <CUSTOM-APP-NAME>}

dpi {logging [level [<0-7>|alerts|critical|debugging|emergencies|errors|
informational|notifications|warnings]|on]}

dpi {metadata [http|ssl|tcp-rtt|voice-video]}

dpi {metadata [http|ssl|voice-video]}

dpi {metadata tcp-rtt {app-group <APPLICATION-GROUP-NAME>}}

```

#### Parameters

- dpi {custom-app <CUSTOM-APP-NAME>}

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dpi                             | Enables DPI on this profile/device context and configures DPI settings. When enabled, all flow traffic is subjected to DPI for detection of applications, application categories, custom applications, and metadata extraction.                                                                                                                                                                                                     |
| custom-app<br><CUSTOM-APP-NAME> | Optional. ## 7.1.24 dscp-mapping

### ► Profile Config Commands

Configures IP *Differentiated Services Code Point* (DSCP) to 802.1p priority mapping for untagged frames

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dscp-mapping <WORD> priority <0-7>
```

#### Parameters

- dscp-mapping <word> priority <0-7>

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WORD>         | Specifies the DSCP value of a received IP packet. This could be a single value or a list. For example, 10-20, 25, 30-35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| priority <0-7> | <p>Specifies the 802.1p priority to use for a packet if untagged. The priority is set on a scale of 0 - 7. The priority values are:</p> <ul style="list-style-type: none"> <li>• 0 - Best effort</li> <li>• 1 - Background</li> <li>• 2 - Spare</li> <li>• 3 - Excellent effort</li> <li>• 4 - Controlled load</li> <li>• 5 - Video</li> <li>• 6 - Voice</li> <li>• 7 - Network control</li> </ul> <p><b>Note:</b> The specified 802.1p priority value is added as a 3-bit IP precedence value in the <i>Type of Service</i> (ToS) field of the IP header used to set the priority. Up to 64 entries are permitted.</p> |

#### Example

```
rfs7000-37FABE(config-profile-default-rfs7000)#dscp-mapping 20 priority 7

rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
 dscp-mapping 20 priority 7
 no autoinstall configuration
 no autoinstall firmware
 crypto isakmp policy default
 crypto ipsec transform-set default esp-aes-256 esp-sha-hmac
 interface mel
 interface gel
 ip dhcp trust
 qos trust dscp
rfs7000-37FABE(config-profile-default-rfs7000)#
```

## 7.1.25 eguest-server (VX9000 only)

► *Profile Config Commands*

Enables the *ExtremeGuest* (EGuest) server

The WiNG EGuest solution is an independently installable VM/Server that provides integrated guest management and analytics. Use this command to enable the EGuest daemon on the EGuest server.

**NOTE:** EGuest being a licensed feature, ensure that the EGUEST-DEV license is applied on the EGuest server's self context. For more information, see *license*.

**Supported in the following platforms:**

- Service Platforms — VX9000

**NOTE:** For more information on configuring an EGuest captive-portal deployment, see *configuring ExtremeGuest captive-portal*.

**Syntax**

`eguest-server`

**Parameters**

- `eguest-server`

|                            |                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>eguest-server</code> | Execute this command, without the 'host' option, on the EGuest server. When executed, the EGuest daemon is enabled on the host.<br>EGuest server can be hosted only a VX9000 platform. |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

On the EGuest server, execute the command without the 'host' option to enable the EGuest daemon.

```
EG-Server(config-device-02-EE-1A-7E-AE-5B)#eguest-server

EG-Server(config-device-02-EE-1A-7E-AE-5B)#show context include-factory | include
eguest-server
eguest-server
EG-Server(config-device-02-EE-1A-7E-AE-5B)#
```

**Related Commands**

|           |                                                          |
|-----------|----------------------------------------------------------|
| <i>no</i> | Disables the EGuest server by stopping the EGuest daemon |
|-----------|----------------------------------------------------------|

## 7.1.26 eguest-server (NOC Only)

### ► Profile Config Commands

Points to the EGuest server when executed along with the 'host' option. The WiNG EGuest solution is an independently installable VM/Server that provides integrated guest management and analytics. Use this command to enable the EGuest daemon on the EGuest server.

**NOTE:** EGuest being a licensed feature, ensure that the EGUEST-DEV license is applied on the EGuest server's self context. For more information, see [license](#).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**NOTE:** For more information on configuring an EGuest captive-portal deployment, see [configuring ExtremeGuest captive-portal](#).

#### Syntax

```
eguest-server <1-3> host <IPv4/IPv6/HOSTNAME> {http|https}
```

#### Parameters

- eguest-server <1-3> host <IPv4/IPv6/HOSTNAME> {http|https}

|                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>eguest-server &lt;1-3&gt; host &lt;IPv4/IPv6/ HOSTNAME&gt; {http https}</pre> | <p>Configures the EGuest server details in the profile/device context of the NOC (access point/controller). When configured, the NOC posts registration requests and captive-portal related data directly to the specified EGuest server.</p> <ul style="list-style-type: none"> <li>• &lt;1-3&gt; - Configures the EGuest server index number. A maximum of three EGuest servers can be configured. <ul style="list-style-type: none"> <li>• host &lt;IPv4/IPv6/HOSTNAME&gt; - Configures the EGuest server's IPv4/IPv6 address or hostname. <ul style="list-style-type: none"> <li>• {http https} - Optional. Configures the mode of connection as HTTP or HTTPS.</li> </ul> </li> </ul> </li> </ul> <p><b>Note:</b> HTTPS is recommended as it uses encryption for transmission and is therefore more secure.</p> |
|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

On the NOC, execute along with the 'host' option to point to the EGuest server.

```
EG-NOC(config-device-74-67-F7-5C-64-4A)#eguest-server 1 host EG-Server https

EG-NOC(config-device-74-67-F7-5C-64-4A)#show context include-factory | include
eguest-server
no eguest-server
eguest-server 1 host EG-Server https
EG-NOC(config-device-74-67-F7-5C-64-4A)#
```

#### Related Commands

|           |                                                             |
|-----------|-------------------------------------------------------------|
| <i>no</i> | Removes the EGuest server IP address/hostname configuration |
|-----------|-------------------------------------------------------------|

## 7.1.27 email-notification

### ► Profile Config Commands

Configures e-mail notification settings. When a system event occurs e-mail notifications are sent (provided message logging is enabled) based on the settings configured here. Use this option to configure the outgoing SMTP server settings.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
email-notification [host|recipient]

email-notification recipient <RECIPIENT-NAME>

email-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>
[port|security|username]

email-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL> [(port <1-65535>, security [none|ssl|starttls], username <SMTP-USERNAME> password [2 <WORD>|<WORD>])]
```

#### Parameters

- email-notification recipient <RECIPIENT-EMAIL>

|                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                     |

## 7.1.28 enforce-version

### ► Profile Config Commands

Enables checking of a device’s firmware version before attempting adoption or clustering

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
enforce-version [adoption|cluster] [full|major|minor|none|strict]
```

#### Parameters

- enforce-version [adoption|cluster] [full|major|minor|none|strict]

|          |                                                                                                                                                                            |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adoption | Verifies firmware versions before adopting. This option is enabled by default.                                                                                             |
| cluster  | Verifies firmware versions before clustering. This option is enabled by default.                                                                                           |
| full     | Allows adoption or clustering when the first four octets of the firmware versions match (for example 5.8.6.0)                                                              |
| major    | Allows adoption or clustering when the first two octets of the firmware versions match (for example 5.8)                                                                   |
| minor    | Allows adoption or clustering when the first three octets of the firmware versions match (for example 5.8.6)                                                               |
| none     | Allows adoption or clustering between any firmware versions                                                                                                                |
| strict   | Allows adoption or clustering only when firmware versions exactly match (for example 5.8.6.0-008B). This is the default setting for both ‘adoption’ and ‘cluster’ options. |

#### Example

```
nx9500-6C8809(config-profile-test-nx5500)#enforce-version cluster full
nx9500-6C8809(config-profile-test-nx5500)#enforce-version adoption major

nx9500-6C8809(config-profile-test-nx5500)#show context
profile nx5500 test-nx5500
no autoinstall configuration
no autoinstall firmware
crypto ikev1 policy ikev1-default
isakmp-proposal default encryption aes-256 group 2 hash sha
.....
interface pppoel
use firewall-policy default
enforce-version adoption major
enforce-version cluster full
service pm sys-restart
router ospf
router bgp
dot1x system-auth-control
dot1x use aaa-policy OnBoarding
nx9500-6C8809(config-profile-test-nx5500)#
```

#### Related Commands

## 7.1.29 environmental-sensor

### ► Profile Config Commands

Configures the environmental sensor settings

An AP8132 sensor module is a USB environmental sensor extension to an AP8132 model access point. It provides a variety of sensing mechanisms, allowing the monitoring and reporting of the AP8132's radio coverage area.

#### Supported in the following platforms:

- Access Points — AP8132

#### Syntax

```
environmental-sensor [humidity|light|motion|polling-interval|temperature]
environmental-sensor [humidity|motion|polling-interval <1-100>|temperature]
environmental-sensor light {holdtime|radio-shutdown|threshold}
environmental-sensor light {holdtime <10-201>|radio-shutdown [all|radio-1|radio-2]}
environmental-sensor light {threshold [high <100-10000>|low <0-1000>]}
```

#### Parameters

- environmental-sensor [humidity|motion|polling-interval <1-100>|temperature]

|                          |                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environmental-sensor     | Configures environmental sensor settings on this profile                                                                                                                                                                                                                                                                            |
| humidity                 | Enables (turns on) humidity sensors. This setting is enabled by default.                                                                                                                                                                                                                                                            |
| motion                   | Enables (turns on) motion sensors. This setting is enabled by default.                                                                                                                                                                                                                                                              |
| polling-interval <1-100> | Configures polling interval, in seconds, on all sensors. This is the interval after which the sensor module polls its environment to assess the various parameters, such as light intensity.<br><ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify a value from 1 - 100 seconds. The default is 5 seconds.</li> </ul> |
| temperature              | Enables (turns on) temperature sensors. This setting is enabled by default.                                                                                                                                                                                                                                                         |

- environmental-sensor light {holdtime <10-201>|radio-shutdown [all|radio-1|radio-2]}

|                      |                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environmental-sensor | Configures environmental sensor settings on this profile                                                                                                                                                                                                                                                                                                                                   |
| light                | Enables (turns on) light sensors and specifies its settings<br>When enabled, the sensor module polls the environment to determine the light intensity. Based on the reading, the system determines whether the AP8132's deployment location has lights on or off. Light intensity also helps determine whether the access point's deployment location is currently populated with clients. |
| holdtime <10-201>    | Optional. Configures a holdtime, in seconds, for the light sensor<br><ul style="list-style-type: none"> <li>• &lt;10-201&gt; - Specify a value from 10 - 201 seconds. The default value is 11 seconds.</li> </ul>                                                                                                                                                                          |

## 7.1.30 events

### ► Profile Config Commands

Displays system event messages

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
events [forward on|on]
```

#### Parameters

- events [forward on|on]

|            |                                                                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| forward on | Forwards system event messages to the wireless controller, service platform, or cluster members. This feature is enabled by default. <ul style="list-style-type: none"> <li>• on – Enables forwarding of system events</li> </ul> |
| on         | Generates system events. This feature is enabled by default.                                                                                                                                                                      |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#events forward on
rfs6000-37FABE(config-profile-default-rfs6000)#
```

| <i>no</i> | Disables or reverts settings to their default |
|-----------|-----------------------------------------------|

## 7.1.31 export

### ► Profile Config Commands

Enables export of startup.log file after every boot

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
export startup-log [max-retries|retry-interval|url]
export startup-log [max-retries <2-65535>|retry-interval <30-86400>|url <URL>]
```

#### Parameters

- export startup-log [max-retries <2-65535>|retry-interval <30-86400>|url <URL>]

|                              |                                                                                                                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| export startup-log           | Enables export of the startup.log file after every boot. This option is disabled by default.                                                                                                             |
| max-retries<br><2-65535>     | Configures the maximum number of retries in case the export process fails <ul style="list-style-type: none"> <li>• &lt;2-65535&gt; - Specify a value from 2 - 65535.</li> </ul>                          |
| retry-interval<br><30-86400> | Configures the interval between two consecutive retries <ul style="list-style-type: none"> <li>• &lt;30-86400&gt; - Specify a value from 30 - 86400 seconds.</li> </ul>                                  |
| url <URL>                    | Configures the destination URL in the following format:<br>tftp://<hostname IP>[:port]/path/file<br>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file<br>sftp://<user>@<hostname IP>[:port]/path/file |

#### Example

## 7.1.32 file-sync

### ► Profile Config Commands

Configures parameters enabling auto syncing of trustpoint/wireless-bridge certificate between the staging-controller and its adopted access points

This command is applicable to the access point's profile as well as device configuration modes.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
file-sync [auto|count <1-20>]
```

#### Parameters

- file-sync [auto|count <1-20>]

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 7.1.33 floor

► *Profile Config Commands*

Sets the floor name where the target device (access point, wireless controller, or service platform using this profile) is physically located. Assigning a building floor name helps in grouping devices within the same general coverage area.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
floor <WORD> {<1-4094>}
```

**Parameters**

- floor <WORD> {<1-4094>}

|                         |                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| floor <WORD> {<1-4094>} | Sets the floor name where the target device is located <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the floor name (should not exceed 64 characters in length).</li> <li>• &lt;1-4094&gt; - Optional. Configures the floor number from 1 - 4094. The default is 1.</li> </ul> |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#floor fifth

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs7000 default-rfs7000
bridge vlan 1
 ip igmp snooping
 ip igmp snooping querier
area Ecospace
floor fifth
autoinstall configuration
autoinstall firmware
--More--
rfs6000-37FABE(config-profile-default-rfs6000)#
```

**Related Commands**

## 7.1.34 gre

### ► Profile Config Commands

The following table summarizes commands that allow you to enter the GRE configuration mode:

| Command                    | Description                                                                                                                                                                        | Reference         |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>gre</i>                 | Enables GRE tunneling on a profile/device. This command also creates a GRE tunnel and enters its configuration mode. Use this command to modify an existing GRE tunnel's settings. | <i>page 7-166</i> |
| <i>gre-config-instance</i> | Summarizes GRE tunnel configuration mode commands                                                                                                                                  | <i>page 7-168</i> |

### 7.1.34.1 gre

► *gre*

Enables *Generic Routing Encapsulation* (GRE) tunneling on this profile, and creates a new GRE tunnel or modifies an existing GRE tunnel.

The GRE protocol allows encapsulation of one protocol over another. It is a tunneling protocol that transports any layer 3 protocol over an IP network. When enabled, a payload packet is first encapsulated in the GRE protocol. The GRE encapsulated payload is then encapsulated in another IP packet before being forwarded to the destination.

GRE tunneling can be configured to bridge Ethernet packets between WLANs and a remote WLAN gateway over an IPv4 GRE tunnel. The tunneling of 802.3 packets using GRE is an alternative to MiNT or L2TPv3. Related features like ACLs for extended VLANs are still available using layer 2 tunneling over GRE.

Using GRE, access points map one or more VLANs to a tunnel. The remote end point is a user-configured WLAN gateway IP address, with an optional secondary IP address should connectivity to the primary GRE peer be lost. VLAN traffic is expected in both directions in the GRE tunnel. A WLAN mapped to these VLANs can be either open or secure. Secure WLANs require authentication to a remote RADIUS server available within your deployment using standard RADIUS protocols. Access Points can reach both the GRE peer as well as the RADIUS server using IPv4.

The WiNG software now supports for both IPv4 or IPv6 tunnel endpoints. However, a tunnel needs to contain either IPv4 or IPv6 formatted device addresses and cannot be mixed. With the new IPv6 tunnel implementation, all outbound packets are encapsulated with the GRE header, then the IPv6 header. The header source IP address is the local address of the IPv6 address of tunnel interface, and the destination address peer address of the tunnel. All inbound packets are de-capsulated by removing the IPv6 and GRE header before sending it over to the IP stack.

**NOTE:** Only one GRE tunnel can be created for every profile.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
gre tunnel <GRE-TUNNEL-NAME>
```

**Parameters**

- gre tunnel <GRE-TUNNEL-NAME>

|                                 |                                                                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gre tunnel<br><GRE-TUNNEL-NAME> | Creates a new GRE tunnel or modifies an existing GRE tunnel <ul style="list-style-type: none"> <li>• &lt;GRE-TUNNEL-NAME&gt; – If creating a new tunnel, specify a unique name for it. If modifying an existing tunnel, specify its name.</li> </ul> |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

### 7.1.34.2 gre-config-instance

#### ► gre

The following table summarizes GRE tunnel configuration mode commands:

| Command                       | Description                                                                                             | Reference                  |
|-------------------------------|---------------------------------------------------------------------------------------------------------|----------------------------|
| <i>dscp</i>                   | Sets the GRE tunnel's <i>Differentiated Services Code Point</i> (DSCP) / 802.1q priority value          | <a href="#">page 7-169</a> |
| <i>establishment-criteria</i> | Configures the GRE tunnel establishment criteria                                                        | <a href="#">page 7-169</a> |
| <i>failover</i>               | Enables periodic pinging of the primary gateway to assess its availability, in case it is unreachable   | <a href="#">page 7-171</a> |
| <i>mtu</i>                    | Configures the <i>maximum transmission unit</i> (MTU) for IPv4/IPv6 L2GRE tunnel endpoints              | <a href="#">page 7-172</a> |
| <i>native</i>                 | Configures native trunking settings for this GRE tunnel                                                 | <a href="#">page 7-173</a> |
| <i>no</i>                     | Removes the GRE tunnel settings based on the parameters passed                                          | <a href="#">page 7-174</a> |
| <i>peer</i>                   | Configures the GRE tunnel's end-point peers                                                             | <a href="#">page 7-175</a> |
| <i>tunneled-vlan</i>          | Defines the VLAN that connected clients use to route GRE-tunneled traffic within their respective WLANs | <a href="#">page 7-176</a> |

### 7.1.34.2.1 dscp

▶ *gre-config-instance*

Sets the GRE tunnel's DSCP / 802.1q priority value from encapsulated packets to the outer packet IPv4 header.

This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dscp [<0-63>|reflect]
```

#### Parameters

- dscp [<0-63>|reflect]

|              |                                                                                           |
|--------------|-------------------------------------------------------------------------------------------|
| dscp <0-63>  | Specifies the DSCP 802.1q priority value for outer packets from 0 - 63. The default is 1. |
| dscp reflect | Copies the DSCP 802.1q value from inner packets                                           |

#### Example

```
rfs4000-229D58 (config-device 00-23-68-22-9D-58-gre-tunnel-testGREtunnel) #dscp 20
rfs4000-229D58 (config-device 00-23-68-22-9D-58-gre-tunnel-testGREtunnel) #show
context
gre tunnel testGREtunnel
 dscp 20
rfs4000-229D58 (config-device 00-23-68-22-9D-58-gre-tunnel-testGREtunnel) #
```

#### Related Commands

|           |                                                                |
|-----------|----------------------------------------------------------------|
| <i>no</i> | Removes the GRE tunnel settings based on the parameters passed |
|-----------|----------------------------------------------------------------|

### 7.1.34.2.2 establishment-criteria

▶ *gre-config-instance*

Configures the GRE tunnel establishment criteria

In a multi-controller RF domain, it is always the master node that establishes the tunnel. The tunnel is created only if the tunnel device is designated as one of the following: vrrp-master, cluster-master, or rf-domain-manager.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]
```

**Parameters**

- establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]

|                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>establishment-criteria [always] cluster-master  rf-domain-manager  vrrp-master &lt;1-255&gt;]</pre> | <p>Configures the GRE tunnel establishment criteria. The options are:</p> <ul style="list-style-type: none"> <li>• always – Always automatically establishes tunnel (default setting). The tunnel device need not be a cluster master, RF Domain manager, or VRRP master to establish the GRE tunnel. This is the default setting.</li> <li>• cluster-master – Establishes tunnel only if the tunnel device is designated as the cluster master</li> <li>• rf-domain-manager – Establishes tunnel only if the tunnel device is designated as the RF Domain manager</li> <li>• vrrp-master &lt;1-255&gt; – Establishes tunnel only if the tunnel device is designated as the <i>Virtual Router Redundancy (VRRP)</i> master             <ul style="list-style-type: none"> <li>• &lt;1-255&gt; – Configures the VRRP group ID from 1 - 255. A VRRP group enables the creation of a group of routers as a default gateway for redundancy. Clients can point to the IP address of the VRRP virtual router as their default gateway and utilize a different group member if a master becomes unavailable.</li> </ul> </li> </ul> |
|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#establishment-
criteria rf-domain-manager

nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#show context
gre tunnel testGREtunnel
establishment-criteria rf-domain-manager
nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#
```

### 7.1.34.2.3 failover

▶ *gre-config-instance*

Enables periodic pinging of the primary gateway to assess its availability. When enabled, the system continues pinging, an unreachable gateway, for a specified number of times and at the specified interval.

This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
failover interval <1-250> retry <1-10>
```

**Parameters**

- failover interval <1-250> retry <1-10>

|                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 7.1.34.2.4 mtu

▶ *gre-config-instance*

Configures the MTU for IPv4/IPv6 L2GRE tunnel endpoints

The MTU is the largest physical packet size (in bytes) transmittable within the tunnel. Any messages larger than the configured MTU are divided into smaller packets before transmission. Larger the MTU greater is the efficiency because each packet carries more user data, while protocol overheads, such as headers or underlying per-packet delays remain fixed; the resulting higher efficiency means a slight improvement in bulk protocol throughput. A larger MTU results in the processing of fewer packets for the same amount of data.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
mtu [ipv4 <900-1476>|ipv6 <1236-1456>]
```

**Parameters**

- mtu [ipv4 <900-1476>|ipv6 <1236-1456>]

|                                                                |                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>mtu [ipv4 &lt;900-1476&gt;] ipv6 &lt;1236-1456&gt;]</pre> | <p>Configures the MTU for L2GRE tunnel endpoints</p> <ul style="list-style-type: none"> <li>• ipv4 &lt;900-1476&gt; - Configures IPv4 L2GRE tunnel endpoint MTU from 900 - 1476. ```

### 7.1.34.2.5 native

▶ *gre-config-instance*

Configures native trunking settings for this GRE tunnel

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
native [tagged|vlan <1-4094>]
```

**Parameters**

- native [tagged|vlan <1-4094>]

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| native tagged        | <p>Enables native VLAN tagging</p> <p>The IEEE 802.1Q specification is supported for tagging frames and coordinating VLANs between devices. IEEE 802.1Q adds four bytes to each frame identifying the VLAN ID for upstream devices that the frame belongs to. If the upstream Ethernet device does not support IEEE 802.1Q tagging, it does not interpret the tagged frames. When VLAN tagging is required between devices, both devices must support tagging and be configured to accept tagged VLANs. When a frame is tagged, the 12 bit frame VLAN ID is added to the 802.1Q header so upstream Ethernet devices know which VLAN ID the frame belongs to. The device reads the 12 bit VLAN ID and forwards the frame to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream device classifies the frame using the default or native VLAN assigned to the Trunk port. The native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. This feature is disabled by default.</p> |
| native vlan <1-4094> | <p>Specifies a numerical VLAN ID (1 - 4094) for the native VLAN</p> <p>The native VLAN allows an Ethernet device to associate untagged frames to a VLAN, when no 802.1q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic is directed over when using a port in trunk mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Example**

```

nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#native tagged
nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#native vlan 20
nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#show context
gre tunnel testGREtunnel
 native vlan 20
 native tagged
 mtu ipv4 1200
 mtu ipv6 1300
 establishment-criteria rf-domain-manager
nx9500-6C8809(config-profile testNX9500-gre-tunnel-testGREtunnel)#

```

| <i>no</i> | Removes the GRE tunnel settings based on the parameters passed |
|-----------|----------------------------------------------------------------|

### 7.1.34.2.6 no

#### ▶ *gre-config-instance*

Removes or resets the GRE tunnel settings based on the parameters passed

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [dscp|establishment-criteria|failover|mtu|native|peer|tunneled-vlan]
no [dscp|establishment-criteria|failover|tunneled-vlan]
no mtu [ipv4|ipv6]
no native [tagged|vlan]
no peer <1-2>
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                            |
|-----------------|----------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets the GRE tunnel's settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------|

#### Example

The following example shows the GRE tunnel 'testGREtunnel' settings before the no commands are executed:

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGREtunnel)#show
context
gre tunnel testGREtunnel
peer 1 ip 192.168.13.6
native vlan 1
tunneled-vlan 1,10
native tagged
dscp 20
failover interval 200 retry 5

The following example shows the GRE tunnel 'testGREtunnel' settings after the no commands are executed:

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGREtunnel)#show
context
gre tunnel testGREtunnel
peer 1 ip 192.168.13.6
native tagged
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGREtunnel)#
```

### 7.1.34.2.7 peer

▶ *gre-config-instance*

Adds the GRE tunnel's end-point peers. A maximum of two peers, representing the tunnel's end points, can be added for each GRE tunnel.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
peer <1-2> ip <IPv4/IPv6>
```

#### Parameters

- peer <1-2> ip <IPv4/IPv6>

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <i>no</i> | Removes the GRE tunnel settings based on the parameters passed |
|-----------|----------------------------------------------------------------|

### 7.1.34.2.8 tunneled-vlan

▶ *gre-config-instance*

Defines the VLAN that connected clients use to route GRE tunneled traffic within their respective WLANs

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
tunneled-vlan <VLAN-ID>
```

**Parameters**

- tunneled-vlan <VLAN-ID>

|                            |                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tunneled-vlan<br><VLAN-ID> | Specifies the VLANs associated with this GRE tunnel<br><br>• <VLAN-ID> - Specify the VLAN IDs. Specify a comma-separated list of IDs, to specify multiple VLANs. For example, 1,10,12,16-20. |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRE Tunnel) #
tunneled-vlan 10

rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRE Tunnel) #show
context
gre tunnel testGRE Tunnel
peer 1 ip 192.168.13.6
native vlan 1
tunneled-vlan 1,10
native tagged
dscp 20
failover interval 200 retry 5
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRE Tunnel) #
```

**Related Commands**

## 7.1.35 http-analyze

### ► Profile Config Commands

Enables forwarding of HTTP request related data to the HTTP analytics engine

Wireless clients (MUs) connect to APs and route their HTTP requests through the APs. These APs extract and forward HTTP request packets, through MiNT, to the NX series controller. The NX series controller uses a new analytic daemon to cache, format, and forward information to the analytics engine. Currently the analytics daemon is supported only on the NX series service platform. Therefore, it is essential that all APs should use an NX series service platform as controller.

In a hierarchically organized network, HTTP analytics data forwarding is a simple and transparent process. The site controllers receive the HTTP data from adopted APs adopted. This data is compressed and forwarded to the *Network Operations Center* (NOC) controller. There is no need for a separate configuration to enable this feature.

Use this command to configure the mode and interval at which data is sent to the controller and the external analytics engine. This command also configures the external engine’s details, such as URL, credentials, etc.

**NOTE:** The Analytics module helps gather data about customer behavior such as web sites visited, search terms used, mobile device types, number of new users vs. repeat users. This data provides a better understanding of pricing strategies and promotions being run by competitors.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
http-analyze [compress|external-server|update-interval <1-3600>]
```

```
http-analyze [compress|update-interval <1-3600>
```

```
http-analyze external-server [password <WORD>|proxy <URL>|update-interval <1-3600>|url <URL>|username <WORD>|validate-server-certificate]
```

#### Parameters

- http-analyze [compress|update-interval <1-3600>]

|                          |                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http-analyze             | Configures HTTP analysis related parameters                                                                                                                                                                                             |
| compress                 | Compresses update files before forwarding to the controller. This option is disabled by default.                                                                                                                                        |
| update-interval <1-3600> | Configures the interval, in seconds, at which buffered packets are pushed to the controller <ul style="list-style-type: none"> <li>• &lt;1-3600&gt; – Specify the interval from 1 - 3600 seconds. The default is 60 seconds.</li> </ul> |

- http-analyze external-server [password <WORD>|proxy <URL>|update-interval |url |username |validate-server-certificate]

|                              |                                                            |
|------------------------------|------------------------------------------------------------|
| http-analyze external-server | Configures the external HTTP analytics engine’s parameters |
|------------------------------|------------------------------------------------------------|

|                             |                                                                                                                                                                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password <WORD>             | Configures the external analytics engine's password <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Provide the login password. This is the password associated with the user name needed to access the external analytics engine.</li> </ul>                                       |
| proxy <URL>                 | Configures the proxy server's <i>uniform resource locator</i> (URL) <ul style="list-style-type: none"> <li>• &lt;URL&gt; - Specify the proxy server's URL in the following format: http://username:password@proxy-server:port. For example, http://mot:sym@wwwgate0.mot.com:1080</li> </ul> |
| update-interval <1-36000>   | Configures the interval, in seconds, at which buffered packets are pushed to the external analytics engine <ul style="list-style-type: none"> <li>• &lt;1-3600&gt; - Specify the interval from 1 - 3600 seconds. The default is 60 seconds.</li> </ul>                                      |
| url <URI>                   | Configures the external analytics engine's IP address or URL <ul style="list-style-type: none"> <li>• &lt;URL&gt; - Provide the IP address or URL.</li> </ul>                                                                                                                               |
| username <WORD>             | Configures the user name needed to access the external analytics engine <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Provide the user name.</li> </ul>                                                                                                                           |
| validate-server-certificate | Validates the external analytics engine's certificate, if it is using HTTPS as the mode of access                                                                                                                                                                                           |

## 7.1.36 interface

### ► Profile Config Commands

The following table summarizes interface configuration commands:

| Command                                       | Description                                                                                                                   | Reference         |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>interface</i>                              | Selects an interface to configure                                                                                             | <i>page 7-181</i> |
| <i>interface-config-ge-instance</i>           | Summarizes Ethernet interface (associated with the wireless controller or service platform) configuration commands            | <i>page 7-184</i> |
| <i>interface-config-vlan-instance</i>         | Summarizes VLAN interface configuration commands                                                                              | <i>page 7-217</i> |
| <i>interface-config-port-channel-instance</i> | Summarizes port-channel interface configuration commands                                                                      | <i>page 7-235</i> |
| <i>interface-config-radio-instance</i>        | Summarizes radio interface configuration commands (applicable to devices with built-in radios)                                | <i>page 7-252</i> |
| <i>interface-config-wwan-instance</i>         | Summarizes WWAN interface configuration commands                                                                              | <i>page 7-327</i> |
| <i>interface-config-bluetooth-instance</i>    | Summarizes the Bluetooth radio interface configuration commands (supported only on the AP8432 and AP8533 model access points) | <i>page 7-337</i> |

### 7.1.36.1 interface

► *interface*

Selects an interface to configure

A profile’s interface configuration can be defined to support separate physical Ethernet configurations both unique and specific to RFS4000, RFS6000 controllers and NX7500 and NX95XX series service platforms. Ports vary depending on the platform, but controller or service platform models do have some of the same physical interfaces.

A controller or service platform requires its virtual interface be configured for layer 3 (IP) access or layer 3 service on a VLAN. A virtual interface defines which IP address is associated with each VLAN ID the controller or service platform is connected to.

If the profile is configured to support an access point radio, an additional radio interface is available, unique to the access point’s radio configuration.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax Service Platforms**

```
interface [<INTERFACE-NAME>|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|
radio [1|2|3]|serial <1-4>|tle1 <1-4>|up <1-2>|vlan <1-4094>|wwan1|xge <1-4>]
```

**Syntax Access Points and Wireless Controllers**

```
interface [<INTERFACE-NAME>|bluetooth <1-1>|fe <1-4>|ge <1-8>|me1|port-channel <1-
4>|pppoe1|radio [1|2|3]|up1|vlan <1-4094>|wwan1|xge <1-4>]
```

**Parameters**

- interface [<INTERFACE-NAME>|bluetooth <1-1>|fe <1-4>|ge <1-8>|me1|port-channel <1-4>|radio [1|2|3]|serial <1-4>|tle1 <1-4>|up <1-2>|vlan <1-4094>|wwan1|xge <1-4>]

|                  |                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <INTERFACE-NAME> | Enters the configuration mode of the interface identified by the <INTERFACE-NAME> keyword                                                                                                                                                                                                                   |
| bluetooth <1-1>  | Selects the Bluetooth radio interface <ul style="list-style-type: none"> <li>• &lt;1-1&gt; - Specify the Bluetooth radio interface index from 1 - 1. As of now only one Bluetooth radio interface is supported.</li> </ul> This interface is applicable only for the AP8432 and AP8533 model access points. |
| fe <1-4>         | Selects a FastEthernet interface <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Specify the interface index from 1 - 4.</li> </ul>                                                                                                                                                                  |
| ge <1-24>        | Selects a GigabitEthernet interface <ul style="list-style-type: none"> <li>• &lt;1-24&gt; - Specify the interface index from 1 - 24. (4 for RFS7000 and 8 for RFS6000).</li> </ul>                                                                                                                          |

|                    |                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| me1                | Selects a management interface<br>Not applicable for RFS4000 model devices.<br>The management interface is applicable only for RFS6000 and RFS7000 model controllers.                                                    |
| port-channel <1-4> | Selects the port channel interface<br>• <1-4> – Specify the interface index from 1 - 4.                                                                                                                                  |
| pppoe1             | Selects the PPP over Ethernet interface to configure                                                                                                                                                                     |
| radio [1 2 3]      | Selects a radio interface<br>• 1 – Selects radio interface 1<br>• 2 – Selects radio interface 2<br>• 3 – Selects radio interface 3<br>The radio interface is not available on wireless controllers or service platforms. |
| up1                | Selects the uplink GigabitEthernet interface                                                                                                                                                                             |
| vlan <1-4094>      | Selects a VLAN interface<br>• <1-4094> – Specify the SVI VLAN ID from 1 - 4094.                                                                                                                                          |
| wwan1              | Selects a Wireless WAN interface<br>This interface is applicable only to AP7161, AP81XX, AP8232, RFS4000, RFS6000 model access points and controllers.                                                                   |
| xge <1-4>          | Selects a TenGigabitEthernet interface<br>• <1-2> – Specify the interface index from 1 - 4.                                                                                                                              |

**Usage Guidelines**

The ports available on a device vary depending on the model. For example, the following ports are available on RFS4000, RFS6000 and RFS7000 model wireless controllers:

- RFS4000 - ge1, ge2, ge3, ge4, ge5, up1
- RFS6000 - ge1, ge2, ge3, ge4, ge5, ge6, ge7, ge8, me1, up1

GE ports on are RJ-45 supporting 10/100/1000Mbps..

ME ports are available on RFS6000 platforms. ME ports are out-of-band management ports used to manage the controller via CLI or Web UI, even when the other ports on the controller are unreachable.

The ports available on service platforms also vary depending on the model. For example, the following ports are available on NX series service platforms:

- NX7500 - ge1-ge10, xge1-xge2
- NX95XX series - ge1, ge2, xge1-xge4
- EX3500 – ge1-1 to ge1-24
- EX3548 – ge1-1 to ge1-48

GE ports are available on devices, such as RFS4000 and RFS6000controllers. GE ports are RJ-45 supporting 10/100/1000Mbps.

ME ports are available on RFS6000 platforms. ME ports are out-of-band management ports used to manage the controller via CLI or Web UI, even when the other ports on the controller are unreachable.

UP ports are available on RFS4000 and RFS6000 platforms. A UP port is used to connect to the backbone network. UP ports are available on devices, such as RFS4000 and RFS6000 controllers. A UP port supports either RJ-45 or fiber. The UP port is the preferred means to connect to the backbone as it has a non-blocking 1gbps connection unlike the GE ports.

The following ports are available on access points:

- AP6511 - fe1, fe2, fe3, fe4, up1
- AP6521 - GE1/POE (LAN)
- AP6522 - GE1/POE (LAN)
- AP6532 - GE1/POE
- AP6562 - GE1/POE
- AP7161 - GE1/POE (LAN), GE2 (WAN)
- AP7502 - GE1 (THRU), fe1, fe2, fe3,
- AP7522 - GE1/POE (LAN)
- AP7532 - GE1/POE (LAN)
- AP81XX - GE1/POE (LAN), GE2 (WAN)
- AP82XX - GE1/POE (LAN), GE2 (WAN)

**NOTE:** For a NX7500 model service platform, there are options for either a 2 port or 4 port network management card. Either card can be managed using WiNG. If the 4 port card is used, ports ge7-ge10 are available. If the 2 port card is used, ports xge1-xge2 are available.

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan44)#
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan44)#?
SVI configuration commands:
 crypto Encryption module
 description Vlan description
 dhcp Dynamic Host Configuration Protocol (DHCP)
 dhcp-relay-incoming Allow on-board DHCP server to respond to relayed DHCP
 packets on this interface
 ip Interface Internet Protocol config commands
 ipv6 Internet Protocol version 6 (IPv6)
 no Negate a command or set its defaults
 shutdown Shutdown the selected interface
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system

### 7.1.36.2 interface-config-ge-instance

► *interface*

This section documents the GigabitEthernet configuration commands.

GE port placement and quantity varies depending on the controller, service platform, or access point model. Configure the GE interface either in the device's profile-config context or directly on a device.

The following example uses the config-profile-default-rfs7000 instance to configure a GigabitEthernet interface:

```

nx9500-6C8809(config-profile-testNX9000-if-ge2)#?
Interface configuration commands:
 captive-portal-enforcement Enable captive-portal enforcement on this port
 cdp Cisco Discovery Protocol
 channel-group Channel group commands
 description Interface specific description
 dot1x 802.1X
 duplex Set duplex to interface
 ip Internet Protocol (IP)
 ipv6 Internet Protocol version 6 (IPv6)
 lacp LACP commands
 lacp-channel-group LACP channel commands
 lldp Link Local Discovery Protocol
 mac-auth Enable mac-auth for this port
 no Negate a command or set its defaults
 power PoE Command
 qos Quality of service
 remove-override Remove configuration item override from the
 device (so profile value takes effect)
 shutdown Shutdown the selected interface
 spanning-tree Spanning tree commands
 speed Configure speed
 switchport Set switching mode characteristics
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or
 terminal

nx9500-6C8809(config-profile-testNX9000-if-ge2)#

```

The following table summarizes the interface configuration commands:

| Command                           | Description                                                         | Reference                  |
|-----------------------------------|---------------------------------------------------------------------|----------------------------|
| <i>captive-portal-enforcement</i> | Enables captive-portal enforcement on this Ethernet port            | <a href="#">page 7-186</a> |
| <i>cdp</i>                        | Enables <i>Cisco Discovery Protocol</i> (CDP) on this Ethernet port | <a href="#">page 7-187</a> |
| <i>channel-group</i>              | Assigns this Ethernet port to a channel group                       | <a href="#">page 7-188</a> |
| <i>description</i>                | Configures a description for this Ethernet port                     | <a href="#">page 7-189</a> |
| <i>dot1x (authenticator)</i>      | Configures 802.1X authenticator settings                            | <a href="#">page 7-190</a> |

| Command                   | Description                                                                                           | Reference                  |
|---------------------------|-------------------------------------------------------------------------------------------------------|----------------------------|
| <i>dot1x (supplicant)</i> | Configures 802.1X supplicant settings                                                                 | <a href="#">page 7-193</a> |
| <i>duplex</i>             | Specifies the duplex mode for the interface                                                           | <a href="#">page 7-195</a> |
| <i>ip</i>                 | Sets the IP address for this Ethernet port                                                            | <a href="#">page 7-196</a> |
| <i>ipv6</i>               | Sets the DHCPv6 and ICMPv6 <i>neighbor discovery</i> (ND) components for this interface               | <a href="#">page 7-197</a> |
| <i>lACP</i>               | Configures the selected GE port's <i>Link Aggregation Control Protocol</i> (LACP) port-priority value | <a href="#">page 7-199</a> |
| <i>lACP-channel-group</i> | Configures the selected GE port as a member of a port-channel group (also referred as LAG)            | <a href="#">page 7-200</a> |
| <i>lldp</i>               | Configures <i>Link Local Discovery Protocol</i> (LLDP)                                                | <a href="#">page 7-202</a> |
| <i>mac-auth</i>           | Enables MAC-based authentication on this Ethernet port                                                | <a href="#">page 7-203</a> |
| <i>no</i>                 | Removes or reverts the selected Ethernet port settings                                                | <a href="#">page 7-204</a> |
| <i>power</i>              | Configures <i>Power over Ethernet</i> (PoE) settings on this interface                                | <a href="#">page 7-205</a> |
| <i>qos</i>                | Enables QoS                                                                                           | <a href="#">page 7-206</a> |
| <i>shutdown</i>           | Disables the selected Ethernet port                                                                   | <a href="#">page 7-207</a> |
| <i>spanning-tree</i>      | Configures spanning tree parameters                                                                   | <a href="#">page 7-208</a> |
| <i>speed</i>              | Specifies the speed on this Ethernet port                                                             | <a href="#">page 7-211</a> |
| <i>switchport</i>         | Sets interface switching mode characteristics                                                         | <a href="#">page 7-212</a> |
| <i>use</i>                | Associates IPv4, IPv6, and/or MAC ACL with the selected Ethernet port                                 | <a href="#">page 7-215</a> |

### 7.1.36.2.1 captive-portal-enforcement

▶ *interface-config-ge-instance*

Enables application of captive portal access permission rules to data transmitted over this specific Ethernet port. This setting is disabled by default.

Captive portal enforcement allows users on the wired network to pass traffic through the captive portal without being redirected to an authentication page. Authentication instead takes place when the RADIUS server is queried against the wired user's MAC address. If the MAC address is in the RADIUS server's user database, the user can pass traffic on the captive portal.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
captive-portal-enforcement {fall-back}
```

#### Parameters

- captive-portal-enforcement {fall-back}

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>captive-portal-enforcement<br/>fall-back</p> | <p>Enables captive-portal enforcement on this Ethernet port</p> <ul style="list-style-type: none"> <li>• fall-back - Optional. Enforces captive portal validation only if port authentication fails. When selected, captive portal policies are enforced only when RADIUS authentication of the client MAC address is not successful. If this option is not selected, captive portal policies are enforced regardless of the client's MAC address being in the RADIUS server's user database or not.</li> </ul> |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-device-B4-C7-99-6D-CD-4B-if-ge2)#captive-portal-
enforcement

rfs6000-37FABE(config-device-B4-C7-99-6D-CD-4B-if-ge2)#show context
interface ge2
 captive-portal-enforcement
rfs6000-37FABE(config-device-B4-C7-99-6D-CD-4B-if-ge2)#
```

#### Related Commands

|-----------|-------------------------------------------------------|
| <i>no</i> | Disables captive-portal enforcement on this interface |
|-----------|-------------------------------------------------------|

### 7.1.36.2.2 cdp

▶ *interface-config-ge-instance*

Enables CDP on the selected GE port

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
cdp [receive|transmit]
```

**Parameters**

- cdp [receive|transmit]

|          |                                                                                                                                                                                                                  |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| receive  | Enables CDP packet snooping on this interface. When enabled, the port receives periodic interface updates from a multicast address. This option is enabled by default.                                           |
| transmit | Enables CDP packet transmission on this interface. When enabled, the port sends out periodic interface updates to a multicast address to advertise its presence to neighbors. This option is enabled by default. |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#cdp transmit
```

**Related Commands**

|           |                                                                                        |
|-----------|----------------------------------------------------------------------------------------|
| <i>no</i> | Disables CDP packet snooping on the controller or service platform's selected GE ports |
|-----------|----------------------------------------------------------------------------------------|

### 7.1.36.2.3 channel-group

▶ *interface-config-ge-instance*

Assigns this Ethernet port to a channel group. Ethernet ports can be aggregated to form a channel group. For example, an RFS7000 has four (4) Ethernet ports (1, 2, 3, & 4). These can be aggregated to form a minimum of one and maximum of two channel groups. A port can be a member of only one channel group at a time.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
channel-group <1-4>
```

#### Parameters

- channel-group <1-4>

|       |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-4> | <p>Specifies a channel group number from 1 - 4. The number of channel groups supported varies with the device type. For example:</p> <p>RFS7000 - Supports two channel groups</p> <p>RFS6000 - Supports four channel groups</p> <p>RFS4000 - Supports three channel groups</p> <p>NX5500 - Supports three channel groups</p> <p>NX75XX - Supports four channel groups</p> <p>NX95XX - Supports two channel groups</p> |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#channel-group 1

rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#show context
interface ge1
 ip dhcp trust
 qos trust dscp
 qos trust 802.1p
 channel-group 1
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#
```

#### Related Commands

|           |                                                      |
|-----------|------------------------------------------------------|
| <i>no</i> | Removes the channel group to which this port belongs |
|-----------|------------------------------------------------------|

### 7.1.36.2.4 description

▶ *interface-config-ge-instance*

Configures a description for this Ethernet port

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
description [<LINE>|<WORD>]
```

#### Parameters

- description [<LINE>|<WORD>]

|        |                                                                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------------------|
| <LINE> | Configures the maximum length (number of characters) of the interface description                                                   |
| <WORD> | Configures a unique description for this interface. The description should not exceed the length specified by the <LINE> parameter. |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#description "This is
GigabitEthernet interface for Royal King"

rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#show context
interface ge1
 description "This is GigabitEthernet interface for Royal King"
 ip dhcp trust
 qos trust dscp
 qos trust 802.1p
 channel-group 1
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#
```

#### Related Commands

|           |                                   |
|-----------|-----------------------------------|
| <i>no</i> | Removes the interface description |
|-----------|-----------------------------------|

### 7.1.36.2.5 dot1x (authenticator)

▶ *interface-config-ge-instance*

Configures 802.1X authenticator settings

Dot1x (or 802.1x) is an IEEE standard for network authentication. It enables media-level (layer 2) access control, providing the capability to permit or deny connectivity based on user or device identity. Dot1x allows port-based access using authentication. An dot1x enabled port can be dynamically enabled or disabled depending on user identity or device connection.

Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Before authentication, the endpoint is unknown, and traffic is blocked. Upon authentication, the endpoint is known and traffic is allowed. The controller or service platform uses source MAC filtering to ensure only the authenticated endpoint is allowed to send traffic.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6562, AP7161, AP7502, AP81XX, AP8232, AP8432
- Wireless Controllers — RFS4000, RFS6000, NX5500, NX7500

**Syntax**

```
dot1x authenticator [guest-vlan|host-mode|max-reauth-req|port-control|
reauthenticate|timeout]
```

```
dot1x authenticator [guest-vlan <1-4094>|host-mode [multi-host|single-host]|
max-reauth-req <1-10>|port-control [auto|force-authorized|force-unauthorized]|
reauthenticate|timeout [quiet-period|reauth-period] <1-65535>]
```

**NOTE:** The dot1x (802.1x) supplicant settings are documented in the next section.

**Parameters**

- dot1x authenticator [guest-vlan <1-4094>|host-mode [multi-host|single-host]| max-reauth-req <1-10>|port-control [auto|force-authorized|force-unauthorized]| reauthenticate|timeout [quiet-period|reauth-period]]

|                                    |                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x authenticator                | Configures 802.1x authenticator settings                                                                                                                                                                                                                                                            |
| guest-vlan <1-4094>                | Configures the guest VLAN for this interface. This is the VLAN, traffic is bridged on if this port is unauthorized and the guest VLAN is globally enabled. Select the VLAN index from 1 - 4094.                                                                                                     |
| host-mode [multi-host single-host] | Configures the host mode for this interface <ul style="list-style-type: none"> <li>• multi-host - Configures multiple host mode</li> <li>• single-host - Configures single host mode. This is the default setting.</li> </ul>                                                                       |
| max-reauth-req <1-10>              | Configures maximum number of re-authorization retries for the supplicant. This is the maximum number of re-authentication attempts made before this port is moved to unauthorized. <ul style="list-style-type: none"> <li>• &lt;1-10&gt; - Specify a value from 1 -10. The default is 2.</li> </ul> |

|                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port-control<br>[auto]<br>force-authorized]<br>force-unauthorized] | Configures port control state <ul style="list-style-type: none"> <li>• auto - Configures auto port state</li> <li>• force-authorized - Configures authorized port state. This is the default setting.</li> <li>• force-unauthorized - Configures unauthorized port state</li> </ul>                                                                                                                                                                                                                                                                                              |
| reauthenticate                                                     | Enables re-authentication for this port. When enabled, clients are forced to re-authenticate on this port. The setting is disabled by default. Therefore, clients are not required to re-authenticate for connection over this port until this setting is enabled.                                                                                                                                                                                                                                                                                                               |
| timeout [quiet-period]<br>reauth-period]<br><1-65535>              | Configures timeout settings for this interface <ul style="list-style-type: none"> <li>• quiet-period - Configures the quiet period timeout in seconds. This is the interval, in seconds, between successive client authentication attempts.</li> <li>• reauth-period - Configures the time after which re-authentication is initiated</li> </ul> <p>The following option is common to 'quiet-period' and 'reauth-period' keywords:</p> <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify a 'quiet-period' or 'reauth-period' from 1 - 65535 seconds.</li> </ul> |

**Example**

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #dot1x authenticator guest-vlan
2

rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #dot1x authenticator host-mode
multi-host

rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #dot1x authenticator max-reauth-
req 6

rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #dot1x authenticator
reauthenticate

rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #show context
interface ge1
 dot1x authenticator host-mode multi-host
 dot1x authenticator guest-vlan 2
 dot1x authenticator reauthenticate
 dot1x authenticator max-reauth-count 6
 ip dhcp trust
 qos trust dscp
 qos trust 802.1p
rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #
```

The following examples show the configurations made on an RFS6000 to enable it as a dot1X authenticator:

- 1 Configure AAA policy on the authenticator, and identify the authentication server as onboard (self):

```
rfs6000-817379 (config-aaa-policy-aaa-wireddot1x) #show context
aaa-policy aaa-wireddot1x
authentication server 1 onboard controller
rfs6000-817379 (config-aaa-policy-aaa-wireddot1x) #
```

This AAA policy is used in the authenticator's *self configuration* mode as shown in the last step.

- 2 Configure RADIUS user policy on the authenticator:

```
rfs6000-817379 (config-radius-user-pool-wired-dot1x-users) #show con
radius-user-pool-policy wired-dot1x-users
user bob password 0 bob1234
rfs6000-817379 (config-radius-user-pool-wired-dot1x-users) #
```

The user name and password configured here should match that of the supplicant. For more information, see the examples provided in the *dot1x (supplicant)* section.

- 3 Configure RADIUS server policy on the authenticator, and associate the RADIUS user policy created in the previous step:

```
rfs6000-817379(config-radius-server-policy-for-wired-dot1x)#show con
radius-server-policy for-wired-dot1x
use radius-user-pool-policy wired-dot1x-users
rfs6000-817379(config-radius-server-policy-for-wired-dot1x)#
```

- 4 In the authenticator's self configuration mode, associate the RADIUS server policy, created in the previous step, and configure other parameters (in bold) as shown in the following example:

```
rfs6000-817379(config-device-00-15-70-81-73-79)#use radius-server-policy for-
wired-dot1x
```

- 5 In the authenticator's *interface > ge* configuration mode, configure the following parameters:

```
rfs6000-817379(config-device-00-15-70-81-73-79-if-ge2)#dot1x authenticator
host-mode single-host
rfs6000-817379(config-device-00-15-70-81-73-79-if-ge2)#dot1x authenticator
port-control auto
```

- 6 In the authenticator's *self* configuration mode, configure the following parameters:

```
rfs6000-817379(config-device-00-15-70-81-73-79)#dot1x system-auth-control
rfs6000-817379(config-device-00-15-70-81-73-79)#dot1x use aaa-policy aaa-
wireddot1x
```

Following example displays the above configured parameters:

```
rfs6000-817379(config-device-00-15-70-81-73-79)#show context
use profile default-rfs6000
use rf-domain default
hostname rfs6000-817379
use radius-server-policy for-wired-dot1x
interface me1
ip address 192.168.0.1/24
interface ge2
dot1x authenticator host-mode single-host
dot1x authenticator port-control auto
interface vlan1
ip address dhcp
ip dhcp client request options all
logging on
logging console debugging
dot1x system-auth-control
dot1x use aaa-policy aaa-wireddot1x
--More--
rfs6000-817379(config-device-00-15-70-81-73-79)#
```

### 7.1.36.2.6 dot1x (supplicant)

▶ *interface-config-ge-instance*

Configures 802.1X supplicant (client) settings

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, NX5500, NX7500

#### Syntax

```
dot1x supplicant username <USERNAME> password [0 <WORD>|2 <WORD>|<WORD>]
```

#### Parameters

- dot1x supplicant username <USERNAME> password [0 <WORD>|2 <WORD>|<WORD>]

|                                                |                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x supplicant                               | Configures 802.1x supplicant settings                                                                                                                                                                                                                                                                        |
| username<br><USERNAME>                         | Sets the username for authentication <ul style="list-style-type: none"> <li>• &lt;USERNAME&gt; - Specify the supplicant's username.</li> </ul>                                                                                                                                                               |
| password<br>[0 <WORD> <br>2 <WORD> <br><WORD>] | Sets the password associated with the supplicant's username. Select any one of the following options: <ul style="list-style-type: none"> <li>• 0 &lt;WORD&gt; - Sets a clear text password</li> <li>• 2 &lt;WORD&gt; - Sets an encrypted password</li> <li>• &lt;WORD&gt; - Specify the password.</li> </ul> |

#### Example

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#dot1x supplicant username bob password 0 test@123
```

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#show context
interface ge1
 dot1x supplicant username bob password 0 test@123
 dot1x authenticator host-mode multi-host
 dot1x authenticator guest-vlan 2
 dot1x authenticator reauthenticate
 dot1x authenticator max-reauth-count 6
 ip dhcp trust
 qos trust dscp
 qos trust 802.1p
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#
```

The following example shows the configuration made on an AP7522 to enable it as a dot1X supplicant:

```
ap7522-85B19C (config-device-84-24-8D-85-B1-9C-if-ge2)#dot1x supplicant username bob password 0 bob1234
ap7522-85B19C (config-device-84-24-8D-85-B1-9C)#show context
use profile default-ap7522
use rf-domain default
hostname ap7522-85B19C
no adoption-mode
interface ge1
 switchport mode access
 switchport access vlan 1
 dot1x supplicant username bob password 0 bob1234
logging on
logging console debugging
--More--
ap7522-85B19C (config-device-84-24-8D-85-B1-9C
```

### 7.1.36.2.7 duplex

▶ *interface-config-ge-instance*

Configures duplex mode (for the flow of packets) on this Ethernet port

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
duplex [auto|half|full]
```

#### Parameters

- duplex [auto|half|full]

|      |                                                                                                                                                                                                                                     |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto | Enables automatic duplexity on an interface port. The port automatically detects whether it should run in full or half-duplex mode. (default setting)                                                                               |
| half | Sets the port to half-duplex mode. Allows communication in one direction only at any given time. When selected, data is sent over the port, then immediately data is received from the direction in which the data was transmitted. |
| full | Sets the port to full-duplex mode. Allows communication in both directions simultaneously. When selected, the port can send data while receiving data as well.                                                                      |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#duplex full
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#show context
interface ge1
description "This is GigabitEthernet interface for Royal King"
duplex full
dot1x supplicant username Bob password 0 test@123
ip dhcp trust
qos trust dscp
qos trust 802.1p
channel-group 1
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#
```

### 7.1.36.2.8 ip

▶ *interface-config-ge-instance*

Sets the ARP and DHCP components for this Ethernet port

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip [arp|dhcp]
ip [arp [header-mismatch-validation|trust]|dhcp trust]
```

**Parameters**

- ip [arp [header-mismatch-validation|trust]|dhcp trust]

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arp [header-mismatch-validation trust] | Configures ARP packet settings <ul style="list-style-type: none"> <li>• header-mismatch-validation - Enables matching of source MAC address in the ARP and Ethernet headers to check for mismatch. This option is disabled by default.</li> <li>• trust - Enables trust state for ARP responses on this interface. When enabled, ARP packets received on this port are considered trusted and information from these packets is used to identify rogue devices within the network. This option is disabled by default.</li> </ul> |
| dhcp trust                             | Enables trust state for DHCP responses on this interface. When enabled, only DHCP responses are trusted and forwarded on this port, and a DHCP server can be connected only to a DHCP trusted port. This option is enabled by default.                                                                                                                                                                                                                                                                                            |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#ip dhcp trust
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#ip arp header-mismatch-validation
rfs7000-37FABE(config-profile-default-rfs6000-if-ge1)#show context
interface ge1
description "This is GigabitEthernet interface for Royal King"
duplex full
dot1x supplicant username Bob password 0 test@123
ip dhcp trust
ip arp header-mismatch-validation

### 7.1.36.2.9 ipv6

▶ *interface-config-ge-instance*

Sets the DHCPv6 and ICMPv6 *neighbor discovery* (ND) components for this interface

The ICMPv6 ND protocol uses ICMP messages and solicited multicast addresses to track neighboring devices on the same local network. These messages are used to discover a neighbor’s link layer address and to verify if a neighboring device is reachable.

The ICMP messages are *neighbor solicitation* (NS) and *neighbor advertisement* (NA) messages. When a destination host receives an NS message from a neighbor, it replies back with a NA. The NA contains the following information:

- Source address – This is the IPv6 address of the device sending the NA
- Destination address – This is the IPv6 address of the device from whom the NS message is received
- Data portion – Includes the link layer address of the device sending the NA

NS messages are used to verify a neighbor’s (whose link layer address is known) reachability. To confirm a neighbor’s reachability a node sends an NS message in which the neighbor’s unicast address is specified as the destination address. If the neighbor sends back an acknowledgment on receipt of the NS message it is considered reachable.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]
```

**Parameters**

- `ipv6 dhcpv6 trust`

|                                |                                                                                                                                                                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 dhcpv6 trust</code> | Enables trust state for DHCPv6 responses on this interface. When enabled, all DHCPv6 responses received on this port are trusted and forwarded. This option is enabled by default.<br>A DHCPv6 server can be connected to a DHCPv6 trusted port. |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `ipv6 nd [header-mismatch-validation|raguard|trust]`

|                                         |                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 nd</code>                    | Configures IPv6 ND settings                                                                                                                                                                                                                                                                                                            |
| <code>header-mismatch-validation</code> | Enables matching of source MAC address in the ICMPv6 ND and Ethernet headers (link layer option) to check for mismatch. This option is disabled by default.                                                                                                                                                                            |
| <code>raguard</code>                    | Allows redirection of <i>router advertisements</i> (RAs) and ICMPv6 packets originating on this interface. When selected, RAs are periodically sent to hosts or sent in response to neighbor solicitation requests. The advertisement includes IPv6 prefixes and other subnet and host information. This option is enabled by default. |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trust | Enables trust state for IPv6 ND requests received on this interface. When enabled, IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the neighbor discovery protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters; routers respond to the request with a router advertisement packet containing Internet Layer configuration parameters. This option is disabled by default. |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-device-B4-C7-99-6D-CD-4B-if-gel)#ipv6 dhcpv6 trust
rfs6000-37FABE(config-device-B4-C7-99-6D-CD-4B-if-gel)#ipv6 nd header-mismatch-validation
rfs6000-37FABE(config-device-B4-C7-99-6D-CD-4B-if-gel)#ipv6 nd trust

|-----------|----------------------------------------------------|
| <i>no</i> | Removes or reverts IPv6 settings on this interface |
|-----------|----------------------------------------------------|

### 7.1.36.2.10 lacp

▶ *interface-config-ge-instance*

Configures the selected GE port's *Link Aggregation Control Protocol* (LACP) port-priority value. If LACP is enabled, and the selected port is a member of a *link aggregation group* (LAG), use this command to configure the port's priority within the LAG.

As per the IEEE 802.3ad standard, LACP enables aggregation of multiple physical links to form a single logical channel. Each aggregated group of physical links is a LAG. When enabled, LACP dynamically determines if link aggregation is possible between two peers, and automatically configures the aggregation. LACP also allows the switch to dynamically reconfigure the LAGs. The LAG is enabled only when LACP detects that the remote device is also using LACP and is able to join the LAG.

Enabling LACP provides automatic recovery in case one or more of the aggregated physical links fail.

**NOTE:** Use the *lacp-channel-group* command to configure this port as a LAG member.

#### Supported in the following platforms:

- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
lacp port-priority <1-65535>
```

#### Parameters

- lacp port-priority <1-65535>

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lacp port-priority <1-65535> | Configures the selected GE port's port-priority value. The selected port's actual priority within the LAG is determined by the port-priority value specified here along with the port's number. Higher the value, lower is the priority. Use this option to manipulate a port's priority. For example, in a LAG having five physical ports, four active and one standby, manually increasing the standby port's priority ensures that if one of the active port fails, the standby port is included in the LAG during re-negotiation.<br><br>• <1-65535> – Specify a value from 1 - 65535. The default value is 32768. |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testnx9000-if-ge1)#lacp port-priority 2
nx9500-6C8809(config-profile-testnx9000-if-ge1)#show context
interface ge1
 lacp port-priority 2
nx9500-6C8809(config-profile-testnx9000-if-ge1)#
```

#### Related Commands

|           |                                                               |
|-----------|---------------------------------------------------------------|
| <i>no</i> | Removes the selected GE port's configured port-priority value |
|-----------|---------------------------------------------------------------|

### 7.1.36.2.11 lacp-channel-group

▶ *interface-config-ge-instance*

Configures the selected GE port as a member of a port channel group (also referred as LAG)

As per the IEEE 802.3ad standard, LACP enables the aggregation of multiple physical links (ethernet ports) to form a single logical channel. When enabled, LACP dynamically determines if link aggregation is possible and then automatically configures the aggregation. LACP also allows the switch to dynamically reconfigure the LAGs. The LAG is enabled only when LACP detects that the remote device is also using LACP and is able to join the LAG.

**NOTE:** Successful aggregation of two or more physical links is feasible only if the aggregating physical links are configured identically. To ensure uniformity in configuration across LAG members, implement configuration changes (such as changes in the switching mode, speed, etc.) on the logical port (the port-channel) and not on the physical port. Changes made on the port-channel will cascade down to each member of the LAG thereby retaining uniformity.

#### Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
lacp-channel-group <1-4> mode [active|passive]
```

#### Parameters

- lacp-channel-group <1-4> mode [active|passive]

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lacp-channel-group <1-4> | <p>Associates this GE port with an existing port-channel group</p> <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Specify a value from 1 - 4.</li> </ul> <p>Use the <i>interface &gt; port-channel &gt; &lt;1-4&gt;</i> command to configure a port-channel group. For more information, see <i>interface-config-port-channel-instance</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| mode [active passive]    | <p>After configuring the selected port as a LAG member, specify whether the port is an active or passive member within the group. An active member initiates and participates in LACP negotiations.</p> <ul style="list-style-type: none"> <li>• active - Configures the port as an active member. When set to active, the port always transmits LACPDU irrespective of the remote device's port mode.</li> <li>• passive - Configures the port as passive member. When set to passive, the port will only respond to LACPDU received from its corresponding <i>Active</i> port.</li> </ul> <p>At least one port within a LAG, on either of the two negotiating peers, should be in the active mode. LACP negotiations are not initiated if all LAG member ports are passive. Further, the peer-to-peer LACP negotiations are always initiated by the peer with the lower system-priority value. For more information on configuring the system-priority, see <i>lacp</i>.</p> |

#### Example

```
nx9500-6C8809(config-profile-testnx9000-if-ge1)#lacp-channel-group 2 mode active
nx9500-6C8809(config-profile-test2nx9000-if-ge1)#show context
interface ge1
 lacp-channel-group 2 mode active
 lacp port-priority 2
nx9500-6C8809(config-profile-test2nx900-if-ge1)#
```

To enable dynamic link aggregation on a device (service platform), execute the following steps:

- 1 Create a port-channel group on the device. Enter the port-channel configuration mode.
 

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#interface port-channel 1
```

  - a Set the switching mode to *access* or *trunk* as per requirement. In this example, the mode is set to 'access'.
 

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09-if-port-channel1)#switchport
mode
access
```
  - b Specify the VLAN to switch, commit changes and exit.
 

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09-if-port-channel1)#switchport
access vlan 1
nx9500-6C8809(config-device-B4-C7-99-6C-88-09-if-port-channel1)#commit
nx9500-6C8809(config-device-B4-C7-99-6C-88-09-if-port-channel1)#exit
```
- 2 Enable dynamic link aggregation on the device's physical port. Enter the GE port's configuration mode.
 

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#interface ge 2
```

  - a Enable link aggregation and associate the port with the port-channel group created in step 1.
 

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09-if-ge2)#lacp-channel-group 1
mode
active
```

Note, the mode can be set to *passive*. However, at least one of the aggregated GE ports in the port-channel group should be active in order to initiate link aggregation negotiations with other LACP-enabled peers.
  - b Specify the GE port's priority value.
 

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09-if-ge2)#lacp port-priority 2
```

### 7.1.36.2.12 lldp

▶ *interface-config-ge-instance*

Configures *Link Local Discovery Protocol* (LLDP) parameters on this Ethernet port

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
lldp [receive|transmit]
```

#### Parameters

- lldp [receive|transmit]

|          |                                                                                                                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| receive  | Enables LLDP <i>Protocol Data Units</i> (PDUs) snooping. When enabled, the port receives periodic updates from a multicast address informing about presence of neighbors. This option is enabled by default. |
| transmit | Enables LLDP PDU transmission. When enabled, the port sends out periodic interface updates to a multicast address to advertise its presence to neighbors. This option is enabled by default.                 |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#lldp transmit
```

#### Related Commands

|           |                                                         |
|-----------|---------------------------------------------------------|
| <i>no</i> | Disables or reverts interface settings to their default |
|-----------|---------------------------------------------------------|

### 7.1.36.2.13 mac-auth

#### ▶ *interface-config-ge-instance*

Enables authentication of MAC addresses on the selected wired port. When enabled, this feature authenticates the MAC address of a device, connecting to this interface, with a RADIUS server. When successfully authenticated, packets from the source are processed. Since only one MAC address is supported per wired port, packets from all other sources are dropped.

For more information on enabling this feature, see *mac-auth*.

Enable port MAC authentication in conjunction with Wired 802.1x settings to configure a MAC authentication AAA policy.

This option is also available in the device configuration mode.

#### Supported in the following platforms:

- Access Points — AP6522 AP6562, AP7161, AP7502, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac-auth
```

#### Parameters

None

#### Example

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #mac-auth

rfs4000-229D58 (config-profile-testRFS4000-if-ge1) #show context
interface ge1
 mac-auth
 ip dhcp trust
 qos trust dscp
 qos trust 802.1p

rfs4000-229D58 (config-profile-testRFS4000-if-ge5) #mac-auth

rfs4000-229D58 (config-device-00-23-68-22-9D-58-if-ge5) #show context
interface ge5
 switchport mode access
 switchport access vlan 1
 dot1x authenticator host-mode single-host
 dot1x authenticator guest-vlan 5
 dot1x authenticator port-control auto
 mac-auth
rfs4000-229D58 (config-device-00-23-68-22-9D-58-if-ge5) #
```

#### Related Commands

|           |                                                                     |
|-----------|---------------------------------------------------------------------|
| <i>no</i> | Disables authentication of MAC addresses on the selected wired port |
|-----------|---------------------------------------------------------------------|

### 7.1.36.2.14 no

▶ *interface-config-ge-instance*

Removes or reverts the selected Ethernet port settings

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [captive-portal-enforcement|cdp|channel-group|description|dot1x|duplex|ip|
ip|ipv6|lacp|lacp-channel-group|lldp|mac-auth|power|qos|shutdown|spanning-tree|
speed|switchport|use]

no [captive-portal-enforcement|channel-group|description|duplex|mac-auth|
shutdown|speed]

no [cdp|lldp] [receive|transmit]

no dot1x [authenticator [guest-vlan|host-mode|max-reauth-req|port-control|
reauthentication|timeout [quiet-period|reauth-period]]|supplicant]

no ip [arp [header-mismatch-validation|trust]|dhcp trust]

no [lacp port-priority|lacp-channel-group]

no power {best-effort|limit|priority}

no qos trust [802.1p|cos|dscp]

no spanning-tree [bpdufilter|bpduguard|force-version|guard|link-type|mst|
portfast]

no switchport [access vlan|mode|trunk native tagged]

no use [ip-access-list|ipv6-access-list|mac-access-list] in
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this Ethernet port settings based on the parameters passed |
|-----------------|-------------------------------------------------------------------------------|

#### Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#no cdp
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#no duplex
```

### 7.1.36.2.15 power

▶ *interface-config-ge-instance*

Configures *Power over Ethernet* (PoE) settings on this interface

When configured, this option allows the selected port to use Power over Ethernet. When enabled, the controller supports 802.3af PoE on each of its GE ports. PoE allows users to monitor port power consumption and configure power usage limits and priorities for each GE port.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
power {best-effort|limit <0-40>|priority [critical|high|low]}
```

#### Parameters

- power {best-effort|limit <0-40>|priority [critical|high|low]}

|                              |                                                                                                                                                                                                                                                                                                                                                                                                          |

| power                        | Configures power related thresholds for this interface                                                                                                                                                                                                                                                                                                                                                   |
| best-effort                  | Optional. Enables power when the device is not operating from an 802.3at class 4 power source                                                                                                                                                                                                                                                                                                            |
| limit <0-40>                 | Optional. Configures the PoE power limit from 0 - 40 Watts. The default is 30 Watts.                                                                                                                                                                                                                                                                                                                     |
| priority [critical high low] | Optional. Configures the PoE power priority on this interface. This is the priority assigned to this port versus the power requirements of the other ports available on the controller. <ul style="list-style-type: none"> <li>• critical - Sets PoE priority as critical</li> <li>• high - Sets PoE priority as high</li> <li>• low - Sets PoE priority as low. This is the default setting.</li> </ul> |

#### Example

```
rfs4000-229D58(config-profile-testRFS4000-if-ge1)#power limit 30
rfs4000-229D58(config-profile-testRFS4000-if-ge1)#power priority critical
rfs4000-229D58(config-profile-testRFS4000-if-ge1)#show context
interface ge1
 ip dhcp trust
 qos trust dscp
 qos trust 802.1p
 power limit 30
 power priority critical
rfs4000-229D58(config-profile-testRFS4000-if-ge1)#
```

### 7.1.36.2.16 qos

▶ *interface-config-ge-instance*

Defines *Quality of Service* (QoS) settings on this Ethernet port

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
qos trust [802.1p|cos|dscp]
```

#### Parameters

- qos trust [802.1p|cos|dscp]

|                         |                                                                                                                                                                                                                                                                                                                                                                                                  |

**7.1.36.2.17 shutdown**

▶ *interface-config-ge-instance*

Shuts down (disables) an interface. The interface is administratively enabled unless explicitly disabled using this command.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
shutdown
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#shutdown
```

### 7.1.36.2.18 spanning-tree

▶ *interface-config-ge-instance*

Configures spanning tree parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
spanning-tree [bpdufilter|bpduguard|force-version|guard|link-type|mst|port-cisco-
interoperability|portfast]
```

```
spanning-tree [force-version <0-3>|guard root|portfast]
```

```
spanning-tree [bpdufilter|bpduguard] [default|disable|enable]
```

```
spanning-tree link-type [point-to-point|shared]
```

```
spanning-tree mst <0-15> [cost <1-200000000>|port-priority <0-240>]
```

```
spanning-tree port-cisco-interoperability [disable|enable]
```

#### Parameters

- `spanning-tree [force-version <0-3>|guard root|portfast]`

|                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force-version <0-3>                                                                                                            | Specifies the spanning tree force version. A version identifier of less than 2 enforces the spanning tree protocol. Select one of the following versions: <ul style="list-style-type: none"> <li>• 0 – <i>Spanning Tree Protocol</i> (STP)</li> <li>• 1 – Not supported</li> <li>• 2 – <i>Rapid Spanning tree Protocol</i> (RSTP)</li> <li>• 3 – <i>Multiple Spanning Tree Protocol</i> (MSTP). This is the default setting</li> </ul>                                                                                                            |
| guard root                                                                                                                     | Enables Root Guard for the port<br><br>The Root Guard disables superior <i>Bridge Protocol Data Unit</i> (BPDU) reception. The Root Guard ensures the enabled port is a designated port. If the Root Guard enabled port receives a superior BPDU, it moves to a discarding state (root-inconsistent STP state). This state is equivalent to a listening state, and data is not forwarded across the port. Therefore, enabling the guard root enforces the root bridge position. Use the no parameter with this command to disable the Root Guard. |
| portfast                                                                                                                       | Enables rapid transitions. Enabling PortFast allows the port to bypass the listening and learning states.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <ul style="list-style-type: none"> <li>• <code>spanning-tree [bpdufilter bpduguard] [default disable enable]</code></li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| bpdufilter<br>[default disable enable]                                                                                         | Sets a PortFast BPDU filter for the port<br><br>Use the no parameter with this command to revert the port BPDU filter to its default. The spanning tree protocol sends BPDUs from all ports. Enabling the BPDU filter ensures PortFast enabled ports do not transmit or receive BPDUs.                                                                                                                                                                                                                                                            |

|                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| cost <1-200000000>                                                                                                                      | Defines path cost for a port from 1 - 200000000. The default path cost depends on the speed of the port. The cost helps determine the role of the port in the MSTP network. The designated cost is the cost for a packet to travel from this port to the root in the MSTP configuration. The slower the media, the higher the cost.                                                                                                                                                      |
| port-priority <0-240>                                                                                                                   | Defines port priority for a bridge from 1 - 240. Lower the priority greater is the likelihood of the port becoming a designated port. Applying a higher value impacts the port's likelihood of becoming a designated port.                                                                                                                                                                                                                                                               |
| <ul style="list-style-type: none"> <li>spanning-tree port-cisco-interoperability [disable enable]</li> </ul>                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 7.1.36.2.19 speed

▶ *interface-config-ge-instance*

Specifies the speed of a FastEthernet (10/100) or GigabitEthernet (10/100/1000) port. This is the speed at which the port can receive and transmit the data.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
speed [10|100|1000|auto]
```

#### Parameters

- speed [10|100|1000|auto]

|      |                                                                                                                                                                                                                                                                                                                                                                   |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10   | Forces 10 Mbps operation                                                                                                                                                                                                                                                                                                                                          |
| 100  | Forces 100 Mbps operation                                                                                                                                                                                                                                                                                                                                         |
| 1000 | Forces 1000 Mbps operation                                                                                                                                                                                                                                                                                                                                        |
| auto | Port automatically detects its operational speed based on the port at the other end of the link. Select this option to enable the port to automatically exchange information about data transmission speed and duplex capabilities. Auto negotiation is helpful when in an environment where different devices are connected and disconnected on a regular basis. |

#### Usage Guidelines

Set the interface speed to auto detect and use the fastest speed available. Speed detection is based on connected network hardware.

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#speed 10

rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#show context
interface ge1
description "This is GigabitEthernet interface for Royal King"
speed 10
duplex full
spanning-tree bpduguard enable
spanning-tree bpdufilter disable
spanning-tree force-version 1
spanning-tree guard root
spanning-tree mst 2 port-priority 10
dot1x supplicant username Bob password 0 test@123
ip dhcp trust
ip arp header-mismatch-validation
qos trust dscp
qos trust 802.1p
channel-group 1
rfs6000-37FABE(config-profile-default-rfs6000-if-ge1)#
```

### 7.1.36.2.20 switchport

▶ *interface-config-ge-instance*

Sets switching mode characteristics for the selected interface

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
switchport [access|mode|trunk]

switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]
switchport mode [access|trunk]
switchport trunk [allowed|native]
switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|none|remove <VLAN-ID>]
switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]
```

#### Parameters

- switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]

|                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <pre>trunk</pre>                                                                            | <p>Sets trunking mode characteristics of the switchport</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <pre>native [tagged  vlan [&lt;1-4094&gt;  &lt;VLAN-ALIAS- NAME&gt;]]</pre>                 | <p>Configures the native VLAN ID for the trunk-mode port</p> <p>The native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic is directed over when using a port in trunk mode.</p> <ul style="list-style-type: none"> <li>• tagged – Tags the native VLAN. When a frame is tagged, the 12 bit frame VLAN ID is added to the 802.1Q header enabling upstream Ethernet devices to know which VLAN ID the frame belongs to. The device reads the 12 bit VLAN ID and forwards the frame to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream device classifies the frame using the default or native VLAN assigned to the Trunk port. A native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame.</li> <li>• vlan [&lt;1-4094&gt; &lt;VLAN-ALIAS-NAME&gt;] – Sets the native VLAN for classifying untagged traffic when the interface is in trunking mode. <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; – Specify a value from 1 - 4094.</li> <li>• &lt;VLAN-ALIAS-NAME&gt; – Specify the VLAN alias name used to identify the VLANs. The VLAN alias should be existing and configured.</li> </ul> </li> </ul> |

**Usage Guidelines**

Interfaces ge1 - ge4 can be configured as trunk or in access mode. An interface configured as “trunk” allows packets (from the given list of VLANs) to be added to the trunk. An interface configured as “access” allows packets only from native VLANs.

Use the *[no] switchport (access|mode|trunk)* to undo switchport configurations.

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-gel)#switchport trunk native
tagged

rfs6000-37FABE(config-profile-default-rfs6000-if-gel)#switchport access vlan 1

rfs6000-37FABE(config-profile-default-rfs6000-if-gel)#show context
interface gel
description "This is GigabitEthernet interface for Royal King"
speed 10
duplex full
switchport mode access
switchport access vlan 1
spanning-tree bpduguard enable
spanning-tree bpdufilter disable
--More--
rfs6000-37FABE(config-profile-default-rfs6000-if-gel)#
```

### 7.1.36.2.21 use

▶ *interface-config-ge-instance*

Specifies the IP (IPv4 and IPv6) access list and MAC access list used with this Ethernet port. The associated ACL firewall inspects IP and MAC traffic flows and detects attacks typically not visible to traditional wired firewall appliances.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use [ip-access-list in <IPv4-ACCESS-LIST-NAME>|ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list in <MAC-ACCESS-LIST-NAME>]
```

**Parameters**

```
• use [ip-access-list in <IPv4-ACCESS-LIST-NAME>|ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list in <MAC-ACCESS-LIST-NAME>]
```

### 7.1.36.3 interface-config-vlan-instance

► *interface*

Use the config-profile-<DEVICE-PROFILE-NAME> mode to configure Ethernet, VLAN and tunnel settings.

To switch to this mode, use the following commands:

```
<DEVICE>(config-profile-default-<DEVICE-TYPE>)#interface [<INTERFACE-NAME>|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|radio [1|2|3]|up1|vlan <1-4094>|wwan1|xge <1-24>]
```

The following example uses the config-profile-default-rfs7000 instance to configure a VLAN interface:

```
rfs6000-37FABE(config-profile-default-rfs6000)#interface vlan 8
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#?
SVI configuration commands:
 crypto Encryption module
 description Vlan description
 dhcp Dynamic Host Configuration Protocol (DHCP)
 dhcp-relay-incoming Allow on-board DHCP server to respond to relayed DHCP
 packets on this interface
 ip Interface Internet Protocol config commands
 ipv6 Internet Protocol version 6 (IPv6)
 no Negate a command or set its defaults
 shutdown Shutdown the selected interface
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

The following table summarizes interface VLAN configuration commands:

| Commands                   | Description                                                                                                                                | Reference                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>crypto</i>              | Defines the encryption module used with this VLAN interface                                                                                | <a href="#">page 7-218</a> |
| <i>description</i>         | Defines the VLAN interface description                                                                                                     | <a href="#">page 7-219</a> |
| <i>dhcp</i>                | Enables inclusion of optional fields (client identifier) in DHCP client requests                                                           | <a href="#">page 7-220</a> |
| <i>dhcp-relay-incoming</i> | Allows an onboard DHCP server to respond to relayed DHCP packets on this interface                                                         | <a href="#">page 7-221</a> |
| <i>ip</i>                  | Configures the VLAN interface's IP settings                                                                                                | <a href="#">page 7-222</a> |
| <i>ipv6</i>                | Configures the VLAN interface's IPv6 settings                                                                                              | <a href="#">page 7-225</a> |
| <i>no</i>                  | Removes or reverts this VLAN interface's settings to default                                                                               | <a href="#">page 7-230</a> |
| <i>shutdown</i>            | Shuts down this VLAN interface                                                                                                             | <a href="#">page 7-232</a> |
| <i>use</i>                 | Associates an IP (IPv4 and IPv6) access list, bonjour-gw-discovery policy, and an IPv6-route-advertisement policy with this VLAN interface | <a href="#">page 7-233</a> |

### 7.1.36.3.1 crypto

▶ *interface-config-vlan-instance*

Associates an existing and configured VPN crypto map with this VLAN interface.

Crypto map entries are sets of configuration parameters for encrypting packets that pass through the VPN tunnel. For more information on crypto maps, see *crypto-map-config-commands*.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
crypto map <CRYPTO-MAP-NAME>
```

**Parameters**

- crypto map <CRYPTO-MAP-NAME>

|                          |                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| map<br><CRYPTO-MAP-NAME> | Attaches a crypto map to the selected VLAN interface. The crypto map should be existing and configured.<br><br>• <CRYPTO-MAP-NAME> - Specify the crypto map name. |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE (config-profile-default-rfs6000-if-vlan8)#crypto map map1
rfs6000-37FABE (config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 crypto map map1
rfs6000-37FABE (config-profile-default-rfs6000-if-vlan8)#
```

**Related Commands**

|           |                                                              |
|-----------|--------------------------------------------------------------|
| <i>no</i> | Disables or reverts interface VLAN settings to their default |
|-----------|--------------------------------------------------------------|

### 7.1.36.3.2 description

▶ *interface-config-vlan-instance*

Defines this VLAN interface’s description. Use this command to provide additional information about the VLAN.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
description <WORD>
```

**Parameters**

- description <WORD>

|                    |                                                                                                                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <WORD> | Configures a description for this VLAN interface (should not exceed 64 characters in length) <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify a description unique to the VLAN’s specific configuration, to help differentiate it from other VLANs with similar configurations.</li> </ul> |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#description "This VLAN interface is configured for the Sales Team"

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 description "This VLAN interface is configured for the Sales Team"
 crypto map map1
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

**Related Commands**

|           |                                        |
|-----------|----------------------------------------|
| <i>no</i> | Removes the VLAN interface description |
|-----------|----------------------------------------|

### 7.1.36.3.3 dhcp

▶ *interface-config-vlan-instance*

Enables inclusion of optional fields (client identifier) in DHCP client requests. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
dhcp client include client-identifier
```

**Parameters**

- dhcp client include client-identifier

|                                       |                                                                |
|---------------------------------------|----------------------------------------------------------------|
| dhcp client include client-identifier | Enables inclusion of client identifier in DHCP client requests |
|---------------------------------------|----------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#dhcp client include
client-identifier

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 dhcp client include client-identifier
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

**Related Commands**

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <i>no</i> | Disables inclusion of client identifier in DHCP client requests |
|-----------|-----------------------------------------------------------------|

### 7.1.36.3.4 dhcp-relay-incoming

▶ *interface-config-vlan-instance*

Allows an onboard DHCP server to respond to relayed DHCP packets. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dhcp-relay-incoming
```

#### Parameters

None

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#dhcp-relay-incoming

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 description "This VLAN interface is configured for the Sales Team"
 crypto map map1
 dhcp-relay-incoming
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

#### Related Commands

|           |                                                              |
|-----------|--------------------------------------------------------------|
| <i>no</i> | Disables or reverts interface VLAN settings to their default |
|-----------|--------------------------------------------------------------|

### 7.1.36.3.5 ip

▶ *interface-config-vlan-instance*

Configures the VLAN interface's IP settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip [address|dhcp|helper-address|nat|ospf]

ip helper-address <IP>

ip address [<IP/M>|<NETWORK-ALIAS-NAME>|dhcp|zeroconf]
ip address [<IP/M>|<NETWORK-ALIAS-NAME>|zeroconf] {secondary}
ip address dhcp

ip dhcp client request options all

ip nat [inside|outside]

ip ospf [authentication|authentication-key|bandwidth|cost|message-digest-key|
priority]

ip ospf authentication [message-digest|null|simple-password]
ip ospf authentication-key simple-password [0 <WORD>|2 <WORD>]
ip ospf [bandwidth <1-10000000>|cost <1-65535>|priority <0-255>]
ip ospf message-digest-key key-id <1-255> md5 [0 <WORD>|2 <WORD>]
```

**Parameters**

- ip helper-address <IP>

|                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| helper-address <IP>                                                                                                           | Enables DHCP and BOOTP requests forwarding for a set of clients. Configure a helper address on the VLAN interface connected to the client. The helper address should specify the address of the BOOTP or DHCP servers to receive the requests. If you have multiple servers, configure one helper address for each server. <ul style="list-style-type: none"> <li>• &lt;IP&gt; – Specify the IP address of the DHCP or BOOTP server.</li> </ul> |
| <ul style="list-style-type: none"> <li>• ip address [&lt;IP/M&gt; &lt;NETWORK-ALIAS-NAME&gt; zeroconf] {secondary}</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| address                                                                                                                       | Sets the VLAN interface's IP address                                                                                                                                                                                                                                                                                                                                                                                                            |
| <IP/M>                                                                                                                        | Specifies the interface IP address in the A.B.C.D/M format <ul style="list-style-type: none"> <li>• secondary – Optional. Sets the specified IP address as a secondary address</li> </ul>                                                                                                                                                                                                                                                       |
| <NETWORK-ALIAS-NAME>                                                                                                          | Uses a pre-defined network alias to provide this VLAN interface's IP address. Specify the network alias name. <ul style="list-style-type: none"> <li>• secondary – Optional. Sets the network-alias provided IP address as the secondary address</li> </ul>                                                                                                                                                                                     |
| zeroconf {secondary}                                                                                                          | Uses <i>Zero Configuration Networking</i> (zeroconf) to generate an IP address for this interface<br>Contd..                                                                                                                                                                                                                                                                                                                                    |

|                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 7.1.36.3.6 ipv6

▶ *interface-config-vlan-instance*

Configures the VLAN interface's IPv6 settings

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```

ipv6 [accept|address|dhcp|enable|enforce-dad|mtu|redirects|request-dhcpv6-
options|router-advertisements]

ipv6 accept ra {(no-default-router|no-hop-limit|no-mtu)}

ipv6 address [<IPv6/M>|autoconfig|eui-64|link-local|prefix-from-provider]

ipv6 address [<IPv6/M>|autoconfig]
ipv6 address eui-64 [<IPv6/M>|prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-
LENGTH>]
ipv6 address prefix-from-provider <WORD> <HOST-PORTION/LENGTH>
ipv6 address link-local <LINK-LOCAL-ADD>

ipv6 dhcp [client [information|prefix-from-provider <WORD>]|relay destination
<DEST-IPv6-ADD>]

ipv6 [enable|enforce-dad|mtu <1280-1500>|redirects|request-dhcpv6-options]

ipv6 router-advertisements [prefix <IPv6-PREFIX>|prefix-from-provider <WORD>] {no-
autoconfig|off-link|site-prefix|valid-lifetime}

```

**Parameters**

- `ipv6 accept ra {(no-default-router|no-hop-limit|no-mtu)}`

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 accept ra    | Enables processing of <i>router advertisements</i> (RAs) on this VLAN interface. This option is enabled by default.<br><br>When enabled, IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the neighbor discovery protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters; routers respond to the request with a router advertisement packet containing Internet layer configuration parameters. |
| no-default-router | Optional. Disables inclusion of routers on this interface in the default router selection process. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| no-hop-limit      | Optional. Disables the use of RA advertised hop-count value on this interface. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| no-mtu            | Optional. Disables the use of RA advertised MTU value on this interface. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

This prefix is used to auto-generate the static IPv6 address (for this interface) in the modified <i>Extended Unique Identifier</i> (EUI)-64 format.</p> <p>Implementing the IEEE's 64-bit EUI64 format enables a host to automatically assign itself a unique 64-bit IPv6 interface identifier, without manual configuration or DHCP. This is accomplished on a virtual interface by referencing the already unique 48-bit MAC address, and reformatting it to match the EUI-64 specification.</p> <p>In the EUI-64 IPv6 address the prefix and host portions are each 64 bits in length.</p>                                                                                                                                                                                                                                                      |
| <code>&lt;IPv6/M&gt;</code>                                                                                                                                               | <p>Specify the IPv6 prefix and prefix length. This configured value is used as the prefix portion of the auto-generated IPv6 address, and the host portion is derived from the MAC address of the interface.</p> <p>Any bits of the configured value exceeding the prefix-length "M" are ignored and replaced by the host portion derived from the MAC address.</p> <p>For example:</p> <p>Prefix portion provided using this command: <code>ipv6 &gt; address &gt; eui-64 &gt; 2004:b055:15:dead::1111/64</code>.</p> <p>Host portion derived using the interface's MAC address (00-15-70-37-FB-5E): <code>215:70ff:fe37:fb5e</code></p> <p>Auto-configured IPv6 address using the above prefix and host portions: <code>2004:b055:15:dead:215:70ff:fe37:fb5e/64</code></p> <p>In this example, the host part "::1111" is ignored and replaced with the modified eui-64 formatted host address.</p> |

DHCP relays exchange messages between a DHCPv6 server and client. A client and relay agent exist on the same link. When a DHCP request is received from the client, the relay agent creates a relay forward message and sends it to a specified server address. If no addresses are specified, the relay agent forwards the message to all DHCP server relay multicast addresses. The server creates a relay reply and sends it back to the relay agent. The relay agent then sends back the response to the client.</p> |

|-----------|--------------------------------------------------------|
| <i>no</i> | Removes or resets IPv6 settings on this VLAN interface |
|-----------|--------------------------------------------------------|

### 7.1.36.3.7 no

▶ *interface-config-vlan-instance*

Negates a command or reverts to defaults. The no command, when used in the Config Interface VLAN mode, negates VLAN interface settings or reverts them to their default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [crypto|description|dhcp|dhcp-relay-incoming|ip|ipv6|shutdown|use]

no dhcp client include client-identifier

no [crypto map|description|dhcp-relay-incoming|shutdown]

no ip [address|dhcp|helper-address|nat|ospf]
no ip [helper-address <IP>|nat]
no ip address {<IP/M> {secondary}}|<NETWORK-ALIAS-NAME> {secondary}|dhcp|zeroconf
{secondary}}
no ip dhcp client request options all
no ip ospf [authentication|authentication-key|bandwidth|cost|message-digest-key|
priority]

no ipv6 [accept|address|dhcp|enable|enforce-dad|mtu|redirects|request-dhcpv6-
options|router-advertisement]

no ipv6 [accept ra|enable|enforce-dad|mtu|redirects|request-dhcpv6-options]
no ipv6 address [<IPv6/M>|autoconfig|eui-64|link-local|prefix-from-provider]
no ipv6 dhcp [client|relay]
no ipv6 router-advertisement [prefix <WORD>|prefix-from-provider <WORD>]

no use [bonjour-gw-discovery-policy]|ip-access-list in|ipv6-access-list in|ipv6-
router-advertisement-policy|url-filter]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                  |
|-----------------|----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this VLAN interface's settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------------|

**Example**

The following example shows the VLAN interface settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 description "This VLAN interface is configured for the Sales Team"
 ip address 10.0.0.1/8
 ip dhcp client request options all
 ip helper-address 172.16.10.3
 ip nat inside
 crypto map map1
 dhcp-relay-incoming
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#no crypto map
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#no description
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#no dhcp-relay-incoming
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#no ip dhcp client request
options all
```

The following example shows the VLAN interface settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 ip address 10.0.0.1/8
 ip helper-address 172.16.10.3
 ip nat inside
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

### 7.1.36.3.8 shutdown

▶ *interface-config-vlan-instance*

Shuts down the selected interface. Use the no shutdown command to enable an interface.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
shutdown
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#shutdown

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
 ip address 10.0.0.1/8
 ip helper-address 172.16.10.3
 shutdown
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

|-----------|--------------------------------------------------------------|
| <i>no</i> | Disables or reverts interface VLAN settings to their default |
|-----------|--------------------------------------------------------------|

### 7.1.36.3.9 use

▶ *interface-config-vlan-instance*

Associates an IP (IPv4 and IPv6) access list, bonjour-gw-discovery policy, and an IPv6-router-advertisement policy with this VLAN interface

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use [bonjour-gw-discovery-policy <POLICY-NAME>|ip-access-list in <IP-ACL-NAME>|ipv6-access-list in <IPv6-ACL-NAME>|ipv6-router-advertisement-policy <POLICY-NAME>|url-filter <URL-FILTER-NAME>]
```

**Parameters**

- use [bonjour-gw-discovery-policy <POLICY-NAME>|ip-access-list in <IP-ACL-NAME>|ipv6-access-list in <IPv6-ACL-NAME>|ipv6-router-advertisement-policy <POLICY-NAME>|url-filter <URL-FILTER-NAME>]

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bonjour-gw-discovery-policy <POLICY-NAME>      | <p>Uses an existing Bonjour GW Discovery policy with this VLAN interface. When associated, the Bonjour GW Discovery policy is applied for the Bonjour requests coming over the VLAN interface.</p> <ul style="list-style-type: none"> <li>• &lt;POLICY-NAME&gt; – Specify the Bonjour GW Discovery policy name (should be existing and configured).</li> </ul> <p>For more information on Bonjour GW Discovery policy, see <i>bonjour-gw-discovery-policy</i>.</p> |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#use ip-access-list in
test

rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#show context
interface vlan8
ip address 10.0.0.1/8
 use ip-access-list in test
ip helper-address 172.16.10.3
rfs6000-37FABE(config-profile-default-rfs6000-if-vlan8)#
```

**Related Commands**

|           |                                                              |
|-----------|--------------------------------------------------------------|
| <i>no</i> | Disables or reverts interface VLAN settings to their default |
|-----------|--------------------------------------------------------------|

### 7.1.36.4 interface-config-port-channel-instance

► *interface*

Profiles can utilize customized port channel configurations as part of their interface settings. Existing port channel profile configurations can be overridden as they become obsolete for specific device deployments.

The following example uses the config-profile-testNX9000 instance to configure a port-channel interface:

```

nx9500-6C8809(config-profile-testNX9000)#interface port-channel 1
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#
Port Channel Mode commands:
 description Port description
 duplex Set duplex to interface
 ip Internet Protocol (IP)
 ipv6 Internet Protocol version 6 (IPv6)
 no Negate a command or set its defaults
 port-channel Portchannel commands
 qos Quality of service
 remove-override Remove configuration item override from the device (so
 profile value takes effect)
 shutdown Shutdown the selected interface
 spanning-tree Spanning tree commands
 speed Configure speed
 switchport Set switching mode characteristics
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-profile-testNX9000-if-port-channell)#

```

### 7.1.36.4.1 description

▶ *interface-config-port-channel-instance*

Configures a brief description for this port channel interface

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
description <LINE>
```

#### Parameters

- description <LINE>

|                    |                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <LINE> | Configures a description for this port-channel interface that uniquely identifies it from other port channel interfaces <ul style="list-style-type: none"> <li>• &lt;LINE&gt; - Provide a description not exceeding 64 characters in length.</li> </ul> |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config-profile-testNX9000-if-port-channell)#description "This port
-channel is for enabling dynamic LACP."

nx9500-6C8809(config-profile-testNX9000-if-port-channell)#show context
interface port-channell
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#

```

#### Related Commands

|           |                                                   |
|-----------|---------------------------------------------------|
| <i>no</i> | Removes this port-channel interface's description |
|-----------|---------------------------------------------------|

### 7.1.36.4.2 duplex

▶ *interface-config-port-channel-instance*

Configures the duplex-mode (that is the data transmission mode) for this port channel interface

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
duplex [auto|half|full]
```

**Parameters**

- duplex [auto|half|full]

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| duplex [auto half full] | <p>Configures the mode of data transmission as auto, full, or half</p> <ul style="list-style-type: none"> <li>• auto - Select this option to enable the controller, service platform, or access point to dynamically duplex as port channel performance needs dictate. This is the default setting.</li> <li>• full - Select this option to simultaneously transmit data to and from the port channel.</li> <li>• half - Select this option to send data over the port channel, then immediately receive data from the same direction in which the data was transmitted.</li> </ul> |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#duplex full
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#show context
interface port-channel1
description "This port-channel is for enabling dynamic LACP."
duplex full
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#
```

**Related Commands**

|           |                                                     |
|-----------|-----------------------------------------------------|
| <i>no</i> | Reverts the duplex-mode to the default value (auto) |
|-----------|-----------------------------------------------------|

### 7.1.36.4.3 ip

▶ *interface-config-port-channel-instance*

Configures ARP and DHCP related security parameters on this port-channel interface

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip [arp|dhcp]
ip arp [header-mismatch-validation|trust]
ip dhcp trust
```

**Parameters**

- ip arp [header-mismatch-validation|trust]

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip arp [header-mismatch-validation trust]                         | <p>Configures ARP related parameters on this port-channel interface</p> <ul style="list-style-type: none"> <li>• header-mismatch-validation – Enables a source MAC mismatch check in both the ARP and ethernet headers. This option is enabled by default.</li> <li>• trust – Enables ARP trust on this port channel. If enabled, ARP packets received on this port are considered trusted, and information from these packets is used to identify rogue devices. This option is disabled by default.</li> </ul> |
| <ul style="list-style-type: none"> <li>• ip dhcp trust</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ip dhcp trust                                                     | <p>Enables DHCP trust. If enabled, only DHCP responses are trusted and forwarded on this port channel, and a DHCP server can be connected only to a DHCP trusted port. This option is enabled by default.</p>                                                                                                                                                                                                                                                                                                    |

**Example**

```
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#ip arp trust
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#show context
interface port-channell
description "This port-channel is for enabling dynamic LACP."
duplex full
ip arp trust
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#
```

**Related Commands**

|-----------|-------------------------------------------------------------------------------|
| <i>no</i> | Removes or reverts to default the ARP and DHCP security parameters configured |
|-----------|-------------------------------------------------------------------------------|

### 7.1.36.4.4 ipv6

▶ *interface-config-port-channel-instance*

Configures IPv6 related parameters on this port-channel interface

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```

ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|rguard|trust]

```

**Parameters**

- `ipv6 dhcpv6 trust`

|                                |                                                                                                                                                                                                         |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 dhcpv6 trust</code> | Enables DHCPv6 trust. If enabled, only DHCPv6 responses are trusted and forwarded on this port channel, and a DHCPv6 server can be connected only to a trusted port. This option is enabled by default. |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `ipv6 nd [header-mismatch-validation|rguard|trust]`

|                                                                |                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 nd [header-mismatch-validation rguard trust]</code> | Configures IPv6 <i>neighbor discovery</i> (ND) parameters <ul style="list-style-type: none"> <li>• <code>header-mismatch-validation</code> - Enables a mismatch check for the source MAC in both the ND header and link layer options. This option is disabled by default.</li> </ul>     |
| <code>rguard</code>                                            | Enables router advertisements or IPv6 redirects from this port. Router advertisements are periodically sent to hosts or are sent in response to solicitation requests. The advertisement includes IPv6 prefixes and other subnet and host information. This option is enabled by default. |
| <code>trust</code>                                             | Enables DHCPv6 trust. If enabled, only DHCPv6 responses are trusted and forwarded on this port channel, and a DHCPv6 server can be connected only to a trusted port. This option is enabled by default.                                                                                   |

**Example**

```

nx9500-6C8809(config-profile-testNX9000-if-port-channell)#ipv6 nd header-
mismatch-validation
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#ipv6 nd trust
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#show context
interface port-channell
description "This port-channel is for enabling dynamic LACP."
duplex full
ipv6 nd trust
ipv6 nd header-mismatch-validation
ip arp trust
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#

```

|-----------|------------------------------------------------------------------------------------------|
| <i>no</i> | Removes or reverts to default the IPv6 related parameters on this port-channel interface |
|-----------|------------------------------------------------------------------------------------------|

### 7.1.36.4.5 port-channel

▶ *interface-config-port-channel-instance*

Configures client load balancing parameters on this port-channel interface

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
port-channel load-balance [src-dst-ip|src-dst-mac]
```

**Parameters**

- port-channel load-balance [src-dst-ip|src-dst-mac]

|                                                    |                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port-channel load-balance [src-dst-ip src-dst-mac] | Specifies whether port channel load balancing is conducted using a source/destination IP or a source/destination MAC. <ul style="list-style-type: none"> <li>• src-dst-ip - Uses a source/destination IP to conduct client load balancing. This is the default setting.</li> <li>• src-dst-mac - Uses a source/destination MAC to conduct client load balancing</li> </ul> |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-profile-testNX9000-if-port-channell)#port-channel load-
balance src-dst-mac

nx9500-6C8809(config-profile-testNX9000-if-port-channell)#show context
interface port-channell
description "This port-channel is for enabling dynamic LACP."
duplex full
ipv6 nd trust
ipv6 nd header-mismatch-validation
ip arp trust
port-channel load-balance src-dst-mac
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#

```

### 7.1.36.4.6 qos

▶ *interface-config-port-channel-instance*

Configures *Quality of Service* (QoS) related parameters on this port-channel interface

**Supported in the following platforms:**

- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
qos trust [802.1p|dscp]
```

**Parameters**

- qos trust [802.1p|dscp]

|                                    |                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>qos trust [802.1p dscp]</pre> | <p>Configures the following QoS related parameters:</p> <ul style="list-style-type: none"> <li>• 802.1p - Trusts 802.1p <i>class of service</i> (COS) values ingressing on this port channel. This option is enabled by default.</li> <li>• dscp - Trusts IP DSCP QOS values ingressing on this port channel. This option is enabled by default.</li> </ul> |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#qos trust dscp
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#show context
```

**Related Commands**

|                  |                                                                                     |
|------------------|-------------------------------------------------------------------------------------|
| <p><i>no</i></p> | <p>Removes the QoS related parameters configured on this port-channel interface</p> |
|------------------|-------------------------------------------------------------------------------------|

**7.1.36.4.7 no**

▶ *interface-config-port-channel-instance*

Removes or reverts to default this port-channel interface’s settings

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no beacon [description|duplex|ip|ipv6|port-channel|qos|shutdown|spanning-tree|
speed|switchport|use]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts to default this port-channels interface’s settings based on the parameters passed |
|                 | <ul style="list-style-type: none"> <li>• &lt;PARAMETERS&gt; - Specify the parameters.</li> </ul>     |

**Example**

The following example shows the port-channel interface’s interface settings before the ‘no’ commands are executed:

```
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#show context
description "This port-channel is for enabling dynamic LACP."
speed 100
duplex full
switchport mode trunk
switchport trunk native vlan 1
no switchport trunk native tagged
switchport trunk allowed vlan 1
use ip-access-list in BROADCAST-MULTICAST-CONTROL
ipv6 nd trust
ipv6 nd header-mismatch-validation
spanning-tree portfast
spanning-tree bpduguard enable
spanning-tree bpdufilter enable
spanning-tree mst 1 port-priority 1
spanning-tree mst 1 cost 20000
ip arp trust
port-channel load-balance src-dst-mac
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#

nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#no duplex
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#no ip arp trust
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#no ipv6 nd trust
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#no port-channel load-
balance
```

The following example shows the port-channel interface's interface settings after the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#show context
interface port-channell
 description "This port-channel is for enabling dynamic LACP."
 speed 100
 switchport mode trunk
 switchport trunk native vlan 1
 no switchport trunk native tagged
 switchport trunk allowed vlan 1
 use ip-access-list in BROADCAST-MULTICAST-CONTROL
 ipv6 nd header-mismatch-validation
 spanning-tree portfast
 spanning-tree bpduguard enable
 spanning-tree bpdufilter enable
 spanning-tree mst 1 port-priority 1
 spanning-tree mst 1 cost 20000
 no qos trust dscp
nx9500-6C8809(config-profile-testNX9000-if-port-channell)#
```

### 7.1.36.4.8 shutdown

▶ *interface-config-port-channel-instance*

Shutsdown this port-channel interface

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

shutdown

#### Parameters

None

#### Example

```
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#shutdown
```

#### Related Commands

|           |                                        |
|-----------|----------------------------------------|
| <i>no</i> | Re-enables this port-channel interface |
|-----------|----------------------------------------|

### 7.1.36.4.9 spanning-tree

▶ *interface-config-port-channel-instance*

Configures spanning-tree related parameters on this port-channel interface

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
spanning-tree [bpdufilter|bpduguard|force-version|guard|link-type|mst|port-cisco-
interoperability|portfast]
```

```
spanning-tree [bpdufilter|bpduguard] [default|disable|enable]
```

```
spanning-tree [force-version <0-3>|guard root|portfast|port-cisco-
interoperability [disable|enable]]
```

```
spanning-tree link-type [point-to-point|shared]
```

```
spanning-tree mst <0-15> [cost <1-200000000>|port-priority <0-240>]]
```

#### Parameters

- spanning-tree [bpdufilter|bpduguard] [default|disable|enable]

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 7.1.36.4.10 speed

▶ *interface-config-port-channel-instance*

Configures the speed at which this port-channel interface receives and transmits data

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
speed [10|100|1000|auto]]]
```

#### Parameters

- speed [10|100|1000|auto]

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 7.1.36.4.11 switchport

▶ *interface-config-port-channel-instance*

Configures the VLAN switching parameters for this port-channel interface

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
switchport [access|mode|trunk]

switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]
switchport mode [access|trunk]
switchport trunk [allowed|native]
switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|none|remove <VLAN-ID>]
switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]
```

**Parameters**

- switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]

|                                                     |                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| access vlan<br>[<1-4094> <br><VLAN-ALIAS-<br>NAME>] | Configures the VLAN to which this port-channel interface is mapped when the switching mode is set to access. <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the SVI VLAN ID from 1 - 4094.</li> <li>• &lt;VLAN-ALIAS-NAME&gt; - Specify the VLAN alias name (should be existing and configured).</li> </ul> |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- switchport mode [access|trunk]

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode [access trunk] | Configures the VLAN switching mode over the port channel <ul style="list-style-type: none"> <li>• access - If selected, the port channel accepts packets only form the native VLANs. Frames are forwarded out the port untagged with no 802.1Q header. All frames received on the port are expected as untagged and are mapped to the native VLAN. This is the default setting.</li> <li>• trunk - If selected, the port channel allows packets from a list of VLANs you add to the trunk. A port channel configured as Trunk supports multiple 802.1Q tagged VLANs and one Native VLAN which can be tagged or untagged.</li> </ul> |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|none|remove <VLAN-ID>]

|               |                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trunk allowed | If configuring the VLAN switching mode as trunk, use this option to configure the VLANs allowed on this port channel. Add VLANs that exclusively send packets over the port channel. |

| <i>no</i> | Removes the packet switching parameters configured on this port-channel interface |
|-----------|-----------------------------------------------------------------------------------|

### 7.1.36.4.12 use

► *interface-config-port-channel-instance*

Configures access controls on this port-channel interface

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use [ip-access-list|ipv6-access-list|mac-access-list] in <IP/IPv6/MAC-ACCESS-LIST-NAME>]]
```

**Parameters**

- use [ip-access-list|ipv6-access-list|mac-access-list] in <IP/IPv6/MAC-ACCESS-LIST-NAME>]

|                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>use [ip-access-list  ipv6-access-list  mac-access-list] &lt;IP/IPv6/MAC- ACCESS-LIST- NAME&gt;]</pre> | <p>Associates an access list controlling the inbound traffic on this port channel.</p> <ul style="list-style-type: none"> <li>• ip-access-list – Specify the IPv4 specific firewall rules to apply to this profile’s port channel configuration. IPv4 is a connectionless protocol for packet switched networking. IPv4 operates as a best effort delivery method, as it does not guarantee delivery, and does not ensure proper sequencing or duplicate delivery (unlike (TCP). IPv4 hosts can use link local addressing to provide local connectivity.</li> <li>• ipv6-access-list – Specify the IPv6 specific firewall rules to apply to this profile’s port channel configuration. IPv6 is the latest revision of the Internet Protocol (IP) designed to replace IPv4. IPV6 provides enhanced identification and location information for computers on networks routing traffic across the Internet. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.</li> <li>• mac-access-list – Specify the MAC specific firewall rules to apply to this profile’s port channel configuration. <ul style="list-style-type: none"> <li>• &lt;IP/IPv6/MAC-ACCESS-LIST-NAME&gt; – Provide the IPv4, IPv6, or MAC access list name based on the option selected. The access list specified should be existing and configured.</li> </ul> </li> </ul> |
|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#use ip-access-list in
BROADCAST-MULTICAST-CONTROL

nx9500-6C8809(config-profile-testNX9000-if-port-channel1)#show context
interface port-channel1
description "This port-channel is for enabling dynamic LACP."

