|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nai-routing                                                                                                                                                                                                                             | Enables <i>Network Access Identifier</i> (NAI) routing. This option is disabled by default.<br>The NAI is a character string in the format of an e-mail address as either <i>user</i> or <i>user@realm</i> but it need not be a valid e-mail address or a fully qualified domain name. AAA servers identify clients using the NAI. The NAI can be used either in a <i>specific</i> or <i>generic</i> form. The specific form, which must contain the user portion and may contain the @realm portion, identifies a single user. Using the generic form allows all users to be configured on a single command line, irrespective of whether the users are within a realm or not. Each user still needs a unique security association, but these associations can be stored on a AAA server. The original purpose of the NAI was to support roaming between dial up ISPs. With NAI, an ISP does not have the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers as need be. |
| realm-type                                                                                                                                                                                                                              | Specifies whether the prefix or suffix of the username is used as the match criteria. For example, if the option selected is prefix, the username's prefix is matched to the realm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| [prefix suffix]                                                                                                                                                                                                                         | Select one of the following options: <ul style="list-style-type: none"> <li>• prefix – Matches the prefix of the username (For example, username is of type DOMAIN/user1, DOMAIN/user2). This is the default setting.</li> <li>• suffix – Matches the suffix of the username (For example, user1@DOMAIN, user2@DOMAIN)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| realm<br><REALM-TEXT>                                                                                                                                                                                                                   | Configures the text matched against the username. Enter the realm name (should not exceed 50 characters). When the RADIUS accounting server receives a request for a user name, the server references a table of user names. If the user name is known, the server proxies the request to the RADIUS server. <ul style="list-style-type: none"> <li>• &lt;REALM-TEXT&gt; – Specifies the matching text including the delimiter (a delimiter is typically " or '@')</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| strip                                                                                                                                                                                                                                   | Optional. When enabled, strips the realm from the username before forwarding the request to the RADIUS server. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Up to 6 accounting servers can be configured.                                                                                                                      |
| timeout <1-60>                                                                                                                              | Configures the timeout for each request sent to the RADIUS server <ul style="list-style-type: none"> <li>• &lt;1-60&gt; - Specify a value from 1 - 60 seconds. The default is 5 seconds.</li> </ul> |
| attempts <1-10>                                                                                                                             | Optional. Specifies the number of times a transmission request is attempted <ul style="list-style-type: none"> <li>• &lt;1-10&gt; - Specify a value from 1 - 10. The default is 3.</li> </ul>       |
| <ul style="list-style-type: none"> <li>• <code>accounting type [start-interim-stop start-stop stop-only]</code></li> </ul>                  |                                                                                                                                                                                                     |
| type                                                                                                                                        | Configures the type of RADIUS accounting packets sent. The options are: start-interim-stop, start-stop, and stop-only.                                                                              |
| start-interim-stop                                                                                                                          | Sends accounting-start and accounting-stop messages when the session starts and stops. This parameter also sends interim accounting updates.                                                        |
| start-stop                                                                                                                                  | Sends accounting-start and accounting-stop messages when the session starts and stops. This is the default setting.                                                                                 |
| stop-only                                                                                                                                   | Sends an accounting-stop message when the session ends                                                                                                                                              |

**Example**

```
rfs6000-37FABE(config-aaa-policy-test)#accounting interim interval 65

rfs6000-37FABE(config-aaa-policy-test)#accounting server 2 host 172.16.10.10
secret test1 port 1
rfs6000-37FABE(config-aaa-policy-test)#accounting server 2 timeout 2 attempts 2
rfs6000-37FABE(config-aaa-policy-test)#accounting type start-stop
rfs6000-37FABE(config-aaa-policy-test)#accounting server preference auth-server-number

rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
 accounting server 2 host 172.16.10.10 secret 0 test1 port 1
 accounting server 2 timeout 2 attempts 2
 accounting interim interval 65
 accounting server preference auth-server-number
rfs6000-37FABE(config-aaa-policy-test)#
```

## 8.1.2 attribute

### ▶ *aaa-policy*

Configures RADIUS Framed-MTU attribute used in access and accounting requests. The Framed-MTU attribute reduces the *Extensible Authentication Protocol* (EAP) packet size of the RADIUS server. This command is useful in networks where routers and firewalls do not perform fragmentation.

To ensure network security, some firewall software drop UDP fragments from RADIUS server EAP packets. Consequently, the packets are large. Using Framed MTU reduces the packet size. EAP authentication uses Framed MTU to notify the RADIUS server about the *Maximum Transmission Unit* (MTU) negotiation with the client. The RADIUS server communications with the client do not include EAP messages that cannot be delivered over the network.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622,, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
attribute [acct-delay-time|acct-multi-session-id|chargeable-user-identity|cisco-
vsa|framed-ip-address|framed-mtu|location-information|nas-ip-address|nas-ipv6-
address|operator-name|service-type]
```

```
attribute acct-delay-time
attribute acct-multi-session-id
attribute chargeable-user-identity
attribute cisco-vsa audit-session-id
attribute framed-ip-address
attribute framed-mtu <100-1500>
attribute location-information [include-always|none|server-requested]
attribute nas-ip-address <WORD>
attribute nas-ipv6-address
attribute operator-name <OPERATOR-NAME>
attribute service-type [framed|login]
```

#### Parameters

- attribute acct-delay-time

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acct-delay-time | <p>Enables support for <i>accounting-delay-time</i> attribute in accounting requests. When enabled, this attribute indicates the number of seconds the client has been trying to send a request to the accounting server. By subtracting this value from the time the packet is received by the server, the system is able to calculate the time of a request-generating event. Note, the network transit time is ignored. This option is disabled by default.</p> <p>Including the <i>acct-delay-time</i> attribute in accounting requests updates the acct-delay-time value whenever the packet is retransmitted, This changes the content of the attributes field, requiring a new identifier and request authenticator.</p> |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- attribute acct-multi-session-id

|                       |                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acct-multi-session-id | <p>Enables support for <i>accounting-multi-session-id</i> attribute. When enabled, it allows linking of multiple related sessions of a roaming client. This option is useful in scenarios where a client roaming between access points sends multiple RADIUS accounting requests to different access points. This option is disabled by default.</p> |

| nas-ip-address<br><WORD>                                                                                                               | <p>Enables configuration of an IP address, which is used as the RADIUS attribute 4, NAS-IP-Address, without changing the source IP address in the IP header of the RADIUS packets. If you are using a cluster of small network access servers (NASs) to simulate a large NAS, use this option to improve scalability. The IP address configured using this option allows the NASs to behave as a single RADIUS client from the perspective of the RADIUS server.</p> <ul style="list-style-type: none"> <li>• <code>&lt;WORD&gt;</code> – Provide the IPv4 address.</li> </ul>                                                                                                                                                                                                                                                                                                                          |

- `attribute nas-ipv6-address`

|                  |                                                                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nas-ipv6-address | Enables support for NAS IPv6 address. This option is disabled by default.<br>When enabled, IPv6 addresses are assigned to hosts. The length of IPv4 and IPv6 addresses is 32-bit and 128-bit respectively. Consequently, an IPv6 address requires a larger address space. |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `attribute operator-name <OPERATOR-NAME>`

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operator-name<br><OPERATOR-NAME> | Enables support for RFC5580 operator name attribute. When enabled, the network operator's name is included in all RADIUS authentication and accounting messages and uniquely identifies the access network owner. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;OPERATOR-NAME&gt; - Specify the network operator's name (should not exceed 63 characters in length).</li> </ul> |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `attribute service-type [framed|login]`

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service-type<br>[framed login] | Configures the service-type (6) attribute value. This attribute identifies the following: the type of service requested and the type of service to be provided. <ul style="list-style-type: none"> <li>• framed - Sets service-type to <i>framed</i> (2) in the authentication packets. When enabled, a framed protocol, <i>Point-to-Point Protocol</i> (PPP) or <i>Serial Line Internet Protocol</i> (SLIP), is started for the client. This is the default setting.</li> <li>• login - Sets service-type to <i>login</i> (1) in the authentication packets. When enabled, the client is connected to the host.</li> </ul> |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Example

```
rfs6000-37FABE(config-aaa-policy-test)#attribute framed-mtu 110
rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
 accounting server 2 host 172.16.10.10 secret 0 test1 port 1
 accounting server 2 timeout 2 attempts 2
 accounting interim interval 65
 accounting server preference auth-server-number
attribute framed-mtu 110
rfs6000-37FABE(config-aaa-policy-test)#

rfs6000-37FABE(config-aaa-policy-test1)#attribute cisco-vsa audit-session-id

rfs6000-37FABE(config-aaa-policy-test1)#show context
aaa-policy test
attribute cisco-vsa audit-session-id
rfs6000-37FABE(config-aaa-policy-test)#
```

## 8.1.3 authentication

### ► *aaa-policy*

Configures user authentication parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
authentication [eap|protocol|server]

authentication eap wireless-client [attempts <1-10>|identity-request-retry-
timeout <10-5000>|identity-request-timeout <1-60>|retry-timeout-factor <50-200>|
timeout <1-60>]

authentication protocol [chap|mschap|mschapv2|pap]

authentication server <1-6> [dscp|host|nac|nai-routing|onboard|proxy-mode|retry-
timeout-factor|timeout]

authentication server <1-6> dscp <0-63>

authentication server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2
<SECRET>|<SECRET>] {port <1-65535>}

authentication server <1-6> nac

authentication server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-
NAME>{strip}

authentication server <1-6> onboard [centralized-controller|controller|self]

authentication server <1-6> proxy-mode [none|through-centralized-controller|
through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-
manager]

authentication server <1-6> retry-timeout-factor <50-200>

authentication server <1-6> timeout <1-60> {attempts <1-10>}
```

#### Parameters

- authentication eap wireless-client [attempts <1-10>|identity-request-retry-
timeout <10-5000>|identity-request-timeout <1-60>|retry-timeout-factor <50-
200>|timeout <1-60>]

|                                           |                                                                                                                                                                                                                                                                      |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eap                                       | Configures EAP authentication parameters                                                                                                                                                                                                                             |
| wireless-client                           | Configures wireless client's EAP parameters                                                                                                                                                                                                                          |
| attempts <1-10>                           | Configures the maximum number of attempts allowed to authenticate a wireless client <ul style="list-style-type: none"> <li>• &lt;1-10&gt; - Specify a value from 1 - 10. The default is 3.</li> </ul>                                                                |
| identity-request-retry- timeout <10-5000> | Configures the interval, in milliseconds, after which an EAP-identity request to the wireless client is retried <ul style="list-style-type: none"> <li>• &lt;10-5000&gt; - Specify a value from 10 - 5000 milliseconds. The default is 1000 milliseconds.</li> </ul> |

|                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| nac                                                                                                                                                       | Enables <i>Network Access Control</i> (NAC) on the RADIUS authentication server identified by the <1-6> parameter.<br><br>Using NAC, the controller hardware and software grant access to specific network resources. NAC performs a user and client authorization check for resources that do not have a NAC agent. NAC verifies the client's compliance with the controller's security policy. The controller supports only the EAP/802.1x type of NAC. However, the controller also provides a means to bypass NAC authentication for client's that do not have NAC 802.1x support (printers, phones, PDAs, etc.).                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| nai-routing                                                                                                                                               | Enables NAI routing. When enabled, AAA servers identify clients using NAI. This option is disabled by default.<br><br>The NAI is a character string in the format of an e-mail address as either <i>user</i> or <i>user@realm</i> but it need not be a valid e-mail address or a fully qualified domain name. AAA servers identify clients using the NAI. The NAI can be used either in a <i>specific</i> or <i>generic</i> form. The specific form, which must contain the user portion and may contain the @realm portion, identifies a single user. Using the generic form allows all users to be configured on a single command line, irrespective of whether the users are within a realm or not. Each user still needs a unique security association, but these associations can be stored on a AAA server. The original purpose of the NAI was to support roaming between dial up ISPs. With NAI, an ISP does not have the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers as need be. |

|-----------|-----------------------------------------------------|

## 8.1.4 health-check

### ► *aaa-policy*

An AAA server could go offline. When a server goes offline, it is marked as *down*. This command configures the interval after which a server marked as *down* is checked to see if it has come back online and is reachable.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
health-check interval <60-86400>
```

#### Parameters

- health-check interval <60-86400>

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| interval <60-86400> | Configures an interval (in seconds) after which a down server is checked to see if it is reachable again |
|                     | • <60-86400> - Specify a value from 60 - 86400 seconds. The default is 3600 seconds.                     |

#### Example

```
rfs6000-37FABE(config-aaa-policy-test)#health-check interval 4000

rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
 authentication server 5 host 172.16.10.10 secret 0 test1 port 1
 authentication server 5 timeout 10
 accounting server 2 host 172.16.10.10 secret 0 test1 port 1
 accounting server 2 timeout 2 attempts 2
 authentication protocol chap
 accounting interim interval 65
 accounting server preference auth-server-number
 health-check interval 4000
 attribute framed-mtu 110
rfs6000-37FABE(config-aaa-policy-test)#
```

#### Related Commands

|           |                                                  |
|-----------|--------------------------------------------------|
| <i>no</i> | Resets the health-check interval for AAA servers |
|-----------|--------------------------------------------------|

## 8.1.5 mac-address-format

### ► *aaa-policy*

Configures the format MAC addresses are filled in RADIUS request frames

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot]
mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case
[lower|upper] attributes [all|username-password]
```

#### Parameters]

- `mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper] attributes [all|username-password]`

|                                    |                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| middle-hyphen                      | Configures the MAC address format as AABBCC-DDEEFF                                                                                                                                                                                                                                                                                                 |
| no-delim                           | Configures the MAC address format as AABBCCDDEEFF (without delimiters)                                                                                                                                                                                                                                                                             |
| pair-colon                         | Configures the MAC address format as AA:BB:CC:DD:EE:FF                                                                                                                                                                                                                                                                                             |
| pair-hyphen                        | Configures the MAC address display format as AA-BB-CC-DD-EE-FF (default setting)                                                                                                                                                                                                                                                                   |
| quad-dot                           | Configures the MAC address display format as AABB.CCDD.EEFF                                                                                                                                                                                                                                                                                        |
| case [lower upper]                 | Indicates the case the MAC address is formatted <ul style="list-style-type: none"> <li>• lower - Indicates MAC address is in lower case. For example, aa:bb:cc:dd:ee:ff</li> <li>• upper - Indicates MAC address is in upper case. For example, AA:BB:CC:DD:EE:FF (default setting)</li> </ul>                                                     |
| attributes [all username-password] | Configures RADIUS attributes to which this MAC format is applicable <ul style="list-style-type: none"> <li>• all - Applies to all attributes with MAC addresses such as username, password, calling-station-id, and called-station-id</li> <li>• username-password - Applies only to the username and password fields (default setting)</li> </ul> |

#### Example

```
rfs6000-37FABE(config-aaa-policy-test)#mac-address-format quad-dot case upper
attributes username-password
```

```
rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
authentication server 5 host 172.16.10.10 secret 0 test1 port 1
authentication server 5 timeout 10
accounting server 2 host 172.16.10.10 secret 0 test1 port 1
accounting server 2 timeout 2 attempts 2
mac-address-format quad-dot case upper attributes username-password
authentication protocol chap
--More--
rfs6000-37FABE(config-aaa-policy-test)#
```

|-----------|--------------------------------------------------------|
| <i>no</i> | Resets the MAC address format to default (pair-hyphen) |
|-----------|--------------------------------------------------------|

## 8.1.6 no

### ► *aaa-policy*

Negates a AAA policy command or sets its default

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [accounting|attribute|authentication|health-check|mac-address-format|proxy-
attribute|server-pooling-mode|use]

no accounting interim interval

no accounting server preference

no accounting server <1-6> {dscp|nai-routing|proxy-mode|retry-timeout-factor|
timeout}

no accounting type

no attribute [acct-delay-time|acct-multi-session-id|chargeable-user-identity|
cisco-vsa audit-session-id|framed-ip-address|framed-mtu|location-information|nas-
ipv6-address|operator-name|service-type]

no authentication [eap|protocol|server]

no authentication eap wireless-client [attempts|identity-request-retry-timeout|
identity-request-timeout|retry-timeout-factor|timeout]

no authentication protocol

no authentication server <1-6> {dscp|nac|nai-routing|proxy-mode|retry-timeout-
factor|timeout}

no health-check interval

no mac-address-format

no proxy-attribute [nas-identifier|nas-ip-address]

no server-pooling-mode

no use nac-list
```

#### Parameters

- no <PARAMETERS>

|                 |                                                  |
|-----------------|--------------------------------------------------|
| no <PARAMETERS> | Negates a AAA policy command or sets its default |
|-----------------|--------------------------------------------------|

**Example**

The following example shows the AAA policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
 authentication server 5 host 172.16.10.10 secret 0 test1 port 1
 authentication server 5 timeout 10
 accounting server 2 host 172.16.10.10 secret 0 test1 port 1
 accounting server 2 timeout 2 attempts 2
 mac-address-format quad-dot case upper attributes username-password
 authentication protocol chap
 accounting interim interval 65
 accounting server preference auth-server-number
 health-check interval 4000
 attribute framed-mtu 110
rfs6000-37FABE(config-aaa-policy-test)#

rfs6000-37FABE(config-aaa-policy-test)#no accounting server 2 timeout 2
rfs6000-37FABE(config-aaa-policy-test)#no accounting interim interval
rfs6000-37FABE(config-aaa-policy-test)#no health-check interval
rfs6000-37FABE(config-aaa-policy-test)#no attribute framed-mtu
rfs6000-37FABE(config-aaa-policy-test)#no authentication protocol
```

The following example shows the AAA policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
 authentication server 5 host 172.16.10.10 secret 0 test1 port 1
 authentication server 5 timeout 10
 accounting server 2 host 172.16.10.10 secret 0 test1 port 1
 mac-address-format quad-dot case upper attributes username-password
 accounting server preference auth-server-number
 health-check interval 4000
rfs6000-37FABE(config-aaa-policy-test)#
```

## 8.1.7 proxy-attribute

### ► *aaa-policy*

Configures RADIUS server's attribute behavior when proxying through a wireless controller or a RF Domain manager

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
proxy-attribute [nas-identifier|nas-ip-address]
proxy-attribute [nas-identifier [originator|proxier]|nas-ip-address
[none|proxier]]
```

#### Parameters

- proxy-attribute [nas-identifier [originator|proxier]|nas-ip-address [none|proxier]]

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nas-identifier<br>[originator proxier] | <p>Uses NAS identifier</p> <ul style="list-style-type: none"> <li>• originator - Configures the NAS identifier as the originator of the RADIUS request. The originator could be an AP, or a wireless controller with radio. This is the default setting.</li> <li>• proxier - Configures the proxying device as the NAS identifier. The device could be a controller or a RF Domain manager.</li> </ul> |
| nas-ip-address<br>[none proxier]       | <p>Uses NAS IP address</p> <ul style="list-style-type: none"> <li>• none - NAS IP address attribute is not filled</li> <li>• proxier - NAS IP address is filled by the proxying device. The device could be a controller or a RF Domain manager. This is the default setting.</li> </ul>                                                                                                                |

#### Example

```
rfs6000-37FABE(config-aaa-policy-test)#proxy-attribute nas-ip-address proxier
rfs6000-37FABE(config-aaa-policy-test)#proxy-attribute nas-identifier originator
```

#### Related Commands

|           |                                            |
|-----------|--------------------------------------------|
| <i>no</i> | Resets RADIUS server's proxying attributes |
|-----------|--------------------------------------------|

## 8.1.8 server-pooling-mode

Configures the server selection method from a pool of AAA servers. The available methods are *failover* and *load-balance*.

In the failover scenario, when a configured AAA server goes down, the server with the next higher index takes over for the failed server.

In the load-balance scenario, when a configured AAA server goes down, the remaining servers distribute the load amongst themselves.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
server-pooling-mode [failover|load-balance]
```

### Parameters

- `server-pooling-mode [failover|load-balance]`

|              |                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| failover     | Sets the pooling mode to failover. This is the default setting.<br>When a configured AAA server fails, the server with the next higher index takes over the failed server's load.     |
| load-balance | Sets the pooling mode to load balancing<br>When a configured AAA server fails, all servers in the pool share the failed server's load transmitting requests in a round-robin fashion. |

### Example

```
rfs6000-37FABE(config-aaa-policy-test)#server-pooling-mode load-balance

rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
authentication server 5 host 172.16.10.10 secret 0 test2 port 1
authentication server 5 timeout 10
accounting server 2 host 172.16.10.10 secret 0 test1 port 1
server-pooling-mode load-balance
mac-address-format quad-dot case upper attributes username-password
accounting server preference auth-server-number
health-check interval 4000
rfs6000-37FABE(config-aaa-policy-test)#
```

### Related Commands

|           |                                                                                  |
|-----------|----------------------------------------------------------------------------------|
| <i>no</i> | Resets the method of selecting a server, from the pool of configured AAA servers |
|-----------|----------------------------------------------------------------------------------|

## 8.1.9 use

### ► *aaa-policy*

Associates a *Network Access Control* (NAC) with this AAA policy. This allows only the set of configured devices to use the configured AAA servers.

For more information on creating a NAC list, see *nac-list*.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
use nac-list <NAC-LIST-NAME>
```

#### Parameters

- `use nac-list <NAC-LIST-NAME>`

|                                             |                                                                                                                                                                                                    |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>nac-list &lt;NAC-LIST-NAME&gt;</code> | Associates a NAC list with this AAA policy <ul style="list-style-type: none"> <li>• <code>&lt;NAC-LIST-NAME&gt;</code> - Specify the NAC list name (should be existing and configured).</li> </ul> |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-aaa-policy-test)#use nac-list test1

rfs6000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
 authentication server 5 host 172.16.10.10 secret 0 test1 port 1
 authentication server 5 timeout 10
 accounting server 2 host 172.16.10.10 secret 0 test1 port 1
 server-pooling-mode load-balance
 mac-address-format quad-dot case upper attributes username-password
 accounting server preference auth-server-number
 health-check interval 4000
 use nac-list test1
rfs6000-37FABE(config-aaa-policy-test)#
```

#### Related Commands

# 9 AUTO-PROVISIONING-POLICY

This chapter summarizes the auto provisioning policy commands in the CLI command structure.

Wireless devices can adopt and manage other wireless devices. For example, a wireless controller can adopt multiple access points. When a device is adopted, the device configuration is provisioned by the adopting device. Since multiple configuration policies are supported, an adopting device uses auto provisioning policies to determine which configuration policies are applied to an adoptee based on its properties. For example, a configuration policy could be assigned based on MAC address, IP address, CDP snoop strings, etc.

Auto provisioning or adoption is the process by which an access point discovers controllers in the network, identifies the most desirable controller, associates with the identified controller, and optionally obtains an image upgrade, obtains its configuration and considers itself provisioned.

At adoption, an access point solicits and receives multiple adoption responses from controllers available on the network. These adoption responses contain loading policy information the access point uses to select the optimum controller for adoption. An auto-provisioning policy maps a new AP to a profile and RF Domain based on various parameters related to the AP and where it is connected. By default a new AP will be mapped to the default profile and default RF Domain. Modify existing auto-provisioning policies or create a new one as needed to meet the configuration requirements of a device.

An auto-provisioning policy enables an administrator to define rules for the supported access points capable of being adopted by a controller. The policy determines which configuration policies are applied to an adoptee based on its properties. For example, a configuration policy could be assigned based on MAC address, IP address, *CISCO Discovery Protocol* (CDP) snoop strings, etc. Once created an auto provisioning policy can be used in profiles or device configuration objects. The policy contains a set of rules (ordered by precedence) that either deny or allow adoption based on potential adoptee properties and a catch-all variable that determines if the adoption should be allowed when none of the rules is matched. All rules (both deny and allow) are evaluated sequentially starting with the rule with the lowest precedence. The evaluation stops as soon as a rule has been matched, no attempt is made to find a better match further down in the set.

For example,

```
rule #1 adopt ap7161 10 profile default vlan 10
rule #2 adopt ap6562 20 profile default vlan 20
rule #3 adopt ap7161 30 profile default serial-number
rule #4 adopt ap7161 40 p d mac aa bb
```

AP7161 L2 adoption, VLAN 10 - will use rule #1

AP7161 L2 adoption, VLAN 20 - will not use rule #2 (wrong type), may use rule #3 if the serial number matched, or rule #4

If aa<= MAC <= bb, or else default.

With the implementation of the *hierarchically managed* (HM) network, the auto-provisioning policy has been modified to enable controllers to adopt other controllers in addition to access points.

The new WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller, The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

All adopted devices (access points and second-level controllers) are referred to as the ‘adoptee’. The adopting devices are the ‘adopters’.

A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller). Therefore, a site controller, which has been adopted by a NOC controller, cannot adopt another controller.

A controller should be configured to specify the device types (APs and/or controllers) that it can adopt. For more information on configuring the adopted-device types for a controller, see [controller](#).

---

**NOTE:** The adoption capabilities of a controller depends on:

- Whether the controller is deployed at the NOC or site
    - A NOC controller can adopt site controllers and access points
    - A site controller can only adopt access points
  - The controller device type, which determines the number and type of devices it can adopt
- 

**NOTE:** Some access points can be configured as virtual controllers. When configured as a virtual controller, an AP can only adopt another AP of the same type. In such a scenario, an auto provisioning policy is required to enable adoption of a specific device identified by its MAC address, IP address, serial number, model number, etc.

---

Use the (config) instance to configure an auto-provisioning policy. To navigate to the auto-provisioning-policy configuration instance, use the following command:

```
<DEVICE>(config)#auto-provisioning-policy <POLICY-NAME>

nx9500-6C8809((config)#auto-provisioning-policy test
nx9500-6C8809((config-auto-provisioning-policy-test)#?
Auto-Provisioning Policy Mode commands:
 adopt Add rule for device adoption
 auto-create-rfd-template When RF Domain specified by the matching rule
 template does not exist create new RF Domain
 automatically
 default-adoption Adopt devices even when no matching rules are
 found. Assign default profile and default
 rf-domain
 deny Add rule to deny device adoption
 evaluate-always Set the flag to evaluate the policy everytime,
 regardless of previous adoption status
 no Negate a command or set its defaults
 redirect Add rule to redirect device adoption
 upgrade Add rule for device upgrade

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal
nx9500-6C8809((config-auto-provisioning-policy-test)#
```

**NOTE:** The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore ( \_ ) character. In other words, the name of a device cannot contain an underscore.

---

## 9.1 auto-provisioning-policy

► *AUTO-PROVISIONING-POLICY*

The following table summarizes auto provisioning policy configuration commands:

**Table 9.1** *Auto-Provisioning-Policy-Config Commands*

| Command                         | Description                                                                                                   | Reference        |
|---------------------------------|---------------------------------------------------------------------------------------------------------------|------------------|
| <i>adopt</i>                    | Adds a permit adoption rule                                                                                   | <i>page 9-5</i>  |
| <i>auto-create-rfd-template</i> | Enables auto creation of a new RF Domain based on an existing RF Domain template specified using this command | <i>page 9-10</i> |
| <i>default-adoption</i>         | Adopts devices even when no matching rules are found. Assigns default profile and default RF Domain           | <i>page 9-12</i> |
| <i>deny</i>                     | Adds a deny adoption rule                                                                                     | <i>page 9-13</i> |
| <i>evaluate-always</i>          | Runs this policy every time a device is adopted                                                               | <i>page 9-16</i> |
| <i>redirect</i>                 | Adds a rule redirecting device adoption to a specified controller within the system                           | <i>page 9-17</i> |
| <i>upgrade</i>                  | Adds a device upgrade rule to this auto provisioning policy                                                   | <i>page 9-21</i> |
| <i>no</i>                       | Negates a command or reverts settings to their default                                                        | <i>page 9-24</i> |

**NOTE:** For more information on common commands (clear, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

## 9.1.1 adopt

### ► *auto-provisioning-policy*

Adds device adoption rules

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
adopt [anyap|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|

#### Parameters

- adopt [anyap|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|nx5500|nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000> [profile <DEVICE-PROFILE-NAME>|rf-domain <RF-DOMAIN-NAME>] any

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adopt | <p>Adds an adopt device rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.</p> <p>The different device types are: anyap, AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX7500, NX7510, NX7520, NX7530 NX95XX, VX9000, and NX9600.</p> <p>Note: 'anyap' is used in auto provisioning policies to create rules that are applicable to any AP regardless of the model type.</p> |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| precedence<br><1-10000>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Sets the rule precedence from 1 - 10000. A rule with a lower value has a higher precedence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| profile<br><DEVICE-PROFILE-NAME>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Sets the device profile for this provisioning policy. The selected device profile must be appropriate for the device being provisioned. For example, use an AP7502 device profile for an AP7502. Using an inappropriate device profile can result in unpredictable results. Provide a device profile name.</p> <p>Provide a device profile name (should be existing and configured). Or a template with appropriate substitution tokens, such as 'campus-\$MODEL[1:6]', 'FQDN[1:4]-indoor'.</p> <p>Please see the Usage Guidelines section <i>Built-in Tokens &amp; Alias</i> for the different types of built in tokens available in the system.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| rf-domain<br><RF-DOMAIN-NAME>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Sets the RF Domain for this auto provisioning policy. The provisioning policy is only applicable to devices that try to become a part of the specified RF Domain. Provide the full RF Domain name OR use a string alias to identify the RF Domain.</p> <p>Provide the full RF Domain name or an alias (should be existing and configured). Or a template with appropriate substitution tokens, such as '\$CDP[1:7]', '\$DNS-SUFFIX[1:5]'</p> <p>Please see the Usage Guidelines section <i>Built-in Tokens &amp; Alias</i> for the different types of built in tokens available in the system.</p> <p><b>Note:</b> Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, 'alias string \$DOMAIN test.example_company.com'. In this example, the string-alias \$DOMAIN is mapped to the string: test.example_company.com. For more information, see <i>alias</i>.</p> |

A rule with a lower value has a higher precedence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>profile<br/>&lt;DEVICE-PROFILE-NAME&gt;</p>  | <p>Sets the device profile for this provisioning policy. The selected device profile must be AP7502 for the device being provisioned. For example, use an AP7502 device profile for an AP7502. Using an inappropriate device profile can result in unpredictable results. Provide a device profile name (should be existing and configured). Or a template with appropriate substitution tokens, such as 'campus-\$MODEL[1:6]', 'FQDN[1:4]-indoor' Please see the Usage Guidelines section <i>Built-in Tokens &amp; Alias</i> for the different types of built in tokens available in the system.</p>                                                                                                                                                                                                                                                                                                                                                          |
| <p>rf-domain<br/>&lt;RF-DOMAIN-NAME&gt;</p>     | <p>Sets the RF Domain for this auto provisioning policy. The provisioning policy is only applicable to devices that try to become a part of the specified RF Domain. Provide the full RF Domain name or an alias (should be existing and configured). Or a template with appropriate substitution tokens, such as '\$CDP[1:7]', '\$DNS-SUFFIX[1:5]'. Please see the Usage Guidelines section <i>Built-in Tokens &amp; Alias</i> for the different types of built in tokens available in the system.<br/><b>Note:</b> Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, 'alias string \$DOMAIN test.example_company.com'. In this example, the string-alias <i>\$DOMAIN</i> is mapped to the string: <i>test.example_company.com</i>. For more information, see <i>alias</i>.</p> |
| <p>area &lt;AREA-NAME&gt;</p>                   | <p>Matches the area of deployment. This option is not applicable to the 'rf-domain' parameter.</p> <ul style="list-style-type: none"> <li>• &lt;AREA-NAME&gt; - Enter a 64 character maximum deployment area name assigned to this policy. Devices with matching area names are adopted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p>cdp-match<br/>&lt;LOCATION-SUBSTRING&gt;</p> | <p>Matches a substring in a list of CDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com, and controller3.example.com, 'controller1', 'example', 'example.com', are examples of the substrings that will match.</p> <ul style="list-style-type: none"> <li>• &lt;LOCATION-SUBSTRING&gt; - Specify the value to match. Devices matching the specified value are adopted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p>dhcp-option<br/>&lt;DHCP-OPTION&gt;</p>      | <p>Matches the value found in DHCP vendor option 191 (case insensitive). DHCP vendor option 191 can be setup to communicate various configuration parameters to an AP. The value of the option in a string in the form of tag=value separated by a semicolon, for example 'tag1=value1;tag2=value2;tag3=value3'. The access point includes the value of tag 'rf-domain', if present.</p> <ul style="list-style-type: none"> <li>• &lt;DHCP-OPTION&gt; - Specify the DHCP option. Devices matching the specified value are adopted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>floor<br/>&lt;FLOOR-NAME&gt;</p>             | <p>Matches the floor name. This option is not applicable to the 'rf-domain' parameter.</p> <ul style="list-style-type: none"> <li>• &lt;FLOOR-NAME&gt; - Enter a 32 character maximum deployment floor name assigned to this policy. Devices with matching floor names are adopted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p>fqdn &lt;FQDN&gt;</p>                        | <p>Matches a substring to the <i>Fully Qualified Domain Name</i> (FQDN) of a device (case insensitive)<br/>FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain. This parameter allows a device to adopt based on its FQDN value.</p> <ul style="list-style-type: none"> <li>• &lt;FQDN&gt; - Specify the FQDN. Devices matching the specified value are adopted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <pre>rf-domain &lt;RF-DOMAIN-NAME&gt;</pre>                        | <p>Adopts a device if its RF Domain matches &lt;RF-DOMAIN-NAME&gt;</p> <p>&lt;RF-DOMAIN-NAME&gt; – Specify the RF Domain name. You can use a string alias to specify a RF Domain.</p> <p>Provide the full RF Domain name or an alias (should be existing and configured). Or a template with appropriate substitution tokens, such as '\$CDP[1:7]', '\$DNS-SUFFIX[1:5]' Please see the Usage Guidelines section <i>Built-in Tokens &amp; Alias</i> for the different types of built in tokens available in the system.</p> <p><b>Note:</b> Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, 'alias string \$DOMAIN test.example_company.com'. In this example, the string-alias <i>\$DOMAIN</i> is mapped to the string: <i>test.example_company.com</i>. For more information, see <i>alias</i>.</p> |
| <pre>serial-number &lt;SERIAL-NUMBER&gt;</pre>                     | <p>Adopts a device if its serial number matches &lt;SERIAL-NUMBER&gt;</p> <ul style="list-style-type: none"> <li>• &lt;SERIAL-NUMBER&gt; – Specify the serial number.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <pre>vlan &lt;VLAN-ID&gt;</pre>                                    | <p>Adopts a device if its VLAN matches &lt;VLAN-ID&gt;</p> <ul style="list-style-type: none"> <li>• &lt;VLAN-ID&gt; – Specify the VLAN ID.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Usage Guidelines Built-in Tokens & Alias

Following are the built-in tokens that can be used to identify the devices to adopt:

```

$FQDN - references FQDN of adopting device
$CDP - references CDP Device Id of the wired switch to which
 adopting device is connected
$LLDP - references LLDP System Name of wired switch to
 which adopting device is connected
$DHCP - references DHCP Option Value received by the
 adopting device
$SN - references SERIAL NUMBER of adopting device
$MODEL - references MODEL NUMBER of adopting device
$DNS-SUFFIX - references FQDN excluding the hostname of the
 adopting device
$CDP-SUFFIX - references CDP excluding the hostname of the
 adopting device
$LLDP-SUFFIX - references LLDP excluding the hostname of the
 adopting device

```

Following is the built-in alias that can be used to identify the RF Domain of devices to adopt:

```
$AUTO-RF-DOMAIN - rf-domain of adopting device
```

### Example

```

rfs4000-229D58(config-auto-provisioning-policy-test)#adopt ap81xx precedence 1
profile default-ap81xx vlan 1

rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
 adopt ap81xx precedence 1 profile default-ap81xx vlan 1
rfs4000-229D58(config-auto-provisioning-policy-test)#

rfs4000-229D58(config-auto-provisioning-policy-test)#show wireless ap configured

 IDX NAME MAC PROFILE RF-DOMAIN ADOPTED-BY

 1 ap81xx-711728 B4-C7-99-71-17-28 default-ap81xx default 00-23-68-22-
9D-58
 2 rfs4000-229D58 00-23-68-22-9D-58 default-rfs4000 default

rfs4000-229D58(config-auto-provisioning-policy-test)#

rfs6000-6DCD4B(config-auto-provisioning-policy-test)#adopt anyap precedence 1
profile rfs6000 any

rfs6000-6DCD4B(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
 adopt anyap precedence 1 profile rfs6000 any
rfs6000-6DCD4B(config-auto-provisioning-policy-test)#

```

|-----------|-----------------------|
| <i>no</i> | Removes an adopt rule |
|-----------|-----------------------|

## 9.1.2 auto-create-rfd-template

### ► *auto-provisioning-policy*

Enables auto creation of an RF Domain:

- when tokens are used to select the RF Domain to apply to devices matching the adoption criteria, and
- the token-specified RF Domain does not exist.

During device adoption, if the token-specified RF Domain (configured using the 'adopt' rule) is not found, the system auto creates a new RF Domain based on an existing RF Domain template specified using this command. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
auto-create-rfd-template <RF-DOMAIN-NAME>
```

#### Parameters

- auto-create-rfd-template <RF-DOMAIN-NAME>

|                                                             |                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>auto-creates-rfd-template<br/>&lt;RF-DOMAIN-NAME&gt;</p> | <p>Auto creates a new RF Domain based on an existing RF Domain template</p> <ul style="list-style-type: none"> <li>• &lt;RF-DOMAIN-NAME&gt; - Specify the RF Domain name (should be existing and configured). The new RF Domain created is saved with the token name specified in the 'adopt' command.</li> </ul> <p><b>Note:</b> For more information on configuring tokens, see <i>adopt</i>.</p> |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

The following example configures an adopt rule for adopting any AP7532 and applying an RF Domain matching the token "\$MODEL[1:5]" to the adopted AP:

```
nx9500-6C8809(config-auto-provisioning-policy-test)#adopt ap7532 precedence 20
rf-domain $MODEL[1:5] any

nx9500-6C8809(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
 adopt ap7532 precedence 20 rf-domain $MODEL[1:5] any
nx9500-6C8809(config-auto-provisioning-policy-test)#
```

The following example enables auto creation of the following RF Domain using an existing RF Domain 'rfd-AP' as template:

- RF Domain name "AP-75": Applicable to any AP7532
- ```
nx9500-6C8809(config-auto-provisioning-policy-test)#auto-create-rfd-template rfd-
AP

nx9500-6C8809(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
  adopt ap7532 precedence 20 rf-domain $MODEL[1:5] any
  auto-create-rfd-template rfd-AP
nx9500-6C8809(config-auto-provisioning-policy-test)#
```

As per the above configurations, when an AP7532 comes up for first-time adoption, the system:

- Checks for an RF Domain matching the options provided in the 'adopt' rule, and if not found
- auto creates the RF Domain only if:
 - A token is specified in the 'adopt' rule. For example, \$MODEL[1:5], and
 - the 'auto-create-rfd-template' option is configured
- Uses the 'RF Domain' specified in the auto-create-rfd-template command as a template. Therefore, the specified RF Domain should be existing and configured.
- Applies the new RF Domain to the AP.

Related Commands

| <i>no</i> | Disables auto creation of an RF Domain |
|-----------|--|

9.1.3 default-adoption

▶ *auto-provisioning-policy*

Adopts devices, even when no matching rules are defined, and assigns a default profile and default RF Domain to the adopted device

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

default-adoption

Parameters

None

Example

```
rfs4000-229D58(config-auto-provisioning-policy-test)#default-adoption

rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
  default-adoption
  adopt ap81xx precedence 1 profile default-ap81xx vlan 1
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```

| | |
|--------------------------------------|--|
| deny | <p>Adds a deny adoption rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.</p> <p>The different device types are: anyap, AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, VX9000, and NX9600.</p> |
| precedence <1-10000> | <p>Sets the rule precedence. A rule with a lower value has a higher precedence.</p> <p>After specifying the rule precedence, specify the match criteria. Devices matching the specified criteria are denied adoption.</p> |
| cdp-match <LOCATION-SUBSTRING> | <p>Matches a substring in a list of CDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com and controller3.example.com, 'controller1', 'example', 'example.com', are examples of the substrings that will match.</p> <ul style="list-style-type: none"> <LOCATION-SUBSTRING> - Specify the value to match. Devices matching the specified value are denied adoption. |
| dhcp-option <DHCP-OPTION> | <p>Matches the value found in DHCP vendor option 191 (case insensitive). DHCP vendor option 191 can be setup to communicate various configuration parameters to an AP. The value of the option in a string in the form of tag=value separated by a semicolon, for example 'tag1=value1;tag2=value2;tag3=value3'. The access point includes the value of tag 'rf-domain', if present.</p> <ul style="list-style-type: none"> <DHCP-OPTION> - Specify the DHCP option value to match. Devices matching the specified value are denied adoption. |
| fqdn <FQDN> | <p>Matches a substring to the FQDN of a device (case insensitive)</p> <p>FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain.</p> <ul style="list-style-type: none"> <FQDN> - Specify the FQDN. Devices matching the specified value are denied adoption. |
| ip [<START-IP> <END-IP> <IP/MASK>] | <p>Denies adoption if a device's IP address matches the specified IPv4 address or is within the specified IP address range</p> <ul style="list-style-type: none"> <START-IP> - Specify the first IPv4 address in the range. <ul style="list-style-type: none"> <END-IP> - Specify the last IPv4 address in the range. <IP/MASK> - Specify the IPv4 subnet and mask to match against the device's IP address. |
| ipv6 [<START-IP> <END-IP> <IP/MASK>] | <p>Denies adoption if a device's IPv6 address matches the specified IP address or is within the specified IP address range</p> <ul style="list-style-type: none"> <START-IP> - Specify the first IPv6 address in the range. <ul style="list-style-type: none"> <END-IP> - Specify the last IPv6 address in the range. <IP/MASK> - Specify the IPv6 subnet and mask to match against the device's IP address. |

| | |
|-----------------------------------|--|
| lldp-match <LLDP-STRING> | Matches a substring in a list of LLDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com and controller3.example.com, 'controller1', 'example', 'example.com', are examples of the substrings that will match. LLDP is a vendor neutral link layer protocol used to advertise a network device's identity, capabilities, and neighbors on a local area network. <ul style="list-style-type: none"> • <LLDP-STRING> - Specify the LLDP string. Devices matching the specified values are denied adoption. |
| mac <START-MAC> {<END-MAC>} | Denies adoption if a device's MAC address matches the specified MAC address or is within the specified MAC address range <ul style="list-style-type: none"> • <START-MAC> - Specify the first MAC address in the range. Provide this MAC address if you want to match for a single device. • <END-MAC> - Optional. Specify the last MAC address in the range. |
| model-number <MODEL-NUMBER> | Denies adoption if a device's model number matches <MODEL-NUMBER> <ul style="list-style-type: none"> • <MODEL-NUMBER> - Specify the model number. |
| serial-number <SERIAL-NUMBER> | Denies adoption if a device's serial number matches <SERIAL-NUMBER> <ul style="list-style-type: none"> • <SERIAL-NUMBER> - Specify the serial number. |
| vlan <VLAN-ID> | Denies adoption if a device's VLAN matches <VLAN-ID> <ul style="list-style-type: none"> • <VLAN-ID> - Specify the VLAN ID. |

Example

```

9.1.5 evaluate-always

► *auto-provisioning-policy*

Sets flag to run this auto-provisioning policy every time an access point is adopted. The access point's previous adoption status is not taken into consideration.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
evaluate-always
```

Parameters

None

Example

```
rfs4000-229D58(config-auto-provisioning-policy-test)#evaluate-always

rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
evaluate-always
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

9.1.6 redirect

► *auto-provisioning-policy*

Adds a rule redirecting device adoption to another controller within the system. Devices seeking adoption are redirected to a specified controller based on the redirection parameters specified.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```

9.1.7 upgrade

► *auto-provisioning-policy*

Adds a device upgrade rule to this auto provisioning policy. When applied to a controller, the upgrade rule ensures adopted devices, of the specified type, are upgraded automatically.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
upgrade [anyap|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|

Removes a deny, permit, or redirect rule from the specified auto provisioning policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [adopt|auto-create-rfd-template|default-adoption|deny|evaluate-always |
redirect|upgrade]
no adopt precedence <1-10000>
no auto-create-rfd-template
no deny precedence <1-10000>
no evaluate-always
no default-adoption
no redirect precedence <1-10000>
no upgrade precedence <1-10000>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes a deny, permit, or redirect rule from the specified auto provisioning policy |
|-----------------|--|

Example

The following example shows the auto-provisioning-policy 'test' settings before the 'no' commands are executed:

```
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
  default-adoption
  adopt ap81xx precedence 1 profile default-ap81xx vlan 1
  deny ap71xx precedence 2 model-number AP7131N
  deny ap71xx precedence 3 ip 192.168.13.23 192.168.13.23
  redirect ap81xx precedence 4 controller 192.168.13.10 ip 192.168.13.25
  192.168.13.25
  redirect ap81xx precedence 5 controller 192.168.13.10 model-number AP-8132-66040-
US
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```
rfs4000-229D58(config-auto-provisioning-policy-test)#no default-adoption
rfs4000-229D58(config-auto-provisioning-policy-test)#no deny precedence 2
rfs4000-229D58(config-auto-provisioning-policy-test)#no deny precedence 3
rfs4000-229D58(config-auto-provisioning-policy-test)#no deny precedence 5
```

The following example shows the auto-provisioning-policy 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
  adopt ap81xx precedence 1 rf-domain TechPubs vlan 1
  redirect ap81xx precedence 4 controller 192.168.13.10 ip 192.168.13.25
  192.168.13.25
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
  upgrade ap6521 precedence 1 any
  upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```
rfs4000-229D58(config-auto-provisioning-policy-test)#no upgrade precedence 1
```

```
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
  upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

10 ASSOCIATION-ACL-POLICY

This chapter summarizes the association ACL policy commands in the CLI command structure. An association ACL is a policy-based *Access Control List (ACL)* that either *allows* or *denies* wireless clients from connecting to a wireless controller, service platform, or access point managed WLAN.

System administrators can use an association ACL to grant or restrict wireless clients access to the WLAN by specifying a client's MAC address or a range of MAC addresses to either include or exclude from WLAN connectivity. Association ACLs are applied to WLANs as an additional access control mechanism.

Use the (config) instance to configure the association ACL policy. To navigate to the association-acl-policy instance, use the following commands:

```
<DEVICE> (config) #association-acl-policy <POLICY-NAME>

rfs6000-37FABE (config) #association-acl-policy test
rfs6000-37FABE (config-assoc-acl-test) #

rfs6000-37FABE (config-assoc-acl-test) #?
Association ACL Mode commands:
deny      Specify MAC addresses to be denied
no        Negate a command or set its defaults
permit    Specify MAC addresses to be permitted

clrscr    Clears the display screen
commit    Commit all changes made in this session
do        Run commands from Exec mode
end       End current mode and change to EXEC mode
exit      End current mode and down to previous mode
help      Description of the interactive help system
revert    Revert changes
service   Service Commands
show      Show running system information
write     Write running configuration to memory or terminal

rfs6000-37FABE (config-assoc-acl-test) #
```

NOTE: If creating an new association ACL policy, provide a name specific to its function. Avoid naming it after a WLAN it may support. The name cannot exceed 32 characters.

Before defining an association ACL policy and applying it to a WLAN, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- The name and configuration of an association ACL policy should meet the requirements of the WLANs it may map to. However, be careful not to name ACLs after specific WLANs, as individual ACL policies can be used by more than one WLAN.
- You cannot apply more than one MAC based ACL to a layer 2 interface. If a MAC ACL is already configured on a layer 2 interface, and a new MAC ACL is applied to the interface, the new ACL replaces the previously configured one.

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (`_`) character. In other words, the name of a device cannot contain an underscore.