### 7.1.36.5 interface-config-radio-instance

► *interface*

This section documents radio interface configuration parameters applicable only to the access point profiles.

The access point radio interface can be radio1, radio2, or radio3. The AP7161 models contain either a single or a dual radio configuration. Newer AP7161N model access points support single, dual, or triple radio configurations.

To enter the AP/RFS4000 profile > radio interface context, use the following commands:

```
<DEVICE>(config)#profile <AP-TYPE> <PROFILE-NAME>

rfs6000-37FABE(config)#profile ap71xx 71xxTestProfile
rfs6000-37FABE(config-profile-71xxTestProfile)#

rfs6000-37FABE(config-profile-71xxTestProfile)#interface radio 1
rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#

rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#?
Radio Mode commands:
 adaptivity Adaptivity
 aeroscout Aeroscout Multicast MAC/Enable
 aggregation Configure 802.11n aggregation related parameters
 airtime-fairness Enable fair access to medium for clients based
 on their usage of airtime
 antenna-diversity Transmit antenna diversity for non-11n transmit
 rates
 antenna-downtilt Enable ADEPT antenna mode
 antenna-elevation Specifies the antenna elevation gain
 antenna-gain Specifies the antenna gain of this radio
 antenna-mode Configure the antenna mode (number of transmit
 and receive antennas) on the radio
 assoc-response Configure transmission parameters for
 Association Response frames
 association-list Configure the association list for the radio
 beacon Configure beacon parameters
 bridge Bridge rf-mode related configuration
 channel Configure the channel of operation for this
 radio
 data-rates Specify the 802.11 rates to be supported on this
 radio
 description Configure a description for this radio
 dfs-rehome Revert to configured home channel once dfs
 evacuation period expires
 dynamic-chain-selection Automatic antenna-mode selection (single antenna
 for non-11n transmit rates)
 ekahau Ekahau Multicast MAC/Enable
 extended-range Configure extended range
 fallback-channel Configure the channel to be used for falling
 back in the event of radar being detected on the
 current operating channel
 guard-interval Configure the 802.11n guard interval
 ldpc Configure support for Low Density Parity Check
 Code
 lock-rf-mode Retain user configured rf-mode setting for this
 radio
 max-clients Maximum number of wireless clients allowed to
 associate subject to AP limit
 mesh Configure radio mesh parameters
 meshpoint Enable meshpoints on this radio
 mu-mimo Enable multi user MIMO on this radio (selected
 platforms only)
 no Negate a command or set its defaults
```

```

non-unicast Configure handling of non-unicast frames
off-channel-scan Enable off-channel scanning on the radio
placement Configure the location where this radio is
 operating
power Configure the transmit power of the radio
preamble-short Use short preambles on this radio
probe-response Configure transmission parameters for Probe
 Response frames
radio-resource-measurement Configure support for 802.11k Radio Resource
 Measurement
radio-share-mode Configure the radio-share mode of operation for
 this radio
rate-selection Default or Opportunistic rate selection
remove-override Negate a command or set its defaults
rf-mode Configure the rf-mode of operation for this
 radio
rifs Configure Reduced Interframe Spacing (RIFS)
 parameters
rts-threshold Configure the RTS threshold
shutdown Shutdown the selected radio interface
smart-rf Configure radio specific smart-rf settings
sniffer-redirect Capture packets and redirect to an IP address
 running a packet capture/analysis tool
stbc Configure Space-Time Block Coding (STBC)
 parameters
transmit-beamforming Enable Transmit Beamforming
use Set setting to use
wips Wireless intrusion prevention related
 configuration
wireless-client Configure wireless client related parameters
wlan Enable wlans on this radio

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or
 terminal

```

rf6000-37FABE (config-profile-71xxTestProfile-if-radio1) #

The following table summarizes the radio interface configuration commands:

| Commands                 | Description                                                                                                                      | Reference                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>adaptivity</i>        | Configures an adaptivity timeout value, in minutes, for avoidance of channels detected with radar or high levels of interference | <a href="#">page 7-256</a> |
| <i>aeroscout</i>         | Enables Aeroscout multicast packet forwarding                                                                                    | <a href="#">page 7-257</a> |
| <i>aggregation</i>       | Configures 802.11n aggregation parameters                                                                                        | <a href="#">page 7-258</a> |
| <i>airtime-fairness</i>  | Enables fair access for clients based on airtime usage                                                                           | <a href="#">page 7-261</a> |
| <i>antenna-diversity</i> | Transmits antenna diversity for non-11n transmit rates                                                                           | <a href="#">page 7-262</a> |
| <i>antenna-downtilt</i>  | Enables <i>Advanced Element Panel Technology (ADEPT)</i> antenna mode                                                            | <a href="#">page 7-263</a> |
| <i>antenna-elevation</i> | Configures the antenna's elevation gain. This command is applicable only to the AP7562 model access point                        | <a href="#">page 7-264</a> |
| <i>antenna-gain</i>      | Specifies the antenna gain for the selected radio                                                                                | <a href="#">page 7-266</a> |
| <i>antenna-mode</i>      | Configures the radio antenna mode                                                                                                | <a href="#">page 7-267</a> |

| Commands                          | Description                                                                                                                                                                                    | Reference                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>assoc-response</i>             | Enables an access point to ignore or respond to an association/ authorization request based on the configured <i>Received Signal Strength Index</i> (RSSI) threshold and deny-threshold values | <a href="#">page 7-268</a> |
| <i>association-list</i>           | Associates an existing global association list with this radio interface                                                                                                                       | <a href="#">page 7-269</a> |
| <i>beacon</i>                     | Configures beacon parameters                                                                                                                                                                   | <a href="#">page 7-270</a> |
| <i>bridge</i>                     | Configures client-bridge related parameters, if the selected radio's RF mode is set to bridge                                                                                                  | <a href="#">page 7-272</a> |
| <i>channel</i>                    | Configures a radio's channel of operation                                                                                                                                                      | <a href="#">page 7-278</a> |
| <i>data-rates</i>                 | Specifies the 802.11 rates supported on a radio                                                                                                                                                | <a href="#">page 7-280</a> |
| <i>description</i>                | Configures the selected radio's description                                                                                                                                                    | <a href="#">page 7-284</a> |
| <i>dfs-rehome</i>                 | Reverts to configured home channel once <i>Dynamic Frequency Selection</i> (DFS) evacuation period expires                                                                                     | <a href="#">page 7-285</a> |
| <i>dynamic-chain-selection</i>    | Enables automatic antenna mode selection                                                                                                                                                       | <a href="#">page 7-286</a> |
| <i>ekahau</i>                     | Enables Ekahau multicast packet forwarding                                                                                                                                                     | <a href="#">page 7-287</a> |
| <i>extended-range</i>             | Configures extended range                                                                                                                                                                      | <a href="#">page 7-288</a> |
| <i>fallback-channel</i>           | Configures the channel to which the radio switches in case of radar detection on the current channel                                                                                           | <a href="#">page 7-289</a> |
| <i>guard-interval</i>             | Configures the 802.11n guard interval                                                                                                                                                          | <a href="#">page 7-290</a> |
| <i>ldpc</i>                       | Enables support for <i>Low Density Parity Check</i> (LDPC) on the radio interface                                                                                                              | <a href="#">page 7-291</a> |
| <i>lock-rf-mode</i>               | Retains user configured RF mode settings for the selected radio                                                                                                                                | <a href="#">page 7-292</a> |
| <i>max-clients</i>                | Configures the maximum number of wireless clients allowed to associate with this radio                                                                                                         | <a href="#">page 7-293</a> |
| <i>mesh</i>                       | Configures radio mesh parameters                                                                                                                                                               | <a href="#">page 7-294</a> |
| <i>meshpoint</i>                  | Maps an existing meshpoint to this radio interface                                                                                                                                             | <a href="#">page 7-296</a> |
| <i>mu-mimo</i>                    | Enables <i>multi-user multiple input multiple output</i> (MU-MIMO) support on a radio                                                                                                          | <a href="#">page 7-297</a> |
| <i>no</i>                         | Negates or resets radio interface settings configured on a profile or a device                                                                                                                 | <a href="#">page 7-298</a> |
| <i>non-unicast</i>                | Configures the handling of non unicast frames on this radio                                                                                                                                    | <a href="#">page 7-301</a> |
| <i>off-channel-scan</i>           | Enables selected radio's off channel scanning parameters                                                                                                                                       | <a href="#">page 7-303</a> |
| <i>placement</i>                  | Defines selected radio's deployment location                                                                                                                                                   | <a href="#">page 7-305</a> |
| <i>power</i>                      | Configures the transmit power on this radio                                                                                                                                                    | <a href="#">page 7-306</a> |
| <i>preamble-short</i>             | Enables the use of short preamble on this radio                                                                                                                                                | <a href="#">page 7-307</a> |
| <i>probe-response</i>             | Configures transmission parameters for probe response frames                                                                                                                                   | <a href="#">page 7-308</a> |
| <i>radio-resource-measurement</i> | Enables 802.11k radio resource measurement                                                                                                                                                     | <a href="#">page 7-309</a> |
| <i>radio-share-mode</i>           | Configures the mode of operation, for this radio, as radio-share                                                                                                                               | <a href="#">page 7-310</a> |
| <i>rate-selection</i>             | Sets the rate selection method to standard or opportunistic                                                                                                                                    | <a href="#">page 7-311</a> |

| Commands                    | Description                                                                                                                              | Reference                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>rf-mode</i>              | Configures the radio's RF mode                                                                                                           | <a href="#">page 7-312</a> |
| <i>rifs</i>                 | Configures <i>Reduced Interframe Spacing</i> (RIFS) parameters on this radio                                                             | <a href="#">page 7-314</a> |
| <i>rts-threshold</i>        | Configures the <i>Request to Send</i> (RTS) threshold value on this radio                                                                | <a href="#">page 7-315</a> |
| <i>service</i>              | Enables dynamic control function. This dynamic function controls performance of the radio receiver's <i>low noise amplifiers</i> (LNAs). | <a href="#">page 7-316</a> |
| <i>shutdown</i>             | Terminates or shuts down selected radio interface                                                                                        | <a href="#">page 7-317</a> |
| <i>smart-rf</i>             | Overrides Smart RF channel width setting on the selected radio interface                                                                 | <a href="#">page 7-318</a> |
| <i>sniffer-redirect</i>     | Captures and redirects packets to an IP address running a packet capture/analysis tool                                                   | <a href="#">page 7-319</a> |
| <i>stbc</i>                 | Configures radio's <i>Space Time Block Coding</i> (STBC) mode                                                                            | <a href="#">page 7-321</a> |
| <i>transmit-beamforming</i> | Enables transmit beamforming on the selected radio interface                                                                             | <a href="#">page 7-322</a> |
| <i>use</i>                  | Enables use of an association ACL policy and a radio QoS policy by selected radio interface                                              | <a href="#">page 7-323</a> |
| <i>wips</i>                 | Enables access point to change its channel of operation in order to terminate rogue devices                                              | <a href="#">page 7-324</a> |
| <i>wireless-client</i>      | Configures wireless client parameters on selected radio                                                                                  | <a href="#">page 7-325</a> |
| <i>wlan</i>                 | Enables a WLAN on selected radio                                                                                                         | <a href="#">page 7-326</a> |

### 7.1.36.5.1 adaptivity

▶ *interface-config-radio-instance*

Configures an interval, in minutes, for avoiding channels detected with high levels of interference

As per the *European Telecommunications Standards Institute's* (ETSI) EN 300 328 V1.8.1/ ETSI EN 301 893 V1.7.1 requirements, access points have to monitor interference levels on operating channels, and stop functioning on channels with interference levels exceeding ETSI-specified threshold values.

This command configures the interval for which a channel is avoided on detection of interference, and is applicable only if the channel selection mode is set to ACS, Random, or Fixed.

**NOTE:** If the channel selection mode is set to Smart, in the Smart-RF policy mode, use the *avoidance-time > [adaptivity/dfs] > <30-3600>* command to specify the interval for which a channel is avoided on detection of high levels of interference or radar. For more information, see *avoidance-time*.

When configured, this feature ensures recovery by switching the radio to a new operating channel. Once adaptivity is triggered, the evacuated channel becomes inaccessible and is available again only after the adaptivity timeout, specified here, expires. In case of fixed channel, the radio switches back to the original channel of operation after the adaptivity timeout expires. On the other hand, ACS-enabled radios continue operating on the new channel even after the adaptivity timeout period expires.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
adaptivity [recovery|timeout <30-3600>]
```

**Parameters**

- *adaptivity* [*recovery|timeout <30-3600>*]

|                   |                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adaptivity        | Configures adaptivity parameters on the radio. These parameters are: recovery and timeout.                                                                                                                                                                                                                                                                                                                  |
| recovery          | Enables switching of channels when an access point's radio is in the adaptivity mode. In the adaptivity mode, an access point monitors interference on its set channel and stops functioning when the radio's defined interference tolerance level is exceeded. When the defined adaptivity timeout is exceeded, the radio resumes functionality on a different channel. This option is enabled by default. |
| timeout <30-3600> | Configures an adaptivity timeout <ul style="list-style-type: none"> <li>• &lt;30-3600&gt; - Specify a value from 30 - 3600 minutes. The default is 90 minutes.</li> </ul>                                                                                                                                                                                                                                   |

**Example**

```
nx4500-5CFA2B(config-profile-testAP7532-if-radio1)#adaptivity timeout 200
nx4500-5CFA2B(config-profile-testAP7532-if-radio1)#show context
interface radio1
 adaptivity timeout 200
nx4500-5CFA2B(config-profile-testAP7532-if-radio1)#
```

**Related Commands**

|           |                                                                                  |
|-----------|----------------------------------------------------------------------------------|
| <i>no</i> | Removes the configured adaptivity timeout value and disables adaptivity recovery |

### 7.1.36.5.2 aeroscout

▶ *interface-config-radio-instance*

Enables Aeroscout multicast packet forwarding. This feature is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6532, AP7502, AP7522

#### Syntax

```
aeroscout [forward ip <IP> port <0-65535>|mac <MAC>]
```

#### Parameters

- aeroscout [forward ip <IP> port <0-65535>|mac <MAC>]

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aeroscout                      | Enables Aeroscout packet forwarding and configures the packet forwarding parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| forward ip <IP> port <0-65535> | Configures the following Aeroscout locationing engine details: <ul style="list-style-type: none"> <li>• ip - Configures Aeroscout engine's IP address <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the Aeroscout engine's IP address. When specified, the AP forwards Aeroscout beacons directly to the Aeroscout locationing engine without proxying through the controller or RF Domain manager.</li> </ul> </li> <li>• port - Configures the port on which the Aeroscout engine is reachable <ul style="list-style-type: none"> <li>• &lt;0-65535&gt; - Specify the port number from 0 - 65535.</li> </ul> </li> </ul> |
| mac <MAC>                      | Configures the multicast MAC address to forward the Aeroscout packets <ul style="list-style-type: none"> <li>• &lt;MAC&gt; - Specify the MAC address in the AA-BB-CC-DD-EE-FF format. The default value is 01-0C-CC-00-00-00.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                   |

#### Example

```
nx9500-6C8809(config-profile-ProfileTestAP7532-if-radio2)#aeroscout forward ip
10.233.84.206 port 22

nx9500-6C8809(config-profile-ProfileTestAP7532-if-radio2)#show context
interface radio2
 aeroscout forward ip 10.233.84.206 port 22
nx9500-6C8809(config-profile-ProfileTestAP7532-if-radio2)#
```

### 7.1.36.5.3 aggregation

▶ *interface-config-radio-instance*

Configures 802.11n frame aggregation parameters. Frame aggregation increases throughput by sending two or more data frames in a single transmission. There are two types of frame aggregation: *MAC Service Data Unit* (MSDU) aggregation and *MAC Protocol Data Unit* (MPDU) aggregation. Both modes group several data frames into one large data frame.

#### Supported in the following platforms:

- Access Points — AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
aggregation [ampdu|amsdu]

aggregation ampdu [rx-only|tx-only|tx-rx|none|max-aggr-size|min-spacing]

aggregation ampdu [rx-only|tx-only|tx-rx|none]

aggregation ampdu max-aggr-size [rx|tx]
aggregation ampdu max-aggr-size rx [8191|16383|32767|65535]
aggregation ampdu max-aggr-size tx <2000-65535>

aggregation ampdu min-spacing [0|1|2|4|8|16]

aggregation amsdu [rx-only|tx-rx]
```

#### Parameters

- aggregation ampdu [rx-only|tx-only|tx-rx|none]

|             |                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 7.1.36.5.4 airtime-fairness

▶ *interface-config-radio-instance*

Enables fair access to the medium for wireless clients based on their airtime usage (i.e. regardless of whether the client is a high-throughput (802.11n) or legacy client). This option is enabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
airtime-fairness {prefer-ht} {weight <1-10>}
```

#### Parameters

- `airtime-fairness {prefer-ht} {weight <1-10>}`

|                  |                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| airtime-fairness | Enables fair access to the medium for wireless clients based on their airtime usage                                                                                                                    |
| prefer-ht        | Optional. Prioritizes high throughput (802.11n) clients over clients with slower throughput (802.11 a/b/g) and legacy clients                                                                          |
| weight <1-10>    | Optional. Configures the relative weightage for 11n clients over legacy clients. <ul style="list-style-type: none"> <li>• &lt;1-10&gt; - Sets a weightage ratio for 11n clients from 1 - 10</li> </ul> |

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#airtime-fairness prefer-ht weight 6

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 aggregation ampdu tx-only
 aeroscout forward

### 7.1.36.5.5 antenna-diversity

▶ *interface-config-radio-instance*

Configures transmit antenna diversity for non-11n transmit rates

Antenna diversity uses two or more antennas to increase signal quality and strength. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
antenna-diversity
```

#### Parameters

None

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#antenna-diversity

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 aggregation ampdu tx-only
 aeroscout forward
 antenna-diversity
 airtime-fairness prefer-ht weight 6
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#
```

### 7.1.36.5.6 antenna-downtilt

▶ *interface-config-radio-instance*

Enables the *Advanced Element Panel Technology (ADEPT)* antenna mode. The ADEPT mode increases the probability of parallel data paths enabling multiple spatial data streams. This option is disabled by default.

**Supported in the following platforms:**

- Access Point – AP7161

**NOTE:** This feature is not supported on AP6521, AP6522, AP6532, AP6562, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, and AP8533.

**Syntax**

```
antenna-downtilt
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#antenna-downtilt

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 antenna-gain 12.0
 aggregation ampdu tx-only
 aeroscout forward
 antenna-diversity
 airtime-fairness prefer-ht weight 6
 antenna-downtilt
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#
```

**Related Commands**

|           |                                 |
|-----------|---------------------------------|
| <i>no</i> | Disables the ADEPT antenna mode |
|-----------|---------------------------------|

### 7.1.36.5.7 antenna-elevation

#### ▶ *interface-config-radio-instance*

Configures an antenna's elevation gain. Antenna gain is the ratio of an antenna's radiation intensity in a given direction to the intensity produced by a no-loss, isotropic antenna radiating equally in all directions. An antenna's gain along the horizon and at an elevation of 30 degree may vary. The elevation gain is defined as the maximum antenna gain at 30 to 150 degrees above the horizon. If elevation gain is configured, the transmit (TX) power calculations maximize the allowable TX power for an elevation below 30 degree.

Access Points must conform to U.S. *Federal Communications Commission's* (FCC) limitations. FCC has now stipulated a 21dBm *Effective Isotropic Radiated Power* (EIRP) limit for power directed 30 degrees above the horizon.

For Extreme Networks -supplied antennas, compatible with 5.0 GHz on the AP7562 access point, refer to the Antenna Guide for "Elevation Gain" information. If using a third-party antenna, it is required that you obtain the antenna-elevation gain information from the antenna manufacturer.

The elevation gain should be configured if the access point:

- Is deployed outdoors, and
- Is used with a dipole antenna (panel antenna and polarized antenna are for point to point only, and are excluded from this requirement), and
- Is transmitting in the 5.15 - 5.25 GHz *Unlicensed National Information Infrastructure-1* (UNII-1) band.

Professional installers must complete the following steps to ensure compliance with the FCC rule:

1 Configure the antenna type. For example:

```
ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#service antenna-type dipole
```

2 Configure the antenna peak gain. For example:

```
ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#antenna-gain 7.0
```

3 Configure the antenna placement. For example:

```
ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#placement outdoor
```

4 Configure the antenna elevation gain. For example:

```
ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#antenna-elevation 5.0
```

After the professional installer enters the antenna type, gain, placement, and elevation gain using the CLI as outlined above, the firmware will use this information and hardcoded maximum limits determined during testing (See Annex C in FCC Report #FR4D0448AB) to limit the EIRP below 21dBm for outdoor use in UNII-1 band. The antenna information is provided in the Installation guide and antenna guide.

#### Supported in the following platforms:

- Access Points — AP7562

#### Syntax

```
antenna-elevation <-30.0-36.0>
```

**NOTE:** The antenna elevation gain feature is supported only on the AP7562 model access point.

---

---

**Parameters**

- antenna-elevation <-30.0-36.0>

|                                   |                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| antenna-elevation<br><-30.0-36.0> | Configures the antenna elevation gain from -30.0 - 36.0 dB. Refer to the antenna specifications for antenna-elevation gain information.<br><br>The default value is 0 dB. |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
ap7562-80C2AC (config-device-84-24-8D-80-C2-AC-if-radio2) #antenna-elevation 5.0

ap7562-80C2AC (config-device-84-24-8D-80-C2-AC-if-radio2) #show context
interface radio2

| <i>no</i> | Resets antenna elevation gain to default (0 dB) |
|-----------|-------------------------------------------------|

### 7.1.36.5.8 antenna-gain

▶ *interface-config-radio-instance*

Configures the antenna gain for the selected radio

Antenna gain is the ability of an antenna to convert power into radio waves and vice versa. The access point or wireless controller's *Power Management Antenna Configuration File* (PMACF) automatically configures the access point or wireless controller's radio transmit power based on the antenna type, its antenna gain (provided here) and the deployed country's regulatory domain restrictions. Once provided, the access point or wireless controller calculates the power range. Antenna gain relates the intensity of an antenna in a given direction to the intensity that would be produced ideally by an antenna that radiates equally in all directions (isotropically), and has no losses. Although the gain of an antenna is directly related to its directivity, its gain is a measure that takes into account the efficiency of the antenna as well as its directional capabilities. It is recommended that only a professional installer set the antenna gain.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
antenna-gain <0.0-15.0>
```

#### Parameters

- antenna-gain <0.0-15.0>

|                            |                                                                     |
|----------------------------|---------------------------------------------------------------------|
| antenna-gain<br><0.0-15.0> | Sets the antenna gain from 0.0 - 15.0 dBi. The default is 0.00 dBi. |
|----------------------------|---------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#antenna-gain 12.0

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 antenna-gain 12.0
 aggregation ampdu tx-only
 aeroscout forward
 antenna-diversity
 airtime-fairness prefer-ht weight 6
 antenna-downtilt
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#
```

#### Related Commands

|           |                                           |
|-----------|-------------------------------------------|
| <i>no</i> | Resets the radio's antenna gain parameter |
|-----------|-------------------------------------------|

### 7.1.36.5.9 antenna-mode

▶ *interface-config-radio-instance*

Configures the antenna mode (the number of transmit and receive antennas) on the access point

This command sets the number of transmit and receive antennas on the access point. The 1x1 mode is used for transmissions over just the single -A- antenna, 1xALL is used for transmissions over the -A- antenna and all three antennas for receiving. The 2x2 mode is used for transmissions and receipts over two antennas for dual antenna models. 3x3x3 is used for transmissions and receipts over three antennas for AP81XX models. The default setting is dynamic based on the access point model deployed and its transmit power settings.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
antenna-mode [1*1|1*ALL|2*2|3*3|default]
```

#### Parameters

- antenna-mode [1\*1|1\*ALL|2\*2|default]

|              |                                                             |
|--------------|-------------------------------------------------------------|
| antenna-mode | Configures the antenna mode                                 |
| 1*1          | Uses only antenna A to receive and transmit                 |
| 1*ALL        | Uses antenna A to transmit and receives on all antennas     |
| 2*2          | Uses antennas A and C for both transmit and receive         |
| 3*3          | Uses antenna A, B, and C for both transmit and receive      |
| default      | Uses default antenna settings. This is the default setting. |

#### Usage Guidelines

To support STBC feature on AP7161 profile, the antenna-mode should not be configured to 1\*1.

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#antenna-mode 2x2
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 antenna-gain 12.0
 aggregation ampdu tx-only
 aeroscout forward
 antenna-mode 2x2
 antenna-diversity
 airtime-fairness prefer-ht weight 6
 antenna-downtilt
 rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#
```

#### Related Commands

|           |                                                                                            |
|-----------|--------------------------------------------------------------------------------------------|
| <i>no</i> | Resets the radio antenna mode (the number of transmit and receive antennas) to its default |
|-----------|--------------------------------------------------------------------------------------------|

### 7.1.36.5.10 assoc-response

▶ *interface-config-radio-instance*

Configures the parameters determining whether the access point ignores or responds to an association/authorization request

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
assoc-response [deny-threshold <1-12>|rssi-threshold <-128--40>]
```

#### Parameters

- `assoc-response [deny-threshold <1-12>|rssi-threshold <-128--40>]`

|                           |                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| assoc-response            | Configures the following thresholds, based on which the AP ignores or responds to an association/authorization request: deny-threshold and rssi-threshold.<br>Both these options are disabled by default.                                                                                                                                                                                 |
| deny-threshold <1-12>     | Configures the number of times the AP ignores association/authorization requests, if the RSSI is below the configured RSSI threshold value<br><ul style="list-style-type: none"> <li>• &lt;1-12&gt; - Specify a value from 1 - 12.</li> </ul> <b>Note:</b> The AP always ignores association/authorization requests when deny-threshold is not specified and rssi-threshold is specified. |
| rssi-threshold <-128--40> | Configures the RSSI threshold. If the RSSI is lower than the threshold configured here, the AP ignores the association/authorization request.<br><ul style="list-style-type: none"> <li>• &lt;-128--40&gt; - Specify the RSSI threshold from -128 - -40 dBi.</li> </ul>                                                                                                                   |

#### Example

```
rfs6000-37FABE(config-profile-71XXTestProfile-if-radiol)#assoc-response rssi-
threshold -128

rfs6000-37FABE(config-profile-71XXTestProfile-if-radiol)#show context
interface radiol
 assoc-response rssi-threshold -128
rfs6000-37FABE(config-profile-71XXTestProfile-if-radiol)#
```

#### Related Commands

|           |                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the RSSI threshold, based on which an association/authorization request is either ignored or responded. |
|-----------|-----------------------------------------------------------------------------------------------------------------|

### 7.1.36.5.11 association-list

▶ *interface-config-radio-instance*

Associates an existing global association list with this radio interface

An association ACL is a policy-based *access control list* (ACL) that either prevents or allows wireless clients from connecting to a managed access point radio. An ACL is a sequential collection of permit and deny rules that apply to incoming and outgoing packets. When a packet is received on an interface, the controller, service platform, or access point compares the fields in the packet against the applied ACLs to verify the packet has the required permissions to be forwarded. If a packet does not meet any of the criteria specified in the ACL, it is dropped.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
association-list global <GLOBAL-ASSOC-LIST-NAME>
```

#### Parameters

- association-list global <GLOBAL-ASSOC-LIST-NAME>

|                                                  |                                                                          |
|--------------------------------------------------|--------------------------------------------------------------------------|
| association-list global <GLOBAL-ASSOC-LIST-NAME> | Associates an existing global association list with this radio interface |
|--------------------------------------------------|--------------------------------------------------------------------------|

#### Example

```
rfs4000-880DA7(config-profile-test-if-radio1)#association-list global test
rfs4000-880DA7(config-profile-test-if-radio1)#show context
interface radio1
 association-list global test
rfs4000-880DA7(config-profile-test-if-radio1)#
```

#### Related Commands

|           |                                                                          |
|-----------|--------------------------------------------------------------------------|
| <i>no</i> | Removes the global association list associated with this radio interface |
|-----------|--------------------------------------------------------------------------|

### 7.1.36.5.12 beacon

▶ *interface-config-radio-instance*

Configures radio beacon parameters

A beacon is a packet broadcasted by adopted radios to keep the network synchronized. Included in a beacon is information, such as the WLAN service area, the radio address, the broadcast destination addresses, a time stamp, and indicators about traffic and delivery such as a *Delivery Traffic Indication Message* (DTIM). Increase the DTIM/beacon settings (lengthening the time) to let nodes sleep longer and preserve battery life. Decrease these settings (shortening the time) to support streaming-multicast audio and video applications that are jitter sensitive.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
beacon [dtim-period|period]
beacon dtim-period [<1-50>|bss]
beacon dtim-period [<1-50>|bss <1-16> <1-50>]
beacon period [50|100|200]
```

**Parametersd**

- beacon dtim-period [<1-50>|bss <1-8> <1-50>]

|                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| beacon                                                                         | Configures radio beacon parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| dtim-period                                                                    | Configures the radio DTIM interval. A DTIM is a message that informs wireless clients about the presence of buffered multicast or broadcast data. These are simple data frames that require no acknowledgement, so nodes sometimes miss them. Increase the DTIM/ beacon settings (lengthening the time) to let nodes sleep longer and preserve their battery life. Decrease these settings (shortening the time) to support streaming multicast audio and video applications that are jitter-sensitive. |
| <1-50>                                                                         | Configures a single value to use on the radio. Specify a value between 1 and 50.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| bss <1-16> <1-50>                                                              | Configures a separate DTIM for a <i>Basic Service Set</i> (BSS) on this radio interface <ul style="list-style-type: none"> <li>• &lt;1-16&gt; - Sets the BSS number from 1 - 16</li> <li>• &lt;1-50&gt; - Sets the BSS DTIM from 1 - 50. ### 7.1.36.5.13 bridge

▶ *interface-config-radio-instance*

Configures the client-bridge parameters for radios with *rf-mode* set to *bridge*. When configured as a client bridge, the radio can authenticate and associate to the *Wireless LAN* (WLAN) hosted on the infrastructure access point. After successfully associating with the infrastructure WLAN, the client-bridge access point switches frames between its bridge radio and wired/wireless client(s) connected either to its GE port(s) or to the other radio, there by providing the clients access to the infrastructure WLAN resources.

**NOTE:** The radio interface configured to form the client-bridge will not be able to service wireless clients as its *RF mode* is set to *bridge* and not *2.5 GHz* or *5.0 GHz*.

**Supported in the following platforms:**

- Access Points — AP6522, AP6562, AP7522, AP7532, AP7562, AP7602, AP7622

**Syntax**

```
bridge [authentication-type [eap|none]|channel-dwell-time <50-2000>|channel-list [2.4GHz|5GHz] <LIST>|connect-through-bridges|eap [password <PASSWORD>|type [peap-mschapv2|tls]|username <USERNAME>]|encryption-type [ccmp|none|tkip]|inactivity-timeout <0-864000>|keepalive [frame-type [null-data|wnmp]|interval <0-36000>]|max-clients <1-64>|on-link-loss shutdown-other-radio <1-1800>|on-link-up refresh-vlan-interface|roam-criteria [missed-beacons <1-60>|rssi-threshold <-128--40>]|ssid <SSID>|wpa-wpa2 psk [0|2|<LINE>]]
```

**Parameters**

- bridge [authentication-type [eap|none]|channel-dwell-time <50-2000>|channel-list [2.4GHz|5GHz] <LIST>|connect-through-bridges|eap [password <PASSWORD>]|type [peap-mschapv2|tls]|username <USERNAME>]|encryption-type [ccmp|none|tkip]|inactivity-timeout <0-864000>|keepalive [frame-type [null-data|wnmp]|interval <0-36000>]|max-clients <1-64>|on-link-loss shutdown-other-radio <1-1800>|on-link-up refresh-vlan-interface|roam-criteria [missed-beacons <1-60>|rssi-threshold <-128--40>]|ssid <SSID>|wpa-wpa2 psk [0|2|<LINE>]]

### Usage Guidelines EAP Authentication

Use the following commands to view client-bridge configuration:

- 1 show > wireless > bridge > config  
Shows the current client bridge configuration.
- 2 show > wireless > bridge > candidate-ap  
Shows the available infrastructure WLAN candidates that are found during the last scan.
- 3 show > wireless > bridge > host  
Shows the wired/wireless clients that are being bridged.
- 4 show > wireless > bridge > statistics > rf  
Shows the client bridge RF statistics.
- 5 show > wireless > bridge > statistics > traffic  
Shows the client bridge traffic statistics.
- 6 show > wireless > bridge > certificate > status  
Shows the client bridge authentication certificate status.

### Example

The following examples show the basic parameters that need to be configured on the Infrastructure and the client-bridge APs in order to enable the client-bridge AP to associate with the Infrastructure WLAN. Note, in this example, the authentication mode is set to 'none' and the encryption-type is set to 'ccmp'. The authentication and encryption modes used will vary as per requirement.

- 1 Configuring the Infrastructure WLAN:

```
InfrastrNOC(config)#wlan cb-psk
InfrastrNOC(config-wlan-cb-psk)#ssid cb-psk
InfrastrNOC(config-wlan-cb-psk)#encryption-type ccmp
InfrastrNOC(config-wlan-cb-psk)#wpa-wpa2 psk extreme@123
InfrastrNOC(config-wlan-cb-psk)#authentication-type none
```

```
InfrastrNOC(config)#show running-config wlan cb-psk
wlan cb-psk
 ssid cb-psk
 bridging-mode local
 encryption-type ccmp
 authentication-type none
 wpa-wpa2 psk 0 extreme@123
```

```
InfrastrNOC(config)#
```

- 2 Associating the 'cb-psk' WLAN to the Infrastructure AP's radio.

```
Infra7131-5F5078(config-device-B4-C7-99-5F-50-78-if-radio2)#wlan cb-psk
```

```

### 7.1.36.5.14 channel

▶ *interface-config-radio-instance*

Configures a radio's channel of operation

Only a trained installation professional should define the radio channel. Select Smart for the radio to scan non-overlapping channels listening for beacons from other access points. After the channels are scanned, the radio selects the channel with the fewest access points. In case of multiple access points on the same channel, it selects the channel with the lowest average power level.

**NOTE:** Channels with a “w” appended to them are unique to the 40 MHz band. Channels with a “ww” appended to them are 802.11ac specific, and appear only when using an AP8232, and are unique to the 80 MHz band.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
channel [smart|acs|random|1|2|3|4|-----]
```

#### Parameters

- channel [smart|acs|random|1|2|3|4|-----]

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channel                          | Configures a radio's channel of operation                                                                                                                                                                                                                                                                                                                                                                                                                              |
| [smart acs random 1 2 3 4 -----] | Configures a radio's channel of operation. Resets a radio's channel of operation

### 7.1.36.5.15 data-rates

▶ *interface-config-radio-instance*

Configures the 802.11 data rates on this radio

This command sets the rate options depending on the 802.11 protocol and the radio band selected. If 2.4 GHz is selected as the radio band, select separate 802.11b, 802.11g and 802.11n rates and define how they are used in combination. If 5.0 GHz is selected as the radio band, select separate 802.11a and 802.11n rates then define how they are used together.

If dedicating the radio to either 2.4 or 5.0 GHz support, use the *custom* keyword to set a 802.11n *modulation and coding scheme* (MCS) in respect to the radio's channel width and guard interval. A MCS defines (based on RF channel conditions) an optimal combination of rates, bonded channels, multiple spatial streams, different guard intervals and modulation types. Clients can associate as long as they support basic MCS (as well as non-11n basic rates).

Data rates are fixed and not user configurable for radios functioning as sensors.

**NOTE:** Use the *rf-mode* command to configure a radio's mode of operation.

**NOTE:** The MCS-1s and MCS-2s options are available for each supported access point. However, the MCS-3s option is only available to the AP8232 model access point, and its ability to provide 3x3x3 MIMO support.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default|custom|mcs]
```

```
data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default]

**Usage Guidelines (Supported data rates)**

The following table defines the 802.11n MCS for MCS 1 streams, both with and without SGI:

| MCS-1Stream Index | Number of Streams | 20 MHz No SGI | 20 MHz With SGI | 40 MHz No SGI | 20 MHz With SGI |
|-------------------|-------------------|---------------|-----------------|---------------|-----------------|
| 0                 | 1                 | 6.5           | 7.2             | 13.5          | 15              |
| 1                 | 1                 | 13            | 14.4            | 27            | 30              |
| 2                 | 1                 | 19.5          | 21.7            | 40.5          | 45              |
| 3                 | 1                 | 26            | 28.9            | 54            | 60              |
| 4                 | 1                 | 39            | 43.4            | 81            | 90              |
| 5                 | 1                 | 52            | 57.8            | 108           | 120             |
| 6                 | 1                 | 58.5          | 65              | 121.5         | 135             |
| 7                 | 1                 | 65            | 72.2            | 135           | 150             |

The following table defines the 802.11n MCS for MCS 2 streams, both with and without SGI:

| MCS-2Stream Index | Number of Streams | 20 MHz No SGI | 20 MHz With SGI | 40 MHz No SGI | 20 MHz With SGI |
|-------------------|-------------------|---------------|-----------------|---------------|-----------------|
| 0                 | 2                 | 13            | 14.4            | 27            | 30              |
| 1                 | 2                 | 26            | 28.9            | 54            | 60              |
| 2                 | 2                 | 39            | 43.4            | 81            | 90              |
| 3                 | 2                 | 52            | 57.8            | 108           | 120             |
| 4                 | 2                 | 78            | 86.7            | 162           | 180             |
| 5                 | 2                 | 104           | 115.6           | 216           | 240             |
| 6                 | 2                 | 117           | 130             | 243           | 270             |
| 7                 | 2                 | 130           | 144.4           | 270           | 300             |

The following table defines the 802.11n MCS for MCS 3 streams, both with and without SGI:

| MCS-3Stream Index | Number of Streams | 20 MHz No SGI | 20 MHz With SGI | 40 MHz No SGI | 20 MHz With SGI |
|-------------------|-------------------|---------------|-----------------|---------------|-----------------|
| 0                 | 3                 | 19.5          | 21.7            | 40.5          | 45              |
| 1                 | 3                 | 39            | 43.3            | 81            | 90              |
| 2                 | 3                 | 58.5          | 65              | 121.5         | 135             |
| 3                 | 3                 | 78            | 86.7            | 162           | 180             |
| 4                 | 3                 | 117           | 130.7           | 243           | 270             |
| 5                 | 3                 | 156           | 173.3           | 324           | 360             |
| 6                 | 3                 | 175.5         | 195             | 364.5         | 405             |
| 7                 | 3                 | 195           | 216.7           | 405           | 450             |

The following table defines the 802.11ac MCS rates (theoretical throughput for single spatial streams) both with and without SGI:

| MCS Index | 20 MHz No SGI | 20 MHz With SGI | 40 MHz No SGI | 40 MHz With SGI | 80 MHz No SGI | 80 MHz With SGI |
|-----------|---------------|-----------------|---------------|-----------------|---------------|-----------------|
| 0         | 6.5           | 7.2             | 13.5          | 15              | 29.3          | 32.5            |
| 1         | 13            | 14.4            | 27            | 30              | 58.5          | 65              |
| 2         | 19.5          | 21.7            | 40.5          | 45              | 87.8          | 97.5            |
| 3         | 26            | 28.9            | 54            | 60              | 117           | 130             |
| 4         | 39            | 43.3            | 81            | 90              | 175.5         | 195             |
| 5         | 52            | 57.8            | 108           | 120             | 234           | 260             |
| 6         | 58.5          | 65              | 121.5         | 135             | 263.3         | 292.5           |
| 7         | 65            | 72.2            | 135           | 150             | 292.5         | 325             |
| 8         | 78            | 86.7            | 162           | 180             | 351           | 390             |

**Related Commands**

|                |                                             |
|----------------|---------------------------------------------|
| <i>no</i>      | Resets the 802.11 data rates on a radio     |
| <i>rf-mode</i> | Configures the radio's RF mode of operation |

**7.1.36.5.16 description**

▶ *interface-config-radio-instance*

Configures the selected radio's description that helps differentiate it from other radios with similar configurations

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

description <WORD>

**Parameters**

- description <WORD>

|                    |                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------|
| description <WORD> | Provide a description for the selected radio (should not exceed 64 characters in length). |
|--------------------|-------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#description "Primary
radio to use"

rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

|           |                               |
|-----------|-------------------------------|
| <i>no</i> | Removes a radio's description |
|-----------|-------------------------------|

### 7.1.36.5.17 dfs-rehome

▶ *interface-config-radio-instance*

Reverts to configured home channel once the *Dynamic Frequency Selection* (DFS) evacuation period expires

**NOTE:** This option is applicable only if the radio's RF mode is set to '5GHz-wlan'.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
dfs-rehome {holdtime <30-3600>}
```

#### Parameters

- `dfs-rehome {holdtime <30-3600>}`

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>dfs-rehome {holdtime &lt;30-3600&gt;}</pre> | <p>Enables the radio to revert to the configured home channel once the DFS evacuation period expires</p> <ul style="list-style-type: none"> <li>• <code>holdtime</code> - Optional. Specifies the duration, in minutes, to stay in the new channel</li> <li>• <code>&lt;30-3600&gt;</code> - Specify the holdtime from 30 - 3600 minutes. The default is 90 minutes.</li> </ul> |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#dfs-rehome holdtime 500

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 dfs-rehome holdtime 500
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#
```

#### Related Commands

|           |                                                              |
|-----------|--------------------------------------------------------------|
| <i>no</i> | Stays on DFS elected channel after evacuation period expires |
|-----------|--------------------------------------------------------------|

### 7.1.36.5.18 dynamic-chain-selection

#### ▶ *interface-config-radio-instance*

Enables automatic antenna mode selection. When enabled, the radio can dynamically change the number of transmit chains used (uses a single chain/antenna for frames at non-11n transmit rates). This option is enabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
dynamic-chain-selection
```

#### Parameters

None

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#dynamic-chain-selection
rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

#### Related Commands

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>no</i> | Uses the configured transmit antenna mode for all clients |
|-----------|-----------------------------------------------------------|

### 7.1.36.5.19 ekahau

▶ *interface-config-radio-instance*

Enables Ekahau multicast packet forwarding. When enabled, Ekahau small, battery powered Wi-Fi tags are attached to tracked assets or assets carried by people. Ekahau processes locations, rules, messages, and environmental data and turns the information into locating maps, alerts and reports.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
ekahau [forward ip <IP> port <0-65535>|mac <MAC>]
```

**Parameters**

- ekahau [forward ip <IP> port <0-65535>|mac <MAC>]

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 7.1.36.5.20 extended-range

▶ *interface-config-radio-instance*

Enables the extended range capability for AP7161 model access point. When enabled, these access points can exchange signals with their clients at greater distances without being timed out. This option is disabled by default.

#### Supported in the following platforms:

- Access Point — AP7161

#### Syntax

extended-range <1-25>

#### Parameters

- extended-range <1-25>

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| extended-range <1-25> | Configures extended range on this radio interface from 1 - 25 kilometers. The default is 2 km on 2.4 GHz band and 7 km on 5.0 GHz band. |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#extended-range 15

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context

| <i>no</i> | Resets the extended range to default (7 km for 2.4 GHz and 5 km for 5.0 GHz) |
|-----------|------------------------------------------------------------------------------|

### 7.1.36.5.21 fallback-channel

▶ *interface-config-radio-instance*

Configures the channel to which the radio switches in case of radar detection on the current channel

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
fallback-channel [100|100w|100ww|104|104w|104ww|108|108w.....]
```

#### Parameters

- fallback-channel [100|100w|100ww|104|104w|104ww|108|108w.....]

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>fallback-channel<br/>[100 100w .....]</pre> | <p>Configures the fallback channel. This is the channel the radio switches to in case a radar is detected on the radio's current operating channel.</p> <ul style="list-style-type: none"> <li>• [100 100w 100ww ...] - Select the fall back channel from the available options.</li> </ul> <p><b>Note:</b> Channels with a “w” appended to them are unique to the 40 MHz band. Channels with a “ww” appended to them are 802.11ac specific, and appear only when using an AP8232, and are unique to the 80 MHz band.</p> |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testAP81XX-if-radio2)#fallback-channel 104
NOTE: Functionality is supported only in the US regulatory domain and only a non-
dfs channel can be configured as a fallback channel

nx9500-6C8809(config-profile-testAP81XX-if-radio2)#show context

|-----------|--------------------------------------------|
| <i>no</i> | Removes the fallback-channel configuration |
|-----------|--------------------------------------------|

### 7.1.36.5.22 guard-interval

▶ *interface-config-radio-instance*

Configures the 802.11n guard interval. A guard interval ensures distinct transmissions do not interfere with one another. It provides immunity to propagation delays, echoes and reflection of radio signals.

The guard interval is the space between transmitted characters. The guard interval eliminates *inter symbol interference* (ISI). ISI which occurs when echoes or reflections from one symbol interferes with another. Adding time between transmissions allows echoes and reflections to settle before the next symbol is transmitted. A shorter guard interval results in shorter symbol times, which reduces overhead and increases data rates by up to 10%.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
guard-interval [any|long]
```

#### Parameters

- guard-interval [any|long]

|                |                                                                                |
|----------------|--------------------------------------------------------------------------------|
| guard-interval | Configures the 802.11n guard interval                                          |
| any            | Enables the radio to use any short (400nSec) or long (800nSec) guard interval  |
| long           | Enables the use of long guard interval (800nSec). This is the default setting. |

#### Example

```
rfs6000-37FABE (config-profile-71xxTestProfile-if-radiol)#guard-interval long
rfs6000-37FABE (config-profile-71xxTestProfile-if-radiol)#show context

```

#### Related Commands

|           |                                                              |
|-----------|--------------------------------------------------------------|
| <i>no</i> | Resets the 802.11n guard interval to default (long: 800nSec) |
|-----------|--------------------------------------------------------------|

### 7.1.36.5.23 ldpc

▶ *interface-config-radio-instance*

Enables support for *Low Density Parity Check* (LDPC) codes on the radio interface

LDPC consists of forward error correcting codes that enable error control in data transmission. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
ldpc
```

**Parameters**

None

**Example**

```
rfs4000-229D58 (config-profile-Test81XX-if-radiol) #ldpc
rfs4000-229D58 (config-profile-Test81XX-if-radiol) #show context
interface radiol
 ldpc
rfs4000-229D58 (config-profile-Test81XX-if-radiol) #
```

**Related Commands**

|-----------|-----------------------|
| <i>no</i> | Disables LDPC support |
|-----------|-----------------------|

### 7.1.36.5.24 lock-rf-mode

▶ *interface-config-radio-instance*

Retains user configured RF mode settings for the selected radio. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
lock-rf-mode
```

#### Parameters

None

#### Example

```

### 7.1.36.5.25 max-clients

▶ *interface-config-radio-instance*

Configures the maximum number of wireless clients allowed to associate with this radio

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
max-clients <0-256>
```

#### Parameters

- max-clients <0-256>

|                     |                                                                                                                                                                                                                                                            |

### 7.1.36.5.26 mesh

▶ *interface-config-radio-instance*

Use this command to configure radio mesh parameters. A *Wireless Mesh Network* (WMN) is a network of radio nodes organized in a mesh topology. It consists of mesh clients, mesh routers, and gateways.

Each radio setting can have a unique mesh mode and link configuration. This provides a customizable set of connections to other mesh supported radios within the same radio coverage area.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
mesh [client|links|portal|preferred-peer|psk]
mesh [client|links <1-6>|portal|preferred-peer <1-6> <MAC>|psk [0 <LINE>|2 <LINE>|<LINE>]]
```

**Parameters**

- mesh [client|links <1-6>|portal|preferred-peer <1-6> <MAC>|psk [0 <LINE>|2 <LINE>|<LINE>]]

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mesh                            | Configures radio mesh parameters, such as maximum number of mesh links, preferred peer device, client operations, etc.                                                                                                                                                                                                                                                                                   |
| client                          | Enables operation as a client<br>Setting the mesh mode to 'client' enables the radio to operate as a mesh client that scans for and connects to mesh portals or nodes that are connected to portals.                                                                                                                                                                                                     |
| links <1-6>                     | Configures the maximum number of mesh links a radio attempts to create<br>• <1-6> - Sets the maximum number of mesh links from 1 - 6. The default is 6.                                                                                                                                                                                                                                                  |
| portal                          | Enables operation as a portal<br>Setting the mesh mode to 'portal' turns the radio into a mesh portal. The radio starts beaconing immediately and accepts connections from other mesh nodes, typically the node with a connection to the wired network.                                                                                                                                                  |
| preferred-peer <1-6> <MAC>      | Configures a preferred peer device<br>• <1-6> - Configures the priority at which the peer node will be added<br>When connecting to the mesh infrastructure, nodes with lower priority are given precedence over nodes with higher priority.<br>• <MAC> - Sets the MAC address of the preferred peer device (Ethernet MAC of either a AP, wireless controller, or service platform with onboard radios)   |
| psk [0 <LINE> 2 <LINE>  <LINE>] | Configures the pre-shared key. Ensure this key is configured on the access point when staged for mesh, and added to the mesh client and to the portal access point's configuration on the controller or service platform.<br>• 0 <LINE> - Enter a clear text key<br>• 2 <LINE> - Enter an encrypted key<br>• <LINE> - Enter the pre-shared key<br>Pre-shared keys should be 8 - 64 characters in length. |

**Example**

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#mesh client
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 description "Primary radio to use"
 channel 1
 data-rates b-only
 mesh client
 beacon period 50
 --More--
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#
```

**Related Commands**

|-----------|----------------------------------------------------|
| <i>no</i> | Disables mesh mode operation of the selected radio |
|-----------|----------------------------------------------------|

### 7.1.36.5.27 meshpoint

▶ *interface-config-radio-instance*

Maps an existing meshpoint to this radio

Use this command to assign each WLAN its own BSSID. If using a single-radio access point, there are 8 BSSIDs available. If using a dual-radio access point there are 8 BSSIDs for the 802.11b/g/n radio and 8 BSSIDs for the 802.11a/n radio.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
meshpoint <MESHPOINT-NAME> {bss <1-16>}
```

#### Parameters

- meshpoint <MESHPOINT-NAME> {bss <1-16>}

|                               |                                                                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| meshpoint<br><MESHPOINT-NAME> | Maps a meshpoint to this radio. Specify the meshpoint name.                                                                                                               |
| bss <1-16>                    | Optional. Specifies the radio's BSS where this meshpoint is mapped <ul style="list-style-type: none"> <li>• &lt;1-16&gt; - Specify the BSS number from 1 - 16.</li> </ul> |

#### Example

```
rfs6000-37FABE(config-profile-ap71xxTest-if-radiol)#meshpoint test bss 7
rfs6000-37FABE(config-profile-ap71xxTest-if-radiol)#show context
interface radiol
 meshpoint test bss 7
rfs6000-37FABE(config-profile-ap71xxTest-radiol)#
```

| <i>no</i> | Disables meshpoint on the selected radio |
|-----------|------------------------------------------|

### 7.1.36.5.28 mu-mimo

#### ▶ *interface-config-radio-instance*

Enables *multi-user multiple input multiple output* (MU-MIMO) support on the selected radio. When enabled, multiple users are able to simultaneously access the same channel using the spatial degrees of freedom offered by MIMO.

#### Supported in the following platforms:

- Access Points — AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
mu-mimo
```

#### Parameters

None

#### Example

```
nx9500-6C8809(config-profile-TestAP81xx-if-radiol)#mu-mimo
nx9500-6C8809(config-profile-TestAP81xx-if-radiol)#show context include-factory |

| <i>no</i> | Disables mu-mimo on the selected radio |
|-----------|----------------------------------------|

**7.1.36.5.29 no**

▶ *interface-config-radio-instance*

Negates a command or resets settings to their default. When used in the profile/device > radio interface configuration mode, the no command disables or resets radio interface settings.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

no <PARAMETERS>

**Parameters**

- no <PARAMETERS>

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this radio interface's settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------------|

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Example**

```
rfs6000-37FABE(config-profile-ap7lxxTest-if-radiol)#no ?
 adaptivity Adaptivity
 aeroscout Use Default Aeroscout Multicast MAC Address
 aggregation Configure 802.11n aggregation related parameters
 airtime-fairness Disable fair access to medium for clients,
 provide access in a round-robin mode
 antenna-diversity Use single antenna for non-11n transmit rates
 antenna-downtilt Reset ADEPT antenna mode
 antenna-elevation Reset the antenna elevation of this radio to
 default
 antenna-gain Reset the antenna gain of this radio to default
 antenna-mode Reset the antenna mode (number of transmit and
 receive antennas) on the radio to its default
 assoc-response Configure transmission parameters for
 Association Response frames
 association-list Configure the association list for the radio
 beacon Configure beacon parameters
 bridge Bridge rf-mode related configuration
 channel Reset the channel of operation of this radio to
 default
 data-rates Reset radio data rate configuration to default
 description Reset the description of the radio to its
 default
 dfs-rehome Stay on dfs elected channel after evacuation
 period expires
 dynamic-chain-selection
 Use the configured transmit antenna mode for all
 clients
 ekahau Use Default Ekahau Multicast MAC Address
 extended-range Reset extended range to default
 fallback-channel Clear the DFS fallback channel for this radio
 guard-interval Configure default value of 802.11n guard
 interval (long: 800nSec)
 ldpc Configure support for Low Density Parity Check
 Code
 lock-rf-mode Allow smart-rf to change rf-mode setting for
 this radio
 max-clients Maximum number of wireless clients allowed to
 associate
 mesh Disable mesh mode operation of the radio
```

```

meshpoint Disable a meshpoint from this radio
mu-mimo Disable multi user MIMO on this radio (selected
 platforms only)
non-unicast Configure handling of non-unicast frames
off-channel-scan Disable off-channel scanning on the radio
placement Reset the placement of the radio to its default
power Reset the transmit power of this radio to
 default
preamble-short Disable the use of short-preamble on this radio
probe-response Configure transmission parameters for Probe
 Response frames
radio-resource-measurement Configure support for 802.11k Radio Resource
 Measurement
radio-share-mode Configure the radio-share mode of operation for
 this radio
rate-selection Monotonic rate selection
rf-mode Reset the RF mode of operation for this radio to
 default (2.4GHz on radio1, 5GHz on radio2,
 sensor on radio3)
rifs Configure Reduced Interframe Spacing (RIFS)
 parameters
rts-threshold Reset the RTS threshold to its default (65536)
shutdown Re-enable the selected interface
smart-rf Reset smart-rf related configuration to default
sniffer-redirect Disable capture and redirection of packets
stbc Configure Space-Time Block Coding (STBC)
 parameters
transmit-beamforming Disable Transmit Beamforming
use Set setting to use
wips Wireless intrusion prevention related
 configuration
wireless-client Configure wireless client related parameters
wlan Disable a wlan from this radio

```

### 7.1.36.5.30 non-unicast

▶ *interface-config-radio-instance*

Configures support for forwarding of non-unicast (multicast and broadcast) frames on this radio

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```

non-unicast [forwarding|queue|tx-rate]

non-unicast forwarding [follow-dtim|power-save-aware]

non-unicast queue [<1-200>|bss]
non-unicast queue [<1-200>|bss <1-16> <1-200>]

non-unicast tx-rate [bss <1-16>|dynamic-all|dynamic-basic|highest-basic|lowest-basic]
non-unicast tx-rate bss <1-16> [dynamic-all|dynamic-basic|highest-basic|lowest-basic]

```

#### Parameters

- `non-unicast forwarding [follow-dtim|power-save-aware]`

|                        |                                                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| non-unicast forwarding | Enables non-unicast frame forwarding on this radio. Once enabled, select one of the available options to specify whether these frames should always <i>follow DTIM</i> , or only follow DTIM when using <i>power save aware</i> mode. |
| follow-dtim            | Specifies frames always wait for the DTIM interval to time out. The DTIM interval is configured using the <i>beacon</i> command. This is the default setting.                                                                         |
| power-save-aware       | Enables immediate forwarding of frames only if all associated wireless clients are in the power save mode                                                                                                                             |

- `non-unicast queue [<1-200>|bss <1-16> <1-200>]`

|                    |                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| non-unicast queue  | Enables non-unicast frame forwarding on this radio. Once enabled, specify the number of broadcast packets queued per BSS on this radio. This option is enabled by default.<br><br>This command also enables you to override the default on a specific BSS.  |
| <1-200>            | Specify a number from 1 - 200. This value applies to all BSSs. The default is 50 frames per BSS.                                                                                                                                                            |
| bss <1-16> <1-200> | Overrides the default on a specified BSS <ul style="list-style-type: none"> <li>• &lt;1-16&gt; - Select the BSS number from 1 - 16.</li> <li>• &lt;1-200&gt; - Specify the number of broadcast packets queued for the selected BSS from 1 - 200.</li> </ul> |

- `non-unicast tx-rate [bss <1-16>|dynamic-all|dynamic-basic|highest-basic|lowest-basic]`

|                     |                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| non-unicast tx-rate | Enables non-unicast frame forwarding on this radio. Once enabled, use one of the available options to configure the rate at which these frames are transmitted.                                                                                                                                        |
| bss <1-16>          | Overrides the default on a specified BSS <ul style="list-style-type: none"> <li>• &lt;1-16&gt; - Select the BSS number from 1 - 16. The transmit rate selected is applied only to the BSS specified here. The tx-rate options are: dynamic-all, dynamic-basic, highest-basic, lowest-basic.</li> </ul> |

|               |                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------|
| dynamic-all   | Dynamically selects a rate from all supported rates based on current traffic conditions       |
| dynamic-basic | Dynamically selects a rate from all supported basic rates based on current traffic conditions |
| highest-basic | Uses the highest configured basic rate. This is the default setting.                          |
| lowest-basic  | Uses the lowest configured basic rate                                                         |

### 7.1.36.5.31 off-channel-scan

▶ *interface-config-radio-instance*

Enables off channel scanning on this radio. This option is disabled by default.

Channel scanning uses the access point's resources and is time consuming. Therefore, enable this option only if the radio has the bandwidth to support channel scan without negatively impacting client support.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
off-channel-scan {channel-list|max-multicast|scan-interval|sniffer-redirect}
off-channel-scan {channel-list [2.4Ghz|5Ghz]} {<CHANNEL-LIST>}
off-channel-scan {max-multicast <0-100>|scan-interval <2-100>}
off-channel-scan {sniffer-redirect tzsp <IP>}
```

#### Parameters

- `off-channel-scan {channel-list [2.4Ghz|5Ghz]} {<CHANNEL-LIST>}`

|                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| off-channel-scan                                                                                                                            | Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.                                                                                                                                                                                             |
| channel-list [2.4GHz 5GHz]                                                                                                                  | Optional. Selects the 2.4GHz or 5GHz access point radio band. Restricting off channel scans to specific channels frees bandwidth otherwise utilized for scanning across all channels. <ul style="list-style-type: none"> <li>• 2.4GHz - Selects the 2.4 GHz band</li> <li>• 5GHz - Selects the 5.0 GHz band</li> </ul>                                            |
| <CHANNEL-LIST>                                                                                                                              | Optional. Specifies a list of 20 MHz, 40 MHz, or 80 MHz channels for the selected band (the channels are separated by commas or hyphens)                                                                                                                                                                                                                          |
| <ul style="list-style-type: none"> <li>• <code>off-channel-scan {max-multicast &lt;0-100&gt; scan-interval &lt;2-100&gt;}</code></li> </ul> |                                                                                                                                                                                                                                                                                                                                                                   |
| off-channel-scan                                                                                                                            | Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.                                                                                                                                                                                             |
| max-multicast <0-100>                                                                                                                       | Optional. Configures the maximum multicast/broadcast messages used to perform OCS <ul style="list-style-type: none"> <li>• &lt;0-100&gt; - Specify a value from 0 - 100. The default is 4.</li> </ul>                                                                                                                                                             |
| scan-interval <2-100>                                                                                                                       | Optional. Configures the scan interval in dtims <ul style="list-style-type: none"> <li>• &lt;2-100&gt; - Specify a value from 2 - 100. The default is 20 dtims.</li> </ul>                                                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>• <code>off-channel-scan {sniffer-redirect tzsp &lt;IP&gt;}</code></li> </ul>                        |                                                                                                                                                                                                                                                                                                                                                                   |
| off-channel-scan                                                                                                                            | Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.                                                                                                                                                                                             |
| sniffer-redirect tzsp <IP>                                                                                                                  | Optional. Captures and redirects packets to a host running a packet capture/analysis tool. Use this command to configure the IP address of the host. <ul style="list-style-type: none"> <li>• tzsp - Encapsulates captured packets in TZSP before redirecting to the specified host</li> <li>• &lt;IP&gt; - Specify the destination device IP address.</li> </ul> |

### 7.1.36.5.32 placement

▶ *interface-config-radio-instance*

Defines the radio's location (whether the radio is deployed indoors or outdoors). The radio's placement should depend on the country of operation selected and its regulatory domain requirements for radio emissions.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
placement [indoor|outdoor]
```

#### Parameters

- placement [indoor|outdoor]

|           |                                                                                        |
|-----------|----------------------------------------------------------------------------------------|
| placement | Defines the radio's location                                                           |
| indoor    | Radio is deployed indoors (uses indoor regulatory rules). This is the default setting. |
| outdoor   | Radio is deployed outdoors (uses outdoor regulatory rules)                             |

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#placement outdoor

rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

### 7.1.36.5.33 power

▶ *interface-config-radio-instance*

Configures the radio's transmit power setting

The *transmit power control* (TPC) mechanism automatically reduces the used transmission output power when other networks are within range. Reduced power results in reduced interference issues and increased battery capacity.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
power [<1-30>|smart]
```

#### Parameters

- power [<1-30>|smart]

|        |                                                                                                                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| power  | Configures a radio's transmit power                                                                                                                                                                                                                                     |
| <1-30> | Configures the transmit power from 1 - 30 dBm (actual power could be lower based on regulatory restrictions)<br><br>For APs with dual or three radios, each radio should be configured with a unique transmit power in respect to its intended client support function. |
| smart  | Enables Smart RF to determine the optimum transmit power needed. By default APs use Smart RF to determine transmit power.                                                                                                                                               |

### 7.1.36.5.34 preamble-short

▶ *interface-config-radio-instance*

Enables short preamble on this radio. If using an 802.11bg radio, enable short preamble. Short preambles improve throughput. However, some devices (SpectralLink phones) require long preambles. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
preamble-short
```

#### Parameters

None

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radio1)#preamble-short

### 7.1.36.5.35 probe-response

▶ *interface-config-radio-instance*

Configures transmission parameters for probe response frames

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
probe-response [rate|retry|rssi-threshold]

probe-response retry
probe-response rate [follow-probe-request|highest-basic|lowest-basic]
probe-response rssi-threshold <-128--40>
```

#### Parameters

- `probe-response retry`

|                                   |                                                                                                                                       |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>probe-response retry</code> | Enables retransmission of probe-response frames if no acknowledgement is received from the client. This option is enabled by default. |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|

- `probe-response rate [follow-probe-request|highest-basic|lowest-basic]`

|                                   |                                                                                                                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>probe-response rate</code>  | Configures the rates used for transmission of probe response frames. The tx-rate options available for transmitting probe response frames are: follow-probe-request, highest-basic, lowest-basic. |
| <code>follow-probe-request</code> | Transmits probe responses at the same rate as the received request (default setting)                                                                                                              |
| <code>highest-basic</code>        | Uses the highest configured basic rate                                                                                                                                                            |
| <code>lowest-basic</code>         | Uses the lowest configured basic rate                                                                                                                                                             |

- `probe-response rssi-threshold <-128--40>`

|                                                             |                                                                                                                                                                       |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>probe-response rssi-threshold &lt;-128--40&gt;</code> | Ignores probe request from client if the received signal strength is less than the RSSI threshold specified here<br><br><-128--40> - Specify a value from -128 - -40. |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809 (config-profile-testAP7161-if-radiol) #probe-response rate highest-basic
nx9500-6C8809 (config-profile-testAP7161-if-radiol) #probe-response retry
nx9500-6C8809 (config-profile-testAP7161-if-radiol) #probe-response rssi-threshold -60
nx9500-6C8809 (config-profile-testAP7161-if-radiol) #show context
interface radiol
 probe-response rate highest-basic
 probe-response rssi-threshold -60
nx9500-6C8809 (config-profile-testAP7161-if-radiol) #
```

### 7.1.36.5.36 radio-resource-measurement

▶ *interface-config-radio-instance*

Enables 802.11k radio resource measurement. When enabled, the radio station sends channel and neighbor reports.

The IEEE 802.11 Task Group k defined a set of specifications regarding radio resource measurements. These specifications specify the radio resources to be measured and the mechanism used to communicate measurement requests and results.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
radio-resource-measurement [attenuation-threshold <1-199>|max-entries <1-12>]
```

#### Parameters

- radio-resource-measurement [attenuation-threshold <1-199>|max-entries <1-12>]

|                               |                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radio-resource-measurement    | Enables 802.11k radio resource measurement on the radio                                                                                                                                                                                      |
| attenuation-threshold <1-199> | Configures the neighbor attenuation threshold, considered when generating channel and neighbor reports <ul style="list-style-type: none"> <li>• &lt;1-199&gt; - Specify the attenuation threshold from 1 -199. The default is 90.</li> </ul> |
| max-entries <1-12>            | Configures the maximum number of entries to include in channel and neighbor reports <ul style="list-style-type: none"> <li>• &lt;1-12&gt; - Specify a value from 1 - 12. The default is 6.</li> </ul>                                        |

#### Example

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-if-radiol)#radio-resource-
measurement attenuation-threshold 20

rfs4000-229D58(config-device-00-23-68-22-9D-58-if-radiol)#radio-resource-
measurement max-entries 10

rfs4000-229D58(config-device-00-23-68-22-9D-58-if-radiol)#show context
interface radiol
 radio-resource-measurement max-entries 10
 radio-resource-measurement attenuation-threshold 20
rfs4000-229D58(config-device-00-23-68-22-9D-58-if-radiol)#
```

#### Related Commands

|-----------|-----------------------------------------------------|
| <i>no</i> | Disables 802.11k radio resource measurement support |
|-----------|-----------------------------------------------------|

### 7.1.36.5.37 radio-share-mode

▶ *interface-config-radio-instance*

Configures the radio's mode of operation as radio share. A radio operating in the radio share mode services clients and also performs sensor functions (defined by the radio's *AirDefense Services Platform (ADSP)* licenses and profiles).

**NOTE:** The sensor capabilities of the radio are restricted to the channel and WLANs defined on the radio.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
radio-share-mode [inline|off|promiscuous]
```

#### Parameters

- radio-share-mode [inline|off|promiscuous]

|                  |                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radio-share-mode | Enables sharing of packets, switched by this radio, with the WIPS sensor module. There are two radio-share modes, these are: inline and promiscuous                                                                                                                                                        |
| inline           | Enables sharing of all WLAN packets (matching the BSSID of the radio) serviced by the radio with the WIPS sensor module.                                                                                                                                                                                   |
| off              | Disables radio share (no packets shared with the WIPS sensor module)                                                                                                                                                                                                                                       |
| promiscuous      | Enables the <i>promiscuous radio share</i> mode. In this mode the radio is configured to receive all packets on the channel irrespective of whether the destination address is the radio or not, and shares these packets with the WIPS sensor module for analysis (i.e. without filtering based on BSSI). |

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#radio-share-mode
promiscuous

rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#show context
interface radiol
 power 12
 data-rates b-only
 placement outdoor
 mesh client
 off-channel-scan channel-list 2.4GHz 1

### 7.1.36.5.38 rate-selection

▶ *interface-config-radio-instance*

Sets the data-rate selection mode to standard or opportunistic

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
rate-selection [opportunistic|standard]
```

#### Parameters

- `rate-selection [opportunistic|standard]`

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rate-selection | Sets the rate selection mode to standard or opportunistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| standard       | Configures the monotonic rate selection mode. This is the default setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| opportunistic  | Configures the <i>opportunistic radio link adaptation</i> (ORLA) rate selection mode<br>The ORLA algorithm is designed to select data rates that provide best throughput. Instead of using local conditions to decide whether a data rate is acceptable or not, ORLA pro-actively probes other rates to determine if greater throughput is available. If these other rates do provide improved throughput, ORLA intelligently adjusts its selection tables to favour higher performance. ORLA provides improvements both on the client side of a mesh network as well as in the backhaul capabilities.<br><b>Note:</b> The ORLA rate selection mode is supported only on the AP7161 and AP8163 model access points. |

#### Example

```
nx9500-6C8809(config-profile-testAP7161-if-radio1)#rate-selection opportunistic
nx9500-6C8809(config-profile-testAP7161-if-radio1)#show context
interface radio1
 rate-selection opportunistic
nx9500-6C8809(config-profile-testAP7161-if-radio1)#
```

|-----------|--------------------------------------------------------|
| <i>no</i> | Resets the rate selection mode to standard (monotonic) |
|-----------|--------------------------------------------------------|

### 7.1.36.5.39 rf-mode

▶ *interface-config-radio-instance*

Configures the radio's RF mode of operation

This command sets the mode to either 2.4 GHz WLAN or 5.0 GHz WLAN support depending on the radio's intended client support. If you are currently licensed to use 4.9 GHz, configure the 4.9 GHz-WLAN option.

Set the mode to sensor if using the radio for rogue device detection. The radio cannot support rogue detection when one of the other radios is functioning as a WIPS sensor. To set a radio as a detector, disable sensor support on the other access point radios.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
rf-mode [2.4GHz-wlan|4.9GHz-wlan|5GHz-wlan|bridge|scan-ahead|sensor]
```

#### Parameters

- rf-mode [2.4GHz-wlan|4.9GHz-wlan|5GHz-wlan|bridge|scan-ahead|sensor]

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 2.4GHz-wlan | Provides WLAN service in the 2.4 GHz bandwidth                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 4.9GHz-wlan | Provides WLAN service in the 4.9 GHz bandwidth                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5GHz-wlan   | Provides WLAN service in the 5.0 GHz bandwidth                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| bridge      | <p>Enables this radio to operate as client bridge that can authenticate and associate to a defined infrastructure <i>Wireless LAN</i> (WLAN) access point</p> <p><b>Note:</b> This option is applicable only on the AP6522, AP6562, AP7522, AP7532, and AP7562 model access points. Enable this option only if the access point is to provide client-bridge support. Once enabled, configure the client-bridge parameters. For more information, see <i>bridge</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| scan-ahead  | <p>Enables this radio to operate as a scan-ahead radio</p> <p>A radio functioning in the scan-ahead mode is used for forward scanning only. The radio does not support WLAN or mesh services.</p> <p>The scan ahead feature is used in <i>Dynamic Frequency Selection</i> (DFS) aware countries for infrastructure devices, static, and <i>vehicular mounted modems</i> (VMMs). It enables a secondary radio to scan ahead for an active channel for backhaul transmission, in the event of a radar trigger on the primary radio. The device then switches radios allowing transmission to continue. This is required in environments where handoff is required and DFS triggers are common.</p> <p>With a secondary radio dedicated for forward scanning, the primary radio, in case of radar hit, hands over the <i>channel availability check</i> (CAC) function to the secondary radio. This avoids a break in data communication, which would have resulted if the primary radio was to do CAC itself.</p> <p>The secondary radio periodically does a scan of the configured channel list, searching for the other available meshpoint roots. When configured on the root meshpoint, the scan-ahead feature also scans for cleaner channels.</p> |

|        |                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sensor | Operates as a sensor radio. Configures this radio to function as a scanner, providing scanning services on both 2.4 GHz and 5.0 GHz bands. The radio does not provide WLAN services. |

|-------------------|------------------------------------------------|
| <i>no</i>         | Resets the radio's RF mode of operation        |
| <i>data-rates</i> | Configures the 802.11 data rates on this radio |

### 7.1.36.5.40 rifs

▶ *interface-config-radio-instance*

Configures *Reduced Interframe Spacing* (RIFS) parameters on this radio

This value determines whether interframe spacing is applied to access point transmitted or received packets, both, or none. Inter-frame spacing is the interval between two consecutive Ethernet frames that enable a brief recovery between packets and allow target devices to prepare for the reception of the next packet.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
rifs [none|rx-only|tx-only|tx-rx]
```

#### Parameters

- rifs [none|rx-only|tx-only|tx-rx]

|         |                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------|
| rifs    | Configures RIFS parameters                                                                                        |
| none    | Disables support for RIFS<br>Consider setting the value to None for high-priority traffic to reduce packet delay. |
| rx-only | Supports RIFS possession only                                                                                     |
| tx-only | Supports RIFS transmission only                                                                                   |
| tx-rx   | Supports both RIFS transmission and possession (default setting)                                                  |

#### Example

```
rfs6000-37FABE(config-profile-71xxTestProfile-if-radiol)#rifs tx-only

### 7.1.36.5.41 rts-threshold

▶ *interface-config-radio-instance*

Configures the *Request to Send* (RTS) threshold value on this radio

RTS is a transmitting station's signal that requests a *Clear To Send* (CTS) response from a receiving client. This RTS/CTS procedure clears the air where clients are contending for transmission time. Benefits include fewer data collisions and better communication with nodes that are hard to find (or hidden) because of other active nodes in the transmission path.

The RTS threshold controls RTS/CTS by initiating an RTS/CTS exchange for data frames larger than the threshold, and sends (without RTS/CTS) any data frames smaller than the threshold.

Consider the trade-offs when setting an appropriate RTS threshold for the WLAN's access point radios. A lower RTS threshold causes more frequent RTS/CTS exchanges. This consumes more bandwidth because of additional latency (RTS/CTS exchanges) before transmissions can commence. A disadvantage is the reduction in data-frame throughput. An advantage is quicker system recovery from electromagnetic interference and data collisions. Environments with more wireless traffic and contention for transmission make the best use of a lower RTS threshold.

A higher RTS threshold minimizes RTS/CTS exchanges, consuming less bandwidth for data transmissions. A disadvantage is less help to nodes that encounter interference and collisions. An advantage is faster data-frame throughput. Environments with less wireless traffic and contention for transmission make the best use of a higher RTS threshold.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
rts-threshold <0-65536>
```

#### Parameters

- rts-threshold <0-65536>

|                         |                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------|
| rts-threshold <0-65536> | Specify the RTS threshold value from 0 - 65536 bytes. The default is 65536 bytes. |
|-------------------------|-----------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE (config-profile-71xxTestProfile-if-radio1)#rts-threshold 100

rfs6000-37FABE (config-profile-71xxTestProfile-if-radio1)#show context
interface radio1
 rf-mode sensor
 placement outdoor

|-----------|-----------------------------------------------|

### 7.1.36.5.42 service

▶ *interface-config-radio-instance*

Enables dynamic control function. This dynamic function controls performance of the radio receiver's *low noise amplifiers* (LNAs).

When enabled, the control function, in the presence of very strong received signals, improves the receiver's performance on radio 1. Strong signals are caused if the distance between the WiFi client and the AP is within two (2) meters. When disabled, the control function is a useful debug tool in case the uplink throughput is less than expected and the AP-to-client separation is greater than two (2) meters. Disabling the control function does not affect the receive sensitivity of the radio.

#### Supported in the following platforms:

- Access Points — AP6522, AP6562

#### Syntax

```
service radio-lna [agc|ms]
```

#### Parameters

- service radio-lna [agc|ms]

|                               |                                                                                                                                                                                                                     |

| <i>no</i> | Reverts radio-lna mode to default (agc) |
|-----------|-----------------------------------------|

### 7.1.36.5.43 shutdown

▶ *interface-config-radio-instance*

Terminates or shuts down selected radio interface

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
shutdown
```

#### Parameters

None

#### Example

```
rfs6000-37FABE (config-profile-71xxTestProfile-if-radio1) #shutdown
rfs6000-37FABE (config-profile-71xxTestProfile-if-radio1) #
```

### 7.1.36.5.44 smart-rf

▶ *interface-config-radio-instance*

Overrides Smart RF channel width setting on this radio. When configured, the radio overrides the Smart RF selected channel setting and operates in the channel configured using this command.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
smart-rf preferred-channel-width [20MHz|40MHz|80MHz]
```

**Parameters**

- smart-rf preferred-channel-width [20MHz|40MHz|80MHz]

|                                                                 |                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>smart-rf preferred-channel-width [20MHz 40MHz 80MHz]</pre> | <p>Configures the preferred channel width. The options are:</p> <ul style="list-style-type: none"> <li>• 20MHz - Sets 20 MHz as the preferred channel of operation</li> <li>• 40MHz - Sets 40MHz as the preferred channel of operation</li> <li>• 80MHz - Sets 80MHz as the preferred channel of operation (default setting)</li> </ul> |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testAP7161-if-radiol)#smart-rf preferred-channel-width 40MHz

nx9500-6C8809(config-profile-testAP7161-if-radiol)#show context
interface radiol
 smart-rf preferred-channel-width 40MHz
 rate-selection opportunistic
nx9500-6C8809(config-profile-testAP7161-if-radiol)#
```

**Related Commands**

|           |                                                       |

| <i>no</i> | Enables use of Smart RF selected channel of operation |
|-----------|-------------------------------------------------------|

### 7.1.36.5.45 sniffer-redirect

▶ *interface-config-radio-instance*

Captures and redirects packets to an IP address running a packet capture/analysis tool

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
sniffer-redirect [omnipeek|tzsp] <IP> channel [1|10|100|100w -----] {snap <1-65535> (append descriptor)}
```

#### Parameters

```
• sniffer-redirect [omnipeek|tzsp] <IP> channel [1|10|100|100w -----] {snap <1-65535> (append descriptor)}
```

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sniffer-redirect      | Captures and redirects packets to an IP address running a packet capture/analysis tool                                                                                                                                                                                                                                                                                                                                                                                                |
| omnipeek              | Encapsulates captured packets in proprietary header (used with OmniPeek and plug-in)                                                                                                                                                                                                                                                                                                                                                                                                  |
| tzsp                  | Encapsulates captured packets in TZSP (used with WireShark and other tools)                                                                                                                                                                                                                                                                                                                                                                                                           |
| <IP>                  | Specify the IP address of the device running the capture/analysis tool (the host to which captured off channel scan packets are redirected)                                                                                                                                                                                                                                                                                                                                           |
| [1 10 100 100w -----] | Specify the channel to capture packets <ul style="list-style-type: none"> <li>• 1 – Channel 1 in 20 MHz mode (default setting)</li> <li>• 10 – Channel 10 in 20 MHz mode</li> <li>• 100 – Channel 100 in 20 MHz mode</li> <li>• 100w – Channels 100w in 40 MHz mode (channels 100*,104)</li> </ul>                                                                                                                                                                                    |
| snap <1-65535>        | Optional. Allows truncating of large captured frames at a specified length (in bytes). This option is useful when capturing traffic with large frames. Use this option when only headers are needed for analysis, since it reduces the bandwidth needed for sniffing, and (for typical values) eliminates any fragmentation of the outer packet. <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; – Specify the maximum truncated byte length of captured packets.</li> </ul> |
| append descriptor     | Optional – Enables appending of the radio's receive descriptor to the captured packet                                                                                                                                                                                                                                                                                                                                                                                                 |

#### Example

```
rfs6000-37FABE (config-profile-71xxTestProfile-if-radiol) #sniffer-redirect omnipeek 172.16.10.1 channel 1
```

```
rfs6000-37FABE (config-profile-71xxTestProfile-if-radiol) #show context
interface radiol
 rf-mode sensor
 placement outdoor

### 7.1.36.5.46 stbc

▶ *interface-config-radio-instance*

Configures the radio's *Space Time Block Coding* (STBC) mode. STBC is a pre-transmission encoding scheme providing an improved SNR ratio (even at a single RF receiver). STBC transmits multiple data stream copies across multiple antennas. The receiver combines the copies into one to retrieve data from the signal. These transmitted data versions provide redundancy to increase the odds of receiving data streams with a good data decode (especially in noisy environments).

**NOTE:** STBC requires the radio has at least two antennas with the capability to transmit two streams. If the antenna mode is configured to 1x1 (or falls back to 1x1 for some reason), STBC support is automatically disabled.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
stbc [auto|none|tx-only]
```

#### Parameters

- stbc [auto|none|tx-only]

|         |                                                                                                                       |
|---------|-----------------------------------------------------------------------------------------------------------------------|
| stbc    | Configures the radio's STBC mode                                                                                      |
| auto    | Autoselects STBC settings based on the platform type and other radio interface settings. This is the default setting. |
| none    | Disables STBC support                                                                                                 |
| tx-only | Configures the AP radio to format and broadcast the special stream (enables STBC support for transmit only)           |

#### Example

```
rfs6000-37FABE(config-profile-81xxTestProfile-if-radio1)#stbc tx-only
rfs6000-37FABE(config-profile-81xxTestProfile-if-radio1)#show context
interface radio1
 stbc tx-only
rfs6000-37FABE(config-profile-81xxTestProfile-if-radio1)#
```

**7.1.36.5.47 transmit-beamforming**

▶ *interface-config-radio-instance*

Enables transmit beamforming on this radio interface. This option is disabled by default.

When enabled, this option steers signals to peers in a specific direction to enhance signal strength and improve throughput amongst meshed devices (not clients). Each access point radio supports up to 16 beamforming capable mesh peers. When enabled, a beamformer steers its wireless signals to its peers. A beamformee device assists the beamformer with channel estimation by providing a feedback matrix. The feedback matrix is a set of values sent by the beamformee to assist the beamformer in computing a steering matrix. A steering matrix is an additional set of values used to steer wireless signals at the beamformer so constructive signals arrive at the beamformee for better SNR and throughput. Any beamforming capable mesh peer connecting to a radio whose capacity is exhausted cannot enable beamforming itself.

**Supported in the following platforms:**

- Access Points — AP6522, AP6532, AP6562, AP8122, AP8132, AP8163, AP8432, AP8533

**Syntax**

`transmit-beamforming`

**Parameters**

None

**Example**

`nx9500-6C8809(config-profile-testAP81XX-if-radiol)#transmit-beamforming`

**Related Commands**

|           |                                                       |

| <i>no</i> | Disables transmit beamforming on this radio interface |
|-----------|-------------------------------------------------------|

### 7.1.36.5.48 use

► *interface-config-radio-instance*

Applies an association ACL policy and a radio QoS policy on this radio interface

An association ACL is a policy-based *Access Control List (ACL)* that either prevents or allows wireless clients from connecting to a controller managed access point radio. An ACL is a sequential collection of permit and deny conditions that apply to controller packets. When a packet is received on an interface, the controller compares the fields in the packet against any applied ACLs to verify the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. If a packet does not meet any of the criteria specified in the ACL, the packet is dropped.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
use [association-acl-policy|radio-qos-policy]

use [association-acl-policy <ASSOC-ACL-POLICY-NAME>|radio-qos-policy <RADIO-QOS-POLICY-NAME>]
```

**Parameters**

- use [association-acl-policy <ASSOC-ACL-POLICY-NAME>|radio-qos-policy <RADIO-QOS-POLICY-NAME>]

|                        |                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| use                    | Applies an association ACL policy and a radio QoS policy on this radio interface                                                                                                                                                         |

### 7.1.36.5.49 wips

▶ *interface-config-radio-instance*

Enables access point to change its channel of operation in order to terminate rogue devices. The radio should be configured to provide WLAN service.

This option is enabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**NOTE:** AP7522 and AP7532 access points use Smart RF to perform off-channel scans. Therefore, ensure that a Smart RF policy is configured and applied to AP7522 and AP7532 access points RF Domains to enable them perform rogue detection and termination.

#### Syntax

```
wips airtime-termination allow-channel-change
```

#### Parameters

- wips airtime-termination allow-channel-change

|                                                  |                                                                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| wips airtime-termination<br>allow-channel-change | Enables access point to change its channel of operation (to that of the rogue device) in order to terminate the rogue device |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testAP81XX-if-radiol)#wips air-termination allow-channel-change
```

#### Related Commands

|           |                                                                                              |
|-----------|----------------------------------------------------------------------------------------------|
| <i>no</i> | Disables access point to change its channel of operation in order to terminate rogue devices |
|-----------|----------------------------------------------------------------------------------------------|

### 7.1.36.5.50 wireless-client

▶ *interface-config-radio-instance*

Configures wireless client parameters on this radio

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
wireless-client tx-power [<0-20>|mode]
wireless-client <0-20>
wireless-client tx-power mode [802.11d {wing-ie}|wing-ie {802.11d}]
```

#### Parameters

- wireless-client tx-power <0-20>

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless-client | Configures wireless client parameters                                                                                                                                                                                                                                                                                                                                                                                                                      |
| tx-power <0-20> | Configures the transmit power indicated to wireless clients. If using a dual or three radio model access point, each radio should be configured with a unique transmit power in respect to its intended client support function. A setting of 0 defines the radio as using Smart RF to determine its output power. 20 dBm is the default value. <ul style="list-style-type: none"> <li>• &lt;0-20&gt; - Specify transmit power from 0 - 20 dBm.</li> </ul> |

- wireless-client tx-power mode [802.11d {wing-ie}|wing-ie {802.11d}]

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 7.1.36.5.51 wlan

▶ *interface-config-radio-instance*

Enables a WLAN on this radio

Use this command to configure WLAN/BSS mappings for an existing access point deployment. Administrators can assign each WLAN its own BSSID. If using a single-radio access point, there are 8 BSSIDs available. If using a dual-radio access point there are 8 BSSIDs for the 802.11b/g/n radio and 8 BSSIDs for the 802.11a/n radio.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

#### Syntax

```
wlan <WLAN-NAME> {bss|primary}
wlan <WLAN-NAME> {bss <1-16>} {primary}
```

#### Parameters

- wlan <WLAN-NAME> {bss <1-16>} {primary}

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 7.1.36.6 interface-config-wwan-instance

► *interface*

A *Wireless Wide Area Network* (WWAN) card is a specialized network interface card that allows a device to connect, transmit and receive data over a Cellular Wide Area Network. The RFS4000 and RFS6000 each have a PCI Express card slot that supports 3G WWAN cards. The WWAN card uses *point to point protocol* (PPP) to connect to the *Internet Service Provider* (ISP) and gain access to the Internet. PPP is the protocol used for establishing Internet links over dial-up modems, DSL connections, and many other types of point-to-point communications. PPP packages your system’s TCP/IP packets and forwards them to the serial device where they can be put on the network. PPP is a full-duplex protocol that can be used on various physical media, including twisted pair or fiber optic lines or satellite transmission. It uses a variation of *High Speed Data Link Control* (HDLC) for packet encapsulation.

To switch to the WWAN Interface configuration mode, use the following command:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>

<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface wwan1

<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#?
Interface configuration commands:
 apn Enter the access point name provided by the service provider
 auth-type Type of authentication, Eg chap, pap
 crypto Encryption Module
 description Port description
 ip Internet Protocol (IP)
 no Negate a command or set its defaults
 password Enter password provided by the service provider
 shutdown Disable wireless wan feature
 use Set setting to use
 username Enter username provided by the service provider

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#
```

The following table summarizes WWAN interface configuration commands:

| Commands         | Description                                                         | Reference                  |
|------------------|---------------------------------------------------------------------|----------------------------|
| <i>apn</i>       | Configures the access point’s name provided by the service provider | <a href="#">page 7-328</a> |
| <i>auth-type</i> | Configures the authentication types used on this interface          | <a href="#">page 7-329</a> |
| <i>crypto</i>    | Associates a crypto map with this interface                         | <a href="#">page 7-330</a> |
| <i>ip</i>        | Associates an IP ACL with this interface                            | <a href="#">page 7-331</a> |
| <i>no</i>        | Removes or reverts the WWAN interface settings                      | <a href="#">page 7-332</a> |
| <i>password</i>  | Configures a password for this WWAN interface                       | <a href="#">page 7-333</a> |
| <i>use</i>       | Associates an IP ACL with this interface                            | <a href="#">page 7-335</a> |
| <i>username</i>  | Configures the names of users accessing this interface              | <a href="#">page 7-336</a> |

### 7.1.36.6.1 apn

▶ *interface-config-wwan-instance*

Configures the cellular data provider’s name. This setting is needed in areas with multiple cellular data providers using the same protocols, such as Europe and Asia.

**Supported in the following platforms:**

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

apn <WORD>

**Parameters**

- apn <WORD>

|            |                                                         |
|------------|---------------------------------------------------------|
| apn <WORD> | Specify the name of the cellular data service provider. |
|------------|---------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#apn AT&T
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 apn AT&T
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#

```

**Related Commands**

|           |                                           |
|-----------|-------------------------------------------|
| <i>no</i> | Removes the configured access point name. |
|-----------|-------------------------------------------|

### 7.1.36.6.2 auth-type

▶ *interface-config-wwan-instance*

Configures the authentication type used by the cellular data provider

#### Supported in the following platforms:

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
auth-type [chap|mschap|mschap-v2|pap]
```

#### Parameters

- `auth-type [chap|mschap|mschap-v2|pap]`

|           |                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------|
| auth-type | Configures the authentication protocol used on this interface. The options are: PAP, CHAP, MSCHAP, and MSCHAP-v2 |
| chap      | Configures <i>Challenge-Handshake Authentication Protocol</i> (CHAP). This is the default value.                 |
| mschap    | Configures <i>Microsoft Challenge-Handshake Authentication Protocol</i> (MSCHAP)                                 |
| mschapv2  | Configures <i>Microsoft Challenge-Handshake Authentication Protocol</i> (MSCHAP) version 2                       |
| pap       | Configures <i>Password Authentication Protocol</i> (PAP)                                                         |

#### Example

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#auth-type mschap-v2

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 apn AT&T
 auth-type mschap-v2
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

|           |                                                                  |
|-----------|------------------------------------------------------------------|
| <i>no</i> | Removes the authentication protocol configured on this interface |
|-----------|------------------------------------------------------------------|

### 7.1.36.6.3 crypto

▶ *interface-config-wwan-instance*

Associates a crypto map with this interface

**Supported in the following platforms:**

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
crypto map <CRYPTO-MAP-NAME>
```

**Parameters**

- crypto map <CRYPTO-MAP-NAME>

|                                 |                                                                                                                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto map<br><CRYPTO-MAP-NAME> | Associates a crypto map with this interface <ul style="list-style-type: none"> <li>• &lt;CRYPTO-MAP-NAME&gt; - Specify the crypto map name (should be existing and configured).</li> </ul> |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#crypto map test

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 apn AT&T
 auth-type mschap-v2
 crypto map test
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

**Related Commands**

|           |                                                       |
|-----------|-------------------------------------------------------|
| <i>no</i> | Removes the crypto map associated with this interface |
|-----------|-------------------------------------------------------|

### 7.1.36.6.4 ip

▶ *interface-config-wwan-instance*

Configures IP related settings on this interface

#### Supported in the following platforms:

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
ip [default-gateway|nat]
ip default-gateway priority <1-8000>
ip nat [inside|outside]
```

#### Parameters

- ip default-gateway priority <1-8000>

|                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip                                                                          | Configures IP related settings on this interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| default-gateway priority <1-8000>                                           | Configures the default-gateway's (learned by the wireless WAN) priority. <ul style="list-style-type: none"> <li>• &lt;1-8000&gt; - Specify a value from 1 - 8000. The default is 3000.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <ul style="list-style-type: none"> <li>• ip nat [inside outside]</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ip                                                                          | Configures IP related settings on this interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| nat [inside outside]                                                        | Configures the NAT settings. This option is disabled by default. <ul style="list-style-type: none"> <li>• inside - Marks this WWAN interface as NAT inside. The inside network is transmitting data over the network to its intended destination. On the way out, the source IP address is changed in the header and replaced by the (public) IP address.</li> <li>• outside - Marks this WWAN interface as NAT outside. Packets passing through the NAT on the way back to the controller or service platform managed LAN are matched against the records kept by the NAT engine. There, the destination IP address is changed back to the specific internal private class IP address in order to reach the LAN over the network.</li> </ul> |

#### Example

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#ip nat inside
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 apn AT&T
 auth-type mschap-v2
 crypto map test
 ip nat inside
 ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

|           |                                               |
|-----------|-----------------------------------------------|
| <i>no</i> | Removes IP related settings on this interface |
|-----------|-----------------------------------------------|

### 7.1.36.6.5 no

▶ *interface-config-wwan-instance*

Removes or reverts the WWAN interface settings

#### Supported in the following platforms:

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
no [all|apn|auth-type|crypto|description|ip|password|shutdown|use|username]
no [all|apn|auth-type|description|password|shutdown|username]
no crypto map
no ip [default-gateway priority|nat]
no use ip-access-list in
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                  |
|-----------------|----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this WWAN interface's settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------------|

#### Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

#### Example

The following example displays the WWAN interface settings before the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 apn AT&T
 auth-type mschap-v2
 crypto map test
 ip nat inside
 ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#no apn
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#no auth-type
```

The following example displays the WWAN interface settings after the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 crypto map test
 ip nat inside
 ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

### 7.1.36.6.6 password

▶ *interface-config-wwan-instance*

Configures a password for this WWAN interface. The configured value is used for authentication support by the cellular data carrier.

**Supported in the following platforms:**

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
password [2 <WORD>|<WORD>]
```

**Parameters**

- password [2 <WORD>|<WORD>]

|          |                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------|
| password | Configures a password for this WWAN interface                                                         |
| 2 <WORD> | Configures an encrypted password. Use this option when copy pasting the password from another device. |
| <WORD>   | Enter the password string (should not exceed 32 characters in length).                                |

**Example**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#password 2 TechPubsTesting@123

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 password TechPubsTesting@123
 crypto map test
 ip nat inside
 ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

**Related Commands**

|           |                                 |
|-----------|---------------------------------|
| <i>no</i> | Removes the configured password |
|-----------|---------------------------------|

### 7.1.36.6.7 shutdown

▶ *interface-config-wwan-instance*

Shuts down this WWAN interface. Use the `no > shutdown` command to re-start the WWAN interface.