10.1 association-acl-policy

► ASSOCIATION-ACL-POLICY

The following table summarizes association ACL policy configuration commands:

Table 10.1 Association-ACL-Policy-Config Commands

| Command | Description | Reference |
|---------------|--|------------------|
| <i>deny</i> | Specifies a range of MAC addresses denied access to the WLAN | <i>page 10-3</i> |
| <i>no</i> | Removes a deny or permit rule from this association ACL policy | <i>page 10-5</i> |
| <i>permit</i> | Specifies a range of MAC addresses allowed access to the WLAN | <i>page 10-6</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

10.1.1 deny

► *association-acl-policy*

Creates a list of devices denied access to the managed network. Devices are identified by their MAC address. A single MAC address or a range of MAC addresses can be denied access. This command also sets the precedence on how deny rules are applied. Up to a thousand (1000) deny rules can be defined for every association ACL policy. Each rule has a unique sequential precedence value assigned, and is applied to packets on the basis of the precedence value. Lower the precedence, higher is the priority. This results in the rule with the lowest precedence being applied first. No two rules can have the same precedence. The default precedence is 1, prioritize ACLs accordingly as they are added.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
deny <STARTING-MAC> [<ENDING-MAC>|precedence]
deny <STARTING-MAC> precedence <1-1000>
deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>
```

Parameters

- deny <STARTING-MAC> precedence <1-1000>

| | |
|------------------------|--|
| deny | Adds a single device or a set of devices to the deny list |
| <STARTING-MAC> | To add a single device, enter its MAC address in the <STARTING-MAC> parameter. |
| precedence <1-1000> | Sets a precedence rule. Rules are applied in an increasing order of precedence. <ul style="list-style-type: none"> • <1-1000> – Specify a precedence value from 1 - 1000. |

- deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

| | |
|------------------------|---|
| deny | Adds a single device or a set of devices to the deny list To add a set of devices, provide the range of MAC addresses. |
| <STARTING-MAC> | Specify the first MAC address in the range. |
| <ENDING-MAC> | Specify the last MAC address in the range. |
| precedence <1-1000> | Sets a precedence rule. Rules are applied in an increasing order of precedence. <ul style="list-style-type: none"> • <1-1000> – Specify a value from 1 - 1000. |

Usage Guidelines

Every rule has a unique sequential precedence value. You cannot add two rules with the same precedence. Rules are applied in an increasing order of precedence. That means the rule with precedence 1 is applied first, then the rule with precedence 2 and so on.

Example

```
rfs6000-37FABE(config-assoc-acl-test)#deny 11-22-33-44-55-01 11-22-33-44-55-FF
precedence 150

rfs6000-37FABE(config-assoc-acl-test)#deny 11-22-33-44-56-01 11-22-33-44-56-01
precedence 160

rfs6000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
  deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
  deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
rfs6000-37FABE(config-assoc-acl-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a deny rule based on its precedence value |
|-----------|---|

10.1.2 no

► *association-acl-policy*

Removes a deny or permit rule from this association ACL policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [deny|permit]

no deny <STARTING-MAC> precedence <1-1000>
no deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

no permit <STARTING-MAC> precedence <1-1000>
no permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes a deny or permit rule from this association ACL policy |
|-----------------|--|

Example

The following example shows the association ACL policy 'test' settings before the 'no' commands is executed:

```
rfs6000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
 deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
 deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
rfs6000-37FABE(config-assoc-acl-test)#

rfs6000-37FABE(config-assoc-acl-test)#no deny 11-22-33-44-56-01 11-22-33-44-56-FF
precedence 160
```

The following example shows the association ACL policy 'test' settings after the 'no' commands is executed:

```
rfs6000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
 deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
rfs6000-37FABE(config-assoc-acl-test)#
```

10.1.3 permit

► *association-acl-policy*

Creates a list of devices allowed access to the managed network. Devices are permitted access based on their MAC address. A single MAC address or a range of MAC addresses can be specified. This command also sets the precedence on how permit list rules are applied. Up to a thousand (1000) permit rules can be defined for every association ACL policy. Each rule has a unique sequential precedence value assigned, and are applied to packets on the basis of this precedence value. Lower the precedence of a rule, higher is its priority. This results in the rule with the lowest precedence being applied first. No two rules can have the same precedence. The default precedence is 1, so be careful to prioritize ACLs accordingly as they are added.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
permit <STARTING-MAC> [<ENDING-MAC>|precedence]
permit <STARTING-MAC> precedence <1-1000>
permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>
```

Parameters

- permit <STARTING-MAC> precedence <1-1000>

| | |
|------------------------|--|
| permit | Adds a single device or a set of devices to the permit list |
| <STARTING-MAC> | To add a single device, enter its MAC address in the <STARTING-MAC> parameter. |
| precedence <1-1000> | Specifies a rule precedence. Rules are applied in an increasing order of precedence. <ul style="list-style-type: none"> • <1-1000> – Specify a value from 1 - 1000. |

- permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

| | |
|------------------------|--|
| permit | Adds a single device or a set of devices to the permit list To add a set of devices, provide the MAC address range. |
| <STARTING-MAC> | Specify the first MAC address of the range. |
| <ENDING-MAC> | Specify the last MAC address of the range. |
| precedence <1-1000> | Specifies a rule precedence. Rules are applied in an increasing order of precedence. <ul style="list-style-type: none"> • <1-1000> – Specify a value from 1 - 1000. |

Usage Guidelines

Every rule has a unique sequential precedence value. You cannot add two rules with the same precedence. Rules are applied to packets in an increasing order of precedence. That means the rule with precedence 1 is applied first, then the rule with precedence 2 and so on.

Example

```

rfs6000-37FABE(config-assoc-acl-test)# permit 11-22-33-44-66-01 11-22-33-44-66-FF
precedence 170

rfs6000-37FABE(config-assoc-acl-test)# permit 11-22-33-44-67-01 precedence 180

rfs6000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
permit 11-22-33-44-66-01 11-22-33-44-66-FF precedence 170
permit 11-22-33-44-67-01 11-22-33-44-67-01 precedence 180
rfs6000-37FABE(config-assoc-acl-test)#

```

Related Commands

|-----------|---|
| <i>no</i> | Removes a permit rule based on its precedence |
|-----------|---|

11 ACCESS-LIST

This chapter summarizes IPv4, IPv6, and MAC access list commands in the CLI command structure.

Access lists control access to the managed network using a set of rules also known as *Access Control Entries* (ACEs). Each rule specifies an action taken when a packet matches that rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed. A set of deny and/or permit rules based on IP (IPv4 and IPv6) addresses constitutes a *IP Access Control List* (ACL). Similarly, a set of deny and/or permit rules based on MAC addresses constitutes a MAC ACL.

Within a managed network, IP ACLs are used as firewalls to filter packets and also mark packets. IP based firewall rules are specific to the source and destination IP addresses and have unique precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying an IP ACL. With either IPv4 or IPv6, create access rules for traffic entering a controller, service platform, or access point interface, because if you are going to deny specific types of packets, it's recommended you do it before the controller, service platform, or access point spends time processing them, since access rules are given priority over other types of firewall rules.

MAC ACLs are firewalls that filter or mark packets based on the MAC address which they arrive, as opposed to filtering packets on layer 2 ports. Optionally filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to controller managed packet traffic.

Once defined, an IP and/or MAC ACL (consisting of a set of firewall rules) must be applied to an interface to be a functional filtering tool.

Firewall supported devices (access points, wireless controllers, and service platforms) process firewall rules (within an IP/MAC ACL) sequentially, in ascending order of their precedence value. When a packet matches a rule, the firewall applies the action specified in the rule to determine whether the traffic is allowed or denied. Once a match is made, the firewall does not process subsequent rules in the ACL.

The WiNG software enables the configuration of IP SNMP ACLs. These ACLs control access by combining IP ACLs with SNMP server community strings.

The following ACLs are supported:

- *ip-access-list*
- *mac-access-list*
- *ipv6-access-list*
- *ip-snmp-access-list*
- *ex3500-ext-access-list*
- *ex3500-std-access-list*

Use IP and MAC commands under the global configuration to create an access list.

- When the access list is applied on an Ethernet port, it becomes a port ACL.
- When the access list is applied on a VLAN interface, it becomes a router ACL.

Use the (config) instance to configure a new ACL or modify an existing ACL. To navigate to the (config-access-list) instance, use the following commands:

```

<DEVICE>(config)#ip access-list <IP-ACCESS-LIST-NAME>

<DEVICE>(config)#mac access-list <MAC-ACCESS-LIST-NAME>

<DEVICE>(config)#ipv6 access-list <IPv6-ACCESS-LIST-NAME>

<DEVICE>(config)#ip snmp-access-list <SNMP-ACCESS-LIST-NAME>

<DEVICE>(config)#ex3500-ext-access-list <EX3500-EXT-ACCESS-LIST-NAME>

<DEVICE>(config)#ex3500-std-access-list <EX3500-STD-ACCESS-LIST-NAME>

```

NOTE: If creating a new ACL policy, provide a name that uniquely identifies its purpose. The name cannot exceed 32 characters.

ip-access-list

```

rfs6000-37FABE(config)#ip access-list test
rfs6000-37FABE(config-ip-acl-test)#?
ACL Configuration commands:

```

The WiNG NOC controller also has the capabilities of adopting and managing EX3500 series switch. These switches are Gigabit Ethernet layer 2 switches with either 24 or 48 10/100/1000-BASE-T ports, and four *Small Form Factor Pluggable* (SFP) transceiver slots for fiber connectivity. Once adopted to the NOC, various ACLs specifically defined for a **EX3500** switch can be used to either prevent or allow specific clients from using it.

The following EX3500 ACLs are supported:

- *ex3500-ext-access-list*
- *ex3500-std-access-list*
- *ex3500*: This configures a EX3500 deny or permit rule in a MAC ACL.

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (`_`) character. In other words, the name of a device cannot contain an underscore.

11.1 ip-access-list

▶ ACCESS-LIST

The following table summarizes IP access list configuration commands:

Table 11.1 *IP-Access-List-Config Commands*

| Command | Description | Reference |
|----------------|---|-------------------|
| <i>deny</i> | Creates a deny access rule or modifies an existing rule. A deny access rule rejects packets from specified address(es) and/or destined for specified address(es). | <i>page 11-5</i> |
| <i>disable</i> | Disables an existing deny or permit rule without removing it from the ACL | <i>page 11-17</i> |
| <i>insert</i> | Inserts a rule in an IP ACL without overwriting or replacing an existing rule having the same precedence | <i>page 11-20</i> |
| <i>no</i> | Removes a deny and/or a permit access rule from a IP ACL | <i>page 11-22</i> |
| <i>permit</i> | Creates a permit access rule or modifies an existing rule. A permit access rule accepts packets from specified address(es) and/or destined for specified address(es). | <i>page 11-23</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

11.1.1 deny

► *ip-access-list*

Creates a deny rule that rejects packets from a specified source IP and/or to a specified destination IP. You can also use this command to modify an existing deny rule.

NOTE: Use a decimal value representation to implement a `permit/deny` designation for a packet. The command set for IP ACLs provides the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
deny [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]

deny <NETWORK-SERVICE-ALIAS-NAME> [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|
any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|any|host <DEST-
HOST-IP>|<NETWORK-GROUP-ALIAS-NAME>] (log,mark [8021p <0-7>|dscp <0-63>],
rule-precedence <1-5000>) {(rule-description <LINE>)}

deny dns-name [contains|exact|suffix]

deny dns-name [contains|exact|suffix] <WORD> (log,rule-precedence <1-5000>)

Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. rule-description – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre> • deny proto [<PROTOCOL-NUMBER> <PROTOCOL-NAME> eigrp gre igmp igp ospf vrrp] [<SOURCE-IP/MASK> <NETWORK-GROUP-ALIAS-NAME> any from-vlan <VLAN-ID> host <SOURCE-HOST-IP>] [<DEST-IP/MASK> <NETWORK-GROUP-ALIAS-NAME> any host <DEST-HOST-IP>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| proto | Configures the ACL for additional protocols Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter |
| <PROTOCOL-NUMBER> | Filters protocols using their <i>Internet Assigned Numbers Authority</i> (IANA) protocol number <ul style="list-style-type: none"> <PROTOCOL-NUMBER> – Specify the protocol number. |
| <PROTOCOL-NAME> | Filters protocols using their IANA protocol name <ul style="list-style-type: none"> <PROTOCOL-NAME> – Specify the protocol name. |
| eigrp | Identifies the <i>Enhanced Internet Gateway Routing Protocol</i> (EIGRP) protocol (number 88) EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| gre | Identifies the <i>General Routing Encapsulation</i> (GRE) protocol (number 47) GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination. |

| | |
|------------------------------------|--|
| igmp | Identifies the <i>Internet Group Management Protocol</i> (IGMP) protocol (number 2) IGMP establishes and maintains multicast group memberships to interested members. Multicasting allows a networked computer to send content to multiple computers who have registered to receive the content. IGMP snooping is for listening to IGMP traffic between an IGMP host and routers in the network to maintain a map of the links that require multicast streams. Multicast traffic is filtered out for those links which do not require them. |
| igrp | Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9) IGP enables exchange of information between hosts and routers within a managed network. The most commonly used <i>interior gateway protocol</i> (IGP) protocols are: <i>Routing Information Protocol</i> (RIP) and <i>Open Shortest Path First</i> (OSPF) |
| ospf | Identifies the OSPF protocol (number 89) OSPF is a link-state <i>interior gateway protocol</i> (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. |
| vrrp | Identifies the <i>Virtual Router Redundancy Protocol</i> (VRRP) protocol (number 112) VRRP allows a pool of routers to be advertized as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |
| <SOURCE-IP/ MASK> | Specifies the source IP address and mask (A.B.C.D/M) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified sources are dropped. |
| <NETWORK- GROUP-ALIAS- NAME> | Applies a network-group alias to identify the source IP addresses. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the sources defined in the network-group alias are dropped. <ul style="list-style-type: none"> <NETWORK-GROUP-ALIAS-NAME> - Specify the network-group alias name (should be existing and configured). |
| any | Specifies the source as any IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are dropped. |
| from-vlan <VLAN-ID> | Specifies a single VLAN or a range of VLANs as the match criteria. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the VLANs identified here are dropped. <ul style="list-style-type: none"> <VLAN-ID> - Specify the VLAN ID. A range of VLANs is represented by the start and end VLAN IDs separated by a hyphen (for example, 12-20). <p>Note: Use this option with WLANs and port ACLs.</p> |
| host <SOURCE-HOST-IP> | Identifies a specific host (as the source to match) by its IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are dropped. <ul style="list-style-type: none"> <SOURCE-HOST-IP> - Specify the source host's exact IP address in the A.B.C.D format. |
| <DEST-IP/MASK> | Specifies the destination IP address and mask (A.B.C.D/M) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified destinations are dropped. |

| | |
|---|--|
| any | Specifies the destination as any IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are dropped. |
| host <DEST-HOST-IP> | Identifies a specific host (as the destination to match) by its IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addresses to the specified host are dropped. <ul style="list-style-type: none"> <SOURCE-HOST-IP> - Specify the destination host's exact IP address in the A.B.C.D format. |
| <NETWORK-GROUP-ALIAS-NAME> | Applies a network-group alias to identify the destination IP addresses. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the destinations identified in the network-group alias are dropped. <ul style="list-style-type: none"> <NETWORK-ALIAS-NAME> - Specify the network-group alias name (should be existing and configured). <p>Note: After specifying the source and destination IP address(es), specify the action taken in case of a match.</p> |
| log | Logs all deny events matching this entry. If a source and/or destination IP address is matched (i.e. a packet (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |

Usage Guidelines

Use this command to deny traffic between networks/hosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- IP
- ICMP
- TCP
- UDP
- PROTO (any Internet protocol other than TCP, UDP, and ICMP)

The last *access control entry* (ACE) in the access list is an implicit deny statement.

Whenever the interface receives the packet, its content is checked against the ACEs in the ACL. It is allowed or denied based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria
- Select ICMP as the protocol to allow or deny ICMP packets. Selecting ICMP filters ICMP packets based on ICMP type and code.

NOTE: The log option is functional only for router ACL's. The log option displays an informational logging message about the packet that matches the entry sent to the console.

Example

```
rfs6000-37FABE(config-ip-acl-test)#deny proto vrrp any any log rule-precedence 600
rfs6000-37FABE(config-ip-acl-test)#deny proto ospf any any log rule-precedence 650

rfs6000-37FABE(config-ip-acl-test)#show context
ip access-list test
 deny proto vrrp any any log rule-precedence 600
 deny proto ospf any any log rule-precedence 650
rfs6000-37FABE(config-ip-acl-test)#
```

Using aliases in IP access list.

The following examples show the usage of network-group aliases:

```
rfs4000-229D58(config)#ip access-list bar
```

Example 1:

```
rfs4000-229D58(config-ip-acl-bar)#permit ip $foo any rule-precedence 10
```

Example 2

```
rfs4000-229D58(config-ip-acl-bar)#permit tcp 192.168.100.0/24 $foobar eq ftp rule-
precedence 20
```

Example 3

```
rfs4000-229D58(config-ip-acl-bar)#deny ip $guest $lab rule-precedence 30
```

- In example 1, network-group alias \$foo is used as a source
- In example 2, network-group alias \$foobar is used as a destination
- In example 3, network-group aliases \$guest and \$lab are used as source and destination respectively.

The following examples show the usage of network-service aliases:

Example 4

```
rfs4000-229D58(config-ip-acl-bar)# permit $kerberos 10.60.20.0/24 $kerberos-
servers log rule-precedence 40
```

Example 5

```
rfs4000-229D58(config-ip-acl-bar)#permit $Tandem 10.60.20.0/24 $Tandem-servers
log rule-precedence 50
```

In examples 4, and 5:

- The network-service aliases (\$kerberos and \$Tandem) define the destination protocol-port combinations
- The source network is 10.60.20.0/24
- The destination network-address combinations are defined by the network-group aliases (\$kerberos-servers and \$Tandem-servers)

Related Commands

|--------------|---|
| <i>no</i> | Removes a specified IP deny access rule |
| <i>alias</i> | Creates and configures aliases (network, VLAN, and service) |

11.1.2 disable

▶ *ip-access-list*

Disables an existing deny or permit rule without removing it from the ACL. A disabled rule is inactive and is not used to filter packets.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
disable [deny|insert|permit]
```

```
disable [deny|insert [deny|permit]|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]
```

```
disable [deny|insert [deny|permit]|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name [contains|exact|suffix]|icmp|ip|proto <PROTOCOL-OPTIONS>|tcp|udp] [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>] (log,mark [8021p <0-7>|dscp <0-63>],rule-precedence)
```

Parameters

- `disable [deny|insert [deny|permit]|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name [contains|exact|suffix]|icmp|ip|proto <PROTOCOL-OPTIONS>|tcp|udp] [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>] (log,mark [8021p <0-7>|dscp <0-63>],rule-precedence)`

| | |
|---|---|
| disable [deny insert permit] insert [deny permit] permit] | Disables a deny or permit access rule without removing it from the ACL This command also enables the insertion of a disable deny or permit rule without overwriting an existing rule in the IP ACL. Note: To disable an existing deny/permit rule, provide the exact values used to configure the deny or permit rule. |
| <NETWORK-SERVICE-ALIAS-NAME> | Specifies the network-service alias, identified by the <NETWORK-SERVICE-ALIAS-NAME> keyword, associated with the deny/permit rule |
| dns-name [contains exact suffix] | Specifies the packets to reject based on the dns-name match. Applies this deny rule to packets based on dns-names specified in the network-service |
| icmp | Disables a rule applicable to ICMP packets only |
| ip | Disables a rule applicable to IP packets only |
| proto <PROTOCOL-OPTIONS> | Disables a rule applicable to any Internet protocol other than TCP, UDP, or ICMP packets <ul style="list-style-type: none"> • <PROTOCOL-OPTIONS> - Identify the Internet protocol using the options available. |
| tcp | Disables a rule applicable to TCP packets only |

| | |
|------------------------------------|---|
| udp | Disables a rule applicable to UDP packets only Note: After specifying the packet type, specify the source and destination devices and network address(es) to match. |
| <SOURCE-IP/ MASK> | Specify the source IP address and mask in the A.B.C.D/M format. |
| <NETWORK- GROUP-ALIAS- NAME> | Specifies the network-group alias, identified by the <NETWORK-GROUP-ALIAS-NAME> keyword, associated with this deny/permit rule |
| any | Select 'any' if the rule is applicable to any source IP address. |
| from-vlan <VLAN-ID> | Specify the VLAN IDs. |
| host <SOURCE- HOST-IP> | Specify the source host's exact IP address. |
| <DEST-IP/MASK> | Specify the destination IP address and mask in the A.B.C.D/M format. |
| <NETWORK- GROUP-ALIAS- NAME> | Specifies the network-group alias, identified by the <NETWORK-GROUP-ALIAS-NAME> keyword, associated with this deny/permit rule |
| any | Select 'any' if the rule is applicable to any destination IP address. |
| host <DEST-HOST-IP> | Specify the destination host's exact IP address. |
| log | Select log, if the rule has been configured to log records in case of a match. |
| mark [8021p <0-7> dscp <0-63>] | Specifies packets to mark <ul style="list-style-type: none"> 8021p <0-7> - Marks packets by modifying 802.1p VLAN user priority dscp <0-63> - Marks packets by modifying DSCP TOS bits in the header |
| rule-precedence <1-5000> | Specify the rule precedence. The deny or permit rule with the specified precedence is disabled. Note: To enable a disabled rule, enter the rule again without the 'disable' keyword. Note: The <i>no > disable</i> command removes a disabled rule from the ACL. |

Example

The following example shows the 'auto-tunnel-acl' settings before the disable command is executed:

```
rfs6000-37FABE(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
 permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
 permit ip host 200.200.200.99 any rule-precedence 3
rfs6000-37FABE(config-ip-acl-auto-tunnel-acl)#

rfs6000-37FABE(config-ip-acl-auto-tunnel-acl)#disable permit ip host
200.200.200.99 any rule-precedence 3
rfs6000-37FABE(config-ip-acl-auto-tunnel-acl)#
```

The following example shows the 'auto-tunnel-acl' settings after the disable command is executed:

```
rfs6000-37FABE(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
 permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
```

```

disable permit ip host 200.200.200.99 any rule-precedence 3
rfs6000-37FABE(config-ip-acl-auto-tunnel-acl)#

rfs4000-229D58(config-ip-acl-test)#deny icmp any any log rule-precedence 1

rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
deny icmp any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#

rfs4000-229D58(config-ip-acl-test)#disable deny icmp any any rule-precedence 1

rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
disable deny icmp any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#

```

In the following example a disable deny rule has been inserted in the IP ACL "test":

```

rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
deny tcp from-vlan 1 any any rule-precedence 1
permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#

rfs4000-229D58(config-ip-acl-test)#disable insert deny ip any any log rule-
precedence 2

rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
deny tcp from-vlan 1 any any rule-precedence 1
disable deny ip any any log rule-precedence 2
permit icmp any host 192.168.13.7 1 1 rule-precedence 3
rfs4000-229D58(config-ip-acl-test)#

```

Related Commands

| | |
|---------------|---|
| <i>no</i> | Enables a disabled deny or permit rule |
| <i>deny</i> | Creates a new deny access rule or modifies an existing rule |
| <i>permit</i> | Creates a new permit access rule or modifies an existing rule |
| <i>alias</i> | Creates and configures a aliases (network, VLAN, and service) |

11.1.3 insert

▶ *ip-access-list*

Enables the insertion of a rule in an IP ACL without overwriting or replacing an existing rule having the same precedence

The insert option allows a new rule to be inserted within a IP access list. Consider an IP ACL consisting of rules having precedences 1, 2, 3, 4, 5, and 6. You want to insert a new rule with precedence 4, without overwriting the existing precedence 4 rule. Using the insert option inserts the new rule prior to the existing one. The existing precedence 4 rule's precedence changes to 5, and the change cascades down the list of rules within the ACL. That means rule 5 becomes rule 6, and rule 6 becomes rule 7.

NOTE: NOT using *insert* when creating a new rule having the same precedence as an existing rule, overwrites the existing rule.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
insert [deny|permit] <PARAMETERS> (log,mark [8021p <0-7>|dscp <0-63>],rule-
precedence <1-5000>) {(rule-description <LINE>)}
```

Parameters

```
• insert [deny|permit] <PARAMETERS> (log,mark [8021p <0-7>|dscp <0-63>],rule-
precedence <1-5000>) {(rule-description <LINE>)}
```

| | |
|------------------------------------|--|
| [deny permit] | Inserts a deny or a permit rule within an IP ACL |
| <PARAMETERS> | Provide the match criteria for this deny/permit rule. Packets will be filtered based on the criteria set here. For more information on the deny rule, see deny . For more information on the permit rule, see permit . |
| log | After specifying the match criteria, specify the action taken for filtered packets Logs all deny/permit events matching this entry. If a source and/or destination IP address is matched an event is logged. |
| mark [8021p <0-7> dscp <0-63>] | Specifies packets to mark <ul style="list-style-type: none"> • 8021p <0-7> - Marks packets by modifying 802.1.p VLAN user priority • dscp <0-63> - Marks packets by modifying DSCP TOS bits in the header |

| | |
|---|--|
| rule-precedence <1-5000> rule-description <LINE> | <p>Assigns a precedence for this deny/permit rule</p> <ul style="list-style-type: none"> • <1-5000> – Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> <ul style="list-style-type: none"> • rule-description – Optional. Configures a description for this new rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
|---|--|

NOTE: The log option is functional only for router ACL's. The log option displays an informational logging message about the packet that matches the entry sent to the console.

Example

```
rfs4000-229D58(config-ip-acl-test)#deny tcp from-vlan 1 any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#permit icmp any host 192.168.13.7 1 1 rule-
precedence 2
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
  deny tcp from-vlan 1 any any rule-precedence 1
  permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#
```

In the following example a new rule is inserted between the rules having precedences 1 and 2. The precedence of the existing precedence '2' rule changes to precedence 3.

```
rfs4000-229D58(config-ip-acl-test)#insert deny ip any any rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
  deny tcp from-vlan 1 any any rule-precedence 1
  deny ip any any rule-precedence 2
  permit icmp any host 192.168.13.7 1 1 rule-precedence 3
rfs4000-229D58(config-ip-acl-test)#
```

Related Commands

| | |
|--------------|---|
| <i>alias</i> | Creates and configures aliases (network, VLAN, and service) |
|--------------|---|

11.1.4 no

► *ip-access-list*

Removes a deny, permit, or disable rule

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [deny|disable|permit]
```

```
no [deny|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]
<RULE-PARAMETERS>
```

```
no disable [deny|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|
tcp|udp] <RULE-PARAMETERS>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes a deny, permit, or disable rule |
|-----------------|---|

Usage Guidelines

Removes an access list control entry. Provide the rule-precedence value when using the no command.

Example

The following example shows the ACL 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-ip-acl-test)#show context
ip access-list test
  deny proto vrrp any any log rule-precedence 600
  deny proto ospf any any log rule-precedence 650
rfs6000-37FABE(config-ip-acl-test)#

rfs6000-37FABE(config-ip-acl-test)#no deny proto vrrp any any rule-precedence 600
rfs6000-37FABE(config-ip-acl-test)#no deny proto ospf any any rule-precedence 650
```

The following example shows the ACL 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-ip-acl-test)#show context
ip access-list test
rfs6000-37FABE(config-ip-acl-test)#
```

11.1.5 permit

► *ip-access-list*

Creates a permit rule that marks packets (from a specified source IP and/or to a specified destination IP) for forwarding. You can also use this command to modify an existing permit rule.

NOTE: Use a decimal value representation to implement a `permit/deny` designation for a packet. The command set for IP ACLs provides the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
permit [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]

permit <NETWORK-SERVICE-ALIAS-NAME> [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|
any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|any|host <DEST-
HOST-IP>|<NETWORK-GROUP-ALIAS-NAME>] (log,mark [8021p <0-7>|dscp <0-63>],
rule-precedence <1-5000>) {(rule-description <LINE>)}

permit dns-name [contains|exact|suffix]

permit dns-name [contains|exact|suffix] <WORD> (log,rule-precedence <1-5000>)
{(rule-description <LINE>)}

permit dns-name exact <WORD> (log,mark [8021p <0-7>|dscp <0-63>],rule-precedence
<1-5000>) {(rule-description <LINE>)}

permit icmp [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|
host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-
HOST-IP>] (<ICMP-TYPE> <ICMP-CODE>,<log,rule-precedence <1-5000>)&#123;(rule-
description <LINE>)&#125;

permit ip [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|
host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-
HOST-IP>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

permit proto [<PROTOCOL-NUMBER>|<PROTOCOL-NAME>|eigrp|gre|igmp|igp|ospf|vrrp]
[<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host
<SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-
IP>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

permit [tcp|udp] [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan
<VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-
NAME>|any|eq <SOURCE-PORT>|host <DEST-HOST-IP>|range <START-PORT> <END-PORT>] [eq
[<1-65535>|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|
sip|smtp|ssh|telnet|tftp|www]|range <START-PORT> <END-PORT>] (log,rule-precedence
<1-5000>) {(rule-description <LINE>)}&#125;
```

Parameters

```

• permit <NETWORK-SERVICE-ALIAS-NAME> [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|any|host <DEST-HOST-IP>|<NETWORK-GROUP-ALIAS-NAME>] (log,mark [8021p <0-7>|dscp <0-63>], rule-precedence <1-5000>) {(rule-description <LINE>)}

```

| | |
|------------------------------|---|
| <NETWORK-SERVICE-ALIAS-NAME> | <p>Applies this permit rule to packets based on service protocols and ports specified in the network-service alias</p> <ul style="list-style-type: none"> <NETWORK-SERVICE-ALIAS-NAME> – Specify the network-service alias name (should be existing and configured). <p>A network-service alias defines service protocols and ports to match. When used with an ACL, the network-service alias defines the service-specific components of the ACL permit rule.</p> <p>Note: For more information on configuring network-service alias, see alias.</p> |
| <SOURCE-IP/MASK> | <p>Specifies the source IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified network are permitted.</p> |

| rule-precedence <1-5000> rule-description <LINE> | <p>The following keywords are recursive and common to all of the above parameters:</p> <ul style="list-style-type: none"> rule-precedence – Assigns a precedence for this deny rule <ul style="list-style-type: none"> <1-5000> – Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> <ul style="list-style-type: none"> rule-description – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre>• permit icmp [<SOURCE-IP/MASK> <NETWORK-GROUP-NAME> any from-vlan <VLAN-ID> host <SOURCE-HOST-IP>] [<DEST-IP/MASK> <NETWORK-GROUP-NAME> any host <DEST-HOST- IP>] (<ICMP-TYPE> <ICMP-CODE>,log,rule-precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| icmp | Applies this permit rule to ICMP packets only |
| <SOURCE-IP/ MASK> | Specifies the source IP address and mask (A.B.C.D/M) to match. ICMP packets received from the specified sources are permitted. |
| <NETWORK- GROUP-ALIAS- NAME> | Applies a network-group alias to identify the source IP addresses. ICMP packets received from the addresses identified by the network-group alias are permitted. <ul style="list-style-type: none"> <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name (should be existing and configured). |
| any | Specifies the source as any source IP address. ICMP packets received from any source are permitted. |
| from-vlan <VLAN- ID> | Specifies a single VLAN or a range of VLANs as the match criteria. ICMP packets received from the VLANs identified here are permitted. <ul style="list-style-type: none"> <VLAN-ID> – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20). <p>Note: Use this option with WLANs and port ACLs.</p> |
| host <SOURCE- HOST-IP> | Identifies a specific host (as the source to match) by its IP address. ICMP packets received from the specified host are permitted. <ul style="list-style-type: none"> <SOURCE-HOST-IP> – Specify the source host's exact IP address in the A.B.C.D format. |
| <DEST-IP/MASK> | Specifies the destination IP address and mask (A.B.C.D/M) to match. ICMP packets addressed to specified destinations are permitted. |
| <NETWORK- GROUP-ALIAS- NAME> | Applies a network-group alias to identify the destination IP addresses. ICMP packets destined for addresses identified by the network-group alias are permitted. <ul style="list-style-type: none"> <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name (should be existing and configured). |
| any | Specifies the destination as any destination IP address. ICMP packets addressed to any destination are permitted. |
| host <DEST-HOST- IP> | Identifies a specific host (as the destination to match) by its IP address. ICMP packets addressed to the specified host are permitted. <ul style="list-style-type: none"> <DEST-HOST-IP> – Specify the destination host's exact IP address in the A.B.C.D format. |

| | |
|--|---|
| <ICMP-TYPE> | Defines the ICMP packet type For example, an ICMP type 0 indicates it is an ECHO REPLY, and type 8 indicates it is an ECHO. |
| <ICMP-CODE> | Defines the ICMP message type For example, an ICMP code 3 indicates "Destination Unreachable", code 1 indicates "Host Unreachable", and code 3 indicates "Port Unreachable." Note: After specifying the source and destination IP address(es), the ICMP message type, and the ICMP code, specify the action taken in case of a match. |
| log | Logs all permit events matching this entry. If a source and/or destination IP address is matched (i.e. a ICMP packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |
| rule-precedence <1-5000> rule-description <LINE> | The following keywords are recursive and common to all of the above parameters: <ul style="list-style-type: none"> rule-precedence - Assigns a precedence for this permit rule <ul style="list-style-type: none"> <1-5000> - Specify a value from 1 - 5000. | <pre> • permit proto [<PROTOCOL-NUMBER> <PROTOCOL-NAME> eigrp gre igmp igp ospf vrrp] [<SOURCE-IP/MASK> <NETWORK-GROUP-ALIAS-NAME> any from-vlan <VLAN-ID> host <SOURCE-HOST-IP>] [<DEST-IP/MASK> <NETWORK-GROUP-ALIAS-NAME> any host <DEST-HOST- IP>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| proto | Configures the ACL for additional protocols Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter. |
| <PROTOCOL-NUMBER> | Filters protocols using their IANA protocol number <ul style="list-style-type: none"> • <PROTOCOL-NUMBER> - Specify the protocol number. |
| <PROTOCOL-NAME> | Filters protocols using their IANA protocol name <ul style="list-style-type: none"> • <PROTOCOL-NAME> - Specify the protocol name. |
| eigrp | Identifies the EIGRP protocol (number 88) EIGRP enables routers to maintain copies of neighbors' routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| gre | Identifies the GRE protocol (number 47) GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination. |

| | |
|------------------------------------|---|
| igmp | <p>Identifies the IGMP protocol (number 2)</p> <p>IGMP establishes and maintains multicast group memberships to interested members. Multicasting allows a networked computer to send content to multiple computers who have registered to receive the content. IGMP snooping is for listening to IGMP traffic between an IGMP host and routers in the network to maintain a map of the links that require multicast streams. Multicast traffic is filtered out for those links which do not require them.</p> |
| igp | <p>Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9)</p> <p>IGP enables exchange of information between hosts and routers within a managed network. The most commonly used <i>interior gateway protocol</i> (IGP) protocols are: <i>Routing Information Protocol</i> (RIP) and <i>Open Shortest Path First</i> (OSPF)</p> |
| ospf | <p>Identifies the OSPF protocol (number 89)</p> <p>OSPF is a link-state <i>interior gateway protocol</i> (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.</p> |
| vrrp | <p>Identifies the VRRP protocol (number 112)</p> <p>VRRP allows a pool of routers to be advertized as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.</p> |
| <SOURCE-IP/ MASK> | <p>Specifies the source IP address and mask (A.B.C.D/M) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified sources are permitted.</p> |
| <NETWORK- GROUP-ALIAS- NAME> | <p>Applies a network-group alias to identify the source IP addresses. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the sources defined in the network-group alias are permitted.</p> <ul style="list-style-type: none"> • <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name (should be existing and configured). |
| any | <p>Specifies the source as any IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are permitted.</p> |
| from-vlan <VLAN- ID> | <p>Specifies a single VLAN or a range of VLANs as the match criteria. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the VLANs identified here are permitted.</p> <ul style="list-style-type: none"> • <VLAN-ID> – Specify the VLAN ID. A range of VLANs is represented by the start and end VLAN IDs separated by a hyphen (for example, 12-20). <p>Note: Use this option with WLANs and port ACLs.</p> |
| host <SOURCE- HOST-IP> | <p>Identifies a specific host (as the source to match) by its IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are permitted.</p> <ul style="list-style-type: none"> • <SOURCE-HOST-IP> – Specify the source host's exact IP address in the A.B.C.D format. |
| <DEST-IP/MASK> | <p>Specifies the destination IP address and mask (A.B.C.D/M) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified destinations are permitted.</p> |

| | |
|--|--|
| any | Specifies the destination as any destination IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are permitted. |
| host <DEST-HOST-IP> | Identifies a specific host (as the destination to match) by its IP address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addresses to the specified host are permitted. <ul style="list-style-type: none"> <SOURCE-HOST-IP> - Specify the destination host's exact IP address in the A.B.C.D format. |
| <NETWORK-GROUP-ALIAS-NAME> | Applies a network-group alias to identify the destination IP addresses. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the destinations identified in the network-group alias are permitted. <ul style="list-style-type: none"> <NETWORK-ALIAS-NAME> - Specify the network-group alias name (should be existing and configured). <p>Note: After specifying the source and destination IP address(es), specify the action taken in case of a match.</p> |

Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

Usage Guidelines

Use this command to permit traffic between networks/hosts based on the protocol type selected in the access list. The following protocols are supported:

- IP
- ICMP
- ICP
- UDP
- PROTO (any Internet protocol other than TCP, UDP, and ICMP)

The last ACE in the access list is an implicit deny statement.

Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. The packet is allowed or denied based on the ACL configuration.

- Filtering on TCP or UDP allows you to specify port numbers as filtering criteria.
- Select ICMP to allow/deny packets. Selecting ICMP filters ICMP packets based on ICMP type and code.

NOTE: The log option is functional only for router ACL's. The log option displays an informational logging message about the packet matching the entry sent to the console.

Example

```
rfs6000-37FABE(config-ip-acl-test)#show context
ip access-list test
rfs6000-37FABE(config-ip-acl-test)#

rfs6000-37FABE(config-ip-acl-test)#permit ip 172.16.10.0/24 any log rule-
precedence 750
rfs6000-37FABE(config-ip-acl-test)#permit tcp 172.16.10.0/24 any log rule-
precedence 800

rfs6000-37FABE(config-ip-acl-test)#show context
ip access-list test
  permit ip 172.16.10.0/24 any log rule-precedence 750
  permit tcp 172.16.10.0/24 any log rule-precedence 800
rfs6000-37FABE(config-ip-acl-test)#
```

Related Commands

| | |
|--------------|---|
| <i>no</i> | Removes a specified IP permit access rule |
| <i>alias</i> | Creates and configures aliases (network, VLAN, and service) |

11.2 mac-access-list

▶ ACCESS-LIST

The following table summarizes MAC Access list configuration commands:

Table 11.2 *MAC-Access-List-Config Commands*

| Command | Description | Reference |
|----------------|---|-------------------|
| <i>deny</i> | Creates a new deny access rule or modifies an existing rule. A deny access rule marks packets for rejection. | <i>page 11-35</i> |
| <i>disable</i> | Disables a MAC deny or permit rule without removing it from the ACL | <i>page 11-38</i> |
| <i>ex3500</i> | Creates a MAC ACL deny and/or permit rule applicable only to the EX3500 switch | <i>page 11-40</i> |
| <i>insert</i> | Inserts a rule in an MAC ACL without overwriting or replacing an existing rule having the same precedence | <i>page 11-43</i> |
| <i>no</i> | Removes a deny and/or a permit access rule from a MAC ACL | <i>page 11-45</i> |
| <i>permit</i> | Creates a new permit access rule or modifies an existing rule. A deny access rule marks packets for forwarding. | <i>page 11-46</i> |

11.2.1 deny

► *mac-access-list*

Creates a deny rule that marks packets (from a specified source MAC and/or to a specified destination MAC) for rejection. You can also use this command to modify an existing deny rule.

NOTE: Use a decimal value representation to implement a `permit/deny` designation for a packet. The command set for MAC ACLs provide the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
deny [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC>
<DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,type [8021q|<1-65535>|
aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>,log,rule-precedence
<1-5000>) {(rule-description <LINE>)}
```

Parameters

```
• deny [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC>
<DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,type [8021q|<1-65535>|
aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>,log,rule-precedence
<1-5000>) {(rule-description <LINE>)}
```

| | |
|-----------------------------------|---|
| <SOURCE-MAC> <SOURCE-MAC-MASK> | Configures the source MAC address and mask to match <ul style="list-style-type: none"> • <SOURCE-MAC> - Specify the source MAC address to match. • <SOURCE-MAC-MASK> - Specify the source MAC address mask. Packets received from the specified MAC addresses are dropped. |
| any | Identifies all devices as the source to deny access. Packets received from any source are dropped. |
| host <SOURCE-HOST-MAC> | Identifies a specific host as the source to deny access <ul style="list-style-type: none"> • <SOURCE-HOST-MAC> - Specify the source host's exact MAC address to match. Packets received from the specified host are dropped. |
| <DEST-MAC> <DEST-MAC-MASK> | Configures the destination MAC address and mask to match <ul style="list-style-type: none"> • <DEST-MAC> - Specify the destination MAC address to match. • <DEST-MAC-MASK> - Specify the destination MAC address mask to match. Packets addressed to the specified MAC addresses are dropped. |
| any | Identifies all devices as the destination to deny access. Packets addressed to any destination are dropped. |
| host <DEST-HOST-MAC> | Identifies a specific host as the destination to deny access <ul style="list-style-type: none"> • <DEST-HOST-MAC> - Specify the destination host's exact MAC address to match. Packets addressed to the specified host are dropped. |

| | |
|---|--|
| dot1p <0-7> | Configures the 802.1p priority value. Sets the service classes for traffic handling <ul style="list-style-type: none"> • <0-7> – Specify 802.1p priority from 0 - 7. |
| type [8021q <1-65535> aarp appletalk arp ip ipv6 ipx mint rarp wisp] | Configures the EtherType value An EtherType is a two-octet field in an Ethernet frame that indicates the protocol encapsulated in the payload of the frame. The EtherType values are: <ul style="list-style-type: none"> • 8021q – Indicates a 802.1q payload (0x8100) • <1-65535> – Indicates the EtherType protocol number • aarp – Indicates the Appletalk <i>Address Resolution Protocol</i> (ARP) payload (0x80F3) • appletalk – Indicates the Appletalk Protocol payload (0x809B) • arp – Indicates the ARP payload (0x0806) • ip – Indicates the Internet Protocol, Version 4 (IPv4) payload (0x0800) • ipv6 – Indicates the Internet Protocol, Version 6 (IPv6) payload (0x86DD) • ipx – Indicates the Novell's IPX payload (0x8137) • mint – Indicates the MiNT protocol payload (0x8783) • rarp – Indicates the reverse <i>Address Resolution Protocol</i> (ARP) payload (0x8035) • wisp – Indicates the <i>Wireless Internet Service Provider</i> (WISP) payload (0x8783) |
| vlan <1-4095> | Configures the VLAN where the traffic is received <ul style="list-style-type: none"> • <1-4095> – Specify the VLAN ID from 1 - 4095. |
| log | Logs all deny events matching this entry. If a source and/or destination MAC address is matched (i.e. a packet is received from a specified MAC address or is destined for a specified MAC address), an event is logged. |
| rule-precedence <1-5000> rule-description <LINE> | The following keywords are recursive and common to all of the above parameters: <ul style="list-style-type: none"> • rule-precedence – Assigns a precedence for this deny rule <ul style="list-style-type: none"> • <1-5000> – Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> <ul style="list-style-type: none"> • rule-description – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

Usage Guidelines

The deny command disallows traffic based on layer 2 (data-link layer) data. The MAC access list denies traffic from a particular source MAC address or any MAC address. It can also disallow traffic from a list of MAC addresses based on the source mask.

The MAC access list can disallow traffic based on the VLAN and EtherType.

- ARP
- WISP
- IP
- 802.1q

NOTE: MAC ACLs always take precedence over IP based ACLs.

The last ACE in the access list is an implicit deny statement. Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. It is allowed or denied based on the ACL's configuration.

Example

```
rfs4000-229D58(config-mac-acl-test)#deny 41-85-45-89-66-77 ff-ff-ff-00-00-00 any
vlan 1 rule-precedence 1

rfs4000-229D58(config-mac-acl-test)#deny host 00-01-ae-00-22-11 any rule-
precedence 2

rfs4000-229D58(config-mac-acl-test)#show context
mac access-list test
  deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
  deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#
```

The MAC ACL (in the example below) denies traffic from any source MAC address to a particular host MAC address:

```
rfs6000-37FABE(config-mac-acl-test)#deny any host 00:01:ae:00:22:11
```

The following example denies traffic between two hosts based on MAC addresses:

```
rfs6000-37FABE(config-mac-acl-test)#deny host 01:02:fe:45:76:89 host
01:02:89:78:78:45
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes a specified MAC deny access rule |
|-----------|--|

11.2.2 disable

► *mac-access-list*

Disables a MAC deny or permit rule without removing it from the ACL. A disabled rule is inactive and is not used to filter packets.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
disable [deny|insert|permit]
```

```
disable [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>]
[<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,&#x27;mark [8021p <0-7>|dscp <0-63>],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}
```

```
disable insert [deny|permit]
```

Parameters

- `disable [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,'mark [8021p <0-7>|dscp <0-63>],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}`

| | |
|-----------------------------------|--|
| disable [deny insert permit] | Disables a deny, insert or permit access rule without removing it from the MAC ACL Note: Provide the exact values used to configure the deny or permit rule that is to be disabled. |
| <SOURCE-MAC> <SOURCE-MAC-MASK> | Specifies the source MAC address and mask to match <ul style="list-style-type: none"> • <SOURCE-MAC> - Specify the source MAC address to match. • <SOURCE-MAC-MASK> - Specify the source MAC address mask. |
| any | Select 'any' if the rule is applicable to any source MAC address |
| host <SOURCE-HOST-MAC> | Specify the source host's exact MAC address |
| <DEST-MAC> <DEST-MAC-MASK> | Specifies the destination MAC address and mask to match <ul style="list-style-type: none"> • <DEST-MAC> - Specify the destination MAC address. • <DEST-MAC-MASK> - Specify the destination MAC address mask. |
| any | Select 'any' if the rule is applicable to any destination MAC address |
| host <DEST-HOST-MAC> | Specify the destination host's exact MAC address |
| log | The following keyword defines the action taken when a packet matches any or all of the above specified criteria <ul style="list-style-type: none"> • log - Logs a record. when a packet matches the specified criteria |

| | |
|---|---|
| dot1p <0-7> | Specify the 802.1p priority from 0 - 7. |
| mark [8021p <0-7> dscp <0-63>] | Marks/modifies packets that match the criteria specified here <ul style="list-style-type: none"> • 8021p <0-7> - Modifies 802.1p VLAN user priority from 0 - 7 • dscp <0-63> - Modifies DSCP TOS bits in the IP header from 0 - 63 Note: This option is applicable only to the <i>disable</i> > <i>permit</i> MAC ACL rule. |
| type [8021q <1-65535> arp appletalk arp ip ipv6 ipx mint rarp wisp] | Use the available options to specify the EtherType value. |
| vlan <1-4095> | Specify the VLAN ID(s) |
| log | Select log, if the rule has been configured to log records in case of a match. |
| rule-precedence <1-5000> {(rule-description <LINE>)} | The following keywords are recursive and common to all of the above parameters: <ul style="list-style-type: none"> • rule-precedence - Provide the precedence assigned to this deny or permit rule. <ul style="list-style-type: none"> • <1-5000> - Specify a value from 1 - 5000. The rule with the specified precedence is removed from the MAC ACL. • rule-description <LINE> - Optional. Enter the description configured for this deny or permit rule. |

Example

The following example shows the MAC access list 'test' settings before the 'disable' command is executed:

```
rfs4000-229D58(config-mac-acl-test)#show context
mac access-list test
deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#

rfs4000-229D58(config-mac-acl-test)#disable deny host 00-01-AE-00-22-11 any rule-
precedence 2
```

The following example shows the MAC access list 'test' settings after the 'disable' command is executed:

```
rfs4000-229D58(config-mac-acl-test)#show context
mac access-list test
deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
disable deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#
```

11.2.3 ex3500

► *mac-access-list*

Creates a MAC ACL deny and/or permit rule, applicable only to the EX3500 switch

Each deny or permit rule consists of a set of match criteria and an associated action, which is deny access for the deny rule and allow access for the permit rule. When applied to layer 2 traffic (between a EX3500 switch and the WiNG managed service platform or a WiNG VM interface) every packet is matched against the configured match criteria and in case of a match the packet is dropped or forwarded depending on the rule type.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and *command line interface* (CLI), which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

NOTE: To implement the EX3500 MAC ACL rule, apply the MAC ACL directly to a EX3500 device, or to an EX35XX profile. For more information, see *access-group*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ex3500 [deny|permit] [all|tagged-eth2|untagged-eth2]
```

```
ex3500 [deny|permit] [all|tagged-eth2|untagged-eth2] [any|host <SOURCE-MAC>|
network <SOURCE-MAC> <SOURCE-MAC-MASK>] [any|host <DEST-MAC>|network <DEST-MAC>
<DEST-MAC-MASK>] [ethertype <0-65535|ethertype-mask <0-65535>|ex3500-time-range
<TIME-RANGE-NAME>|rule-precedence <1-128>|vlan <1-4094>|vlan-mask <1-4095>]
```

Parameters

```
• ex3500 [deny|permit] [all|tagged-eth2|untagged-eth2] [any|host <SOURCE-MAC>|
network <SOURCE-MAC> <SOURCE-MAC-MASK>] [any|host <DEST-MAC>|network <DEST-MAC>
<DEST-MAC-MASK>] [ethertype <0-65535|ethertype-mask <0-65535>|ex3500-time-range
<TIME-RANGE-NAME>|rule-precedence <1-128>|vlan <1-4094>|vlan-mask <1-4095>]
```

[deny|permit]

Creates a deny or permit MAC ACL rule and configures the rule parameters
Every EX3500 MAC ACL rule provides a set of match criteria against which incoming and outgoing packets (to and from an EX3500 device) are matched. In case of a match, the packet is dropped or forwarded depending on the rule type. The packet is dropped in case of a *deny* rule, and forwarded for an *permit* rule.

| | |
|--|--|
| [all tagged-eth2 untagged-eth2] | <p>Specifies the packet type</p> <ul style="list-style-type: none"> all – Applies this deny/permit rule to all packets tagged-eth2 – Applies this deny/permit rule only to tagged Ethernet-2 packets untagged-eth2 – Applies this deny/permit rule only to untagged Ethernet-2 packets <p>After specifying the packet type, configure the source and/or EX3500 MAC addresses to match.</p> |
| [any host <SOURCE-MAC> network <SOURCE- MAC> <SOURCE- MAC-MASK>] | <p>Enter the <i>Source</i> MAC addresses</p> <ul style="list-style-type: none"> any – Identifies all EX3500 devices as a source to match host <SOURCE-MAC> – Identifies a specific EX3500 host as the source to match <ul style="list-style-type: none"> <SOURCE-MAC> – Specify the source host's exact MAC address network <SOURCE-MAC> <SOURCE-MAC-MASK> – Configures a range of MAC addresses as the source to match. Packets received from any of these MAC addresses are dropped. <ul style="list-style-type: none"> <SOURCE-MAC> – Specify the source MAC address to match. <ul style="list-style-type: none"> <SOURCE-MAC-MASK> – Specify the source MAC bit mask. <p>For a deny rule, packets received from EX3500 device(s) matching the specified MAC address(es) are dropped.</p> <p>For a permit rule, packets received from EX3500 device(s) matching the specified MAC address(es) are forwarded.</p> |
| [any host <DEST-MAC> network <DEST-MAC> <DEST-MAC-MASK>] | <p>Enter the <i>Destination</i> MAC addresses</p> <ul style="list-style-type: none"> any – Identifies all EX3500 devices as a destination to match host <SOURCE-MAC> – Identifies a specific EX3500 host as the destination to match <ul style="list-style-type: none"> <SOURCE-MAC> – Specify the destination host's exact MAC address network <SOURCE-MAC> <SOURCE-MAC-MASK> – Configures a range of MAC addresses as the destination to match. Packets addressed to any of these MAC addresses are dropped. <ul style="list-style-type: none"> <SOURCE-MAC> – Specify the destination MAC address to match. <ul style="list-style-type: none"> <SOURCE-MAC-MASK> – Specify the destination MAC bit mask. <p>For a deny rule, packets addressed to EX3500 device(s) matching the specified MAC address(es) are dropped.</p> <p>For a permit rule, packets addressed to EX3500 device(s) matching the specified MAC address(es) are forwarded.</p> |
| ether-type <0-65535> | <p>Configures the Ethertype protocol number. The ether type is a two-octet field within an Ethernet frame. It indicates the protocol encapsulated in the payload of an Ethernet frame.</p> <ul style="list-style-type: none"> <0-65535> – Specify the value from 0 - 65535. The default value is 1. |
| ethertype-mask <0-65535> | <p>Configures the Ethertype mask</p> <ul style="list-style-type: none"> <0-65535> – Specify the value from 0 - 65535. The default value is 1. |

| | |
|--|---|
| ex3500-time-range <TIME-RANGE-NAME> | <p>Applies a specified EX3500 time range (should be existing and configured). The deny or permit rule is applied during the time period specified in the EX3500 time range.</p> <ul style="list-style-type: none"> • <TIME-RANGE-NAME> – Specify the time range name. <p>An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).</p> <p>Note: For information on configuring EX3500 time-range, see ex3500.</p> |
| vlan <1-4094> | <p>Configures a VLAN ID representative of the shared SSID each user employs to interoperate within the network (once authenticated by the local RADIUS server)</p> <ul style="list-style-type: none"> • <1-4094> – Specify the VLAN ID from 1 - 4094. |
| vlan-mask <1-4095> | <p>Configures the VLAN ID bit mask value</p> <ul style="list-style-type: none"> • <1-4095> – Specify the VLAN bit mask from 1 - 4095. |
| rule-precedence <1-128> | <p>Configures a precedence for this EX3500 MAC ACL</p> <ul style="list-style-type: none"> • <1 - 128> – Specify a value from 1 - 128. ACLs with lower precedence are applied first to packets. |

Example

```

nx9500-6C8809(config-mac-acl-ex3500MacACL)#ex3500 deny tagged-eth2 any any vlan
20 rule-precedence 1

nx9500-6C8809(config-mac-acl-ex3500MacACL)#show context
mac access-list ex3500MacACL
  ex3500 deny tagged-eth2 any any vlan 20 rule-precedence 1
nx9500-6C8809(config-mac-acl-ex3500MacACL)#

```

11.2.4 insert

► *mac-access-list*

Enables the insertion of a rule in an MAC ACL without overwriting or replacing an existing rule having the same precedence

The insert option allows a new rule to be inserted within a MAC ACL. Consider an MAC ACL consisting of rules having precedences 1, 2, 3, 4, 5, and 6. You want to insert a new rule with precedence 4, without overwriting the existing precedence 4 rule. Using the insert option inserts the new rule prior to the existing one. The existing precedence 4 rule's precedence changes to 5, and the change cascades down the list of rules within the ACL. That means rule 5 becomes rule 6, and rule 6 becomes rule 7.

NOTE: NOT using insert when creating a new rule having the same precedence as an existing rule, overwrites the existing rule.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
insert [deny|permit] <PARAMETERS> (dot1p <0-7>,mark [8021p <0-7>|dscp <0-63>],
type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-
4095>,log,rule-precedence <1-5000>) {(rule-description <LINE>)}
```

Parameters

```
• insert [deny|permit] <PARAMETERS> (dot1p <0-7>,mark [8021p <0-7>|dscp <0-63>],
type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-
4095>,log,rule-precedence <1-5000>) {(rule-description <LINE>)}
```

| | |
|--------------------------------|--|
| insert [deny permit] | Inserts a deny or permit rule within an MAC ACL |
| <PARAMETERS> | Provide the match criteria for this deny/permit rule. Packets will be filtered based on the criteria set here. For more information on the deny rule, see <i>deny</i> . For more information on the permit rule, see <i>permit</i> . |
| dot1p <0-7> | Configures the 802.1p priority value. Sets the service classes for traffic handling <ul style="list-style-type: none"> • <0-7> - Specify 802.1p priority from 0 - 7. |
| mark [8021p <0-7> dscp <0-63>] | Marks/modifies packets that match the criteria specified here <ul style="list-style-type: none"> • 8021p <0-7> - Modifies 802.1p VLAN user priority from 0 - 7 • dscp <0-63> - Modifies DSCP TOS bits in the IP header from 0 - 63 <p>Note: This option is applicable only to the <i>insert > permit</i> MAC ACL rule.</p> |

| | |
|---|--|
| type [8021q <1-65535> aarp appletalk arp ip ipv6 ipx mint rarp wisp] | Configures the EtherType value An EtherType is a two-octet field in an Ethernet frame that indicates the protocol encapsulated in the payload of the frame. The EtherType values are: <ul style="list-style-type: none"> • 8021q - Indicates a 802.1q payload (0x8100) • <1-65535> - Indicates the EtherType protocol number • aarp - Indicates the Appletalk ARP payload (0x80F3) • appletalk - Indicates the Appletalk Protocol payload (0x809B) • arp - Indicates the ARP payload (0x0806) • ip - Indicates the IPv4 payload (0x0800) • ipv6 - Indicates the IPv6 payload (0x86DD) • ipx - Indicates the Novell's IPX payload (0x8137) • mint - Indicates the MiNT protocol payload (0x8783) • rarp - Indicates the reverse ARP payload (0x8035) • wisp - Indicates the WISP payload (0x8783) |
| vlan <1-4095> | Configures the VLAN where the traffic is received <ul style="list-style-type: none"> • <1-4095> - Specify the VLAN ID from 1 - 4095. |
| log | Logs all deny/permit events matching this entry. If a source and/or destination MAC address is matched (i.e. a packet is received from a specified MAC address or is destined for a specified MAC address), an event is logged. |
| rule-precedence <1-5000> rule-description <LINE> | The following keywords are recursive and common to all of the above parameters: <ul style="list-style-type: none"> • rule-precedence - Assigns a precedence for this deny rule <ul style="list-style-type: none"> • <1-5000> - Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> <ul style="list-style-type: none"> • rule-description - Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

Example

```
rfs4000-229D58 (config-mac-acl-test1)#deny 11-22-33-44-55-66 11-22-33-44-55-77 any
rule-precedence 1
rfs4000-229D58 (config-mac-acl-test1)#deny host B4-C7-99-6D-CD-9B any rule-
precedence 2
```

```
rfs4000-229D58 (config-mac-acl-test1)#show context
mac access-list test1
  deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1
  deny host B4-C7-99-6D-CD-9B any rule-precedence 2
rfs4000-229D58 (config-mac-acl-test1)#
```

In the following example a new rule is inserted between the rules having precedences 1 and 2. The precedence of the existing precedence '2' rule changes to precedence 3.