#### Supported in the following platforms:

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
shutdown
```

#### Parameters

None

#### Example

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#shutdown
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 shutdown
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

|           |                              |
|-----------|------------------------------|
| <i>no</i> | Re-starts the WWAN interface |
|-----------|------------------------------|

### 7.1.36.6.8 use

▶ *interface-config-wwan-instance*

Associates an IP ACL with this interface. The ACL should be existing and configured.

The ACL applies an IP based firewall to all incoming packets. The ACL identifies a single IP or a range of IPs that are to be allowed or denied access on this interface.

#### Supported in the following platforms:

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
use ip-access-list in <ACCESS-LIST-NAME>
```

#### Parameters

- use ip-access-list in <ACCESS-LIST-NAME>

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>use ip-access-list in &lt;ACCESS-LIST- NAME&gt;</pre> | <p>Associates an inbound IPv4 ACL with this interface. This setting applies to IPv4 inbound traffic only and not IPv6 traffic. IPv4 operates as a best effort delivery method, as it does not guarantee delivery, and does not ensure proper sequencing or duplicate delivery (unlike TCP). IPv4 hosts can use link local addressing to provide local connectivity.</p> <ul style="list-style-type: none"> <li>• &lt;ACCESS-LIST-NAME&gt; - Specify the IP ACL name.</li> </ul> |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#use ip-access-list in test
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
password TechPubsTesting@123
crypto map test
ip nat inside
use ip-access-list in test
ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

|           |                                                   |
|-----------|---------------------------------------------------|
| <i>no</i> | Removes the IP ACL associated with this interface |
|-----------|---------------------------------------------------|

### 7.1.36.6.9 username

▶ *interface-config-wwan-instance*

Configures the names of users accessing this interface

#### Supported in the following platforms:

- Access Point — AP7161, AP81XX, AP8232
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
username <WORD>
```

#### Parameters

- username <WORD>

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| username <WORD> | Configures the username for authentication support by the cellular data carrier |
|                 | • <WORD> - Specify the username (should not exceed 32 characters).              |

#### Example

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#username TechPubsUser1

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
 username TechPubsUser1
 password TechPubsTesting@123
 crypto map test
 ip nat inside
 use ip-access-list in test
 ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

|           |                                 |
|-----------|---------------------------------|
| <i>no</i> | Removes the configured username |
|-----------|---------------------------------|

### 7.1.36.7 interface-config-bluetooth-instance

► *interface*

AP8432 and AP8533 model access points utilize a built-in Bluetooth chip for specific Bluetooth functional behaviors in a WiNG managed network. AP8432 and AP8533 models support both Bluetooth classic and *Bluetooth low energy* (BLE) technology. These platforms use their Bluetooth classic enabled radio to sense other Bluetooth enabled devices and report device data (MAC address, RSSI and device calls) to an ADSP server for intrusion detection. If the device presence varies in an unexpected manner, ADSP can raise an alarm.

**NOTE:** AP8132 model access points support an external USB Bluetooth radio providing ADSP Bluetooth classic sensing functionality only, not the BLE beaconing functionality available for AP8432 and AP8533 model access points described in this section.

AP8432 and AP8533 model access points support Bluetooth beaconing to emit either iBeacon or Eddystone-URL beacons. The access point's Bluetooth radio sends non-connectable, undirected *low-energy* (LE) advertisement packets periodically. These advertisement packets are short and sent on Bluetooth advertising channels that conform to already-established iBeacon and Eddystone-URL standards. However, portions of the advertising packet are customizable via the Bluetooth radio interface configuration context.

To switch to this mode, use the following commands:

```
<DEVICE>(config)#profile <ap8432/ap8533> <PROFILE-NAME>

<DEVICE>(config-profile-default-ap8432)#interface bluetooth ?
<1-1> Bluetooth interface index?
```

The following example uses the default-ap8432 profile instance to configure the Bluetooth radio interface:

```
nx9500-6C8809(config-profile-default-ap8432)#interface bluetooth 1
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#
Bluetooth Radio Mode commands:
 beacon Configure low-energy beacon operation parameters
 description Configure a description for this bluetooth radio
 eddystone Configure eddystone beacon payload parameters
 ibeacon Configure iBeacon beacon payload parameters
 mode Set the bluetooth operation mode
 no Negate a command or set its defaults
 shutdown Shutdown the selected bluetooth radio interface

 clrscr Clears the display screen

### 7.1.36.7.1 beacon

▶ *interface-config-bluetooth-instance*

Configures the Bluetooth radio's beacon's emitted transmission pattern for Bluetooth radios functioning in the *low energy beacon* (le-beacon) mode. This option is applicable *only if* the Bluetooth radio's operational mode is set to *le-beacon*.

**Supported in the following platforms:**

- Access Points – AP8432, AP8533

**Syntax**

```
beacon [pattern|period]
beacon pattern [eddytone-url1|eddytone-ulr2|ibeacon]
beacon period <100-10000>
```

**Parameters**

- beacon pattern [eddytone-url1|eddytone-ulr2|ibeacon]

|                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>beacon pattern [eddytone-url1 eddytone-ulr2 ibeacon]</p> | <p>When the beacon mode is set to 'le-beacon', use this command to configure the Bluetooth radio's beacon's emitted transmission pattern. Select one of the following beacon patterns:</p> <ul style="list-style-type: none"> <li>• eddytone-url1 – Transmits an Eddystone-URL beacon using URL 1. This is the default setting.</li> <li>• eddytone-url2 – Transmits an Eddystone-URL beacon using URL 2</li> </ul> <p>An Eddystone-URL frame broadcasts a URL using a compressed encoding scheme to better fit within a limited advertisement packet. Once decoded, the URL can be used by a client for Internet access. If an Eddystone-URL beacon broadcasts https:anysite, clients receiving the packet can access that URL. If setting the transmission pattern as 'eddytone-url1' or 'eddytone-ulr2', use the 'eddytone' keyword to configure Eddystone beacon payload parameters. For more information, see <i>eddytone</i>.</p> <ul style="list-style-type: none"> <li>• ibeacon – Transmits an ibeacon beacon. iBeacon was created by Apple for use in <i>iPhone OS</i> (iOS) devices (beginning with iOS version 7.0). There are three data fields Apple has made available to iOS applications, a <i>Universally Unique Identifier</i> (UUID) for device identification, a <i>Major</i> value for device class and a <i>Minor</i> value for more refined information like product category. If setting the transmission pattern as 'ibeacon', use the 'ibeacon' keyword to configure ibeacon beacon payload parameters. For more information, see <i>ibeacon</i>.</li> </ul> <p>For more information on configuring the Bluetooth radio's operational mode, see <i>mode</i>.</p> |
| <p>beacon period &lt;100-10000&gt;</p>                      | <p>Configures the Bluetooth radio's beacon transmission period, in milliseconds, from 100 - 10000. As the defined period increases, so does the CPU processing time and the number of packets incrementally transmitted (typically one per minute).</p> <ul style="list-style-type: none"> <li>• &lt;100-10000&gt; – Specify a value from 100 - 10000 milliseconds. The default value is 1000 milliseconds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 7.1.36.7.2 description

▶ *interface-config-bluetooth-instance*

Configures a description for the Bluetooth radio interface, differentiating it from other Bluetooth supported radio's within the same RF Domain

**Supported in the following platforms:**

- Access Points - AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

**Syntax**

```
description <WORD>
```

**Parameters**

- description <WORD>

|                    |                                                                                                                                                                                                                                                                                                                                                |

### 7.1.36.7.3 eddystone

▶ *interface-config-bluetooth-instance*

Configures Eddystone beacon payload parameters. Configure these parameters only if the Bluetooth radio interface’s operational mode is set to ‘le-beacon’, and the beacon’s emitted transmission pattern is set to either ‘eddystone-url1’ or ‘eddystone-ur2’.

**Supported in the following platforms:**

- Access Points – AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

**Syntax**

```
eddystone [calibration-rssi <-127-127>|url [1|2] <WORD>]
```

**Parameters**

- eddystone [calibration-rssi|url [1|2] <WORD>]

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 7.1.36.7.4 ibeacon

▶ *interface-config-bluetooth-instance*

Configures iBeacon beacon payload parameters. Configure these parameters only if the Bluetooth radio interface's operational mode is set to 'le-beacon', and the beacon's emitted transmission pattern is set to 'ibeacon'.

**Supported in the following platforms:**

- Access Points – AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

**Syntax**

```

ibeacon [calibration-rssi <-127-127>|major <0-65535>|minor <0-65535>|uuid <WORD>]
ibeacon [calibration-rssi <-127-127>|uuid <WORD>]
ibeacon [major|minor] <0-65535>

```

**Parameters**

- `ibeacon [calibration-rssi <-127-127>|major <0-65535>|minor <0-65535>|uuid <WORD>]`

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ibeacon                     | Configures following iBeacon beacon payload parameters: calibration-rssi, major, minor, and uuid                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| calibration-rssi <-127-127> | Configures the ibeacon measured calibration signal strength, from -127 to 127 dBm, at 1 meter. Mobile devices can approximate their distance to beacons based on received signal strength. However, distance readings can fluctuate since they depend on several external factors. The closer you are to a beacon, the more accurate the reported distance. This setting is the projected calibration signal strength at 1 meter.<br><ul style="list-style-type: none"> <li>• &lt;-127-127&gt; – Specify a value from -127 - 127 dBm. The default value is -60 dBm.</li> </ul> |
| major <0-65535>             | Configures the iBeacon Major value from 0 - 65535. Major values identify and distinguish groups. For example, each beacon on a specific floor in a building could be assigned a unique major value.<br><ul style="list-style-type: none"> <li>• &lt;0-65535&gt; – Specify a value from 0 - 65535. The default value is 1111.</li> </ul>                                                                                                                                                                                                                                        |
| minor <0-65535>             | Configures the iBeacon Minor value from 0 - 65535. Minor values identify and distinguish individual beacons. Minor values help identify individual beacons within a group of beacons assigned a major value. The default setting is 2,222.<br><ul style="list-style-type: none"> <li>• &lt;0-65535&gt; – Specify a value from 0 - 65535. The default value is 2222.</li> </ul>                                                                                                                                                                                                 |
| uuid <WORD>                 | Configures a 32 hex character maximum UUID. The UUID classification contains 32 hexadecimal digits, split into 5 groups, separated by dashes. For example, f2468da65fa82e841134bc5b71e0893e. The UUID distinguishes iBeacons in the network from all other beacons in networks outside of your direct administration.<br><ul style="list-style-type: none"> <li>• &lt;WORD&gt; – Specify the UUID (should not exceed 32 hexadecimal characters). The default value is 01F101F101F101F101F101F101F1.</li> </ul>                                                                 |

**Example**

```

nx9500-6C8809 (config-profile-default-ap8432-if-bluetooth1)#ibeacon calibration-rssi -70

### 7.1.36.7.5 mode

▶ *interface-config-bluetooth-instance*

Configures the Bluetooth radio interface's mode of operation as *bt-sensor* or *le-beacon*

**Supported in the following platforms:**

- Access Points - AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

**Syntax**

```
mode [bt-sensor|le-beacon|le-tracking]
```

**Parameters**

- mode [bt-sensor|le-beacon|le-tracking]

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode | <p>Configures the Bluetooth radio interface's mode of operation. The options are:</p> <ul style="list-style-type: none"> <li>• <i>bt-sensor</i> - Select this option to provide Bluetooth support for legacy devices. <i>bt-sensors</i> are Bluetooth classic sensors providing robust wireless connections for legacy devices. Typically these connections are not ideally suited for the newer <i>Bluetooth low energy</i> (BLE) technology supported devices. This is the default setting.</li> <li>• <i>le-beacon</i> - Select this option to provide Bluetooth support for newer BLE technology supported devices. <i>le-beacons</i> are newer Bluetooth low energy beacons ideal for applications requiring intermittent or periodic transfers of small amounts of data. <i>le-beacons</i> are not designed as replacements for classic beacon sensors. If selecting this option, use the <i>beacon</i> keyword to configure the Beacon transmission period and Beacon transmission pattern.</li> <li>• <i>le-tracking</i> - Select this option to provide Bluetooth support for BLE asset tracking. When enabled, it uses the AP's Bluetooth radio to detect BLE 'asset tags' within the managed network. This information is reported to a back-end server (NSight server).</li> </ul> |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809 (config-profile-default-ap8432-if-bluetooth1) #mode le-beacon

nx9500-6C8809 (config-profile-default-ap8432-if-bluetooth1) #show context
interface bluetooth1
 shutdown
 mode le-beacon
 beacon pattern ibeacon
 ibeacon calibration-rssi -70
 ibeacon major 1110
 ibeacon minor 2210
 ibeacon uuid f2468da65fa82e841134bc5b71e0893e
nx9500-6C8809 (config-profile-default-ap8432-if-bluetooth1) #

```

**Related Commands**

|           |                                                                      |
|-----------|----------------------------------------------------------------------|
| <i>no</i> | Reverts this Bluetooth radio's mode of operation to <i>le-beacon</i> |
|-----------|----------------------------------------------------------------------|

### 7.1.36.7.6 shutdown

▶ *interface-config-bluetooth-instance*

Shutsdown the selected AP8432/AP8533 Bluetooth radio interface

**Supported in the following platforms:**

- Access Points - AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

**Syntax**

```
shutdown
```

**Parameters**

None

**Example**

```

nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#shutdown

nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#show context
interface bluetooth1
 shutdown
 mode le-beacon
 beacon pattern ibeacon
 ibeacon calibration-rssi -70
 ibeacon major 1110
 ibeacon minor 2210
 ibeacon uuid f2468da65fa82e841134bc5b71e0893e
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#

```

**Related Commands**

|           |                   |
|-----------|-------------------|
| <i>no</i> | Reverses shutdown |
|-----------|-------------------|

### 7.1.36.7.7 no

▸ *interface-config-bluetooth-instance*

Removes or reverts to default this AP8432/AP8533 Bluetooth radio interface's settings

**Supported in the following platforms:**

- Access Points - AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

**Syntax**

```
no [beacon|description|eddytone|ibeacon|mode|shutdown]

no beacon [pattern|period]
no description
no eddytone [calibration-rssi|url [1|2]]
no ibeacon [calibration-rssi|major|minor|uuid]
no mode
no shutdown
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts to default this Bluetooth radio interface's settings based on the parameters passed <ul style="list-style-type: none"> <li>• &lt;PARAMETERS&gt; - Specify the parameters.</li> </ul> |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

The following example shows the AP8432 default profile's Bluetooth radio interface settings:

```
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#show context
interface bluetooth1
 shutdown
 mode le-beacon
 beacon pattern ibeacon
 ibeacon calibration-rssi -70
 ibeacon major 1110
 ibeacon minor 2210
 ibeacon uuid f2468da65fa82e841134bc5b71e0893e
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#

nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#no shutdown
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#no ibeacon minor
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#no ibeacon
calibration-rssi
```

The following example shows the AP8432 default profile's Bluetooth radio interface settings after the 'no' commands are executed:

```
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#show context
interface bluetooth1
 no shutdown
 mode le-beacon
 beacon pattern ibeacon
 ibeacon major 1110
 ibeacon uuid f2468da65fa82e841134bc5b71e0893e
nx9500-6C8809(config-profile-default-ap8432-if-bluetooth1)#
```

## 7.1.37 ip

### ► Profile Config Commands

The following table summarizes NAT pool configuration commands:

| Command                         | Description                                                                                                                       | Reference         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>ip</i>                       | Configures IP components, such as default gateway, DHCP, DNS server forwarding, name server, domain name, routing standards, etc. | <i>page 7-349</i> |
| <i>nat-pool-config-instance</i> | Invokes NAT pool configuration parameters                                                                                         | <i>page 7-355</i> |

### 7.1.37.1 ip

Configures IPv4 routing components, such as default gateway, DHCP, DNS server forwarding, name server, domain name, routing standards, etc.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
ip [default-gateway|dhcp|dns-server-forward|domain-lookup|domain-name|igmp|name-server|nat|route|routing]

ip default-gateway [<IP>|<HOST-ALIAS-NAME>|failover|priority [dhcp-client <1-1800>|static-route <1-1800>]]

ip [dns-server-forward|domain-lookup|domain-name <DOMAIN-NAME>|name-server <IP>|routing]

ip dhcp client [hostname|persistent-lease]

ip igmp snooping {fast-leave|forward-unknown-multicast|querier}
ip igmp snooping {fast-leave|forward-unknown-multicast}
ip igmp snooping {querier} {max-response-time <1-25>|query-interval <1-18000>|robustness-variable <1-7>|timer expiry <60-300>|version <1-3>}
```

**NOTE:** The command 'ip igmp snooping' can be configured under bridge VLAN context also. For example: rfs7000-37FABE(config-device 00-15-70-37-FA-BE-bridge-vlan-1)#ip igmp snooping forward-unknown-multicast

```
ip nat [crypto|inside|outside|pool]

ip nat [crypto source pool|pool] <NAT-POOL-NAME>

ip nat [inside|outside] [destination|source]

ip nat [inside|outside] destination static <ACTUAL-IP> <1-65535> [tcp|udp] [(<NATTED-IP> {<1-65535>})]

ip nat [inside|outside] source [list|static]

ip nat [inside|outside] source static <ACTUAL-IP> <1-65535> [tcp|udp] [(<NATTED-IP> {<1-65535>})]

ip nat [inside|outside] source list <IP-ACCESS-LIST-NAME> interface [<INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address <IP>|interface <L3-IF-NAME>|overload|pool <NAT-POOL-NAME>)]

ip route <IP/M> [<IP>|<HOST-ALIAS-NAME>]
```

**Parameters**

- ip default-gateway [<IP>|<HOST-ALIAS-NAME>|failover|priority [dhcp-client <1-1800>|static-route <1-1800>]]

|    |                                    |
|----|------------------------------------|
| ip | Configures IPv4 routing components |
|----|------------------------------------|

|                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default-gateway                                                                                                                                          | Configures default gateway (next-hop router) parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 7.1.37.2 nat-pool-config-instance

► *ip*

Use the config-profile-<DEVICE-PROFILE-NAME> instance to configure *Network Address Translation* (NAT) pool settings.

The following example uses the config-profile-default-rfs7000 instance to configure NAT pool settings:

```
rfs6000-37FABE(config-profile-default-rfs6000)#ip nat pool pool1
rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#

rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#?
Nat Policy Mode commands:
 address Specify addresses for the nat pool
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)
```

The following table summarizes NAT pool configuration commands:

| Command        | Description                           | Reference                  |
|----------------|---------------------------------------|----------------------------|
| <i>address</i> | Configures NAT pool addresses         | <a href="#">page 7-356</a> |
| <i>no</i>      | Negates a command or sets its default | <a href="#">page 7-357</a> |

### 7.1.37.2.1 address

▶ *nat-pool-config-instance*

Configures NAT pool of IP addresses

Define a range of IP addresses hidden from the public Internet. NAT modifies network address information in the defined IP range while in transit across a traffic routing device. NAT only provides IP address translation and does not provide a firewall. A branch deployment with NAT by itself will not block traffic from being potentially routed through a NAT device. Consequently, NAT should be deployed with a stateful firewall.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
address [<IP>|range <START-IP> <END-IP>]
```

#### Parameters

- address [<IP>|range <START-IP> <END-IP>]

|                           |                                                                                                                                                                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <IP>              | Adds a single IP address to the NAT pool                                                                                                                                                                                                  |
| range <START-IP> <END-IP> | Adds a range of IP addresses to the NAT pool <ul style="list-style-type: none"> <li>• &lt;START-IP&gt; - Specify the starting IP address of the range.</li> <li>• &lt;END-IP&gt; - Specify the ending IP address of the range.</li> </ul> |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#address range 172.16.10.2 172.16.10.8

rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#show context
ip nat pool pool1
 address range 172.16.10.2 172.16.10.8
rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#
```

#### Related Commands

|           |                                                   |
|-----------|---------------------------------------------------|
| <i>no</i> | Removes address(es) configured with this NAT pool |
|-----------|---------------------------------------------------|

**7.1.37.2.2 no**

▶ *nat-pool-config-instance*

Removes address(es) configured with this NAT pool

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

no address [<IP>|range <START-IP> <END-IP>]

**Parameters**

- no address [<IP>|range <START-IP> <END-IP>]

|                                             |                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------|
| no address [<IP> range <START-IP> <END-IP>] | Removes a single IP address or a range of IP addresses from this NAT pool |
|---------------------------------------------|---------------------------------------------------------------------------|

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#show context
ip nat pool pool1
 address range 172.16.10.2 172.16.10.8
rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#

rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#no address range 1
72.16.10.2 172.16.10.8

rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#show context
ip nat pool pool1
rfs6000-37FABE(config-profile-default-rfs6000-nat-pool-pool1)#
```

## 7.1.38 ipv6

### ► Profile Config Commands

Configures IPv6 routing components, such as default gateway, DNS server forwarding, name server, routing standards, etc.

These IPv6 settings are applied to all devices using this profile.

You can also configure IPv6 settings on a device, using the device's configuration mode.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**NOTE:** The IPv6 settings configured at the profile/device level are global configuration settings and not interface-specific.

#### Syntax

```

ipv6 [default-gateway|dns-server-forward|hop-limit|mld|name-server|nd-reachable-time|neighbor|ns-interval|ra-convert|route|ula-reject-route|unicast-routing]

ipv6 [default-gateway <IPv6> {vlan <VLAN-ID>}|dns-server-forward|hop-limit <1-255>|name-server <IPv6>|nd-reachable-time <5000-3600000>|ns-interval <1000-3600000>|ula-reject-route|unicast-routing]

ipv6 ra-convert {throttle interval <3-1800> max-RAs <1-256>}

ipv6 mld snooping {forward-unknown-multicast|querier}
ipv6 mld snooping {forward-unknown-multicast}
ipv6 mld snooping {querier} {max-response-time <1-25000>|query-interval <1-18000>|robustness-variable <1-7>|timer expiry <60-300>|version <1-2>}

ipv6 neighbor [<IPv6>|timeout]

ipv6 neighbor <IPv6> <MAC> [<INTF-NAME>|pppoe1|vlan <1-4094>|wwan1] {dhcp-server|router}
ipv6 neighbor timeout <15-86400>

ipv6 route <DEST-IPv6-PREFIX/PREFIX-LENGTH> <IPv6-GATEWAY-ADDRESS> {vlan <VLAN-ID>}

```

#### Parameters

- ipv6 [default-gateway <IPv6> {vlan <VLAN-ID>}|dns-server-forward|hop-limit <1-255>|name-server <IPv6>|nd-reachable-time <5000-3600000>|ns-interval <1000-3600000>|ula-reject-route|unicast-routing]

|                                         |                                                                                                                                                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6                                    | Configures IPv6 routing components                                                                                                                                                                                                 |
| default-gateway <IPv6> {vlan <VLAN-ID>} | Configures IPv6 default gateway's address in the ::/0 format <ul style="list-style-type: none"> <li>• vlan &lt;VLAN-ID&gt; - Optional. Specify the VLAN interface's ID through which the default gateway is accessible.</li> </ul> |
| dns-server-forward                      | Enables DNS server forwarding. This command enables the forwarding of DNS queries to DNS servers outside of the network. This feature is disabled by default.                                                                      |

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hop-limit <1-255>                                      | Configures the IPv6 hop count limit <ul style="list-style-type: none"> <li>• &lt;1-255&gt; – Specify a value between 1 - 255. The default is 64.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| name-server <IPv6>                                     | Configures the IPv6 name server's address <ul style="list-style-type: none"> <li>• &lt;IPv6&gt; – Specify the address of the IPv6 name server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| nd-reachable-time <5000-3600000>                       | Configures the time, in milliseconds, that a neighbor is assumed to be reachable after having received <i>neighbor discovery</i> (ND) confirmation for their reachability <ul style="list-style-type: none"> <li>• &lt;5000-3600000&gt; – Specify a value from 5000 - 3600000 milliseconds. The default is 30,000 milliseconds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ns-interval <1000-3600000>                             | Configures the interval, in milliseconds, between two consecutive retransmitted <i>neighbor solicitation</i> (NS) messages. NS messages are sent by a node to determine the link layer address of a neighbor, or verify a neighbor is still reachable via a cached link-layer address. <ul style="list-style-type: none"> <li>• &lt;1000-3600000&gt; – Specify a value from 1000 - 3600000. The default is 1000 milliseconds.</li> </ul>                                                                                                                                                                                                                                                                                                                                         |
| ula-reject-route                                       | Installs a "reject" route for <i>Unique Local Address</i> (ULA) prefixes. This ensures that site-border routers and firewalls do not forward packets with ULA source or destination addresses outside of the site, unless explicitly configured with routing information about specific /48 or longer Local IPv6 prefixes. This option is disabled by default.<br><br>The ULA is an IPv6 address used in private networks for local communication within a site (for example a company, campus, or within a set of branch office networks). These site local addresses are IPv6 addresses that fall in the block fc00::/7, defined in RFC 4193.                                                                                                                                  |
| unicast-routing                                        | Enables IPv6 unicast routing. This feature is enabled by default. <ul style="list-style-type: none"> <li>• <code>ipv6 ra-convert {throttle interval &lt;3-1800&gt; max-RAs &lt;1-256&gt;}</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| ra-convert {throttle interval <3-1800> max-RAs <1-256> | Enables conversion of multicast <i>router advertisements</i> (RAs) to unicast RAs at the dot11 layer. This feature is disabled by default. <ul style="list-style-type: none"> <li>• throttle – Optional. Throttles multicast RAs before converting to unicast <ul style="list-style-type: none"> <li>• interval &lt;3-1800&gt; – Throttles multicast RAs for a specified time period. Specify the interval from 3 - 1800 seconds. The default is 3 seconds.</li> <li>• max-RAs &lt;1-256&gt; – Specifies the maximum number of RAs per IPv6 router during the specified throttle interval. Specify a value from 1 - 256. The default is 1.</li> </ul> </li> </ul> <ul style="list-style-type: none"> <li>• <code>ipv6 mld snooping {forward-unknown-multicast}</code></li> </ul> |
| ipv6                                                   | Configures IPv6 routing components                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mld snooping forward-unknown-multicast                 | Enables <i>multicast listener discovery</i> (MLD) protocol snooping. This feature is disabled by default.<br><br>When enabled, IPv6 devices (access point, wireless controller, or service platform) can examine MLD messages exchanged between hosts and multicast routers to discern which hosts are receiving multicast group traffic. Based on the information gathered these devices forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This prevents VLANs from getting flooded with IPv6 multicast traffic.<br><br>Contd..                                                                                                                                                               |

## 7.1.39 l2tpv3

### ► Profile Config Commands

Defines the L2TPV3 settings for tunneling layer 2 payloads using VPNs

L2TPv3 is an IETF standard that defines the control and encapsulation protocol settings for tunneling layer 2 frames in an IP network (and access point profile) between two IP nodes. Use L2TPv3 to create tunnels for transporting layer 2 frames. L2TPv3 enables WiNG supported controllers and access points to create tunnels for transporting Ethernet frames to and from bridge VLANs and physical ports. L2TPv3 tunnels can be defined between WiNG devices and other vendor devices supporting the L2TPv3 protocol.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
l2tpv3 [hostname <HOSTNAME>|inter-tunnel-bridging|logging|manual-session|router-id
 [<1-4294967295>|<IP>]|tunnel|udp-listen-port <1024-65535>]
```

```
l2tpv3 logging ip-address [<IP>|any] hostname [<HOSTNAME>|any] router-id
 [<IP>|<WORD>|any]
```

#### Parameters

- l2tpv3 [hostname <HOSTNAME>|inter-tunnel-bridging|manual-session|router-id [<1-4294967295>|<IP>]|tunnel|udp-listen-port <1024-65535>]

|                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l2tpv3                                                                                                                                                                 | Configures the L2TPv3 protocol settings for a profile                                                                                                                                                                                                                                                                                                                   |
| hostname <HOSTNAME>                                                                                                                                                    | Configures the host name sent in the L2TPv3 signalling messages. Tunnel establishment involves exchanging 3 message types (SCCRQ, SCCRP and SCCN) with the peer. Tunnel IDs and capabilities are exchanged during the tunnel establishment with the host. <ul style="list-style-type: none"> <li>• &lt;HOSTNAME&gt; - Specify the L2TPv3 specific host name.</li> </ul> |
| inter-tunnel-bridging                                                                                                                                                  | Enables inter tunnel bridging of packets. This feature is disabled by default.                                                                                                                                                                                                                                                                                          |

|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging                        | Enables L2TPv3 tunnel event logging and debugging. When enabled, all events relating to Ethernet frames to and from bridge VLANs and physical ports on a specified IP address, host or router ID are logged. This option is disabled by default.                                                                                                                                                                                          |
| ip-address<br>[<IP> any]       | Configures the L2TPv3 peer tunnel IP address for which event logging is enabled. The options are: <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the peer's IP address. L2TPv3 events are captured and logged for the specified peer.</li> <li>• any - Peer's IP address is not specified. Enables event logging for all incoming connections from any IP address.</li> </ul>                                              |
| hostname<br>[<HOSTNAME> any]   | Configures the L2TPv3 peer tunnel hostname for which event logging is enabled. The options are: <ul style="list-style-type: none"> <li>• &lt;HOSTNAME&gt; - Specify the peer's host name. L2TPv3 events are captured and logged for specified host.</li> <li>• any - Peer's hostname is not specified. Enables debugging for all incoming connections from any host.</li> </ul>                                                           |
| router-id<br>[<IP> <WORD> any] | Configures the L2TPv3 tunnel router ID for which event logging is enabled. The options are: <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the router ID in the IP address format.</li> <li>• &lt;WORD&gt; - Specify the router ID in the form of an integer or range. For example 100-200.</li> <li>• any - Router ID is not specified. Enables debugging for all incoming connections from any L2TPv3 router.</li> </ul> |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#l2tpv3 hostname l2tpv3Host1
rfs6000-37FABE(config-profile-default-rfs6000)#l2tpv3 inter-tunnel-bridging

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000

|-----------|--------------------------------------------------|
| <i>no</i> | Negates a L2TPv3 tunnel settings on this profile |
|-----------|--------------------------------------------------|

## 7.1.40 l3e-lite-table

### ► Profile Config Commands

Configures L3e lite table aging time

The L3e Lite table stores information about destinations and their location within a specific IPsec tunnel. This enables quicker packet transmissions. The table is updated as nodes transmit packets.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
l3e-lite-table aging-time <10-1000000>
```

#### Parameters

- l3e-lite-table aging-time <10-1000000>

|                                        |                                                                                                                                                                                                             |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l3e-lite-table aging-time <10-1000000> | Configures the aging time in seconds. The aging time defines the duration a learned L3e entry (IP, VLAN) remains in the L3e Lite table before deletion due to lack of activity. The default is 300 seconds. |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#l3e-lite-table aging-time 1000

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs7000 default-rfs7000
bridge vlan 1
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
.....
interface ge4
ip dhcp trust
qos trust dscp
qos trust 802.1p
interface pppoe1
use firewall-policy default
l3e-lite-table aging-time 1000
--More--
rfs6000-37FABE(config-profile-default-rfs6000)#
```

#### Related Commands

|           |                                                     |
|-----------|-----------------------------------------------------|
| <i>no</i> | Removes the L3e lite table aging time configuration |
|-----------|-----------------------------------------------------|

## 7.1.41 led

### ► Profile Config Commands

Turns on and off access point LEDs

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
led {flash-pattern}
```

#### Parameters

- led {flash-pattern}

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| led flash-pattern | Optional. Enables LED flashing on the device using this profile<br>Select this option to flash an access point's LEDs in a distinct manner (different from its operational LED behavior). Enabling this feature allows an administrator to validate an access point has received its configuration (perhaps remotely at the site of deployment) without having to log into the managing controller or service platform. This feature is disabled by default. |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-RFS6000Test)#led flash-pattern

| <i>no</i> | Disables or reverts settings to their default |
|-----------|-----------------------------------------------|

## 7.1.42 led-timeout

### ► Profile Config Commands

Configures the LED-timeout timer in the device or profile configuration mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
led-timeout [<15-1440>|shutdown]
```

#### Parameters

- led-timeout [<15-1440>|shutdown]

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| led-time [<15-1440> shutdown] | <p>Sets the LED-timeout timer. The value provided here determines the interval (time to lapse) for which a device's LEDs are turned off after the last radio state change. For example, if set at 15 minutes, the LEDs are turned off for 15 minutes after the last radio state change.</p> <ul style="list-style-type: none"> <li>• &lt;15-1440&gt; - Specify a value from 15 - 1400 minutes. The default is 30 minutes.</li> <li>• shutdown - Shuts down the LED-timeout timer. The device LEDs are not turned off.</li> </ul> |

## 7.1.45 lldp

### ► Profile Config Commands

Enables LLDP on this profile and configures LLDP settings

LLDP or IEEE 802.1AB is a vendor-neutral Data Link Layer protocol used by network devices for advertising of (announcing) identity, capabilities, and interconnections on a IEEE 802 LAN network. The protocol is formally referred to by the IEEE as Station and Media Access Control Connectivity Discovery. Both LLDP snooping and ability to generate and transmit LLDP packets is provided.

Information obtained via CDP and LLDP snooping is available in the UI. Information obtained using LLDP is provided during the adoption process, so the layer 2 device detected by the access point can be used as a criteria in the provisioning policy.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
lldp [holdtime|med-tlv-select|run|timer]
lldp [holdtime <10-1800>|run|timer <5-900>]
lldp med-tlv-select [inventory-management|power-management {auto}]
```

#### Parameters

- lldp [holdtime <10-1800>|run|timer <5-900>]

|                    |                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lldp               | Enables LLDP on this profile and configures LLDP settings                                                                                                                                                                                                                         |
| holdtime <10-1800> | Sets the holdtime for transmitted LLDP PDUs. This command specifies the time a receiving device holds information before discarding. <ul style="list-style-type: none"> <li>• &lt;10-1800&gt; - Specify a holdtime from 10 - 1800 seconds. The default is 180 seconds.</li> </ul> |
| run                | Enables LLDP on this profile                                                                                                                                                                                                                                                      |
| timer <5-900>      | Sets the transmit interval. This command specifies the transmission frequency of LLDP updates in seconds. <ul style="list-style-type: none"> <li>• &lt;5-900&gt; - Specify transmit interval from 5 - 900 seconds. The default is 60 seconds.</li> </ul>                          |

- lldp med-tlv-select [inventory-management|power-management {auto}]

|                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 7.1.46 load-balancing

### ► Profile Config Commands

Configures load balancing parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
load-balancing [advanced-params|balance-ap-loads|balance-band-loads|balance-channel-loads|band-control-strategy|band-ratio|group-id|neighbor-selection-strategy]

load-balancing advanced-params [2.4GHz-load|5GHz-load|ap-load|equality-margin|hiwater-threshold|max-neighbors|max-preferred-band-load|min-common-clients|min-neighbor-rssi|min-probe-rssi]

load-balancing advanced-params [2.4GHz-load|5GHz-load|ap-load] [client-weightage|throughput-weightage] <0-100>

load-balancing advanced-params equality-margin [2.4GHz|5GHz|ap|band] <0-100>

load-balancing advanced-params hiwater-threshold [ap|channel-2.4GHz|channel-5GHz]<0-100>

load-balancing advanced-params max-preferred-band-load [2.4GHz|5GHz] <0-100>

load-balancing advanced-params [max-neighbors <0-16>|min-common-clients <0-256>|min-neighbor-rssi <-100-30>|min-probe-rssi <-100-30>]

load-balancing [balance-ap-loads|balance-band-loads|balance-channel-loads [2.4GHz|5GHz]]

load-balancing band-control-strategy [distribute-by-ratio|prefer-2.4GHz|prefer-5GHz]

load-balancing band-ratio [2.4GHz|5GHz] [0|<1-10>]

load-balancing group-id<GROUP-ID>

load-balancing neighbor-selection-strategy [use-common-clients|use-roam-notification|use-smart-rf]
```

#### Parameters

- load-balancing advanced-params [2.4GHz-load|5GHz-load|ap-load] [client-weightage|throughput-weightage] <0-100>

|                                                             |                                                                                                                                                                                                                  |

## 7.1.47 logging

### ► Profile Config Commands

Enables message logging and configures logging settings. When enabled, the profile logs individual system events to a user-defined log file or a syslog server. Message logging is disabled by default.

Enabling message logging is recommended, because system event logs can be analyzed to determine an overall pattern that may be negatively impacting performance.

This command can also be executed in the device configuration mode.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
logging [aggregation-time|buffered|console|facility|forward|host|on|syslog]
logging [aggregation-time <1-60>|host [<IPv4>|<IPv6>] {port <1-65535>}|on]
logging [buffered|console|syslog|forward] [<0-7>|emergencies|alerts|critical|errors|warnings|notifications|informational|debugging]
logging facility [local0|local1|local2|local3|local4|local5|local6|local7]
```

#### Parameters

- logging [aggregation-time <1-60>|host [<IPv4>|<IPv6>] {port <1-65535>}|on]

|                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 7.1.48 mac-address-table

### ► Profile Config Commands

Configures the MAC address table. Use this command to create MAC address table entries by assigning a static address to the MAC address table.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac-address-table [aging-time|detect-gateways|static]
mac-address-table aging-time [0|<10-1000000>]
mac-address-table detect-gateways
mac-address-table static <MAC> vlan <1-4094> interface [<L2-INTERFACE>|ge <1-4>|
port-channel <1-2>]
```

#### Parameters

- mac-address-table aging-time [0|<10-1000000>]

|                                               |                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-address-table aging-time [0 <10-1000000>] | Sets the duration a learned MAC address persists after the last update <ul style="list-style-type: none"> <li>• 0 - Entering the value '0' disables the aging time</li> <li>• &lt;10-1000000&gt; - Sets the aging time from 10 -100000 seconds. The default is 300 seconds.</li> </ul> |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- mac-address-table detect-gateways

|                                   |                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------|
| mac-address-table detect-gateways | Enables automatic detection of gateways. Detected gateways are remembered in the MAC address table. |
|-----------------------------------|-----------------------------------------------------------------------------------------------------|

- mac-address-table static <MAC> vlan <1-4094> interface [<L2-INTERFACE>|ge <1-4>| port-channel <1-2>]

|                                |                                                                                                                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-address-table static <MAC> | Creates a static MAC address table entry <ul style="list-style-type: none"> <li>• &lt;MAC&gt; - Specifies the static address to add to the MAC address table. Specify the MAC address in the AA-BB-CC-DD-EE-FF, AA:BB:CC:DD:EE:FF, or AABB.CCDD.EEFF format.</li> </ul> |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|               |                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan <1-4094> | Assigns a static MAC address to a specified VLAN port <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN index from 1 - 4094.</li> </ul> |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface [<L2-INTERFACE>  ge <1-4>  port-channel <1-2>] | Specifies the interface type. The options are: layer 2 Interface, GigabitEthernet interface, and a port channel interface <ul style="list-style-type: none"> <li>• &lt;L2-INTERFACE&gt; - Specify the layer 2 interface name.</li> <li>• ge - Specifies a GigabitEthernet interface <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Specify the GigabitEthernet interface index from 1 - 4.</li> </ul> </li> <li>• port-channel - Specifies a port channel interface <ul style="list-style-type: none"> <li>• &lt;1-2&gt; - Specify the port channel interface index from 1 - 2.</li> </ul> </li> </ul> |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#mac-address-table static 00-40-96-
B0-BA-2A vlan 1 interface ge 1

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000
 bridge vlan 1

 logging facility local4
 mac-address-table static 00-40-96-B0-BA-2A vlan 1 interface ge1
 ip nat pool pool1
 --More--
rfs6000-37FABE(config-profile-default-rfs6000)#
```

## 7.1.49 mac-auth

### ► Profile Config Commands

Enables authentication of a client's MAC address on wired ports. When configured, MAC authentication will be enabled on devices using this profile.

To enable MAC address authentication on a device, enter the device's configuration mode and execute the *mac-auth* command.

When enabled, the source MAC address of a device, connected to the specified wired port, is authenticated with the RADIUS server. Once authenticated the device is permitted access to the managed network and packets from the authenticated source are processed. If not authenticated the device is either denied access or provided guest access through the guest VLAN (provided guest VLAN access is configured on the port).

Enabling MAC authentication requires you to first configure a AAA policy specifying the RADIUS server. Configure the client's MAC address on the specified RADIUS server. Attach this AAA policy to a profile or a device. Finally, enable MAC authentication on the desired wired port of the device or device-profile.

Only one MAC address is supported for every wired port. Consequently, when one source MAC address is authenticated, packets from all other sources are dropped.

To enable client MAC authentication on a wired port:

- 1 Configure the user on the RADIUS server. The following examples create a RADIUS server user entry.

- a `<DEVICE>(config)#radius-group <RAD-GROUP-NAME>`

```
<DEVICE>(config-radius-group-<RAD-GROUP-NAME>)#policy vlan <VLAN-ID>
```

- b `<DEVICE>(config)#radius-user-pool-policy <RAD-USER-POOL-NAME>`

```
<DEVICE>(config-radius-user-pool-<RAD-USER-POOL-NAME>)#user <USER-NAME> password
<PASSWORD> group <RAD-GROUP-OF-STEP-A>
```

Note: The `<USER-NAME>` and `<PASSWORD>` should be the client's MAC address. This address will be matched against the MAC address of incoming traffic at the specified wired port.

- c `<DEVICE>(config)#radius-server-policy <RAD-SERVER-POL-NAME>`

```
<DEVICE>(config-radius-server-policy-<RAD-SERVER-POL-NAME>)#use radius-user-
pool-policy <RAD-USER-POOL-OF-STEP-B>
```

- 2 Configure a AAA policy exclusively for wired MAC authentication and specify the authentication (RADIUS) server settings. The following example creates a AAA policy 'macauth' and enters its configuration mode:

```
<DEVICE-A>(config)#aaa-policy macauth
<DEVICE-A>(config-aaa-policy-macauth)#...
```

- a Specify the RADIUS server details.

```
<DEVICE-A>(config)#aaa-policy macauth
<DEVICE-A>(config-aaa-policy-macauth)#authentication server <1-6> [host
<IP>|onboard]
```

- 3 Attach the AAA policy to the device or profile. When attached to a profile, the AAA policy is applied to all devices using this profile.

```
<DEVICE>(config-device-aa-bb-cc-dd-ee)#mac-auth use aaa-policy macauth
```

```
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#mac-auth use aaa-policy macauth
```

- 4 Enable mac-auth on the device's desired GE port. When enabled on a profile, MAC address authentication is enabled, on the specified GE port, of all devices using this profile.

```
<DEVICE>(config-device-aa-bb-cc-dd-ee)#interface ge x
<DEVICE>(config-device-aa-bb-cc-dd-ee-ge x)#mac-auth

<DEVICE>(config-profile-<PROFILE-NAME>)#interface ge x
<DEVICE>(config-profile-<PROFILE-NAME>)#mac-auth
```

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
mac-auth use aaa-policy <AAA-POLICY-NAME>
```

**Parameters**

- mac-auth use aaa-policy <AAA-POLICY-NAME>

|                                  |                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-auth                         | Enables 802.1X authentication of MAC addresses on this profile. Use the device configuration mode to enable this feature on a device.                                                                                                               |
| use aaa-policy <AAA-POLICY-NAME> | Associates an existing AAA policy with this profile (or device) <ul style="list-style-type: none"> <li>• &lt;AAA-POLICY NAME&gt; - Specify the AAA policy name.</li> </ul> The AAA policy used should be created especially for MAC authentication. |

**Example**

The following examples demonstrate the configuration of authentication of MAC addresses on wired ports:

```
rfs4000-229D58(config-aaa-policy-mac-auth)#authentication server 1 onboard controller

rfs4000-229D58(config-aaa-policy-mac-auth)#show context

## 7.1.50 management-server

### ► Profile Config Commands

Configures a management server with this profile. This command is also applicable to the device configuration context.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
management-server <HOST-NAME> port <1-65535>
```

#### Parameters

- `management-server <HOST-NAME> port <1-65535>`

|                                                                     |                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>management-server &lt;HOST-NAME&gt; port &lt;1-65535&gt;</pre> | <p>Configures a management server with this profile. |-----------|---------------------------------------------|

## 7.1.51 memory-profile

### ► Profile Config Commands

Configures memory profile used on the device

#### Supported in the following platforms:

- Access Points — AP6511, AP6521

#### Syntax

```
memory-profile [adopted|standalone]
```

#### Parameters

- memory-profile [adopted|standalone]

|                |                                                                         |
|----------------|-------------------------------------------------------------------------|
| memory-profile | Configures memory profile used on the device                            |
| adopted        | Configures adopted mode (no GUI and higher MiNT routes, firewall flows) |
| standalone     | Configures standalone mode (GUI and fewer MiNT routes, firewall flows)  |

#### Example

```
nx9500-6C8809(config-profile-testAP6511)#memory-profile adopted
Note: memory-profile change will take effect after device reboot
nx9500-6C8809(config-profile-testAP6511)#
```

#### Related Commands

| <i>no</i> | Resets device's memory profile configuration |
|-----------|----------------------------------------------|

## 7.1.52 meshpoint-device

### ► Profile Config Commands

Configures meshpoint device parameters. This feature is configurable in the profile and device configuration modes.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
meshpoint-device <MESHPOINT-NAME>
```

#### Parameters

- meshpoint-device <MESHPOINT-NAME>

|                                      |                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| meshpoint-device<br><MESHPOINT-NAME> | Configures meshpoint device parameters <ul style="list-style-type: none"> <li>• &lt;MESHPOINT-NAME&gt; - Specify meshpoint name.</li> </ul> |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

#### Usage Guidelines

For *Vehicular Mounted Modem* (VMM) access points or other mobile devices, set the path selection method as mobile-snr-leaf in the config-meshpoint-device mode. For more information, see [path-method](#).

#### Example

```
rfs6000-37FABE(config-profile-testAP7161)#meshpoint-device test
rfs6000-37FABE(config-profile-testAP7161-meshpoint-test)#?
Mesh Point Device Mode commands:
 acs Configure auto channel selection parameters
 exclude Exclude neighboring Mesh Devices
 hysteresis Configure path selection SNR hysteresis values
 monitor Event Monitoring
 no Negate a command or set its defaults
 path-method Path selection method used to find a root node
 preferred Configure preferred path parameters
 root Set this meshpoint as root
 root-select Root selection method parameters

 clrscr Clears the display screen

**NOTE:** For more information on the meshpoint-device configuration parameters, see [Chapter 26, MESHPOINT](#).

---

---

## 7.1.53 meshpoint-monitor-interval

► *Profile Config Commands*

Configures the meshpoint monitoring interval. This is the interval, in seconds, at which the meshpoint status is checked.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
meshpoint-monitor-interval <1-65535>
```

**Parameters**

- meshpoint-monitor-interval <1-65535>

|                                      |                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| meshpoint-monitor-interval <1-65535> | Configures the meshpoint monitoring interval in seconds<br>• <1-65535> - Specify the interval from 1 - 65535 seconds. The default is 30 seconds. |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#meshpoint-monitor-interval 100

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000
bridge vlan 1
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
meshpoint-monitor-interval 100
ip default-gateway 172.16.10.4
--More--
rfs6000-37FABE(config-profile-default-rfs6000)#
```

**Related Commands**

|           |                                                                  |
|-----------|------------------------------------------------------------------|
| <i>no</i> | Resets the meshpoint monitoring interval to default (30 seconds) |
|-----------|------------------------------------------------------------------|

## 7.1.54 min-misconfiguration-recovery-time

### ► Profile Config Commands

Configures the minimum device connectivity verification time

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
min-misconfiguration-recovery-time <60-3600>
```

#### Parameters

- min-misconfiguration-recovery-time <60-3600>

|                                                 |                                                                                                                                                                                                                                 |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| min-misconfiguration-recovery-time<br><60-3600> | Configures the minimum connectivity (with the associated device) verification interval<br><ul style="list-style-type: none"> <li>• &lt;60-3600&gt; - Specify a value from 60 - 3600 seconds (default is 60 seconds).</li> </ul> |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testRFS4000)#min-misconfiguration-recovery-time 500

## 7.1.55 mint

### ► Profile Config Commands

Configures MiNT protocol parameters required for MiNT creation and adoption

MiNT links are required for adoption of a device (APs, wireless controller, and service platform) to a controller. The MiNT link is created on both the adoptee and the adopter. WiNG provides several commands to configure MiNT links and establish adoption for both IPv4 and IPv6 addresses.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mint [dis|inter-tunnel-bridging|level|link|mlcp|rate-limit|spf-latency|tunnel-
across-extended-vlan|tunnel-controller-load-balancing]

mint dis [priority-adjustment <-255-255>|strict-evis-reachability]

The host alias should existing and configured.</li> </ul> </li> </ul> </li> </ul> <p>UDP/IP links can be created by configuring a matching pair of links, one on each end point. However, that is error prone and does not scale. So UDP/IP links can also listen (in the TCP sense), and dynamically create connected UDP/IP links when contacted. The typical configuration is to have a listening UDP/IP link on the IP address S.S.S.S, and for all the APs to have a regular UDP/IP link to S.S.S.S.</p> |

Excessive traffic can be caused by numerous sources including network loops, faulty devices, or malicious software.</p> <p>Rate limiting reduces the maximum rate sent or received per wireless client. It prevents any single user from overwhelming the wireless network, and also provides differential service for service providers. Uplink and downlink rate limits are usually configured on a RADIUS server using vendor specific attributes. Rate limits are extracted from the RADIUS server's response. When such attributes are not present, the settings defined on the controller, service platform or access point are applied. You can set separate QoS rate limit configurations for data types transmitted from the network (upstream) and data transmitted from a wireless clients back to associated radios (downstream).</p> |

| rate <50-1000000>                                                                  | <p>Configures the rate limit from 50 - 1000000 Kbps</p> <p>This limit constitutes a threshold for the maximum number of packets transmitted or received (from all access categories). Traffic exceeding the defined rate is dropped and a log message is generated. The default setting is 5000 Kbps.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| max-burst-size <2-1024>                                                            | <p>Configures the maximum burst size from 0 - 1024 Kbytes</p> <p>Smaller the burst size, lesser is the probability of the upstream packet transmission resulting in congestion for the WLAN's client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, add a 10% margin (minimally) to allow for traffic bursts. The default burst size is 320 Kbytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| red-threshold<br>[background best-effort video voice] <0-100>                      | <p>Optional. Configures the <i>random early detection</i> (RED) threshold (as a percentage) for the following traffic types:</p> <ul style="list-style-type: none"> <li>background – Configures the RED threshold for low priority background traffic. Background packets are dropped and a log message generated if the rate exceeds the set value. Background traffic consumes the least bandwidth of any access category, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 50%.</li> <li>best-effort – Configures the RED threshold for low priority best-effort traffic. Best-effort packets are dropped and a log message generated if the rate exceeds the set value. Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis).The default setting is 50%.</li> <li>video – Configures the RED threshold for high priority video traffic. Video packets are dropped and a log message generated if the rate exceeds the set value. Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).The default setting is 25%.</li> <li>voice – Configures the RED threshold for high priority voice traffic. Voice packets are dropped and a log message generated if the rate exceeds the set value. Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).The default setting is 0%. <ul style="list-style-type: none"> <li>&lt;0-100&gt; – After selecting the traffic type, specify the RED threshold from 0 - 100%.</li> </ul> </li> </ul> |

## 7.1.56 misconfiguration-recovery-time

► *Profile Config Commands*

Verifies connectivity after a configuration is received

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
misconfiguration-recovery-time [0|<60-300>]
```