```
rfs4000-229D58 (config-mac-acl-test1)#insert permit host B4-C7-99-6D-B5-D6 host B4-
C7-99-6D-CD-9B rule-precedence 2
rfs4000-229D58 (config-mac-acl-test1)#show context
mac access-list test1
  deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1
  permit host B4-C7-99-6D-B5-D6 host B4-C7-99-6D-CD-9B rule-precedence 2
  deny host B4-C7-99-6D-CD-9B any rule-precedence 3
rfs4000-229D58 (config-mac-acl-test1)#
```

11.2.5 no

► *mac-access-list*

Negates a command or sets its default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [deny|disable|permit]
```

```
no [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>]
[<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,mark [8021p <0-7>|dscp <0-63>],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}
```

```
no disable [deny|permit] <RULE-PARAMETERS>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes a deny or permit rule from the MAC ACL |
|-----------------|--|

Example

```
rfs6000-37FABE(config-mac-acl-test)#show context
mac access-list test
  permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
  permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence
  610
deny any host 33-44-55-66-77-88 log rule-precedence 700

rfs6000-37FABE(config-mac-acl-test)#no deny any host 33-44-55-66-77-88 log
rule-precedence 700

rfs6000-37FABE(config-mac-acl-test)#show context
mac access-list test
  permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
  permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence
  610
```

11.2.6 permit

► *mac-access-list*

Creates a permit rule that marks packets (from a specified source MAC and/or to a specified destination MAC) for forwarding. You can also use this command to modify an existing permit rule.

NOTE: Use a decimal value representation to implement a `permit/deny` designation for a packet. The command set for MAC ACLs provide the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
permit [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC>
<DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,mark [8021p <0-7>,dscp <0-
63>],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan
<1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}
```

Parameters

```
• permit [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC>
<DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,mark [8021p <0-7>,dscp <0-
63>],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan
<1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}
```

| | |
|-----------------------------------|---|
| <SOURCE-MAC> <SOURCE-MAC-MASK> | Configures the source MAC address and mask to match <ul style="list-style-type: none"> • <SOURCE-MAC> - Specify the source MAC address to match. • <SOURCE-MAC-MASK> - Specify the source MAC address mask. Packets addressed to the specified MAC addresses are forwarded. |
| any | Identifies all devices as the source to permit access. Packets addressed from any source are forwarded. |
| host <SOURCE-HOST-MAC> | Identifies a specific host as the source to permit access <ul style="list-style-type: none"> • <SOURCE-HOST-MAC> - Specify the source host's exact MAC address to match. Packets addressed to the specified host are forwarded. |
| <DEST-MAC> <DEST-MAC-MASK> | Configures the destination MAC address and mask to match <ul style="list-style-type: none"> • <DEST-MAC> - Specify the destination MAC address to match. • <DEST-MAC-MASK> - Specify the destination MAC address mask to match. Packets addressed to the specified MAC addresses are forwarded. |
| DEST-MAC-MASK | Specifies the destination MAC address mask to match |
| any | Identifies all devices as the destination to permit access. Packets addressed to any destination are forwarded. |

| | |
|--|--|
| host <DEST-HOST-MAC> | <p>Identifies a specific host as the destination to permit access</p> <ul style="list-style-type: none"> <DEST-HOST-MAC> - Specify the destination host's exact MAC address to match. Packets addressed to the specified host are forwarded. |
| dot1p <0-7> | <p>Configures the 802.1p priority value. Sets the service classes for traffic handling</p> <ul style="list-style-type: none"> <0-7> - Specify 802.1p priority from 0 - 7. |
| mark [8021p <0-7>, dscp <0-63>] | <p>Marks/modifies packets that match the criteria specified here</p> <ul style="list-style-type: none"> 8021p <0-7> - Modifies 802.1p VLAN user priority from 0 - 7 dscp <0-63> - Modifies DSCP TOS bits in the IP header from 0 - 63 <p>Note: This option is applicable only to the MAC ACL permit rule.</p> |

| rule-precedence <1-5000> rule-description <LINE> | <p>The following keywords are recursive and common to all of the above parameters:</p> <ul style="list-style-type: none"> rule-precedence - Assigns a precedence for this permit rule <ul style="list-style-type: none"> <1-5000> - Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> <ul style="list-style-type: none"> rule-description - Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

Usage Guidelines

The permit command in the MAC ACL allows traffic based on layer 2 (data-link layer) information. A MAC access list permits traffic from a source MAC address or any MAC address. It also has an option to allow traffic from a list of MAC addresses (based on the source mask).

The MAC access list can be configured to allow traffic based on VLAN information, or Ethernet type. Common types include:

- ARP
- WISP
- IP
- 802.1q

Layer 2 traffic is not allowed by default. To adopt an access point through an interface, configure an ACL to allow an Ethernet WISP.

Use the mark option to specify the type of service (tos) and priority value. The tos value is marked in the IP header and the 802.1p priority value is marked in the dot1q frame.

Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. It is marked based on the ACL's configuration.

NOTE: To apply an IP based ACL to an interface, a MAC access list entry is mandatory to allow ARP. A MAC ACL always takes precedence over IP based ACLs.

Example

```
rfs6000-37FABE(config-mac-acl-test)#permit host 11-22-33-44-55-66 any log mark
8021p 3 rule-precedence 600

rfs6000-37FABE(config-mac-acl-test)#permit host 22-33-44-55-66-77 host 11-22-33-
44-55-66 type ip log rule-precedence 610

rfs6000-37FABE(config-mac-acl-test)#show context
mac access-list testPF
  permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
  permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence
610
rfs6000-37FABE(config-mac-acl-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes or resets a specified MAC ACL permit rule |
|-----------|---|

11.3 ipv6-access-list

▶ ACCESS-LIST

Configures a IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

The WiNG software supports IPv6 only on VLAN interfaces. Therefore, IPv6 ACLs can be applied only on the VLAN interface.

The following table summarizes IPv6 access list configuration commands:

Table 11.3 IPv6-Access-List-Config Commands

| Command | Description | Reference |
|---------------|--|-------------------|
| <i>deny</i> | Creates a deny access rule or modifies an existing rule. A deny access rule rejects IPv6 packets from specified address(es) and/or destined for specified address(es). | <i>page 11-50</i> |
| <i>no</i> | Removes a deny and/or a access rule from a IPv6 ACL | <i>page 11-56</i> |
| <i>permit</i> | Creates a permit access rule or modifies an existing rule. A permit access rule accepts IPv6 packets from specified address(es) and/or destined for specified address(es). | <i>page 11-57</i> |

11.3.1 deny

▶ *ipv6-access-list*

Creates a deny rule that rejects packets from a specified IPv6 source and/or to a specified IPv6 destination. You can also use this command to modify an existing deny rule.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
deny [icmpv6|ipv6|proto|tcp|udp]

deny icmpv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>|
any|host <DEST-HOST-IPv6>] [code [eq <ICMPv6-CODE>|range <STARTING-ICMPv6-CODE>
<ENDING-ICMPv6-CODE>]|type [eq <ICMPv6-TYPE>|range <STARTING-ICMPv6-TYPE>
<ENDING-ICMPv6-TYPE>]] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

deny ipv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/
MASK>|any|host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-
description <LINE>)}

deny proto [<PROTOCOL-NUMBER>|<PROTOCOL-NAME>|eigrp|gre|igmp|ospf|vrrp]
[<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>|any|
host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

deny [tcp|udp] [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/
MASK>|any|eq <SOURCE-PORT>|host <DEST-HOST-IPv6>|range <START-PORT> <END-PORT>]
[eq [<1-65535>|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|
pop3|sip|smtp|ssh|telnet|tftp|www]|range <START-PORT> <END-PORT>] (log,rule-
precedence <1-5000>) {(rule-description <LINE>)}
```

Parameters

- deny icmpv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>|any|host <DEST-HOST-IPv6>] [code [eq <ICMPv6-CODE>|range <STARTING-ICMPv6-CODE> <ENDING-ICMPv6-CODE>]|type [eq <ICMPv6-TYPE>|range <STARTING-ICMPv6-TYPE> <ENDING-ICMPv6-TYPE>]] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

| | |
|-------------------------|--|
| icmpv6 | Applies this deny rule to ICMPv6 packets only |
| <SOURCE-IPv6/MASK> | Specifies a range of IPv6 source address (network) to match. ICMPv6 packets received from any source in the specified network are dropped. |
| any | Specifies the source as any IPv6 address. ICMPv6 packets received from any source are dropped. |
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are dropped. <ul style="list-style-type: none"> • <SOURCE-HOST-IPv6> - Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are dropped. |
| any | Specifies the destination as any IPv6 address. ICMPv6 packets addressed to any destination are dropped. |

| | |
|---|---|
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. ICMPv6 packets addressed to the specified host are dropped. <ul style="list-style-type: none"> <DEST-HOST-IPv6> - Specify the destination host's exact IPv6 address. |
| <ICMPv6-TYPE> [eq range] | Defines the ICMPv6 type field filter <ul style="list-style-type: none"> eq - Configures a specific ICMPv6 type. Specify the ICMPv6 type value. range - Configures a range of ICMPv6 types. Specify the starting and ending ICMPv6 type values. <p>Note: ICMPv6 packets with type field value matching the values specified here are dropped.</p> |
| <ICMPv6-CODE> | Defines the ICMPv6 code field filter <ul style="list-style-type: none"> eq - Configures a specific ICMPv6 code. Specify the ICMPv6 code value. range - Configures a range of ICMPv6 code. Specify the starting and ending ICMPv6 code values. <p>Note: ICMPv6 packets with code field value matching the values specified here are dropped.</p> |
| log | Logs all deny events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this deny rule <ul style="list-style-type: none"> <1-5000> - Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> |
| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre> • deny ipv6 [<SOURCE-IPv6/MASK> any host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK> any host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| ipv6 | Applies this deny rule to IPv6 packets only |
| <SOURCE-IPv6/MASK> | Specifies a range of IPv6 source address (network) to match. IPv6 packets received from any source in the specified network are dropped. |
| any | Specifies the source as any IPv6 address. IPv6 packets received from any source are dropped. |
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. IPv6 packets received from the specified host are dropped. <ul style="list-style-type: none"> <SOURCE-HOST-IPv6> - Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. IPv6 packets addressed to any destination within the specified network are dropped. |
| any | Specifies the destination as any IPv6 address. IPv6 packets addressed to any destination are dropped. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. IPv6 packets addressed to the specified host are dropped. <ul style="list-style-type: none"> <DEST-HOST-IPv6> - Specify the destination host's exact IPv6 address. |

| | |
|---|---|
| log | Logs all deny events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this deny rule <ul style="list-style-type: none"> • <1-5000> - Specify a value from 1 - 5000 <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> |
| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre> • deny proto [<PROTOCOL-NUMBER> <PROTOCOL-NAME> eigrp gre igp ospf vrrp] [<SOURCE-IPv6/MASK> any host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK> any host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| proto | Configures the ACL for additional protocols Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter. |
| <PROTOCOL-NUMBER> | Filters protocols using their <i>Internet Assigned Numbers Authority</i> (IANA) protocol number <ul style="list-style-type: none"> • <PROTOCOL-NUMBER> - Specify the protocol number. |
| <PROTOCOL-NAME> | Filters protocols using their IANA protocol name <ul style="list-style-type: none"> • <PROTOCOL-NAME> - Specify the protocol name. |
| eigrp | Identifies the EIGRP protocol (number 88) EIGRP enables routers to maintain copies of neighbors' routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| gre | Identifies the GRE protocol (number 47) GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination. |
| igp | Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9) IGP enables exchange of information between hosts and routers within a managed network. The most commonly used IGP protocols are: RIP and OSPF. |
| ospf | Identifies the OSPF protocol (number 89) OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. |

| | |
|---|--|
| vrrp | Identifies the VRRP protocol (number 112) VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |
| <SOURCE-IPv6/ MASK> | Specifies a range of IPv6 source address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source in the specified network are dropped. |
| any | Specifies the source as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are dropped. |
| host <SOURCE-HOST- IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are dropped. <ul style="list-style-type: none"> <SOURCE-HOST-IP> – Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination within the specified network are dropped. |
| any | Specifies the destination as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are dropped. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified host are dropped. <ul style="list-style-type: none"> <DEST-HOST-IPv6> – Specify the destination host's exact IPv6 address. |
| log | Logs all deny events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this deny rule <ul style="list-style-type: none"> <1-5000> – Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> |
| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre> • deny [tcp udp] [<SOURCE-IPv6/MASK> any host <SOURCE-HOST-IPv6>] [<DEST-IPv6/ MASK> any eq <SOURCE-PORT> host <DEST-HOST-IPv6> range <START-PORT> <END-PORT>] [eq [<1-65535> <SERVICE-NAME> bgp dns ftp ftp-data gopher https ldap nntp ntp pop3 sip smtp ssh telnet tftp www] range <START-PORT> <END-PORT>] (log, rule- precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| tcp | Applies this deny rule to TCP packets only |
| udp | Applies this deny rule to UDP packets only |
| <SOURCE-IPv6/ MASK> | This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 source address (network) to match. TCP/UDP packets received from any source in the specified network are dropped. |
| any | This keyword is common to the 'tcp' and 'udp' parameters. Specifies the source as any IPv6 address. TCP/UDP packets received from any source are dropped. |

| | |
|--|--|
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. TCP/UDP packets received from the specified host are dropped. <ul style="list-style-type: none"> • <SOURCE-HOST-IP> – Specify the source host’s exact IPv6 address. |
| <DEST-IPv6/MASK> | This keyword is common to the ‘tcp’ and ‘udp’ parameters. Specifies a range of IPv6 destination address (network) to match. TCP/UDP packets addressed to any destination within the specified network are dropped. |
| any | This keyword is common to the ‘tcp’ and ‘udp’ parameters. Specifies the destination as any destination IPv6 address. TCP/UDP packets received from any destination are dropped. |
| eq <SOURCE-PORT> | Identifies a specific source port <ul style="list-style-type: none"> • <SOURCE-PORT> – Specify the exact source port. |
| host <DEST-HOST-IP> | Identifies a specific host (as the destination to match) by its IPv6 address. TCP/UDP packets addressed to the specified host are dropped. <ul style="list-style-type: none"> • <DEST-HOST-IP> – Specify the destination host’s exact IP address. |
| range <START-PORT> <END-PORT> | Specifies a range of source ports <ul style="list-style-type: none"> • <START-PORT> – Specify the first port in the range. • <END-PORT> – Specify the last port in the range. |
| eq [<1-65535> <SERVICE-NAME> bgp dns ftp ftp-data gropher https ldap nntp ntp pop3 sip smtp ssh telnet tftp www] | Identifies a specific destination or protocol port to match <ul style="list-style-type: none"> • <1-65535> – The destination port is designated by its number • <SERVICE-NAME> – Specifies the service name • bgp – The designated BGP protocol port (179) • dns – The designated DNS protocol port (53) • ftp – The designated FTP protocol port (21) • ftp-data – The designated FTP data port (20) • gropher – The designated GROPPER protocol port (70) • https – The designated HTTPS protocol port (443) • ldap – The designated LDAP protocol port (389) • nntp – The designated NNTP protocol port (119) • ntp – The designated NTP protocol port (123) • pop3 – The designated POP3 protocol port (110) • sip – The designated SIP protocol port (5060) • smtp – The designated SMTP protocol port (25) • ssh – The designated SSH protocol port (22) • telnet – The designated Telnet protocol port (23) • tftp – The designated TFTP protocol port (69) • www – The designated www protocol port (80) |
| range <START-PORT> <END-PORT> | Specifies a range of destination ports <ul style="list-style-type: none"> • <START-PORT> – Specify the first port in the range. • <END-PORT> – Specify the last port in the range. |
| log | Logs all deny events matching this entry |

| | |
|-----------------------------|--|
| rule-precedence <1-5000> | Assigns a precedence for this deny rule <ul style="list-style-type: none"> • <1-5000> - Specify a value from 1 - 5000. Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

Example

```

rfs6000-81742D(config-ipv6-acl-test)#deny icmpv6 any any type eq 1 code eq 0 log
rule-precedence 1

rfs6000-81742D(config-ipv6-acl-test)#show context
ipv6 access-list test
  deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-
  command log rule-precedence 1
rfs6000-81742D(config-ipv6-acl-test)#

```

Related Commands

| | |
|-----------|--------------------------------------|
| <i>no</i> | Removes a specified deny access rule |
|-----------|--------------------------------------|

11.3.2 no

► *ipv6-access-list*

Removes a deny or permit rule

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [deny|permit]
```

```
no [deny|permit] [icmpv6|ipv6|proto|tcp|udp] <RULE-PARAMETERS> {(rule-  
description <LINE>)}
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes a deny or permit rule from the selected IPv6 access list |
|-----------------|--|

Example

The following example shows the ACL 'test' settings before the 'no' commands are executed:

```
rfs6000-81742D(config-ipv6-acl-test)#show context
ipv6 access-list test
  deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-  
command log rule-precedence 1
  permit proto gre any any log rule-precedence 2
rfs6000-81742D(config-ipv6-acl-test)#

rfs6000-81742D(config-ipv6-acl-test)#no deny icmpv6 any any type eq 1 log
rule-precedence 1

rfs6000-81742D(config-ipv6-acl-test)#show context
ipv6 access-list test
  permit proto gre any any log rule-precedence 2
rfs6000-81742D(config-ipv6-acl-test)#
```

11.3.3 permit

▶ *ipv6-access-list*

Creates a permit rule that accepts packets from a specified IPv6 source and/or to a specified IPv6 destination. You can also use this command to modify an existing permit rule.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
permit [icmpv6|ipv6|proto|tcp|udp]

permit icmpv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/
MASK>|any|host <DEST-HOST-IPv6>] [code [eq <ICMPv6-CODE>|range <STARTING-ICMPv6-
CODE> <ENDING-ICMPv6-CODE>]|type [eq <ICMPv6-TYPE>|range <STARTING-ICMPv6-TYPE>
<ENDING-ICMPv6-TYPE>]] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

permit ipv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/
MASK>|any|host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-
description <LINE>)}

permit proto [<PROTOCOL-NUMBER>|<PROTOCOL-NAME>|eigrp|gre|igmp|ospf|vrrp]
[<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>|any|host
<DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

permit [tcp|udp] [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/
MASK>|any|eq <SOURCE-PORT>|host <DEST-HOST-IPv6>|range <START-PORT> <END-PORT>]
[eq [<1-65535>|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|
pop3|sip|smtp|ssh|telnet|tftp|www]|range <START-PORT> <END-PORT>] (log,rule-
precedence <1-5000>) {(rule-description <LINE>)}
```

Parameters

- permit icmpv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/ MASK>|any|host <DEST-HOST-IPv6>] [code [eq <ICMPv6-CODE>|range <STARTING-ICMPv6-CODE> <ENDING-ICMPv6-CODE>]|type [eq <ICMPv6-TYPE>|range <STARTING-ICMPv6-TYPE> <ENDING-ICMPv6-TYPE>]] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}

| | |
|----------------------------|---|
| icmpv6 | Applies this permit rule to ICMPv6 packets only |
| <SOURCE-IPv6/MASK> | Specifies a range of IPv6 source address (network) to match. ICMPv6 packets received from any source in the specified network are accepted. |
| any | Specifies the source as any IPv6 address. ICMPv6 packets received from any source are accepted. |
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are accepted. <ul style="list-style-type: none"> • <SOURCE-HOST-IPv6> - Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are accepted. |
| any | Specifies the destination as any IPv6 address. ICMPv6 packets addressed to any destination are accepted. |

| | |
|---|---|
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. ICMPv6 packets addressed to the specified host are accepted. <ul style="list-style-type: none"> <DEST-HOST-IPv6> - Specify the destination host's exact IPv6 address. |
| <ICMPv6-TYPE> [eq range] | Defines the ICMPv6 type field filter <ul style="list-style-type: none"> eq - Configures a specific ICMPv6 type. Specify the ICMPv6 type value. range - Configures a range of ICMPv6 types. Specify the starting and ending ICMPv6 type values. <p>Note: ICMPv6 packets with type field value matching the values specified here are forwarded.</p> |
| <ICMPv6-CODE> | Defines the ICMPv6 code field filter <ul style="list-style-type: none"> eq - Configures a specific ICMPv6 code. Specify the ICMPv6 code value. range - Configures a range of ICMPv6 code. Specify the starting and ending ICMPv6 code values. <p>Note: ICMPv6 packets with code field value matching the values specified here are forwarded.</p> |
| log | Logs all permit events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this permit rule <ul style="list-style-type: none"> <1-5000> - Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> |
| rule-description <LINE> | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre>• permit ipv6 [<SOURCE-IPv6/MASK> any host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK> any host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)}</pre> | |
| ipv6 | Applies this permit rule to IPv6 packets only |
| <SOURCE-IPv6/MASK> | Specifies a range of IPv6 source address (network) to match. IPv6 packets received from any source in the specified network are forwarded. |
| any | Specifies the source as any IPv6 address. IPv6 packets received from any source are forwarded. |
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. IPv6 packets received from the specified host are forwarded. <ul style="list-style-type: none"> <SOURCE-HOST-IPv6> - Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. IPv6 packets addressed to any destination within the specified network are forwarded. |
| any | Specifies the destination as any IPv6 address. IPv6 packets addressed to any destination are forwarded. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. IPv6 packets addressed to the specified host are forwarded. <ul style="list-style-type: none"> <DEST-HOST-IPv6> - Specify the destination host's exact IPv6 address. |

| | |
|---|---|
| log | Logs all permit events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this permit rule <ul style="list-style-type: none"> • <1-5000> - Specify a value from 1 - 5000 <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> |
| rule-description <LINE> | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <pre> • permit proto [<PROTOCOL-NUMBER> <PROTOCOL-NAME> eigrp gre igp ospf vrrp] [<SOURCE-IPv6/MASK> any host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK> any host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {(rule-description <LINE>)} </pre> | |
| proto | Configures the ACL for additional protocols Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter. |
| <PROTOCOL-NUMBER> | Filters protocols using their <i>Internet Assigned Numbers Authority</i> (IANA) protocol number <ul style="list-style-type: none"> • <PROTOCOL-NUMBER> - Specify the protocol number. |
| <PROTOCOL-NAME> | Filters protocols using their IANA protocol name <ul style="list-style-type: none"> • <PROTOCOL-NAME> - Specify the protocol name. |
| eigrp | Identifies the EIGRP protocol (number 88) EIGRP enables routers to maintain copies of neighbors' routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| gre | Identifies the GRE protocol (number 47) GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination. |
| igp | Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9) IGP enables exchange of information between hosts and routers within a managed network. The most commonly used IGP protocols are: RIP and OSPF. |
| ospf | Identifies the OSPF protocol (number 89) OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. |

| | |
|---|--|
| vrrp | Identifies the VRRP protocol (number 112) VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |
| <SOURCE-IPv6/ MASK> | Specifies a range of IPv6 source address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source in the specified network are forwarded. |
| any | Specifies the source as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are forwarded. |
| host <SOURCE-HOST- IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are forwarded. <ul style="list-style-type: none"> <SOURCE-HOST-IPv6> – Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination within the specified network are forwarded. |
| any | Specifies the destination as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are forwarded. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified host are forwarded. <ul style="list-style-type: none"> <DEST-HOST-IPv6> – Specify the destination host's exact IPv6 address. |
| log | Logs all permit events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this permit rule <ul style="list-style-type: none"> <1-5000> – Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.</p> |
| rule-description <LINE> | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <ul style="list-style-type: none"> permit [tcp udp] [<SOURCE-IPv6/MASK> any host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK> any eq <SOURCE-PORT> host <DEST-HOST-IPv6> range <START-PORT> <END-PORT>] [eq [<1-65535> <SERVICE-NAME> bgp dns ftp ftp-data gopher https ldap nntp ntp pop3 sip smtp ssh telnet tftp www] range <START-PORT> <END-PORT>] (log, rule-precedence <1-5000>) {(rule-description <LINE>)} | |
| tcp | Applies this permit rule to TCP packets only |
| udp | Applies this permit rule to UDP packets only |
| <SOURCE-IPv6/ MASK> | This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 source address (network) to match. TCP/UDP packets received from any source in the specified network are forwarded. |
| any | This keyword is common to the 'tcp' and 'udp' parameters. Specifies the source as any IPv6 address. TCP/UDP packets received from any source are forwarded. |

| | |
|--|--|
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. TCP/UDP packets received from the specified host are forwarded. <ul style="list-style-type: none"> • <SOURCE-HOST-IPv6> – Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 destination address (network) to match. TCP/UDP packets addressed to any destination within the specified network are forwarded. |
| any | This keyword is common to the 'tcp' and 'udp' parameters. Specifies the destination as any destination IPv6 address. TCP/UDP packets received from any destination are forwarded. |
| eq <SOURCE-PORT> | Identifies a specific source port <ul style="list-style-type: none"> • <SOURCE-PORT> – Specify the exact source port. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. TCP/UDP packets addressed to the specified host are forwarded. <ul style="list-style-type: none"> • <DEST-HOST-IPv6> – Specify the destination host's exact IP address. |
| range <START-PORT> <END-PORT> | Specifies a range of source ports <ul style="list-style-type: none"> • <START-PORT> – Specify the first port in the range. • <END-PORT> – Specify the last port in the range. |
| eq [<1-65535> <SERVICE-NAME> bgp dns ftp ftp-data gropher https ldap nntp ntp pop3 sip smtp ssh telnet tftp www] | Identifies a specific destination or protocol port to match <ul style="list-style-type: none"> • <1-65535> – The destination port is designated by its number • <SERVICE-NAME> – Specifies the service name • bgp – The designated BGP protocol port (179) • dns – The designated DNS protocol port (53) • ftp – The designated FTP protocol port (21) • ftp-data – The designated FTP data port (20) • gropher – The designated GROPPER protocol port (70) • https – The designated HTTPS protocol port (443) • ldap – The designated LDAP protocol port (389) • nntp – The designated NNTP protocol port (119) • ntp – The designated NTP protocol port (123) • pop3 – The designated POP3 protocol port (110) • sip – The designated SIP protocol port (5060) • smtp – The designated SMTP protocol port (25) • ssh – The designated SSH protocol port (22) • telnet – The designated Telnet protocol port (23) • tftp – The designated TFTP protocol port (69) • www – The designated www protocol port (80) |
| range <START-PORT> <END-PORT> | Specifies a range of destination ports <ul style="list-style-type: none"> • <START-PORT> – Specify the first port in the range. • <END-PORT> – Specify the last port in the range. |
| log | Logs all permit events matching this entry |

| | |
|-----------------------------|--|
| rule-precedence <1-5000> | Assigns a precedence for this permit rule <ul style="list-style-type: none"> • <1-5000> - Specify a value from 1 - 5000. Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description <LINE> | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

Example

```
rfs6000-81742D(config-ipv6-acl-test)#permit proto gre any any log rule-precedence
2

rfs6000-81742D(config-ipv6-acl-test)#show context
ipv6 access-list test
  deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-
command log rule-precedence 1
  permit proto gre any any log rule-precedence 2
rfs6000-81742D(config-ipv6-acl-test)#
```

11.4 ip-snmp-access-list

▶ ACCESS-LIST

SNMP performs network management functions using a data structure called a *Management Information Base* (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.

Use SNMP ACLs to help reduce SNMP's vulnerabilities, as SNMP traffic can be exploited to produce a *denial of service* (DoS).

The following table summarizes SNMP access list configuration commands:

Table 11.4 *SNMP-Access-List-Config Commands*

| Command | Description | Reference |
|---------------|---|-------------------|
| <i>deny</i> | Creates a deny SNMP MIB object traffic rule | <i>page 11-64</i> |
| <i>permit</i> | Creates a permit SNMP MIB object traffic rule | <i>page 11-65</i> |
| <i>no</i> | Removes a deny or permit SNMP MIB object traffic rule | <i>page 11-66</i> |

11.4.1 deny

▶ *ip-snmp-access-list*

Creates a deny SNMP MIB object traffic rule. Use this command to specify the match criteria based on which SNMP traffic is denied

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
deny [<IP/M>|any|host <IP>]
```

Parameters

- deny [<IP/M>|any|host <IP>]

| | |
|-----------------------------|---|
| deny [<IP/M> any host <IP>] | <p>Configures the match criteria for this deny rule</p> <ul style="list-style-type: none"> • <IP/M> – Specifies a network address and mask in the A.B.C.D/M format. Packets received or destined for this network are dropped • any – Specifies the match criteria as any. Packets received or destined from any address are dropped • host <IP> – Identifies a host by its IP address. Packets received or destined for this host are dropped |
|-----------------------------|---|

Example

```
rfs6000-81742D(config-ip-snmp-acl-test)#deny 192.168.13.0/24

rfs6000-81742D(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
  deny 192.168.13.0/24
rfs6000-81742D(config-ip-snmp-acl-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this deny rule form the IP SNMP ACL |
|-----------|---|

11.4.2 permit

▶ *ip-snmp-access-list*

Creates a permit SNMP MIB object traffic rule. Use this command to specify the match criteria based on which SNMP traffic is permitted.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
permit [<IP/M>|any|host <IP>]
```

Parameters

- permit [<IP/M>|any|host <IP>]

| | |
|---|---|
| <pre>permit [<IP/M> any host <IP>]</pre> | <p>Configures the match criteria for this permit rule</p> <ul style="list-style-type: none"> • <IP/M> – Specifies a network address and mask in the A.B.C.D/M format. Packets received or destined for this network are forwarded • any – Specifies the match criteria as any. Packets received or destined from any address are forwarded • host <IP> – Identifies a host by its IP address. Packets received or destined for this host are forwarded |
|---|---|

Example

```
rfs6000-81742D(config-ip-snmp-acl-test)#permit host 192.168.13.13

rfs6000-81742D(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
  permit host 192.168.13.13
  deny 192.168.13.0/24
rfs6000-81742D(config-ip-snmp-acl-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this permit rule from the IP SNMP ACL |
|-----------|---|

11.4.3 no

▶ *ip-snmp-access-list*

Removes a deny or permit rule from the IP SNMP ACL. Use this command to remove IP SNMP ACL as they become obsolete for filtering network access permissions.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [deny|permit] [<IP/M>|any|host <IP>]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes deny and/or permit access rule from this IP SNMP ACL |
|-----------------|--|

Example

```
rfs6000-81742D(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
  permit host 192.168.13.13
  deny 192.168.13.0/24
rfs6000-81742D(config-ip-snmp-acl-test)#

rfs6000-81742D(config-ip-snmp-acl-test)#no permit host 192.168.13.13

rfs6000-81742D(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
  deny 192.168.13.0/24
rfs6000-81742D(config-ip-snmp-acl-test)#
```

11.5 ex3500-ext-access-list

▶ ACCESS-LIST

IP ACLs function as firewalls that filter or mark packets on layer 3 ports as opposed to MAC ACLs that filter traffic on layer 2 ports.

An IPv4 EX3500 extended ACL is a policy-based ACL that either prevents or allows specific clients from using the EX3500 switch. It allows you to permit or deny client access by specifying that the traffic *from* a specific host or network and/or the traffic *to* a specific host or network be either denied or permitted.

An EX3500 extended ACL consists of a set of deny /permit *rules* that filter packets based on both source and destination IPv4 addresses. Each rule specifies a set of match criteria (the source and destination IP addresses) and has a unique *precedence* value assigned. These ACL rules are applied sequentially to the traffic at a port, by a firewall-supported device, in an increasing order of their precedence. When a packet matches the criteria specified in a rule the packet is either forwarded or dropped based on the rule type.

The following table summarizes IPv4 EX3500 extended ACL configuration commands:

NOTE: To implement the EX3500 extended ACL, apply it directly to a EX3500 device, or to an EX35XX profile. For more information, see [access-group](#).

Table 11.5 EX3500-Extended-Access-List-Config Commands

| Command | Description | Reference |
|---------------|--|----------------------------|
| <i>deny</i> | Creates a deny access rule or modifies an existing rule. A deny access rule rejects packets from specified address(es) and/or destined to specified address(es). | page 11-68 |
| <i>permit</i> | Creates a permit access rule or modifies an existing rule. A permit access rule accepts packets from specified address(es) and/or destined to specified address(es). | page 11-71 |
| <i>no</i> | Removes a deny and/or a permit access rule from this IPv4 EX3500 extended ACL | page 11-74 |

11.5.1 deny

▶ *ex3500-ext-access-list*

Creates a deny ACL rule that filters packets based on the source and/or destination IPv4 address, and other specified criteria. You can also use this command to modify an existing deny rule.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
deny [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]
[<DEST-NETWORK-IP/MASK>|any|host <DEST-HOST-IP>] [control-flag <0-63>|
destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|
ex3500-time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|
source-port <0-65535>|source-port-bitmark <0-65535>]
```

Parameters

```
• deny [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]
[<DEST-NETWORK-IP/MASK>|any|host <DEST-HOST-IP>] [control-flag <0-63>|
destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|
ex3500-time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|
source-port <0-65535>|source-port-bitmark <0-65535>]
```

| | |
|--|--|
| deny [<0-255> tcp udp] | Creates a deny rule and identifies the protocol type. This deny rule is applied only to packets matching the protocol specified here. <ul style="list-style-type: none"> • <0-255> - Identifies the protocol from its number. Specify the protocol number from 0 - 255. • tcp - Configures the protocol as TCP • udp - Configures the protocol as UDP |
| [<SOURCE-NETWORK-IP/MASK> any host <SOURCE-HOST-IP>] | Specifies the source IP address as <i>any</i> , <i>host</i> , or <i>network</i> <ul style="list-style-type: none"> • <SOURCE-NETWORK-IP/MASK> - Configures a network as the source. Provide the network's IPv4 address along with the mask. • host <SOURCE-HOST-IP> - Configures a single device as the source. Provide the host device's IPv4 address. • any - Specifies that the source can be any device |
| [<DEST-NETWORK-IP/MASK> any host <DEST-HOST-IP>] | Specifies the destination IP address as <i>any</i> , <i>host</i> , or <i>network</i> . <ul style="list-style-type: none"> • <DEST-NETWORK-IP/MASK> - Configures a network as the destination. Provide the network's IPv4 address along with the mask • host <DEST-HOST-IP> - Configures a single device as the destination. Provide the host device's IPv4 address • any - Specifies that the destination can be any device |
| control-flag <0-63> | Configures the decimal number (representing a bit string) that specifies the control flag bits in byte 14 of the TCP header <0-63> - Specify a value from 0 - 63. <p>Note: Control flags can be used only in ACLs designed to filter TCP traffic.</p> Contd.. |

| source-port-bitmark <0-65535> | <p>Configures the decimal number representing the protocol source port bits to match</p> <p><0-65535> - Specify the source port bits from 0 - 65535.</p> |
| rule-precedence <1-128> | <p>The following keywords are recursive and common to all of the above parameters:</p> <ul style="list-style-type: none"> • rule-precedence - Assigns a precedence to this deny rule <ul style="list-style-type: none"> • <1-128> - Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 4 and is applied first to packets.</p> |

Usage Guidelines

Use this command to deny traffic between networks/hosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- TCP
- UDP
- <0-255> (any Internet protocol other than TCP, UDP, and ICMP)

Packet content is checked against the ACEs in the ACL, and are allowed or denied access based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria

Example

The following example denies TCP outgoing packets from all sources p indentwithin the 192.168.14.0 network to a specific host 192.168.13.13:

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#deny tcp 192.168.14.0/24 host
192.168.13.13 rule-precedence 1#

nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context
ip ex3500-ext-access-list test
  deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#
```

11.5.2 permit

▶ *ex3500-ext-access-list*

Creates a permit ACL rule that filters packets based on the source and/or destination IPv4 address, and other specified criteria. You can also use this command to modify an existing permit rule.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
permit [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]
 [<DEST-NEWORK-IP/MASK>|any|host <DEST-HOST-IP>] [control-flag <0-63>|destination-
port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|ex3500-time-range
<TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|source-port <0-
65535>|source-port-bitmark <0-65535>]
```

Parameters

- permit [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] [<DEST-NEWORK-IP/MASK>|any|host <DEST-HOST-IP>] [control-flag <0-63>|destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|ex3500-time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|source-port <0-65535>|source-port-bitmark <0-65535>]

| | |
|--|--|
| permit [<0-255> tcp udp] | Creates a permit rule and identifies the protocol type. This permit rule is applied only to packets matching the protocol specified here. <ul style="list-style-type: none"> • <0-255> - Identifies the protocol from its number. Specify the protocol number from 0 - 255. • tcp - Configures the protocol as TCP • udp - Configures the protocol as UDP |
| [<SOURCE-NETWORK-IP/MASK> any host <SOURCE-HOST-IP>] | Specifies the source IP address as <i>any</i> , <i>host</i> , or <i>network</i> . <ul style="list-style-type: none"> • <SOURCE-NETWORK-IP/MASK> - Configures a network as the source. Provide the network's IPv4 address along with the mask. • host <SOURCE-HOST-IP> - Configures a single device as the source. Provide the host device's IPv4 address. • any - Specifies that the source can be any device |
| [<DEST-NETWORK-IP/MASK> any host <DEST-HOST-IP>] | Specifies the destination IP address as <i>any</i> , <i>host</i> , or <i>network</i> . <ul style="list-style-type: none"> • <DEST-NETWORK-IP/MASK> - Configures a network as the destination. Provide the network's IPv4 address along with the mask. • host <DEST-HOST-IP> - Configures a single device as the destination. Provide the host device's IPv4 address. • any - Specifies that the destination can be any device |

| | |
|-------------------------------------|--|
| control-flag <0-63> | <p>Configures the decimal number (representing a bit string) that specifies the control flag bits in byte 14 of the TCP header</p> <ul style="list-style-type: none"> • <0-63> – Specify a value from 0 - 63. <p>Note: Control flags can be used only in ACLs designed to filter TCP traffic.</p> <p>The TCP header contains several one-bit boolean fields known as flags that influence flow of data across a TCP connection. Ignoring the CWR and ECE flags added for congestion notification by RFC 3168, there are six TCP control flags.</p> <ul style="list-style-type: none"> • URG flag - Marks incoming packet as urgent. • ACK flag - Acknowledges receipt of packet • PUSH flag - Ensures that the packet is given appropriate priority. Often used at the beginning and end of data transfer. • RST flag - Resets the connection. Happens when remote host receives a establish connection packet, but does not have a service waiting to answer and sends a reply with reset flag. • SYN flag - Establishes the 3-way handshake between two hosts • FIN flag - Tears down the connection established between two hosts via the 3-way SYN process |
| destination-port <0-65535> | <p>Configures the protocol destination port to match. The destination protocol can be TCP, UDP or any other protocol identified by its number (<0-255>).</p> <ul style="list-style-type: none"> • <0-65535> – Specify the destination port from 0 - 65535. |
| destination-port-bitmark <0-65535> | <p>Configures the decimal number representing the protocol destination port bits to match</p> <ul style="list-style-type: none"> • <0-65535> – Specify the destination port bits from 0 - 65535. |
| dscp <0-63> | <p>Configures the DSCP priority level</p> <ul style="list-style-type: none"> • <0-63> – Specify a value from 0 - 63. <p>Note: If specifying DSCP priority, ip-precedence cannot be specified.</p> |
| ex3500-time-range <TIME-RANGE-NAME> | <p>Applies a periodic or absolute time range to this rule</p> <ul style="list-style-type: none"> • <TIME-RANGE-NAME> – Specify the time range name (should be existing and configured). For information on configuring EX3500 time-range, see ex3500. |
| ip-precedence <0-7> | <p>Configures the IP header precedence</p> <ul style="list-style-type: none"> • <0-7> – Specify a value from 0 - 7. |
| source-port <0-65535> | <p>Configures the protocol source port to match. The source protocol can be TCP, UDP or any other protocol identified by its number (<0-255>).</p> <ul style="list-style-type: none"> • <0-65535> – Specify the source port from 0 - 65535. |
| source-port-bitmark <0-65535> | <p>Configures the decimal number representing the protocol source port bits to match</p> <ul style="list-style-type: none"> • <0-65535> – Specify the source port bits from 0 - 65535. |
| rule-precedence <1-128> | <p>The following keywords are recursive and common to all of the above parameters:</p> <ul style="list-style-type: none"> • rule-precedence – Assigns a precedence to this permit rule <ul style="list-style-type: none"> • <1-128> – Specify a value from 1 - 5000. <p>Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 4 and is applied first to packets.</p> |

Usage Guidelines

Use this command to permit traffic between networks/hosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- TCP
- UDP
- <0-255> (any Internet protocol other than TCP, UDP, and ICMP)

Whenever the interface receives the packet, its content is checked against the ACEs in the ACL. It is allowed or denied based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria

Example

The following example permits outgoing TCP packets from all sources within the 192.168.14.0 network to any destination, with the TCP control flag set to 16 (acknowledge):

```

nx9500-6C8809(config-ip-ex3500-ext-acl-test)#permit tcp 192.168.14.0/24 any
control-flag 16 rule-precedence 2

nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context
ip ex3500-ext-access-list test
deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
permit tcp 192.168.14.0/24 any control-flag 16 rule-precedence 2
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#

```

Related Commands

| <i>no</i> | Removes a specified permit access rule from this IPv4 EX3500 extended ACL |
|-----------|---|

11.5.3 no

► *ex3500-ext-access-list*

Removes a deny or permit access rule from this IPv4 EX3500 extended ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
no [deny|permit] [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-
HOST-IP>] [<DEST-NETWORK-IP/MASK>|any|host <DEST-HOST-IP>] [control-flag <0-63>|
destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|ex3500-
time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|
source-port <0-65535>|source-port-bitmark <0-65535>]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes a deny or permit access rule based on the parameters passed |
|-----------------|---|

Usage Guidelines

The keyword 'control-flag <0-63>' is only applicable to ACL rules filtering TCP traffic.

Example

The following example shows the IPv4 EX3500 extended ACL 'test' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context
ip ex3500-ext-access-list test
deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
permit tcp 192.168.14.0/24 any control-flag 16 rule-precedence 2
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#
```

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#no permit tcp 192.168.14.0/24 any
control-flag 16 rule-precedence 2
```

The following example shows the IPv4 EX3500 extended ACL 'test' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context
ip ex3500-ext-access-list test
deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#
```

11.6 ex3500-std-access-list

▶ ACCESS-LIST

A EX3500 standard ACL is a policy-based ACL that contains a set of filter criteria and action that is applied to traffic originating from a specified source.

The following table summarizes IPv4 EX3500 standard ACL configuration commands:

NOTE: To implement the EX3500 standard ACL, apply it directly to a EX3500 device, or to an EX35XX profile. For more information, see [access-group](#).

Table 11.6 EX3500-Standard-Access-List-Config Commands

| Command | Description | Reference |
|---------------|--|-------------------|
| <i>deny</i> | Creates a deny rule that rejects packets from a specified source or sources. The source can be a single device or a range of devices within a specified network. Use this command to also edit an existing deny rule. | <i>page 11-76</i> |
| <i>permit</i> | Creates a permit rule that allows packets from a specified source or sources. The source can be a single device or a range of devices within a specified network. Use this command to also edit an existing permit rule. | <i>page 11-77</i> |
| <i>no</i> | Removes a deny and/or a permit access rule from this IPv4 EX3500 extended ACL | <i>page 11-78</i> |

11.6.1 deny

▶ *ex3500-std-access-list*

Creates a deny rule that rejects packets from a specified source or sources. The source can be a single device or a range of devices within a specified network. Use this command to also edit an existing deny rule.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
deny [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] {ex3500-time-range
<TIME-RANGE-NAME>}
```

Parameters

- deny [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] {*ex3500-time-range* <TIME-RANGE-NAME>}

| | |
|--|--|
| deny [<SOURCE-NETWORK-IP/MASK> any host <SOURCE-HOST-IP>] | Creates a deny rule that rejects packets from a specified source or a network. Use one of the following options to specify the source: any, host, or network. <ul style="list-style-type: none"> • <SOURCE-NETWORK-IP/MASK> - Configures a network as the source. Provide the network's IPv4 address along with the mask. • host <SOURCE-HOST-IP> - Configures a single device as the source. Provide the host device's IPv4 address. • any - Specifies that the source can be any device |
| <i>ex3500-time-range</i> <TIME-RANGE-NAME> | Optional. Applies a periodic or absolute time range to this deny rule <ul style="list-style-type: none"> • <TIME-RANGE-NAME> - Specify the time range name (should be existing and configured). The ACL is triggered during the time period configured in the specified EX3500 time range. For information on configuring EX3500 time-range, see <i>ex3500</i>. |

Example

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#deny 192.168.14.0/24

nx9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
  deny 192.168.13.0/24
nx9500-6C8809(config-ip-ex3500-std-acl-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a specified deny access rule from this IPv4 EX3500 standard ACL |
|-----------|---|

11.6.2 permit

▶ *ex3500-std-access-list*

Creates a permit rule that allows packets from a specified source or sources. The source can be a single device or a range of devices within a specified network. Use this command to also edit an existing permit rule.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
permit [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] {ex3500-time-range
<TIME-RANGE-NAME>}
```

Parameters

- permit [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] {ex3500-time-range <TIME-RANGE-NAME>}

| | |
|--|---|
| permit [<SOURCE-NETWORK-IP/MASK> any host <SOURCE-HOST-IP>] | Creates a permit rule that allows packets from a specified source or a network. Use one of the following options to specify the source: any, host, or network. <ul style="list-style-type: none"> • <SOURCE-NETWORK-IP/MASK> - Configures a network as the source. Provide the network's IPv4 address along with the mask. • host <SOURCE-HOST-IP> - Configures a single device as the source. Provide the host device's IPv4 address. • any - Specifies that the source can be any device |
| ex3500-time-range <TIME-RANGE-NAME> | Optional. Applies a periodic or absolute time range to this deny rule <ul style="list-style-type: none"> • <TIME-RANGE-NAME> - Specify the time range name (should be existing and configured). The ACL is triggered during the time period configured in the specified EX3500 time range. For information on configuring EX3500 time-range, see <i>ex3500</i>. |

Example

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#permit host 192.168.13.13 ex3500-
time-range EX3500_TimeRange_01

nx9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
deny 192.168.14.0/24
permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
nx9500-6C8809(config-ip-ex3500-std-acl-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a specified permit access rule from this IPv4 EX3500 standard ACL |
|-----------|---|

11.6.3 no

▶ *ex3500-std-access-list*

Removes a deny or permit access rule from this IPv4 EX3500 standard ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
no [deny|permit] [<SOURCE-IP/MASK>|any|host <IP>] {ex3500-time-range <TIME-RANGE-NAME>}
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes a deny or permit access rule based on the parameters passed |
|-----------------|---|

Example

The following example shows the IPv4 EX3500 standard ACL 'test' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
  deny 192.168.14.0/24
  permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
nx9500-6C8809(config-ip-ex3500-std-acl-test)#
```

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#no deny 192.168.14.0/24
```

The following example shows the IPv4 EX3500 standard ACL 'test' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
  permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
nx9500-6C8809(config-ip-ex3500-std-acl-test)#
```

12 DHCP-SERVER-POLICY

This chapter summarizes *Dynamic Host Control Protocols* (DHCP) server policy commands in the CLI command structure.

DHCP automatically assigns network IP addresses to requesting clients to enable them access to network resources. DHCP tracks IP address assignments, their lease times and their availability. Each subnet can be configured with its own address pool. Whenever a DHCP client requests an IP address, the DHCP server assigns an IP address from that subnet's address pool. When the controller's (wireless controller, service platform, or access point) onboard DHCP server allocates an address to a DHCP client, the client is assigned a lease, which expires after a pre-determined interval. Before a lease expires, wireless clients (with assigned leases) are expected to renew them to continue using the addresses. Once the lease expires, the client is no longer permitted to use the leased IP address. The controller's DHCP server policy ensures all IP addresses are unique, and no IP address is assigned to a second client while the first client's assignment is valid (its lease has not expired). IP address management is conducted by a controller's DHCP server and not by an administrator.

The controller's internal DHCP server groups wireless clients based on defined user-class options. Clients with a defined set of user-class values are segregated by class. A DHCP server can associate multiple classes to each pool. Each class in a pool is assigned an exclusive range of IP addresses. DHCP clients are compared against classes. If the client matches one of the classes assigned to the pool, it receives an IP address from the range assigned to the class. If the client doesn't match any of the classes in the pool, it receives an IP address from a default pool range (if defined). Multiple IP addresses for a single VLAN allow the configuration of multiple IP addresses, each belonging to different subnets. Class configuration allows a DHCP client to obtain an address from the first pool to which the class is assigned.

Use the (config) instance to configure DHCP/DHCPv6 server policy parameters. To navigate to the config DHCP server policy instance, use the following commands:

```
<DEVICE>(config)#dhcp-server-policy <POLICY-NAME>

rfs6000-37FABE(config)#dhcp-server-policy test
rfs6000-37FABE(config-dhcp-server-policy-test)#

rfs6000-37FABE(config-dhcp-policy-test)#?
DHCP policy Mode commands:
  bootp          BOOTP specific configuration
  dhcp-class     Configure DHCP class (for address allocation using DHCP
                user-class options)
  dhcp-pool      Configure DHCP server address pool
  dhcp-server    Activating dhcp server based on criteria
  no             Negate a command or set its defaults
  option         Define DHCP server option
  ping          Specify ping parameters used by DHCP Server

  clrscr        Clears the display screen
  commit        Commit all changes made in this session
  do            Run commands from Exec mode
  end           End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert        Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

rfs6000-37FABE(config-dhcp-policy-test)#
```

To navigate to the config DHCPv6 server policy instance, use the following commands:

```
<DEVICE>(config)#dhcpv6-server-policy <POLICY-NAME>

rfs6000-37FABE(config)#dhcpv6-server-policy test
rfs6000-37FABE(config-dhcpv6-server-policy-test)#

rfs6000-37FABE(config-dhcpv6-server-policy-test)#?
DHCPv6 server policy Mode commands:
  dhcpv6-pool          Configure DHCPV6 server address pool
  no                   Negate a command or set its defaults
  option               Define DHCPV6 server option
  restrict-vendor-options Restrict vendor specific options to be sent in
                      server reply
  server-preference    Server preference value sent in the reply, by the
                      server to client

  clrscr               Clears the display screen
  commit               Commit all changes made in this session
  do                   Run commands from Exec mode
  end                  End current mode and change to EXEC mode
  exit                 End current mode and down to previous mode
  help                 Description of the interactive help system
  revert               Revert changes
  service              Service Commands
  show                 Show running system information
  write                Write running configuration to memory or terminal

rfs6000-37FABE(config-dhcpv6-server-policy-test)#
```

This chapter is organized as follows:

- [dhcp-server-policy](#)
- [dhcpv6-server-policy](#)

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

12.1 dhcp-server-policy

► DHCP-SERVER-POLICY

The following table summarizes DHCP server policy configuration commands:

Table 12.1 DHCP-Server-Policy-Config Commands

| Command | Description | Reference |
|--------------------|--|-------------------|
| <i>bootp</i> | Configures a BOOTP specific configuration | <i>page 12-4</i> |
| <i>dhcp-class</i> | Configures a DHCP server class | <i>page 12-5</i> |
| <i>dhcp-pool</i> | Configures a DHCP server address pool | <i>page 12-11</i> |
| <i>dhcp-server</i> | Configures the activation-criteria that triggers dynamic activation of DHCP service running on a redundancy device | <i>page 12-56</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 12-58</i> |
| <i>option</i> | Defines the DHCP option used in DHCP pools | <i>page 12-59</i> |
| <i>ping</i> | Specifies ping parameters used by a DHCP server | <i>page 12-60</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

12.1.1 bootp

► *dhcp-server-policy*

Configures a BOOTP specific configuration

Bootstrap Protocol (BOOTP) requests are used by UNIX diskless workstations to obtain the location of their boot image and IP address within the managed network. A BOOTP configuration server provides this information and also assigns an IP address from a configured pool of IP addresses. By default, all BOOTP requests are forwarded to the BOOTP configuration server by the controller. When enabled, this feature allows controllers, using this DHCP server policy, to ignore BOOTP requests.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
bootp ignore
```

Parameters

- bootp ignore

| | |
|--------------|--|
| bootp ignore | Enables controllers to ignore BOOTP requests |
|--------------|--|

Example

```
rfs6000-37FABE(config-dhcp-policy-test)#bootp ignore
rfs6000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  bootp ignore
rfs6000-37FABE(config-dhcp-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables the ignore BOOTP requests option |
|-----------|---|

12.1.2 dhcp-class

▶ *dhcp-server-policy*

A controller, service platform, or access point's local DHCP server assigns IP addresses to requesting DHCP clients based on user class option names. The DHCP server can assign IP addresses from as many IP address ranges as defined by an administrator. The DHCP user class associates a particular range of IP addresses to a device in such a way that all devices of that type are assigned IP addresses from the defined range.

A DHCP user class applies different DHCP settings to a set of wireless clients. Wireless clients using the same DHCP settings are grouped under one DHCP class. Grouping users into classes facilitates the provision of differentiated service.

The following table summarizes DHCP class configuration commands:

Table 12.2 *DHCP-Class Config Commands*

| Command | Description | Reference |
|---------------------------------|--|------------------|
| <i>dhcp-class</i> | Creates a DHCP class and enters its configuration mode | <i>page 12-6</i> |
| <i>dhcp-class-mode commands</i> | Invokes DHCP class configuration commands | <i>page 12-7</i> |

12.1.2.1 dhcp-class

▶ *dhcp-class*

Creates a DHCP server class and enters its configuration mode. Use this command to configure user class option values. Once defined, the controller's internal DHCP server uses the configured values to group wireless clients into DHCP classes. Therefore, each user class consists of wireless clients sharing the same set of user class values.

You can also use this command to modify an existing DHCP user class settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dhcp-class <DHCP-CLASS-NAME>
```

Parameters

- *dhcp-class* <DHCP-CLASS-NAME>

| | |
|--------------------------------------|--|
| <code><DHCP-CLASS-NAME></code> | <p>Creates a DHCP user class</p> <ul style="list-style-type: none"> • <code><DHCP-CLASS-NAME></code> - Specify a name that appropriately identifies this class of wireless clients. If the class does not exist, it is created. The class name should not exceed 32 characters in length. |
|--------------------------------------|--|

Example

```
rfs6000-37FABE (config-dhcp-policy-test)#dhcp-class dhcpclass1

rfs6000-37FABE (config-dhcp-policy-test-class-dhcpclass1)#?
DHCP class Mode commands:
 multiple-user-class  Enable multiple user class option
 no                   Negate a command or set its defaults
 option               Configure DHCP Server options

 clrscr               Clears the display screen
 commit              Commit all changes made in this session
 do                  Run commands from Exec mode
 end                  End current mode and change to EXEC mode
 exit                 End current mode and down to previous mode
 help                 Description of the interactive help system
 revert               Revert changes
 service              Service Commands
 show                 Show running system information
 write                Write running configuration to memory or terminal

rfs6000-37FABE (config-dhcp-policy-test-class-dhcpclass1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a configured DHCP user class policy |
|-----------|---|

12.1.2.2 dhcp-class-mode commands

▶ *dhcp-class*

Use DHCP class mode commands to configure the parameters of the DHCP user class.

The following table summarizes DHCP user class configuration commands:

Table 12.3 *DHCP-Class-Config-Mode Commands*

| Command | Description | Reference |
|----------------------------|--|-------------------|
| <i>multiple-user-class</i> | Enables multiple user class option for this DHCP user class policy | <i>page 12-8</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 12-9</i> |
| <i>option</i> | Configures DHCP user class options for this DHCP user class policy | <i>page 12-10</i> |

12.1.2.2.1 multiple-user-class

▶ *dhcp-class-mode commands*

Enables multiple user class option for this DHCP user class policy. Enabling this option allows this user class to transmit multiple option values to other DHCP servers also supporting multiple user class options.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
multiple-user-class
```

Parameters

None

Example

```
rfs6000-37FABE(config-dhcp-policy-test-class-class1)#multiple-user-class
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
multiple-user-class
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables the multiple user class option for the selected DHCP user class policy |
|-----------|---|

12.1.2.2.2 no

▶ *dhcp-class-mode commands*

Removes this DHCP user class policy's settings

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [multiple-user-class|option]
no option user-class <VALUE>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Disables multiple user class options on this DHCP user class policy |
|-----------------|---|

Example

The following example shows the DHCP class settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
  option user-class hex
  multiple-user-class
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#

rfs6000-37FABE(config-dhcp-policy-test-class-class1)#no multiple-user-class
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#no option user-class hex
```

The following example shows the DHCP class settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

12.1.2.2.3 option

▶ *dhcp-class-mode commands*

Configures DHCP user class options for this DHCP user class policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
option user-class <VALUE>
```

Parameters

- option user-class <VALUE>

| | |
|--------------------|--|
| user-class <VALUE> | Configures DHCP user class options <ul style="list-style-type: none"> • <VALUE> - Specify the DHCP user class option's ASCII value. |
|--------------------|--|

Example

```
rfs6000-37FABE(config-dhcp-policy-test-class-class1)#option user-class hex
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
  option user-class hex
  multiple-user-class
rfs6000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the configured DHCP user class option |
|-----------|---|

12.1.3 dhcp-pool

▶ *dhcp-server-policy*

The DHCP pool command creates and manages a pool of IP addresses. These IP addresses are assigned to devices using the DHCP protocol. IP addresses have to be unique for each device in the network. Since IP addresses are finite, DHCP ensures that every device, in the network, is issued a unique IP address by tracking the issue, release, and reissue of IP addresses.

The DHCP pool command configures a finite set of IP addresses that can be assigned whenever a device joins a network.

The following table summarizes DHCP pool configuration mode commands:

Table 12.4 *DHCP-Pool-Config Commands*

| Command | Description | Reference |
|--------------------------------|---|-------------------|
| <i>dhcp-pool</i> | Creates a DHCP pool and enters its configuration mode | <i>page 12-12</i> |
| <i>dhcp-pool-mode commands</i> | Summarizes DHCP pool configuration mode commands | <i>page 12-14</i> |

12.1.3.1 dhcp-pool

► *dhcp-pool*

Configures a DHCP server address pool

DHCP services are available for specific IP interfaces. A pool (or range) of IP network addresses and DHCP options can be created for each IP interface defined. This range of addresses is available to DHCP enabled wireless devices on either a permanent or leased basis. This enables the reuse of limited IP address resources for deployment in any network. DHCP options are provided to each DHCP client with a DHCP response and provides DHCP clients information required to access network resources (default gateway, domain name, DNS server and WINS server configuration). An option exists to identify the vendor and functionality of a DHCP client. The information is a variable-length string of characters (or octets) with a meaning specified by the vendor of the DHCP client.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dhcp-pool <POOL-NAME>
```

Parameters

- dhcp-pool <POOL-NAME>

| | |
|--------------------------------|--|
| <code><POOL-NAME></code> | <p>Creates a DHCP server address pool</p> <ul style="list-style-type: none"> • <code><POOL-NAME></code> - Specify a name that appropriately identifies this DHCP address pool. If the pool does not exist, it is created. The pool name cannot be modified as part of the edit process. However, an obsolete address pool can be deleted. |
|--------------------------------|--|

Example

```
rfs6000-37FABE(config-dhcp-policy-test)#dhcp-pool pool1

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1)#?
DHCP pool Mode commands:
  address          Configure network pool's included addresses
  bootfile         Boot file name
  ddns             Dynamic DNS Configuration
  default-router   Default routers
  dns-server       DNS Servers
  domain-name     Configure domain-name
  excluded-address Prevent DHCP Server from assigning certain addresses
  lease           Address lease time
  netbios-name-server NetBIOS (WINS) name servers
  netbios-node-type NetBIOS node type
  network         Network on which DHCP server will be deployed
  next-server     Next server in boot process
  no              Negate a command or set its defaults
  option          Raw DHCP options
  respond-via-unicast Send DHCP offer and DHCP Ack as unicast messages
  static-binding  Configure static address bindings
  static-route    Add static routes to be installed on dhcp clients
  update         Control the usage of DDNS service
```

```

clrscr          Clears the display screen
commit         Commit all changes made in this session
do             Run commands from Exec mode
end           End current mode and change to EXEC mode
exit          End current mode and down to previous mode
help          Description of the interactive help system
revert        Revert changes
service       Service Commands
show         Show running system information
write        Write running configuration to memory or terminal

```

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1)#
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Removes a specified DHCP address pool |
|-----------|---------------------------------------|

12.1.3.2 dhcp-pool-mode commands

▶ *dhcp-pool*

Configures the DHCP pool parameters

The following table summarizes DHCP pool configuration commands:

Table 12.5 *DHCP-Pool-Config-Mode Commands*

| Command | Description | Reference |
|----------------------------|--|-------------------|
| <i>address</i> | Specifies a range of addresses for a DHCP address pool | <i>page 12-15</i> |
| <i>bootfile</i> | Assigns a bootfile name. The bootfile name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted. | <i>page 12-17</i> |
| <i>ddns</i> | Configures dynamic DNS parameters | <i>page 12-18</i> |
| <i>default-router</i> | Configures a default router or gateway IP address for the network pool | <i>page 12-20</i> |
| <i>dns-server</i> | Sets a DNS server's IP address available to all DHCP clients connected to the DHCP pool | <i>page 12-22</i> |
| <i>domain-name</i> | Sets the domain name for the network pool | <i>page 12-24</i> |
| <i>excluded-address</i> | Prevents a DHCP server from assigning certain addresses to the DHCP pool | <i>page 12-25</i> |
| <i>lease</i> | Sets a valid lease for the IP address used by DHCP clients in the DHCP pool | <i>page 12-27</i> |
| <i>netbios-name-server</i> | Configures a NetBIOS (WINS) name server's IP address | <i>page 12-29</i> |
| <i>netbios-node-type</i> | Defines the NetBIOS node type | <i>page 12-30</i> |
| <i>network</i> | Configures the network on which the DHCP server is deployed | <i>page 12-31</i> |
| <i>next-server</i> | Configures the next server in the boot process | <i>page 12-32</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 12-9</i> |
| <i>option</i> | Configures RAW DHCP options | <i>page 12-10</i> |
| <i>respond-via-unicast</i> | Sends a DHCP offer and DHCP Ack as unicast messages | <i>page 12-37</i> |
| <i>static-route</i> | Configures a static route for a DHCP pool | <i>page 12-36</i> |
| <i>update</i> | Controls the usage of the DDNS service | <i>page 12-38</i> |
| <i>static-binding</i> | Configures static address bindings | <i>page 12-39</i> |

12.1.3.2.1 address

▶ *dhcp-pool-mode commands*

Adds IP addresses to the DHCP address pool. These IP addresses are assigned to each device joining the network.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
address [<IP>|<HOST-ALIAS-NAME>|range]
```

```
address [<IP>|<HOST-ALIAS-NAME>|range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]] {class <DHCP-CLASS-NAME>}
```

Parameters

- address [<IP>|<HOST-ALIAS-NAME>|range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]] {class <DHCP-CLASS-NAME>}

| | |
|---|---|
| <IP> | Adds a single IP address to the DHCP address pool |
| <HOST-ALIAS-NAME> | Adds a single host mapped to the specified host alias. The host alias should be existing and configured. A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias . |
| range [<START-IP> <START-HOST-ALIAS-NAME>] [<END-IP> <END-HOST-ALIAS-NAME>] | Adds a range of IP addresses to the DHCP address pool. Use one of the following options to provide the first IP address in the range: <ul style="list-style-type: none"> • <START-IP> – Specifies the first IP address in the range • <START-HOST-ALIAS-NAME> – Specifies a host alias, mapped to the first IP address in the range Use one of the following options to provide the last IP address in the range: <ul style="list-style-type: none"> • <END-IP> – Specifies the last IP address in the range • <END-HOST-ALIAS-NAME> – Specifies a host alias, mapped to the last IP address in the range The host aliases should be existing and configured. |
| class <DHCP-CLASS-NAME> | Optional. Applies additional DHCP options, or a modified set of options to those available to wireless clients. For more information, see dhcp-class . <ul style="list-style-type: none"> • <DHCP-CLASS-NAME> – Sets the DHCP class. |

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#address 192.168.13.4 class
dhcpclass1

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

| | |
|-------------------|---|
| <i>no</i> | Removes the DHCP pool's configured IP addresses |
| <i>dhcp-class</i> | Creates and configures the DHCP class parameters |
| <i>alias</i> | Creates and configures a network, VLAN, host, string, and network-service aliases |

12.1.3.2.2 bootfile

▶ *dhcp-pool-mode commands*

The Bootfile command provides a diskless node path to the image file while booting up. Only one file can be configured for each DHCP pool.

For more information on the BOOTP protocol with reference to the DHCP policy, see *bootp*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
bootfile <IMAGE-FILE-PATH>
```

Parameters

- bootfile <IMAGE-FILE-PATH>

| | |
|-------------------|--|
| <IMAGE-FILE-PATH> | Sets the path to the boot image for BOOTP clients. The file name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted. |
|-------------------|--|

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #bootfile test.txt

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #show context
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
  bootfile test.txt
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #
```

Related Commands

| | |
|--------------|--|
| <i>no</i> | Resets the boot image path for BOOTP clients |
| <i>bootp</i> | Configures BOOTP protocol parameters |

12.1.3.2.3 ddns

▶ *dhcp-pool-mode commands*

Configures *Dynamic Domain Name Service* (DDNS) parameters. Dynamic DNS provides a way to access an individual device in a DHCP serviced network using a static device name.

Depending on the DHCP server's configuration, the IP address of a device changes periodically. To ensure continuous accessibility to a device (having a dynamic IP address), the device's current IP address is published to a DDNS server that resolves the static device name (used to access the device) with a changing IP address.

The DDNS server must be accessible from outside the network and must be configured as an address resolver.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ddns [domainname|multiple-user-class|server|ttl]

ddns domainname <DDNS-DOMAIN-NAME>
ddns multiple-user-class
ddns server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
ddns ttl <1-864000>
```

Parameters

- ddns domainname <DDNS-DOMAIN-NAME>

| | |
|----------------------------------|---|
| domainname <DDNS-DOMAIN-NAME> | Sets the domain name used for DNS updates The controller uses DNS to convert human readable host names into IP addresses. Host names are not case sensitive and can contain alphabetic or numeric letters or a hyphen. A <i>Fully Qualified Domain Name</i> (FQDN) consists of a host name plus a domain name. For example, computername.domain.com. |
|----------------------------------|---|

- ddns multiple-user-class

| | |
|---------------------|---|
| multiple-user-class | Enables the multiple user class options with this DDNS domain |
|---------------------|---|

- ddns server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| | |
|--------------------------|---|
| server | Configures the DDNS server used by this DHCP profile |
| [<IP> <HOST-ALIAS-NAME>] | Configures the primary DDNS server. This is the default server. Use one of the following options to specify the primary DDNS server: <ul style="list-style-type: none"> • <IP> – Specifies the primary DDNS server's IP address • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary DDNS server's IP address. The host alias should be existing and configured. A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see <i>alias</i> . |

| | |
|--|---|
| {<IP1> <HOST-ALIAS-NAME1>} | <p>Optional. Configures the secondary DDNS server. If the primary server is not reachable, this server is used.</p> <p>Use one of the following options to identify the secondary DDNS server:</p> <ul style="list-style-type: none"> • <IP> - Specifies the secondary DDNS server's IP address • <HOST-ALIAS-NAME> - Specifies a host alias, mapped to the secondary DDNS server's IP address. The host alias should be existing and configured. |
| <ul style="list-style-type: none"> • <code>ddns ttl <1-864000></code> | |
| ttl <1-864000> | <p>Configures the <i>Time To Live</i> (TTL) value for DDNS updates</p> <ul style="list-style-type: none"> • <1-86400> - Specify a value from 1 - 864000 seconds. |

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#ddns domainname WID
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#ddns multiple-user-class
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#ddns server 192.168.13.9
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
bootfile test.txt
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

12.1.3.2.4 default-router

► *dhcp-pool-mode commands*

Configures a default router or gateway IP address for a network pool

After a DHCP client has booted, the client begins sending packets to its default router. Set the IP address of one or a group of routers the controller uses to map host names into IP addresses available to DHCP supported clients. Up to 8 default router IP addresses are supported.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- `default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}`

| | |
|----------------------------|--|
| [<IP> <HOST-ALIAS-NAME>] | Configures the primary default router, using one of the following options: <ul style="list-style-type: none"> • <IP> – Specifies the primary default router’s IP address • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary default router’s IP address |
| {<IP1> <HOST-ALIAS-NAME1>} | Optional. Configures the secondary default router, using one of the following options: <ul style="list-style-type: none"> • <IP1> – Specifies the secondary default router’s IP address • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary default router’s IP address. If the primary default router is unavailable, the secondary router is used. <p>A network host alias maps a name to a single network host. For example, ‘alias host \$HOST 1.1.1.100’. In this example the host alias is ‘\$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.</p> <p>A maximum of 8 default routers can be configured.</p> |

Usage Guidelines

The IP address of the router should be on the same subnet as the client subnet.

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #default-router 192.168.13.8
192.168.13.9

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #show context
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
bootfile test.txt
default-router 192.168.13.8 192.168.13.9
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #
```

12.1.3.2.5 dns-server

▶ *dhcp-pool-mode commands*

Configures a network's DNS server. The DNS server supports all clients connected to networks supported by the DHCP server.

For DHCP clients, the DNS server's IP address maps the hostname to an IP address. DHCP clients use the DNS server's IP address based on the order (sequence) configured.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1> <HOST-ALIAS-NAME1>}

| | |
|--|---|
| <pre>[<IP> <HOST-ALIAS-NAME>]</pre> | <p>Configures the primary DNS server, using one of the following options:</p> <ul style="list-style-type: none"> • <IP> - Specifies the primary DNS server's IP address • <HOST-ALIAS-NAME> - Specifies a host alias, mapped to the primary DNS server's IP address <p>A maximum of 8 DNS servers can be configured.</p> <p>To enable redirection of DNS queries to OpenDNS it is necessary that the DNS server IP addresses provided here should point to the OpenDNS resolver (208.67.220.220 or 208.67.222.222). OpenDNS is a proxy DNS server that provides additional functionality, such as Web filtering, reporting, and performance enhancements in addition to DNS services. When configured on a WLAN, DNS queries from wireless clients are redirected to OpenDNS. The following example illustrates the configuration:</p> <pre>dhcp-server-policy dhcppolicy dhcp-pool dhcppool network 192.168.1.0/24 address range 192.168.1.160 192.168.1.200 default-router 192.168.1.105 dns-server 208.67.220.220</pre> <p>Note, the above example shows the OpenDNS server as being 208.67.220.220. The alternative IP address 208.67.222.222 can also be used.</p> <p>For more information on the entire configuration that needs to be done to integrate WiNG access point, controllers, and service platform with OpenDNS, see opendns.</p> |
|--|---|

| | |
|----------------------------|---|
| {<IP1> <HOST-ALIAS-NAME1>} | <p>Optional. Configures the secondary DNS server, using one of the following options:</p> <ul style="list-style-type: none"> • <IP1> – Specifies the secondary DNS server’s IP address • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary DNS server’s IP address. If the primary DNS server is unavailable, the secondary server is used. <p>A network host alias maps a name to a single network host. For example, ‘alias host \$HOST 1.1.1.100’. In this example the host alias is ‘\$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.</p> <p>A maximum of 8 DNS servers can be configured.</p> |
|----------------------------|---|

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#dns-server 192.168.13.19

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context

12.1.3.2.6 domain-name

▸ *dhcp-pool-mode commands*

Sets the domain name for the DHCP pool. This is the domain name used by the controller with this pool.

Domain names are not case sensitive and can contain alphabetic or numeric letters or a hyphen. The FQDN consists of the host name and the domain name. For example, computername.domain.com.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
domain-name <DOMAIN-NAME>
```

Parameters

- domain-name <DOMAIN-NAME>

| | |
|---------------|-------------------------------------|
| <DOMAIN-NAME> | Defines the DHCP pool's domain name |
|---------------|-------------------------------------|

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #domain-name documentation

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #show context

12.1.3.2.7 excluded-address

▶ *dhcp-pool-mode commands*

Identifies a single IP address or a range of IP addresses, included in the DHCP address pool, that cannot be assigned to clients by the DHCP server

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
excluded-address [<IP>|<HOST-ALIAS-NAME>|range]
```

```
excluded-address <IP>
```

```
excluded-address <HOST-ALIAS-NAME>
```

```
excluded-address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]
```

Parameters

- excluded-address <IP>

| | |
|--|--|
| <IP> | Adds a single IP address to the excluded address list |
| <ul style="list-style-type: none"> • excluded-address <HOST-ALIAS-NAME> | |
| <HOST-ALIAS-NAME> | <p>Adds a host alias. The host alias is mapped to a host's IP address. The host identified by the host alias is added to the excluded address list. The host alias should be existing and configured.</p> <p>A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias.</p> |
| <ul style="list-style-type: none"> • excluded-address range [<START-IP> <START-HOST-ALIAS-NAME>] [<END-IP> <END-HOST-ALIAS-NAME>] | |
| range [<START-IP> <START-HOST-ALIAS-NAME>] [<END-IP> <END-HOST-ALIAS-NAME>] | <p>Adds a range of IP addresses to the excluded address list. Use one of the following options to provide the first IP address in the range:</p> <ul style="list-style-type: none"> • <START-IP> – Specifies the first IP address in the range • <START-HOST-ALIAS-NAME> – Specifies a host alias, mapped to the first IP address in the range <p>Use one of the following options to provide the last IP address in the range:</p> <ul style="list-style-type: none"> • <END-IP> – Specifies the last IP address in the range • <END-HOST-ALIAS-NAME> – Specifies a host alias, mapped to the last IP address in the range <p>The host aliases should be existing and configured.</p> |

Example

```

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#excluded-address range
192.168.13.25 192.168.13.28

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context

12.1.3.2.8 lease

▶ *dhcp-pool-mode commands*

A lease is the duration a DHCP issued IP address is valid. Once a lease expires, and if the lease is not renewed, the IP address is revoked and is available for reuse. Generally, before an IP lease expires, the client tries to get the same IP address issued for the next lease period. This feature is enabled by default, with a lease period of 24 hours (1 day).

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
lease [<0-365>|infinite]

lease infinite
lease <0-365> {0-23} {0-59} {0-59}
```

Parameters

- lease infinite

| | |
|--|--|
| infinite | The lease never expires (equal to a static IP address assignment) |
| <ul style="list-style-type: none"> • lease <0-365> {<0-23>} {<0-59>} {<0-59>} | |
| <0-365> | Configures the lease duration in days Note: Days may be 0 only when hours and/or minutes are greater than 0. |
| <0-23> | Optional. Sets the lease duration in hours |
| <0-59> | Optional. Sets the lease duration in minutes |
| <0-59> | Optional. Sets the lease duration in seconds |

Usage Guidelines

If lease parameter is not configured on the DHCP pool, the default is used. The default is 24 hours.

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#lease 100 23 59 59

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
network 192.168.13.0/24

12.1.3.2.9 netbios-name-server

▸ *dhcp-pool-mode commands*

Configures the NetBIOS (WINS) name server's IP address. This server is used to resolve NetBIOS host names.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| | |
|----------------------------|---|
| [<IP> <HOST-ALIAS-NAME>] | Configures the primary NetBIOS name server, using one of the following options: <ul style="list-style-type: none"> • <IP> – Specifies the primary NetBIOS name server's IP address • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary NetBIOS name server's IP address |
| {<IP1> <HOST-ALIAS-NAME1>} | Optional. Configures the secondary NetBIOS name server, using one of the following options: <ul style="list-style-type: none"> • <IP1> – Specifies the secondary NetBIOS name server's IP address • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary NetBIOS name server's IP address. If the primary NetBIOS name server is unavailable, the secondary server is used. <p>A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias.</p> |

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #netbios-name-server 192.168.13.25
```

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #show context

| | |
|-----------|--|
| <i>no</i> | Removes the NetBIOS name server settings |
|-----------|--|

12.1.3.2.10 netbios-node-type

▸ *dhcp-pool-mode commands*

Defines the predefined NetBIOS node type. The NetBIOS node type resolves NetBIOS names to IP addresses.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
netbios-node-type [b-node|h-node|m-node|p-node]
```

Parameters

- `netbios-node-type [b-node|h-node|m-node|p-node]`

| | |
|-----------------------------------|---|
| [b-node h-node m-node p-node] | <p>Defines the netbios node type</p> <ul style="list-style-type: none"> • <code>b-node</code> - Sets the node type as broadcast. Uses broadcasts to query nodes on the network for the owner of a NetBIOS name. • <code>h-node</code> - Sets the node type as hybrid. Uses a combination of two or more nodes. • <code>m-node</code> - Sets the node type as mixed. A mixed node uses broadcast queries to find a node, and failing that, queries a known p-node name server for the address. • <code>p-node</code> - Sets the node type as peer-to-peer. Uses directed calls to communicate with a known NetBIOS name server (such as a WINS server), for the IP address of a NetBIOS machine. |
|-----------------------------------|---|

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#netbios-node-type b-node
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context

12.1.3.2.11 network

▶ *dhcp-pool-mode commands*

Configures the DHCP server's network settings

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
network [<IP/M>|<NETWORK-ALIAS-NAME>]
```

Parameters

- network [<IP/M>|<NETWORK-ALIAS-NAME>]

| | |
|----------------------|---|
| <IP/M> | Configures the network number and mask (for example, 192.168.13.0/24) |
| <NETWORK-ALIAS-NAME> | Configures a network alias to identify the network number and mask <ul style="list-style-type: none"> • <NETWORK-ALIAS-NAME> - Specify the network alias name. It should be existing and configured. <p>A network alias defines a single network address. For example, 'alias network \$NET 1.1.1.0/24'. In this example, the network alias name is: <i>\$NET</i> and the network it is mapped to is: <i>1.1.1.0/24</i>. For more information, see <i>alias</i>.</p> |

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #network 192.168.13.0/24
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #show context
dhcp-pool testPool
  network 192.168.13.0/24
  address 192.168.13.4 class dhcpclass1
  lease 100 23 59 59
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 192.168.13.8 192.168.13.9
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #
```

12.1.3.2.12 next-server

▶ *dhcp-pool-mode commands*

Configures the next server in the boot process

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
next-server [<IP>|<HOST-ALIAS-NAME>]
```

Parameters

- next-server [<IP>|<HOST-ALIAS-NAME>]

| | |
|-------------------|---|
| <IP> | Configures the next server's (the first server in the boot process) IP address |
| <HOST-ALIAS-NAME> | Configures a host alias, mapped to the next server's IP address <ul style="list-style-type: none"> • <HOST-ALIAS-NAME> - Specify the host alias name. It should be existing and configured. <p>A host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see <i>alias</i>.</p> |

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #next-server 192.168.13.26

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #show context
dhcp-pool testPool
network 192.168.13.0/24
address 192.168.13.4 class dhcpclass1
lease 100 23 59 59
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
domain-name documentation
netbios-node-type b-node
bootfile test.txt
default-router 192.168.13.8 192.168.13.9
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
next-server 192.168.13.26
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool) #

```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes or resets this DHCP user pool's settings |
|-----------------|--|

Example

The following example shows the DHCP pool settings before the 'no' commands are executed:

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  network 192.168.13.0/24
  address 192.168.13.4 class dhcpclass1
  lease 100 23 59 59
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
```

```
    default-router 192.168.13.8 192.168.13.9
    dns-server 192.168.13.19
    netbios-name-server 192.168.13.25
    next-server 192.168.13.26
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no bootfile
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no network
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no default-router
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no next-server
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no domain-name
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no ddns domainname
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no lease
```

The following example shows the DHCP pool settings after the 'no' commands are executed:

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  ddns server 192.168.13.9
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  netbios-node-type b-node
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

12.1.3.2.14 option

▶ *dhcp-pool-mode commands*

Configures raw DHCP options. The DHCP option must be configured under the DHCP server policy. The options configured under the DHCP pool/DHCP server policy can also be used in static-bindings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
option <OPTION-NAME> [<DHCP-OPTION-IP>|<DHCP-OPTION-ASCII>]
```

Parameters

- option <OPTION-NAME> [<DHCP-OPTION-IP>|<DHCP-OPTION-ASCII>]

| | |
|---------------------|-------------------------------------|
| <OPTION-NAME> | Sets the name of the DHCP option |
| <DHCP-OPTION-IP> | Sets DHCP option as an IP address |
| <DHCP-OPTION-ASCII> | Sets DHCP option as an ASCII string |

NOTE: An option name in ASCII format accepts backslash (\) as an input but is not displayed in the output (Use `show runnig config` to view the output). Use a double backslash to represent a single backslash.

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#option option1
157.235.208.80

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#
```

Related Commands

| <i>no</i> | Resets values or disables the DHCP pool option settings |
|-----------|---|

12.1.3.2.15 static-route

▶ *dhcp-pool-mode commands*

Configures a static route for a DHCP pool. Static routes define a gateway for traffic intended for other networks. This gateway is always used when an IP address does not match any route in the network.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
static-route <IP/M> <IP>
```

Parameters

- `static-route <IP/M> <IP>`

| | |
|--------|---|
| <IP/M> | Specifies the IP destination prefix (for example, 10.0.0.0/8) |
| <IP> | Specifies the gateway IP address |

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#static-route 192.168.13.0/24 192.168.13.7
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
static-route 192.168.13.0/24 192.168.13.7
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

| | |
|-----------|-------------------------------|
| <i>no</i> | Removes static route settings |
|-----------|-------------------------------|

12.1.3.2.16 respond-via-unicast

▶ *dhcp-pool-mode commands*

Sends DHCP offer and acknowledgement as unicast messages

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
respond-via-unicast
```

Parameters

None

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#respond-via-unicast

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  ddns server 192.168.13.9
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  netbios-node-type b-node
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
  option option1 157.235.208.80
  respond-via-unicast
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables sending of a DHCP offer and DHCP Ack as unicast messages. When disabled, sends offer and acknowledgement as broadcast messages. |
|-----------|--|

12.1.3.2.17 update

► *dhcp-pool-mode commands*

Controls the use of the DDNS service

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
update dns {override}
```

Parameters

- update dns {override}

| | |
|----------------|--|
| dns {override} | Configures Dynamic DNS parameters <ul style="list-style-type: none"> • override - Optional. Enables Dynamic DNS updates on an onboard DHCP server |
|----------------|--|

Usage Guidelines

A DHCP client cannot perform updates for RR's A, TXT and PTR resource records. Use `update (dns) (override)` to enable the internal DHCP server to send DDNS updates for resource records. The DHCP server can override the client, even if the client is configured to perform the updates.

In the DHCP server's DHCP pool, FQDN is configured as the DDNS domain name. This is used internally in DHCP packets between the DHCP server and the DNS server.

Example

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#update dns override

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
update dns override
ddns server 192.168.13.9
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
static-route 192.168.13.0/24 192.168.13.7
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

12.1.3.3 static-binding

▶ *dhcp-pool-mode commands*

Configures static IP address information for a particular device. Static address binding is executed on the device's hostname, client identifier, or MAC address. Static bindings allow the configuration of client parameters, such as DHCP server, DNS server, default routers, fixed IP address etc.

The following table summarizes static binding configuration commands:

Table 12.6 *Static-Binding-Config Commands*

| Command | Description | Reference |
|-------------------------------------|---|-------------------|
| <i>static-binding</i> | Creates a static binding policy and enters its configuration mode | <i>page 12-40</i> |
| <i>static-binding-mode commands</i> | Invokes static binding configuration commands | <i>page 12-42</i> |

12.1.3.3.1 static-binding

▶ *static-binding*

Configures static address bindings

A static address binding is a collection of configuration parameters, including an IP address, associated with, or bound to, a DHCP client. Bindings are managed by DHCP servers. DHCP bindings automatically map a device MAC address to an IP address using a pool of DHCP supplied addresses. Static bindings assign IP addresses without creating numerous host pools with manual bindings. Static host bindings use a text file the DHCP server reads. It eliminates the need for a lengthy configuration file and reduces the space required to maintain address pools.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
static-binding [client-identifier <CLIENT>|hardware-address <MAC>]
```

Parameters

- `static-binding [client-identifier <CLIENT>|hardware-address <MAC>]`

| | |
|-------------------------------|---|
| client-identifier <CLIENT> | Enables a static binding configuration for a client based on its client identifier (as provided by DHCP option 61 and its key value) <ul style="list-style-type: none"> • <CLIENT> - Specify the client identifier (DHCP option 61). |
| hardware-address <MAC> | Enables a static binding configuration for a client based on its MAC address <ul style="list-style-type: none"> • <MAC> - Specify the MAC address of the client. |

Example

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#static-binding client-
identifier test

12.1.3.3 bootfile

▶ *static-binding-mode commands*

The Bootfile command provides a diskless node the path to the image file used while booting up. Only one file can be configured for each static IP binding.

For more information on the BOOTP protocol with reference to static binding, see *bootp*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
bootfile <IMAGE-FILE-PATH>
```

Parameters

- bootfile <IMAGE-FILE-PATH>

| | |
|-------------------|--|
| <IMAGE-FILE-PATH> | Sets the path to the boot image for BOOTP clients. The file name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted. |
|-------------------|--|

Example

```
rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test)#bootfile test.txt

rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  bootfile test.txt
rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |
|--------------|---|
| <i>no</i> | Resets values or disables DHCP pool static binding settings |
| <i>bootp</i> | Configures BOOTP protocol parameters |

12.1.3.3.4 client-name

▶ *static-binding-mode commands*

Configures the client's name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
client-name <NAME>
```

Parameters

- `client-name <NAME>`

| | |
|---------------------------|--|
| <code><NAME></code> | Specify the name of the client using this static IP address host pool. Do not include the domain name. |
|---------------------------|--|

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#client-name RFID
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  client-name RFID
  bootfile test.txt
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets values or disables DHCP pool static binding settings |
|-----------|---|

12.1.3.3.5 default-router

▸ *static-binding-mode commands*

Configures a default router or gateway IP address for the static binding configuration

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- `default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}`

| | |
|----------------------------|--|
| [<IP> <HOST-ALIAS-NAME>] | <p>Configures the primary default router, using one of the following options:</p> <ul style="list-style-type: none"> • <IP> – Specifies the primary default router’s IP address • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary default router’s IP address |
| {<IP1> <HOST-ALIAS-NAME1>} | <p>Optional. Configures the secondary default router, using one of the following options:</p> <ul style="list-style-type: none"> • <IP1> – Specifies the secondary default router’s IP address • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary default router’s IP address. If the primary default router is unavailable, the secondary router is used. <p>A network host alias maps a name to a single network host. For example, ‘alias host \$HOST 1.1.1.100’. In this example the host alias is ‘\$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.</p> |

Usage Guidelines

The IP address of the router should be on the same subnet as the client subnet.

Example

```
rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test) #default-router
172.16.10.8 172.16.10.9

rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test) #show context
static-binding client-identifier test
client-name RFID
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test) #
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets values or disables DHCP pool static binding settings |
|-----------|---|

12.1.3.3.6 dns-server

▸ *static-binding-mode commands*

Configures the DNS server for this static binding configuration. This DNS server supports the client for which the static binding has been configured.

For this client, the DNS server's IP address maps the host name to an IP address. DHCP clients use the DNS server's IP address based on the order (sequence) configured.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| | |
|----------------------------|---|
| [<IP> <HOST-ALIAS-NAME>] | Configures the primary DNS server, using one of the following options: <ul style="list-style-type: none"> • <IP> – Specifies the primary DNS server's IP address • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary DNS server's IP address |
| {<IP1> <HOST-ALIAS-NAME1>} | Optional. Configures the secondary DNS server, using one of the following options: <ul style="list-style-type: none"> • <IP1> – Specifies the secondary DNS server's IP address • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary DNS server's IP address. If the primary DNS server is unavailable, the secondary DNS server is used. <p>A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias.</p> |

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#dns-server
172.16.10.7

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
client-name RFID
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |

12.1.3.3.7 domain-name

▶ *static-binding-mode commands*

Sets the domain name for the static binding configuration

Domain names are not case sensitive and contain alphabetic or numeric letters (or a hyphen). A fully qualified domain name (FQDN) consists of a host name plus a domain name. For example, computername.domain.com

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
domain-name <DOMAIN-NAME>
```

Parameters

- domain-name <DOMAIN-NAME>

| | |
|---------------|--|
| <DOMAIN-NAME> | Defines the domain name for the static binding configuration |
|---------------|--|

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#domain-name
documentation

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
client-name RFID
domain-name documentation
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets values or disables the DHCP pool static binding settings |
|-----------|---|

12.1.3.3.8 ip-address

▸ *static-binding-mode commands*

Configures a fixed IP address for a host

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ip-address [<IP>|<HOST-ALIAS-NAME>]
```

Parameters

- ip-address [<IP>|<HOST-ALIAS-NAME>]

| | |
|-------------------|--|
| <IP> | Configures a fixed IP address (in dotted decimal format) of the client using this host pool |
| <HOST-ALIAS-NAME> | Configures a host alias identifying the fixed IP address of the client using this host pool A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias . |

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#ip-address
172.16.10.9

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  ip-address 172.16.10.9
  client-name RFID
  domain-name documentation
  bootfile test.txt
  default-router 172.16.10.8 172.16.10.9
  dns-server 172.16.10.7
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

|-----------|---|

12.1.3.3.9 netbios-name-server

▸ *static-binding-mode commands*

Configures the NetBIOS (WINS) name server's IP address. This server is used to resolve NetBIOS host names.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| | |
|----------------------------|---|
| [<IP> <HOST-ALIAS-NAME>] | Configures the primary NetBIOS server, using one of the following options: <ul style="list-style-type: none"> • <IP> - Specifies the primary NetBIOS name server's IP address • <HOST-ALIAS-NAME> - Specifies a host alias, mapped to the primary NetBIOS name server's IP address |
| {<IP1> <HOST-ALIAS-NAME1>} | Optional. Configures the secondary NetBIOS name server, using one of the following options: <ul style="list-style-type: none"> • <IP1> - Specifies the secondary NetBIOS name server's IP address • <HOST-ALIAS-NAME1> - Specifies a host alias, mapped to the secondary NetBIOS name server's IP address. If the primary NetBIOS name server is unavailable, the secondary server is used. <p>A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias.</p> |

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#netbios-name-server 172.16.10.23

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
ip-address 172.16.10.9
client-name RFID
domain-name documentation
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
netbios-name-server 172.16.10.23
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

|-----------|---|
| <i>no</i> | Resets values or disables DHCP pool static binding settings |
|-----------|---|

12.1.3.3.10 netbios-node-type

▶ *static-binding-mode commands*

Configures different predefined NetBIOS node types. The NetBIOS node defines the way a device resolves NetBIOS names to IP addresses.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
netbios-node-type [b-node|h-mode|m-node|p-node]
```

Parameters

- netbios-node-type [b-node|h-node|m-node|p-node]

| | |
|-----------------------------------|---|
| [b-node h-mode m-node p-node] | <p>Defines the netbios node type</p> <ul style="list-style-type: none"> • b-node - Sets the node type as broadcast. Uses broadcasts to query nodes on the network for the owner of a NetBIOS name. • h-node - Sets the node type as hybrid. Uses a combination of two or more nodes. • m-node - Sets the node type as mixed. A mixed node uses broadcast queries to find a node, and failing that, queries a known p-node name server for the address. • p-node - Sets the node type as peer-to-peer. Uses directed calls to communicate with a known NetBIOS name server (such as a WINS server), for the IP address of a NetBIOS machine. |
|-----------------------------------|---|

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#netbios-node-  
type  
b-node  
  
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context  
static-binding client-identifier test  
ip-address 172.16.10.9  
client-name RFID  
domain-name documentation  
netbios-node-type b-node  
bootfile test.txt  
default-router 172.16.10.8 172.16.10.9  
dns-server 172.16.10.7  
netbios-name-server 172.16.10.23  
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets values or disables DHCP pool static binding settings |
|-----------|---|

12.1.3.3.1 next-server

▶ *static-binding-mode commands*

Configures the next server utilized in the boot process

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
next-server [<IP>|<HOST-ALIAS-NAME>]
```

Parameters

- next-server [<IP>|<HOST-ALIAS-NAME>]

| | |
|-------------------|--|
| <IP> | Configures the next server's (the first server in the boot process) IP address |
| <HOST-ALIAS-NAME> | Configures a host alias, mapped to the next server's IP address <ul style="list-style-type: none"> • <HOST-ALIAS-NAME> - Specify the host alias name. It should be existing and configured. <p>A network host alias maps a name to a single network host. For example, 'alias host \$HOST 1.1.1.100'. In this example the host alias is '\$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias.</p> |

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#next-server
172.16.10.24

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
ip-address 172.16.10.9
client-name RFID
domain-name documentation
netbios-node-type b-node
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
netbios-name-server 172.16.10.23
next-server 172.16.10.24
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets values or disables DHCP pool static binding settings |
|-----------|---|

12.1.3.3.12 no▶ *static-binding-mode commands*

Negates or reverts static binding settings for the selected DHCP server policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [bootfile|client-name|default-router|dns-server|domain-name|ip-address|
netbios-name-server|netbios-node-type|next-server|option|respond-via-unicast|
static-route]
```

```
no option <OPTION-NAME>
```

```
no static-route <IP/MASK> <GATEWAY-IP>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Negates or reverts static binding settings for the selected DHCP server policy |
|-----------------|--|

Example

The following example shows the DHCP pool static binding settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  ip-address 172.16.10.9
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 172.16.10.8 172.16.10.9
  dns-server 172.16.10.7
  netbios-name-server 172.16.10.23
  next-server 172.16.10.24
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no bootfile
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no ip-address
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no default-router
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no dns-server
```

The following example shows the DHCP pool static binding settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  netbios-name-server 172.16.10.23
  next-server 172.16.10.24
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

12.1.3.3.13 option

▸ *static-binding-mode commands*

Configures the raw DHCP options in the DHCP policy. The DHCP options can be used only in static bindings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
option <OPTION-NAME> [<DHCP-OPTION-IP>|<DHCP-OPTION-ASCII>]
```

Parameters

- option <OPTION-NAME> [<DHCP-OPTION-IP>|<DHCP-OPTION-ASCII>]

| | |
|---------------------|---|
| <OPTION-NAME> | Sets the DHCP option name |
| <DHCP-OPTION-IP> | Sets the DHCP option as an IP address |
| <DHCP-OPTION-ASCII> | Sets the DHCP option as an ASCII string |

Usage Guidelines

Defines non standard DHCP option codes (0-254)

NOTE: An option name in ASCII format accepts a backslash (\) as an input, but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

Example

```
rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test)#option option1
172.16.10.10

rfs6000-37FABE (config-dhcp-policy-test-pool-pool1-binding-test)#show context

12.1.3.3.14 respond-via-unicast

▶ *static-binding-mode commands*

Sends a DHCP offer and DHCP acknowledge as unicast messages

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
respond-via-unicast
```

Parameters

None

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#respond-via-unicast

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  netbios-name-server 172.16.10.23
  next-server 172.16.10.24
  option option1 172.16.10.10
respond-via-unicast
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

|-----------|---|

12.1.3.3.15 static-route

▶ *static-binding-mode commands*

Adds static routes to the static binding configuration

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
static-route <IP/MASK> <GATEWAY-IP>
```

Parameters

- `static-route <IP/MASK> <GATEWAY-IP>`

| | |
|--------------|--|
| <IP/MASK> | Sets the subnet for which the static route is configured |
| <GATEWAY-IP> | Specify the gateway's IP address |

Example

```
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-1)#static-route
10.0.0.0/10 157.235.208.235

rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
client-name RFID
domain-name documentation
netbios-node-type b-node
netbios-name-server 172.16.10.23
next-server 172.16.10.24
option option1 172.16.10.10
respond-via-unicast
static-route 10.0.0.0/10 157.235.208.235
rfs6000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

Related Commands

| | |

| <i>no</i> | Resets values or disables DHCP pool static route settings |
|-----------|---|

12.1.4 dhcp-server

▶ *dhcp-server-policy*

Configures the activation-criteria (run-criteria) that triggers dynamic activation of DHCP service running on a redundancy device

In a managed wireless network, when the primary, active DHCP server fails (is unreachable), network clients are unable to access DHCP services, such as new IP address leasing and renewal of existing IP address leases. In such a scenario, the activation-criteria, when configured, triggers dynamic activation of the secondary DHCP server, allowing network clients to continue accessing DHCP services. The WiNG implementation provides activation-criteria options specific to a RF Domain, cluster setup, and a *Virtual Router Redundancy Protocol (VRRP)* master/client setup.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dhcp-server activation-criteria [cluster-master|rf-domain-manager|vrrp-master]
```

Parameters

- `dhcp-server activation-criteria [cluster-master|rf-domain-manager|vrrp-master]`

| | |
|---|---|
| dhcp-server | Enables dynamic activation of the DHCP server, running on a redundancy device, based on the activation criteria specified |
| activation-criteria [cluster-master rf-domain-manager vrrp-master] | Configures the activation criteria. Specify one of the following options as the activation criteria: <ul style="list-style-type: none"> • cluster-master - Configures the cluster-master criteria in a cluster setup. Within a cluster, DHCP service is enabled on the cluster master. While it remains disabled on the other cluster members. In case of the cluster master failing, the cluster-master activation criteria, when configured, triggers dynamic activation of DHCP service on the new cluster master. • rf-domain-manger - Configures the rf-domain-manager criteria on an RF Domain. Within a RF Domain, DHCP service is enabled on the RF Domain manager. While it remains disabled on the other devices within the RF Domain. In case of the RF Domain manager failing, the rf-domain-manager activation criteria, when configured, triggers dynamic activation of DHCP service on the new RF Domain manager. • vrrp-master - Configures the vrrp-master criteria within a VRRP master/client setup. In such a setup, the DHCP service is enabled on the VRRP master. While it remains disabled on the other members. In case of the VRRP master failing, the vrrp-master activation criteria, when configured, triggers dynamic activation of DHCP service on the new VRRP master. |

Example

```
rfs4000-229D58(config-dhcp-policy-test)#dhcp-server activation-criteria rf-  
domain-manager  
  
rfs4000-229D58(config-dhcp-policy-test)#show context  
dhcp-server-policy test  
dhcp-server activation-criteria rf-domain-manager  
rfs4000-229D58(config-dhcp-policy-test)#  
  
rfs4000-229D58(config-dhcp-policy-test)#no dhcp-server activation-criteria  
  
rfs4000-229D58(config-dhcp-policy-test)#show context  
dhcp-server-policy test  
rfs4000-229D58(config-dhcp-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the DHCP service activation criteria configured on this DHCP server policy |
|-----------|--|

12.1.5 no

▸ *dhcp-server-policy*

Negates a command or sets its default. When used in the DHCP server configuration context, the 'no' command resets or reverts the DHCP server policy settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [bootp|dhcp-class|dhcp-pool|dhcp-server|option|ping]
no bootp ignore
no dhcp-class <DHCP-CLASS-NAME>
no dhcp-pool <DHCP-POOL-NAME>
no dhcp-server activation-criteria
no option <DHCP-OPTION>
no ping timeout
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Negates a command or sets its default. When used in the DHCP server configuration context, the 'no' command resets or reverts the DHCP server policy settings |
|-----------------|---|

Example

The following example shows the DHCP policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  bootp ignore
  dhcp-class dhcpclass1
  dhcp-pool pool1
    address 1.2.3.4 class dhcpclass1
    update dns override
  --More--
rfs6000-37FABE(config-dhcp-policy-test)#

rfs6000-37FABE(config-dhcp-policy-test)#no bootp ignore
rfs6000-37FABE(config-dhcp-policy-test)#no dhcp-class dhcpclass1
rfs6000-37FABE(config-dhcp-policy-test)#no dhcp-pool pool1
```

The following example shows the DHCP policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
rfs6000-37FABE(config-dhcp-policy-test)#
```

12.1.6 option

▸ *dhcp-server-policy*

Configures raw DHCP options. The DHCP option has to be configured in the DHCP server policy. The options configured in the DHCP pool/DHCP server policy can also be used in static bindings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
option <OPTION-NAME> <0-254> [ascii|hexstring|ip]
```

Parameters

- option <OPTION-NAME> <0-254> [ascii|hexstring|ip]

| | |
|---------------|--|
| <OPTION-NAME> | Configures the option name |
| <0-254> | Configures the DHCP option code from 0 - 254 |
| ascii | Configures the DHCP option as an ASCII string |
| hexstring | Configures the DHCP option as a hexadecimal string |
| ip | Configures the DHCP option as an IP address |

Usage Guidelines

Defines non standard DHCP option codes (0-254)

NOTE: An option name in ASCII format accepts a backslash (\) as an input, but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

Example

```
rfs6000-37FABE(config-dhcp-policy-test)#option option1 200 ascii

rfs6000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  option option1 200 ascii
rfs6000-37FABE(config-dhcp-policy-test)#
```

Related Commands

| | |
|-----------|-----------------------------|
| <i>no</i> | Removes DHCP server options |
|-----------|-----------------------------|

12.1.7 ping

► *dhcp-server-policy*

Configures the DHCP server's ping timeout interval. The controller uses the timeout to intermittently ping and discover whether a client requested IP address is available or in use.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ping timeout <1-10>
```

Parameters

- ping timeout <1-10>

| | |
|----------------|---|
| timeout <1-10> | Sets the ping timeout from 1 - 10 seconds. The default is 1 second. |
|----------------|---|

Example

```
rfs6000-37FABE(config-dhcp-policy-test)#ping timeout 2

rfs6000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  ping timeout 2
  option option1 200 ascii
rfs6000-37FABE(config-dhcp-policy-test)#
```

Related Commands

| | |
|-----------|--------------------------------------|
| <i>no</i> | Resets the ping interval to 1 second |
|-----------|--------------------------------------|

12.2 dhcpv6-server-policy

► DHCP-SERVER-POLICY

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

The following table summarizes DHCPv6 server policy configuration commands:

Table 12.8 DHCPv6-Server-Policy-Config Commands

| Command | Description | Reference |
|--------------------------------|---|-------------------|
| <i>dhcpv6-pool</i> | Creates a DHCPv6 pool and enters its configuration mode | <i>page 12-62</i> |
| <i>option</i> | Configures this DHCPv6 server policy's DHCP option settings, such as enterprise (vendor ID) | <i>page 12-73</i> |
| <i>restrict-vendor-options</i> | Restricts the use of vendor-specific DHCP options on this DHCPv6 server policy | <i>page 12-75</i> |
| <i>server-preference</i> | Configures this DHCP server's preference value. This value is sent in DHCP server replies to the IPv6 client. | <i>page 12-76</i> |
| <i>no</i> | Negates or reverts this DHCPv6 server policy's settings | <i>page 12-77</i> |

12.2.1 dhcpv6-pool

▶ *dhcpv6-server-policy*

The following table summarizes DHCPv6 pool configuration mode commands:

Table 12.9 *DHCPv6-Pool-Config Commands*

| Command | Description | Reference |
|----------------------------------|---|-------------------|
| <i>dhcpv6-pool</i> | Creates a DHCPv6 pool and enters its configuration mode | <i>page 12-63</i> |
| <i>dhcpv6-pool-mode commands</i> | Summarizes DHCPv6 pool configuration mode commands | <i>page 12-65</i> |

12.2.1.1 dhcpv6-pool

► *dhcpv6-pool*

Configures a DHCPv6 server address pool and enters its configuration mode

A DHCPv6 IPv6 pool is a resource from which IPv6 formatted addresses can be issued on DHCPv6 client requests. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dhcpv6-pool <POOL-NAME>
```

Parameters

- `dhcpv6-pool <POOL-NAME>`

| | |
|--------------------------------|--|
| <code><POOL-NAME></code> | <p>Creates a DHCPv6 server address pool</p> <ul style="list-style-type: none"> • <code><POOL-NAME></code> - Specify a name that appropriately identifies this DHCPv6 address pool. If the pool does not exist, it is created. The pool name cannot be modified as part of the edit process. However, an obsolete address pool can be deleted. |
|--------------------------------|--|

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test)#dhcpv6-pool DHCPv6Pool1

rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#?
DHCPv6 pool Mode commands:
  dns-server      DNS Servers
  domain-name    Configure domain-name
  network        Network on which DHCPv6 server will be deployed
  no             Negate a command or set its defaults
  option         Raw DHCPv6 options
  refresh-time   Upper limit specifying the timer for which client should wait
                before refreshing information
  sip            SIP server options

  clrscr        Clears the display screen
  commit        Commit all changes made in this session
  do            Run commands from Exec mode
  end           End current mode and change to EXEC mode
  exit          End current mode and down to previous mode
  help         Description of the interactive help system
  revert        Revert changes
  service       Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

```
rfs6000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  dhcpv6-pool DHCPv6Pool1
    network 2002::/64
    domain-name TechPubs
    sip domain-name TechPubsSIP
    dns-server 2002::1
rfs6000-37FABE(config-dhcpv6-server-policy-test)#
```

Related Commands

| <i>no</i> | Removes the DHCPv6 pool identified by the <POOL-NAME> keyword |
|-----------|---|

12.2.1.2 dhcpv6-pool-mode commands

▶ *dhcpv6-pool*

Configures the DHCPv6 pool parameters

The following table summarizes DHCPv6 pool configuration commands:

Table 12.10 *DHCPv6-Pool-Config-Mode Commands*

| Command | Description | Reference |
|---------------------|--|-------------------|
| <i>dns-server</i> | Configures this DHCPv6 pool's DNS server | <i>page 12-66</i> |
| <i>domain-name</i> | Configures this DHCPv6 pool's domain name | <i>page 12-67</i> |
| <i>network</i> | Configures this DHCPv6 pool's network | <i>page 12-68</i> |
| <i>option</i> | Configures this DHCPv6 pool's raw DHCPv6 options. This is the vendor-specific option used in this DHCPv6 pool. | <i>page 12-70</i> |
| <i>refresh-time</i> | Configures this DHCPv6 pool's refresh time in seconds | <i>page 12-71</i> |
| <i>sip</i> | Configures this DHCPv6 pool's <i>Session Initiation Protocol</i> (SIP) server setting | <i>page 12-72</i> |
| <i>no</i> | Negates or reverts this DHCPv6 pool's settings | <i>page 12-69</i> |

12.2.1.2.1 dns-server

▶ *dhcpv6-pool-mode commands*

Configures this DHCPv6 pool's DNS server. The DNS server supports all clients connected to networks supported by the DHCPv6 server.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dns-server <IPv6> {<SECONDARY-IPv6>}
```

Parameters

- dns-server <IPv6> {<SECONDARY-IPv6>}

| | |
|------------------|--|
| <IPv6> | Configures the primary DNS server's IPv6 address <ul style="list-style-type: none"> • <IPv6> - Specify the DNS server's IPv6 address (the server associated with this DHCP pool). |
| <SECONDARY-IPv6> | Configures the secondary DNS server's IPv6 address <ul style="list-style-type: none"> • <SECONDARY-IPv6> - Specify the secondary DNS server's IPv6 address (the server associated with this DHCP pool). |