**Parameters**

- misconfiguration-recovery-time [0|<60-300>]

|          |                                                                       |
|----------|-----------------------------------------------------------------------|
| <60-300> | Sets the recovery time from 60 - 300 seconds (default is 180 seconds) |
| 0        | Disables recovery from misconfiguration                               |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#misconfiguration-recovery-time 65

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000
mint link ip 1.2.3.4
mint level 1 area-id 88
bridge vlan 1
bridging-mode isolated-tunnel
.....
qos trust 802.1p
interface pppoe1
use firewall-policy default
misconfiguration-recovery-time 65
service pm sys-restart
router ospf
rfs6000-37FABE(config-profile-default-rfs6000)#
```

## 7.1.57 neighbor-inactivity-timeout

► *Profile Config Commands*

Configures neighbor inactivity timeout

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
neighbor-inactivity-timeout <1-1000>
```

**Parameters**

- neighbor-inactivity-timeout <1-1000>

|          |                                                                                                                                                                         |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000> | Sets neighbor inactivity timeout <ul style="list-style-type: none"> <li>• &lt;1-1000&gt; - Specify a value from 1 - 1000 seconds. The default is 30 seconds.</li> </ul> |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

## 7.1.58 neighbor-info-interval

► *Profile Config Commands*

Configures the neighbor information exchange interval

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
neighbor-info-interval <1-100>
```

**Parameters**

- neighbor-info-interval <1-100>

|         |                                                                |
|---------|----------------------------------------------------------------|
| <1-100> | Sets interval from 1 - 100 seconds. The default is 10 seconds. |
|---------|----------------------------------------------------------------|

**Example**

```

## 7.1.59 no

### ► Profile Config Commands

Negates a command or resets values to their default

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [adopter-auto-provisioning-policy-lookup|adoption|alias||application-policy|area|arp|auto-learn|autogen-uniqueid|autoinstall|bluetooth-detection|bridge|cdp|cluster|configuration-persistence|controller|critical-resource|crypto|database-backup|device-upgrade|diag|dot1x|dpi|dscp-mapping|eguest-server|email-notification|environmental-sensor|events|export|file-sync|floor|gre|http-analyze|interface|ip|ipv6|lACP|l2tpv3|l3e-lite-table|led|led-timeout|legacy-auto-downgrade|legacy-auto-update|lldp|load-balancing|logging|mac-address-table|mac-auth|management-server|memory-profile|meshpoint-device|meshpoint-monitor-interval|min-misconfiguration-recovery-time|mint|misconfiguration-recovery-time|noc|ntp|otls|offline-duration|power-config|preferred-controller-group|preferred-tunnel-controller|radius|raid|rf-domain-manager|router|spanning-tree|traffic-class-mapping|traffic-shape|trustpoint|tunnel-controller|use|virtual-controller|vrrp|vrrp-state-check|zone|wep-shared-key-auth|service]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                           |
|-----------------|---------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this profile's settings based on the parameters passed |
|-----------------|---------------------------------------------------------------------------|

#### Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

#### Example

```

rfs6000-81742D(config-profile-default-rfs6000)#
```

## 7.1.60 noc

### ► Profile Config Commands

Configures *Network Operations Center* (NOC) statistics update interval. This is the interval at which statistical updates are sent by the RF Domain manager to its adopting controller (the NOC controller).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
noc update-interval [<5-3600>|auto]
```

#### Parameters

- noc update-interval [<5-3600>|auto]

|                                                      |                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>noc update-interval [&lt;5-3600&gt; auto]</pre> | <p>Configures NOC statistics update interval</p> <ul style="list-style-type: none"> <li>• &lt;5-3600&gt; - Specify the update interval from 5 - 3600 seconds.</li> <li>• auto - The NOC statistics update interval is automatically adjusted by the wireless controller or service platform based on load. This option is enabled by default.</li> </ul> |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#noc update-interval 25

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000
mint link ip 1.2.3.4
mint level 1 area-id 88

|-----------|-------------------------------|
| <i>no</i> | Resets NOC related parameters |
|-----------|-------------------------------|

## 7.1.61 nsight

### ► Profile Config Commands

Configures NSight database related parameters. Use this command to configure the data-update periodicity, number of applications posted to the NSight server for a wireless client, and the duration for which data is stored in the NSight database's buckets. These parameters impact the amount of data stored in the NSight DB and interval at which data is aggregated and expired within the NSight DB. For more information on data aggregation and expiration, see [\(Data Aggregation and Expiration\)](#).

Configure these parameters in the NSight server's profile configuration mode. These parameters are also configurable on the NSight server's device configuration mode.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nsight database [statistics|summary]

nsight database statistics [avc-update-interval|max-apps-per-client|max-http-usage-metadata|max-http-visits-metadata|max-ssl-usage-metadata|max-ssl-visits-metadata|update-interval|wireless-clients-update-interval]

nsight database statistics [avc-update-interval|update-interval|wireless-clients-update-interval] [120|30|300|60|600]

nsight database statistics max-apps-per-client <1-1000>

nsight database statistics [max-http-usage-metadata|max-http-visits-metadata|max-ssl-usage-metadata|max-ssl-visits-metadata] <1-1000>

nsight database summary duration <1-24> <1-168> <1-2160> <24-26280>
```

#### Parameters

- nsight database statistics [avc-update-interval|update-interval|wireless-clients-update-interval] [120|30|300|60|600]

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight database statistics | Configures NSight database statistics related parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| avc-update-interval        | Configures the interval, in seconds, at which <i>Application Visibility and Control</i> (AVC) statistics is updated to the NSight database. This interval represents the rate at which AVC-related data is inserted in the NSight database's first bucket. This first bucket data is referred to as the RAW records. A bucket is a database collection that holds statistical data on a per RF Domain basis. For more information, see <a href="#">(Data Aggregation and Expiration)</a> .<br><br>When configured, RF Domain managers posting AVC-related data to the NSight server receive a reply from the NSight server intimating the next update time. The NSight server calculates the 'next update time' based on the <i>avc-update-interval</i> configured here. |
| update-interval            | Configures the interval, in seconds, at which data is updated to the NSight server. This interval represents the rate at which data (excluding AVC and wireless-clients related statistics) is inserted in the NSight database's first bucket. This first bucket data is referred to as the RAW records. A bucket is a database collection that holds statistical data on a per RF Domain basis. For more information, see <a href="#">(Data Aggregation and Expiration)</a> .<br><br>Contd...                                                                                                                                                                                                                                                                           |

The default is 365 days (1 year).</li> </ul> <p>A bucket is a database collection that holds statistical data for each RF Domain within the network. (Note, only those RF Domain's that are using an NSight policy with the NSight server host configured will post data to the NSight server. (For more information, see <a href="#">use</a> in the RF Domain configuration mode.) NSight database has four (4) buckets. The data from each bucket is aggregated and pushed to the next bucket once the data storage duration, specified for the bucket, has exceeded. For more information on data aggregation, see <a href="#">(Data Aggregation and Expiration)</a>.</p> |

**Usage Guidelines(Data Aggregation and Expiration)**

Data Aggregation:

The NSight functionality, a data analytics tool, analyzes data that is generated periodically by the nodes within the managed wireless LAN. For large WLAN networks, generating significantly large amount of data, storing data forever is neither feasible nor beneficial. Therefore, older statistics are summarized into aggregated (averaged) records. All records, for a fixed time period in past, are summarized into one record by taking an average of them. Although this causes a loss in the data's granularity, average numbers for any given time period is still available.

Statistical data periodically posted by RF Domain managers to the NSight server are stored in buckets (database collections) within the NSight database. There are four buckets in total. These are:

- First bucket (termed as the RAW bucket) - B1
- Second bucket - B2
- Third bucket - B3
- Fourth bucket - B4

On completion of the data storage duration, records from a bucket are aggregated (at a fixed rate) and inserted into the next bucket. The rate at which records are aggregated into the next bucket becomes the next bucket's granularity. For example, the B1 records (that have exceeded the data storage duration configured for B1) are aggregated (at the rate specified) and inserted into B2. Similarly, data from B2 are aggregated into B3, and from B3 to B4. The fixed rate of aggregation (or granularity) AND default storage duration for each bucket is as follows:

- B1: storage duration 8 hours
- B2: granularity 10 minutes / storage duration 24 hours
- B3: granularity 1 hour / storage duration 7 days
- B4: granularity 1 day / storage duration 1 year

Let us consider (with default update-interval settings) the growth of any one of the statistical buckets.

- Since B1's default data storage duration is 8 hours, B1 will hold a maximum of 960 records per RF Domain after 8 hours (updated at the rate of 30 seconds).
- Since B2's granularity is 10 minutes, every 10 minutes 20 records from the B1 will be aggregated into a single record and inserted into B2.
- Since B2's default storage duration is 24 hours, it will contain a maximum of 144 records per RF Domain after 24 hours.
- Since B3's granularity is 1 hour, every hour 6 records from B2 will be aggregated into a single record and inserted into B3.
- Since B3's default storage duration is 7 days, it will contain a maximum of 168 records per RF Domain after 7 days.
- Since B4's granularity is 1 day, every day 24 records from B3 will be aggregated into a single record and inserted into B4.
- Since B4's default storage duration is 365 days, it will contain a maximum of 365 records per RF Domain after 1 year.

Data Expiration:

The expiration of older records (also referred to as purging or deleting of records) occurs along with data aggregation for each bucket.

Let us consider (with default data storage-duration settings) the expiration of data for any one of the statistical buckets.

- As stated earlier, at the end of 8 hours B1 will have 960 records per RF Domain. After a period of 8 hours and 10 minutes, all 960 records are aggregated into 144 records and inserted into B2. To enable B1 to hold exactly 8 hours worth of data, 20 of the oldest records (corresponding to the first 10 minutes) are purged from B1 at the end of 8 hours and 10 minutes. This expiration cycle is triggered every 10 minutes.
- At the end of 24 hours B2 will have 144 records per RF Domain. After a period of 24 hours and 10 minutes, one of the oldest record (corresponding to the first 10 minutes) is purged from B2. This expiration cycle is triggered every 10 minutes to enable B2 to maintain exactly 24 hours worth of data.
- At the end of 7 days B3 will have 168 records per RF Domain. After a period of 7 days and one hour one of the oldest record (corresponding to the first hour) is purged from B3. This expiration cycle is triggered every 1 hour to enable B3 to maintain exactly 7 days worth of data.
- At the end of 365 days B4 will have 365 records per RF Domain. After 365 days, the oldest records (corresponding to the first day) are purged from B4. This expiration cycle is triggered every 1 day to enable B4 to maintain exactly 365 days worth of data.

**Example**

```

nx9500-6C8809(config-profile-testNX9500)#nsight database statistics
avc-update-interval 120

nx9500-6C8809(config-profile-testNX9500)#nsight database statistics

## 7.1.62 ntp

### ► Profile Config Commands

Configures the *Network Time Protocol* (NTP) server settings

NTP manages time and/or network clock synchronization within the network. NTP is a client/server implementation. Controllers, service platforms, and access points (NTP clients) periodically synchronize their clock with a master clock (an NTP server). For example, a controller resets its clock to 07:04:59 upon reading a time of 07:04:59 from its designated NTP server.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ntp server <PEER-IP/HOSTNAME> {autokey|key|maxpoll|minpoll|prefer|version}
ntp server <PEER-IP/HOSTNAME> {autokey}
ntp server <PEER-IP/HOSTNAME> {maxpoll [1024|2048|4096|8192]}
ntp server <PEER-IP/HOSTNAME> {minpoll [1024|128|256|512|64]}
ntp server <PEER-IP> {key <1-65534> md5 [0 <WORD>|2<WORD>|<WORD>]}
ntp server <PEER-IP/HOSTNAME> {prefer version <1-4>|version <1-4> prefer}
```

#### Parameters

- ntp server <PEER-IP/HOSTNAME> {autokey} {prefer version <1-4>|version <1-4>}

|                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 7.1.63 otls

### ► Profile Config Commands

Enables support for *OmniTrail Location Server* (OTLS) beacon identification

OmniTrail (offered by OmniTrail technologies) is a Wi-Fi based locationing protocol used in positioning and tracking location solutions. Access points supporting OTLS beacon identification lock their radios to scan channels for beacons with OTLS tags. Beacons received by the access point are matched for the OTLS signature, and in case of a match, the beacons are forwarded to the OTLS server as UDP payload.

Use this command to configure OTLS server details on the AP and enable OTLS data forwarding. Alternately, OTLS parameters can be configured in the AP's profile on the controller or service platform, and pushed to adopted access points. When configured, APs establish connection with the OTLS server and forward OTLS locationing feeds to the server.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8432, AP8533

#### Syntax

```
otls [apid|control-port|data-port|forward|server-ip]
otls apid <WORD>
otls control-port <0-65535>
otls data-port [2.4GHz|5GHz] <0-65535>
otls forward [2.4GHz|5GHz] [disable|enable]
otls server-ip <OTLS-SERVER-IP>
```

#### Parameters

- otls apid <WORD>

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| otls apid <WORD> | <p>Configures a unique identification for the OTLS-enabled access point. The access point <i>identifier</i> (APID) enables the OTLS server to identify the AP forwarding the OTLS tag.</p> <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify an ID for the AP.</li> </ul> <p>To ensure that OTLS-enabled APs have unique OTLS ID, it is recommended that the APID is configured in the device context of each AP.</p> |

**Example**

```

ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls apid 112233
ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls forward 2.4GHz enable
ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls forward 5GHz enable
ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls control-port 8890
ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls data-port 2.4GHz 8888
ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls data-port 5GHz 8889
ap8533-84A224 (config-device-84-24-8D-84-A2-24) #otls server-ip 192.168.13.10

ap8533-84A224 (config-device-84-24-8D-84-A2-24) #show context include-factory |
include otls
 otls forward 5GHz enable
 otls forward 2.4GHz enable
 otls server-ip 192.168.13.10
 otls control-port 8890
 otls data-port 2.4GHz 8888
 otls data-port 5GHz 8889
 otls apid 112233
ap8533-84A224 (config-device-84-24-8D-84-A2-24)

```

The following example displays OTLS parameters configured on an AP8533 profile:

```
nx9500-6C8809(config-profile-testAP8533)#show context include-factory | include
otls
otls forward 5GHz enable
otls forward 2.4GHz enable
otls server-ip 192.168.13.10
otls control-port 8890
otls data-port 2.4GHz 8888
otls data-port 5GHz 8889
otls apid 12345
nx9500-6C8809(config-profile-testAP8533)#
```

## 7.1.64 offline-duration

► *Profile Config Commands*

Sets the duration, in minutes, for which a device remains unadopted before it generates offline event

This command is also supported on the device configuration mode.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
offline-duration <5-43200>
```

**Parameters**

- offline-duration <5-43200>

|                               |                                                                    |
|-------------------------------|--------------------------------------------------------------------|
| offline-duration<br><5-43200> | Specify a value from 5 - 43200 minutes. The default is 10 minutes. |
|-------------------------------|--------------------------------------------------------------------|

**Example**

```
rfs4000-229D58(config-profile-test)#offline-duration 200

rfs4000-229D58(config-profile-test)#show context
profile rfs4000 test
no autoinstall configuration
no autoinstall firmware
crypto ikev1 policy ikev1-default
isakmp-proposal default encryption aes-256 group 2 hash sha
.....
interface wwan1
interface pppoel
use firewall-policy default
service pm sys-restart
router ospf
offline-duration 200
rfs4000-229D58(config-profile-test)#
```

**Related Commands**

|-----------|-----------------------------------------------------|
| <i>no</i> | Resets the offline-duration to default (10 minutes) |
|-----------|-----------------------------------------------------|

## 7.1.65 power-config

### ► Profile Config Commands

Configures the power option mode. Use this command in the profile configuration mode to configure the transmit output power of access point radios. This command is also available in the device-config mode.

Single radio model access points always operate using a full power configuration. The power management configurations described in this section do not apply to single radio models. When an access point is powered on for the first time, the system determines the power budget available to the access point. If 802.3af is selected, the access point assumes 12.95 watts is available. If the mode is changed, the access point requires a reset to implement the change. If 802.3at is selected, the access point assumes 23 - 26 watts is available.

**NOTE:** Single radio model access points (AP6511 and AP6521) always operate using a full power configuration. The power management configurations described in this section do not apply to single radio models.

The access point has to be restarted for power management changes to take effect.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
power-config [af-option|at-option|mode]
power-config [af-option|at-option] [range|throughput]
power-config mode [auto|3af]
```

#### Parameters

- power-config [af-option|at-option] [range|throughput]

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 7.1.66 preferred-controller-group

► *Profile Config Commands*

Specifies the controller group preferred for adoption

At adoption, an access point solicits and receives multiple adoption responses from controllers and service platforms available on the network. These adoption responses contain loading policy information the access point uses to select the optimum controller or service platform for adoption. After selecting the controller or service platform, the access point associates with it and optionally obtains an image upgrade and configuration. By default, an auto provisioning policy generally distributes AP adoption evenly amongst available controllers and service platforms. Use this command to specify the controller or service platform preferred for adoption. Once configured, the access point adopts to the specified preferred controller or service platform.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

**Syntax**

```
preferred-controller-group <WORD>
```

**Parameters**

- preferred-controller-group <WORD>

|        |                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WORD> | Specify the name of the controller (wireless controller or service platform) group preferred for adoption. Devices using this profile are added, on adoption, to the controller group specified here. |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

## 7.1.67 preferred-tunnel-controller

### ► Profile Config Commands

Configures the tunnel controller's name preferred for tunneling extended VLAN traffic. Devices using this profile will prefer to route their extended VLAN traffic through the specified tunnel controller (wireless controller or service platform).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
preferred-tunnel-controller <NAME>
```

#### Parameters

- preferred-tunnel-controller <NAME>

|                                    |                                      |
|------------------------------------|--------------------------------------|
| preferred-tunnel-controller <NAME> | Configures the preferred tunnel name |
|------------------------------------|--------------------------------------|

#### Example

```
rfs6000-37FABE (config-profile-default-rfs6000) #preferred-tunnel-controller
testtunnel
```

#### Related Commands

| <i>no</i> | Removes the preferred tunnel configuration |
|-----------|--------------------------------------------|

## 7.1.68 radius

### ► Profile Config Commands

Configures device level RADIUS authentication parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radius [nas-identifier|nas-port-id] <WORD>
```

#### Parameters

- radius [nas-identifier|nas-port-id] <WORD>

|                          |                                                                                                                                                                                                  |

## 7.1.69 rf-domain-manager

### ► Profile Config Commands

Configures the RF Domain manager election criteria

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rf-domain-manager [capable|priority <1-255>]
```

#### Parameters

- rf-domain-manager [capable|priority <1-255>]

|                   |                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rf-domain-manager | Configures the RF Domain manager election criteria                                                                                                                                                                                                                                                                 |
| capable           | Enables devices using this profile capable of being elected as the RF Domain manager. The RF Domain manager stores and provisions configuration and firmware images for other members of the RF Domain. It also updates state changes, if any, to RF Domain members. This option is enabled by default.            |
| priority <1-255>  | Assigns a priority value for devices using this profile in the RF Domain manager election process. The higher the number set, higher is the device's priority in the RF Domain manager election process. <ul style="list-style-type: none"> <li>• &lt;1-255&gt; - Select a priority value from 1 - 255.</li> </ul> |

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#rf-domain-manager priority 9

rfs6000-37FABE(config-profile-default-rfs6000)#show context

## 7.1.70 router

### ► Profile Config Commands

Enables dynamic routing (BGP and/or OSPF) and enters the routing protocol configuration mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**NOTE:** BGP is supported only on RFS4000, RFS6000, NX75XX, and NX9500 model controllers and service platforms.

The NX9500 and NX9510 service platforms do not support OSPF routing.

The access points only support OSPF routing.

#### Syntax

```
router [bgp|ospf]
```

#### Parameters

- router [bgp|ospf]

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| router | Enables dynamic routing and enters the routing protocol configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| bgp    | <p>Enables BGP dynamic routing and configures relevant settings</p> <p>BGP is an inter-ISP routing protocol, which establishes routing between ISPs. ISPs use BGP to exchange routing and reachability information between <i>Autonomous Systems</i> (AS) on the Internet. BGP uses TCP as its transport protocol, eliminating the need to implement explicit update fragmentation, retransmission, acknowledgement, and sequencing.</p> <p>Routing information exchanged through BGP supports destination based forwarding only. It assumes a router forwards packets based on the destination address carried in the IP header of the packet.</p> <p>An AS is a set of routers under the same administration that use <i>Interior Gateway Protocol</i> (IGP) and common metrics to define how to route packets within the AS.</p> <p>For more information on dynamic BGP routing configurations, see <a href="#">BORDER GATEWAY PROTOCOL</a>.</p> |
| ospf   | <p>Enables OSPF dynamic routing and configures relevant settings. Changes configuration mode to router mode</p> <p>OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.</p> <p>For more information on dynamic OSPF routing configurations, see <a href="#">ROUTER-MODE COMMANDS</a>.</p>                                                                                                                                                                                                                                                                                                              |

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#router ospf
rfs6000-37FABE(config-profile default-rfs6000-router-ospf)#?

## 7.1.71 spanning-tree

### ► Profile Config Commands

Enables spanning tree commands. Use these commands to configure the errdisable, multiple spanning tree and portfast settings.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
spanning-tree [errdisable|mst|portfast]

spanning-tree errdisable recovery [cause bpduguard|interval <10-1000000>]

spanning-tree mst [<0-15>|cisco-interopability|enable|forward-time|hello-time|instance|max-age|max-hops|region|revision]

spanning-tree mst [<0-15> priority <0-61440>|cisco-interopability [enable|disable]|enable|forward-time <4-30>|hello-time <1-10>|instance <1-15>|max-age <6-40>|max-hops <7-127>|region <LINE>|revision <0-255>]

spanning-tree portfast [bpdufilter|bpduguard] default
```

#### Parameters

- spanning-tree errdisable recovery [cause bpduguard|interval <10-1000000>]

|                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                |

The BPDU filter is disabled by default.<br/>The spanning tree protocol sends BPDUs from all ports. Enabling the BPDU filter ensures that PortFast enabled ports do not transmit or receive BPDUs.</li> <li>• bpduguard default - Guards PortFast ports against BPDU receive. The BPDU guard is disabled by default.<br/>Enabling the BPDU guard means this port will shutdown on receiving a BPDU.</li> <li>• default - Enables the BPDU filter and/or BPDU guard on PortFast enabled ports by default</li> </ul> |

### Usage Guidelines

If a bridge does not hear BPDUs from the root bridge within the specified interval, assume the network has changed and recomputed the spanning-tree topology.

Generally, spanning tree configuration settings in the config mode define the configuration for bridge and bridge instances.

MSTP is based on instances. An instance is a group of VLANs with a common spanning tree. A single VLAN cannot be associated with multiple instances.

Wireless Controllers or service platforms with the same instance, VLAN mapping, revision number and region names define a unique region. Wireless Controllers or service platforms in the same region exchange BPDUs with instance record information within.

### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#spanning-tree errdisable recovery
cause bpduguard

rfs6000-37FABE(config-profile-default-rfs6000)#spanning-tree mst 2 priority 4096

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000
mint link ip 1.2.3.4
mint level 1 area-id 88
bridge vlan 1
 bridging-mode isolated-tunnel
 ip igmp snooping
 ip igmp snooping querier
radius nas-identifier test
radius nas-port-id 1
neighbor-info-interval 6
neighbor-inactivity-timeout 500
spanning-tree mst 2 priority 4096
spanning-tree errdisable recovery cause bpduguard
autoinstall configuration
--More--
rfs6000-37FABE(config-profile-default-rfs6000)#
```

## 7.1.72 traffic-class-mapping

### ► Profile Config Commands

Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority. This mapping is required to provide priority of service to some packets over others. For example, VoIP packets get higher priority than data packets to provide a better quality of service for high priority voice traffic. Devices use the traffic class field in the IPv6 header to set this priority. This command allows you to assign a priority for different IPv6 traffic types.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
traffic-class-mapping <IPv6-TRAFFIC-CLASS-VALUE> priority <0-7>
```

#### Parameters

- traffic-class-mapping <IPv6-TRAFFIC-CLASS-VALUE> priority <0-7>

## 7.1.73 traffic-shape

### ► Profile Config Commands

Enables traffic shaping and configures traffic shaping parameters. This command is applicable to both the profile and device configuration modes.

Traffic shaping is a means of regulating data transfers and ensuring a specific level of performance within a network. Traffic shaping does the following:

- Controls flow of packets based on their priority value. Prioritized traffic streams are given priority over less important traffic.
- Controls traffic on an interface to match its flow to the speed of a remote target's interface and ensure traffic conforms to applied policies
- Shapes traffic to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Use this option to apply traffic shaping to specific applications or application categories. Note, in scenarios where a traffic class is matched against an application, application-category, and ACL rule, the application rule will be applied first, followed by the application-category, and finally the ACL. Further, using traffic shaping, an application takes precedence over an application category.

To enable traffic shaping, configure QoS values on the basis of which priority of service is provided to some packets over others. For example, VoIP packets get higher priority than data packets to provide a better quality of service for high priority voice traffic. For configuring IPv6 traffic class mappings, see [traffic-class-mapping](#). And for configuring DSCP traffic class mappings, see [dscp-mapping](#).

#### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530

#### Syntax

```
traffic-shape [activation-criteria|app-category|application|class|enable|
priority-map|total-bandwidth]
```

```
traffic-shape activation-criteria [always|cluster-master|rf-domain-manager|vrrp-
master <1-255>]
```

```
traffic-shape app-category <APP-CATEGORY-NAME> class <1-4>
```

```
traffic-shape application <APPLICATION-NAME> class <1-4>
```

```
traffic-shape class <1-4> [max-buffers|max-latency|rate]
```

```
traffic-shape class <1-4> max-buffers <1-400> {red-level <1-400>|red-percent <1-
100>}
```

```
traffic-shape class <1-4> max-latency <1-1000000> [msec|usec]
```

```
traffic-shape class <1-4> rate [<1-250000> [Kbps|Mbps]|total-bandwidth-percent <1-
100>]
```

**NOTE:** The available range for the 'rate' field will vary depending on the unit selected. It is 250 - 250000 for Kbps and 1 - 250 for Mbps.

```
traffic-shape priority-map <0-7>
traffic-shape total-bandwidth <1-1000000> [Kbps|Mbps]
```

**NOTE:** The available range for the 'total-bandwidth' field will vary depending on the unit selected. It is 250 - 1000000 for Kbps and 1 - 1000 for Mbps.

```
traffic-shape enable
```

### Parameters

- traffic-shape activation-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traffic-shape activation-criteria | Configures traffic-shape activation criteria that determines when the device invokes traffic shaping                                                                                                                                                                                                                                                                                                                                                                                          |
| always                            | Always invokes traffic shaping. This is the default setting.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| cluster-master                    | Invokes traffic shaping when the device is the cluster master. The solitary cluster master (elected using a priority assignment scheme) is a cluster member that provides management configuration and Smart RF data to other members within the cluster. Cluster requests go through the elected master before dissemination to other cluster members.                                                                                                                                       |
| rf-domain-manager                 | Invokes traffic shaping when the device is the RF Domain manager. The RF Domain manager is the elected member capable of storing and provisioning configuration and firmware images for other members of the RF Domain.                                                                                                                                                                                                                                                                       |
| vrrp-master <1-255>               | Invokes traffic shaping when the device is the VRRP master. As the VRRP master, the device responds to ARP requests, forwards packets with a destination link MAC layer address equal to the virtual router MAC layer address, rejects packets addressed to the IP associated with the virtual router and accepts packets addressed to the IP associated with the virtual router. <ul style="list-style-type: none"> <li>• &lt;1-255&gt; - Specify the VRRP group ID from 1 - 255.</li> </ul> |

- traffic-shape app-category <APP-CATEGORY-NAME> class <1-4>

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traffic-shape app-category <APP-CATEGORY-NAME> class <1-4> | Configures an application category to traffic-class mapping. Use this option to apply an application category to traffic-shaper class mapping. Naming and categorizing applications that do not fall into existing groups is an additional means of filtering and potentially limiting network airtime to consumptive non required applications negatively impacting network performance. <p><b>Note:</b> app-category &lt;APP-CATEGORY-NAME&gt; - Specify the application category name. To list the available application categories, press [TAB] after entering app-category. Select the required category from the displayed list.</p> <p>Contd..</p> |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <code>traffic-shape priority-map &lt;0-7&gt;</code> | <p>Configures the traffic-shaper queues, within a class, having different priority values (0, 1, 2, 3, 4, 5, 6, and 7). There are 8 queues (0 - 7), and traffic is queued in each based on the incoming packet's 802.1p 3-bit priority markings.</p> <ul style="list-style-type: none"> <li>• <code>priority-map &lt;0-7&gt;</code> - Specify the priority from 0 - 7 for priority levels 0, 1, 2, 3, 4, 5, 6, and 7.</li> </ul> <p>The IEEE 802.1p standards sets a 3-bit value in the MAC header to indicate prioritization. This 3-bit value provides priority levels ranging from 0 to 7 (i.e., a total of 8 levels), with level 7 representing the highest priority. This permits packets to cluster and form different traffic classes. In case of network congestion, packets with higher priority receive preferential treatment while low priority packets are kept on hold.</p> |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `traffic-shape total-bandwidth <1-1000000> [Kbps|Mbps]`

|                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>traffic-shape total-bandwidth &lt;1-1000000&gt; [Kbps Mbps]</code> | <p>Configures the total-bandwidth for traffic shaping</p> <ul style="list-style-type: none"> <li>• <code>&lt;1-1000000&gt;</code> - Specify the value from 1- 1000000 Kbps/Mbps. The default value is 10 Mbps.</li> <li>• <code>[Kbps Mbps]</code> - Configures the unit for measuring bandwidth as Kbps or Mbps. The default setting is Mbps.</li> </ul> <p><b>Note:</b> The range varies depending on the unit selected. It is 1 - 1000 Mbps, or 250 - 1000000 Kbps.</p> |
|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `traffic-shape enable`

|                                   |                                                                                                                                                                               |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>traffic-shape enable</code> | <p>Enables traffic shaping using the defined bandwidth, rate and class mappings configured using this command</p> <p><b>Note:</b> Traffic shaping is disabled by default.</p> |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Usage Guidelines

Following are the default max-buffers set for the traffic shaper classes:

```
traffic-shape class 1 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23 25 20 15 10
traffic-shape class 2 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23 25 20 15 10
traffic-shape class 3 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23 25 20 15 10
traffic-shape class 4 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23 25 20 15 10
```

Following is the default priority-map settings:

```
traffic-shape priority-map 2 0 1 3 4 5 6 7
```

### Example

```
nx9500-6C8809(config-profile-ProfileNX5500)#show context include-factory |
include traffic-shape
traffic-shape priority-map 2 0 1 3 4 5 6 7
traffic-shape class 1 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23
25 20 15 10
traffic-shape class 2 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23
25 20 15 10
traffic-shape class 3 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23
25 20 15 10
traffic-shape class 4 max-buffers 35 35 35 30 25 20 15 10 red-level 27 27 27 23
25 20 15 10
traffic-shape activation-criteria always
traffic-shape total-bandwidth 10 Mbps
no traffic-shape enable
nx9500-6C8809(config-profile-ProfileNX5500)#

nx9500-6C8809(config-profile-ProfileNX5500)#traffic-shape enable
nx9500-6C8809(config-profile-ProfileNX5500)#traffic-shape class 1 rate 250 Mbps
nx9500-6C8809(config-profile-ProfileNX5500)#traffic-shape application Bing class 1

## 7.1.74 trustpoint (profile-config-mode)

### ► Profile Config Commands

Configures the trustpoint assigned for validating a CMP auth Operator

A certificate links identity information with a public key enclosed in the certificate.

A CA is a network authority that issues and manages security credentials and public keys for message encryption. The CA signs all digital certificates it issues with its own private key. The corresponding public key is contained within the certificate and is called a CA certificate. A browser must contain the CA certificate in its Trusted Root Library so it can trust certificates signed by the CA's private key.

Depending on the public key infrastructure, the digital certificate includes the owner's public key, the certificate expiration date, the owner's name and other public key owner information.

Each certificate is digitally signed by a trustpoint. The trustpoint signing the certificate can be a certificate authority, corporation or individual. A trustpoint represents a CA/identity pair containing the identity of the CA, CA-specific configuration parameters, and an association with an enrolled identity certificate.

**NOTE:** Certificates/trustpoints used in this command should be verifiable as existing on the device.

**NOTE:** For information on configuring trustpoints on a device, see *trustpoint (device-config-mode)*.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
trustpoint [cmp-auth-operator|https|radius-ca|radius-server] <TRUSTPOINT-NAME>
```

#### Parameters

- `trustpoint [cmp-auth-operator|https|radius-ca|radius-server] <TRUSTPOINT-NAME>`

|            |                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------|
| trustpoint | Assigns an existing trustpoint to validate CMP auth operator, client certificates, and RADIUS server certificate |
| https      | Assigns an existing trustpoint to validate HTTPS requests                                                        |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cmp-auth-operator | <p>Assigns an existing trustpoint to validate CMP auth operator. Once validated, CMP is used to obtain and manage digital certificates in a PKI network. Digital certificates link identity information with a public key enclosed within the certificate, and are issued by the CA.</p> <p>Use this command to specify the CMP-assigned trustpoint. When specified, devices send a certificate request to the CMP supported CA server, and download the certificate directly from the CA server. CMP supports multiple request options through for device communicating to a CMP supported CA server. The device can initiate a request for getting the certificates from the server. It can also auto update the certificates which are about to expire.</p> |
| radius-ca         | Assigns an existing trustpoint to validate client certificates in EAP                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| radius-server     | Assigns an existing trustpoint to validate RADIUS server certificate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <TRUSTPOINT-NAME> | <p>The following keyword is common to all of the above parameters:</p> <ul style="list-style-type: none"> <li>&lt;TRUSTPOINT-NAME&gt; - After selecting the service to validate, specify the trustpoint name (should be existing and stored on the device).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Example**

```

nx9500-6C8809(config-profile-testNX9500)#trustpoint cmp-auth-operator test

nx9500-6C8809(config-profile-testNX9500)#show context
profile nx9000 testNX9500
no autoinstall configuration
no autoinstall firmware
crypto ikev1 policy ikev1-default
isakmp-proposal default encryption aes-256 group 2 hash sha
.....
service pm sys-restart
router bgp
trustpoint cmp-auth-operator test
nx9500-6C8809(config-profile-testNX9500)#

```

## 7.1.75 tunnel-controller

### ► Profile Config Commands

Configures the tunneled WLAN (extended VLAN) wireless controller or service platform's name

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
tunnel-controller <NAME>
```

#### Parameters

- tunnel-controller <NAME>

|                             |                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| tunnel-controller<br><NAME> | Configures the tunneled WLAN (extended VLAN) wireless controller or service platform's name<br>• <NAME> - Specify the name. |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE(config-profile-default-rfs7000)#tunnel-controller testgroup
```

#### Related Commands

|           |                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the configured the tunneled WLAN (extended VLAN) wireless controller or service platform's name |
|-----------|---------------------------------------------------------------------------------------------------------|

## 7.1.76 use

### ► Profile Config Commands

Associates existing policies with this profile. This command is also applicable to the device configuration mode.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax Profiles Mode

```
use [auto-provisioning-policy|bonjour-gw-forwarding-policy|bonjour-gw-query-forwarding-policy|captive-portal|client-identity-group|crypto-cmp-policy|database-client-policy|dhcp-server-policy|dhcpv6-server-policy|event-system-policy|firewall-policy|global-association-list|guest-management|ip-access-list|ipv6-access-list|management-policy|radius-server-policy|role-policy|routing-policy|web-filter-policy] <POLICY-NAME>
```

```
use ip/ipv6-access-list <IP/IPv6-ACL-NAME> traffic-shape class <1-4>
```

#### Syntax Device Mode

```
use [auto-provisioning-policy|bonjour-gw-forwarding-policy|bonjour-gw-query-forwarding-policy|captive-portal|client-identity-group|crypto-cmp-policy|database-client-policy|database-policy|dhcp-server-policy|dhcpv6-server-policy|enterprise-ui|event-system-policy|firewall-policy|global-association-list|guest-management|ip-access-list|ipv6-access-list|license|management-policy|nsight-policy|profile|radius-server-policy|rf-domain|role-policy|routing-policy|rtl-server-policy|sensor-policy|web-filter-policy|wips-policy] <POLICY-NAME>
```

**NOTE:** The following tables contain the ‘use’ command parameters for the Profile and Device configuration modes.

#### Parameters Profiles Mode

- use [auto-provisioning-policy|bonjour-gw-forwarding-policy|bonjour-gw-query-forwarding-policy|captive-portal|client-identity-group|crypto-cmp-policy|database-client-policy|dhcp-server-policy|dhcpv6-server-policy|event-system-policy|firewall-policy|global-association-list|guest-management|ip-access-list|ipv6-access-list|management-policy|radius-server-policy|role-policy|routing-policy|web-filter-policy] <POLICY-NAME>

## 7.1.77 vrrp

### ► Profile Config Commands

Configures VRRP group settings

A default gateway is a critical resource for connectivity. However, it is prone to a single point of failure. Thus, redundancy for the default gateway is required. If WAN backhaul is available, and a router failure occurs, then the controller should act as a router and forward traffic on to its WAN link.

Define an external VRRP configuration when router redundancy is required in a network requiring high availability.

Central to VRRP configuration is the election of a VRRP master. A VRRP master (once elected) performs the following functions:

- Responds to ARP requests
- Forwards packets with a destination link layer MAC address equal to the virtual router's MAC address
- Rejects packets addressed to the IP address associated with the virtual router, if it is not the IP address owner
- Accepts packets addressed to the IP address associated with the virtual router, if it is the IP address owner or accept mode is true.

The nodes that lose the election process enter a backup state. In the backup state they monitor the master for any failures, and in case of a failure one of the backups, in turn, becomes the master and assumes the management of the designated virtual IPs. A backup does not respond to an ARP request, and discards packets destined for a virtual IP resource.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
vrrp [<1-255>|version]

vrrp <1-255> [delta-priority|description|interface|ip|monitor|preempt|priority|
sync-group|timers]

vrrp <1-255> [delta-priority <1-253>|description <LINE>|ip <IP> {(<IP>)}|preempt
{delay <1-65535>}|priority <1-254>|sync-group]

vrrp <1-255> interface vlan <1-4094>

vrrp <1-255> monitor [<IF-NAME>|critical-resource|pppoe1|vlan|wwan1]

vrrp <1-255> monitor [<IF-NAME>|pppoe1|vlan <1-4094>|wwan1] {(<IF-NAME>|critical-
resource|pppoe1|vlan|wwan1)}

vrrp <1-255> monitor critical-resource <CRM-NAME1> <CRM-NAME2> <CRM-NAME3> <CRM-
NAME4> (action [decrement-priority|increment-priority] {<IF-NAME>|pppoe1|
vlan|wwan1})

vrrp <1-255> timers advertise [<1-255>|centiseconds <25-4095>|msec <250-999>]
```

vrrp version [2|3]

**Parameters**

- vrrp <1-255> [delta-priority <1-253>|description <LINE>|vrrp ip <IP> {<IP>}|preempt {delay <1-65535>}|priority <1-254>|sync-group]

|                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| vrrp <1-255>                                                                                                                                                                                                                                                  | Configures the virtual router ID from 1- 255. Identifies the virtual router the packet is reporting status for.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| delta-priority <1-253>                                                                                                                                                                                                                                        | Configures the priority to decrement (local link monitoring and critical resource monitoring) or increment (critical resource monitoring). When the monitored interface is down, the configured priority decrements by a value defined by the delta-priority option. When monitoring critical resources, the value increments by the delta-priority option. <ul style="list-style-type: none"> <li>• &lt;1-253&gt; - Specify the delta priority level from 1- 253.</li> </ul>                                                                                      |
| description <LINE>                                                                                                                                                                                                                                            | Configures a text description for the virtual router to further distinguish it from other routers with similar configuration <ul style="list-style-type: none"> <li>• &lt;LINE&gt; - Provide a description (a string from 1- 64 characters in length)</li> </ul>                                                                                                                                                                                                                                                                                                   |
| ip <IP-ADDRESSES>                                                                                                                                                                                                                                             | Identifies the IP address(es) backed by the virtual router. These are IP addresses of Ethernet switches, routers, and security appliances defined as virtual router resources. <ul style="list-style-type: none"> <li>• &lt;IP-ADDRESSES&gt; - Specify the IP address(es) in the A.B.C.D format.</li> </ul> This configuration triggers VRRP operation.                                                                                                                                                                                                            |
| preempt {delay <1-65535>}                                                                                                                                                                                                                                     | Controls whether a high priority backup router preempts a lower priority master. This field determines if a node with higher priority can takeover all virtual IPs from a node with lower priority. This feature is disabled by default. <ul style="list-style-type: none"> <li>• delay - Optional. Configures the pre-emption delay timer from 1 - 65535 seconds (default is 0 seconds). This option can be used to delay sending out the master advertisement or, in case of monitored link coming up, adjusting the VRRP priority by priority delta.</li> </ul> |
| priority <1-254>                                                                                                                                                                                                                                              | Configures the priority level of the router within a VRRP group. This value determines which node is elected as the Master. Higher values imply higher priority, value 254 has the highest precedence (default is 100).                                                                                                                                                                                                                                                                                                                                            |
| sync-group                                                                                                                                                                                                                                                    | Adds this VRRP group to a synchronized group. To trigger VRRP failover, it is essential all individual groups within a synchronized group have failover. VRRP failover is triggered if an advertisement is not received from the virtual masters that are part of this VRRP sync group. This feature is disabled by default.                                                                                                                                                                                                                                       |
| <ul style="list-style-type: none"> <li>• vrrp &lt;1-255&gt; interface vlan &lt;1-4094&gt;</li> </ul>                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| vrrp <1-255>                                                                                                                                                                                                                                                  | Configures the virtual router ID from 1- 255. Identifies the virtual router the packet is reporting status for.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 7.1.78 vrrp-state-check

► *Profile Config Commands*

Publishes interface via OSPF or BGP based on *Virtual Router Redundancy Protocol (VRRP)* status

VRRP allows automatic assignment of available IP routers to participating hosts. This increases the availability and reliability of routing paths via automatic default gateway selections on an IP subnetwork. This option is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
vrrp-state-check
```

**Parameters**

None

**Example**

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#vrrp-state-check

## 7.1.79 virtual-controller

### ► Profile Config Commands

Enables an access point as a *virtual-controller* (VC) or a *dynamic virtual controller* (DVC)

When configured without the ‘auto’ option, this command manually enables an AP as a VC. The ‘auto’ option allows dynamic enabling of APs as VCs. When DVC is enabled on an AP’s device or profile context, the AP is dynamically enabled as the VC on being elected as the RF-Domain manager.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**NOTE:** The DVC feature is supported only on the AP7522, AP7532, AP7562, AP8432, and AP8533 model access points.

#### Syntax

```
virtual-controller {auto|management-interface}
virtual-controller auto
virtual-controller {management-interface [ip address <IP/M>|vlan <1-4094>]}
```

#### Parameters

- virtual-controller auto

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

- `virtual-controller {management-interface [ip address <IP/M>|vlan <1-4094>]}`

|                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>virtual-controller {management-interface [ip address &lt;IP/M&gt; vlan &lt;1-4094&gt;]}</pre> | <p>Enables an AP as a virtual-controller. If enabling DVC, use this option to configure management interface details.</p> <ul style="list-style-type: none"> <li>• <code>management-interface</code> - Configures the management interface for the DVC. Configuring the management interface ensures failover in case the RF Domain manager is unreachable.</li> <li>• <code>ip address &lt;IP/M&gt;</code> - Specify the management interface IP address. Due to the random nature of DVC, specifying an explicit management interface IP address makes it easier to manage VCs. In case of fail over, this IP address is installed as the secondary IP address on the new VC.</li> <li>• <code>vlan &lt;1-4094&gt;</code> - Optional. Specifies the VLAN from 1 - 4094 on which the management interface IP address is configured.</li> </ul> <p><b>Note:</b> For DVC, configuring <code>management-interface ip address</code> is mandatory. However, VLAN configuration is optional. If you configure the <code>ip address</code> without specifying the <code>VLAN</code>, the system configures the specified ip address as secondary ip on VLAN 1.</p> |
|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
ap8533-9A1529(config-device-74-67-F7-9A-15-29)#virtual-controller auto

ap8533-9A1529(config-device-74-67-F7-9A-15-29)#virtual-controller management-
interface ip address 110.110.110.120/24

ap8533-9A1529(config-device-74-67-F7-9A-15-29)#virtual-controller management-
interface vlan 100

ap8533-9A1529(config-device-74-67-F7-9A-15-29)#show context | include virtual-
controller
virtual-controller auto
virtual-controller management-interface ip address 110.110.110.120/24
virtual-controller management-interface vlan 100
ap8533-9A1529(config-device-74-67-F7-9A-15-29)#
```

The following example shows the management interface VLAN IP address being configured as the secondary IP address.

```
ap8533-9A1529(config-device-74-67-F7-9A-15-29)#show ip interface brief

INTERFACE IP-ADDRESS/MASK TYPE STATUS PROTOCOL

vlan1 10.1.1.11/24 primary UP up
vlan100 110.110.110.110/24 primary UP up
vlan100 110.110.110.120/24 secondary UP up

```

## 7.1.80 wep-shared-key-auth

► *Profile Config Commands*

Enables support for 802.11 WEP shared key authentication

When enabled, devices, using this profile, use a WEP key to access the network. The controller or service platform use the key algorithm to convert an ASCII string to the same hexadecimal number. Clients without the recommended adapters need to use WEP keys manually configured as hexadecimal numbers. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
wep-shared-key-auth
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#wep-shared-key-auth

rfs6000-37FABE(config-profile-default-rfs6000)#show context

## 7.1.81 service

### ► Profile Config Commands

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```

service [captive-portal-server|cluster|critical-resource|fast-switching|enable|
global-association-list|lldp|memory|meshpoint|pm|power-config|radius|remote-
config|rss-timeout|watchdog|wireless|show]

service captive-portal-server connections-per-ip <3-64>

service cluster master-election immediate

service critical-resource port-mode-source-ip <IP>

service enable [l2tpv3|pppoe|radiusd]

service global-association-list blacklist-interval <1-65535>

service lldp loop-detection

service memory kernel decrease

service meshpoint loop-prevention-port [<L2-INTERFACE-NAME>|ge <1-5>|port-channel
<1-2>|up1]

service pm sys-restart

service power-config [3af-out|force-3at]

service radius dynamic-authorization additional-port <1-65535>

service remote-config apply-delay <0-600>

service rss-timeout <0-86400>

service watchdog

service wireless [anqp-frag-always|anqp-frag-size|ap650|client|cred-cache-sync|
inter-ap-key|noise-immunity|reconfig-on-tx-stall|test|wisper-controller-port]

service wireless anqp-frag-always
service wireless anqp-frag-size <100-1500>
service wireless ap650 legacy-auto-update-image <FILE>
service wireless client tx-deauth on-radar-detect
service wireless cred-cache-sync [full|interval <30-864000>|never|partial]
service wireless test [max-rate|max-retries|min-rate]
service wireless test [max-rate|min-rate] [1,2,5.5,6,11,12,18,24,36,48,54,mcs0,
mcs1,.....mcs23]
service wireless inter-ap-key [0 <WORD>|2 <WORD>|<WORD>]
service wireless noise-immunity
service wireless reconfig-on-rx-stall
service wireless test max-retries <0-15>
service wireless wispe-controller-port <1-65535>

```

```
service show cli
```

**Parameters**

- `service captive-portal-server connections-per-ip <3-64>`

|                                                 |                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| captive-portal-server connections-per-ip <3-64> | Configures the maximum number of simultaneous captive portal connection allowed per IP address<br><ul style="list-style-type: none"> <li>• &lt;3-64&gt; - Specify the maximum number of connections per IP address from 3 - 64. The default is 3.</li> </ul> <p><b>Note:</b> This command is applicable only to the NX9XXX and NX9600 service platform profiles.</p> |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `service cluster master-election immediate`

|                                   |                                                                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster master-election immediate | Initiates and completes cluster master election as soon as just one cluster member comes on and is active. This option is disabled by default. |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|

- `service critical-resource port-mode-source-ip <IP>`

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| critical-resource port-mode-source-ip <IP> | Hard codes a source IP for critical resource management The default is 0.0.0.0<br>Use this option to define the IP address used as the source address in ARP packets used to detect a critical resource on a layer 2 interface. By default, the source address used in ARP packets to detect critical resources is 0.0.0.0. However, some devices do not support the above IP address and drop the ARP packets. Use this field to provide an IP address specifically used for this purpose. The IP address used for port-mode-source-ip monitoring must be different from the IP address configured on the device. |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `service enable [l2tpv3|pppoe|radiusd]`

|                       |                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service enable l2tpv3 | Enables L2TPV3 on this profile<br><br>The L2TPV3 enable/disable option is not supported on AP6522, AP6532, AP6562, AP7161, AP81XX, AP8232, AP8432, AP8533, RFS4000, RFS6000, and NX95XX model devices.<br><br>It is supported only on AP6521. |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                      |                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service enable pppoe | Enables PPPoE features. When executed on a device, enables PPPoE on the logged device. When executed on a profile, enables PPPoE on all devices using that profile. |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service enable radiusd | Enables RADIUS features. When executed on a device, enables RADIUS on the logged device. When executed on a profile, enables RADIUS on all devices using that profile. |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `service global-association-list blacklist-interval <1-65535>`

|                                 |                                                       |
|---------------------------------|-------------------------------------------------------|
| service global-association-list | Configures global association list related parameters |
|---------------------------------|-------------------------------------------------------|

|                              |                                                                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blacklist-interval <1-65535> | Configures the period for which a client is blacklisted. A client is considered blacklisted after being denied access by the server.<br><ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify a value from 1 - 65535 seconds. The default is 60 seconds.</li> </ul> |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `service lldp loop-detection`

|                     |                                                                              |
|---------------------|------------------------------------------------------------------------------|
| lldp loop-detection | Enables network loop detection via LLDP. This option is disabled by default. |
|---------------------|------------------------------------------------------------------------------|

|                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                   |

## 7.1.82 zone

### ► Profile Config Commands

Configures the zone for devices using this profile. The zone can also be configured on the device's self context.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
zone <NAME>
```

#### Parameters

- zone <NAME>

|             |                                                                            |
|-------------|----------------------------------------------------------------------------|
| zone <NAME> | Configures the device's zone/area<br>• <NAME> - Specify the zone/areaname. |
|-------------|----------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testNX9000)#szone Ecospace

nx9500-6C8809(config-profile-testNX9000)#show context include-factory | include
zone
zone Ecospace
nx9500-6C8809(config-profile-testNX9000)#
```

#### Related Commands

|           |                                                       |
|-----------|-------------------------------------------------------|
| <i>no</i> | Removes the zone configured on this profile or device |
|-----------|-------------------------------------------------------|

## 7.2 Device Config Commands

► *PROFILES*

Use the (config) instance to configure device specific parameters

To navigate to this instance, use the following commands:

```

<DEVICE>(config)#<DEVICE-TYPE> <MAC>
<DEVICE>(config-device-<MAC>)#?
Device Mode commands:
 adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning
 adoption policy when adopted by another
 adoption-mode controller
 adoption-site Adoption configuration
 alias Configure the adoption mode for the
 application-policy access-points in this RF-Domain
 area Set system's adoption site
 arp Alias
 auto-learn Application Policy configuration
 autogen-uniqueid Set name of area where the system
 autoinstall is located?
 bridge Address Resolution Protocol (ARP)
 captive-portal Auto learning
 cdp Autogenerate a unique id
 channel-list Autoinstall settings
 cluster Ethernet bridge
 configuration-persistence Captive portal
 contact Cisco Discovery Protocol
 controller Configure channel list to be
 country-code advertised to wireless clients
 critical-resource Cluster configuration
 crypto Enable persistence of configuration
 database across reloads (startup config
 device-upgrade file)
 device-onboard Configure the contact
 dot1x WLAN controller configuration
 dpi Configure the country of operation
 dscp-mapping Critical Resource
 eguest-server Encryption related commands
 email-notification Database command
 enforce-version Device firmware upgrade
 environmental-sensor Device-onboarding configuration
 events 802.1X
 export Enable Deep-Packet-Inspection
 file-sync (Application Assurance)
 floor Configure IP DSCP to 802.1p
 geo-coordinates priority mapping for untagged
 gre Enable EGuest Server functionality
 hostname frames
 http-analyze Email notification configuration
 interface Check the firmware versions of
 devices before interoperating
 Environmental Sensors Configuration
 System event messages
 Export a file
 File sync between controller and
 adoptees
 Set the floor within a area where
 the system is located
 Configure geo coordinates for this
 device
 GRE protocol
 Set system's network name
 Specify HTTP-Analysis configuration
 Select an interface to configure

```

|                                    |                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------|
| ip                                 | Internet Protocol (IP)                                                              |
| ipv6                               | Internet Protocol version 6 (IPv6)                                                  |
| l2tpv3                             | L2tpv3 protocol                                                                     |
| l3e-lite-table                     | L3e lite Table                                                                      |
| lacp                               | LACP commands                                                                       |
| layout-coordinates                 | Configure layout coordinates for this device                                        |
| led                                | Turn LEDs on/off on the device                                                      |
| led-timeout                        | Configure the time for the led to turn off after the last radio state change        |
| legacy-auto-downgrade              | Enable device firmware to auto downgrade when other legacy devices are detected     |
| legacy-auto-update                 | Auto upgrade of legacy devices                                                      |
| license                            | License management command                                                          |
| lldp                               | Link Layer Discovery Protocol                                                       |
| load-balancing                     | Configure load balancing parameter                                                  |
| location                           | Configure the location                                                              |
| logging                            | Modify message logging facilities                                                   |
| mac-address-table                  | MAC Address Table                                                                   |
| mac-auth                           | 802.1X                                                                              |
| mac-name                           | Configure MAC address to name mappings                                              |
| management-server                  | Configure management server address                                                 |
| memory-profile                     | Memory profile to be used on the device                                             |
| meshpoint-device                   | Configure meshpoint device parameters                                               |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                             |
| min-misconfiguration-recovery-time | Check controller connectivity after configuration is received                       |
| mint                               | MiNT protocol                                                                       |
| mirror                             | Mirroring                                                                           |
| misconfiguration-recovery-time     | Check controller connectivity after configuration is received                       |
| mpact-server                       | MPACT server configuration                                                          |
| neighbor-inactivity-timeout        | Configure neighbor inactivity timeout                                               |
| neighbor-info-interval             | Configure neighbor information exchange interval                                    |
| no                                 | Negate a command or set its defaults                                                |
| noc                                | Configure the noc related setting                                                   |
| nsight                             | NSight                                                                              |
| nsight-sensor                      | Enable sensor for Nsight                                                            |
| ntp                                | Ntp server A.B.C.D                                                                  |
| offline-duration                   | Set duration for which a device remains unadopted before it generates offline event |
| otls                               | Omnitrail Location Server                                                           |
| override-wlan                      | Configure RF Domain level overrides for wlan                                        |
| power-config                       | Configure power mode                                                                |
| preferred-controller-group         | Controller group this system will prefer for adoption                               |
| preferred-tunnel-controller        | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic  |
| radius                             | Configure device-level radius authentication parameters                             |
| raid                               | RAID                                                                                |
| remove-override                    | Remove configuration item override from the device (so profile value takes effect)  |
| rf-domain-manager                  | RF Domain Manager                                                                   |
| router                             | Dynamic routing                                                                     |

|                       |                                                                               |
|-----------------------|-------------------------------------------------------------------------------|
| rsa-key               | Assign a RSA key to a service                                                 |
| sensor-server         | AirDefense sensor server configuration                                        |
| slot                  | PCI expansion Slot                                                            |
| spanning-tree         | Spanning tree                                                                 |
| timezone              | Configure the timezone                                                        |
| traffic-class-mapping | Configure IPv6 traffic class to 802.1p priority mapping for untagged frames   |
| traffic-shape         | Traffic shaping                                                               |
| trustpoint            | Assign a trustpoint to a service                                              |
| tunnel-controller     | Tunnel Controller group this controller belongs to                            |
| use                   | Set setting to use                                                            |
| vrrp                  | VRRP configuration                                                            |
| vrrp-state-check      | Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP |
| wep-shared-key-auth   | Enable support for 802.11 WEP shared key authentication                       |
| zone                  | Configure Zone name                                                           |
| clrscr                | Clears the display screen                                                     |
| commit                | Commit all changes made in this session                                       |
| do                    | Run commands from Exec mode                                                   |
| end                   | End current mode and change to EXEC mode                                      |
| exit                  | End current mode and down to previous mode                                    |
| help                  | Description of the interactive help system                                    |
| revert                | Revert changes                                                                |
| service               | Service Commands                                                              |
| show                  | Show running system information                                               |
| write                 | Write running configuration to memory or terminal                             |

<DEVICE> (config-device-<MAC>) #

The following table summarizes device configuration mode commands:

| Command                                        | Description                                                                                                                                                                                                            | Reference         |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>adopter-auto-provisioning-policy-lookup</i> | Enables the use of a centralized auto provisioning policy on this device                                                                                                                                               | <i>page 7-11</i>  |
| <i>adoption</i>                                | Configures a minimum and maximum delay time in the initiation of the device adoption process                                                                                                                           | <i>page 7-13</i>  |
| <i>adoption-site</i>                           | Sets the device's adoption site name                                                                                                                                                                                   | <i>page 7-464</i> |
| <i>alias</i>                                   | Configures network, VLAN, and service aliases on a device                                                                                                                                                              | <i>page 7-15</i>  |
| <i>application-policy</i>                      | Associates a RADIUS server provided application policy with this device. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane. | <i>page 7-22</i>  |
| <i>area</i>                                    | Sets the name of area where the system is deployed                                                                                                                                                                     | <i>page 7-465</i> |
| <i>arp</i>                                     | Configures ARP parameters                                                                                                                                                                                              | <i>page 7-25</i>  |

| Command                            | Description                                                                                                                                                                                                    | Reference         |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>auto-learn</i>                  | Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device's host name via DHCP options. | <i>page 7-27</i>  |
| <i>autogen-uniqueid</i>            | When executed in the device configuration mode, this command generates a unique ID for the logged device                                                                                                       | <i>page 7-28</i>  |
| <i>autoinstall</i>                 | Autoinstalls firmware image and configuration setup parameters                                                                                                                                                 | <i>page 7-30</i>  |
| <i>bridge</i>                      | Configures Ethernet Bridging parameters                                                                                                                                                                        | <i>page 7-31</i>  |
| <i>captive-portal</i>              | Configures captive portal advanced Web page upload on this profile                                                                                                                                             | <i>page 7-62</i>  |
| <i>cdp</i>                         | Operates CDP on the device                                                                                                                                                                                     | <i>page 7-63</i>  |
| <i>channel-list</i>                | Configures channel list advertised to wireless clients                                                                                                                                                         | <i>page 7-466</i> |
| <i>cluster</i>                     | Sets cluster configuration                                                                                                                                                                                     | <i>page 7-64</i>  |
| <i>configuration-persistence</i>   | Enables configuration persistence across reloads                                                                                                                                                               | <i>page 7-67</i>  |
| <i>contact</i>                     | Sets contact information                                                                                                                                                                                       | <i>page 7-467</i> |
| <i>controller</i>                  | Configures a WLAN's wireless controller or service platform                                                                                                                                                    | <i>page 7-68</i>  |
| <i>country-code</i>                | Configures wireless controller or service platform's country code                                                                                                                                              | <i>page 7-468</i> |
| <i>critical-resource</i>           | Monitors user configured IP addresses and logs their status                                                                                                                                                    | <i>page 7-72</i>  |
| <i>crypto</i>                      | Configures data encryption protocols and settings                                                                                                                                                              | <i>page 7-80</i>  |
| <i>database</i>                    | Backs up captive-portal and/or NSight database to a specified location and file and configures a low-disk-space threshold value                                                                                | <i>page 7-143</i> |
| <i>device-upgrade</i>              | Configures device firmware upgrade settings on this device                                                                                                                                                     | <i>page 7-145</i> |
| <i>diag</i>                        | Enables looped packet logging                                                                                                                                                                                  | <i>page 7-147</i> |
| <i>dot1x</i>                       | Configures 802.1x standard authentication controls                                                                                                                                                             | <i>page 7-148</i> |
| <i>dpi</i>                         | Enables <i>Deep Packet Inspection</i> (DPI) on this device                                                                                                                                                     | <i>page 7-150</i> |
| <i>dscp-mapping</i>                | Configures IP <i>Differentiated Services Code Point</i> (DSCP) to 802.1p priority mapping for untagged frames                                                                                                  | <i>page 7-153</i> |
| <i>eguest-server (VX9000 only)</i> | Enables the EGuest daemon when executed without the 'host' option                                                                                                                                              | <i>page 7-154</i> |
| <i>eguest-server (NOC Only)</i>    | Points to the EGuest server, when executed along with the 'host' option                                                                                                                                        | <i>page 7-155</i> |
| <i>email-notification</i>          | Configures e-mail notification settings                                                                                                                                                                        | <i>page 7-156</i> |
| <i>enforce-version</i>             | Checks the device firmware version before attempting connection                                                                                                                                                | <i>page 7-158</i> |
| <i>environmental-sensor</i>        | Configures the environmental sensor device settings. If the device is an environmental sensor, use this command to configure its settings.                                                                     | <i>page 7-159</i> |
| <i>events</i>                      | Enables system event message generation and forwarding                                                                                                                                                         | <i>page 7-161</i> |
| <i>export</i>                      | Enables export of startup.log file after every boot                                                                                                                                                            | <i>page 7-162</i> |
| <i>file-sync</i>                   | Configures parameters enabling syncing of trustpoint/wireless-bridge certificate between the staging-controller and its adopted access points                                                                  | <i>page 7-163</i> |
| <i>floor</i>                       | Sets the floor name where the system is located                                                                                                                                                                | <i>page 7-164</i> |

| Command                                   | Description                                                                                                                                                   | Reference                  |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>geo-coordinates</i>                    | Configures the geographic coordinates for this device                                                                                                         | <a href="#">page 7-470</a> |
| <i>gre</i>                                | Enables GRE tunneling on this device                                                                                                                          | <a href="#">page 7-166</a> |
| <i>hostname</i>                           | Sets a system's network name                                                                                                                                  | <a href="#">page 7-471</a> |
| <i>http-analyze</i>                       | Enables HTTP analysis on this device                                                                                                                          | <a href="#">page 7-177</a> |
| <i>interface</i>                          | Selects an interface to configure                                                                                                                             | <a href="#">page 7-180</a> |
| <i>ip</i>                                 | Configures IPv4 components                                                                                                                                    | <a href="#">page 7-348</a> |
| <i>ipv6</i>                               | Configures IPv6 components                                                                                                                                    | <a href="#">page 7-358</a> |
| <i>l2tpv3</i>                             | Defines the <i>Layer 2 Tunnel Protocol</i> (L2TP) protocol for tunneling Layer 2 payloads using <i>Virtual Private Networks</i> (VPNs)                        | <a href="#">page 7-362</a> |
| <i>l3e-lite-table</i>                     | Configures L3e Lite Table with this profile                                                                                                                   | <a href="#">page 7-364</a> |
| <i>lACP</i>                               | Configures an LACP-enabled peer's system-priority value. LACP uses this system-priority value along with the peer's MAC address to form the peer's system ID. | <a href="#">page 7-472</a> |
| <i>layout-coordinates</i>                 | Configures layout coordinates                                                                                                                                 | <a href="#">page 7-473</a> |
| <i>led</i>                                | Turns LEDs on or off                                                                                                                                          | <a href="#">page 7-365</a> |
| <i>led-timeout</i>                        | Configures the LED-timeout timer in the device or profile configuration mode                                                                                  | <a href="#">page 7-366</a> |
| <i>legacy-auto-downgrade</i>              | Enables legacy device firmware to auto downgrade                                                                                                              | <a href="#">page 7-368</a> |
| <i>legacy-auto-update</i>                 | Auto updates AP7161 legacy device firmware                                                                                                                    | <a href="#">page 7-369</a> |
| <i>license</i>                            | Adds device feature licenses                                                                                                                                  | <a href="#">page 7-474</a> |
| <i>lldp</i>                               | Configures <i>Link Layer Discovery Protocol</i> (LLDP) settings for this device                                                                               | <a href="#">page 7-370</a> |
| <i>load-balancing</i>                     | Configures load balancing parameters.                                                                                                                         | <a href="#">page 7-372</a> |
| <i>location</i>                           | Configures the system's location (place of deployment)                                                                                                        | <a href="#">page 7-477</a> |
| <i>logging</i>                            | Enables message logging                                                                                                                                       | <a href="#">page 7-377</a> |
| <i>mac-address-table</i>                  | Configures the MAC address table                                                                                                                              | <a href="#">page 7-379</a> |
| <i>mac-auth</i>                           | Enables 802.1x authentication of hosts on this device                                                                                                         | <a href="#">page 7-381</a> |
| <i>mac-name</i>                           | Configures MAC address to device name mappings                                                                                                                | <a href="#">page 7-478</a> |
| <i>management-server</i>                  | Configures a management server with this profile                                                                                                              | <a href="#">page 7-384</a> |
| <i>memory-profile</i>                     | Configures memory profile used on the device                                                                                                                  | <a href="#">page 7-385</a> |
| <i>meshpoint-device</i>                   | Configures meshpoint device parameters                                                                                                                        | <a href="#">page 7-386</a> |
| <i>meshpoint-monitor-interval</i>         | Configures meshpoint monitoring interval                                                                                                                      | <a href="#">page 7-388</a> |
| <i>min-misconfiguration-recovery-time</i> | Configures the minimum device connectivity verification time                                                                                                  | <a href="#">page 7-389</a> |
| <i>mint</i>                               | Configures MiNT protocol settings                                                                                                                             | <a href="#">page 7-390</a> |

| <b>Command</b>                         | <b>Description</b>                                                                                                                                                                                                                                                                                | <b>Reference</b>           |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>misconfiguration-recovery-time</i>  | Verifies device connectivity after a configuration is received                                                                                                                                                                                                                                    | <a href="#">page 7-397</a> |
| <i>neighbor-inactivity-timeout</i>     | Configures neighbor inactivity timeout value                                                                                                                                                                                                                                                      | <a href="#">page 7-398</a> |
| <i>neighbor-info-interval</i>          | Configures the neighbor information exchange interval                                                                                                                                                                                                                                             | <a href="#">page 7-399</a> |
| <i>no</i>                              | Negates a command or resets values to their default settings                                                                                                                                                                                                                                      | <a href="#">page 7-479</a> |
| <i>noc</i>                             | Configures NOC settings                                                                                                                                                                                                                                                                           | <a href="#">page 7-402</a> |
| <i>nsight</i>                          | Configures NSight database statistics related parameters. Use this command to set the interval at which data is updated by the RF Domain managers to the NSight server. This command is applicable only on the NX95XX series and NX9600 service platforms and is configured on the NSight server. | <a href="#">page 7-480</a> |
| <i>ntp</i>                             | Configures NTP server settings                                                                                                                                                                                                                                                                    | <a href="#">page 7-408</a> |
| <i>offline-duration</i>                | Sets the duration, in minutes, for which a device remains unadopted before it generates offline event                                                                                                                                                                                             | <a href="#">page 7-414</a> |
| <i>override-wlan</i>                   | Configures WLAN RF Domain level overrides on the logged device                                                                                                                                                                                                                                    | <a href="#">page 7-484</a> |
| <i>power-config</i>                    | Configures power mode features                                                                                                                                                                                                                                                                    | <a href="#">page 7-415</a> |
| <i>preferred-controller-group</i>      | Specifies the wireless controller or service platform group the system prefers for adoption                                                                                                                                                                                                       | <a href="#">page 7-417</a> |
| <i>preferred-tunnel-controller</i>     | Configures the tunnel wireless controller or service platform preferred by the system for tunneling extended VLAN traffic                                                                                                                                                                         | <a href="#">page 7-418</a> |
| <i>radius</i>                          | Configures device-level RADIUS authentication parameters                                                                                                                                                                                                                                          | <a href="#">page 7-419</a> |
| <i>remove-override</i>                 | Removes device overrides                                                                                                                                                                                                                                                                          | <a href="#">page 7-486</a> |
| <i>rf-domain-manager</i>               | Enables the RF Domain manager                                                                                                                                                                                                                                                                     | <a href="#">page 7-420</a> |
| <i>router</i>                          | Configures dynamic router protocol settings.                                                                                                                                                                                                                                                      | <a href="#">page 7-421</a> |
| <i>rsa-key</i>                         | Assigns a RSA key to SSH                                                                                                                                                                                                                                                                          | <a href="#">page 7-488</a> |
| <i>sensor-server</i>                   | Configures an AirDefense sensor server                                                                                                                                                                                                                                                            | <a href="#">page 7-489</a> |
| <i>spanning-tree</i>                   | Enables spanning tree commands on the logged device                                                                                                                                                                                                                                               | <a href="#">page 7-423</a> |
| <i>traffic-class-mapping</i>           | Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority                                                                                                                                                                                                            | <a href="#">page 7-426</a> |
| <i>traffic-shape</i>                   | Enables traffic shaping and configures traffic shaping parameters on this device                                                                                                                                                                                                                  | <a href="#">page 7-428</a> |
| <i>trustpoint (device-config-mode)</i> | Assigns trustpoints to validate various services, such as HTTPS, RADIUS CA, RADIUS server, external LDAP server, etc.                                                                                                                                                                             | <a href="#">page 7-491</a> |
| <i>timezone</i>                        | Configures wireless controller or service platform's time zone settings                                                                                                                                                                                                                           | <a href="#">page 7-490</a> |
| <i>tunnel-controller</i>               | Configures the tunneled WLAN (extended VLAN) wireless controller or service platform's name                                                                                                                                                                                                       | <a href="#">page 7-436</a> |
| <i>use</i>                             | Associates different policies and settings with this device                                                                                                                                                                                                                                       | <a href="#">page 7-437</a> |
| <i>vrrp</i>                            | Configures VRRP group settings                                                                                                                                                                                                                                                                    | <a href="#">page 7-443</a> |

| Command                    | Description                                                                                          | Reference         |
|----------------------------|------------------------------------------------------------------------------------------------------|-------------------|
| <i>vrrp-state-check</i>    | Publishes interface via OSPF or BGP based on <i>Virtual Router Redundancy Protocol</i> (VRRP) status | <i>page 7-447</i> |
| <i>wep-shared-key-auth</i> | Enables support for 802.11 WEP shared key authentication                                             | <i>page 7-450</i> |
| <i>raid</i>                | Enables alarm on the array. This command is supported only on the NX9500 series service platform.    | <i>page 7-493</i> |

## 7.2.1 adoption-site

### ► Device Config Commands

Sets the device's adoption site name

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
adoption-site <SITE-NAME>
```

#### Parameters

- adoption-site <SITE-NAME>

|                              |                                      |
|------------------------------|--------------------------------------|
| adoption-site<br><SITE-NAME> | Sets the device's adoption site name |
|------------------------------|--------------------------------------|

#### Example

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58) #adoption-site SanJoseMainOffice
```

#### Related Commands

|           |                                               |
|-----------|-----------------------------------------------|
| <i>no</i> | Disables or reverts settings to their default |
|-----------|-----------------------------------------------|

## 7.2.2 area

### ► Device Config Commands

Sets the physical area where the device (controller, service platform, or access point) is deployed. This can be a building, region, campus or other area that describes the deployment location of the device. Assigning an area name is helpful when grouping devices in RF Domains and profiles, as devices in the same physical deployment location may need to share specific configuration parameters in respect to radio transmission and interference requirements specific to that location.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
area <AREA-NAME>
```

#### Parameters

- area <AREA-NAME>

|                  |                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------|
| area <AREA-NAME> | Sets the physical area where the device is deployed<br><AREA-NAME> - Specify the area name (should not 64 characters in length). |
|------------------|----------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE (config-device-00-04-96-4A-A7-08) #area RMZEcoSpace

rfs7000-37FABE (config-device-00-04-96-4A-A7-08) #show context
ap71xx 00-04-96-4A-A7-08
 use profile default-ap71xx
 use rf-domain default
 hostname ap7131-4AA708
 area RMZEcospace
rfs7000-37FABE (config-device-00-04-96-4A-A7-08) #
```

#### Related Commands

|           |                                               |
|-----------|-----------------------------------------------|
| <i>no</i> | Disables or reverts settings to their default |
|-----------|-----------------------------------------------|

## 7.2.3 channel-list

► *Device Config Commands*

Configures the channel list advertised to wireless clients

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
channel-list [2.4GHz|5GHz|dynamic]
channel-list [2.4GHz <CHANNEL-LIST>|5GHz <CHANNEL-LIST>|dynamic]
```

**Parameters**

- channel-list [2.4GHz <CHANNEL-LIST>|5GHz <CHANNEL-LIST>|dynamic]

|                          |                                                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| channel-list             | Configures the channel list advertised to wireless clients                                                                                             |
| 2.4GHz<br><CHANNEL-LIST> | Configures the channel list advertised by radios operating in 2.4 GHz<br>• <CHANNEL-LIST> - Specify a list of channels separated by commas or hyphens. |
| 5GHz <CHANNEL-LIST>      | Configures the channel list advertised by radios operating in 5.0 GHz<br>• <CHANNEL-LIST> - Specify a list of channels separated by commas or hyphens. |
| dynamic                  | Enables dynamic (neighboring access point based) update of configured channel list                                                                     |

**Example**

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#channel-list 2.4GHz 1,2

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
 use profile default-ap71xx
 use rf-domain default
 hostname ap7131-4AA708
 area RMZEospace
 channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

**Related Commands**

|           |                                       |
|-----------|---------------------------------------|
| <i>no</i> | Resets the channel list configuration |
|-----------|---------------------------------------|

## 7.2.4 contact

### ► Device Config Commands

Defines an administrative contact for a deployed device (controller, service platform, or access point)

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
contact <WORD>
```

#### Parameters

- contact <WORD>

|                |                                                                                     |
|----------------|-------------------------------------------------------------------------------------|
| contact <WORD> | Specify the administrative contact name (should not exceed 64 characters in length) |
|----------------|-------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE (config-device-00-04-96-4A-A7-08) #contact Bob+1-631-738-5200

rfs7000-37FABE (config-device-00-04-96-4A-A7-08) #show context
ap71xx 00-04-96-4A-A7-08
 use profile default-ap71xx
 use rf-domain default
 hostname ap7131-4AA708
 area RMZEcospace
 contact Bob+1-631-738-5200
 channel-list 2.4GHz 1,2
rfs7000-37FABE (config-device-00-04-96-4A-A7-08) #
```

#### Related Commands

|           |                                        |
|-----------|----------------------------------------|
| <i>no</i> | Resets the administrative contact name |
|-----------|----------------------------------------|

## 7.2.5 country-code

### ► Device Config Commands

Defines the two digit country code for legal device deployment

Configuring the correct country is central to legal operation. Each country has its own regulatory restrictions concerning electromagnetic emissions and the maximum RF signal strength that can be transmitted.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
country-code <WORD>
```

#### Parameters

- country-code <COUNTRY-CODE>

|                                |                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| country-code<br><COUNTRY-CODE> | Defines the two digit country code for legal device deployment<br>• <COUNTRY-CODE> - Specify the two letter ISO-3166 country code. |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#country-code us

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
 use profile default-ap71xx
 use rf-domain default
 hostname ap7131-4AA708
 area RMZEcospace
 contact Bob+1-631-738-5200
 country-code us
 channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

#### Related Commands

|           |                                     |
|-----------|-------------------------------------|
| <i>no</i> | Removes the configured country code |

## 7.2.6 floor

### ► Device Config Commands

Sets the building floor name representative of the location within the area or building the device (controller, service platform, or access point) is physically deployed. Assigning a building floor name is helpful when grouping devices in RF Domains and profiles, as devices on the same physical building floor may need to share specific configuration parameters in respect to radio transmission and interference requirements specific to that location.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
floor <FLOOR-NAME> <1-4094>
```

#### Parameters

- floor <FLOOR-NAME> <1-4094>

|                                   |                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| floor<br><FLOOR-NAME><br><1-4094> | Sets the building floor name where the device is deployed <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Sets a numerical floor designation in respect to the floor's actual location within a building. Specify a value from 1 - 4094. The default setting is the 1st floor.</li> </ul> |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#floor 5thfloor

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
use profile default-ap71xx
use rf-domain default
hostname ap7131-4AA708
area RMZEcospace
floor 5thfloor
contact Bob+1-631-738-5200
country-code us
channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#

|-----------|--------------------------------------|
| <i>no</i> | Removes device's location floor name |
|-----------|--------------------------------------|

## 7.2.7 geo-coordinates

### ► Device Config Commands

Configures the geographic coordinates for this device. Specifies the exact location of this device in terms of latitude and longitude coordinates.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
geographic coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

#### Parameters

- geographic coordinates <-90.0000-90.0000> <-180.0000-180.0000>

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <i>no</i> | Removes device's geographic coordinates |
|-----------|-----------------------------------------|

## 7.2.8 hostname

### ► Device Config Commands

Sets the system's network name

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
hostname <WORD>
```

#### Parameters

- hostname <WORD>

|                 |                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| hostname <WORD> | Sets the name of the managing wireless controller, service platform, or access point. This name is displayed when accessed from any network. |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#hostname TechPubAP7131
```

The hostname has changed from 'ap7131-4AA708' to 'TechPubAP7131'

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
 use profile default-ap71xx
 use rf-domain default
 hostname TechPubAP7131
 area RMZEcospace
 floor 5thfloor
 contact Bob+1-631-738-5200
 country-code us
 channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

#### Related Commands

|           |                           |
|-----------|---------------------------|
| <i>no</i> | Removes device's hostname |
|-----------|---------------------------|

## 7.2.9 lacp

### ► Device Config Commands

Configures an LACP-enabled peer’s system priority value. LACP uses this system priority value along with the peer’s MAC address to form the system ID. In a LAG, the peer with the lower system ID initiates LACP negotiations with another peer. In scenarios, where both peers have the same system-priority value assigned, the peer with the lower MAC gets precedence.

**NOTE:** For more information on enabling link aggregation, see *lacp* and *lacp-channel-group*.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
lacp system-priority <1-65535>
```

#### Parameters

- lacp system-priority <1-65535>

|                                |                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lacp system-priority <1-65535> | <p>Configures the LACP system priority value</p> <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify a value from 1 - 65535. Lower the value, higher is the priority. Therefore, '1' and '65535' indicate highest and lowest system-priority values respectively. The default value is 32768.</li> </ul> |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#lacp system-priority 1
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory |
include lacp
lacp system-priority 1
lacp-channel-group 1 mode active
lacp port-priority 2
lacp-channel-group 1 mode active
lacp port-priority 2
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

#### Related Commands

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>no</i> | Removes this device’s configured system-priority value |
|-----------|--------------------------------------------------------|

## 7.2.10 layout-coordinates

### ► Device Config Commands

Configures X and Y layout coordinates for the device

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
layout-coordinates <-4096.0-4096.0> <-4096.0-4096.0>
```

#### Parameters

- layout-coordinates <-4096.0-4096.0> <-4096.0-4096.0>

|                    |                                                      |
|--------------------|------------------------------------------------------|
| layout-coordinates | Configures X and Y layout coordinates for the device |
| <-4096.0-4096.0>   | Specify the X coordinate from -4096 - 4096.0         |
| <-4096.0-4096.0>   | Specify the Y coordinate from -4096 - 4096.0         |

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#layout-coordinates 1.0 2.0

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
 use profile default-ap71xx
 use rf-domain default
 hostname TechPubAP7131
 area RMZEcospace
 floor 5thfloor
 layout-coordinates 1.0 2.0
 contact Bob+1-631-738-5200
 country-code us
 channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

#### Related Commands

|           |                                      |
|-----------|--------------------------------------|
| <i>no</i> | Removes device's layout co-ordinates |
|-----------|--------------------------------------|

## 7.2.11 license

### ► *Device Config Commands*

Adds a license pack on the device for the specified feature (AP/AAP/ADSEC/HTANLT/WEBF/NSIGHT/NSIGHT-PER/EGUEST-DEV)

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller, The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

The NOC controllers and/or site controllers can both have license packs installed. Adoption of APs by the NOC and site controllers depends on the number of licenses available on each of these controllers.

The NOC controllers and/or site controllers can both have license packs installed. When a AP is adopted by a site controller, the site controller pushes a license on to the AP. The various possible scenarios are:

- AP licenses installed only on NOC controller:

The NOC controller provides the site controllers with AP licenses, ensuring that per platform limits are not exceeded.

- AP licenses installed on site controller:

The site controller uses its installed licenses, and then asks the NOC controller for additional licenses in case of a shortage.

In a hierarchical and centrally managed network, the NOC controller can pull unused AP licenses from site controllers and relocate to other site controllers when required.

- AP licenses installed on any member of a site cluster:

The site controller shares installed and borrowed (from the NOC) licenses with other controllers within a site cluster.

### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### **Syntax**

```
license <WORD> <LICENSE-KEY>
```

### **Parameters**

- license <WORD> <LICENSE-KEY>

| <WORD>        | <p>Specify the feature name (AP/AAP/ADSEC/HTANLT/WEBF/NSIGHT/NSIGHT-PER/EGUEST-DEV) for which license is added</p> <p>AP License: This is the license key required for AP adoptions. The number of APs that can be adopted depends on the installed license count. If the installed license count is 10 APs and the number of AP adoptions is 5, 5 additional APs can still be adopted under the terms of the license.</p> <p>AAP License: This is the license key required for AAP adoptions. The number of AAPs that can be adopted depends on the installed license count. If the installed license count is 10 APs and the number of AAP adoptions is 5, 5 additional AAPs can still be adopted under the terms of the license.</p> <p>ADSEC License: This is the license key required to install the Role Based Firewall feature and increase the number of IPSec VPN tunnels. The number of IPSec tunnels varies by platform.</p> <p>HTANLT: This is the license key required to install Analytics (an enhanced statistical management tool) for NX95XX series service platforms.</p> <p>WEBF License: This is the license key required to install the Web filtering feature. Web filtering is used to restrict access to specific resources on the Internet.</p> <p>NSIGHT/NSIGHT-PER Licenses: This is the license key required to install NSight on a supported service platform. The NSight UI displays a comprehensive, day-to-day overview of the network in a graphical, visually interactive, and easy-to-use format. However, NSight being a licensed service, on expiration of the first 120 days grace period, the NSight server's NSight UI can be launched <i>only on the application</i> of the <i>NSight</i> or <i>NSight-Per</i> (NSight Perpetual) license.</p> <p>The difference between the <i>NSight</i> and <i>NSight-Per</i> licenses is that the first one has an expiration date, whereas the latter doesn't have an expiration date. Once purchased and applied, the NSight-Per license is active forever, and is therefore ideally suited for a Replica-set, NSight deployment, where it is essential that the license is perpetually active and synched across the NSight servers and their primary and secondary databases.</p> <p><b>Note:</b> NSight is supported only on NX9500, NX9510, NX9600 model service platforms, and the VX9000 virtual controller.</p> <p>EGUEST-DEV License - This is the per-device license key installed on the EGuest server. Once installed the EGuest feature is activated. The EGuest-DEV license defines the number of APs supported by each EGuest server. The maximum limit for per-device license is 100,000.</p> <p>The EGuest server is supported only on the VX9000 platform.</p> |
| <LICENSE-KEY> | Specify the license key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 7.2.12 location

### ► Device Config Commands

Sets the location where a managed device (controller, service platform, or access point) is deployed. This is the location of the device with respect to the RF Domain it belongs.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
location <WORD>
```

#### Parameters

- location <WORD>

|        |                                                                              |
|--------|------------------------------------------------------------------------------|
| <WORD> | Specify the managed device's location as part of its RF Domain configuration |
|--------|------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#location SanJose

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

## 7.2.13 mac-name

### ► Device Config Commands

Configures a client name to MAC address mapping. Use this command to assign a user-friendly name to the device (controller, service platform, or access point) and map it to the device's MAC address.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac-name <MAC> <NAME>
```

#### Parameters

- mac-name <MAC> <NAME>

|                                              |                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>mac-name &lt;MAC&gt; &lt;NAME&gt;</pre> | <p>Maps a user-friendly name to the device's MAC address</p> <ul style="list-style-type: none"> <li>• &lt;MAC&gt; - Specify the device's MAC address.</li> <li>• &lt;NAME&gt; - Specify the 'friendly' name used for the specified MAC address. This is the name used in events and statistics logs.</li> </ul> |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#mac-name 00-04-96-4A-A7-08
5.8TestAP

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

 use profile default-ap71xx
 use rf-domain default
 hostname TechPubAP7131
 area RMZEcospace
 floor 5thfloor
 layout-coordinates 1.0 2.0
 location SanJose
 contact Bob+1-631-738-5200
 country-code us
 channel-list 2.4GHz 1,2
 mac-name 00-04-96-4A-A7-08 5.8TestAP
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

#### Related Commands

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>no</i> | Removes the device's friendly name to MAC address mapping |
|-----------|-----------------------------------------------------------|

## 7.2.14 no

### ► Device Config Commands

Negates a command or resets values to their default

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [adopter-auto-provisioning-policy-lookup|adoption-site|alias|application-policy|area|arp|auto-learn-staging-config|autoinstall|bridge|captive-portal|cdp|channel-list|cluster|configuration-persistence|contact|controller|country-code|critical-resource|crypto|database-backup|device-upgrade|dot1x|dpi|dscp-mapping|email-notification|environmental-sensor|events|export|file-sync|floor|geo-coordinates|gre|hostname|http-analyze|interface|ip|ipv6|l2tpv3|l3-lite-table|lacp|layout-coordinates|led|led-timeout|legacy-auto-downgrade|legacy-auto-update|license|lldp|load-balancing|location|logging|mac-address-table|mac-auth|mac-name|management-server|memory-profile|meshpoint-device|meshpoint-monitor-interval|min-misconfiguration-recovery-time|mint|mirror|misconfiguration-recovery-time|mpact-server|noc|nsight|ntp|offline-duration|override-wlan|power-config|preferred-controller-group|preferred-tunnel-controller|radius|raid|rf-domain-manager|router|rsa-key|sensor-server|slot|spanning-tree|timezone|traffic-class-mapping|traffic-shape|trustpoint|tunnel-controller|use|vrrp|vrrp-state-check|wep-shared-key-auth|service]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets the logged device's settings based on the parameters passed |
|-----------------|-------------------------------------------------------------------------------|

#### Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#no area
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#no contact
```

## 7.2.15 nsight

### ► Device Config Commands

Configures NSight database related parameters. Use this command to configure the data-update periodicity, number of applications posted to the NSight server for a wireless client, and the duration for which data is stored in the NSight database's buckets. These parameters impact the amount of data stored in the NSight DB and interval at which data is aggregated and expired within the NSight DB. For more information on data aggregation and expiration, see [\(Data Aggregation and Expiration\)](#).

Configure these parameters in the NSight server's device configuration mode.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nsight database [statistics|summary]

nsight database statistics [avc-update-interval|max-apps-per-client|update-
interval|wireless-clients-update-interval]

nsight database statistics [avc-update-interval|update-interval|wireless-clients-
update-interval] [120|30|300|60|600]

nsight database statistics max-apps-per-client <1-1000>

nsight database summary duration <1-24> <1-168> <1-2160> <24-26280>
```

#### Parameters

- nsight database statistics [avc-update-interval|update-interval|wireless-clients-update-interval] [120|30|300|60|600]

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight database statistics | Configures NSight database statistics related parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| avc-update-interval        | Configures the interval, in seconds, at which <i>Application Visibility and Control (AVC)</i> statistics is updated to the NSight database. This interval represents the rate at which AVC-related data is inserted in the NSight database's first bucket. This first bucket data is referred to as the RAW records. A bucket is a database collection that holds statistical data on a per RF Domain basis. For more information, see <a href="#">(Data Aggregation and Expiration)</a> .<br><br>When configured, RF Domain managers posting AVC-related data to the NSight server receive a reply from the NSight server intimating the next update time. The NSight server calculates the 'next update time' based on the <i>avc-update-interval</i> configured here.                                                                                                                                                                                                           |
| update-interval            | Configures the interval, in seconds, at which data is updated to the NSight server. This interval represents the rate at which data (excluding AVC and wireless-clients related statistics) is inserted in the NSight database's first bucket. This first bucket data is referred to as the RAW records. A bucket is a database collection that holds statistical data on a per RF Domain basis. For more information, see <a href="#">(Data Aggregation and Expiration)</a> .<br><br>When configured, RF Domain managers posting data to the NSight server receive a reply from the NSight server intimating the next update time. The NSight server calculates the 'next update time' based on the <i>update-interval</i> configured here.<br><br><b>Note:</b> Use the ' <i>avc-update-interval</i> ' and ' <i>wireless-clients-update-interval</i> ' keywords to configure update interval for <i>AVC-related</i> and <i>wireless-clients</i> related information respectively. |

|                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

The default is 24 hours.</li> <li>• &lt;1-2160&gt; - Specify the <i>bucket 3</i> duration from 1 - 2160 hours (i.e. 1 hour to 90 days). The default is 7 days (168 hours).</li> <li>• &lt;24-26280&gt; - Specify the <i>bucket 4</i> duration from 24 - 26280 hours (i.e. 1 day to 3 years). The default is 365 days (1 year).</li> </ul> <p><b>Note:</b> A bucket is a database collection that holds statistical data for each RF Domain within the network. (Note, only those RF Domain's that are using an NSight policy with the NSight server host configured will post data to the NSight server. For more information, see <a href="#">use</a> in the RF Domain configuration mode.) NSight database has four (4) buckets. The data from each bucket is aggregated and pushed to the next bucket once the data storage duration, specified for the bucket, has exceeded. For more information on data aggregation, see <a href="#">(Data Aggregation and Expiration)</a>.</p> |

## Usage Guidelines (Data Aggregation and Expiration)

### Data Aggregation:

The NSight functionality, a data analytics tool, analyzes data that is generated periodically by the nodes within the managed wireless LAN. For large WLAN networks, generating significantly large amount of data, storing data forever is neither feasible nor beneficial. Therefore, older statistics are summarized into aggregated (averaged) records. All records, for a fixed time period in past, are summarized into one record by taking an average of them. Although this causes a loss in the data's granularity, average numbers for any given time period is still available.

Statistical data periodically posted by RF Domain managers to the NSight server are stored in buckets (database collections) within the NSight database. There are four buckets in total. These are:

- First bucket (termed as the RAW bucket) - B1
- Second bucket - B2
- Third bucket - B3
- Fourth bucket - B4

On completion of the data storage duration, records from a bucket are aggregated (at a fixed rate) and inserted into the next bucket. The rate at which records are aggregated into the next bucket becomes the next bucket's granularity. For example, the B1 records (that have exceeded the data storage duration configured for B1) are aggregated (at the rate specified) and inserted into B2. Similarly, data from B2 are aggregated into B3, and from B3 to B4. The fixed rate of aggregation (or granularity) AND default storage duration for each bucket is as follows:

- B1: storage duration 8 hours
- B2: granularity 10 minutes / storage duration 24 hours
- B3: granularity 1 hour / storage duration 7 days
- B4: granularity 1 day / storage duration 1 year

Let us consider (with default update-interval settings) the growth of any one of the statistical buckets.

- Since B1's default data storage duration is 8 hours, B1 will hold a maximum of 960 records per RF Domain after 8 hours (updated at the rate of 30 seconds).
- Since B2's granularity is 10 minutes, every 10 minutes 20 records from the B1 will be aggregated into a single record and inserted into B2.
- Since B2's default storage duration is 24 hours, it will contain a maximum of 144 records per RF Domain after 24 hours.
- Since B3's granularity is 1 hour, every hour 6 records from B2 will be aggregated into a single record and inserted into B3.
- Since B3's default storage duration is 7 days, it will contain a maximum of 168 records per RF Domain after 7 days.
- Since B4's granularity is 1 day, every day 24 records from B3 will be aggregated into a single record and inserted into B4.
- Since B4's default storage duration is 365 days, it will contain a maximum of 365 records per RF Domain after 1 year.

### Data Expiration:

The expiration of older records (also referred to as purging or deleting of records) occurs along with data aggregation for each bucket.

Let us consider (with default data storage-duration settings) the expiration of data for any one of the statistical buckets.

- As stated earlier, at the end of 8 hours B1 will have 960 records per RF Domain. After a period of 8 hours and 10 minutes, all 960 records are aggregated into 144 records and inserted into B2. To enable B1 to hold exactly 8 hours worth of data, 20 of the oldest records (corresponding to the first 10 minutes) are purged from B1 at the end of 8 hours and 10 minutes. This expiration cycle is triggered every 10 minutes.
- At the end of 24 hours B2 will have 144 records per RF Domain. After a period of 24 hours and 10 minutes, one of the oldest record (corresponding to the first 10 minutes) is purged from B2. This expiration cycle is triggered every 10 minutes to enable B2 to maintain exactly 24 hours worth of data.
- At the end of 7 days B3 will have 168 records per RF Domain. After a period of 7 days and one hour one of the oldest record (corresponding to the first hour) is purged from B3. This expiration cycle is triggered every 1 hour to enable B3 to maintain exactly 7 days worth of data.
- At the end of 365 days B4 will have 365 records per RF Domain. After 365 days, the oldest records (corresponding to the first day) are purged from B4. This expiration cycle is triggered every 1 day to enable B4 to maintain exactly 365 days worth of data.

**Example**

```

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#nsight database statistics
avc-update-interval 120

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#nsight database statistics
update-interval 30

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#nsight database statistics
wireless-clients-update-interval 600

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#nsight database statistics
max-apps-per-client 20

## 7.2.16 override-wlan

### ► Device Config Commands

Configures WLAN's RF Domain level overrides

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
override-wlan <WLAN> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]
override-wlan <WLAN> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}|
wpa-wpa2-psk <WORD>]
override-wlan <WLAN> wep128 [key <1-4> hex [0<WORD>|2 <WORD>]]|transmit-key <1-4>]
```

#### Parameters

- override-wlan <WLAN> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}|wpa-wpa2-psk <WORD>]

|                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                   |

WEP 128 uses a 104 bit key, which is concatenated with a 24-bit initialization vector (IV) to form the RC4 traffic key. This results in a level of security and privacy comparable to that of a wired LAN.<br>Contd.. |

## 7.2.17 remove-override

### ► Device Config Commands

Removes device overrides in order to enable profile settings to take effect

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
remove-override <PARAMETERS>
```

#### Parameters

- remove-override <PARAMETERS>

|                                 |                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remove-override<br><PARAMETERS> | Removes settings configured at the device level based on the parameters passed. The profile (applied to the device) settings take effect once the device-level overrides are removed. |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58) #remove-override ?
 adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning
 policy when adopted by another
 controller
 adoption Adoption configuration
 adoption-mode Configure the adoption mode for the
 access-points in this RF-Domain
 alias Alias
 all Remove all overrides for the device
 application-policy Application Policy configuration
 area Reset name of area where the system
 is located
 arp Address Resolution Protocol (ARP)
 auto-learn Auto learning
 autogen-uniqueid Autogenerate a unique id
 autoinstall Autoinstall settings
 bridge Bridge group commands
 captive-portal Captive portal
 cdp Cisco Discovery Protocol
 channel-list Configure a channel list to be
 advertised to wireless clients
 cluster Cluster configuration
 configuration-persistence Automatic write of startup
 configuration file
 contact The contact
 controller WLAN controller configuration
 country-code The country of operation
 critical-resource Critical Resource
 crypto Encryption related commands
 device-upgrade Device firmware upgrade
 dot1x 802.1X
 dpi Deep-Packet-Inspection (Application
 Assurance)
 dscp-mapping IP DSCP to 802.1p priority mapping
 for untagged frames
 email-notification Email notification configuration
 enforce-version Check the firmware versions of
 devices before interoperating
 environmental-sensor Environmental Sensors Configuration

## 7.2.18 rsa-key

### ► Device Config Commands

Assigns an SSH RSA key

SSH keys are a pair of cryptographic keys used to authenticate users instead of, or in addition to, a username/password. One key is private and the other is public key. *Secure Shell* (SSH) public key authentication can be used by a requesting client to access resources, if properly configured. The RSA key pair must be generated on the client. The public portion of the key pair resides with the controller, service platform, or access point locally, while the private portion remains on a secure area of the client.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rsa-key ssh <RSA-KEY-NAME>
```

#### Parameters

- `rsa-key ssh <RSA-KEY-NAME>`

|                                               |                                                                                                                                                                                                               |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rsa-key ssh &lt;RSA-KEY-NAME&gt;</code> | Assigns RSA key to SSH <ul style="list-style-type: none"> <li>• <code>&lt;RSA-KEY-NAME&gt;</code> - Specifies the RSA key name. The key should be installed using PKI commands in the enable mode.</li> </ul> |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```

## 7.2.19 sensor-server

### ► Device Config Commands

Configures an AirDefense sensor server resource for client terminations and WIPS event logging. This is the server that supports WIPS events on behalf of the controller or service platform.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

#### Parameters

- sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}

|                      |                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sensor-server <1-3>  | Sets a numerical index to differentiate this AirDefense sensor server from other servers. A maximum of 3 (three) sensor server resources can be defined.                                                                                                                                  |
| ip <IP/HOSTNAME>     | Configures the AirDefense sensor server's IP address or hostname <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the IP address.</li> </ul>                                                                                                                        |
| port [443 <1-65535>] | Optional. Configures the port. The options are: <ul style="list-style-type: none"> <li>• 443 - The default port used by the AirDefense server. This is the default setting.</li> <li>• &lt;1-65535&gt; - Manually sets the port number of the AirDefense server from 1 - 65535</li> </ul> |

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#sensor-server 1 ip 172.16.10.7

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

## 7.2.20 timezone

### ► Device Config Commands

Configures device's timezone

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
timezone <TIMEZONE>
```

#### Parameters

- timezone <TIMEZONE>

|                        |                                  |
|------------------------|----------------------------------|
| timezone<br><TIMEZONE> | Configures the device's timezone |
|------------------------|----------------------------------|

#### Example

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#timezone Etc/UTC

## 7.2.21 trustpoint (device-config-mode)

### ► Device Config Commands

Assigns trustpoints to validate various services, such as HTTPS, RADIUS CA, RADIUS server, external LDAP server, etc.

For more information on digital certificates and certificate authorities, see [trustpoint \(profile-config-mode\)](#).