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#dns-server
2002::1

rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
  dns-server 2002::1
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this DHCPv6 pool's configured DNS server settings |
|-----------|---|

12.2.1.2.2 domain-name

▶ *dhcpv6-pool-mode commands*

Configures this DHCPv6 pool's domain name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
domain-name <DOMAIN-NAME>
```

Parameters

- domain-name <DOMAIN-NAME>

| | |
|---------------|--|
| <DOMAIN-NAME> | Specify the DHCP pool's hostname or hostnames of the domain or domains |
|---------------|--|

Example

```
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #domain-name
TechPubs

rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #show context
dhcpv6-pool DHCPv6Pool1
  domain-name TechPubs
  dns-server 2002::1
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes this DHCPv6 pool's domain name |
|-----------|--|

12.2.1.2.3 network

▸ *dhcpv6-pool-mode commands*

Configures this DHCPv6 pool's network. Use this command to configure the address of the network on which this DHCP server is deployed.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
network [<IPv6/M>|<NETWORK-ALIAS-NAME>]
```

Parameters

- network [<IPv6/M>|<NETWORK-ALIAS-NAME>]

| | |
|----------------------|---|
| <IPv6/M> | Specify this DHCPv6 pool network's IPv6 address and mask (for example, 1:2::1:0/96) |
| <NETWORK-ALIAS-NAME> | Specify this DHCPv6 pool network's alias name |

Example

```
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #network
2002::0/64

rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #show context
dhcpv6-pool DHCPv6Pool1
  network 2002::/64
  domain-name TechPubs
  dns-server 2002::1
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the network IPv6 address and mask configured for this DHCPv6 pool |
|-----------|---|

12.2.1.2.4 no

▶ *dhcpv6-pool-mode commands*

Negates a command or sets its default. When used in the DHCPv6 pool configuration context, the 'no' command resets or reverts the DHCPv6 pool's settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [dns-server|domain-name|network|option|refresh-time|sip]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Negates a command or sets its default. When used in the DHCPv6 pool configuration context, the 'no' command resets or reverts the DHCPv6 pool's settings. |
|-----------------|---|

Example

```
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64
refresh-time 1000
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
option DHCPv6Pool1Option 60
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #

rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #no option
DHCPv6Pool1Option

rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #no refresh-time

rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
rfs6000-37FABE (config-dhcpv6-server-policy-test-pool-DHCPv6Pool1) #
```

12.2.1.2.5 option

▶ *dhcpv6-pool-mode commands*

Configures this DHCPv6 pool's raw DHCPv6 options. This is the vendor-specific option used in this DHCPv6 pool.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
option <OPTION-NAME> [<DHCPv6-OPTION-IP>|<DHCPv6-OPTION-ASCII>]
```

Parameters

- option <OPTION-NAME> [<DHCPv6-OPTION-IP>|<DHCPv6-OPTION-ASCII>]

| | |
|-----------------------|---------------------------------------|
| <OPTION-NAME> | Sets the name of the DHCPv6 option |
| <DHCPv6-OPTION-IP> | Sets DHCPv6 option as an IPv6 address |
| <DHCPv6-OPTION-ASCII> | Sets DHCPv6 option as an ASCII string |

NOTE: An option name in ASCII format accepts backslash (\) as an input but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#option
DHCPv6Pool1Option 60

rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
dns-server 2002::1
option DHCPv6Pool1Option 60
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this DHCPv6 pool's DHCP option settings |
|-----------|---|

12.2.1.2.6 refresh-time

▶ *dhcpv6-pool-mode commands*

Configures this DHCPv6 pool's refresh time in seconds. This is the interval between two successive DHCP pool refreshes. The DHCP refresh process refreshes IPv6 client information.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
refresh-time <600-4294967295>
```

Parameters

- refresh-time <600-4294967295>

| | |
|----------------------------------|---|
| refresh-time <600-4294967295> | Specify this DHCPv6 pool's refresh time from 600 -4294967295 seconds. |
|----------------------------------|---|

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#refresh-time
1000

rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64
refresh-time 1000
domain-name TechPubs
dns-server 2002::1
option DHCPv6Pool1Option 60
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes or reverts the configured DHCPv6 pool's refresh time |
|-----------|--|

12.2.1.2.7 sip

▶ *dhcpv6-pool-mode commands*

Configures this DHCPv6 pool's *Session Initiation Protocol* (SIP) server setting

Configures the domain name or domain names associated with the SIP servers. The SIP server is used to prioritize voice and video traffic on the network. SIP is an application-layer control protocol that can establish, modify and terminate multimedia sessions or calls. A SIP system has several components (user agents, proxy servers, redirect servers, and registrars). User agents can contain SIP clients; proxy servers always contain SIP clients.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
sip [address <IPv6>|domain-name <DOMAIN-NAME>]
```

Parameters

- sip [address <IPv6>|domain-name <DOMAIN-NAME>]

| | |
|--|---|
| sip [address <IPv6> domain-name <DOMAIN-NAME>] | Configures the SIP server's setting, such as address and/or domain name |
|--|---|

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#sip domain-name
TechPubsSIP

rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64
refresh-time 1000
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
option DHCPv6Pool1Option 60
rfs6000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this DHCPv6 pool's SIP server setting |
|-----------|---|

12.2.2 option

► *dhcpv6-server-policy*

Configures this DHCPv6 server policy's DHCP option settings, such enterprise (vendor) ID

DHCPv6 services are available for specific IP interfaces. A pool (or range) of IPv6 network addresses and DHCPv6 options can be created for each IPv6 interface defined. This range of addresses can be made available to DHCPv6 enabled devices on either a permanent or leased basis. DHCPv6 options are provided to each client with a DHCPv6 response and provide DHCPv6 clients information required to access network resources (default gateway, domain name, DNS server and WINS server configuration). An option exists to identify the vendor and functionality of a DHCPv6 client. The information is a variable-length string of characters (or octets) with a meaning specified by the vendor of the DHCPv6 client.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
option <OPTION-NAME> <0-254> [ascii|hexstring|ipv6] <1-4294967295>
```

Parameters

- option <OPTION-NAME> <0-254> [ascii|hexstring|ipv6] <1-4294967295>

| | |
|-------------------------|---|
| option <OPTION-NAME> | Specify a unique name for this DHCP option. The name should describe option's function. |
| <0-254> | Specify a DHCP option code for this option. <ul style="list-style-type: none"> • <0-254> – Specify a value from 0 -254. The system allows only one code, of the same value, for each DHCP option used in each DHCPv6 server policy. |
| ascii | Specifies the option type as ASCII (sends an ASCII compliant string to the client) |
| hexstring | Specifies the option type as a string of hexadecimal characters (sends a hexadecimal string to the client) |
| ipv6 | Specifies the option type as IPv6 address (sends an IPv6 compatible address to the client) |
| <1-4294967295> | This parameter is common to all option types. <ul style="list-style-type: none"> • <1-4294967295> – Specifies the enterprise (vendor) ID. Specify a value from 1 - 4294967295. The option code (1) is reserved for subnet-mask and cannot be used. Each vendor should have a unique vendor ID used by the DHCP server to issue vendor-specific DHCP options. |

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test)#option DHCPServerOption1 10
ascii 50

rfs6000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
rfs6000-37FABE(config-dhcpv6-server-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the DHCPv6 server option settings configured for this DHCPv6 server policy |
|-----------|--|

12.2.3 restrict-vendor-options

▸ *dhcpv6-server-policy*

Restricts the use of vendor-specific DHCP options on this DHCPv6 server policy. When restricted, vendor-specific DHCP options, configured on this DHCPv6 server policy, are not included in the DHCPv6 server replies to IPv6 clients.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
restrict-vendor-options
```

Parameters

None

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test)#restrict-vendor-options

rfs6000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
restrict-vendor-options
rfs6000-37FABE(config-dhcpv6-server-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes restriction on sending of vendor-specific options in DHCPv6 server replies to IPv6 clients |
|-----------|--|

12.2.4 server-preference

▸ *dhcpv6-server-policy*

Configures this DHCPv6 server's preference value. When configured, the server preference value is included in the DHCPv6 server's replies to IPv6 clients.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
server-preference <0-255>
```

Parameters

- `server-preference <0-255>`

| | |
|------------------------------|--|
| server-preference <0-255> | Configures this DHCP server's preference value <ul style="list-style-type: none"> • <0-255> - Specify a value from 0 - 255. |
|------------------------------|--|

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test)#server-preference 1

rfs6000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
server-preference 1
restrict-vendor-options
rfs6000-37FABE(config-dhcpv6-server-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this DHCPv6 server's preference value |
|-----------|---|

12.2.5 no

▸ *dhcpv6-server-policy*

Negates or reverts this DHCPv6 server policy's settings

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [dhcpv6-pool|option|restrict-vendor-options|server-preference]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Negates or reverts this DHCPv6 server policy's settings |
|-----------------|---|

Example

```
rfs6000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
server-preference 1
restrict-vendor-options
rfs6000-37FABE(config-dhcpv6-server-policy-test)#

rfs6000-37FABE(config-dhcpv6-server-policy-test)#no restrict-vendor-options
rfs6000-37FABE(config-dhcpv6-server-policy-test)#no server-preference

rfs6000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
rfs6000-37FABE(config-dhcpv6-server-policy-test)#
```

13 FIREWALL-POLICY

This chapter summarizes the firewall policy commands in the CLI command structure.

A firewall protects a network from attacks and unauthorized access from outside the network. Simultaneously, it allows authorized users to access required resources. Firewalls work on multiple levels. Some work at layers 1, 2 and 3 to inspect each packet. The packet is either passed, dropped or rejected based on rules configured on the firewall.

Firewalls use application layer filtering to enforce compliance. These firewalls can understand applications and protocols and can detect if an unauthorized protocol is being used, or an authorized protocol is being abused in any malicious way.

The third set of firewalls, 'Stateful Firewalls', consider the placement of individual packets within each packet in the series of packets being transmitted. If there is a packet that does not fit into the sequence, it is automatically identified and dropped.

Use (config) instance to configure firewall policy commands. To navigate to the *config-fw-policy* instance, use the following commands:

```
<DEVICE>(config)#firewall-policy <POLICY-NAME>

rfs6000-37FABE(config)#firewall-policy test
rfs6000-37FABE(config-fw-policy-test)#?
Firewall policy Mode commands:
  acl-logging          Log on flow creating traffic
  alg                  Enable ALG
  clamp                Clamp value
  dhcp-offer-convert  Enable conversion of broadcast dhcp offers to
                    unicast
  dns-snoop           DNS Snooping
  firewall            Wireless firewall
  flow                Firewall flow
  ip                  Internet Protocol (IP)
  ip-mac              Action based on ip-mac table
  ipv6                Internet Protocol version 6 (IPv6)
  ipv6-mac            Action based on ipv6-mac table
  logging             Firewall enhanced logging
  no                  Negate a command or set its defaults
  proxy-arp           Enable generation of ARP responses on behalf
                    of another device
  proxy-nd            Enable generation of ND responses (for IPv6)
                    on behalf of another device
  stateful-packet-inspection-l2 Enable stateful packet inspection in layer2
                    firewall
  storm-control        Storm-control
  virtual-defragmentation Enable virtual defragmentation for IPv4
                    packets (recommended for proper functioning
                    of firewall)

  clrscr              Clears the display screen
  commit              Commit all changes made in this session
  do                  Run commands from Exec mode
  end                 End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert              Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or
                    terminal
rfs6000-37FABE(config-fw-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

13.1 firewall-policy

► FIREWALL-POLICY

The following table summarizes default firewall policy configuration commands:

Table 13.1 *Firewall-Policy-Config Commands*

| Command | Description | Reference |
|--------------------------------------|---|-------------------|
| <i>acl-logging</i> | Enables logging on flow creating traffic | <i>page 13-4</i> |
| <i>alg</i> | Enables an algorithm | <i>page 13-5</i> |
| <i>clamp</i> | Sets a clamp value to limit TCP MSS to inner path-MTU for tunnelled packets | <i>page 13-7</i> |
| <i>dhcp-offer-convert</i> | Enables the conversion of broadcast DHCP offers to unicast | <i>page 13-8</i> |
| <i>dns-snoop</i> | Sets the timeout value for DNS entries | <i>page 13-9</i> |
| <i>firewall</i> | Configures the wireless firewall | <i>page 13-10</i> |
| <i>flow</i> | Defines a session flow timeout | <i>page 13-11</i> |
| <i>ip</i> | Configures <i>Internet Protocol</i> (IP) components on this firewall policy | <i>page 13-13</i> |
| <i>ip-mac</i> | Defines an action based on IP-MAC table | <i>page 13-20</i> |
| <i>ipv6</i> | Configures IPv6 components on this firewall policy | <i>page 13-22</i> |
| <i>ipv6-mac</i> | Defines an action based on IPv6-MAC table | <i>page 13-26</i> |
| <i>logging</i> | Enables enhanced firewall logging | <i>page 13-28</i> |
| <i>no</i> | Negates a command or reverts settings to their default | <i>page 13-30</i> |
| <i>proxy-arp</i> | Enables the generation of ARP responses on behalf of another device | <i>page 13-32</i> |
| <i>proxy-nd</i> | Enables the generation of ND responses (for IPv6) on behalf of another device | <i>page 13-33</i> |
| <i>stateful-packet-inspection-12</i> | Enables stateful packets-inspection in layer 2 firewall | <i>page 13-34</i> |
| <i>storm-control</i> | Defines storm control and logging settings | <i>page 13-35</i> |
| <i>virtual-defragmentation</i> | Enables virtual defragmentation of IPv4 packets | <i>page 13-37</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

13.1.1 acl-logging

► *firewall-policy*

Enables logging on flow creating traffic. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
acl-logging
```

Parameters

None

Example

```
rfs4000-229D58 (config-fw-policy-test) #acl-logging
rfs4000-229D58 (config-fw-policy-test) #no acl-logging

rfs4000-229D58 (config-fw-policy-test) #show context
firewall-policy test
no ip dos tcp-sequence-past-window
no acl-logging
rfs4000-229D58 (config-fw-policy-test) #
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables logging on flow creating traffic |
|-----------|---|

13.1.2 alg

▸ *firewall-policy*

Enables traffic filtering at the application layer using the *Application Layer Gateway* (ALG) feature

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
alg [dns|facetime|ftp|pptp|sccp|sip|tftp]
```

Parameters

- alg [dns|facetime|ftp|pptp|sccp|sip|tftp]

| | |
|----------|---|
| alg | Enables traffic filtering at the application layer. The ALG provides filters for the following common protocols: DNS, Facetime, FTP, PPTP, SCCP, SIP, and TFTP. |
| dns | Allows <i>Domain Name System</i> (DNS) traffic through the firewall using its default ports. This option is enabled by default. When enabled, you can easily permit or deny traffic based on a packet's DNS name, instead of the IP address. Use this option when configuring ACLs allowing or denying traffic for Web sites that have a single domain name resolving to any one of multiple IP addresses. |
| facetime | Allows Apple's FaceTime video calling traffic through the firewall using its default ports. This option is disabled by default. |
| ftp | Allows <i>File Transfer Protocol</i> (FTP) traffic through the firewall using its default ports. This option is enabled by default. |
| pptp | Allows <i>Point-to-Point Tunneling Protocol</i> (PPTP) traffic through the firewall using its default ports. PPTP, a network protocol, enables secure transfer of data from a remote client to an enterprise server by encapsulating PPP packets into IP datagrams for transmission over the Internet or other public TCP/IP-based networks. This option is enabled by default. |
| sccp | Allows <i>Signalling Connection Control Part</i> (SCCP) traffic through the firewall using its default ports. This option is disabled by default. SCCP is a network protocol that provides routing, flow control and error correction in telecommunication networks. |
| sip | Allows <i>Session Initiation Protocol</i> (SIP) traffic through the firewall using its default ports. This option is enabled by default. |
| tftp | Enables the <i>Trivial File Transfer Protocol</i> (TFTP) algorithm. When enabled, allows TFTP traffic through the firewall using its default ports. This option is enabled by default. |

Example

```
nx4500-5CFA2B(config-fw-policy-test)#alg facetime
nx4500-5CFA2B(config-fw-policy-test)#show context
firewall-policy test
  no ip dos tcp-sequence-past-window
  alg facetime
nx4500-5CFA2B(config-fw-policy-test)#
```

Related Commands

| | |

| <i>no</i> | Removes or reverts ALG related settings |
|-----------|---|

13.1.3 clamp

► *firewall-policy*

This option limits the TCP *Maximum Segment Size* (MSS) to the size of the *Maximum Transmission Unit* (MTU) discovered by path MTU discovery for the inner protocol. This ensures the packet traverses through the inner protocol without fragmentation. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
clamp tcp-mss
```

Parameters

- `clamp tcp-mss`

| | |
|---------|---|
| tcp-mss | Limits the TCP MSS size to the MTU value of the inner protocol for tunneled packets |
|---------|---|

Example

```
rfs6000-37FABE(config-fw-policy-test)#clamp tcp-mss
```

Related Commands

| | |
|-----------|----------------------------------|
| <i>no</i> | Disables limiting of the TCP MSS |
|-----------|----------------------------------|

13.1.4 dhcp-offer-convert

► *firewall-policy*

Enables the conversion of broadcast DHCP offers to unicast. Converting DHCP broadcast traffic to unicast traffic can help reduce network traffic loads. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dhcp-offer-convert
```

Parameters

None

Example

```
rfs6000-37FABE(config-fw-policy-test)#dhcp-offer-convert

rfs6000-37FABE(config-fw-policy-test)#show context
firewall-policy test
no ip dos tcp-sequence-past-window
dhcp-offer-convert
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables the conversion of broadcast DHCP offers to unicast |
|-----------|---|

13.1.5 dns-snoop

► *firewall-policy*

Sets the timeout interval for DNS snoop table entries. DNS snoop entries provide information, such as client to IP address and client to default gateway(s) mappings. This information is used to detect if the client is sending routed packets to a wrong MAC address.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dns-snoop entry-timeout <30-86400>
```

Parameters

- dns-snoop entry-timeout <30-86400>

| | |
|-----------------------------|--|
| entry-timeout <30-86400> | Sets the DNS snoop table entry timeout interval from 30 - 86400 seconds. An entry is retained in the DNS snoop table only for the specified time, and is deleted once this time is exceeded. The default is 1,800 seconds. |
|-----------------------------|--|

Example

```
rfs6000-37FABE(config-fw-policy-test)#dns-snoop entry-timeout 35

rfs6000-37FABE(config-fw-policy-test)#show context
firewall-policy test
no ip dos tcp-sequence-past-window
dhcp-offer-convert
dns-snoop entry-timeout 35
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the DNS snoop table entry timeout interval |
|-----------|--|

13.1.6 firewall

► *firewall-policy*

Enables a device's firewall

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
firewall enable
```

Parameters

- `firewall enable`

| | |
|------------------------------|----------------------------|
| <code>firewall enable</code> | Enables wireless firewalls |
|------------------------------|----------------------------|

Example

```
rfs6000-37FABE(config-fw-policy-default)#firewall enable
rfs6000-37FABE(config-fw-policy-default)#
```

Related Commands

| | |
|-----------|------------------------------|
| <i>no</i> | Disables a device's firewall |
|-----------|------------------------------|

13.1.7 flow

► *firewall-policy*

Defines the session flow timeout interval for different packet types

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
flow [dhcp|timeout]
flow dhcp stateful
flow timeout [icmp|other|tcp|udp]
flow timeout [icmp|other] <1-32400>
flow timeout udp <15-32400>
flow timeout tcp [close-wait|reset|setup|stateless-fin-or-reset|stateless-
general] <1-32400>
flow timeout tcp established <15-32400>
```

Parameters

- flow dhcp stateful

| | |
|----------|--|
| dhcp | Configures DHCP packet flow |
| stateful | Performs a stateful check on DHCP packets. This feature is enabled by default. |

- flow timeout [icmp|other] <1-32400>

| | |
|-----------|---|
| timeout | Configures a packet timeout |
| icmp | Configures the timeout for ICMP packets. The default is 30 seconds. |
| other | Configures the timeout for packets other than ICMP, TCP, or UDP. The default is 30 seconds. |
| <1-32400> | Configures the timeout from 1 - 32400 seconds |

- flow timeout udp <15-32400>

| | |
|------------|--|
| timeout | Configures a packet timeout |
| udp | Configures the timeout for UDP packets. The default is 30 seconds. |
| <15-32400> | Configures the timeout from 15 - 32400 seconds |

- flow timeout tcp [close-wait|reset|setup|stateless-fin-or-reset|stateless-
general] <1-32400>

| | |
|------------|--|
| timeout | Configures a packet timeout |
| tcp | Configures the timeout for TCP packets |
| close-wait | Configures the closed TCP flow timeout. The default is 10 seconds. |
| reset | Configures the reset TCP flow timeout. The default is 10 seconds. |

| | |
|---|---|
| setup | Configures the opening TCP flow timeout. The default is 10 seconds. |
| stateless-fin-or-reset | Configures stateless TCP flow timeout created with the FIN or RESET packets. The default is 10 seconds. |
| stateless-general | Configures the stateless TCP flow timeout. The default is 90 seconds (1m 30 s). |
| <1-32400> | Configures the timeout from 1 - 32400 seconds |
| <ul style="list-style-type: none"> • flow timeout tcp established <15-32400> | |
| timeout | Configures the packet timeout |
| tcp | Configures the timeout for TCP packets |
| established | Configures the established TCP flow timeout. The default is 5400 seconds. |
| <15-32400> | Configures the timeout from 15 - 32400 seconds |

Example

```
rfs6000-37FABE(config-rw-policy-test)#flow timeout udp 10000
rfs6000-37FABE(config-rw-policy-test)#flow timeout icmp 16000
rfs6000-37FABE(config-rw-policy-test)#flow timeout other 16000
rfs6000-37FABE(config-rw-policy-test)#flow timeout tcp established 1500

rfs6000-37FABE(config-fw-policy-test)#show context
firewall-policy test
no ip dos tcp-sequence-past-window
flow timeout icmp 16000
flow timeout udp 10000
flow timeout tcp established 1500
flow timeout other 16000
dhcp-offer-convert
dns-snoop entry-timeout 35
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes session timeout intervals configured for different packet types |
|-----------|---|

13.1.8 ip

▸ *firewall-policy*

Configures *Internet Protocol* (IP) components

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ip [dos|tcp]

ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-max-incomplete|tcp-null-scan|tcp-post-syn|tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|udp-short-hdr|winnuke}

ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-null-scan|tcp-post-scan|tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|udp-short-hdr|winnuke} [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]

ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-null-scan|tcp-post-scan|tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|udp-short-hdr|winnuke} [drop-only]

ip dos tcp-max-incomplete [high|low] <1-1000>

ip tcp [adjust-mss|optimize-unnecessary-resends|recreate-flow-on-out-of-state-syn|validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]

ip tcp adjust-mss <472-1460>

ip tcp [optimize-unnecessary-resends|recreate-flow-on-out-of-state-syn|validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]
```

Parameters

```
• ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-null-scan|tcp-post-scan|tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|udp-short-hdr|winnuke} [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|emergencies|errors|informational|notifications|warnings]
```

| | |
|--------|--|
| dos | Identifies IP events as DoS events |
| ascend | Optional. Detects ASCEND DoS attacks Ascend DoS attacks target known vulnerabilities in various versions of Ascend routers. Ascend routers listen on UDP port 9 for packets from Ascend's Java Configurator. Sending a formatted packet to this port can cause an Ascend router to crash. |

| | |
|--------------------------|---|
| broadcast-multicast-icmp | <p>Optional. Detects broadcast or multicast ICMP DoS attacks</p> <p>Broadcast or multicast ICMP DoS attacks take advantage of ICMP behavior in response to echo replies. These attacks spoof the source address of the target and send ICMP broadcast or multicast echo requests to the rest of the network, flooding the target machine with replies.</p> |
| chargen | <p>Optional. Detects Chargen attacks</p> <p>The Character Generation Protocol (chargen) is an IP suite service primarily used for testing and debugging networks. It is also used as a source of generic payload for bandwidth and QoS measurements.</p> <p>The Chargen attack establishes a Telnet connection to port 19 and attempts to use the character generator service to create a string of characters which is then directed to the DNS service on port 53 to disrupt DNS services.</p> |
| fraggle | <p>Optional. Detects Fraggle DoS attacks</p> <p>The Fraggle DoS attack uses a list of broadcast addresses to send spoofed UDP packets to each broadcast address' echo port (port 7). Each of those addresses that have port 7 open will respond to the request generating a lot of traffic on the network. For those that do not have port 7 open they will send an unreachable message back to the originator, further clogging the network with more traffic.</p> |
| ftp-bounce | <p>Optional. Detects FTP bounce attacks</p> <p>A FTP bounce attack is a MIM attack that enables an attacker to open a port on a different machine using FTP. FTP requires that when a connection is requested by a client on the FTP port (21), another connection must open between the server and the client. To confirm, the PORT command has the client specify an arbitrary destination machine and port for the data connection. This is exploited by the attacker to gain access to a device that may not be the originating client.</p> |
| invalid-protocol | <p>Optional. Enables a check for an invalid protocol number</p> <p>Attackers may use vulnerability in the endpoint implementation by sending invalid protocol fields, or may misuse the misinterpretation of endpoint software. This can lead to inadvertent leakage of sensitive network topology information, call hijacking, or a DoS attack.</p> |
| ip-ttl-zero | <p>Optional. Enables a check for the TCP/IP TTL field having a value of zero (0)</p> <p>The TCP IP TTL Zero DoS attack sends spoofed multicast packets onto the network which have a <i>Time to Live</i> (TTL) of 0. This causes packets to loop back to the spoofed originating machine, and can cause the network to overload.</p> |
| ipsproof | <p>Optional. Enables a check for the IP spoofing DoS attacks</p> <p>IP Spoof is a category of DoS attack that sends IP packets with forged source addresses. This can hide the identity of the attacker.</p> |
| land | <p>Optional. Detects LAND DoS attacks</p> <p>A <i>Local Area Network Denial</i> (LAND) is a DoS attack where IP packets are spoofed and sent to a device where the source IP and destination IP of the packet are the target device's IP, and similarly, the source port and destination port are open ports on the same device. This causes the attacked device to reply to itself continuously.</p> |
| option-route | <p>Optional. Enables an IP Option Record Route DoS check</p> |

| | |
|------------------|--|
| router-advrt | <p>Optional. Detects router-advertisement attacks</p> <p>This attack uses ICMP to redirect the network router function to some other host. If that host can not provide router services, a DoS of network communications occurs as routing stops. This can also be modified to single out a specific system, so that only that system is subject to attack (because only that system sees the 'false' router). By providing router services from a compromised host, the attacker can also place themselves in a man-in-the-middle situation and take control of any open channel at will (as mentioned earlier, this is often used with TCP packet forgery and spoofing to intercept and change open TELNET sessions).</p> |
| router-solicit | <p>Optional. Detects router solicitation attacks</p> <p>The ICMP router solicitation scan is used to actively find routers on a network. A hacker could set up a protocol analyzer to detect routers as they broadcast routing information on the network. In some instances, however, routers may not send updates. For example, if the local network does not have other routers, the router may be configured to not send routing information packets onto the local network.</p> <p>ICMP offers a method for router discovery. Clients send ICMP router solicitation multicasts onto the network, and routers must respond (as defined in RFC 1122).</p> <p>By sending ICMP router solicitation packets (ICMP type 9) on the network and listening for ICMP router discovery replies (ICMP type 10), hackers can build a list of all of the routers that exist on a network segment. Hackers often use this scan to locate routers that do not reply to ICMP echo requests</p> |
| smurf | <p>Optional. In this attack, a large number of ICMP echo packets are sent with a spoofed source address. This causes the device with the spoofed source address to be flooded with a large number of replies.</p> |
| snork | <p>Optional. This attack causes a remote Windows™ NT to consume 100% of the CPU's resources. This attack uses a UDP packet with a destination port of 135 and a source port of 7, 9, or 135. This attack can also be exploited as a bandwidth consuming attack.</p> |
| tcp-bad-sequence | <p>Optional. A DoS attack that uses a specially crafted TCP packet to cause the targeted device to drop all subsequent network traffic for a specific TCP connection</p> |
| tcp-fin-scan | <p>Optional. Detects TCP FIN scan attacks</p> <p>Hackers use the TCP FIN scan to identify listening TCP port numbers based on how the target device reacts to a transaction close request for a TCP port (even though no connection may exist before these close requests are made). This type of scan can get through basic firewalls and boundary routers that filter on incoming TCP packets with the <i>Finish</i> (FIN) and ACK flag combination. The TCP packets used in this scan include only the TCP FIN flag setting.</p> <p>If the target device's TCP port is closed, the target device sends a TCP RST packet in reply. If the target device's TCP port is open, the target device discards the FIN and sends no reply.</p> |

| | |
|--------------------------|---|
| tcp-intercept | <p>Optional. Prevents TCP intercept attacks by using TCP SYN cookies</p> <p>A SYN-flooding attack occurs when a hacker floods a server with a barrage of requests for connection.</p> <p>Because these messages have unreachable return addresses, the connections cannot be established. The resulting volume of unresolved open connections eventually overwhelms the server and can cause it to deny service to valid requests, thereby preventing legitimate users from connecting to a Web site, accessing e-mail, using FTP service, and so on.</p> <p>The TCP intercept feature helps prevent SYN-flooding attacks by intercepting and validating TCP connection requests. In intercept mode, the TCP intercept software intercepts TCP <i>synchronization</i> (SYN) packets from clients to servers that match an extended access list. The software establishes a connection with the client on behalf of the destination server, and if successful, establishes the connection with the server on behalf of the client and knits the two half-connections together transparently. Thus, connection attempts from unreachable hosts will never reach the server. The software continues to intercept and forward packets throughout the duration of the connection. The number of SYNs per second and the number of concurrent connections proxied depends on the platform, memory, processor, and other factors. In the case of illegitimate requests, the software's aggressive timeouts on half-open connections and its thresholds on TCP connection requests protect destination servers while still allowing valid requests.</p> <p>When establishing a security policy using TCP intercept, you can choose to intercept all requests or only those coming from specific networks or destined for specific servers. You can also configure the connection rate and threshold of outstanding connections. Optionally operate TCP intercept in watch mode, as opposed to intercept mode. In watch mode, the software passively watches the connection requests flowing through the router. If a connection fails to get established in a configurable interval, the software intervenes and terminates the connection attempt.</p> |
| tcp-null-scan | <p>Optional. Detects TCP NULL scan attacks</p> <p>Hackers use the TCP NULL scan to identify listening TCP ports. This scan also uses a series of strangely configured TCP packets, which contain a sequence number of 0 and no flags. Again, this type of scan can get through some firewalls and boundary routers that filter incoming TCP packets with standard flag settings.</p> <p>If the target device's TCP port is closed, the target device sends a TCP RST packet in reply. If the target device's TCP port is open, the target discards the TCP NULL scan, sending no reply.</p> |
| tcp-post-syn | <p>Optional. Detects TCP post SYN DoS attacks</p> <p>A remote attacker may be attempting to avoid detection by sending a SYN frame with a different sequence number than the original SYN. This can cause an <i>Intrusion Detection System</i> (IDS) to become unsynchronized with the data in a connection. Subsequent frames sent during the connection are ignored by the IDS.</p> |
| tcp-sequence-past-window | <p>Optional. Enables a TCP SEQUENCE PAST WINDOW DoS attack check. Disable this check to work around a bug in Windows XP's TCP stack which sends data past the window when conducting a selective ACK.</p> |
| tcp-xmas-scan | <p>Optional. A TCP XMAS scan finds services on ports. A closed port returns a RST. This allows the attacker to identify open ports.</p> |
| tcphdrfrag | <p>Optional. A DoS attack where the TCP header spans IP fragments</p> |
| twinge | <p>Optional. A twinge attack is a flood of false ICMP packets to try and slow down a system</p> |

| | |
|---|--|
| udp-short-hdr | Optional. Enables the identification of truncated UDP headers and UDP header length fields |
| winnuke | Optional. This DoS attack is specific to Windows™ 95 and Windows™ NT. The WINNUKE DoS attack sends a large amount of data to UDP port 137 to crash the NETBIOS service on windows and results in high CPU utilization on the target machine. |
| log-and-drop | Logs the event and drops the packet |
| log-only | Logs the event only, the packet is not dropped |
| log-level | Configures the log level |
| <0-7> | Sets the numeric logging level |
| emergencies | Numerical severity 0. System is unusable |
| alerts | Numerical severity 1. Indicates a condition where immediate action is required |
| critical | Numerical severity 2. Indicates a critical condition |
| errors | Numerical severity 3. Indicates an error condition |
| warnings | Numerical severity 4. Indicates a warning condition |
| notification | Numerical severity 5. Indicates a normal but significant condition |
| informational | Numerical severity 6. Indicates a informational condition |
| debugging | Numerical severity 7. Debugging messages |
| <pre> • ip dos {ascend broadcast-multicast-icmp chargen fraggle ftp-bounce invalid-protocol ip-ttl-zero ipsproof land option-route router-advrt router- solicit smurf snork tcp-bad-sequence tcp-fin-scan tcp-intercept tcp-null-scan tcp-post-scan tcp-sequence-past-window tcp-xmas-scan tcphdrfrag twinge udp-short-hdr winnuke} [drop-only] </pre> | |
| dos | Identifies IP events as DoS events |
| ascend | Optional. Enables an ASCEND DoS check. Ascend routers listen on UDP port 9 for packets from Ascend's Java Configurator. Sending a formatted packet to this port can cause an Ascend router to crash. |
| broadcast-multicast-icmp | Optional. Detects broadcast or multicast ICMP packets as an attack |
| chargen | Optional. The <i>Character Generation Protocol</i> (chargen) is an IP suite service primarily used for testing and debugging networks. It is also used as a source of generic payload for bandwidth and QoS measurements. |
| fraggle | Optional. A Fraggle DoS attack checks for UDP packets to or from port 7 or 19 |
| ftp-bounce | Optional. A FTP bounce attack is a MIM attack that enables an attacker to open a port on a different machine using FTP. FTP requires that when a connection is requested by a client on the FTP port (21), another connection must open between the server and the client. To confirm, the PORT command has the client specify an arbitrary destination machine and port for the data connection. This is exploited by the attacker to gain access to a device that may not be the originating client. |
| invalid-protocol | Optional. Enables a check for invalid protocol number |
| ip-ttl-zero | Optional. Enables a check for the TCP/IP TTL field having a value of zero (0) |
| ipsproof | Optional. Enables a check for IP spoofing DoS attack |

| | |
|--------------------------|--|
| land | Optional. A <i>Local Area Network Denial</i> (LAND) is a DoS attack where IP packets are spoofed and sent to a device where the source IP and destination IP of the packet are the target device's IP, and similarly, the source port and destination port are open ports on the same device. This causes the attacked device to reply to itself continuously. |
| option-route | Optional. Enables an IP Option Record Route DoS check |
| router-advrt | Optional. This is an attack, where a default route entry is added remotely to a device. This route entry is given preference, and thereby exposes an attack vector. |
| router-solicit | Optional. Router solicitation messages are sent to locate routers as a form of network scanning. This information can then be used to attack a device. |
| smurf | Optional. In this attack, a large number of ICMP echo packets are sent with a spoofed source address. This causes the device with the spoofed source address to be flooded with a large number of replies. |
| snork | Optional. This attack causes a remote Windows™ NT to consume 100% of the CPU's resources. This attack uses a UDP packet with a destination port of 135 and a source port of 7, 9, or 135. This attack can also be exploited as a bandwidth consuming attack. |
| tcp-bad-sequence | Optional. A DoS attack that uses a specially crafted TCP packet to cause the targeted device to drop all subsequent network traffic for a specific TCP connection |
| tcp-fin-scan | Optional. A FIN scan finds services on ports. A closed port returns a RST. This allows the attacker to identify open ports. |
| tcp-intercept | Optional. Prevents TCP intercept attacks by using TCP SYN cookies |
| tcp-null-scan | Optional. A TCP null scan finds services on ports. A closed port returns a RST. This allows the attacker to identify open ports |
| tcp-post-syn | Optional. Enables a TCP post SYN DoS attack |
| tcp-sequence-past-window | Optional. Enables a TCP SEQUENCE PAST WINDOW DoS attack check. Disable this check to work around a bug in Windows XP's TCP stack which sends data past the window when conducting a selective ACK. |
| tcp-xmas-scan | Optional. A TCP XMAS scan finds services on ports. A closed port returns a RST. This allows the attacker to identify open ports. |
| tcphdrfrag | Optional. A DoS attack where the TCP header spans IP fragments |
| twinge | Optional. A twinge attack is a flood of false ICMP packets to try and slow down a system |
| udp-short-hdr | Optional. Enables the identification of truncated UDP headers and UDP header length fields |
| winnuke | Optional. This DoS attack is specific to Windows™ 95 and Windows™ NT, causing devices to crash with a blue screen |
| drop-only | Optional. Drops a packet without logging |

- `ip dos tcp-max-incomplete [high|low] <1-1000>`

| | |
|--------------------|---|
| dos | Identifies IP events as DoS events |
| tcp-max-incomplete | Sets the limits for the maximum number of incomplete TCP connections |
| high | Sets the upper limit for the maximum number of incomplete TCP connections |
| low | Sets the lower limit for the maximum number of incomplete TCP connections |
| <1-1000> | Sets the range limit from 1 - 1000 connections |

- `ip tcp adjust-mss <472-1460>`

| | |
|------------|--|
| tcp | Identifies and configures TCP events and configuration items |
| adjust-mss | Adjusts the TCP <i>Maximum Segment Size</i> (MSS). Use this option to adjust the MSS for TCP segments on the router. |
| <472-1460> | Sets the TCP MSS value from 472 - 1460 bytes. The default is 472 bytes. |

- `ip tcp [optimize-unnecessary-resends|recreate-flow-on-out-of-state-sync|validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]`

| | |
|------------------------------------|---|
| tcp | Identifies and configures TCP events and configuration items |
| optimize-unnecessary-resends | Enables the validation of unnecessary TCP packets |
| recreate-flow-on-out-of-state-sync | Allows a TCP SYN packet to delete an old flow in TCP_FIN_FIN_STATE, and TCP_CLOSED_STATE states and create a new flow |
| validate-icmp-unreachable | Enables the validation of the sequence number in ICMP unreachable error packets, which abort an established TCP flow |
| validate-rst-ack-number | Enables the validation of the acknowledgment number in RST packets, which abort a TCP flow |
| validate-rst-seq-number | Enables the validation of the sequence number in RST packets, which abort an established TCP flow |

Example

```
rfs6000-37FABE(config-rw-policy-test)#ip dos fraggle drop-only
rfs6000-37FABE(config-rw-policy-test)#ip dos tcp-max-incomplete high 600
rfs6000-37FABE(config-rw-policy-test)#ip dos tcp-max-incomplete low 60
rfs6000-37FABE(config-fw-policy-test)#ip dos tcp-sequence-past-window drop-only

rfs6000-37FABE(config-fw-policy-test)#show context
firewall-policy test
  ip dos fraggle drop-only
  ip dos tcp-sequence-past-window drop-only
  ip dos tcp-max-incomplete high 600
  ip dos tcp-max-incomplete low 60
  flow timeout icmp 16000
  flow timeout udp 10000
  flow timeout tcp established 1500
  flow timeout other 16000
  dhcp-offer-convert
  dns-snoop entry-timeout 35
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

13.1.9 ip-mac

▸ *firewall-policy*

Defines an action based on the device IP MAC table, and also detects conflicts between IP addresses and MAC addresses

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ip-mac [conflict|routing]
```

```
ip-mac conflict drop-only
```

```
ip-mac conflict [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|
emergencies|errors|informational|notifications|warnings]
```

```
ip-mac routing conflict drop-only
```

```
ip-mac routing [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|
emergencies|errors|informational|notifications|warnings]
```

Parameters

- ip-mac conflict drop-only

| | |
|-----------|--|
| conflict | Action performed when a conflict exists between the IP address and MAC address. This option is enabled by default. |
| drop-only | Drops a packet without logging |

- ip-mac conflict [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|emergencies|errors|informational|notifications|warnings]

| | |
|---------------|--|
| conflict | Action performed when a conflict exists between the IP address and MAC address. This option is enabled by default. |
| log-and-drop | Logs the event and drops the packet. This is the default setting. |
| log-only | Logs the event only, the packet is not dropped |
| log-level | Configures the log level |
| <0-7> | Sets the numeric logging level |
| alerts | Numerical severity 1. Indicates a condition where immediate action is required |
| critical | Numerical severity 2. Indicates a critical condition |
| debugging | Numerical severity 7. Debugging messages |
| emergencies | Numerical severity 0. System is unusable |
| errors | Numerical severity 3. Indicates an error condition |
| informational | Numerical severity 6. Indicates a informational condition |
| notification | Numerical severity 5. Indicates a normal but significant condition |
| warnings | Numerical severity 4. Indicates a warning condition. This is the default setting |

- ip-mac routing conflict drop-only

| | |
|-----------|---|
| routing | Enables IPMAC routing conflict detection. This is also known as a Hole-196 attack in the network. This feature helps to detect if the client is sending routed packets to the correct router-mac-address. |
| conflict | Defines the action performed when a routing table conflict is detected. This option is enabled by default. |
| drop-only | Drops a packet without logging |

- ip-mac routing [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|emergencies|errors|informational|notifications|warnings]

| | |
|---------------|--|
| routing | Defines a routing table based action |
| conflict | Action performed when a conflict exists in the routing table. This option is enabled by default. |
| log-and-drop | Logs the event and drops the packet. This is the default setting. |
| log-only | Logs the event only, the packet is not dropped |
| log-level | Configures the log level to log this event under |
| <0-7> | Sets the numeric logging level |
| alerts | Numerical severity 1. Indicates a condition where immediate action is required |
| critical | Numerical severity 2. Indicates a critical condition |
| debugging | Numerical severity 7. Debugging messages |
| emergencies | Numerical severity 0. System is unusable |
| errors | Numerical severity 3. Indicates an error condition |
| informational | Numerical severity 6. Indicates a informational condition |
| notification | Numerical severity 5. Indicates a normal but significant condition |
| warnings | Numerical severity 4. Indicates a warning condition. This is the default setting. |

Example

```
rfs6000-37FABE(config-rw-policy-test)#ip-mac conflict drop-only
rfs6000-37FABE(config-rw-policy-test)#ip-mac routing conflict log-and-drop log-
level notifications

rfs6000-37FABE(config-fw-policy-test)#show context
firewall-policy test
ip dos fraggle drop-only
ip dos tcp-sequence-past-window drop-only
ip dos tcp-max-incomplete high 600
ip dos tcp-max-incomplete low 60
ip-mac conflict drop-only
ip-mac routing conflict log-only log-level notifications
flow timeout icmp 16000
flow timeout udp 10000
flow timeout tcp established 1500
flow timeout other 16000
dhcp-offer-convert
dns-snoop entry-timeout 35
rfs6000-37FABE(config-fw-policy-test)#
```

13.1.10 ipv6

▸ *firewall-policy*

Configures IPv6 components on this firewall policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ipv6 [dos|duplicate-options|firewall|option|rewrite-flow-label|routing-type|
strict-ext-hdr-check|unknown-options]
```

```
ipv6 dos {hop-limit-zero|multicast-icmpv6|tcp-intercept-mobility} [drop-only|
log-and-drop|log-only]
```

```
ipv6 [duplicate-options|routing-type [one|two]|strict-ext-hdr-check|unknown-
options] [drop-only|log-and-drop|log-only]
```

```
ipv6 option {endpoint-identification|network-service-access-point|router-alert|
strict-hao-opt-alert|strict-padding} [drop-only|log-and-drop|log-only]
```

```
ipv6 [firewall enable|rewrite-flow-label]
```

Parameters

- `ipv6 dos {hop-limit-zero|multicast-icmpv6|tcp-intercept-mobility} [drop-only|log-and-drop|log-only]`

| | |
|------------------------|--|
| dos | Identifies IPv6 events as DoS events |
| hop-limit-zero | Optional. Enables checking of IPv6 hop limit field. If the IPv6 hop limit field is ZERO (0) it is considered as attack. This option is enabled by default. |
| multicast-icmpv6 | Optional. Enables detection of multicast ICMPv6 traffic as attack. This option is applicable only to ICMPv6 Echo request or reply packets. This option is enabled by default. |
| tcp-intercept-mobility | Optional. Enables detection of IPv6 TCP packets with mobility option "HAO(Home-Address-Option)" or "RH(Routing Header) type two". When enabled, this option also detects the "don't generate TCP syn cookies" for such packets. This option is enabled by default. |
| drop-only | This parameter is common to all of the above keywords. Drops all packets. Drops the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility). |
| log-and-drop | Logs the event and drops the packet. Drops the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility) and logs an event. |
| log-only | Logs the event only, the packet is not dropped. Does not drop the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility). But, an event is logged. |

| | |
|------------------------|---|
| log-level | <p>If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:</p> <ul style="list-style-type: none"> • <0-7> – Sets the numeric logging level • alerts – Numerical severity 1. Indicates a condition where immediate action is required • critical – Numerical severity 2. Indicates a critical condition • debugging – Numerical severity 7. Debugging messages • emergencies – Numerical severity 0. System is unusable • errors – Numerical severity 3. Indicates an error condition • informational – Numerical severity 6. Indicates a informational condition • notifications – Numerical severity 5. Indicates a normal but significant condition • warnings – Numerical severity 4. Indicates a warning condition. This is the default setting. |
| | <ul style="list-style-type: none"> • ipv6 [duplicate-options routing-type [one two] strict-ext-hdr-check unknown-options] [drop-only log-and-drop log-only] |
| duplicate-options | Enables handling of duplicate options in hop-by-hop and destination option extension headers. This configuration excludes HAO handling. This option is enabled by default. |
| routing-type [one two] | Enables checking of the following IPv6 routing types: <ul style="list-style-type: none"> • one – Routing Type 1(Nimrod routing). This option is disabled by default. • two – Routing Type 2(Mobile IP). This option is disabled by default. |
| strict-ext-hdr-check | Enables strict checking for out of order and number of occurrences of extension header. This option is enabled by default. |
| unknown-options | Enables handling unknown options in hop-by-hop and destination option extension headers. This option is enabled by default. |
| drop-only | This parameter is common to all of the above keywords. Drops all packets. Drops the packet if matching any of the above specified types. |
| log-and-drop | Logs the event and drops the packet. Drops the packet, if matching any of the above specified types, and logs an event. |
| log-only | Logs the event only, the packet is not dropped. Does not drop the packet, if matching any of the above specified types. But an event is logged. |
| log-level | <p>If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:</p> <ul style="list-style-type: none"> • <0-7> – Sets the numeric logging level • alerts – Numerical severity 1. Indicates a condition where immediate action is required • critical – Numerical severity 2. Indicates a critical condition • debugging – Numerical severity 7. Debugging messages • emergencies – Numerical severity 0. System is unusable • errors – Numerical severity 3. Indicates an error condition • informational – Numerical severity 6. Indicates a informational condition • notifications – Numerical severity 5. Indicates a normal but significant condition • warnings – Numerical severity 4. Indicates a warning condition. This is the default setting. |

• `ipv6 option {endpoint-identification|network-service-access-point|router-alert|strict-hao-opt-alert|strict-padding} [drop-only|log-and-drop|log-only]`

| | |
|---|---|
| option | <p>Enables checking for the following ipv6 extension header options:</p> <ul style="list-style-type: none"> • End point identification option (disabled by default) • Network service access point address option (disabled by default) • Router alert option (disabled by default) • Home address option in destination option extension header (enabled by default) • Pad1 and PadN options validating (enabled by default) <p>All of these are optional parameters. If no option is specified, the system enables checks as per the default values.</p> |
| drop-only | <p>This parameter is common to all of the above keywords.</p> <p>Drops all packets. Drops the packet if matching any of the above specified “option” types.</p> |
| log-and-drop | <p>Logs the event and drops the packet. Drops the packet, if matching any of the above specified “option” types, and logs an event.</p> |
| log-only | <p>Logs the event only, the packet is not dropped. Does not drop the packet, if matching any of the above specified “option” types. But an event is logged.</p> |
| log-level | <p>If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:</p> <ul style="list-style-type: none"> • <0-7> – Sets the numeric logging level • alerts – Numerical severity 1. Indicates a condition where immediate action is required • critical – Numerical severity 2. Indicates a critical condition • debugging – Numerical severity 7. Debugging messages • emergencies – Numerical severity 0. System is unusable • errors – Numerical severity 3. Indicates an error condition • informational – Numerical severity 6. Indicates a informational condition • notifications – Numerical severity 5. Indicates a normal but significant condition • warnings – Numerical severity 4. Indicates a warning condition. This is the default setting. |
| <p>• <code>ipv6 [firewall enable rewrite-flow-label]</code></p> | |
| firewall enable | <p>Enables IPv6 firewall. This option is enabled by default.</p> |
| rewrite-flow-label | <p>Rewrites the IPv6 flow label field of every packet. This option is disabled by default.</p> |

Example

```

nx4500-5CFA2B(config-fw-policy-test)#ipv6 dos hop-limit-zero drop-only

nx4500-5CFA2B(config-fw-policy-test)#ipv6 routing-type two log-and-drop log-level
warnings

nx4500-5CFA2B(config-fw-policy-test)#show context
firewall-policy test
no ip dos tcp-sequence-past-window
ipv6 routing-type two log-and-drop log-level warnings
ipv6 dos hop-limit-zero drop-only
nx4500-5CFA2B(config-fw-policy-test)#

```

Related Commands

*no*Resets this firewall policy's IPv6 components

13.1.11 ipv6-mac

▸ *firewall-policy*

Defines an action based on conflicts detected in a device's IPv6 and MAC addresses

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ipv6-mac [conflict|routing]
```

```
ipv6-mac conflict [drop-only|log-and-drop|log-only]
```

```
ipv6-mac routing conflict [drop-only|log-and-drop|log-only]
```

Parameters

- `ipv6-mac conflict [drop-only|log-and-drop|log-only]`

| | |
|--|--|
| conflict | Enables detection of conflict between a device's IPv6 and MAC addresses. This option is enabled by default. This command also specifies the action to be performed when a such a conflict is detected. The options are: drop-only, log-and-drop, and log-only |
| drop-only | Drops a packet (with conflicting IPv6 and MAC address) without logging |
| log-and-drop | Logs the event and drops the packet. This is the default setting. |
| log-only | Logs the event only, the packet is not dropped |
| log-level | If selecting the "log-and-drop" and "log-only" action type, specify the log level. The options are: <ul style="list-style-type: none"> • <0-7> - Sets the numeric logging level • alerts - Numerical severity 1. Indicates a condition where immediate action is required • critical - Numerical severity 2. Indicates a critical condition • debugging - Numerical severity 7. Debugging messages • emergencies - Numerical severity 0. System is unusable • errors - Numerical severity 3. Indicates an error condition • informational - Numerical severity 6. Indicates a informational condition • notifications - Numerical severity 5. Indicates a normal but significant condition • warnings - Numerical severity 4. Indicates a warning condition. This is the default setting. |
| <ul style="list-style-type: none"> • <code>ipv6-mac routing conflict [drop-only log-and-drop log-only]</code> | |
| routing conflict | Enables detection of conflict between the next-hop's IPv6 and MAC addresses. This option is enabled by default. This command also specifies the action to be performed when a such a conflict is detected. The options are: drop-only, log-and-drop, and log-only |

| | |
|--------------|---|
| drop-only | Drops a packet (with conflicting next-hop IPv6 and MAC addresses) without logging |
| log-and-drop | Logs the event and drops the packet. This is the default setting. |
| log-only | Logs the event only, the packet is not dropped |
| log-level | <p>If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:</p> <ul style="list-style-type: none"> • <0-7> – Sets the numeric logging level • alerts – Numerical severity 1. Indicates a condition where immediate action is required • critical – Numerical severity 2. Indicates a critical condition • debugging – Numerical severity 7. Debugging messages • emergencies – Numerical severity 0. System is unusable • errors – Numerical severity 3. Indicates an error condition • informational – Numerical severity 6. Indicates a informational condition • notifications – Numerical severity 5. Indicates a normal but significant condition • warnings – Numerical severity 4. Indicates a warning condition. This is the default setting. |

Example

```

nx4500-5CFA2B(config-fw-policy-test)#ipv6-mac routing conflict drop-only

nx4500-5CFA2B(config-fw-policy-test)#show context
firewall-policy test
no ip dos tcp-sequence-past-window
ipv6 routing-type two log-and-drop log-level warnings
ipv6 dos hop-limit-zero drop-only
ipv6-mac routing conflict drop-only
nx4500-5CFA2B(config-fw-policy-test)#

```

13.1.12 logging

► *firewall-policy*

Configures enhanced firewall logging

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
logging [icmp-all|icmp-packet-drop|malformed-packet-drop|verbose]
logging icmp-all
logging verbose
logging [icmp-packet-drop|malformed-packet-drop] [all|rate-limited]
```

Parameters

- logging icmp-all

| | |
|----------|---|
| logging | Configures enhanced firewall logging parameters |
| icmp-all | Enables logging of all ICMPv4/v6 packets allowed by the firewall. This option is disabled by default. |