**NOTE:** Certificates/trustpoints used in this command should be verifiable as existing on the device.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
trustpoint [cloud-client|cmp-auth-operator|https|radius-ca|radius-ca-ldaps|radius-server|radius-server-ldaps] <TRUSTPOINT-NAME>
```

#### Parameters

```
• trustpoint [cloud-client|cmp-auth-operator|https|radius-ca|radius-ca-ldaps|radius-server|radius-server-ldaps] <TRUSTPOINT-NAME>
```

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trustpoint        | Assigns trustpoints to validate various services. The assigned trustpoint is used as the CA for validating the services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| cloud-client      | Assigns trustpoint to validate cloud client. The trustpoint should be existing and installed on the device.<br><br>Use this option on cloud-enabled access points and cloud-adopted, to secure the communication between the cloud AP and cloud client. The trustpoint should be existing and installed on the AP. The cloud-enabled access points are AP7502, AP7522, AP7532, and AP7562. For local-controller adopted APs, this configuration is not required,                                                                                                                                                                                                                                                                                                                                                                                                                  |
| cmp-auth-operator | Assigns an existing trustpoint to validate CMP auth operator. Once validated, CMP is used to obtain and manage digital certificates in a PKI network. Digital certificates link identity information with a public key enclosed within the certificate, and are issued by the CA.<br><br>Use this command to specify the CMP-assigned trustpoint. When specified, devices send a certificate request to the CMP supported CA server, and download the certificate directly from the CA server. CMP supports multiple request options through for device communicating to a CMP supported CA server. The device can initiate a request for getting the certificates from the server. It can also auto update the certificates which are about to expire.<br><br><b>Note:</b> When configured, this cmp-auth-operator trustpoint setting overrides the profile-level configuration. |
| https             | Assigns an existing trustpoint to validate HTTPS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| radius-ca         | Assigns an existing trustpoint to validate client certificates in EAP                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radius-ca-ldaps     | Assigns an existing trustpoint to validate external LDAP server                                                                                                                                                                                                                                                                                                                                                            |
| radius-server       | Assigns an existing trustpoint to validate RADIUS server certificate                                                                                                                                                                                                                                                                                                                                                       |
| radius-server-ldaps | Assigns an existing trustpoint to RADIUS server certificate to validate LDAP server                                                                                                                                                                                                                                                                                                                                        |
| <TRUSTPOINT-NAME>   | <p>The following keyword is common to all of the above parameters:</p> <ul style="list-style-type: none"> <li>&lt;TRUSTPOINT-NAME&gt; - After selecting the service to validate, specify the trustpoint name (should be existing and stored on the device).</li> </ul> <p><b>Note:</b> By default, the system assigns the default-trustpoint to validate the following: https, radius-server, and radius-server-ldaps.</p> |

**Example**

A device's default HTTPS, RADIUS, and CMP certificate/trustpoint configuration is as follows:

```

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory |
include trustpoint
 trustpoint https default-trustpoint
 no trustpoint radius-ca
 trustpoint radius-server default-trustpoint
 no trustpoint radius-ca-ldaps
 trustpoint radius-server-ldaps default-trustpoint
 no trustpoint cmp-auth-operator
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#trustpoint https test

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory |
include trustpoint
 trustpoint https test
 no trustpoint radius-ca
 trustpoint radius-server default-trustpoint
 no trustpoint radius-ca-ldaps
 trustpoint radius-server-ldaps default-trustpoint
 no trustpoint cmp-auth-operator
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#

```

## 7.2.22 raid

### ► Device Config Commands

Enables chassis alarm that sounds when events are detected that degrade RAID support (drive content mirroring) on a service platform

The NX95XX (NX9500 and NX9510) series service platforms include a single Intel MegaRAID controller (virtual drive) with RAID-1 mirroring support enabled. The online virtual drive supports up to two physical drives that could require hot spare substitution if a drive were to fail. The WiNG software allows you to manage the RAID controller event alarm and syslogs supporting the array hardware from the service platform user interface without rebooting the service platform BIOS.

Although RAID controller drive arrays are available only on the NX95XX series service platforms, they can be administrated on behalf of a NX95XX profile by a different model service platform or wireless controller.

#### Supported in the following platforms:

- Service Platforms — NX7530, NX9500, NX9510, NX9600

#### Syntax

```
raid alarm enable
```

#### Parameters

- raid alarm enable

|              |                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alarm enable | Enables audible alarm, which is triggered a RAID drives fails. When triggered the alarm can be disabled by executing the <i>raid &gt; silence</i> command in the device's Priv Exec mode. |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#raid alarm enable

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context
nx9000 B4-C7-99-6C-88-09
 use profile default-nx9000
 use rf-domain default
 hostname nx9500-6C8809
 ip default-gateway 192.168.13.2
 interface gel
 switchport mode access
 switchport access vlan 1
 interface vlan1
 ip address 192.168.13.13/24
 logging on
 logging console warnings
 logging buffered warnings
 raid alarm enable
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

#### Related Commands

|           |                     |
|-----------|---------------------|
| <i>no</i> | Disables RAID alarm |
|-----------|---------------------|

## 7.3 T5 Profile Config Commands

► *PROFILES*

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The *Customer Premises Equipment* (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

To navigate to this instance, use the following commands:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#?
T5 Profile Mode commands:
 cpe T5 CPE configuration
 interface Select an interface to configure
 ip Internet Protocol (IP)
 no Negate a command or set its defaults
 ntp Configure NTP
 override-wlan Configure RF Domain level overrides for wlan
 t5 T5 configuration
 t5-logging Modify message logging facilities
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

<DEVICE>(config-profile-<PROFILE-NAME>)#
```

The following table summarizes T5 profile configuration mode commands:

| Command              | Description                                                                                                         | Reference                  |
|----------------------|---------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>cpe</i>           | Configures T5 CPE related settings (IP address range and VLAN)                                                      | <a href="#">page 7-495</a> |
| <i>interface</i>     | Configures the T5 controller's interfaces                                                                           | <a href="#">page 7-497</a> |
| <i>ip</i>            | Configures the default gateway's IP address                                                                         | <a href="#">page 7-499</a> |
| <i>no</i>            | Removes or reverts this T5 controller profile settings                                                              | <a href="#">page 7-500</a> |
| <i>ntp</i>           | Configures the NTP server associated with this T5 profile                                                           | <a href="#">page 7-501</a> |
| <i>override-wlan</i> | Configures the RF Domain level overrides for applied on a WLAN on this T5 profile                                   | <a href="#">page 7-502</a> |
| <i>t5</i>            | Configures the logged T5 controller's country of operation                                                          | <a href="#">page 7-503</a> |
| <i>t5-logging</i>    | Configures a maximum of 5 (five) remote hosts capable of receiving syslog messages from this selected T5 controller | <a href="#">page 7-504</a> |
| <i>use</i>           | Defines this T5 profile's management settings                                                                       | <a href="#">page 7-505</a> |

### 7.3.1 cpe

► *T5 Profile Config Commands*

Configures T5 CPE related settings. This command is available both in the T5 profile and T5 device contexts

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax T5 Profile & T5 Device Context**

```
cpe [address led]
cpe address vlan <1-4094> <START-IP> <END-IP>
cpe led cpe <cpe1-24>
```

The following commands are specific to the T5 device context:

```
cpe [boot|reload|upgrade]
cpe boot system <cpe1-24> <primary|secondary>
cpe reload <cpe1-24>
cpe <cpe1-24> upgrade <IMAGE-LOCATION>
```

**Parameters**

- cpe address vlan <1-4094> <START-IP> <END-IP>

|                        |                                                                                                                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cpe address            | Configures the range of addresses that can be assigned to adopted CPEs                                                                                                                                                                                                                      |
| vlan <1-4094>          | Configures the VLAN assigned to the CPEs managed by this T5 controller                                                                                                                                                                                                                      |
| <START-IP><br><END-IP> | Configures the range of IP addresses that can be assigned to the CPEs managed by this T5 controller <ul style="list-style-type: none"> <li>• &lt;START-IP&gt; - Specify the first IP address in the range.</li> <li>• &lt;END-IP&gt; - Specify the last IP address in the range.</li> </ul> |

- cpe led cpe <cpe1-24>

|               |                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cpe led       | Enables flashing of LEDs on specified CPEs                                                                                                                                                                                                                                                                                                                                         |
| cpe <cpe1-24> | Identifies the CPE(s) on which the operation is performed <ul style="list-style-type: none"> <li>• &lt;cpe1-24&gt; - Configures the CPE's ID from cpe1 - cpe24. To enable led flashing on all adopted CPEs, enter cpe1-X, where X is the total number of adopted CPEs. **Example**

```

nx9500-6C8809(config-profile-T5TestProfile)#cpe address vlan 200 192.168.13.26
192.168.13.30

nx9500-6C8809(config-profile-T5TestProfile)#show context
profile t5 T5TestProfile
no autoinstall configuration
no autoinstall firmware
interface vlan1
interface vlan4090
interface fe 5 2
.....
interface radio 11 1
interface fe 9 2
interface radio 18 1
interface fe 9 1
use firewall-policy default
service pm sys-restart
cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#

```

## 7.3.2 interface

### ► T5 Profile Config Commands

Configures the T5 controller's interfaces

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

#### Syntax

```
interface [<WORD>|dsl|fe|ge|radio|vlan]
```

```
interface [<WORD>|dsl <1-24>|fe <1-24> <1-2>|ge <1-2>|radio <1-24> <1-2>|vlan <1-4094>]
```

#### Parameters

- interface [<WORD>|dsl <1-24>|fe <1-24> <1-2>|ge <1-2>|radio <1-24> <1-2>|vlan <1-4094>]

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <WORD>             | Configures the interface identified by the <WORD> keyword                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| dsl <1-24>         | Configures the specified DSL interface. A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack. <ul style="list-style-type: none"> <li>• &lt;1-24&gt; - Specify the DSL port index from 1 - 24.</li> </ul> |
| fe <1-24> <1-2>    | Configures the specified FastEthernet interface. The T5 controller has the following FastEthernet port designations: fe1-fe2 (fe1-fe2 are for up to 24 CPE devices managed by a T5 controller). <ul style="list-style-type: none"> <li>• &lt;1-24&gt; - Specify the DSL port index from 1 - 24.</li> <li>• &lt;1-2&gt; - Specify the FastEthernet interface to configure.</li> </ul> In the FastEthernet interface configuration mode, specify the interface settings.                                                                                                                                                                                                                                                                       |
| ge <1-2>           | Configures the specified GigabitEthernet interface. <p>T5 controllers have two Ethernet port designations, These are ge1 and ge2.</p> <p>The GE ports can be RJ-45 or fiber ports supporting 10/100/1000Mbps.</p> <ul style="list-style-type: none"> <li>• &lt;1-2&gt; - Specify the interface index from 1 - 2.</li> </ul> In the GigabitEthernet interface configuration mode, specify the interface settings.                                                                                                                                                                                                                                                                                                                             |
| radio <1-24> <1-2> | Configures the specified radio interface. T5 controller managed CPE device radios can have their radio configurations overridden once their radios have successfully associated and have been provisioned by the adopting controller, service platform, or peer model AP controller access point. <ul style="list-style-type: none"> <li>• &lt;1-24&gt; - Specify the radio interface index from 1 - 24.</li> <li>• &lt;1-2&gt; - Allows the second radio to be specified as a radio interface. For example, this is "interface radio X Y" where 'X' is the DSL line number and 'Y' is the radio interface (number).</li> </ul>                                                                                                              |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| vlan <1-4094> | <p>Configures the specified VLAN interface. Once configured, the VLAN interface provides layer 3 (IP) T5 controller access or provides layer 3 service on a VLAN. The VLAN interface defines which IP address is associated with each VLAN ID a T5 controller is connected to. A VLAN interface is created for the default VLAN (VLAN 1) to enable remote administration. This interface is also used to map VLANs to IP4 and IPv6 formatted IP address ranges. This mapping determines the destination for routing.</p> <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN interface index from 1 - 4094.</li> </ul> <p>In the VLAN configuration mode, specify the interface's primary IP address in the A.B.C.D/M format. Optionally specify the secondary IP address.</p> |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs7000-37FABE(config-profile-t5Profile)#interface dsl 1

rfs7000-37FABE(config-profile-t5Profile-if-dsl1)#?
Interface configuration commands:
 description Port description
 ds-interleaver Enable impulse noise protection in the downstream
 direction
 ds-max-datarate Configure maximum allowed downstream rate for the
 interface
 ds-min-margin Configure the minimum downstream signal-to-noise(SNR)
 ratio margin
 ds-target-margin Configure the desired downstream signal-to-noise (SNR)
 ratio margin
 duplex Set duplex to interface
 flowcontrol Set flowcontrol to interface
 line-power Use the line-power command to apply power to the interface
 no Negate a command or set its defaults
 qos QOS settings
 shutdown Shutdown the selected interface
 speed Configure speed
 switchport Set switching mode characteristics
 us-interleaver Enable impulse noise protection in the upstream direction
 us-max-datarate Configure maximum allowed upstream rate for the interface
 us-min-margin Configure the minimum upstream signal-to-noise (SNR) ratio
 margin
 us-target-margin Configure the desired upstream signal-to-noise (SNR) ratio
 margin

### 7.3.3 ip

▶ *T5 Profile Config Commands*

Configures the default gateway's IP address

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
ip default-gateway <IP>
```

**Parameters**

- ip default-gateway <IP>

|                         |                                                               |
|-------------------------|---------------------------------------------------------------|
| ip default-gateway <IP> | Enter the default gateway's IP address in the A.B.C.D format. |
|-------------------------|---------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-profile-t5Profile)#ip default-gateway 192.168.13.7

nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
 ip default-gateway 192.168.13.7
 no autoinstall configuration
 no autoinstall firmware
 interface vlan1
 interface vlan4090
 interface fe 5 2
 interface ge 2
 interface ge 1
 interface fe 5 1
--More--
nx9500-6C8809(config-profile-t5Profile)#

```

### 7.3.4 no

► *T5 Profile Config Commands*

Removes or reverts this T5 controller profile settings

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
no [cpe|interface|ntp|override-wlan|t5-logging|use]
no cpe led cpe <1-24>
no interface vlan <2-4094>
no ntp server <IP>
no override-wlan <WLAN-NAME> vlan
no t5-logging host <IP>
no use management-policy
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                              |
|-----------------|------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts to default the selected T5 profile's or device's settings |
|-----------------|------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
 ip default-gateway 192.168.13.7
 no autoinstall configuration
 no autoinstall firmware
 interface vlan1
 interface vlan4090

 use firewall-policy default
 ntp server 192.168.13.2
 service pm sys-restart
nx9500-6C8809(config-profile-t5Profile)#

nx9500-6C8809(config-profile-t5Profile)#no ntp server 192.168.13.2

nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
 ip default-gateway 192.168.13.7
 no autoinstall configuration
 no autoinstall firmware
 interface vlan1
 interface vlan4090

 use firewall-policy default
 service pm sys-restart
nx9500-6C8809(config-profile-t5Profile)#
```

### 7.3.5 ntp

▶ *T5 Profile Config Commands*

Configures the NTP server associated with this T5 profile. T5 controllers, using this profile, will obtain their system time from the specified NTP server resources.

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
ntp server <IP>
```

**Parameters**

- ntp server <IP>

|                 |                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------|
| ntp server <IP> | Specify the NTP server’s IP address. You can specify a maximum of 3 (three) NTP server resources. |
|-----------------|---------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-t5Profile)#ntp server 192.168.13.2

nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
 ip default-gateway 192.168.13.7
 no autoinstall configuration
 no autoinstall firmware
 interface dsl 5

 use firewall-policy default
 ntp server 192.168.13.2
 service pm sys-restart
nx9500-6C8809(config-profile-t5Profile)#
```

**Related Commands**

|           |                                     |
|-----------|-------------------------------------|
| <i>no</i> | Removes the NTP server’s IP address |
|-----------|-------------------------------------|

### 7.3.6 override-wlan

► *T5 Profile Config Commands*

Use this option to configure RF Domain level configuration for WLAN. The override configured here are applied to all T5 devices using this T5 profile.

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
override-wlan <WLAN-NAME> vlan <1-4094>
```

**Parameters**

- override-wlan <WLAN-NAME> vlan <1-4094>

|                           |                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------|
| override-wlan <WLAN-NAME> | Overrides the specified WLAN's VLAN configuration<br><WLAN-NAME> - Specify the WLAN's name. |
| vlan <1-4094>             | Specify the new VLAN option<br>• <1-4094> - Specify the VLAN from 1 - 4094.                 |

**Example**

The following example displays the WLAN SJOFFWLAN configuration:

```
nx9500-6C8809(config-wlan-SJOFFWLAN)#show context
wlan SJOFFWLAN
 description "SJ Office WLAN"
 ssid SJOFFWLAN
 vlan 468
 bridging-mode local
 encryption-type ccmp
 authentication-type eap-psk
 use aaa-policy test
nx9500-6C8809(config-wlan-SJOFFWLAN)#
```

The following example overrides the SJOFFWLAN WLAN's VLAN configuration on the T5 profile:

```
nx9500-6C8809(config-profile-testT5)#override-wlan SJOFFWLAN vlan 30

nx9500-6C8809(config-profile-testT5)#show context include-factory | include
override-wlan
 override-wlan SJOFFWLAN vlan 30
nx9500-6C8809(config-profile-testT5)#
```

**Related Commands**

|           |                                                                                |
|-----------|--------------------------------------------------------------------------------|
| <i>no</i> | Removes the RF Domain level overrides for applied on a WLAN on this T5 profile |
|-----------|--------------------------------------------------------------------------------|

### 7.3.7 t5

▶ *T5 Profile Config Commands*

Configures this T5 controller’s country of operation

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
t5 country-code <WORD>
```

**Parameters**

- t5 country-code <WORD>

|                        |                                                                      |
|------------------------|----------------------------------------------------------------------|
| country-code<br><WORD> | Configures the 2 letter ISO-3166 country code for this T5 controller |
|------------------------|----------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-profile-T5TestProfile)#t5 country-code us

nx9500-6C8809(config-profile-T5TestProfile)#show context
profile t5 T5TestProfile
 no autoinstall configuration
 no autoinstall firmware
 interface vlan1
 interface vlan4090
 interface fe 5 2

 interface fe 9 1
 use firewall-policy default
 service pm sys-restart
 t5 country-code US
 cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#

```

### 7.3.8 t5-logging

► *T5 Profile Config Commands*

Configures a maximum of 5 (five) remote hosts capable of receiving syslog messages from this selected T5 controller

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
t5-logging host <IP> severity [error|info|notice|trace|warning] facility
[local0|local1|local2|local3|local4|local5|local6|local7]
```

**Parameters**

```
• t5-logging host <IP> severity [error|info|notice|trace|warning] facility
[local0|local1|local2|local3|local4|local5|local6|local7]
```

|                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t5-logging host <IP>                                               | Configures syslog message logging settings <ul style="list-style-type: none"> <li>• host &lt;IP&gt; - Configures the external syslog remote host resource’s IP address. This is the host dedicated to receive T5 syslog messages.</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| severity [error info notice trace warning]                         | Configures the syslog message filtering severity level. The options are: <ul style="list-style-type: none"> <li>• Error - Only forwards error and above syslog event messages.</li> <li>• Info - Only forwards informational and above syslog event messages.</li> <li>• notice - Only forwards syslog notices relating to general device operational events. These are events that are of more interest than the “info” events.</li> <li>• trace - Only forwards trace routing event messages</li> <li>• warning - Only forwards warnings and above syslog event messages</li> </ul> |
| facility [local0 local1 local2 local3 local4 local5 local6 local7] | Configures the facility level for log messages sent to the syslog server. The facility level specifies the type of program logging the message. Specifying the facility level allows the configuration file to specify that message handling will vary with varying facility type. The options are: local0, local1, local2, local3, local4, local5, local5, local6, local7. The default value is local7.                                                                                                                                                                              |

**Example**

```
nx9500-6C8809(config-profile-T5TestProfile)#t5-logging host 192.168.13.10
severity warning facility local6

nx9500-6C8809(config-profile-T5TestProfile)#show context
profile t5 T5TestProfile
 t5-logging host 192.168.13.10 severity warning facility local6
 no autoinstall configuration

 no autoinstall firmware
 t5 country-code US
 cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#
```

**Related Commands**

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>no</i> | Modifies message logging severity level and facilities |
|-----------|--------------------------------------------------------|

### 7.3.9 use

► *T5 Profile Config Commands*

Associates a management policy with this T5 profile. The specified policy is applied to all T5 controllers using this profile.

**Supported in the following platforms:**

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

**Syntax**

```
use management-policy <POLICY-NAME>
```

**Parameters**

- use management-policy <POLICY-NAME>

|                                     |                                                                                                                                                                                                         |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| use management-policy <POLICY-NAME> | Associates a management policy with this T5 profile (should be existing and configured) <ul style="list-style-type: none"> <li>• &lt;POLICY-NAME&gt; - Specify the management policy's name.</li> </ul> |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-t5Profile)#use management-policy default
Trustpoints HTTPS Server and RSA keys for SSH can be configured with 'trustpoint'
and 'rsa-key' commands in device context
nx9500-6C8809(config-profile-t5Profile)#
```

**Related Commands**

|           |                                                         |
|-----------|---------------------------------------------------------|
| <i>no</i> | Removes the management policy used with this T5 profile |
|-----------|---------------------------------------------------------|

## 7.4 EX3524 & EX3548 Profile/Device Config Commands

### ► PROFILES

Creates a new EX3524 and EX3548 profile and enters its configuration mode.

To navigate to this instance, use the following commands:

```
<DEVICE>(config)#profile ex35xx <EX35XX-PROFILE-NAME>
```

Where ex35xx can be a EX3524 or a EX3548 device type.

```
<DEVICE>(config-profile-<EX35XX-PROFILE-NAME>)#?
EX35XX Profile Mode commands:
interface Select an interface to configure
ip Internet Protocol (IP)
no Negate a command or set its defaults
power EX3500 Power over Ethernet Command
upgrade Configures upgrade option for ex3500 system
use Set setting to use

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

<DEVICE>(config-profile-<EX35XX-PROFILE-NAME>)#
```

The following table summarizes EX3524 and EX3548 profile/device configuration mode commands:

| Command          | Description                                                                             | Reference         |
|------------------|-----------------------------------------------------------------------------------------|-------------------|
| <i>interface</i> | Selects an interface type and enters the selected interface's configuration mode        | <i>page 7-507</i> |
| <i>ip</i>        | Configures the default gateway through which this EX35XX switch can reach other subnets | <i>page 7-527</i> |
| <i>power</i>     | Enables power inline compatibility mode on this EX35XX profile                          | <i>page 7-528</i> |
| <i>upgrade</i>   | Configures adopted EX35XX switch upgrade settings                                       | <i>page 7-529</i> |
| <i>use</i>       | Applies an EX3500 management policy to this EX35XX profile                              | <i>page 7-530</i> |
| <i>no</i>        | Removes or reverts this EX35XX profile's settings                                       | <i>page 7-531</i> |

## 7.4.1 interface

### ▶ *EX3524 & EX3548 Profile/Device Config Commands*

This command selects an interface type and enters the selected interface's configuration mode. The EX35XX switch has GE and VLAN interfaces. Select the interface type and provide the interface ID to enter its configuration mode.

| Command                               | Description                                                                      | Reference         |
|---------------------------------------|----------------------------------------------------------------------------------|-------------------|
| <i>interface</i>                      | Selects an interface type and enters the selected interface's configuration mode | <i>page 7-508</i> |
| <i>interface-ge-config commands</i>   | Summarizes GE interface configuration mode commands                              | <i>page 7-510</i> |
| <i>interface-vlan-config commands</i> | Summarizes VLAN interface configuration mode commands                            | <i>page 7-523</i> |

### 7.4.1.1 interface

► *interface*

Selects the EX35XX interface type and enters the selected interface's configuration mode

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
interface [ge 1 <1-48>|vlan <1-4094>]
```

**Parameters**

- interface [ge 1 <1-48>|vlan <1-4094>]

|               |                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface     | Selects the EX35XX interface type and enters its configuration mode. The interface options available are: GE and VLAN                                                                                                                                                                                                               |
| ge 1 <1-48>   | Selects a GE interface to configure <ul style="list-style-type: none"> <li>• 1 - Configures the GE interface unit identifier as 1</li> <li>• &lt;1-48&gt; - Configures the physical port number from 1 - 24/48</li> </ul> <p><b>Note:</b> For the EX3524 model switch the GE port range is 1-24, and for the EX3548 it is 1-48.</p> |
| vlan <1-4094> | Selects a VLAN interface to configure <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN interface ID from 1 - 4094.</li> </ul>                                                                                                                                                                             |

**Example**

```
nx4500-5CFA8E(config-profile-testEX35XX)#interface vlan 1
nx4500-5CFA8E(config-profile-testEX35XX-if-vlan1)#?
commands:
 ip Internet Protocol (IP)
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx4500-5CFA8E(config-profile-testEX35XX-if-vlan1)#

nx4500-5CFA8E(config-profile-testEX35XX)#interface ge 1 1
nx4500-5CFA8E(config-profile-testEX35XX-if-ge1-1)#?
commands:
 access-group Access group to bind a port to an ACL name
 no Negate a command or set its defaults
 port Configures the characteristics of the port
 power EX3500 Power over Ethernet Command
 shutdown Shutdown the selected interface
 speed-duplex Configures speed and duplex operation
 switchport Configures switch mode characteristics
 use Set setting to use
```

```

### 7.4.1.2 interface-ge-config commands

#### ► *interface*

The following table lists the EX35XX GE interface configuration mode commands:

| <b>Command</b>      | <b>Description</b>                                                                                                                   | <b>Reference</b>  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>access-group</i> | Binds an EX3500 ACL to the selected port                                                                                             | <i>page 7-511</i> |
| <i>port</i>         | Enables port monitoring on the selected port                                                                                         | <i>page 7-512</i> |
| <i>power</i>        | Turns power on or off for the selected port                                                                                          | <i>page 7-514</i> |
| <i>shutdown</i>     | Shuts down the selected port                                                                                                         | <i>page 7-516</i> |
| <i>speed-duplex</i> | Configures the speed and duplex mode of the selected port when auto-negotiation is disabled. Auto-negotiation is enabled by default. | <i>page 7-517</i> |
| <i>switch-port</i>  | Configures the switch mode characteristics of the selected port                                                                      | <i>page 7-518</i> |
| <i>use</i>          | Applies a EX3500 QoS policy map with the selected port                                                                               | <i>page 7-520</i> |
| <i>no</i>           | Removes or reverts the selected port's settings                                                                                      | <i>page 7-521</i> |

### 7.4.1.2.1 access-group

► *interface-ge-config commands*

Binds an EX3500 ACL to the selected port

When applied to the port, the ACL takes effect. Only one ACL can be bound to a port at a time. In case you bind a new ACL to a port with an existing ACL binding, the old binding is replaced with the new one.

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
access-group [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list]
<ACL-NAME> in {time-range <TIME-RANGE-NAME>}
```

**Parameters**

- access-group [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list] <ACL-NAME> in {time-range <TIME-RANGE-NAME>}

|                                   |                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| access-group                      | Binds a EX3500 ACL with this GE port. Select ACL type and specify the ACL name. The ACL should be existing and configured.                                                                                                                                                                                                                    |
| ex3500-ext-access-list <ACL-NAME> | Binds an existing and configured EX3500 extended ACL<br><ul style="list-style-type: none"> <li>• &lt;ACL-NAME&gt; - Specify the ACL name.</li> </ul>                                                                                                                                                                                          |
| ex3500-std-access-list <ACL-NAME> | Binds an existing and configured EX3500 standard ACL<br><ul style="list-style-type: none"> <li>• &lt;ACL-NAME&gt; - Specify the ACL name.</li> </ul>                                                                                                                                                                                          |
| mac-access-list <ACL-NAME>        | Binds an existing and configured EX3500 MAC ACL<br><ul style="list-style-type: none"> <li>• &lt;ACL-NAME&gt; - Specify the MAC ACL name.</li> </ul>                                                                                                                                                                                           |
| in                                | Applies the specified ACL to all incoming packets                                                                                                                                                                                                                                                                                             |
| time-range <TIME-RANGE-NAME>      | Optional. Associates a EX3500 absolute or periodic time range with this access group. The specified ACL is bound to the port during the time period specified by the associated time range.<br><ul style="list-style-type: none"> <li>• &lt;TIME-RANGE-NAME&gt; - Specify the time range name (should be existing and configured).</li> </ul> |

**Example**

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#access-group ex3500-ext-
access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
 access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

### 7.4.1.2.2 port

▶ *interface-ge-config commands*

Enables port monitoring on the selected port. This allows the port to monitor specified ports and/or MAC address(es). When enabled, the switch sends a copy of the network packets seen on the specified switch port (or VLAN interface) to the monitoring switch port. These packets are analyzed and debugged to provide vital information, such as network performance, intrusion alerts, etc.

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
port monitor [ethernet|ex3500-ext-access-list|ex3500-std-access-list|mac-access-list|mac-address|vlan]
port monitor ethernet 1 <1-52> {both|rx|tx}
port monitor [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list] <ACL-NAME>
port monitor mac-address <MAC>
port monitor vlan <1-4094>
```

**Parameters**

- port monitor ethernet 1 <1-52> {both|rx|tx}

|                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 7.4.1.2.3 power

► *interface-ge-config commands*

Enables power allocation to the selected port. When enabled, the power is allocated to this port. Use the command to configure the power allocation settings, such as maximum power allocated, priority level of this port in connection with power allocation, and the time range within which these power settings are applied.

This option is enabled by default.

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
power inline {maximum|priority|time-range}
power inline {maximum allocation milliwatts <3000-34200>}
power inline {priority [critical|high|low]}
power inline {time-range <TIME-RANGE-NAME>}
```

**Parameters**

- `power inline {maximum allocation milliwatts <3000-34200>}`

|                                            |                                                                                                                                                                                                                                         |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| power inline                               | Turns power on or off for the selected port. This option is enabled by default.                                                                                                                                                         |
| maximum allocation milliwatts <3000-34200> | Optional. Configures the maximum power allocation, in milliwatts, for this port <ul style="list-style-type: none"> <li>• &lt;3000-34200&gt; - Specify a value from 3000 - 34200 milliwatts. The default is 34200 milliwatts.</li> </ul> |

- `power inline {priority [critical|high|low]}`

|                              |                                                                                                                                                                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| power inline                 | Turns power on or off for the selected port. This option is enabled by default.                                                                                                                                                                                                                                  |
| priority [critical high low] | Optional. Configures the PoE power priority as: <ul style="list-style-type: none"> <li>• critical - Configures the PoE power priority as critical</li> <li>• high - Configures the PoE power priority as high</li> <li>• low - Configures the PoE power priority as low (this is the default setting)</li> </ul> |

- `power inline {time-range <TIME-RANGE-NAME>}`

|                              |                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| power inline                 | Turns power on or off for the selected port. This option is enabled by default.                                                                                                                 |
| time-range <TIME-RANGE-NAME> | Optional. Binds a EX3500 time range to this port <ul style="list-style-type: none"> <li>• &lt;TIME-RANGE-NAME&gt; - Specify the time range name (should be existing and configured).</li> </ul> |

**Example**

```

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#power inline maximum
allocation milliwatts 30000

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#power inline priority critical

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#power inline time-range
EX3500_TimeRange_01

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
 power inline maximum allocation milliwatts 30000
 power inline priority critical
 power inline time-range EX3500_TimeRange_01
 access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
 port_monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#

```

**Related Commands**

|-----------|------------------------------------------------|
| <i>no</i> | Disables power allocation to the selected port |
|-----------|------------------------------------------------|

### 7.4.1.2.4 shutdown

▶ *interface-ge-config commands*

Shuts down the selected port

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
shutdown
```

**Parameters**

None

**Example**

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#shutdown
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
 shutdown
 power inline maximum allocation milliwatts 30000
 power inline priority critical
 power inline time-range EX3500_TimeRange_01
 access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
 port monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

**Related Commands**

|           |                           |
|-----------|---------------------------|
| <i>no</i> | Brings up a shutdown port |
|-----------|---------------------------|

### 7.4.1.2.5 speed-duplex

▶ *interface-ge-config commands*

Configures the speed and duplex mode of the selected port when auto-negotiation is disabled. Auto-negotiation is enabled by default.

This option is disabled by default.

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
speed-duplex [100full|100half|10full|10half]
```

**Parameters**

- speed-duplex [100full|100half|10full|10half]

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>speed-duplex [100full 100half  10full 10half]</pre> | <p>Configures the speed and duplex mode of the selected port to one of the following modes:</p> <ul style="list-style-type: none"> <li>• 100full – Forces 100 Mbps full-duplex operation</li> <li>• 100half – Forces 100 Mbps half-duplex operation</li> <li>• 10full – Force 10 Mbps full-duplex operation</li> <li>• 10half – Force 10 Mbps half-duplex operation</li> </ul> <p>When configured, forces the switch to operate at the specified speed and mode.</p> |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#speed-duplex 100half

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
shutdown
speed-duplex 100half
power inline maximum allocation milliwatts 30000
power inline priority critical
power inline time-range EX3500_TimeRange_01
access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
port_monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

**Related Commands**

|           |                                                                          |
|-----------|--------------------------------------------------------------------------|
| <i>no</i> | Removes the speed and duplex settings configured for this EX35XX profile |
|-----------|--------------------------------------------------------------------------|

### 7.4.1.2.6 switch-port

► *interface-ge-config commands*

Configures the switch mode characteristics of the selected port

**Supported in the following platforms:**

- Switches – EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
switchport [allowed|l2protocol-tunnel|mode|native]
switchport allowed [add <VLAN-ID>|none|remove <VLAN-ID>]
switchport l2protocol-tunnel [cdp|lldp|pvst+|spanning-tree|vtp]
switchport mode [access|hybrid|trunk]
switchport native
```

**Parameters**

- switchport allowed [add <VLAN-ID>|none|remove <VLAN-ID>]

|                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|-----------|--------------------------------------------------------|
| <i>no</i> | Removes the selected port's switchport characteristics |
|-----------|--------------------------------------------------------|

**7.4.1.2.7 use**

▶ *interface-ge-config commands*

Applies a EX3500 QoS policy map with the selected port

**Supported in the following platforms:**

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
use ex3500-policy-map <EX3500-QoS-POLICY-MAP-NAME> in
```

**Parameters**

- use ex3500-policy-map <EX3500-QoS-POLICY-MAP-NAME> in

|                                                                     |                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>use ex3500-policy-map &lt;EX3500-QoS-POLICY-MAP-NAME&gt;</pre> | <p>Applies a EX3500 QoS policy map with the selected port</p> <ul style="list-style-type: none"> <li>• &lt;EX3500-QoS-POLICY-MAP-NAME&gt; - Specify the EX3500 QoS policy map name (should be existing and configured)</li> <li>• in - Applies the specified policy to traffic ingressing at the selected port.</li> </ul> |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#use ex3500-policy-map in test
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
shutdown
speed-duplex 100half
switchport mode access
use ex3500-policy-map in test
power inline maximum allocation milliwatts 30000
power inline priority critical
power inline time-range EX3500_TimeRange_01
access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
port monitor vlan 20

| <p><i>no</i></p> | <p>Disassociates the EX3500 QoS policy map linked to this EX3500 profile</p> |
|------------------|------------------------------------------------------------------------------|

### 7.4.1.2.8 no

► *interface-ge-config commands*

Removes or reverts the selected port's settings

**Supported in the following platforms:**

- Switches — EX3524, EX3548

**Syntax**

```
no [access-group|port|power|shutdown|speed-duplex|switchport|use]
no access-group [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list]
<ACL-NAME> in
no port monitor [ethernet|ex3500-ext-access-list|ex3500-std-access-list|mac-
access-list|mac-address|vlan]
no port monitor ethernet 1 <1-52>
no port monitor [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list]
<ACL-NAME>
no port monitor mac-address <MAC>
no port monitor vlan <1-4094>
no power inline {maximum allocation|priority|time-range}
no shutdown
no speed-duplex
no switchport [l2protocol-tunnel [cdp|lldp|pvst+|spanning-tree|vtp]|native vlan]
no use ex3500-policy-map in
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                |
|-----------------|--------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts the selected port's settings based on the parameters passed |
|-----------------|--------------------------------------------------------------------------------|

**Example**

The following example shows the EX3524 profile's GE port 20's settings before the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
 shutdown
 speed-duplex 100half
 switchport mode access
 use ex3500-policy-map in test
 power inline maximum allocation milliwatts 30000
 power inline priority critical
 power inline time-range EX3500 TimeRange_01
 access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
 port monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#no shutdown
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#no power inline maximum
allocation
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#no use ex3500-policy-map in
```

The following example shows the EX3524 profile's GE port 20's settings after the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
 speed-duplex 100half
 switchport mode access
 power inline maximum allocation milliwatts 32400
 power inline priority critical
 power inline time-range EX3500_TimeRange_01
 access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range
EX3500_TimeRange_01
 port monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

### 7.4.1.3 interface-vlan-config commands

► *interface*

The following table lists the VLAN interface configuration mode commands:

| Command   | Description                                                        | Reference         |
|-----------|--------------------------------------------------------------------|-------------------|
| <i>ip</i> | Configures IP related settings for this VLAN interface             | <i>page 7-524</i> |
| <i>no</i> | Removes the IP related settings configured for this VLAN interface | <i>page 7-526</i> |

### 7.4.1.3.1 ip

► *interface-vlan-config commands*

Configures IP related settings for this VLAN interface

**Supported in the following platforms:**

- Switches – EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
ip address [<IP/M>|bootp|dhcp]
```

```
ip address <IP/M> {default-gateway <IP>|secondary <IP>}
```

```
ip address [bootp|dhcp]
```

**Parameters**

- ip address <IP/M> {default-gateway <IP>|secondary <IP>}

|                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>ip address &lt;IP/M&gt; {default-gateway &lt;IP&gt; secondary &lt;IP&gt;}</pre> | <p>Manually configures the selected VLAN interface's primary and secondary IPv4 addresses. It also allows to optionally configure the default gateway.</p> <ul style="list-style-type: none"> <li>• &lt;IP/M&gt; – Manually configures this VLAN interface's IP address in the A.B.C.D/M format. Network mask for the associated IP subnet. This mask identifies the host address bits used for routing to specific subnets. The network mask can be either in the traditional format xxx.xxx.xxx.xxx or use classless format with the range /5 to /32. For example the subnet 255.255.224.0 would be /19.</li> <li>• default-gateway &lt;IP&gt; – Optional. Configures the default gateway's IP address. This is the gateway through which this switch can reach other subnets not found in the local routing table. Before specifying the default gateway, ensure that the network interface directly connecting to the gateway is configured on the route. By default no gateway is specified. <ul style="list-style-type: none"> <li>• &lt;IP&gt; – Specify the IP address in the A.B.C.D address.</li> </ul> </li> <li>• secondary &lt;IP&gt; – Optional. Configures this VLAN interface's secondary IP address <ul style="list-style-type: none"> <li>• &lt;IP&gt; – Specify the secondary IP address in the A.B.C.D address</li> </ul> </li> </ul> |
| <ul style="list-style-type: none"> <li>• ip address [bootp dhcp]</li> </ul>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <pre>ip address [bootp dhcp]</pre>                                                   | <p>Enables a DHCP or Bootp server to provide the primary IPv4 address for the selected VLAN interface</p> <ul style="list-style-type: none"> <li>• bootp – Enables the VLAN interface to get its IP address from a Bootp server</li> <li>• dhcp – Enables the VLAN interface to get its IP address from a DHCP server</li> </ul> <p>If selecting DHCP/Bootp, ensure that a server on the network has been configured to provide the necessary configuration to the switch. Using DHCP or Bootp results in frequent connectivity loss between the browser interface and the switch. Further, DHCP and Bootp cannot configure secondary IP addresses needed for multinetting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Example**

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#ip address 192.168.13.28/24
default-gateway 192.168.13.13

nx9500-6C8809(config-profile-testEX3524-if-vlan20)#show context
interface vlan 20
 ip address 192.168.13.28/24 default-gateway 192.168.13.13
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#
```

**Related Commands**

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>no</i> | Removes the IP address configured for this VLAN interface |
|-----------|-----------------------------------------------------------|

### 7.4.1.3.2 no

#### ▶ *interface-vlan-config commands*

Removes the IP related settings configured for this VLAN interface

#### Supported in the following platforms:

- Switches – EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
no ip address [<IP/M>|bootp|dhcp]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes this EX3500's selected VLAN's settings based on the parameters passed |
|-----------------|-------------------------------------------------------------------------------|

#### Example

The following example shows the interface VLAN 20 setting before the 'no' command is executed:

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#show context
interface vlan 20
 ip address 192.168.13.28/24 default-gateway 192.168.13.13
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#
```

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#no ip address 192.168.13.28/24
```

The following example shows the interface VLAN 20 setting after the 'no' command is executed:

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#show context
interface vlan 20
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#
```

## 7.4.2 ip

### ► EX3524 & EX3548 Profile/Device Config Commands

Configures the default gateway through which this EX35XX switch can reach other subnets

#### Supported in the following platforms:

- Switches – EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
ip default-gateway <IP>
```

#### Parameters

- ip default-gateway <IP>

|                         |                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip default-gateway <IP> | Configures the default gateway's IP address in the A.B.C.D format <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the IP address.</li> </ul> |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config-profile-testEX3524)#ip default-gateway 192.168.13.13

nx9500-6C8809(config-profile-testEX3524)#show context

```

### 7.4.3 power

▶ *EX3524 & EX3548 Profile/Device Config Commands*

Enables power inline compatibility mode on this EX35XX profile. This option is disabled by default.

**Supported in the following platforms:**

- Switches – EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
power inline compatible
```

**Parameters**

- power inline compatible

|                         |                                         |
|-------------------------|-----------------------------------------|
| power inline compatible | Enables power inline compatibility mode |
|-------------------------|-----------------------------------------|

**Example**

```
nx9500-6C8809(config-profile-testEX3524)#power inline compatible

nx9500-6C8809(config-profile-testEX3524)#show context
profile ex3524 testEX3524
ip default-gateway 192.168.13.13
power inline compatible
no autoinstall configuration
no autoinstall firmware
interface ge 1 17
interface ge 1 16
interface ge 1 15
interface ge 1 14
interface ge 1 13
interface ge 1 12
--More--
nx9500-6C8809(config-profile-testEX3524)#
```

## 7.4.4 upgrade

### ► EX3524 & EX3548 Profile/Device Config Commands

Configures adopted EX35XX switch upgrade settings

For a EX35XX switch to adopt to and be managed by a WiNG controller, you need to upload two images on the switch. An *operation code* (opcode) image and an adopted image. The opcode image functions as an operating system that enables the WiNG controller to communicate with the EX35XX switch. This command allows you to configure the EX35XX's opcode image upgrade settings.

#### Supported in the following platforms:

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
upgrade opcode [auto|path <LINE>|reload]
```

#### Parameters

- upgrade opcode [auto|path <LINE>|reload]

|                |                                                                       |
|----------------|-----------------------------------------------------------------------|
| upgrade opcode | Configures the opcode image upgrade settings                          |
| auto           | Enables automatic upgrade                                             |
| path <LINE>    | Configures the location of the opcode image                           |
| reload         | Enables automatic reload after successful loading of the opcode image |

#### Example

```
<EX35XX-DEVICE>#show versions
Unit 1

```

## 7.4.5 use

### ▶ EX3524 & EX3548 Profile/Device Config Commands

Applies an EX3500 management policy to this EX35XX profile

#### Supported in the following platforms:

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
use ex3500-management-policy <POLICY-NAME>
```

#### Parameters

- use ex3500-management-policy <POLICY-NAME>

|                                                                      |                                                                                                                                                                                                                            |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>use ex3500-<br/>management-policy<br/>&lt;POLICY-NAME&gt;</pre> | <p>Applies an EX3500 management policy to this EX35XX profile</p> <ul style="list-style-type: none"> <li>• &lt;POLICY-NAME&gt; - Specify the EX3500 management policy name (should be existing and configured).</li> </ul> |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-testEX3524)#use ex3500-management-policy test
Trustpoints HTTPS Server and RSA keys for SSH can be configured with 'trustpoint'
and 'rsa-key' commands in device context
nx9500-6C8809(config-profile-testEX3524)#

nx9500-6C8809(config-profile-testEX3524)#show context
profile ex3524 testEX3524
ip default-gateway 192.168.13.13
power inline compatible
no autoinstall configuration
no autoinstall firmware
interface ge 1 17
interface ge 1 16
interface ge 1 15
--More--
use ex3500-management-policy test
use firewall-policy default
service pm sys-restart
upgrade opcode auto
upgrade opcode path ftp://anonymous:anonymous@192.168.13.10/ex35xx/EX3524.img
upgrade opcode reload
nx9500-6C8809(config-profile-testEX3524)#
```

## 7.4.6 no

### ► EX3524 & EX3548 Profile/Device Config Commands

Removes or reverts this EX3500 profile's settings

#### Supported in the following platforms:

- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
no [interface vlan <1-4094>|default-gateway {<IP>}|power inline compatible|
upgrade opcode [auto|path|reload]|use ex3500-management-policy]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                |

```

# 8 AAA-POLICY

This chapter summarizes the *Authentication, Authorization, and Accounting (AAA)* policy commands in the CLI command structure.

A AAA policy enables administrators to define access control settings governing network permissions. External RADIUS and LDAP servers (AAA servers) also provide user database information and user authentication data. Each WLAN maintains its own unique AAA configuration.

AAA provides a modular way of performing the following services:

*Authentication* — Provides a means for identifying users, including login and password dialog, challenge and response, messaging support and (depending on the security protocol), encryption. Authentication is the technique by which a user is identified before allowed access to the network. Configure AAA authentication by defining a list of authentication methods, and then applying the list to various interfaces. The list defines the authentication schemes performed and their sequence. The list must be applied to an interface before the defined authentication technique is conducted.

*Authorization* — Authorization occurs immediately after authentication. Authorization is a method for remote access control, including authorization for services and individual user accounts and profiles. Authorization functions through the assembly of attribute sets describing what the user is authorized to perform. These attributes are compared to information contained in a database for a given user and the result is returned to AAA to determine the user's actual capabilities and restrictions. The database could be located locally or be hosted remotely on a RADIUS server. Remote RADIUS servers authorize users by associating *attribute-value (AV)* pairs with the appropriate user. Each authorization method must be defined through AAA. When AAA authorization is enabled it's applied equally to all interfaces.

*Accounting* — Collects and sends security server information for billing, auditing, and reporting user data; such as start and stop times, executed commands (such as PPP), number of packets, and number of bytes. Accounting enables wireless network administrators to track the services users are accessing and the network resources they are consuming. When accounting is enabled, the network access server reports user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored locally on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA. When AAA accounting is activated, it is applied equally to all interfaces on the access servers.

Use the (config) instance to configure AAA policy commands. To navigate to the config-aaa-policy instance, use the following commands:

```
<DEVICE>(config)#aaa-policy <POLICY-NAME>

rfs6000-37FABE(config)#aaa-policy test

rfs6000-37FABE(config-aaa-policy-test)#?
AAA Policy Mode commands:
 accounting Configure accounting parameters
 attribute Configure RADIUS attributes in access and accounting
 requests
 authentication Configure authentication parameters
 health-check Configure server health-check parameters
 mac-address-format Configure the format in which the MAC address must be
 filled in the Radius-Request frames
 no Negate a command or set its defaults
 proxy-attribute Configure radius attribute behavior when proxying
 through controller or rf-domain-manager
 server-pooling-mode Configure the method of selecting a server from the
```

```
use pool of configured AAA servers
 Set setting to use

## 8.1 aaa-policy

### ► AAA-POLICY

The following table summarizes AAA policy configuration commands:

**Table 8.1** AAA-Policy-Config Commands

| Command                    | Description                                                                                                              | Reference        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|------------------|
| <i>accounting</i>          | Configures accounting parameters                                                                                         | <i>page 8-4</i>  |
| <i>attribute</i>           | Configure RADIUS attributes in access and accounting requests                                                            | <i>page 8-8</i>  |
| <i>authentication</i>      | Configures authentication parameters                                                                                     | <i>page 8-11</i> |
| <i>health-check</i>        | Configures health check parameters                                                                                       | <i>page 8-16</i> |
| <i>mac-address-format</i>  | Configures the MAC address format                                                                                        | <i>page 8-17</i> |
| <i>no</i>                  | Negates a command or sets its default                                                                                    | <i>page 8-19</i> |
| <i>proxy-attribute</i>     | Configures the RADIUS server's attribute behavior when proxying through the wireless controller or the RF Domain manager | <i>page 8-21</i> |
| <i>server-pooling-mode</i> | Defines the method for selecting a server from the pool of configured AAA servers                                        | <i>page 8-22</i> |
| <i>use</i>                 | Defines the AAA command settings                                                                                         | <i>page 8-23</i> |

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

## 8.1.1 accounting

### ► *aaa-policy*

Configures the server type and interval at which interim accounting updates are sent to the server. A maximum of 6 accounting servers can be configured.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
accounting [interim|server|type]
accounting interim interval <60-3600>
accounting server [<1-6>|preference]
accounting server preference [auth-server-host|auth-server-number|none]
accounting server <1-6> [dscp|host|nai-routing|onboard|proxy-mode|retry-timeout-factor|timeout]
accounting server <1-6> [dscp <0-63>|retry-timeout-factor <50-200>]
accounting server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2 <SECRET>|<SECRET>] {port <1-65535>}
accounting server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-TEXT> {strip}
accounting server <1-6> onboard [centralized-controller|self|controller]
accounting server <1-6> proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]
accounting server <1-6> timeout <1-60> {attempts <1-10>}
accounting type [start-interim-stop|start-stop|stop-only]
```

#### Parameters

- `accounting interim interval <60-3600>`

|                                                                                                                                          |                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interim                                                                                                                                  | Configures the interim accounting interval. This is the interval at which interim accounting updates are posted to the accounting server.                                                                              |
| interval <60-3000>                                                                                                                       | Specify the interim interval from 60 - 3600 seconds. The default is 1800 seconds.                                                                                                                                      |
| <ul style="list-style-type: none"> <li>• <code>accounting server preference [auth-server-host auth-server-number none]</code></li> </ul> |                                                                                                                                                                                                                        |
| server                                                                                                                                   | Configures a RADIUS accounting server's settings                                                                                                                                                                       |
| preference                                                                                                                               | Configures the accounting server's preference mode. Authentication requests are forwarded to a accounting server, from the pool, based on the preference mode selected.                                                |
| auth-server-host                                                                                                                         | Sets the authentication server as the accounting server. This is the default setting.<br>This parameter indicates the same server is used for authentication and accounting. The server is identified by its hostname. |

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth-server-number                                 | Sets the authentication server as the accounting server<br>This parameter indicates the same server is used for authentication and accounting. The server is identified by its index or number.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| none                                               | Indicates the accounting server is independent of the authentication server<br><br>• <code>accounting server &lt;1-6&gt; [dscp &lt;0-63&gt; retry-timeout-factor &lt;50-200&gt;]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| server <1-6>                                       | Configures an accounting server. Up to 6 accounting servers can be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| dscp <0-63>                                        | Sets the <i>Differentiated Services Code Point</i> (DSCP) value for <i>Quality of Service</i> (QoS) monitoring. This value is used in generated RADIUS packets.<br>• <0-63> - Sets the DSCP value from 0 - 63. The default value is 34.                                                                                                                                                                                                                                                                                                                                                                                           |
| retry-timeout-factor <50-200>                      | Sets the scaling factor for retransmission timeouts. The timeout at each attempt is a function of this retry-timeout factor and the attempt number.<br>• <50-200> - Specify a value from 50 - 200. The default is 100.<br><br>If the scaling factor is 100, the interval between two consecutive retries remains the same, irrespective of the number of retries.<br><br>If the scaling factor is less than 100, the interval between two consecutive retries reduces with subsequent retries.<br><br>If this scaling factor is greater than 100, the interval between two consecutive retries increases with subsequent retries. |
|                                                    | • <code>accounting server &lt;1-6&gt; host &lt;IP/HOSTNAME/HOST-ALIAS&gt; secret [0 &lt;SECRET&gt; 2 &lt;SECRET&gt; &lt;SECRET&gt;] {port &lt;1-65535&gt;}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| server <1-6>                                       | Configures an accounting server. Up to 6 accounting servers can be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| host <IP/<br>HOSTNAME/HOST-<br>ALIAS>              | Configures the accounting server's hostname IP address, or host-alias<br>The host alias should be existing and configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| secret<br>[0 <SECRET> <br>2 <SECRET> <br><SECRET>] | Configures a common secret key used to authenticate with the accounting server<br>• 0 <SECRET> - Configures a clear text secret key<br>• 2 <SECRET> - Configures an encrypted secret key<br>• <SECRET> - Specify the secret key. This shared secret should not exceed 127 characters.                                                                                                                                                                                                                                                                                                                                             |