- logging verbose

| | |
|---------|--|
| logging | Configures enhanced firewall logging parameters. This option is disabled by default. |
| verbose | Enables verbose logging |

- logging [icmp-packet-drop|malformed-packet-drop] [all|rate-limited]

| | |
|-----------------------|---|
| logging | Configures enhanced firewall logging parameters |
| icmp-packet-drop | Drops ICMP (ICMPv4 and ICMPv6) packets that do not pass sanity checks. The default is none. |
| malformed-packet-drop | Drops raw IP (IPv4 and IPv6) packets that do not pass sanity checks. The default is none. |
| all | Logs all messages |
| rate-limited | Enables rate-limited logging. This option sets the rate limit for log messages to one message every 20 seconds. |

Example

```

rfs6000-37FABE(config-rw-policy-test)#logging verbose
rfs6000-37FABE(config-rw-policy-test)#logging icmp-packet-drop rate-limited
rfs6000-37FABE(config-rw-policy-test)#logging malformed-packet-drop all
rfs6000-37FABE(config-fw-policy-test)#show context

13.1.14 proxy-arp

▸ *firewall-policy*

Enables the generation of ARP responses on behalf of another device. Proxy ARP allows the Firewall to handle ARP routing requests for devices behind the firewall. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
proxy-arp
```

Parameters

None

Example

```
rfs6000-37FABE(config-fw-policy-test)#proxy-arp
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables the generation of ARP responses on behalf of another device |
|-----------|--|

13.1.15 proxy-nd

▸ *firewall-policy*

Enables generation of ND responses (for IPv6) on behalf of another device

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
proxy-nd
```

Parameters

None

Example

```
nx9500-6C8809(config-fw-policy-fw1)#proxy-nd
nx9500-6C8809(config-fw-policy-fw1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables the generation of ND responses on behalf of another device |
|-----------|---|

13.1.16 stateful-packet-inspection-12

► *firewall-policy*

Enables layer 2 firewall stateful packet inspection. When enabled, allows stateful packet inspection for RF Domain manager routed interfaces within the layer 2 firewall. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
stateful-packet-inspection-12
```

Parameters

None

Example

```
rfs6000-37FABE(config-fw-policy-test)#stateful-packet-inspection-12
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables stateful packet inspection in a layer 2 firewall |
|-----------|---|

13.1.17 storm-control

► *firewall-policy*

Enables storm control on the firewall policy

Storms are packet bombardments that exceed the high threshold value configured for an interface. During a storm, packets are throttled until the rate falls below the configured rate, severely impacting performance for the RF Domain manager interface.

Storm control limits multicast, unicast and broadcast frames accepted and forwarded by a device. Messages are logged based on their severity level.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
storm-control [arp|broadcast|multicast|unicast]
storm-control [arp|broadcast|multicast|unicast] [level|log]

storm-control [arp|broadcast|multicast|unicast] level <1-1000000> [fe <1-4>|ge <1-8>|port-channel <1-8>|up1|wlan <WLAN-NAME>]

storm-control [arp|broadcast|multicast|unicast] log [<0-7>|alerts|critical|debugging|emergencies|errors|informational|none|notifications|warnings]
```

Parameters

- storm-control [arp|broadcast|multicast|unicast] level <1-1000000> [fe <1-4>|ge <1-8>|port-channel <1-8>|up1|wlan <WLAN-NAME>]

| | |
|--------------------|---|
| arp | Configures storm control for ARP packets |
| broadcast | Configures storm control for broadcast packets |
| multicast | Configures storm control for multicast packets |
| unicast | Configures storm control for unicast packets |
| level <1-1000000> | Configures the allowed number of packets received per second before storm control begins <ul style="list-style-type: none"> • <1-1000000> - Sets the number of packets received per second |
| fe <1-4> | Sets the FastEthernet port for storm control from 1 - 4 |
| ge <1-8> | Sets the GigabitEthernet port for storm control from 1 - 8 |
| port-channel <1-8> | Sets the port channel for storm control from 1- 8 |
| up1 | Sets the uplink interface |
| wlan <WLAN-NAME> | Configures the WLAN <ul style="list-style-type: none"> • <WLAN-NAME> - Sets the WLAN ID for the storm control configuration |

- storm-control [arp|bcast|multicast|unicast] log [<0-7>|alerts|critical|debugging|emergencies|errors|informational|none|notifications|warnings]

| | |
|---------------|---|
| arp | Configures storm control for ARP packets |
| broadcast | Configures storm control for broadcast packets |
| multicast | Configures storm control for multicast packets |
| unicast | Configures storm control for unicast packets |
| log | Configures the storm control log level for storm control events |
| <0-7> | Sets the numeric logging level from 0 - 7 |
| alerts | Numerical severity 1. Indicates a condition where immediate action is required |
| critical | Numerical severity 2. Indicates a critical condition |
| debugging | Numerical severity 7. Debugging messages |
| emergencies | Numerical severity 0. System is unusable |
| errors | Numerical severity 3. Indicates an error condition |
| informational | Numerical severity 6. Indicates a informational condition |
| none | Disables storm control logging |
| notification | Numerical severity 5. Indicates a normal but significant condition |
| warnings | Numerical severity 4. Indicates a warning condition. This is the default setting. |

Example

```
rfs6000-37FABE(config-fw-policy-test)#storm-control arp log warning

rfs6000-37FABE(config-fw-policy-test)#storm-control broadcast level 20000 ge 4

rfs6000-37FABE(config-fw-policy-test)#show context
firewall-policy test
ip dos fraggle drop-only
no ip dos tcp-sequence-past-window
ip dos tcp-max-incomplete high 600
ip dos tcp-max-incomplete low 60
storm-control broadcast level 20000 ge 4
storm-control arp log warnings
ip-mac conflict drop-only
ip-mac routing conflict log-and-drop log-level notifications
flow timeout icmp 16000
flow timeout udp 10000
flow timeout tcp established 1500
flow timeout other 16000
dhcp-offer-convert
logging icmp-packet-drop rate-limited
logging malformed-packet-drop all
logging verbose
dns-snoop entry-timeout 35
rfs6000-37FABE(config-fw-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables storm control limits on multicast, unicast, and broadcast frames accepted and forwarded by a device |
|-----------|--|

13.1.18 virtual-defragmentation

▸ *firewall-policy*

Enables the virtual de-fragmentation of IPv4 and IPv6 packets. This parameter is required for optimal firewall functionality and is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
virtual-defragmentation {maximum-defragmentation-per-host <1-16384>|maximum-fragments-per-datagram <2-8129>|minimum-first-fragment-length <8-1500>|timeout <1-60>}
```

Parameters

```
• virtual-defragmentation {maximum-defragmentation-per-host <1-16384>|maximum-fragments-per-datagram <2-8129>|minimum-first-fragment-length <8-1500>|timeout <1-60>}
```

| | |
|--|---|
| maximum-defragmentation-per-host <1-16384> | Optional. Configures the maximum number of active defragmentations allowed per host before it is dropped (applicable to IPv4 and IPV6 packets) <ul style="list-style-type: none"> • <1-16384> - Sets a value from 1 - 16384. The default is 8. |
| maximum-fragments-per-datagram <2-8129> | Optional. Configures the maximum number of fragments allowed in a datagram before it is dropped (applicable to IPv4 and IPV6 packets) <ul style="list-style-type: none"> • <2-8129> - Sets a value from 2 - 8129. The default is 140. |
| minimum-first-fragment-length <8-1500> | Optional. Defines the minimum length required for the first fragment (applicable to IPv4 and IPV6 packets) <ul style="list-style-type: none"> • <8-1500> - Sets a value from 8 - 1500 bytes. The default is 8 bytes. |
| timeout <1-60> | Optional. Configures a virtual defragmentation timeout, in seconds, applicable to both IPv4 and IPV6 packets <ul style="list-style-type: none"> • <1-60> - Specify a value from 1 - 60 seconds. The default is 1 second. |

Example

```
rfs6000-37FABE (config-fw-policy-test) #virtual-defragmentation maximum-fragments-per-datagram 10
rfs6000-37FABE (config-fw-policy-test) #virtual-defragmentation minimum-first-fragment-length 100
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets values or disables virtual defragmentation settings |
|-----------|--|

14 MINT-POLICY

This chapter summarizes MiNT policy commands in the CLI command structure.

All communication using the MiNT transport layer can be optionally secured. This includes confidentiality, integrity and authentication of all communications. In addition, a device can be configured to communicate over MiNT with other devices authorized by an administrator.

Use the (config) instance to configure mint-policy related configuration commands. To navigate to the config MiNT policy instance, use the following command:

```
<DEVICE>(config)#mint-policy global-default

rfs6000-37FABE(config-mint-policy-global-default)#?
Mint Policy Mode commands:
  level      Mint routing level
  lsp        LSP
  mtu        Configure the global Mint MTU
  no         Negate a command or set its defaults
  router     Mint router
  udp        Configure mint UDP/IP encapsulation

  clrscr     Clears the display screen
  commit     Commit all changes made in this session
  do         Run commands from Exec mode
  end        End current mode and change to EXEC mode
  exit       End current mode and down to previous mode
  help       Description of the interactive help system
  revert     Revert changes
  service    Service Commands
  show       Show running system information
  write      Write running configuration to memory or terminal

rfs6000-37FABE(config-mint-policy-global-default)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

14.1 mint-policy

► MINT-POLICY

The following table summarizes MiNT policy configuration commands:

Table 14.1 *MiNT-Policy-Config Commands*

| Command | Description | Reference |
|---------------|---|------------------|
| <i>level</i> | Configures the MiNT routing level | <i>page 14-3</i> |
| <i>lsp</i> | Enables adding of checksum to LSP messages forwarded across MiNT links | <i>page 14-4</i> |
| <i>mtu</i> | Configures the global MiNT MTU | <i>page 14-5</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 14-8</i> |
| <i>router</i> | Configures the priority for MiNT router packets (HELLO, LSP, PSNP, and EXTVLAN) | <i>page 14-6</i> |
| <i>udp</i> | Configures the MiNT UDP/IP encapsulation parameters | <i>page 14-7</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

14.1.1 level

► *mint-policy*

Configures the global MiNT routing level

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
level 2 area-id <1-16777215>
```

Parameters

- `level 2 area-id <1-16777215>`

| | |
|-------------------------|---|
| level 2 | Configures level 2 inter-site MiNT routing |
| area-id <1-16777215> | Configures the routing area identifier <ul style="list-style-type: none"> • <1-16777215> - Specify a value from 1 - 16777215. <p>The level 2 area ID is the global MiNT area identifier. This area identifier separates two overlapping MiNT networks. Configure the level 2 area ID only if there are two MiNT networks sharing the same packet broadcast domain.</p> |

Example

```
rfs6000-37FABE(config-mint-policy-global-default)#level 2 area-id 2000

rfs6000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  level 2 area-id 2000
rfs6000-37FABE(config-mint-policy-global-default)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables level 2 MiNT packet routing (inter-site packet routing) |
|-----------|--|

14.1.2 lsp

► *mint-policy*

Enables adding of checksum to *label-switched path* (LSP) messages forwarded across MiNT links. When enabled, this option helps to verify integrity of LSP messages. LSP messages exchanged over MiNT links are often corrupted. These LSP corruptions cause inaccuracies in the *Shortest Path First* (SPF) calculation process, leading to access point adoption related issues. Enabling LSP checksum helps troubleshooting adoption-related issues.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
lsp checksum
```

Parameters

- `lsp checksum`

| | |
|--------------|---|
| lsp checksum | Enables adding of checksum to LSP messages forwarded across MiNT links. When enabled, the integrity of LSP messages is verified by matching the LSP message checksum at the MiNT link end nodes. In case of a match the message is uncorrupted. |
|--------------|---|

Example

```
nx4500-5CFA2B(config-mint-policy-global-default)#lsp checksum

nx4500-5CFA2B(config-mint-policy-global-default)#show context
mint-policy global-default
  lsp checksum
nx4500-5CFA2B(config-mint-policy-global-default)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables adding of checksum to LSP messages forwarded across MiNT links |
|-----------|---|

14.1.3 mtu

▸ *mint-policy*

Configures global MiNT *Multiple Transmission Unit* (MTU). Use this command to specify the maximum packet size, in bytes, for MiNT routing. Higher the MTU values, greater is the network efficiency. The user data per packet increases, while protocol overheads, such as headers or underlying per-packet delays remain the same.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mtu <900-1500>
```

Parameters

- mtu <900-1500>

| | |
|-------------------------------|---|
| <code><900-1500></code> | <p>Specifies the maximum packet size from 900 - 1500 bytes</p> <p>The maximum packet size specified is rounded down to a value using the following formula: 4 + a multiple of 8.</p> <p>The MTU setting specifies the maximum packet size used for MiNT packets. Larger packets are fragmented to fit within the specified packet size limit. You may want to configure this parameter if the MiNT backhaul network requires or recommends smaller packet sizes. The default value is 1500 bytes.</p> |
|-------------------------------|---|

Example

```
rfs6000-37FABE(config-mint-policy-global-default)#mtu 1000

rfs6000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  mtu 996
  level 2 area-id 2
rfs6000-37FABE(config-mint-policy-global-default)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | <p>Reverts the configured MiNT MTU value to its default (1500 bytes)</p> <p>Negates the configured maximum packet size for MiNT routing</p> |
|-----------|---|

14.1.4 router

► *mint-policy*

Configures the priority for MiNT router packets (HELLO, LSP, PSNP, and EXTVLAN)

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
router packet priority <0-7>
```

Parameters

- router packet priority <0-7>

| | |
|---------------------------------|--|
| router packet priority <0-7> | Allows you to configure the priority for MiNT router packets from 0 - 7. The default is 5. Higher the value higher is the priority. Therefore, seven (7) represents highest priority. |
|---------------------------------|--|

Example

```
rfs4000-229D58(config-mint-policy-global-default)#router packet priority 4

rfs4000-229D58(config-mint-policy-global-default)#show context
mint-policy global-default
  router packet priority 4
rfs4000-229D58(config-mint-policy-global-default)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Reverts the MiNT router packet priority to default (5) |
|-----------|--|

14.1.5 udp

► *mint-policy*

Configures MiNT UDP/IP encapsulation parameters. Use this command to configure the default UDP port used for MiNT control packet encapsulation.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
udp port <2-65534>
```

Parameters

- udp port <2-65534>

| | |
|----------------|---|
| port <2-65534> | Configures default UDP port used for MiNT control packet encapsulation <ul style="list-style-type: none"> • <2-65534> - Enter a value from 2 - 65534. This value specifies an alternate UDP port used by MiNT control packets and must be an even number. The specified port number plus 1 is used to carry MiNT data packets. The default value is 24576. |
|----------------|---|

Example

```
rfs6000-37FABE(config-mint-policy-global-default)#udp port 1024

rfs6000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  udp port 1024
  mtu 996
  level 2 area-id 2000
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs6000-37FABE(config-mint-policy-global-default)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Reverts MiNT UDP/IP encapsulation to its default |
|-----------|--|

14.1.6 no

► *mint-policy*

Negates a command or reverts values to their default. When used in the config MiNT policy mode, the `no` command resets or reverts the following global MiNT policy parameters: routing level, MTU, router packet priority, and UDP or IP encapsulation settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [level|lsp|mtu|router|udp]
no level 2 area-id
no lsp checksum
no mtu
no router packet priority
no udp port <LINE-SINK>
```

Parameters

- `no <PARAMETERS>`

| | |
|------------------------------------|--|
| <code>no <PARAMETERS></code> | The <code>no</code> command resets or reverts the following global MiNT policy parameters: routing level, MTU, router packet priority, and UDP or IP encapsulation settings. |
|------------------------------------|--|

Example

The following example shows the global Mint Policy parameters before the 'no' commands are executed:

```
rfs6000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  udp port 1024
  mtu 996
  level 2 area-id 2000
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs6000-37FABE(config-mint-policy-global-default)#
```

```
rfs6000-37FABE(config-mint-policy-global-default)#no level 2 area-id
rfs6000-37FABE(config-mint-policy-global-default)#no mtu
rfs6000-37FABE(config-mint-policy-global-default)#no udp port
```

The following example shows the global Mint Policy parameters after the 'no' commands are executed:

```
rfs6000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs6000-37FABE(config-mint-policy-global-default)#
```

15 MANAGEMENT-POLICY

This chapter summarizes management policy commands in the CLI command structure.

A management policy contains configuration elements for managing a device, such as access control, SNMP, admin user credentials, and roles.

A controller (wireless controller, access point, or service platform) uses mechanisms to allow or deny device access to separate interfaces and protocols (*HTTP, HTTPS, FTP, Telnet, SSH* or *SNMP*). Management access can be enabled or disabled as required for unique policies. The management access functionality is not meant to function as an ACL (in routers or other firewalls), where administrators specify and customize specific IPs to access specific interfaces.

Controllers and service platforms can be managed using multiple interfaces (SNMP, CLI and Web UI). By default, management access is unrestricted, allowing management access to any enabled IP interface from any host using any enabled management service.

To enhance security, administrators can do the following:

- Restrict SNMP, CLI and Web UI access to specific hosts or subnets.
- Disable un-used and insecure interfaces as required within managed access profiles. Disabling un-used management services can dramatically reduce an attack footprint and free resources on managed devices.
- Provide authentication for management users.
- Apply access restrictions and permissions to management users.

Management restrictions can be applied to meet specific policies or industry requirements requiring only certain devices or users be granted access to critical infrastructure devices. Management restrictions can also be applied to reduce the attack footprint of the device when guest services are deployed.

Access Points utilize a single management access policy, so ensure all the intended administrative roles, permissions, authentication and SNMP settings are correctly set. If an access point is functioning as a virtual controller AP, these are the access settings used by adopted access points of the same model as the virtual controller AP.

It is recommended to disable un-used and insecure interfaces as required within managed access profiles. Disabling un-used management services can dramatically reduce an attack footprint and free resources on managed devices.

Use the (config) instance to configure a management policy. To navigate to the config management policy instance, use the following commands:

```
<DEVICE>(config)#management-policy <POLICY-NAME>
```

To commit a management-policy, the policy must have at least one admin user account configured.

```

<DEVICE>(config-management-policy-<POLICY-NAME>)#user admin password 0 test role
superuser access all
<DEVICE>(config-management-policy-<POLICY-NAME>)#

<DEVICE>(config-management-policy-<POLICY-NAME>)#?
Management Mode commands:
  aaa-login          Set authentication for logins
  allowed-locations  Add allowed locations
  banner             Define a login banner
  ftp               Enable FTP server
  http              Hyper Text Terminal Protocol (HTTP)
  https             Secure HTTP
  idle-session-timeout Configure idle timeout for a configuration session
                    (GUI or CLI)
  ipv6              IPv6 Protocol
  no                Negate a command or set its defaults
  passwd-retry      Lockout user if too many consecutive login failures
  privilege-mode-password Set the password for entering CLI privilege mode
  rest-server       Enable rest server for device on-boarding
                    functionality
  restrict-access   Restrict management access to the device
  snmp-server       SNMP
  ssh              Enable ssh
  t5               T5 configuration
  telnet           Enable telnet
  user             Add a user account

  clrscr           Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end            End current mode and change to EXEC mode
  exit          End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service     Service Commands
  show        Show running system information
  write       Write running configuration to memory or terminal

<DEVICE>(config-management-policy-<POLICY-NAME>)#

```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

15.1 management-policy

► MANAGEMENT-POLICY

The following table summarizes management policy configuration commands:

Table 15.1 *Management-Policy-Config Commands*

| Command | Description | Reference |
|--------------------------------|--|-------------------|
| <i>aaa-login</i> | Configures login authentication settings | <i>page 15-5</i> |
| <i>allowed-locations</i> | Configures a user-role based access control to RF Domains and locations with respect to the NSight <i>user interface</i> (UI) | <i>page 15-7</i> |
| <i>banner</i> | Configures the <i>message of the day</i> (motd) text | <i>page 15-9</i> |
| <i>ftp</i> | Enables FTP on this management policy | <i>page 15-10</i> |
| <i>http</i> | Enables HTTP on this management policy | <i>page 15-12</i> |
| <i>https</i> | Enables HTTPS on this management policy | <i>page 15-13</i> |
| <i>idle-session-timeout</i> | Sets the interval after which an idle session is terminated | <i>page 15-15</i> |
| <i>ipv6</i> | Restricts management access to specified hosts and/or subnets based on their IPv6 addresses and prefixes respectively | <i>page 15-16</i> |
| <i>no</i> | Removes or resets this management policy's settings | <i>page 15-18</i> |
| <i>passwd-entry</i> | Configures user-account lockout and unlock parameters | <i>page 15-20</i> |
| <i>privilege-mode-password</i> | Configures the CLI's privilege mode access password | <i>page 15-22</i> |
| <i>rest-server</i> | Enables the <i>Representational State Transfer</i> (REST) server to facilitate device on-boarding | <i>page 15-24</i> |
| <i>restrict-access</i> | Restricts management access to a set of hosts or subnets | <i>page 15-25</i> |
| <i>snmp-server</i> | Sets the SNMP server settings on this management policy | <i>page 15-28</i> |
| <i>ssh</i> | Enables SSH on this management policy | <i>page 15-33</i> |
| <i>t5</i> | Configures SNMP server settings for T5 devices on this management policy. This command is available only RFS4000, RFS6000, and NX95XX platforms. | <i>page 15-34</i> |
| <i>telnet</i> | Enables Telnet on this management policy | <i>page 15-36</i> |
| <i>user</i> | Creates a new user account | <i>page 15-37</i> |
| <i>service</i> | Invokes service commands to troubleshoot or debug (<code>config-if</code>) instance configurations | <i>page 15-41</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see [COMMON COMMANDS](#).

15.1.1 aaa-login

► *management-policy*

Configures *Authentication, Authorization and Accounting* (AAA) authentication mode used with this management policy. The different modes are: local authentication and external RADIUS server authentication.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
aaa-login [local|radius|tacacs]
```

```
aaa-login local
```

```
aaa-login radius [external|fallback|policy]
```

```
aaa-login radius [external|fallback|policy <AAA-POLICY-NAME>]
```

```
aaa-login tacacs [accounting|authentication|authorization|fallback|policy]
```

```
aaa-login tacacs [accounting|authentication|authorization|fallback|policy <AAA-TACACS-POLICY-NAME>]
```

Parameters

- `aaa-login local`

| | |
|--|--|
| local | Sets local as the preferred authentication mode. Local authentication uses the local username database to authenticate a user. Note: The AP6511 and AP6521 platforms do not support local RADIUS resource. |
| <ul style="list-style-type: none"> • <code>aaa-login radius [external fallback policy <AAA-POLICY-NAME>]</code> | |
| radius | Configures the RADIUS server parameters Note: If local authentication is disabled, use this command to specify if the RADIUS server used is external, fallback, or specified by a AAA policy. |
| external | Configures external RADIUS server as the preferred authentication mode |
| fallback | Configures RADIUS server authentication as the primary authentication mode When RADIUS server authentication fails, the system uses local authentication. This command configures local authentication as a backup mode. |
| policy <AAA-POLICY-NAME> | Associates a specified AAA policy with this management policy. The AAA policy determines if a client is granted access to the network. <ul style="list-style-type: none"> • <AAA-POLICY-NAME> - Specify the AAA policy name (should be existing and configured). Note: For more information on configuring AAA policy, see AAA-POLICY . |

- `aaa-login tacacs [accounting|authentication|authorization|fallback|policy <AAA-TACACS-POLICY-NAME>]`

| | |
|------------------------------------|---|
| tacacs | Configures <i>Terminal Access Control Access-Control System</i> (TACACS) server parameters |
| accounting | Configures TACACS accounting |
| authentication | Configures TACACS authentication |
| authorization | Configures TACACS authorization |
| fallback | Configures TACACS as the primary authentication mode. When TACACS authentication fails, the system uses local authentication. This command configures local authentication as a backup mode. |
| policy <AAA-TACACS-POLICY-NAME> | <p>Associates a specified AAA TACACS policy with this management policy. TACACS policies control user access to devices and network resources while providing separate accounting, authentication, and authorization services.</p> <ul style="list-style-type: none"> • <AAA-TACACS-POLICY-NAME> - Specify the TACACS policy name (should be existing and configured). <p>Note: For more information on configuring AAA TACACS policy, see AAA-TACACS-POLICY.</p> |

Usage Guidelines

Use AAA login to determine whether management user authentication must be performed against a local user database or an external RADIUS server.

Example

```
rfs6000-37FABE (config-management-policy-test)#aaa-login radius external
rfs6000-37FABE (config-management-policy-test)#aaa-login radius policy test
rfs6000-37FABE (config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  aaa-login radius external
  aaa-login radius policy test
rfs6000-37FABE (config-management-policy-test)#
```

Related Commands

| | |
|-----------|------------------------------------|
| <i>no</i> | Removes the TACACS server settings |
|-----------|------------------------------------|

15.1.2 allowed-locations

► *management-policy*

Configures a user-role based access control to RF Domains and locations with respect to the NSight *user interface* (UI). When configured, this access control is enforced only on the NSight UI. The WiNG and NSight applications may have the same users with different permissions defined in each application. Various user roles are supported in WiNG (superuser, system-admin, network-admin, security-admin, device-provisioning-admin, helpdesk and monitor). With NSight, a user logging into the NSight UI should also have an access control restriction based on the role they're assigned. For example, a WiNG user with helpdesk privileges should have access to only the site (RF Domain) in which the helpdesk is situated, and the location tree should contain only one RF Domain. Similarly, when a user responsible for a set of sites logs in NSight, their location tree needs to contain the RF Domains for which they're responsible.

NOTE: For more information on NSight-policy configuration, see *nsight-policy*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
allowed-locations <WORD> locations [NONE|ALL|<LIST-OF-LOCATIONS>]
```

Parameters

- allowed-locations <WORD> locations [NONE|ALL|<LIST-OF-LOCATIONS>]

| | |
|--|--|
| allowed-locations <WORD> | Configures a location tag and associates a list locations with the tag <WORD> - Provide a location tag not exceeding 32 characters in length. |
| locations [NONE ALL <LIST-OF-LOCATIONS>] | Associates locations with the above created location tag <ul style="list-style-type: none"> • NONE - When specified, states that none of the locations are to be allowed access. • ALL - When specified, states that all the locations are to be allowed access. • <LIST-OF-LOCATIONS> - Specifies a list of locations or individual RF Domains. When specified, states that the specified list of locations or RF Domain are allowed access. |

Example

```
nx9500-6C8809(config-management-policy-test)#allowed-locations Ecospace locations
TechPubs ALL

nx9500-6C8809(config-management-policy-test)#allowed-locations TEST locations
NONE

nx9500-6C8809(config-management-policy-test)#show context
management-policy test
  no telnet
  no http server
  https server
  ssh
  allowed-location TEST locations NONE
  allowed-location Ecospace locations TechPubs ALL
nx9500-6C8809(config-management-policy-test)##
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the allowed-locations configuration |
|-----------|---|

15.1.3 banner

► *management-policy*

Configures the *message of the day* (motd) text. This text is displayed at login to clients connecting through Telnet or SSH.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
banner motd <LINE>
```

Parameters

- banner motd <LINE>

| | |
|-------------|--|
| motd <LINE> | Sets the motd banner <ul style="list-style-type: none"> • <LINE> - Enter the message string. The message string should not exceed 255 characters. |
|-------------|--|

Example

```
rfs6000-37FABE(config-management-policy-test)#banner motd "Have a Good Day"

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs6000-37FABE(config-management-policy-test)#
```

Related Commands

| | |
|-----------|-------------------------|
| <i>no</i> | Removes the motd banner |
|-----------|-------------------------|

15.1.4 ftp

► *management-policy*

Enables *File Transfer Protocol* (FTP) on this management policy. FTP is the standard protocol for transferring files over a TCP/IP network. FTP requires administrators enter a valid username and password authenticated locally. FTP access is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ftp {password|rootdir|username}
```

```
ftp {password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]}
```

```
ftp {rootdir <DIR>}
```

```
ftp {username <USERNAME> password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>] rootdir <DIR>}
```

Parameters

- ftp {password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]}

| | |
|------------------------|--|
| ftp password | Optional. Configures the FTP server password |
| 1 <ENCRYPTED-PASSWORD> | Configures an encrypted password. Use this option when copy pasting the password from another device. <ul style="list-style-type: none"> • <ENCRYPTED-PASSWORD> - Specify the password. The password should not exceed 63 characters in length. |
| <PASSWORD> | Configures a clear text password |

- ftp {rootdir <DIR>}

| | |
|-------------------|---|
| ftp rootdir <DIR> | Optional. Configures the root directory for FTP logins <ul style="list-style-type: none"> • <DIR> - Specify the root directory path. By default the root directory is set to flash:/ |
|-------------------|---|

- ftp {username <USERNAME> password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>] rootdir <DIR>}

| | |
|-------------------------|---|
| ftp username <USERNAME> | Optional. Configures a new user account on the FTP server. The FTP user file lists users with FTP server access. <ul style="list-style-type: none"> • <USERNAME> - Specify the username. The username should not exceed 32 characters in length. |
|-------------------------|---|

| | |
|---|---|
| password 1 [<ENCRYPTED-PASSWORD> <PASSWORD>] | Configures an encrypted password <ul style="list-style-type: none"> • <ENCRYPTED-PASSWORD> - Specifies an encrypted password (use this option if copy pasting from another device). The password should not exceed 63 characters in length. • <PASSWORD> - Configures a clear text password |
| rootdir <DIR> | After specifying the password, configure the FTP root directory. <ul style="list-style-type: none"> • rootdir <DIR> - Configures the root directory for FTP logins. Specify the root directory path. |

Usage Guidelines

The string size of an encrypted password (option 1, password is encrypted with a SHA1 algorithm) must be exactly 40 characters.

Example

```
rfs6000-37FABE(config-management-policy-test)#ftp username superuser password
test@123 rootdir dir

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
    ftp username superuser password 1
    f617ca50c59fb47028f96db4baab5f3d8f03c03ab259960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs6000-37FABE(config-management-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables FTP and its settings, such as the server password, root directory, and users |
|-----------|---|

15.1.5 http

► *management-policy*

Enables *Hyper Text Transport Protocol* (HTTP) on this management policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
http server
```

Parameters

- http server

| | |
|-------------|---|
| http server | Enables HTTP on this management policy. HTTP provides limited authentication and no encryption. |
|-------------|---|

Example

```
rfs6000-37FABE(config-management-policy-test)#http server

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  ftp username superuser password 1
  f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs6000-37FABE(config-management-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables HTTP on this management policy |
|-----------|---|

15.1.6 https

► *management-policy*

Enables *Hyper Text Transport Protocol Secure* (HTTPS) on this management policy

NOTE: If the a RADIUS server is not reachable, HTTPS management access to the controller or access point may be denied. RADIUS support is available locally on controllers and access points, with the exception of AP6511 and AP6522 models, which require an external RADIUS resource.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
https [server|sslv3|use-secure-ciphers-only]
```

Parameters

- https [server|sslv3|use-secure-ciphers-only]

| | |
|-------------------------|--|
| https | Configures secure HTTP related parameters on this management policy |
| server | Enables HTTPS on this management policy. HTTPS provides both authentication and data encryption as opposed to just authentication. This option is enabled by default. |
| sslv3 | Enables the use of SSLv3 protocol to connect to a Web page. When enabled, SSLv2 Web authentication is disabled, and enforces the use of Web browsers supporting SSLv3, which is a more secure protocol. This option is disabled by default. |
| use-secure-ciphers-only | Enables the use of TLS v1.2 ciphers to secure client-server network communications. When enabled, for HTTPS connections the TLS v1.2 protocol is used, instead of the less secure TLS v1.0 or TLS v1.1 protocols. This option is enabled by default. |

Example

```
rfs6000-37FABE (config-management-policy-test)#https server

rfs6000-37FABE (config-management-policy-test)#show context
management-policy test
  http server
  https server
  ftp username superuser password 1
  f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs6000-37FABE (config-management-policy-test)#
```

The following example shows that the 'use-secure-ciphers-only' option is enabled by default:

```
rfs6000-817379(config-management-policy-default)#show context include-factory |
incl https
https server
no https sslv3
https use-secure-ciphers-only
rfs6000-817379(config-management-policy-default)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables HTTPS on this management policy |
|-----------|--|

15.1.7 idle-session-timeout

► *management-policy*

Configures a session's idle timeout. An idle session is automatically terminated after the specified interval is exceeded.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
idle-session-timeout <1-4320>
```

Parameters

- `idle-session-timeout <1-4320>`

| | |
|-----------------------------|--|
| <code><1-4320></code> | Sets the interval, in minutes, after which an idle session is timed out. Specify a value from 1 - 4320 minutes. The default is 30 minutes. |
|-----------------------------|--|

Example

```
rfs6000-37FABE(config-management-policy-test)#idle-session-timeout 100

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  https server
  ftp username superuser password 1
f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
no ssh
aaa-login radius external
aaa-login radius policy test
idle-session-timeout 100
banner motd "Have a Good Day"
rfs6000-37FABE(config-management-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the configured idle session timeout value |
|-----------|---|

15.1.8 ipv6

► *management-policy*

Restricts management access to specified hosts and/or subnets based on their IPv6 addresses and prefixes respectively

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```

ipv6 restrict-access [host|ipv6-access-list|subnet]

ipv6 restrict-access host <IPv6> {log|subnet}
ipv6 restrict-access host <IPv6> {log [all|denied-only]}
ipv6 restrict-access host <IPv6> {subnet <IPv6-PREFIX> {log [all|denied-only]}}

ipv6 restrict-access ipv6-access-list <IPv6-ACCESS-LIST-NAME>

ipv6 restrict-access subnet <IPv6-PREFIX> {host|log}
ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}
ipv6 restrict-access subnet <IPv6-PREFIX> {host <IPv6> {log [all|denied-only]}}
```

Parameters

- `ipv6 restrict-access host <IPv6> {log [all|denied-only]}`

| | |
|-----------------------|--|
| host <IPv6> | Restricts management access to a specified host, based on the host's IPv6 address <ul style="list-style-type: none"> • <IPv6> - Specify the host's IPv6 address. |
| log [all denied-only] | Optional. Configures a logging policy for access requests <ul style="list-style-type: none"> • all - Logs all access requests, both denied and permitted • denied-only - Logs only denied access events (when a host is denied access) |

- `ipv6 restrict-access host <IPv6> {subnet <IPv6-PREFIX> {log [all|denied-only]}}`

| | |
|-----------------------|---|
| host <IPv6> | Restricts management access to a specified host, based on the host's IPv6 address. <ul style="list-style-type: none"> • <IPv6> - Specify the host's IPv6 address. |
| subnet <IPv6-PREFIX> | Optional. Restricts access to the host on a specified IPv6 subnet <ul style="list-style-type: none"> • <IPv6-PREFIX> - Specify the subnet's IPv6 prefix in the X::X::X/M format. |
| log [all denied-only] | Optional. Configures a logging policy for access requests <ul style="list-style-type: none"> • all - Logs all access requests, both denied and permitted • denied-only - Logs only denied access events (when a host/subnet is denied access) |

- `ipv6 restrict-access ipv6-access-list <IPv6-ACCESS-LIST-NAME>`

| | |
|---|--|
| ipv6-access-list <IPv6-ACCESS-LIST-NAME> | Uses an IPv6 <i>Access Control List</i> (ACL) to filter access requests. IPv6 ACLs filter/mark packets based on the IPv6 address from which they arrive. IPv6 hosts configure themselves automatically when connected to an IPv6 network using the <i>neighbor discovery</i> (ND) protocol via ICMPv6 router discovery messages. These hosts require firewall packet protection unique to IPv6 traffic, as IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. An existing IPv6 ACL can be created and used in the management policy context to permit or deny access to specific hosts and/or subnets. <ul style="list-style-type: none"> • <IPv6-ACCESS-LIST-NAME> - Specify the IPv6 ACL name. |
|---|--|

- `ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}`

| | |
|-------------------------|---|
| subnet <IPv6-PREFIX> | Restricts management access to a specified IPv6 subnet <ul style="list-style-type: none"> • <IPv6-PREFIX> - Specify the subnet's IPv6 prefix in the X:X::X:X/M format. |
| log [all denied-only] | Optional. Configures a logging policy for access requests <ul style="list-style-type: none"> • all - Logs all access requests, both denied and permitted • denied-only - Logs only denied access events (when a host/subnet is denied access) |

- `ipv6 restrict-access subnet <IPv6-PREFIX> {host <IPv6> {log [all|denied-only]}}`

| | |
|-------------------------|---|
| subnet <IPv6-PREFIX> | Restricts management access to a specified IPv6 subnet <ul style="list-style-type: none"> • <IPv6-PREFIX> - Specify the subnet's IPv6 prefix in the X:X::X:X/M format. |
| host <IPv6> | Optional. Restricts management access to a specific host within the specified subnet <ul style="list-style-type: none"> • <IPv6> - Specify the host's IPv6 address. |
| log [all denied-only] | Optional. Configures a logging policy for access requests <ul style="list-style-type: none"> • all - Logs all access requests, both denied and permitted • denied-only - Logs only denied access events (when a host/subnet is denied access) |

Example

```
rfs6000-37FABE(config-management-policy-test)#ipv6 restrict-access host
2001:fdbc:06cf:0011::13 subnet 2001:fdbc:06cf:0011::0/64 log all

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  ipv6 restrict-access host 2001:fdbc:06cf:0011::13 subnet 2001:fdbc:06cf:0011::0/
64 log all
rfs6000-37FABE(config-management-policy-test)#
```

|-----------|--|

15.1.9 no

► *management-policy*

Negates a command or reverts values to their default. When used in the config management policy mode, the `no` command negates or reverts management policy settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [aaa-login|allowed-locations|banner|ftp|http|https|idle-session-timeout|ipv6|
passwd-entry|privilege-mode-password|rest-server|restrict-access|snmp-server|
ssh|t5|telnet|user|service]

no aaa-login tacacs [accounting|authentication|authorization|fallback|policy]

no allowed-location <LOCATION-TAG>

no banner motd

no ftp {password|rootdir}

no http server

no https [server|sslv3|use-secure-ciphers-only]

no passwd-entry role [device-provisioning-admin|helpdesk|monitor|network-admin|

no ssh
aaa-login radius external
aaa-login radius policy test
idle-session-timeout 0
rfs6000-37FABE(config-management-policy-test)#
```

15.1.10 passwd-entry

► *management-policy*

Configures user-account lockout and unlock parameters. Use this option to configure the maximum number of consecutive, failed login attempts allowed before an account is locked out, and the duration of lockout.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
passwd-entry role [device-provisioning-admin|helpdesk|monitor|network-admin|
security-admin|superuser|system-admin|vendor-admin|web-user-admin] max-fail <1-
100> lockout-time <<0-600>
```

Parameters

```
• passwd-entry role [device-provisioning-admin|helpdesk|monitor|network-admin|
security-admin|superuser|system-admin|vendor-admin|web-user-admin] max-fail <1-
100> lockout-time <0-600>
```

| | |
|--|--|
| <pre>passwd-entry role [device-provisioning- admin helpdesk monitor network-admin security-admin superuser system- admin vendor-admin web-user-admin] max- fail <1-100> lockout-time <<0- 600></pre> | <p>Configures user-role based account lockout criteria</p> <ul style="list-style-type: none"> • role – Select the user-role. The options are: <ul style="list-style-type: none"> • device-provisioning-admin • helpdesk • monitor • network-admin • security-admin • system-admin • vendor-admin • web-user-admin] • max-fail <1-100> – Specify the maximum number of consecutive, failed attempts allowed before an account is locked. Specify a value from 1 - 100. • lockout-time <<0-600> – Specify the maximum time, in minutes, for which an account remains locked. The value '0' indicates that the account is permanently locked. Specify a value from 0 - 600 minutes. <p>When configured, the lockout is individually applied to each account within the specified role/roles. For example, consider the 'monitor' role having two users: 'user1' and 'user2'. The <i>max-fail</i> and <i>lockout-time</i> is set at '5' attempts and '10' minutes respectively. In this scenario, user2 makes 5 consecutive, failed login attempts, and the user2 account is locked out for 10 minutes. However, during this lockout time the user1 account remains active.</p> <p>Note: Note, in the event-system-policy context, enable 'login-lockout' and 'login-unlocked' event notification to trigger e-mail or syslog notification to users on occurrence of the <i>login-lockout</i> and <i>login-unlock</i> events. For more information, see event.</p> |
|--|--|

Example

```

rfs6000-817379(config-management-policy-default)#passwd-retry role monitor max-
fail 5 lockout-time 10

|-----------|--|

15.1.11 privilege-mode-password

► *management-policy*

Configures the CLI's privilege mode access password. Use this option to strengthen security by enforcing a second level authentication to access the privilege configuration mode.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
privilege-mode-password <PASSWORD/HASHED-STRING-ALIAS-NAME>
```

Parameters

- `privilege-mode-password <PASSWORD/HASHED-STRING-ALIAS-NAME>`

| | |
|---|---|
| <pre>privilege-mode- password <PASSWORD/ HASHED-STRING- ALIAS-NAME></pre> | <p>Configures the password required to enter the privilege configuration mode. When configured, users are prompted to provide the password when enabling the privilege configuration mode.</p> <ul style="list-style-type: none"> • <code><PASSWORD/HASHED-STRING-ALIAS-NAME></code> – Enter the password as a clear text, or provide a hashed-string alias. Enter the password as a clear text, or provide a hashed-string alias. If using a hashed-string alias, ensure that the alias is existing and configured. <p>Note, the clear text password is saved and displayed as a hashed string. Hashing is a means of establishing the integrity of transmitted messages. Before transmission, a hash of the message is generated, encrypted and sent along with the message. At the receiving end, the message and the hash are both decrypted, and another hash is generated from the received message. The two hashes are compared. If both are identical the message is considered to have been transmitted intact.</p> <p>Note: For more information on configuring a hashed-string alias, see alias.</p> |
|---|---|

Example

The following example shows the privilege mode password being configured as a hashed string:

```
rfs6000-37FABE(config-management-policy-test)#privilege-mode-password 1
2e9f038ac2ed27f919ed5a4dceb3d30e32f356f2ceff6fbf26a153d0339c734f

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  privilege-mode-password 1
  2e9f038ac2ed27f919ed5a4dceb3d30e32f356f2ceff6fbf26a153d0339c734f
rfs6000-37FABE(config-management-policy-test)#
```

Follow the steps below to configure a hashed-string alias and use it as a privilege mode password:

- 1 In the global-configuration context, create a hashed-string alias.

```
nx9500-6C8809(config)#alias hashed-string $PriMode Test12345

nx9500-6C8809(config)#show context | include alias
alias vlan $BLR-01 1
alias string $IN-Blr-EcoSpace-Floor-4 IBEF4
alias encrypted-string $READ 0 public
alias encrypted-string $WRITE 0 private
alias hashed-string $PriMode 1
faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112ecfc75
nx9500-6C8809(config)#
```

- 2 In the management-policy context, configure the hashed-string alias created in step 1 as the privilege mode password.

```
nx9500-6C8809(config-management-policy-test)#privilege-mode-password $PrivMode

nx9500-6C8809(config-management-policy-default)#show context
management-policy default
https server
rest-server
ssh
user admin password 1

superuser access all
snmp-server community 0 $WRITE rw
snmp-server community 0 $READ ro
snmp-server user snmptrap v3 encrypted des auth md5 2 yqr96yyVzmD4ZbU2I7Eh/
QAAAAjWNKa4KXF95pruUCSnhOiT
snmp-server user snmpmanager v3 encrypted des auth md5 2 NOF8+2+AY2r4ZbU2I7Eh/
QAAAAgc0l8ahJYo3AjHo9wXzYGo
t5 snmp-server community public ro 192.168.0.1
t5 snmp-server community private rw 192.168.0.1
privilege-mode-password $PriMode
nx9500-6C8809(config-management-policy-default)#
```

- 3 Confirm, if the privilege mode is password protected.

```
nx9500-6C8809 login: admin
Password:
Feb 07 14:40:47 2017: %AUTH-6-INFO: login[28768]: user 'admin' on 'ttyS0' from
'Console' logged in
Feb 07 14:40:47 2017: nx9500-6C8809 : %SYSTEM-5-LOGIN: Successfully logged in
user 'admin' with privilege 'superuser' from 'ttyS0'
nx9500-6C8809>en

15.1.12 rest-server

► *management-policy*

Enables the *Representational State Transfer* (REST) server. When enabled, the REST server allows vendor users access to the online device registration portal. All requests and responses to and from the on-boarding portal are handled by the REST server through restful *Application Programming Interface* (API) transactions. The REST server serves the Web pages used to associate a device's MAC address with a specific vendor group.

Each vendor has a 'vendor-admin' user who is assigned a unique, username/password credential for RADIUS server validation. Successfully validated vendor-admins can access the online device registration portal to on-board devices. For more information on vendor-admin user configuration, see *user*.

The REST server is enabled by default.

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
rest-server
```

Parameters

None

Example

```
nx9500-6C8809(config-management-policy-testMNGTPolicy)#show context
management-policy testMNGTPolicy
no telnet
no http server
https server
rest-server
ssh
nx9500-6C8809(config-management-policy-testMNGTPolicy)#
```

```
nx9500-6C8809(config-management-policy-testMNTPolicy)#no rest-server
```

```
nx9500-6C8809(config-management-policy-testMNGTPolicy)#show context
management-policy testMNGTPolicy
no telnet
no http server
https server
no rest-server
ssh
nx9500-6C8809(config-management-policy-testMNGTPolicy)#
```

15.1.13 restrict-access

► *management-policy*

Restricts management access to a set of hosts or subnets

Restricting remote access to a controller or service platform ensures only trusted hosts can communicate with enabled management services. This ensures only trusted hosts can perform management tasks and provide protection from brute force attacks from hosts attempting to break into the controller or service platform managed network.

Administrators can permit management connections to be established on any IP interface on the controller or service platform (including IP interfaces used to provide captive portal guest access). Administrators can restrict management access by limiting access to a specific host (IP address), subnet, or ACL on the controller or service platform.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
restrict-access [host|ip-access-list|subnet]

restrict-access host <IP> {log|subnet}
restrict-access host <IP> {log [all|denied-only]}
restrict-access host <IP> {subnet <IP/M> {log [all|denied-only]}}

restrict-access ip-access-list <IP-ACCESS-LIST-NAME>

restrict-access subnet <IP/M> {host|log}
restrict-access subnet <IP/M> {log [all|denied-only]}
restrict-access subnet <IP/M> {host <IP> {log [all|denied-only]}}
```

Parameters

- `restrict-access host <IP> {log [all|denied-only]}`

| | |
|-----------------------|---|
| host <IP> | Restricts management access to a specified host, based on the host's IPv4 address <ul style="list-style-type: none"> • <IP> - Specify the host's IPv4 address. |
| log [all denied-only] | Optional. Configures a logging policy for access requests <ul style="list-style-type: none"> • all - Logs all access requests, both denied and permitted • denied-only - Logs only denied access (when an access request is received from a host denied access, a record is logged) |

- `restrict-access host <IP> {subnet <IP/M> {log [all|denied-only]}}`

| | |
|---------------|---|
| host <IP> | Restricts management access to a specified host, based on the host's IPv4 address <ul style="list-style-type: none"> • <IP> - Specify the host's IPv4 address. |
| subnet <IP/M> | Optional. Restricts access to the host on a specified subnet <ul style="list-style-type: none"> • <IP/M> - Specify the subnet's IPv4 address and mask in the A.B.C.D/M format. |

| | |
|--|---|
| log [all denied-only] | Optional. Configures a logging policy for access requests. <ul style="list-style-type: none"> all – Logs all access requests, both denied and permitted denied-only – Logs only denied access events (when access request received from a host is denied) |
| <pre>• restrict-access ip-access-list <IP-ACCESS-LIST-NAME></pre> | |
| ip-access-list | Uses an IPv4 ACL to filter access requests IPv4 ACLs filter/mark packets based on the IPv4 address from which they arrive. IP and non-IP traffic, on the same layer 2 interface, can be filtered by applying an IPv4 ACL. Each IPv4 ACL contains a set of deny and/or permit rules. Each rule is specific to source and destination IPv4 addresses and the unique rules and precedence definitions assigned. When the network traffic matches the criteria specified in one of these rules, the action defined in that rule is used to determine whether the traffic is allowed or denied. |
| <IP-ACCESS-LIST-NAME> | Specify the IPv4 ACL name. |
| <pre>• restrict-access subnet <IP/M> {log [all denied-only]}</pre> | |
| subnet <IP/M> | Restricts management access to a specified subnet <ul style="list-style-type: none"> <IP/M> – Specify the subnet's IPv4 address and mask in the A.B.C.D/M format. |
| log [all denied-only] | Optional. Configures a logging policy for access requests. Sets the log type generated for access requests <ul style="list-style-type: none"> all – Logs all access requests, both denied and permitted denied-only – Logs only denied access events (when access request received from a subnet is denied) |
| <pre>• restrict-access subnet <IP/M> {host <IP> {log [all denied-only]}}</pre> | |
| subnet <IP/M> | Restricts management access to a specified subnet <ul style="list-style-type: none"> <IP/M> – Specify the subnet's IPv4 address and mask in the A.B.C.D/M format |
| host <IP> | Optional. Uses the host IP address as a second filter <ul style="list-style-type: none"> <IP> – Specify the host's IPv4 address. |
| log [all denied-only] | Optional. Configures a logging policy for access requests. Sets the log type generated for access requests <ul style="list-style-type: none"> all – Logs all access requests, both denied and permitted denied-only – Logs only denied access events (when access request received from a host within the specified subnet is denied) |

Example

```

rfs6000-37FABE(config-management-policy-test)#restrict-access host 172.16.10.4
log denied-only

rfs6000-37FABE(config-management-policy-test)#show context
management-policy test
  no http server
  https server
  ftp username superuser password 1
  f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir

15.1.14 snmp-server

► *management-policy*

Configures the *Simple Network Management Protocol* (SNMP) engine settings. SNMP is an application layer protocol that facilitates the exchange of management information between the controller and a managed device. SNMP enabled devices listen on port 162 (by default) for SNMP packets from the controller's management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string gathers statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system's performance and other parameters.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
snmp-server [community|enable|display-vlan-info-per-radio|host|manager|max-
pending-requests|request-timeout|suppress-security-configuration-level|
throttle|user]

snmp-server community [0 <WORD>|2 <WORD>|<WORD>] [ro|rw] {ip-snmp-access-list <IP-
SNMP-ACL-NAME>}

snmp-server enable traps

```

Parameters

- `snmp-server community [0 <WORD>|2 <WORD>|<WORD>] [ro|rw] {ip-snmp-access-list <IP-SNMP-ACL-NAME>}`

| | |
|--|---|
| community [0 <WORD> 2 <WORD> <WORD>] | Sets the community string and associated access privileges. Define a public or private community designation. By default, SNMPv2 community strings on most devices are set to <i>public</i> for the <i>read-only</i> community string, and <i>private</i> for the <i>read-write</i> community string. <ul style="list-style-type: none"> • 0 <WORD> – Sets a clear text SNMP community string • 2 <WORD> – Sets an encrypted SNMP community string • <WORD> – Sets the SNMP community string |
| [ro rw] | After configuring the SNMP community string, set the access permission for each community string used by devices to retrieve or modify information. Available options include <ul style="list-style-type: none"> • ro – Assigns read-only access to the specified SNMP community (allows a remote device to retrieve information) • rw – Assigns read and write access to the specified SNMP community (allows a remote device to modify settings) |
| ip-snmp-access-list <IP-SNMP-ACL- NAME> | Optional. Associates an IP SNMP access list (should be existing and configured). The IP SNMP ACL sets the SNMP management station's IP address. SNMP trap information is received at this address. |
| <ul style="list-style-type: none"> • <code>snmp-server enable traps</code> | |
| enable traps | Enables trap generation (using the trap receiver configuration defined). This feature is disabled by default. Enabling this feature ensures the dispatch of SNMP notifications to all hosts. In a managed network, the controller uses SNMP trap receivers to notify faults. SNMP traps are unsolicited notifications triggered by thresholds (or actions) on devices and are therefore an important fault management tool. A SNMP trap receiver is the destination of SNMP messages (external to the controller). A trap is like a Syslog message, just over another protocol (SNMP). A trap is generated when a device consolidates event information and transmits the information to an external repository. The trap contains several standard items, such as the SNMP version, community, etc. SNMP trap notifications exist for most controller operations, but not all are necessary for day-to-day operation. |
| <ul style="list-style-type: none"> • <code>snmp-server host <IP> [v1 v2c v3] {<1-65535>}</code> | |
| host <IP> | Configures a host's IP address. This is the external server resource dedicated to receiving SNMP traps on behalf of the controller. |
| [v1 v2c v3] | Configures the SNMP version used to send the traps <ul style="list-style-type: none"> • v1 – Uses SNMP version 1. This option is disabled by default. • v2c – Uses SNMP version 2c. This option is disabled by default. • v3 – Uses SNMP version 3. This option is enabled by default. |

| | |
|---|---|
| <1-65535> | <p>Optional. Configures the virtual port of the server resource dedicated to receiving SNMP traps</p> <ul style="list-style-type: none"> • <1-65535> – Optional. Specify a value from 1 - 65535. The default port is 162. |
| <ul style="list-style-type: none"> • <code>snmp-server manager [all v1 v2 v3]</code> | |
| manager [all v2 v3] | <p>Enables SNMP manager and specifies the SNMP version</p> <ul style="list-style-type: none"> • all – Enables SNMP manager version v2 and v3 • v1 – Enables SNMP manager version v1 only. SNMPv1 uses a simple password (“community string”). Data is unencrypted (clear text). Consequently it provides limited security, and should be used only inside LANs behind firewalls, not in WANs. • v2 – Enables SNMP manager version v2 only. SNMPv2 provides device management using a hierarchical set of variables. SNMPv2 uses <i>Get</i>, <i>GetNext</i>, and <i>Set</i> operations for data management. SNMPv2 is enabled by default. • v3 – Enables SNMP manager version v3 only. SNMPv3 adds security and remote configuration capabilities to previous versions. The SNMPv3 architecture introduces the <i>User-based Security Model (USM)</i> for message security and the <i>View-based Access Control Model (VACM)</i> for access control. The architecture supports the concurrent use of different security, access control and message processing techniques. SNMPv3 is enabled by default. |
| <ul style="list-style-type: none"> • <code>snmp-server [max-pending-requests {<64-1024>} request-timeout {<2-720>}]</code> | |
| max-pending-requests {<64-1024>} | <p>Sets the maximum number of requests that can be pending at any given time</p> <ul style="list-style-type: none"> • <64-1024> – Optional. Specify a value from 64 - 1024. The default is 128. |
| request-timeout {<2-720>} | <p>Sets the interval, in seconds, after which an error message is returned for a pending request</p> <ul style="list-style-type: none"> • <2-720> – Optional. Specify a value from 2 - 720 seconds. The default is 240 seconds. |
| <ul style="list-style-type: none"> • <code>snmp-server [display-vlan-info-per-radio throttle <1-100> suppress-security-configuration-level [0 1]]</code> | |
| display-vlan-info-per-radio | <p>Enables the display of the VLAN ID along with the radio interface ID</p> |
| throttle <1-100> | <p>Sets CPU usage for SNMP activities. Use this command to set the CPU usage from 1 - 100.</p> |

| | |
|---|---|
| suppress-security-configuration-level [0 1] | <p>Sets the level of suppression of SNMP security configuration information</p> <ul style="list-style-type: none"> • 0 – If this option is selected, an empty string is returned for the SNMP request for security configuration information. Security configuration information consists of: <ul style="list-style-type: none"> • Passwords • Keys • Shared secrets <p>The default setting is 0.</p> <ul style="list-style-type: none"> • 1 – Suppresses the display of the policy, IP ACL, passwords, keys and shared secrets. If this option is selected, in addition to suppression from 'Level 0', an empty string is returned for a SNMP request on following items: <ul style="list-style-type: none"> • Management policies • IP ACL • Tables containing user names and community strings |
| <pre>• snmp-server user [snmpmanager snmpoperator snmptrap] v3 auth md5 [0 <PASSWORD> 2 <ENCRYPTED-PASSWORD> <PASSWORD>]</pre> | |
| user [snmpmanager snmpoperator snmptrap] | <p>Defines user access to the SNMP engine</p> <ul style="list-style-type: none"> • snmpmanager – Sets user as a SNMP manager • snmpoperator – Sets user as a SNMP operator • snmptrap – Sets user as a SNMP trap user |
| v3 auth md5 | <p>Uses SNMP version 3 as the security model</p> <ul style="list-style-type: none"> • auth – Uses an authentication protocol <ul style="list-style-type: none"> • md5 – Uses HMAC-MD5 algorithm for authentication |
| [0 <PASSWORD> 2 <ENCRYPTED-PASSWORD> <PASSWORD>] | <p>Configures password using one of the following options:</p> <ul style="list-style-type: none"> • 0 <PASSWORD> – Configures clear text password • 2 <ENCRYPTED - PASSWORD> – Configures encrypted password • <PASSWORD> – Specifies a password for authentication and privacy protocols |
| <pre>• snmp-server user [snmpmanager snmpoperator snmptrap] v3 encrypted [auth md5 des auth md5] [0 <PASSWORD> 2 <ENCRYPTED-PASSWORD> <PASSWORD>]</pre> | |
| user [snmpmanager snmpoperator snmptrap] | <p>Defines user access to the SNMP engine</p> <ul style="list-style-type: none"> • snmpmanager – Sets user as a SNMP manager • snmpoperator – Sets user as a SNMP operator • snmptrap – Sets user as a SNMP trap user |
| v3 encrypted | <p>Uses SNMP version 3 as the security model</p> <ul style="list-style-type: none"> • encrypted – Uses encrypted privacy protocol |
| auth md5 | <p>Uses authentication protocol</p> <ul style="list-style-type: none"> • auth – Sets authentication parameters <ul style="list-style-type: none"> • md5 – Uses HMAC-MD5 algorithm for authentication |
| des auth md5 | <p>Uses privacy protocol for user privacy</p> <ul style="list-style-type: none"> • des – Uses CBC-DES for privacy <p>After specifying the privacy protocol, specify the authentication mode.</p> <ul style="list-style-type: none"> • auth – Sets user authentication parameters <ul style="list-style-type: none"> • md5 – Uses HMAC-MD5 algorithm for authentication |

| | |
|--|--|
| [0 <PASSWORD> 2 <ENCRYPTED- PASSWORD> <PASSWORD>] | <p>The following are common to both the auth and des parameters:</p> <p>Configures password using one of the following options:</p> <ul style="list-style-type: none"> • 0 <PASSWORD> - Configures a clear text password • 2 <ENCRYPTED - PASSWORD> - Configures an encrypted password • <PASSWORD> - Specifies a password for authentication and privacy protocols |

15.1.15 ssh

► *management-policy*

Enables *Secure Shell* (SSH) for this management policy

SSH, like Telnet, provides a command line interface to a remote host. SSH transmissions are encrypted and authenticated, increasing the security of transmission. SSH access is disabled by default.

NOTE: If the a RADIUS server is not reachable, SSH management access to the controller or access point may be denied. RADIUS support is available locally on controllers and access points, with the exception of AP6511 and AP6522 models, which require an external RADIUS resource.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ssh {login-grace-time <60-300>|port <1-65535>}
```

Parameters

- ssh {login-grace-time <60-300>|port <1-65535>}

| | |
|------------------------------|--|
| ssh | Enables SSH communication between client and server |
| login-grace-time <60-300> | Optional. Configures the login grace time. This is the interval, in seconds, after which an unsuccessful login is disconnected. <ul style="list-style-type: none"> • <60-300> - Specify a value from 60 - 300 seconds. The default is 60 seconds. |
| port <1-65535> | Optional. Configures the SSH port. This is the port used for SSH connections. <ul style="list-style-type: none"> • <1-65535> - Specify a value from 1 - 165535. The default port is 22. |

Example

```
rfs6000-37FABE(config-management-policy-test)#ssh port 162

15.1.16 t5

► *management-policy*

Configures SNMP server settings for T5 devices on this management policy

A T5 controller is an external device that can be adopted and managed by a WiNG controller. When enabled as a supported external device, a T5 controller can provide data to WiNG to assist in its management within a WiNG supported subnet.

This command enables SNMP to communicate with T5 devices within the network. SNMP facilitates the exchange of management information between the controller or service platform and the T5 device. For more information, see *snmp-server*.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

Syntax

```
t5 snmp-server [community|contact|enable|host|location]
t5 snmp-server community <COMMUNITY-NAME> [ro|rw] <SNMP-STATION-IP>
t5 snmp-server contact <LINE>
t5 snmp-server enable [server|traps]
t5 snmp-server host <IP>
t5 snmp-server location <LINE>
```

Parameters

- t5 snmp-server community <COMMUNITY-NAME> [ro|rw] <SNMP-STATION-IP>

| | |
|--|---|
| community <COMMUNITY-NAME> [ro rw] | Defines a public or private community designation. By default, SNMPv2 community strings on most devices are set to public, for the read-only community string, and private for the read-write community string. <ul style="list-style-type: none"> • <COMMUNITY-NAME> - Specify the SNMP community name, and configure the access permission for this community string (used by devices to retrieve or modify information). <ul style="list-style-type: none"> • ro - Allows a remote device to retrieve information only • rw - Allows a remote device to retrieve information and modify settings |
| <SNMP-STATION-IP> | Specify the SNMP management station IP address for receiving trap information <ul style="list-style-type: none"> • t5 snmp-server contact <LINE> |
| contact <LINE> | Configures the administrator of SNMP trap events for the T5 controller. <ul style="list-style-type: none"> • <LINE> - Specify the administrator's name (should not exceed 64 characters). |

- `t5 snmp-server enable [server|traps]`

| | |
|-----------------------|--|
| enable [server traps] | <p>Enables the following:</p> <ul style="list-style-type: none"> • server - Enables the SNMP server. When enabled, the system accepts SNMP management data. This is enabled by default. • traps - Enables SNMP traps. When enabled, the system generates SNMP traps. This is enabled by default. |
|-----------------------|--|

- `t5 snmp-server host <IP>`

| | |
|-----------|--|
| host <IP> | <p>Configures the T5 SNMP host's IP address. The SNMP host receives the SNMP notifications.</p> <ul style="list-style-type: none"> • <IP> - Specify the SNMP host's IP address. |
|-----------|--|

- `t5 snmp-server location <LINE>`

| | |
|-----------------|--|
| location <LINE> | <p>Configures the system location for SNMP traps.</p> <ul style="list-style-type: none"> • <LINE> - Specify the SNMP trap location (should not exceed 64 characters). |
|-----------------|--|

Example

```

nx9500-6C8809(config-management-policy-test)#t5 snmp-server community lab rw
192.168.13.7

nx9500-6C8809(config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  t5 snmp-server community lab rw 192.168.13.7
nx9500-6C8809(config-management-policy-test)#

```

15.1.17 telnet

► *management-policy*

Enables Telnet. Telnet provides a command line interface to a remote host over TCP. Telnet provides no encryption, but it does provide a measure of authentication. Telnet access is disabled by default.

By default Telnet, when enabled, uses *Transmission Control Protocol* (TCP) port 23. Use this command to change the TCP port.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
telnet {port <1-65535>}
```

Parameters

- telnet {port <1-65535>}

| | |
|----------------|--|
| telnet | Enables Telnet |
| port <1-65535> | Optional. Configures the Telnet port. This is the port used for Telnet connections. <ul style="list-style-type: none"> • <1-65535> - Sets a value from 1 - 65535. The default port is 23. |

Example

```
rfs6000-37FABE(config-management-policy-test)#telnet port 200

15.1.18 user

► *management-policy*

Adds new user account. Use this option to add a new user, and define the role, access type, and allowed locations assigned to the user.

Management services like Telnet, SSHv2, HTTP, HTTPs and FTP require users (administrators) enter a valid username and password, which is authenticated locally or centrally on a RADIUS server. SNMPv3 also requires a valid username and password, which is authenticated by the SNMPv3 module. For CLI users, the controller or service platform also requires user role information to know what permissions to assign.

- If local authentication is used, associated role information is defined on the controller or service platform when the user account is created.
- If RADIUS is used, role information is supplied by RADIUS using vendor-specific return attributes. If no role information is supplied by RADIUS, the controller or service platform applies default read-only permissions.

Administrators can limit users to specific management interfaces. During authentication, the controller or service platform looks at the user's access assignment to determine if the user has permissions to access an interface:

- If local authentication is used, role information is defined on the controller or service platform when the user account is created.
- If RADIUS is used, role information is supplied by RADIUS using vendor-specific return attributes.

The controller or service platform authenticates users using the integrated local database. When user credentials are presented the controller or service platform validates the username and password against the local database and assigns permissions based on the associated roles assigned. The controller or service platform can also deny the authentication request if the user is attempting to access a management interface not specified in the account's access mode list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>] role [device-
provisioning-admin|helpdesk|monitor|network-admin|security-admin|
superuser|system-admin|vendor-admin|web-user-admin]
```

```
user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>] role [device-
provisioning-admin|helpdesk|monitor|network-admin|security-admin|
superuser|system-admin|web-user-admin] access [all|console|ssh|telnet|web]
({allowed-locations <ALLOWED-LOCATIONS>})
```

```
user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>] role vendor-
admin group <VENDOR-GROUP-NAME>
```

Parameters

```

• user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>] role
[device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|
superuser|system-admin|web-user-admin] access [all|console|ssh|telnet|web]
({allowed-locations <ALLOWED-LOCATIONS>})

```

| | |
|---|--|
| user <USERNAME> | <p>Adds a new user account to this management policy</p> <ul style="list-style-type: none"> • <USERNAME> - Sets the username. This is a mandatory field and cannot exceed 32 characters. Assign a name representative of the user and the intended role. |
| password [0 <PASSWORD> 1 <SHA1-PASSWORD> <PASSWORD>] | <p>Configures a password</p> <ul style="list-style-type: none"> • 0 <PASSWORD> - Sets a clear text password • 1 <SHA1-PASSWORD> - Sets the SHA1 hash of the password • <PASSWORD> - Sets the password |
| role | <p>Configures the user role. The options are:</p> <ul style="list-style-type: none"> • device-provisioning-admin - Device provisioning administrator. Has privileges to update (provision) device configuration files or firmware. Such updates run the risk of overwriting and losing a devices existing configuration unless the configuration is properly archived. • helpdesk - Helpdesk administrator. Performs troubleshooting tasks, such as run troubleshooting utilities (like a sniffer), view/retrieve logs, clear statistics, reboot, create and copy technical support dumps. The helpdesk administrator can also create a guest user account and password for registration. However, the helpdesk admin cannot execute controller or service platform reloads. • monitor - Monitor. Has read-only access to the system. Can view configuration and statistics except for secret information. • network-admin - Network administrator. Manages layer 2, layer 3, Wireless, RADIUS server, DHCP server, and Smart RF • security-admin - Security administrator. Modifies WLAN keys and passphrases • superuser - Superuser. Has full access, including halt and delete startup-config • system-admin - System administrator. Upgrades image, boot partition, time, and manages admin access • web-user-admin - Web user administrator. This role is used to create guest users and credentials. The Web user admin can access only the custom GUI screen and does not have access to the normal CLI and GUI. |
| access [all console ssh telnet web] | <p>Configures the access type</p> <ul style="list-style-type: none"> • all - Allows all types of access: console, SSH, Telnet, and Web • console - Allows console access only • ssh - Allows SSH access only • telnet - Allows Telnet access only • web - Allows Web access only |
| allowed-locations <ALLOWED- LOCATIONS> | <p>Optional. This keyword is recursive and optional. It configures a list of locations (either as a path or a RF Domain) to which this user is allowed access.</p> <ul style="list-style-type: none"> • <ALLOWED-LOCATIONS> - Specify the allowed locations. <p>Note: Use this option to configure a list of RF Domains or its tree nodes to which this user is allowed access with respect to the Nsight policy.</p> <p>Note: This option is not applicable to the user role 'web-user-admin'.</p> |

- `user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>] role vendor-admin group <VENDOR-GROUP-NAME>`

| | |
|---|--|
| user <USERNAME> | <p>Adds a new user account to this management policy</p> <ul style="list-style-type: none"> • <USERNAME> - Sets the username. This is a mandatory field and cannot exceed 32 characters. Assign a name representative of the user and the intended role. |
| password [0 <PASSWORD> 1 <SHA1-PASSWORD> <PASSWORD>] | <p>Configures a password</p> <ul style="list-style-type: none"> • 0 <PASSWORD> - Sets a clear text password • 1 <SHA1-PASSWORD> - Sets the SHA1 hash of the password • <PASSWORD> - Sets the password |
| role vendor-admin | <p>Configures this user's role as vendor-admin. Once created, the vendor-admin can access the online device-registration portal to add devices to the RADIUS vendor group to which he/she belongs. Vendor-admins have <i>only</i> Web access to the device registration portal.</p> <p>The WiNG software allows multiple vendors to securely on-board their devices through a single SSID. Each vendor has a 'vendor-admin' user who is assigned a unique, username/password credential for RADIUS server validation. Successfully validated vendor-admins can on-board their devices, which are, on completion of the on-boarding process, immediately placed on the vendor-allowed VLAN. On subsequent associations with this SSID, registered devices are dynamically placed into the vendor-allowed VLAN.</p> <p>If assigning the vendor-admin role, provide the vendor's group name for RADIUS authentication. The vendor's group takes precedence over the statically configured group for device registration.</p> <p>Note: Use the <code>service > show > wireless > credential-cache</code> command to view on-boarded device's VLAN assignment.</p> <p>Note: Ensure that the REST server is enabled, to allow vendor users access to the online device registration portal. Note, by default the REST server is enabled. For more information, see rest-server.</p> |
| group <VENDOR-GROUP- NAME> | <p>Associates this vendor-admin user with a vendor group, required for RADIUS authentication. The vendor group should be existing and configured in the RADIUS group policy. For more information on configuring RADIUS groups, see radius-group.</p> <ul style="list-style-type: none"> • <VENDOR-GROUP-NAME> - Provide the vendor group name. In case of multiple allowed groups, provide a list of comma-separated group names. |

15.1.19 service

► *management-policy*

Invokes service commands

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
service [prompt|show]
service [prompt crash-info|show cli]
```

Parameters

- service [prompt crash-info|show cli]

| | |
|------------------------------|---|
| service prompt crash-info | Updates CLI prompt settings <ul style="list-style-type: none"> • crash-info - Includes an asterisk at the end of the prompt if the device has crash files in the flash:/crashinfo folder |
| service show cli | Displays running system information <ul style="list-style-type: none"> • cli - Displays the current mode's CLI tree |

Example

```
rfs6000-37FABE(config-management-policy-test)#service show cli
Management Mode mode:
+-help [help]
+-search
  +-WORD [help search WORD (|detailed|only-show|skip-show|skip-no)]

16 RADIUS-POLICY

This chapter summarizes the RADIUS group, server, and user policy commands in the CLI command structure.

Remote Authentication Dial-In User Service (RADIUS) is a client/server protocol and software that enables remote access servers to authenticate users and authorize their access to the network. RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients send authentication requests to the local RADIUS server containing user authentication and network service access information.

RADIUS enables centralized management of authentication data (usernames and passwords). When a client attempts to associate to a network, the authentication request is sent to the local RADIUS server. The authentication and encryption of communications takes place through the use of a shared secret password (not transmitted over the network).

The local RADIUS server stores the user database locally, and can optionally use a remote user database. It ensures higher accounting performance. It allows the configuration of multiple users, and assigns policies for group authorization.

Controllers and access points allow enforcement of user-based policies. User policies include dynamic VLAN assignment and access based on time of day. A certificate is required for EAP TTLS, PEAP, and TLS RADIUS authentication (configured with the RADIUS service).

Dynamic VLAN assignment is achieved based on the RADIUS server response. A user who associates to WLAN1 (mapped to VLAN1) can be assigned a different VLAN after RADIUS server authentication. This dynamic VLAN assignment overrides the WLAN's VLAN ID to which the user associates.

The chapter is organized into the following sections:

- *radius-group*
- *radius-server-policy*
- *radius-user-pool-policy*

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (`_`) character. In other words, the name of a device cannot contain an underscore.

16.1 radius-group

► RADIUS-POLICY

This section describes RADIUS user group configuration commands.

The local RADIUS server allows the configuration of user groups with common user policies. User group names and associated users are stored in the local database. The user ID in the received access request is mapped to the associated wireless group for authentication. The configuration of groups allows enforcement of the following policies that control user access:

- Assign a VLAN to the user upon successful authentication
- Define start and end of time (HH:MM) when the user is allowed to authenticate
- Define the SSID list to which a user, belonging to this group, is allowed to associate
- Define the days of the week the user is allowed to login
- Rate limit traffic (for non-management users)

RADIUS users are categorized into three groups: normal user, management user, and guest user. A RADIUS group not configured as management or guest is a normal user group. User access and role settings depends on the RADIUS group the user belongs.

Use the (config) instance to configure RADIUS group commands. This command creates a group within the existing RADIUS group. To navigate to the RADIUS group instance, use the following commands:

```
<DEVICE>(config)#radius-group <GROUP-NAME>

rfs6000-37FABE(config)#radius-group test
rfs6000-37FABE(config-radius-group-test)#?
Radius user group configuration commands:
  guest      Make this group a Guest group
  no         Negate a command or set its defaults
  policy     Radius group access policy configuration
  rate-limit Set rate limit for group

  clrscr     Clears the display screen
  commit     Commit all changes made in this session
  do         Run commands from Exec mode
  end        End current mode and change to EXEC mode
  exit       End current mode and down to previous mode
  help       Description of the interactive help system
  revert     Revert changes
  service    Service Commands
  show       Show running system information
  write      Write running configuration to memory or terminal

rfs6000-37FABE(config-radius-group-test)#
```

NOTE: The RADIUS group name cannot exceed 32 characters, and cannot be modified as part of the group edit process.

The following table summarizes RADIUS group configuration commands:

Table 16.1 RADIUS-Group-Config Commands

| Command | Description | Reference |
|-------------------|---|-------------------|
| <i>guest</i> | Enables guest access for the newly created group | <i>page 16-4</i> |
| <i>no</i> | Negates a command or reverts settings to their default | <i>page 16-10</i> |
| <i>policy</i> | Configures RADIUS group access policy parameters | <i>page 16-5</i> |
| <i>rate-limit</i> | Sets the default rate limit per user in Kbps, and applies it to all enabled WLANs | <i>page 16-9</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

16.1.1 guest

▶ *radius-group*

Configures this group as a guest (non-management) group. A guest user group has temporary permissions to the controller's local RADIUS server. You can configure multiple guest user groups, each having a unique set of settings. Guest user groups cannot be made management groups with access and role permissions.

Guest users and policies are used for captive portal authorization to the network.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
guest
```

Parameters

None

Example

```
rfs6000-37FABE(config-radius-group-test)#guest

rfs6000-37FABE(config-radius-group-test)#show context
radius-group test
  guest
rfs6000-37FABE(config-radius-group-test)#
```

Related Commands

| | |
|-----------|------------------------------------|
| <i>no</i> | Makes this group a non-guest group |
|-----------|------------------------------------|

16.1.2 policy

► radius-group

Sets a RADIUS group's authorization settings, such as access day/time, WLANs, etc.

NOTE: A user-based VLAN is effective only if dynamic VLAN authorization is enabled for the WLAN.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
policy [access|day|inactivity-timeout|role|session-time|ssid|time|vlan]
policy vlan <1-4094>
policy access [all|console|ssh|telnet|web]
policy access [all|console|ssh|telnet|web] {(all|console|ssh|telnet|web)}
policy day [all|fr|mo|sa|su|th|tu|we|weekdays] {(fr|mo|sa|su|th|tu|we|weekdays)}
policy inactivity-timeout <60-86400>
policy role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin]
policy session-time <5-144000>
policy ssid <SSID>
policy time start <HH:MM> end <HH:MM>
```

NOTE: Access and role settings are applicable only to a management group. They cannot be configured for a RADIUS non-management group.

Parameters

- policy vlan <1-4094>

| | |
|---------------|--|
| vlan <1-4094> | <p>Sets the guest RADIUS group's VLAN ID from 1 - 4094. The VLAN ID is representative of the shared SSID each group member (user) employs to interoperate within the network (once authenticated by the local RADIUS server).</p> <p>This option applicable to a guest user group, which has guest access and temporary permissions to the local RADIUS server. The terms of the guest access can be set uniquely for each group. Guest user groups cannot be made management groups with unique access and role permissions.</p> <p>Enable dynamic VLAN assignment for the WLAN for the VLAN assignment to take effect.</p> |
|---------------|--|

| | |
|--|---|
| <ul style="list-style-type: none"> • <code>policy access [all console ssh telnet web] {(all console ssh telnet web)}</code> | |
| access | <p>Configures access type for a management group. Management groups can be assigned unique access and role permissions.</p> <ul style="list-style-type: none"> • all – Allows all access. Wireless client access to the console, ssh, telnet, and/or Web • console – Allows console access only • ssh – Allows SSH access only • telnet – Allows Telnet access only • web – Allows Web access only <p>These parameters are recursive, and you can provide access to more than one component.</p> |
| <ul style="list-style-type: none"> • <code>policy role [device-provisioning-admin helpdesk monitor network-admin security-admin superuser system-admin web-user-admin]</code> | |
| role [device-provisioning-admin helpdesk monitor network-admin security-admin superuser system-admin web-user-admin] | <p>Configures the role assigned to a management RADIUS group. If a group is listed as a management group, it may also have a unique role assigned. Available roles include:</p> <ul style="list-style-type: none"> • device-provisioning-admin – Device provisioning administrator. Has privileges to update (provision) device configuration files or firmware. Such updates run the risk of overwriting and losing a devices existing configuration unless the configuration is properly archived. • helpdesk – Helpdesk administrator. Performs troubleshooting tasks, such as clear statistics, reboot, create and copy tech support dumps. The helpdesk administrator can also create a guest user account and password for registration. These details can be e-mailed or sent as SMS to a mobile phone. • monitor – Monitor. Has read-only access to the network. Can view configuration and statistics except for secret information • network-admin – Network administrator. has wired and wireless access to the network. Manages layer 2, layer 3, Wireless, RADIUS server, DHCP server, and Smart RF • security-admin – Security administrator. Has full read/write access to the network. Modifies WLAN keys and passphrases • superuser – Superuser. Has full access, including halt and delete startup config • system-admin – System administrator. Upgrades image, boot partition, time, and manages admin access • web-user-admin – Web user administrator. This role is used to create guest users and credentials. The web-user-admin can access only the custom GUI screen and does not have access to the normal CLI and GUI. |
| <ul style="list-style-type: none"> • <code>policy inactivity-timeout <60-86400></code> | |
| inactivity-timeout <60-86400> | <p>Configures the inactivity time for this RADIUS group users. If a frame is not received from a client for the specified period, then the client's session is removed. When defined, this value is used instead of the captive-portal inactivity timeout. If the inactivity timeout is not configured in the radius-group context or the captive-portal context, the default timeout (60 seconds) is applied.</p> <ul style="list-style-type: none"> • <60-86400> – Specify a value from 60 - 86400 seconds. This option is disabled by default. |

| | |
|---|--|
| <ul style="list-style-type: none"> • <code>policy session-time <5-144000></code> | |
| <code>session-time <5-144000></code> | <p>Configures the session duration for client's belonging to a specific vendor group. Once configured, this is the duration for which over-the-air, on-boarded, successfully authenticated devices, belonging to a vendor group, get online access. The session is removed on completion of this duration. The vendor's RADIUS group takes precedence over statically configured group for device registration.</p> <ul style="list-style-type: none"> • <code><5-144000></code> - Specify a value from 5 - 144000 minutes. This option is disabled by default. <p>For more information, see configuring device registration with dynamic VLAN assignment.</p> |
| <ul style="list-style-type: none"> • <code>policy ssid <SSID></code> | |
| <code>ssid <SSID></code> | <p>Sets the <i>Service Set Identifier</i> (SSID) for this guest RADIUS group. Use this command to assign SSIDs that users within this RADIUS group are allowed to associate. Assign SSIDs of those WLANs only that the guest users need to access. This option is not available for a management group.</p> <ul style="list-style-type: none"> • <code><SSID></code> - Specify a case-sensitive alphanumeric SSID, not exceeding 32 characters. |
| <ul style="list-style-type: none"> • <code>policy day [all fr mo sa su th tu we weekdays] { (fr mo sa su th tu we weekdays) }</code> | |
| <code>day [all fr mo sa su th tu we weekdays]</code> | <p>Configures the days on which this guest RADIUS group members can access the local RADIUS resources. The options are recursive, and you can provide access on multiple days.</p> <ul style="list-style-type: none"> • <code>fr</code> - Allows access on Friday only • <code>mo</code> - Allows access on Mondays only • <code>sa</code> - Allows access on Saturdays only • <code>su</code> - Allows access on Sundays only • <code>th</code> - Allows access on Thursdays only • <code>tu</code> - Allows access on Tuesdays only • <code>we</code> - Allows access on Wednesdays only • <code>weekdays</code> - Allows access on weekdays only (Monday to Friday) |
| <ul style="list-style-type: none"> • <code>policy time start <HH:MM> end <HH:MM></code> | |
| <code>time start<HH:MM> end <HH:MM></code> | <p>Configures the time when this RADIUS group can access the network</p> <ul style="list-style-type: none"> • <code>start <HH:MM></code> - Sets the start time in the HH:MM format (for example, 13:30 means the user can login only after 1:30 PM). Specifies the time users, within each listed group, can access the local RADIUS resources. <ul style="list-style-type: none"> • <code>end <HH:MM></code> - Sets the end time in the HH:MM format (for example, 17:30 means the user is allowed to remain logged in until 5:30 PM). Specifies the time users, within each listed group, lose access to the local RADIUS resources. |

Usage Guidelines

A management group access policy provides:

- access details
- user roles
- policy's start and end time

The SSID, day, and VLAN settings are not applicable to a management user group.

Example

The following example shows a RADIUS guest group settings:

```
rfs6000-37FABE (config-radius-group-test)#policy time start 13:30 end 17:30
rfs6000-37FABE (config-radius-group-test)#policy day all
rfs6000-37FABE (config-radius-group-test)#policy vlan 1
rfs6000-37FABE (config-radius-group-test)#policy ssid test

rfs6000-37FABE (config-radius-group-test)#show context
radius-group test
  guest
  policy vlan 1
  policy ssid test
  policy day mo
  policy day tu
  policy day we
  policy day th
  policy day fr
  policy day sa
  policy day su
  policy time start 13:30 end 17:30
rfs6000-37FABE (config-radius-group-test)#
```

The following example shows a RADIUS management group settings:

```
rfs6000-37FABE (config-radius-group-management)#policy access console ssh telnet
rfs6000-37FABE (config-radius-group-management)#policy role network-admin
rfs6000-37FABE (config-radius-group-management)#policy time start 9:30 end 20:30

rfs6000-37FABE (config-radius-group-management)#show context
radius-group management
  policy time start 9:30 end 20:30
  policy access console ssh telnet web
  policy role network-admin
rfs6000-37FABE (config-radius-group-management)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes or modifies a RADIUS group's access settings |
|-----------|--|

16.1.3 rate-limit

► radius-group

Sets the rate limit for the guest RADIUS server group

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
rate-limit [from-air|to-air] <100-1000000>
```

NOTE: The rate-limit setting is not applicable to a management group.

Parameters

- rate-limit [from-air|to-air] <100-1000000>

| | |
|---------------------------|--|
| to-air <100-1000000> | Sets the rate limit in the downlink direction, from the network to the wireless client <ul style="list-style-type: none"> • <100-1000000> - Specify the rate from 100 - 1000000 Kbps. |
| from-air <100-1000000> | Sets the rate limit in the uplink direction, from the wireless client to the network <ul style="list-style-type: none"> • <100-1000000> - Specify the rate from 100 - 1000000 Kbps. |

Example

```
rfs6000-37FABE(config-radius-group-test)#rate-limit to-air 200

rfs6000-37FABE(config-radius-group-test)#show context
radius-group test
  guest
  policy vlan 1
  policy ssid test
  policy day mo
  policy day tu
  policy day we
  policy day th
  policy day fr
  policy day sa
  policy day su
  rate-limit to-air 200
  policy time start 13:30 end 17:30
rfs6000-37FABE(config-radius-group-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the RADIUS guest group's rate limits |
|-----------|--|

16.1.4 no

► *radius-group*

Negates a command or sets its default. Removes or modifies the RADIUS group policy settings. When used in the config RADIUS group mode, the `no` command removes or modifies the following settings: access type, access days, role type, VLAN ID, and SSID.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [guest|policy|rate-limit]

no policy [access|day|inactivity-timeout|role|session-time|ssid|time|vlan]

no policy access [all|console|ssh|telnet|web]
no policy day [all|fr|mo|sa|su|th|tu|we|weekdays]
no policy session-time
no policy ssid [<SSID>|all]
no policy [inactivity-timeout|role|time|vlan]

no rate-limit [from-air|to-air]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Negates a command or sets its default. Removes or modifies the RADIUS group policy settings. When used in the config RADIUS group mode, the <code>no</code> command removes or modifies the following settings: access type, access days, role type, VLAN ID, and SSID. |
|-----------------|---|

Example

The following example shows the RADIUS guest group 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-radius-group-test)#show context
radius-group test
  guest
  policy vlan 1
  policy ssid test
  policy day mo
  policy day tu
  policy day we
  policy day th
  policy day fr
  policy day sa
  policy day su
  rate-limit to-air 200
  policy time start 13:30 end 17:30
rfs6000-37FABE(config-radius-group-test)#

rfs6000-37FABE(config-radius-group-test)#no guest
rfs6000-37FABE(config-radius-group-test)#no rate-limit to-air
rfs6000-37FABE(config-radius-group-test)#no policy day all
```

The following example shows the RADIUS guest group 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-radius-group-test)#show context
radius-group test
  policy vlan 1
  policy ssid test
  policy time start 13:30 end 17:30
rfs6000-37FABE(config-radius-group-test)#
```

16.2 radius-server-policy

► RADIUS-POLICY

Creates an onboard device RADIUS server policy and enters its configuration mode

A RADIUS server policy is a unique authentication and authorization configuration that receives user connection requests, authenticates users, and returns configuration information necessary for the RADIUS client to deliver service to the user. The client is the entity with authentication information requiring validation. The local RADIUS server has access to a database of authentication information used to validate the client's authentication request.

The local RADIUS server uses authentication schemes like PAP, CHAP, or EAP to verify and confirm information provided by a user. The user's proof of identification is verified, along with, optionally, other information. A local RADIUS server policy can also be configured to refer to an external *Lightweight Directory Access Protocol* (LDAP) resource to verify a user's credentials.

Use the (config) instance to configure RADIUS-Server-Policy related parameters. To navigate to the RADIUS-Server-Policy instance, use the following commands:

```
<DEVICE>(config)#radius-server-policy <POLICY-NAME>

rfs6000-37FABE(config)#radius-server-policy test
rfs6000-37FABE(config-radius-server-policy-test)#?
Radius Configuration commands:
authentication          Radius authentication
bypass                  Bypass Certificate Revocation List( CRL ) check
chase-referral          Enable chasing referrals from LDAP server
crl-check               Enable Certificate Revocation List( CRL ) check
ldap-agent              LDAP Agent configuration parameters
ldap-group-verification Enable LDAP Group Verification setting
ldap-server             LDAP server parameters
local                   RADIUS local realm
nas                     RADIUS client
no                      Negate a command or set its defaults
proxy                  RADIUS proxy server
session-resumption      Enable session resumption/fast reauthentication by
                        using cached attributes
termination            Enable Eap termination for proxy requests
use                     Set setting to use

clrscr                 Clears the display screen
commit                 Commit all changes made in this session
do                     Run commands from Exec mode
end                    End current mode and change to EXEC mode
exit                   End current mode and down to previous mode
help                   Description of the interactive help system
revert                 Revert changes

rfs6000-37FABE(config-radius-server-policy-test)#
```

The following table summarizes RADIUS server policy configuration commands:

Table 16.2 *RADIUS-Server-Policy-Config Commands*

| Commands | Description | Reference |
|--------------------------------|---|-------------------|
| <i>authentication</i> | Configures RADIUS authentication settings | <i>page 16-14</i> |
| <i>bypass</i> | Enables bypassing of CRL check | <i>page 16-16</i> |
| <i>chase-referral</i> | Enables LDAP server referral chasing | <i>page 16-17</i> |
| <i>crl-check</i> | Enables a <i>certificate revocation list</i> (CRL) check | <i>page 16-18</i> |
| <i>ldap-agent</i> | Configures the LDAP agent's settings | <i>page 16-19</i> |
| <i>ldap-group-verification</i> | Enables LDAP group verification | <i>page 16-21</i> |
| <i>ldap-server</i> | Configures the LDAP server's settings | <i>page 16-22</i> |
| <i>local</i> | Configures a local RADIUS realm | <i>page 16-25</i> |
| <i>nas</i> | Configures the key sent to a RADIUS client | <i>page 16-26</i> |
| <i>no</i> | Removes or resets the RADIUS server policy's settings | <i>page 16-28</i> |
| <i>proxy</i> | Configures the RADIUS proxy server's settings | <i>page 16-30</i> |
| <i>session-resumption</i> | Enables session resumption | <i>page 16-32</i> |
| <i>termination</i> | Enables EAP termination on this current RADIUS server policy. When enabled, EAP authentication is terminated at the controller level. | <i>page 16-33</i> |
| <i>use</i> | Defines settings used with the RADIUS server policy | <i>page 16-34</i> |

16.2.1 authentication

► *radius-server-policy*

Specifies the RADIUS datasource used for user authentication. Options include local for the local user database or LDAP for a remote LDAP resource.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
authentication [data-source|eap-auth-type]

authentication data-source [ldap|local]
authentication data-source [ldap {fallback}|local] {(ssid <SSID> precedence <1-5000>)}

authentication eap-auth-type [all|peap-gtc|peap-mschapv2|tls|ttls-md5|ttls-mschapv2|ttls-pap]
```

Parameters

- authentication data-source [ldap {fallback}|local] {(ssid <SSID> precedence <1-5000>)}

| | |
|---------------------------------------|---|
| data-source | The RADIUS sever can either use the local database or an external LDAP server to authenticate a user. It is necessary to specify the data source. The options are: LDAP and local. |
| ldap fallback | Uses a remote LDAP server as the data source <ul style="list-style-type: none"> • fallback - Optional. Enables fallback to local authentication. This feature ensures that if the designated external LDAP resource were to fail or become unavailable, the client is authenticated against the local RADIUS resource. This option is disabled by default. When using LDAP as the authentication external source, PEAP-MSCHAPv2 authentication type can be used only if the LDAP server returns the password as plain-text. PEAP-MSCHAPv2 authentication is not supported if the LDAP server returns encrypted passwords. This restriction does not apply for Microsoft's Active Directory server. |
| local | Uses the local user database to authenticate a user. This is the default setting. |
| ssid <SSID> precedence <1-5000> | The following keywords are recursive and common to both 'ldap' and 'local' parameters: <ul style="list-style-type: none"> • ssid - Optional. Associates the data source, selected in the previous step, with a SSID <ul style="list-style-type: none"> • <SSID> - Specify the SSID for this authentication data source. The SSID is case sensitive and should not exceed 32 characters in length. Do not use any of the following characters (<> " & \ ? ,). Contd.. |

| | |
|---------------|---|
| | <ul style="list-style-type: none"> precedence <SSID> – Sets the precedence for this authentication rule. The precedence value allows systematic evaluation and application of rules. Rules with the lowest precedence receive the highest priority. <1-5000> – Specify a precedence from 1- 5000. <p>Specifying the SSID allows the RADIUS server to use the SSID attribute in access requests to determine the data source to use. This option is applicable to onboard RADIUS servers only.</p> |
| | <ul style="list-style-type: none"> authentication eap-auth-type [all peap-gtc peap-mschapv2 tls ttls-md5 ttls-mschapv2 ttls-pap] |
| eap-auth-type | <p>Uses <i>Extensible Authentication Protocol</i> (EAP), with this RADIUS server policy, for user authentication</p> <p>The EAP authentication types supported by the local RADIUS server are: all, peap-gtc, peap-mschapv2, tls, ttls-md5, ttls-mschapv2, ttls-pap.</p> |
| all | Enables both TTLS and PEAP authentication. This is the default setting. |
| peap-gtc | Enables PEAP with default authentication using GTC |
| peap-mschapv2 | <p>Enables PEAP with default authentication using MSCHAPv2</p> <p>When using LDAP as the authentication external source, PEAP-MSCHAPv2 authentication type can be used only if the LDAP server returns the password as plain-text. PEAP-MSCHAPv2 authentication is not supported if the LDAP server returns encrypted passwords. This restriction does not apply for Microsoft's Active Directory server.</p> |
| tls | Enables TLS as the EAP type |
| ttls-md5 | Enables TTLS with default authentication using md5 |
| ttls-mschapv2 | Enables TTLS with default authentication using MSCHAPv2 |
| ttls-pap | Enables TTLS with default authentication using PAP |

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#authentication eap-auth-type tls
rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
  authentication eap-auth-type tls
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the RADIUS authentication settings |
|-----------|--|

16.2.2 bypass

► *radius-server-policy*

Enables bypassing a CRL check. When enabled, this feature bypasses checks for missing and expired CRLs. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
bypass [crl-check|expired-crl]
```

Parameters

- `bypass [crl-check|expired-crl]`

| | |
|---|--|
| <pre>bypass [crl-check expired-crl]</pre> | <p>Bypasses CRL check based on the parameters passed</p> <ul style="list-style-type: none"> • <code>crl-check</code> – Bypasses CRL check of missing CRLs • <code>expired-crl</code> – Bypasses CRL check of expired CRLs <p>Note: A CRL is a list of certificates that have been revoked or are no longer valid.</p> |
|---|--|

Example

```
nx9500-6C8809(config-radius-server-policy-test)#bypass crl-check
nx9500-6C8809(config-radius-server-policy-test)#no bypass crl-check

nx9500-6C8809(config-radius-server-policy-test)#show context
radius-server-policy test
  no bypass crl-check
nx9500-6C8809(config-radius-server-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables bypassing of checking for missing CRLs or expired CRLs |
|-----------|---|

16.2.3 chase-referral

► *radius-server-policy*

Enables chasing of referrals from an external LDAP server resource

An LDAP referral is a controller or service platform's way of indicating to a client it does not hold the section of the directory tree where a requested content object resides. The referral is the controller or service platform's direction to the client a different location is more likely to hold the object, which the client uses as the basis for a DNS search for a domain controller. Ideally, referrals always reference a domain controller that indeed holds the object. However, it is possible for the domain controller to generate another referral, although it usually does not take long to discover the object does not exist and inform the client.

This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
chase-referral
```

Parameters

None

Example

```
rfs6000-37FABE (config-radius-server-policy-test) #chase-referral
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Disables LDAP server referral chasing |
|-----------|---------------------------------------|

16.2.4 `crl-check`

► *radius-server-policy*

Enables a *certificate revocation list* (CRL) check on this RADIUS server policy

A CRL is a list of revoked certificates issued and subsequently revoked by a *Certification Authority* (CA). Certificates can be revoked for a number of reasons including failure or compromise of a device using a certificate, a compromise of a certificate key pair or errors within an issued certificate. The mechanism used for certificate revocation depends on the CA.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
crl-check
```

Parameters

None

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#crl-check

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
 authentication eap-auth-type tls
 crl-check
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables CRL check on a RADIUS server policy |
|-----------|--|

16.2.5 ldap-agent

► radius-server-policy

Configures the LDAP agent's settings in the RADIUS server policy context

When a user's credentials are stored on an external LDAP server, the local RADIUS server cannot successfully conduct PEAP-MSCHAPv2 authentication, since it is not aware of the user's credentials maintained on the external LDAP server resource. Therefore, up to two LDAP agents can be provided locally so remote LDAP authentication can be successfully accomplished on the remote LDAP resource (using credentials maintained locally).

This feature is available to all controller, service platforms and access point models, with the exception of AP6511 and AP6521 models running in standalone AP or virtual controller AP mode. However, this feature is supported by dependent mode AP6511 and AP6521 model access points when adopted and managed by a controller or service platform.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-agent [join|join-retry-timeout|primary|secondary]
ldap-agent [join {on <DEVICE-NAME>}|join-retry-timeout <60-300>]
ldap-agent [primary|secondary] domain-name <LDAP-DOMAIN-NAME> domain-admin-user
<ADMIN-USER-NAME> domain-admin-password [0 <WORD>|2 <WORD>]
```

Parameters

- ldap-agent [join {on <DEVICE-NAME>}|join-retry-timeout <60-300>]

| | |
|--------------------------------|---|
| ldap-agent | Configures the LDAP agent's settings |
| join {on <DEVICE-NAME>} | <p>Initiates the join process, which binds the RADIUS server with the LDAP server's (Windows) domain. When successful, the hostname (name of the AP, wireless controller, or service platform) is added to the LDAP server's Active Directory.</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Specifies the device name <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. <p>To confirm the join status of a controller, use the <i>show > ldap-agent > join-status</i> command.</p> |
| join-retry-timeout <60-300> | <p>If the join process fails (i.e. the RADIUS server fails to join the LDAP server's domain), the process is retried after a specified interval. This command configures the interval (in seconds) between two successive join attempts.</p> <ul style="list-style-type: none"> • <60-300> - Set the timeout value from 60 - 300 seconds. The default is 60 seconds. <p>A retry timer is initiated as soon as the join process starts, which tracks the time lapse in case of a failure.</p> |

- `ldap-agent [primary|secondary] domain-name <LDAP-DOMAIN-NAME> domain-admin-user <ADMIN-USER-NAME> domain-admin-password [0 <WORD>|2 <WORD>]`

| | |
|--|---|
| <code>ldap-agent</code> | Configures the LDAP agent's settings |
| <code>primary</code> | Configures the primary LDAP server details, such as domain name, user name, and password. The RADIUS server uses these credentials to bind with the primary LDAP server. |
| <code>secondary</code> | Configures the secondary LDAP server details, such as domain name, user name, and password. The RADIUS server uses these credentials to bind with the secondary LDAP server. |
| <code>domain-name <LDAP-DOMAIN-NAME></code> | This keyword is common to both the 'primary' and 'secondary' parameters. <ul style="list-style-type: none"> • <code>domain-name</code> - Configures the primary or secondary LDAP server's domain name • <code><LDAP-DOMAIN-NAME></code> - Specify the domain name. |
| <code>domain-admin-user <ADMIN-USER-NAME></code> | This keyword is common to both the 'primary' and 'secondary' parameters. <ul style="list-style-type: none"> • <code>domain-admin-user</code> - Configures the primary or secondary LDAP server's admin user name • <code><ADMIN-USER-NAME></code> - Specify the admin user's name. |
| <code>domain-admin-password [0 <WORD> 2 <WORD>]</code> | This keyword is common to both the 'primary' and 'secondary' parameters. <ul style="list-style-type: none"> • <code>domain-admin-password</code> - Configures the primary or secondary LDAP server's admin user password • <code>0 <WORD></code> - Specifies the password in the unencrypted format • <code>2 <WORD></code> - Specifies the password in the encrypted format |

Example

```
rfs4000-229D58(config-radius-server-policy-test)#ldap-agent primary domain-name
test domain-admin-user Administrator domain-admin-password 0 test@123
rfs4000-229D58(config-radius-server-policy-test)#

rfs4000-229D58(config-radius-server-policy-test)#show context
radius-server-policy test
  ldap-agent primary domain-name test domain-admin-user Administrator domain-admin-
password 0 test@123
rfs4000-229D58(config-radius-server-policy-test)#
```

Related Commands

| | |
|-----------------|--|
| <code>no</code> | Removes LDAP agent settings from this RADIUS server policy |
|-----------------|--|

16.2.6 ldap-group-verification

► *radius-server-policy*

Enables LDAP group verification settings on this RADIUS server policy. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-group-verification
```

Parameters

None

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#ldap-group-verification
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables LDAP group verification settings |
|-----------|---|

16.2.7 ldap-server

► *radius-server-policy*

Configures the LDAP server's settings. Configuring LDAP server allows users to login and authenticate from anywhere on the network.

Administrators have the option of using the local RADIUS server to authenticate users against an external LDAP server resource. Using an external LDAP user database allows the centralization of user information and reduces administrative user management overhead making RADIUS authorization more secure and efficient.

RADIUS is not just a database. It is a protocol for asking intelligent questions to a user database (like LDAP). LDAP however is just a database of user credentials used optionally with the local RADIUS server to free up resources and manage user credentials from a secure remote location. It is the local RADIUS resources that provide the tools to perform user authentication and authorize users based on complex checks and logic. A LDAP user database alone cannot perform such complex authorization checks.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-server [dead-period|primary|secondary]
```

```
ldap-server dead-period <0-600>
```

```
ldap-server [primary|secondary] host <IP> port <1-65535> login <LOGIN-NAME> bind-dn <BIND-DN> base-dn <BASE-DN> passwd [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>] passwd-attr <ATTR> group-attr <ATTR> group-filter <FILTER> group-membership <WORD> {net-timeout <1-10>|start-tls net-timeout <1-10>|tls-mode net-timeout <1-10>}
```

Parameters

- ldap-server dead-period <0-600>

| | |
|--|---|
| dead-period <0-600> | <p>Sets an interval, in seconds, during which the local server will not contact its LDAP server resource once its been defined as unavailable. A dead period is only implemented when additional LDAP servers are configured and available.</p> <ul style="list-style-type: none"> • <0-600> - Specify a value from 0 - 600 seconds. The default is 300 seconds. |
| <pre>• ldap-server [primary secondary] host <IP> port <1-65535> login <LOGIN-NAME> bind-dn <BIND-DN> base-dn <BASE-DN> passwd [0 <PASSWORD> 2 <ENCRYPTED-PASSWORD> <PASSWORD>] passwd-attr <ATTR> group-attr <ATTR> group-filter <FILTER> group-membership <WORD> {net-timeout <1-10> start-tls net-timeout <1-10> tls-mode net-timeout <1-10>}}</pre> | |
| ldap primary | Configures the primary LDAP server settings |
| ldap secondary | Configures the secondary LDAP server settings |
| host <IP> | <p>Specifies the LDAP host's IP address</p> <ul style="list-style-type: none"> • <IP> - Specify the LDAP server's IP address. |

| | |
|--|--|
| port <1-65535> | Configures the LDAP server port <ul style="list-style-type: none"> • <1-65535> - Specify a port between 1 - 65535. |
| login <LOGIN-NAME> | Configures the login name of a user to access the LDAP server <ul style="list-style-type: none"> • <LOGIN-NAME> - Specify a login ID (should not exceed 127 characters). |
| bind-dn <BIND-DN> | Configures a distinguished bind name. This is the <i>distinguished name</i> (DN) used to bind with the LDAP server. The DN is the name that uniquely identifies an entry in the LDAP directory. A DN is made up of attribute value pairs, separated by commas. <ul style="list-style-type: none"> • <BIND-DN> - Specify a bind name (should not exceed 127 characters). |
| base-dn <BASE-DN> | Configures a distinguished base name. This is the DN that establishes the base object for the search. The base object is the point in the LDAP tree at which to start searching. LDAP DNs begin with a specific attribute (usually some sort of name), and continue with progressively broader attributes, often ending with a country attribute. The first component of the DN is referred to as the <i>Relative Distinguished Name</i> (RDN). It identifies an entry distinctly from any other entries that have the same parent <ul style="list-style-type: none"> • <BASE-DN> - Specify a base name (should not exceed 127 characters). |
| passwd [0 <PASSWORD> 2 <ENCRYPTED-PASSWORD> <PASSWORD>] | Sets a valid password for the LDAP server. <ul style="list-style-type: none"> • 0 <PASSWORD> - Sets an UNENCRYPTED password • 2 <ENCRYPTED-PASSWORD> - Sets an ENCRYPTED password • <PASSWORD> - Sets the LDAP server bind password, specified UNENCRYPTED, with a maximum size of 31 characters |
| passwd-attr <ATTR> | Specify the LDAP server password attribute (should not exceed 63 characters). |
| group-attr <ATTR> | Specify a name to configure group attributes (should not exceed 31 characters). LDAP systems have the facility to poll dynamic groups. In an LDAP dynamic group an administrator can specify search criteria. All users matching the search criteria are considered a member of this dynamic group. Specify a group attribute used by the LDAP server. An attribute could be a group name, group ID, password or group membership name. |
| group-filter <FILTER> | Specify a name for the group filter attribute (should not exceed 255 characters). This filter is typically used for security role-to-group assignments and specifies the property to look up groups in the directory service. |
| group-membership <WORD> | Specify a name for the group membership attribute (should not exceed 63 characters). This attribute is sent to the LDAP server when authenticating users. |
| net-time <1-10> | Optional. Select a value from 1 - 10 to configure the network timeout (number of seconds to wait for a response from the target primary or secondary LDAP server). The default is 10 seconds. |
| start-tls net-timeout <1-10> | Optional. Select a value from 1 - 10 to configure the network timeout for secure communication using start_tls support on the external LDAP server. |
| tls-mode net-timeout <1-10> | Optional. Select a value from 1 - 10 to configure the network timeout for secure communication using tls_mode support on the external LDAP server. |

Example

```

rfs6000-37FABE(config-radius-server-policy-test)#ldap-server dead-period 100

rfs6000-37FABE(config-radius-server-policy-test)#ldap-server primary host 172.16
.10.19 port 162 login test bind-dn bind-dn1 base-dn base-dn1 passwd 0 test@123
passwd-attr test123 group-attr group1 group-filter groupfilter1
group-membership groupmembership1 net-timeout 2
rfs6000-37FABE(config-radius-server-policy-test)#

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
authentication eap-auth-type tls
crl-check
ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
base-dn "base-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
filter "groupfilter1" group-membership groupmembership1 net-timeout 2
ldap-server dead-period 100
rfs6000-37FABE(config-radius-server-policy-test)#

```

| <i>no</i> | Disables the LDAP server parameters |
|-----------|-------------------------------------|

16.2.8 local

► *radius-server-policy*

Configures a local RADIUS realm on this RADIUS server policy

When the local RADIUS server receives a request for a user name with a realm, the server references a table of realms. If the realm is known, the server proxies the request to the RADIUS server.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
local realm <RADIUS-REALM>
```

Parameters

- local realm <RADIUS-REALM>

| | |
|-------------------------|--|
| realm <RADIUS-REALM> | Configures a local RADIUS realm <ul style="list-style-type: none"> • <RADIUS-REALM> - Sets a local RADIUS realm name (a string not exceeding 50 characters) |
|-------------------------|--|

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#local realm realm1

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
 authentication eap-auth-type tls
  crl-check
  local realm realm1
  ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
  base-dn "base-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
  filter "groupfilter1" group-membership groupmembership1 net-timeout 2
  ldap-server dead-period 100
rfs6000-37FABE(config-radius-server-policy-test)#
```

|-----------|--------------------------------|

16.2.9 nas

► *radius-server-policy*

Configures the key sent to a RADIUS client

A RADIUS client is a mechanism to communicate with a central server to authenticate users and authorize access to the controller, service platform or Access Point managed network.

The client and server share a secret (a password). That shared secret followed by the request authenticator is put through a MD5 hash algorithm to create a 16 octet value which is XORed with the password entered by the user. If the user password is greater than 16 octets, additional MD5 calculations are performed, using the previous ciphertext instead of the request authenticator. The server receives a RADIUS access request packet and verifies the server possesses a shared secret for the client. If the server does not possess a shared secret for the client, the request is dropped. If the client received a verified access accept packet, the username and password are considered correct, and the user is authenticated. If the client receives a verified access reject message, the username and password are considered to be incorrect, and the user is not authenticated.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
nas <IP/M> secret [0|2|<LINE>]
```

```
nas <IP/M> secret [0 <LINE>|2 <LINE>|<LINE>]
```

Parameters

- nas <IP/M> secret [0 <LINE>|2<LINE>]

| | |
|--------------------------------------|--|
| <IP/M> | Sets the RADIUS client's IP address <ul style="list-style-type: none"> • <IP/M> - Sets the RADIUS client's IP address in the A.B.C.D/M format |
| secret [0 <LINE> 2 <LINE> <LINE>] | Sets the RADIUS client's shared secret. Use one of the following options: <ul style="list-style-type: none"> • 0 <LINE> - Sets an UNENCRYPTED secret • 2 <LINE> - Sets an ENCRYPTED secret • <LINE> - Defines the secret (client shared secret) up to 64 characters |

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#nas 172.16.10.10/24 secret 0
wirelesswell

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
authentication eap-auth-type tls
crl-check
nas 172.16.10.10/24 secret 0 wirelesswell
local realm realm1
ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
base-dn "base-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
filter "groupfilter1" group-membership groupmembership1 net-timeout 2
ldap-server dead-period 100
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

*no*Removes a RADIUS server's client on a RADIUS server policy

16.2.10 no

► *radius-server-policy*

Negates a command or reverts back to default settings. When used with in the config RADIUS server policy mode, the `no` command removes settings, such as `crl-check`, LDAP group verification, RADIUS client, etc.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [authentication|bypass|chase-referral|clr-check|ldap-agent|ldap-group-
verification|ldap-server|local|nas|proxy|session-resumption|termination|use]

no bypass [crl-check|expired-crl]

no authentication [data-source|eap]

no authentication [data-source {ldap {fallback}|local|ssid}|eap configuration]

no [chase-referral|clr-check|ldap-group-verification|nas <IP/M>|session-
resumption]

no ldap-agent [join-retry-timeout|primary|secondary]

no local realm [<REALM-NAME>|all]

no proxy [realm <REALM-NAME>|retry-count|retry-delay]

no ldap-server [dead-period|primary|secondary]

no termination

no use [radius-group [<RAD-GROUP-NAME>|all]|radius-user-pool-policy [<RAD-USER-
POOL-NAME>|all]]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Negates a command or reverts back to default settings. When used with in the config RADIUS server policy mode, the <code>no</code> command removes settings, such as <code>crl-check</code> , LDAP group verification, RADIUS client etc |
|-----------------|--|

Example

The following example shows the RADIUS server policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
  authentication eap-auth-type tls
  crl-check
  nas 172.16.10.10/24 secret 0 wirelesswell
  local realm realm1
  ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
  base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
  filter "groupfilter1" group-membership groupmembership1 net-timeout 2
  ldap-server dead-period 100
```

```
rfs6000-37FABE(config-radius-server-policy-test)#  
rfs6000-37FABE(config-radius-server-policy-test)#no authentication eap  
configuration  
rfs6000-37FABE(config-radius-server-policy-test)#no crl-check  
rfs6000-37FABE(config-radius-server-policy-test)#no local realm realm1  
rfs6000-37FABE(config-radius-server-policy-test)#no nas 172.16.10.10/24  
rfs6000-37FABE(config-radius-server-policy-test)#no ldap-server dead-period
```

The following example shows the RADIUS server policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-radius-server-policy-test)#show context  
radius-server-policy test  
  ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"  
base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-  
filter "groupfilter1" group-membership groupmembership1 net-timeout 2  
rfs6000-37FABE(config-radius-server-policy-test)#
```

16.2.11 proxy

► *radius-server-policy*

Configures a proxy RADIUS server based on the realm/suffix. The realm identifies where the RADIUS server forwards AAA requests for processing.

A user's access request is sent to a proxy RADIUS server if it cannot be authenticated by the local RADIUS resources. The proxy server checks the information in the user access request and either accepts or rejects the request. If the proxy server accepts the request, it returns configuration information specifying the type of connection service required to authenticate the user.

The RADIUS proxy appears to act as a RADIUS server to NAS, whereas the proxy appears to act as a RADIUS client to the RADIUS server.

When the proxy server receives a request for a user name with a realm, the server references a table of realms. If the realm is known, the server proxies the request to the RADIUS server.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
proxy [realm|retry-count|retry-delay]

proxy realm <REALM-NAME> server <IP> port <1024-65535> secret [0 <PASSWORD>|2
<ENCRYPTED-PASSWORD>|<PASSWORD>]

proxy retry-count <3-6>

proxy retry-delay <5-10>
```

Parameters

- proxy realm <REALM-NAME> server <IP> port <1024-65535> secret [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]

| | |
|--|---|
| proxy realm <REALM-NAME> | Configures the realm name <ul style="list-style-type: none"> • <REALM-NAME> - Specify the realm name. The name should not exceed 50 characters. |
| server <IP> | Configures the proxy server's IP address. This is the address of server checking the information in the user access request and either accepting or rejecting the request on behalf of the local RADIUS server. <ul style="list-style-type: none"> • <IP> - Sets the proxy server's IP address |
| port <1024-65535> | Configures the proxy server's port. This is the TCP/IP port number for the server that acts as a data source for the proxy server. <ul style="list-style-type: none"> • <1024-65535> - Sets the proxy server's port from 1024 - 65535 (default port is 1812) |
| secret [0 <PASSWORD> 2 <ENCRYPTED-PASSWORD> <PASSWORD> | Sets the proxy server secret string. The options are: <ul style="list-style-type: none"> • 0 <PASSWORD> - Sets an UNENCRYPTED password • 2 <ENCRYPTED-PASSWORD> - Sets an ENCRYPTED password • <PASSWORD> - Sets the proxy server shared secret value |

- proxy retry-count <3-6>

| | |
|-------------------|---|
| retry-count <3-6> | Sets the proxy server's retry count. This is the maximum number attempts made by a controller's RADIUS server to connect to the proxy server. <ul style="list-style-type: none"> • <3-6> - Sets a value from 3 - 6 (default is 3 counts) |
|-------------------|---|

- proxy retry-delay <5-10>

| | |
|--------------------|---|
| retry-delay <5-10> | Sets the proxy server's retry delay count. This is the interval the controller's RADIUS server waits before making an additional connection attempt. <ul style="list-style-type: none"> • <5-10> - Sets a value from 5 - 10 seconds (default is 5 seconds) |
|--------------------|---|

Usage Guidelines

A maximum of five RADIUS proxy servers can be configured. The proxy server attempts six retries before it times out. The retry count defines the number of times RADIUS requests are transmitted before giving up. The timeout value is the defines the interval between successive retransmission of a RADIUS request (in case of no reply).

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#proxy realm test1 server 172.16
.10.7 port 1025 secret 0 test1123

rfs6000-37FABE(config-radius-server-policy-test)#proxy retry-count 4

rfs6000-37FABE(config-radius-server-policy-test)#proxy retry-delay 8

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
  proxy retry-delay 8
  proxy retry-count 4
  proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
  ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
  base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
  filter "groupfilter1" group-membership groupmembership1 net-timeout 2
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

| <i>no</i> | Removes or resets the RADIUS proxy server's settings |
|-----------|--|

16.2.12 session-resumption

► *radius-server-policy*

Enables session resumption or fast re-authentication by using cached attributes. This feature controls the volume and duration cached data is maintained by the server policy, upon termination of a server policy session. The availability and quick retrieval of the cached data speeds up session resumption.

This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
session-resumption {lifetime|max-entries}
session-resumption {lifetime <1-24> {max-entries <10-1024>}|max-entries <10-1024>}
```

Parameters

```
• session-resumption {lifetime <1-24> {max-entries <10-1024>}|max-entries <10-1024>}
```

| | |
|--|--|
| lifetime <1-24> {max-entries <10-1024>} | Optional. Sets the lifetime of cached entries <ul style="list-style-type: none"> • <1-24> – Specify the lifetime period from 1 - 24 hours (default is 1 hour) <ul style="list-style-type: none"> • max-entries – Optional. Configures the maximum number of entries in the cache <ul style="list-style-type: none"> • <10-1024> – Sets the maximum number of entries in the cache from 10 - 1024 (default is 128 entries) |
| max-entries <10-1024> | Optional. Configures the maximum number of entries in the cache <ul style="list-style-type: none"> • <10-1024> – Sets the maximum number of entries in the cache from 10 - 1024 (default is 128 entries) |

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#session-resumption lifetime 10
max-entries 11

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
 proxy retry-delay 8
 proxy retry-count 4
 proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
 ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
 base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
 filter "groupfilter1" group-membership groupmembership1 net-timeout 2
 session-resumption lifetime 10 max-entries 11
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables session resumption on this RADIUS server policy |
|-----------|--|

16.2.13 termination

► *radius-server-policy*

Enables EAP termination on this RADIUS server policy. When enabled, EAP authentication is terminated at the controller level. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
termination
```

Parameters

None

Example

```
nx9500-6C8809(config-radius-server-policy-test)#termination
nx9500-6C8809(config-radius-server-policy-test)#show context
radius-server-policy test
  termination
  no bypass crl-check
nx9500-6C8809(config-radius-server-policy-test)#
```

Related Commands

| | |

| <i>no</i> | Disables EAP termination on this RADIUS server policy |
|-----------|---|

16.2.14 use

► *radius-server-policy*

Defines settings used with the RADIUS server policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use [radius-group <RAD-GROUP-NAME1> {RAD-GROUP-NAME2}|radius-user-pool-policy
  <RAD-USER-POOL-NAME>]
```

Parameters

- use [radius-group <RAD-GROUP-NAME1> {RAD-GROUP-NAME2}|radius-user-pool-policy <RAD-USER-POOL-NAME>]

| | |
|--|--|
| radius-group <RAD-GROUP-NAME1> {RAD-GROUP-NAME2} | Associates a specified RADIUS group (for LDAP users) with this RADIUS server policy You can optionally associate two RADIUS groups with one RADIUS server policy. |
| radius-user-pool-policy <RAD-USER-POOL-NAME> | Associates a specified RADIUS user pool with this RADIUS server policy. Specify a user pool name. |

Example

```
rfs6000-37FABE(config-radius-server-policy-test)#use radius-group test

rfs6000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
 proxy retry-delay 8
 proxy retry-count 4
 proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
 ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1"
 base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-
 filter "groupfilter1" group-membership groupmembership1 net-timeout 2
 use radius-group test
 session-resumption lifetime 10 max-entries 11
rfs6000-37FABE(config-radius-server-policy-test)#
```

Related Commands

|-----------|--|

16.3 radius-user-pool-policy

► RADIUS-POLICY

Configures a RADIUS user pool policy and enters its configuration mode

A user pool defines policies for individual user access to the internal RADIUS resources. User pool policies define unique permissions (either temporary or permanent) that control user access to the local RADIUS resources. A pool can contain a single user or multiple users.

Use the (config) instance to configure RADIUS user pool policy commands. To navigate to the radius-user-pool-policy instance, use the following commands:

```
<DEVICE>(config)#radius-user-pool-policy <POOL-NAME>

rfs6000-37FABE(config)#radius-user-pool-policy testuser
rfs6000-37FABE(config-radius-user-pool-testuser)#

rfs6000-37FABE(config-radius-user-pool-testuser)#?
Radius User Pool Mode commands:
  duration  Set a guest user's access duration
  no        Negate a command or set its defaults
  user      Radius user configuration

  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
  service   Service Commands
  show      Show running system information
  write     Write running configuration to memory or terminal

rfs6000-37FABE(config-radius-user-pool-testuser)#
```

The following table summarizes RADIUS user pool policy configuration commands:

Table 16.3 RADIUS-User-Pool-Policy-Config Commands

| Commands | Description | Reference |
|-----------------|---|-------------------|
| <i>duration</i> | Modifies a guest user's duration of captive-portal access | <i>page 16-36</i> |
| <i>user</i> | Configures the RADIUS user parameters | <i>page 16-37</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 16-40</i> |

16.3.1 duration

► *radius-user-pool-policy*

Modifies the duration, in minutes, that a guest user can access the captive portal

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
duration <GUEST-USER-NAME> <0-525600>
```

Parameters

- duration <GUEST-USER-NAME> <0-525600>

| | |
|--|---|
| <pre>duration <GUEST-USER-NAME> <0-525600></pre> | <p>Modifies the duration of captive-portal access (in minutes) for the guest user identified by the <GUEST-USER-NAME> keyword</p> <ul style="list-style-type: none"> • <GUEST-USER-NAME> - Specify the guest user's name. • <0-525600> - Specify the access duration from 0 - 525600 minutes. A value of "0" indicates unlimited access. The default is 1440 minutes. |
|--|---|

Example

```
rfs4000-229D58(config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
 user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-
date 12/15/2014 access-duration 500
rfs4000-229D58(config-radius-user-pool-wdws)#

rfs4000-229D58(config-radius-user-pool-wdws)#duration guestuser1 200

rfs4000-229D58(config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
 user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-
date 12/15/2014 access-duration 200
rfs4000-229D58(config-radius-user-pool-wdws)#
```

16.3.2 user

▶ radius-user-pool-policy

Configures RADIUS user parameters

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
user <USERNAME> password [0 <UNENCRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|
<PASSWORD>] {group <RAD-GROUP-NAME>} {guest}
```

```
user <USERNAME> password [0 <UNENCRYPTED-PASSWORD>|2 <ENCRYPTED-
PASSWORD>|<PASSWORD>] {group <RAD-GROUP-NAME>} {guest expiry-time <HH:MM> expiry-
date <MM/DD/YYYY> {access-duration <0-525600>|data-limit|email-id <EMAIL-ID>|
start-time <HH:MM> start-date <MM/DD/YYYY>|telephone <TELEPHONE-NUMBER>}}
```

```
user <USERNAME> password [0 <UNENCRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|
<PASSWORD>] {group <RAD-GROUP-NAME>} {guest expiry-time <HH:MM> expiry-date <MM/
DD/YYYY> {access-duration <0-525600>|data-limit <1-102400> committed-downlink
<100-1000000> committed-uplink <100-1000000> reduced-downlink <100-1000000>
reduced-uplink <100-1000000>|email-id <EMAIL-ID>|start-time <HH:MM> start-date
<MM/DD/YYYY>|telephone <TELEPHONE-NUMBER>}}
```

Parameters

- user <USERNAME> password [0 <UNENCRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>] {group <RAD-GROUP-NAME>} {guest expiry-time <HH:MM> expiry-date <MM:DD:YYY> {access-duration <0-525600>|data-limit <1-102400> committed-downlink <100-1000000> committed-uplink <100-1000000> reduced-downlink <100-1000000> reduced-uplink <100-1000000>|email-id <EMAIL-ID>|start-time <HH:MM> start-date <MM/DD/YYYY>|telephone <TELEPHONE-NUMBER>}}

| | |
|--|---|
| user <USERNAME> | <p>Adds a new RADIUS user to the RADIUS user pool</p> <ul style="list-style-type: none"> • <USERNAME> - Specify the name of the user. The username should not exceed 64 characters. <p>Note: The username is a unique alphanumeric string identifying this user, and cannot be modified with the rest of the configuration.</p> |
| passwd [0 <UNENCRYPTED-PASSWORD>] 2 <ENCRYPTED-PASSWORD> <PASSWORD>] | <p>Configures the user password (provide a password unique to this user)</p> <ul style="list-style-type: none"> • 0 <UNENCRYPTED-PASSWORD> - Sets an unencrypted password • 2 <ENCRYPTED-PASSWORD> - Sets an encrypted password • <PASSWORD> - Sets a password (specified unencrypted) up to 21 characters |
| group <RAD-GROUP-NAME> | <p>Optional. Configures the RADIUS server group of which this user is a member</p> <ul style="list-style-type: none"> • <RAD-GROUP-NAME> - Specify the group name in the local database. <p>If the user is a guest, assign the user a group with temporary access privileges.</p> |
| guest | <p>Optional. Specifies that this user is a guest user. Guest users have restricted access. After enabling a guest user account, specify the expiry time and date for this account.</p> <p>A guest user can be assigned only to a guest user group.</p> |

| | |
|--|--|
| expiry-time <HH:MM> | Specify the user account expiry time in the HH:MM format (for example, 12:30 means 30 minutes after 12:00 the user login will expire). |
| expiry-date <MM:DD:YYYY> | Specify the user account expiry date in the MM:DD:YYYY format (for example, 02:15:2014). |
| <pre>{access-duration <0-525600> data-limit <1-102400> committed-downlink <100-1000000> committed-uplink <100-1000000> reduced-downlink <100-1000000> reduced-uplink <100-1000000> email-id <EMAIL-ID> start-time <HH:MM> start-date <MM:DD:YYY> telephone <TELEPHONE- NUMBER>}</pre> | <p>After configuring the above user details, optionally configure the following user information:</p> <ul style="list-style-type: none"> • access-duration <0-525600> – Configures the duration, in minutes, for which this guest user can access the captive portal. <ul style="list-style-type: none"> • <0-525600> – Specify a value from 0 - 525600 minutes. • data-limit <1-102400> – Configures the data limit for which this guest user can access the captive portal. Specify a value from 1 - 102400 bytes. <ul style="list-style-type: none"> • committed-downlink <100-1000000> – Configures committed downlink bandwidth until data limit is reached. This value represents the download speed (in kilobits per second) allocated to the guest user. When bandwidth is available, the user can download data at the specified rate. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the <i>reduced downlink rate</i> (specified using this command). Specify a value from 100 - 1000000 Kbps. • committed-uplink <100-1000000> – Configures committed uplink bandwidth until data limit is reached. This value represents the upload speed (in kilobits per second) allocated to the guest user. When bandwidth is available, the user can upload data at the specified rate. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the <i>reduced uplink rate</i> (specified using this command). Specify a value from 100 - 1000000 Kbps. • reduced-downlink <100-1000000> – Configures reduced downlink bandwidth after data Limit is reached. This value represents the reduced speed the guest utilizes (in kilobits per second) when exceeding the specified data limit, if applicable. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the <i>reduced downlink rate</i> specified here. Specify a value from 100-1000000 Kbps. • reduced-uplink <100-1000000> – Configures reduced uplink bandwidth after data Limit is reached. This value represents the reduced speed the guest utilizes (in kilobits per second) when exceeding the specified data limit, if applicable. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the <i>reduced uplink rate</i> specified here. Specify a value from 100 - 1000000 Kbps. • email-id – Optional. User’s e-mail ID • start-time – Optional. User’s account activation time. After specifying the activation time, specify the activation date. <ul style="list-style-type: none"> • start-date – User’s account activation date • telephone – Optional. User’s telephone number (should include the area code) <p>Contd..</p> |

To view access details of guest users on a RADIUS server, in the Priv Executable Configuration mode, use the following command:

```
show > radius > guest-users

rfs6000-37FABE#show radius guest-users time
          TIME (min:sec)
          USED    REMAINING    GUEST USER
          0:00    500:00    user1
Current time: 09:03:07
rfs6000-37FABE#
```

Example

```
rfs4000-229D58 (config-radius-user-pool-wdws)#user guestuser1 password 0
guestuser@1 group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-
duration 500
rfs4000-229D58 (config-radius-user-pool-wdws)#

rfs4000-229D58 (config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
  user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-
date 12/15/2014 access-duration 500
rfs4000-229D58 (config-radius-user-pool-wdws)#

| <i>no</i> | Deletes a user from a RADIUS user pool |
|-----------|--|

16.3.3 no

▶ *radius-user-pool-policy*

Negates a command or sets its default. When used in the RADIUS user pool policy mode, the `no` command deletes a user from a RADIUS user pool

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no user <USERNAME>
```

Parameters

- `no user <USERNAME>`

| | |
|---------------------------------------|--|
| <code>no user <USERNAME></code> | Deletes a RADIUS user <ul style="list-style-type: none"> • <code><USERNAME></code> - Specify the user name. |
|---------------------------------------|--|

Example

The following example shows the RADIUS user pool 'wdws' settings before the 'no' command is executed:

```
rfs4000-229D58 (config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
  user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-
  date 12/15/2014 access-duration 500
rfs4000-229D58 (config-radius-user-pool-wdws)#

rfs4000-229D58 (config-radius-user-pool-wdws)#no user guestuser1
```

The following example shows the RADIUS user pool 'wdws' settings after the 'no' command is executed:

```
rfs4000-229D58 (config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
rfs4000-229D58 (config-radius-user-pool-wdws)#
```

17 RADIO-QOS-POLICY

This chapter summarizes the radio QoS policy in the CLI command structure.

Configuring and implementing a radio QoS policy is essential for WLANs with heavy traffic and less bandwidth. The policy enables you to provide preferential service to selected network traffic by controlling bandwidth allocation. The radio QoS policy can be applied to VLANs configured on an access point. In case no VLANs are configured, the radio QoS policy can be applied to an access point's Ethernet and radio ports.

Without a dedicated QoS policy, a network operates on a best-effort delivery basis, meaning all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped!

When configuring a QoS policy for a radio, select specific network traffic, prioritize it, and use congestion-management and congestion-avoidance techniques to provide deployment customizations best suited to each QoS policy's intended wireless client base.

A well designed QoS policy should:

- Classify and mark data traffic to accurately prioritize and segregate it (by access category) throughout the network.
- Minimize network delay and jitter for latency sensitive traffic.
- Ensure higher priority traffic has a better likelihood of delivery in the event of network congestion.
- Prevent ineffective utilization of access points degrading session quality by configuring admission control mechanisms within each radio QoS policy.

Within a managed wireless network, wireless clients supporting low and high priority traffic contend with one another for access and data resources. The IEEE 802.11e amendment has defined *Enhanced Distributed Channel Access* (EDCA) mechanisms stating high priority traffic can access the network sooner than lower priority traffic. The EDCA defines four traffic classes (or access categories); voice (highest), video (next highest), best effort, and background (lowest). The EDCA has defined a time interval for each traffic class, known as the *Transmit Opportunity* (TXOP). The TXOP prevents traffic of a higher priority from completely dominating the wireless medium, thus ensuring lower priority traffic is still supported.

IEEE 802.11e includes an advanced power saving technique called *Unscheduled Automatic Power Save Delivery* (U-APSD) that provides a mechanism for wireless clients to retrieve packets buffered by an access point. U-APSD reduces the amount of signaling frames sent from a client to retrieve buffered data from an access point. U-APSD also allows access points to deliver buffered data frames as *bursts*, without backing-off between data frames. These improvements are useful for voice clients, as they provide improved battery life and call quality.

The Wi-Fi alliance has created *Wireless Multimedia* (WMM) and *WMM Power Save* (WMM-PS) certification programs to ensure interoperability between 802.11e WLAN infrastructure implementations and wireless clients. A managed wireless network supports both WMM and WMM-Power Save techniques. WMM and WMM-PS (U-APSD) are enabled by default in each WLAN profile.

Enabling WMM support on a WLAN just advertises the WLAN's WMM capability and radio configuration to wireless clients. The wireless clients must also support WMM and use the values correctly while accessing the WLAN to benefit.

WMM includes advanced parameters (CWMin, CWMax, AIFSN and TXOP) specifying back-off duration and inter-frame spacing when accessing the network. These parameters are relevant to both connected access point radios and their wireless clients. Parameters impacting access point transmissions to their clients are controlled using per radio WMM settings, while parameters used by wireless clients are controlled by a WLAN's WMM settings.

Wireless network controllers (access points, controllers, and service platforms) include a *Session Initiation Protocol (SIP)*, *Skinny Call Control Protocol (SCCP)* and *Application Layer Gateway (ALG)* enabling devices to identify voice streams and dynamically set voice call bandwidth.

Wireless network controllers also support static QoS mechanisms per WLAN to provide prioritization of WLAN traffic when legacy (non WMM) clients are deployed. When enabled on a WLAN, traffic forwarded to a client is prioritized and forwarded based on the WLAN's WMM access control setting.

NOTE: Statistically setting a WLAN WMM access category value only prioritizes traffic to the client.

Wireless network administrators can also assign weights to each WLAN in relation to user priority levels. The lower the weight, the lower the priority. Use a weighted technique to achieve different QoS levels across WLANs.

All devices rate-limit bandwidth for WLAN sessions. This form of per-user rate limiting enables administrators to define uplink and downlink bandwidth limits for users and clients. This sets the level of traffic a user or client can forward and receive over the WLAN. If the user or client exceeds the limit, excessive traffic is dropped. Rate limits can be applied to WLANs using groups defined locally or externally from a RADIUS server using *Vendor Specific Attributes (VSAs)*. Rate limits can be applied to users authenticating using 802.1X, captive portal authentication, and devices using MAC authentication.

Use the (config) instance to configure radios QoS policy related configuration commands. To navigate to the radio QoS policy instance, use the following commands:

```
<DEVICE>(config)#radio-qos-policy <POLICY-NAME>

rfs6000-37FABE(config)#radio-qos-policy test
rfs6000-37FABE(config-radio-qos-test)#?
Radio QoS Mode commands:
  accelerated-multicast  Configure multicast streams for acceleration
  admission-control      Configure admission-control on this radio for one or
                        more access categories
  no                     Negate a command or set its defaults
  smart-aggregation      Configure smart aggregation parameters
  wmm                    Configure 802.11e/Wireless MultiMedia parameters

  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

rfs6000-37FABE(config-radio-qos-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

17.1 radio-qos-policy

► RADIO-QOS-POLICY

The following table summarizes radio QoS policy configuration commands:

Table 17.1 *Radio-QoS-Policy-Config Commands*

| Command | Description | Reference |
|------------------------------|---|-------------------|
| <i>accelerated-multicast</i> | Configures multicast streams for acceleration | <i>page 17-5</i> |
| <i>admission-control</i> | Enables admission control across all radios for one or more access categories | <i>page 17-6</i> |
| <i>no</i> | Negates a command or resets configured settings to their default | <i>page 17-10</i> |
| <i>smart-aggregation</i> | Configures smart aggregation parameters | <i>page 17-12</i> |
| <i>service</i> | Invokes service commands in the radio QoS configuration mode | <i>page 17-14</i> |
| <i>wmm</i> | Configures 802.11e/wireless multimedia parameters | <i>page 17-16</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

17.1.1 accelerated-multicast

▶ *radio-qos-policy*

Configures multicast streams for acceleration. Multicasting allows group transmission of data streams.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
accelerated-multicast [client-timeout|max-client-streams|max-streams|overflow-policy|stream-threshold]
```

```
accelerated-multicast [client-timeout <5-6000>|max-client-streams <1-4>|max-streams <0-256>|overflow-policy [reject|revert]|stream-threshold <1-500>]
```

Parameters

- accelerated-multicast [client-timeout <5-6000>|max-client-streams <1-4>|max-streams <0-256>|overflow-policy [reject|revert]|stream-threshold <1-500>]

| | |
|---------------------------------|---|
| client-timeout <5-6000> | Configures a timeout period in seconds for wireless clients <ul style="list-style-type: none"> • <5-6000> - Specify a value from 5 - 6000 seconds. The default is 60 seconds. |
| max-client-streams <1-4> | Configures the maximum number of accelerated multicast streams per client <ul style="list-style-type: none"> • <1-4> - Specify a value from 1 - 4. The default is 2. |
| max-streams <0-256> | Configures the maximum number of accelerated multicast streams per radio <ul style="list-style-type: none"> • <0-256> - Specify a value from 0 - 256. The default is 25. |
| overflow-policy [reject revert] | Specifies the policy in case too many clients register simultaneously. The radio QOS policy can be configured to follow one of the following courses of action: <ul style="list-style-type: none"> • reject - Rejects new clients. The default overflow policy is reject. • revert - Reverts to regular multicast delivery <p>When the number of wireless clients using accelerated multicast exceeds the configured value (max-streams), the radio can either reject new wireless clients or revert existing clients to a non-accelerated state.</p> |
| stream-threshold <1-500> | Configures the number of multicast packets per second threshold value. Once this threshold is crossed, the system triggers streams to accelerate. <ul style="list-style-type: none"> • <1-500> - Specify a value from 1 - 500. The default is 25 packets per second. |

Example

```
rfs6000-37FABE(config-radio-qos-test)#accelerated-multicast client-timeout 500
rfs6000-37FABE(config-radio-qos-test)#accelerated-multicast stream-threshold 15

rfs6000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  accelerated-multicast stream-threshold 15
  accelerated-multicast client-timeout 500
rfs6000-37FABE(config-radio-qos-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Reverts accelerated multicasting settings to their default |
|-----------|--|

17.1.2 admission-control

▶ *radio-qos-policy*

Enables admission control across all radios for one or more access categories. Enabling admission control for an access category, ensures clients associated to an access point and complete WMM admission control before using that access category.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
admission-control [background|best-effort|firewall-detected-traffic|implicit-
tspec|video|voice]

admission-control [firewall-detected-traffic|implicit-tspec]

admission-control [background|best-effort|video|voice] {max-airtime-percent|max-
clients|max-roamed-clients|reserved-for-roam-percent}

admission-control [background|best-effort|video|voice] {max-airtime-percent <0-
150>|max-clients <0-256>|max-roamed-clients <0-256>|reserved-for-roam-percent <0-
150>}
```

Parameters

- admission-control [firewall-detected-traffic|implicit-tspec]

| | |
|---|---|
| admission-control firewall-detected-traffic | Enforces admission control for traffic whose access category is detected by the firewall ALG. For example, SIP voice calls. This feature is enabled by default. When enabled, the firewall simulates reception of frames for voice traffic when the voice traffic was originated via SIP or SCCP control traffic. If a client exceeds configured values, the call is stopped and/or received voice frames are forwarded at the next non admission controlled traffic class priority. This applies to clients that do not send TSPEC frames only. |
| admission-control implicit-tspec | Enables implicit traffic specifiers for clients that do not support WMM TSPEC, but are accessing admission-controlled access categories. This feature is enabled by default. This feature requires wireless clients to send their traffic specifications to an access point before they can transmit or receive data. If enabled, this setting applies to this radio QoS policy. When enabled, the access point simulates the reception of frames for any traffic class by looking at the amount of traffic the client is receiving and sending. If the client sends more traffic than has been configured for an admission controlled traffic class, the traffic is forwarded at the priority of the next non admission controlled traffic class. This applies to clients that do not send TSPEC frames only. |
| <ul style="list-style-type: none"> • admission-control [background best-effort video voice] {max-airtime-percent <0-150> max-clients <0-256> max-roamed-clients <0-256> reserved-for-roam-percent <0-150>} | |
| admission-control background | Configures background access category admission control parameters |

| | |
|-------------------------------|--|
| admission-control best-effort | Configures best effort access category admission control parameters |
| admission-control video | Configures video access category admission control parameters |
| admission-control voice | Configures voice access category admission control parameters |
| max-airtime-percent <0-150> | <p>Optional. Specifies the maximum percentage of airtime, including oversubscription, for the following access category:</p> <ul style="list-style-type: none"> • background – Sets the maximum airtime (in the form of a percentage of the radio's bandwidth) allotted to admission control for low (background) client traffic. Background traffic only needs a short radio airtime to process, so set an intermediate airtime value if this radio QoS policy is reserved to support background data. • best-effort – Sets the maximum airtime (in the form of a percentage of the radio's bandwidth) allotted to admission control for normal (best-effort) client traffic. Normal best effort traffic needs a short radio airtime to process, so set an intermediate airtime value if this radio QoS policy is reserved for best effort data support. • video – Sets the maximum airtime (in the form of a percentage of the radio's bandwidth) allotted to admission control for voice supported client traffic. Video traffic requires longer radio airtime to process, so set a longer airtime value if this radio QoS policy is intended to support video. • voice – Sets the maximum airtime (in the form of a percentage of the radio's bandwidth) allotted to admission control for voice supported client traffic. Voice traffic requires longer radio airtime to process, so set a longer airtime value if this radio QoS policy is intended to support voice. <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-150> – Specify a value from 0 - 150. This is the maximum percentage of airtime, including oversubscription, for the selected access category. The default is 75%. |
| max-clients <0-256> | <p>Optional. Specifies the maximum number of wireless clients admitted to the following access categories:</p> <ul style="list-style-type: none"> • background – Sets the number of wireless clients supporting low (background) traffic allowed to exist (and consume bandwidth) within the radio's QoS policy • best-effort – Sets the number of wireless clients supporting normal (best-effort) traffic allowed to exist (and consume bandwidth) within the radio's QoS policy • video – Sets the number of video supported wireless clients allowed to exist (and consume bandwidth) within the radio's QoS policy. • voice – Sets the number of voice supported wireless clients allowed to exist (and consume bandwidth) within the radio's QoS policy. <p>Since voice and video supported wireless clients use a greater portion of a controller's resources than lower bandwidth traffic (like low and best effort categories), consider setting the max-client value proportionally to the number of other QoS policies supporting voice access category clients.</p> <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-256> – Specify a value from 0 - 256. This is the maximum number of wireless clients admitted to the selected access category. The default is 100 clients. |

| | |
|-----------------------------------|---|
| max-roamed-clients <0-256> | <p>Optional. Specifies the maximum number of roaming wireless clients admitted to the selected access category</p> <ul style="list-style-type: none"> • background – Sets the number of low (background) supported wireless clients allowed to roam to a different access point radio • best-effort – Sets the number of normal (best-effort) supported wireless clients allowed to roam to a different access point radio • video – Sets the number of video supported wireless clients allowed to roam to a different access point radio • voice – Sets the number of voice supported wireless clients allowed to roam to a different access point radio <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-256> – Specify a value from 0 - 256. This is the maximum number of roaming wireless clients admitted to the selected access category. The default is 10 roamed clients. |
| reserved-for-roam-percent <0-150> | <p>Optional. Calculates the percentage of air time, including oversubscription, allocated exclusively for roaming clients. This value is calculated relative to the configured max air time for this access category.</p> <ul style="list-style-type: none"> • background – Sets the roam utilization (in the form of a percentage of the radio's bandwidth) allotted to admission control for low (background) supported clients who have roamed to a different radio. • best-effort – Sets the roam utilization (in the form of a percentage of the radio's bandwidth) allotted to admission control for normal (best-effort) supported clients who have roamed to a different radio. • video – Sets the roam utilization (in the form of a percentage of the radio's bandwidth) allotted to admission control for video supported clients who have roamed to a different radio. • voice – Sets the roam utilization (in the form of a percentage of the radio's bandwidth) allotted to admission control for voice supported clients who have roamed to a different radio. <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-150> – Specify a value from 0 - 150. This is the percentage of air time, including oversubscription, allocated exclusively for roaming clients associated with the selected access category. The default is 10%. |

Example

```

rfs6000-37FABE (config-radio-qos-test) #admission-control best-effort max-clients
200
rfs6000-37FABE (config-radio-qos-test) #admission-control voice reserved-for-roam-
percent 8
rfs6000-37FABE (config-radio-qos-test) #admission-control voice max-airtime-percent
9

rfs6000-37FABE (config-radio-qos-test) #show context
radio-qos-policy test
admission-control voice max-airtime-percent 9
admission-control voice reserved-for-roam-percent 8
admission-control best-effort max-clients 200
accelerated-multicast stream-threshold 15
accelerated-multicast client-timeout 500
rfs6000-37FABE (config-radio-qos-test) #

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Reverts or resets admission control settings to their default |
|-----------|---|

17.1.3 no

▶ *radio-qos-policy*

Negates a command or resets configured settings to their default. When used in the radio QOS policy mode, the `no` command enables the resetting of accelerated multicast parameters, admission control parameters, and MultiMedia parameters.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [accelerated-multicast|admission-control|smart-aggregation|wmm|service]

no accelerated-multicast [client-timeout|max-client-streams|max-streams|
overflow-policy|stream-threshold]

no admission-control [firewall-detected-traffic|implicit-tspec|background|
best-effort|video|voice]
no admission-control [firewall-detected-traffic|implicit-tspec]
no admission-control [background|best-effort|video|voice] {max-airtime-percent|
max-clients|max-roamed-clients|reserved-for-roam-percent}

no smart-aggregation {delay|max-mesh-hops|min-aggregation-limit}
no smart-aggregation {delay [background|best-effort|streaming-video|
video-conferencing|voice]|max-mesh-hops|min-aggregation-limit}

no wmm [background|best-effort|video|voice] [aifsn|cw-max|cw-min|txop-limit]

no service admission-control across-reassoc
```

Parameters

- `no <PARAMETERS>`

| | |
|------------------------------------|---|
| <code>no <PARAMETERS></code> | Negates a command or resets configured settings to their default. When used in the radio QOS policy mode, the <code>no</code> command enables the resetting of accelerated multicast parameters, admission control parameters, and MultiMedia parameters. |
|------------------------------------|---|

Example

The following example shows the Radio-qos-policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
admission-control voice max-airtime-percent 9
admission-control voice reserved-for-roam-percent 8
admission-control best-effort max-clients 200
accelerated-multicast stream-threshold 15
accelerated-multicast client-timeout 500
rfs6000-37FABE(config-radio-qos-test)#

rfs6000-37FABE(config-radio-qos-test)#no admission-control best-effort max-
clients
rfs6000-37FABE(config-radio-qos-test)#no accelerated-multicast client-timeout
```

The following example shows the Radio-qos-policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
 admission-control voice max-airtime-percent 9
 admission-control voice reserved-for-roam-percent 8
 accelerated-multicast stream-threshold 15
rfs6000-37FABE(config-radio-qos-test)#

rfs4000-229D58(config-radio-qos-test)#show context
radio-qos-policy test
 service admission-control across-reassoc
rfs4000-229D58(config-radio-qos-test)#

rfs4000-229D58(config-radio-qos-test)#no service admission-control across-reassoc

rfs4000-229D58(config-radio-qos-test)#show context
radio-qos-policy test
rfs4000-229D58(config-radio-qos-test)#
```

17.1.4 smart-aggregation

▶ *radio-qos-policy*

Configures smart aggregation parameters on this Radio QoS policy. Smart aggregation is disabled by default.

Smart aggregation enhances frame aggregation by dynamically selecting the time when the aggregated frame is transmitted. In a frame's typical aggregation, an aggregated frame is sent when:

- A pre-configured number of aggregated frames is reached
- An administrator-defined interval has elapsed since the first frame (of a set of frames to be aggregated) was received
- An administrator-defined interval has elapsed since the last frame (not necessarily the final frame) of a set of frames to be aggregated was received

With this enhancement, an aggregation delay is set uniquely for each traffic class. For example, voice traffic might not be aggregated, but sent immediately. Whereas, background data traffic is set a delay for aggregating frames, and these aggregated frames are sent.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
smart-aggregation {delay|max-mesh-hops|min-aggregation-limit}

smart-aggregation {delay [background|best-effort|streaming-video|video-
conferencing|voice] <0-1000>}

smart-aggregation {max-mesh-hops <1-10>}

smart-aggregation {min-aggregation-limit <0-64>}
```

Parameters

- `smart-aggregation {delay [background|best-effort|streaming-video|video-conferencing|voice] <0-1000>}`

| | |
|--------------------|--|
| delay | Optional. Configures the maximum delay parameter for each traffic type This is the maximum delay, in milliseconds, in the transmission of the first frame received. |
| background | Configures the maximum delay parameter, in milliseconds, for background traffic (250 msec) |
| best-effort | Configures the maximum delay parameter, in milliseconds, for best effort traffic (150 msec) |
| streaming-video | Configures the maximum delay parameter, in milliseconds, for streaming video traffic (150 msec) |
| video-conferencing | Configures the maximum delay parameter, in milliseconds, for video conference traffic (40 msec) |

| | |
|------------------------------|---|
| voice | Configures the maximum delay parameter, in milliseconds, for voice traffic (0 msec) |
| <0-1000> | This parameter is common to all of the above traffic types. <ul style="list-style-type: none"> <0-1000> - Specify a value from 0 - 1000 msec. |
| | <ul style="list-style-type: none"> smart-aggregation {max-mesh-hops <1-10>} |
| max-mesh-hops <1-10> | Optional. Sets the maximum number of expected hops to the destination within a mesh <ul style="list-style-type: none"> <1-10> - Specify a value from 1 - 10. The default is 3 hops. |
| | <ul style="list-style-type: none"> smart-aggregation {min-aggregation-limit <0-64>} |
| min-aggregation-limit <0-64> | Optional. Sets the minimum number of aggregates buffered before an aggregate is sent <ul style="list-style-type: none"> <0-64> - Specify a value from 0 - 64. The default is 8 frames. |

Example

```
rfs6000-37FABE(config-radio-qos-test)#smart-aggregation delay voice 50
rfs6000-37FABE(config-radio-qos-test)#smart-aggregation delay background 100

rfs6000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  smart-aggregation delay voice 50
  smart-aggregation delay background 100
rfs6000-37FABE(config-radio-qos-test)#
```

Related Commands

| | |
|-----------|--------------------------------------|
| <i>no</i> | Resets the minimum aggregation limit |
|-----------|--------------------------------------|

17.1.5 service

▶ *radio-qos-policy*

Invokes service commands in the radio QoS configuration mode

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
service [admission-control|show]

service admission-control across-reassoc

service show cli
```

Parameters

- `service admission-control across-reassoc`

| | |
|---|---|
| service | Invokes service commands |
| admission-control across-reassoc | Retains previously negotiated TSPEC parameters across re-associations on the radio For more information on admission-control parameters, see admission-control . |
| <ul style="list-style-type: none"> • <code>service show cli</code> | |
| service show cli | Displays running system information <ul style="list-style-type: none"> • cli - Displays the Radio QoS mode's CLI tree |

Example

```
rfs4000-229D58 (config-radio-qos-test)#service admission-control across-reassoc

rfs4000-229D58 (config-radio-qos-test)#show context
radio-qos-policy test
  service admission-control across-reassoc
rfs4000-229D58 (config-radio-qos-test)#

rfs4000-229D58 (config-radio-qos-test)#service show cli
Radio QoS Mode mode:

```

Related Commands*no*

| | |
|-----------|--|
| <i>no</i> | Disables retention of previously negotiated TSPEC parameters across re-associations on the radio |
|-----------|--|

17.1.6 wmm

► *radio-qos-policy*

Configures 802.11e *wireless multimedia* (wmm) parameters

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
wmm [background|best-effort|video|voice]
```

```
wmm [background|best-effort|video|voice] [aifsn <1-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]
```

Parameters

- wmm [background|best-effort|video|voice] [aifsn <1-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]

| | |
|-----------------|--|
| wmm background | Configures background access category wireless multimedia settings |
| wmm best-effort | Configures best effort access category wireless multimedia settings |
| wmm video | Configures video access category wireless multimedia settings |
| wmm voice | Configures voice access category wireless multimedia settings |
| aifsn <1-15> | <p>Configures <i>Arbitrary Inter-Frame Space Number</i> (AIFSN) as the wait time between data frames derived from the AIFSN and slot time</p> <ul style="list-style-type: none"> • background – Sets the current AIFSN for low (background) traffic. The default is 7. • best-effort – Sets the current AIFSN for normal (best-effort) traffic. The default is 3. • video – Set the current AIFSN for video traffic. Higher-priority traffic video categories should have lower AIFSNs than lower-priority traffic categories. This causes lower-priority traffic to wait longer before attempting access. The default is 1. • voice – Sets the current AIFSN for voice traffic. Higher-priority traffic voice categories should have lower AIFSNs than lower-priority traffic categories. This causes lower-priority traffic to wait longer before attempting access. The default is 1. <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <1-15> – Sets a value from 1 - 15 |
| cw-max <0-15> | <p>Clients pick a number between 0 and the min contention window to wait before retransmission. Clients then double their wait time on a collision, until it reaches the maximum contention window.</p> <ul style="list-style-type: none"> • background – Sets CW Max for low (background) traffic. The default is 10. • best-effort – Sets CW Max for normal (best effort) traffic. The default is 6. <p>Contd..</p> |

| | |
|----------------------|--|
| | <ul style="list-style-type: none"> • voice – Sets CW Max for voice traffic. The default is 3. • video – Sets CW Max for video traffic. The default is 4 <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-15> – ECW: the contention window. The actual value used is $(2^{\text{ECW}} - 1)$. <p>Note: Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort).</p> |
| cw-min <0-15> | <p>Clients select a number between 0 and the min contention window to wait before retransmission. Clients then double their wait time on a collision, until it reaches the maximum contention window.</p> <ul style="list-style-type: none"> • background – Sets CW Min for low (background) traffic. The default is 4. • best-effort – Sets CW Min for normal (best effort) traffic. The default is 4. • voice – Sets CW Min for voice traffic. The default is 2. • video – Sets CW Min for video traffic. The default is 3. <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-15> – ECW: the contention window. The actual value used is $(2^{\text{ECW}} - 1)$. <p>Note: Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort).</p> |
| txop-limit <0-65535> | <p>Set the interval, in microseconds, during which a particular client has the right to initiate transmissions</p> <ul style="list-style-type: none"> • background – Sets TXOP for low (background) traffic. The default is 0. • best-effort – Sets TXOP for normal (best effort) traffic. The default is 4. • voice – Sets TXOP for voice traffic. The default is 47. • video – Sets TXOP for video traffic. The default is 94. <p>The following keyword is common to all of the above traffic types:</p> <ul style="list-style-type: none"> • <0-65535> – Specify a value from 0 - 65535 to configure the transmit opportunity limit in 32 microsecond units. <p>Note: Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort).</p> |

Usage Guidelines

Before defining a radio QoS policy, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- To support QoS, each multimedia application, wireless client, and WLAN is required to support WMM.
- WMM enabled clients can co-exist with non-WMM clients on the same WLAN. Non-WMM clients are always assigned a Best Effort access category.
- Default WMM values are recommended for all deployments. Changing these values can lead to unexpected traffic blockages, and the blockages might be difficult to diagnose.
- Overloading an access point radio with too much high priority traffic (especially voice) degrades overall service quality for all users.
- TSPEC admission control is only available with newer voice over WLAN phones. Many legacy voice devices do not support TSPEC or even support WMM traffic prioritization.

Example

```
rfs6000-37FABE(config-radio-qos-test)#wmm best-effort aifsn 7
rfs6000-37FABE(config-radio-qos-test)#wmm voice txop-limit 1

rfs6000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  wmm best-effort aifsn 7
  wmm voice txop-limit 1
  admission-control voice max-airtime-percent 9
  admission-control voice reserved-for-roam-percent 8
  accelerated-multicast stream-threshold 15
rfs6000-37FABE(config-radio-qos-test)#
```

| <i>no</i> | Reverts or resets 802.11e/wireless multimedia settings to their default |
|-----------|---|

18 ROLE-POLICY

This chapter summarizes the role policy commands in the CLI command structure.

A well defined role policy simplifies user management, and is a significant aspect of WLAN management. It acts as a role based firewall (much like ACLs) consisting of user-defined roles. Each role has a set of match criteria (filters) used to filter wireless clients. The action taken when a client matches the defined filters, is determined by the IP or MAC ACL associated with the user-defined role. Based on the conditions specified in the IP and/or MAC ACL, clients are granted or denied access to the controller managed network. The role policy also defines the VLAN and data rates assigned to clients provided network access.

A role policy also enables LDAP service, allowing controllers and access points to retrieve user information from the LDAP server. This information is matched with the user-defined role filters to determine if a client matches the role or not, and should be allowed or denied access to the controller managed network.

Use the (config-role-policy) instance to configure role policy related configuration commands. To navigate to the config-role instance, use the following commands:

```
<DEVICE>(config)#role-policy <POLICY-NAME>

rfs6000-37FABE(config)#role-policy test
rfs6000-37FABE(config-role-policy-test)#?
Role Policy Mode commands:
  default-role      Configuration for Wireless Clients not matching any role
  ldap-deadperiod   Ldap dead period interval
  ldap-query        Set the ldap query mode
  ldap-server       Add a ldap server
  ldap-timeout      Ldap query timeout interval
  no                Negate a command or set its defaults
  user-role         Create a role

  clrscr           Clears the display screen
  commit           Commit all changes made in this session
  do               Run commands from Exec mode
  end              End current mode and change to EXEC mode
  exit             End current mode and down to previous mode
  help            Description of the interactive help system
  revert           Revert changes
  service          Service Commands
  show             Show running system information
  write           Write running configuration to memory or terminal
rfs6000-37FABE(config-role-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

18.1 role-policy

► *ROLE-POLICY*

The following table summarizes role policy configuration commands:

Table 18.1 *Role-Policy-Config Commands*

| Command | Description | Reference |
|------------------------|---|-------------------|
| <i>default-role</i> | Assigns the default role to clients not matching any of the user-defined roles defined in the role policy | <i>page 18-3</i> |
| <i>ldap-deadperiod</i> | Configures the <i>Lightweight Directory Access Protocol</i> (LDAP) deadperiod interval | <i>page 18-5</i> |
| <i>ldap-query</i> | Enables LDAP service and specifies the LDAP server query mode | <i>page 18-6</i> |
| <i>ldap-server</i> | Configures the LDAP server settings | <i>page 18-7</i> |
| <i>ldap-timeout</i> | Configures the LDAP query timeout interval | <i>page 18-9</i> |
| <i>no</i> | Negates a command or reverts settings to their default | <i>page 18-10</i> |
| <i>user-role</i> | Creates a role and associates it to the newly created role policy | <i>page 18-11</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

18.1.1 default-role

► *role-policy*

Assigns a default role to a wireless client that fails to match any of the user-defined roles

When a wireless client accesses a network, the client's details, retrieved from the LDAP server, are matched against all user-defined roles within the role policy. If the client fails to match any of these user-defined role filters, the client is assigned the default role. The action taken (permit or deny access) is determined by the IP and/or MAC ACL associated with the default role.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
default-role use [ip-access-list|ipv6-access-list|mac-access-list]
default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]
<IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>
```

Parameters

- default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out] <IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>

| | |
|---|---|
| default-role use | <p>Enables default role configuration. This role is applied to a wireless client not matching any of the user-defined roles.</p> <ul style="list-style-type: none"> • Use – Associates an IP, IPv6, or MAC access list with the default role |
| [ip-access-list ipv6-access-list mac-access-list] [in out] <IP/IPv6/MAC-ACCESS-LIST-NAME> | <p>Associates an IP access list, IPv6 access list, or a MAC access list with this default role</p> <ul style="list-style-type: none"> • in – Applies the rule (IP, IPv6, or MAC) to incoming packets • out – Applies the rule (IP, IPv6, or MAC) to outgoing packets <p>IP and MAC <i>access control lists</i> (ACLs) act as firewalls by blocking and/or permitting data traffic in both directions (inbound and outbound) within a managed network. IP ACLs use IP addresses for matching operations. Whereas, MAC ACLs use MAC addresses for matching operations. In case of a match (i.e. if a packet is received from or is destined for a specified IP or MAC address), an action is taken. This action is a typical allow, deny or mark designation to controller packet traffic. For more information on ACLs, see AAA-POLICY.</p> <ul style="list-style-type: none"> • <IP/IPv6/MAC-ACCESS-LIST-NAME> – Specify the access list name. <p>The ACL applied determines the action applied to a client assigned the default role.</p> |
| precedence <1-100> | <p>The following keyword is common to the all of the above parameters:</p> <ul style="list-style-type: none"> • precedence – Assigns a precedence value to the ACL identified in the previous step. <ul style="list-style-type: none"> • <1-100> – Specify a precedence from 1 - 100. <p>ACLs are applied in increasing order of their precedence. Rules with lower precedence are given priority.</p> |

Example

```
rfs6000-37FABE(config-role-policy-test)#default-role use ip-access-list in test
precedence 1

rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
rfs6000-37FABE(config-role-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes or resets the default role configuration |
|-----------|--|

18.1.2 ldap-deadperiod

► *role-policy*

Configures the LDAP deadperiod interval

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-deadperiod <60-300>
```

Parameters

- ldap-deadperiod <60-300>

| | |
|-----------------------------|--|
| ldap-deadperiod <60-300> | Configures a LDAP dead period. When enabled, LDAP service allows the AP or controller to bind with the LDAP server and retrieve user details to match with user-defined role filters. The LDAP deadperiod is the interval between two consecutive attempts to bind with the LDAP server. To enable LDAP service, use the <i>ldap-query</i> command. <ul style="list-style-type: none"> • <60-300> - Specify the interval from 60 - 300 seconds. The default is 120 seconds. |
|-----------------------------|--|

Example

```
rfs6000-37FABE(config-role-policy-test)#ldap-deadperiod 100

rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
 default-role use ip-access-list in test precedence 1
 ldap-deadperiod 100
rfs6000-37FABE(config-role-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes or resets the LDAP deadperiod interval |
|-----------|--|

18.1.3 ldap-query

► *role-policy*

Enables LDAP service and specifies the LDAP server query mode

Configuring the LDAP server query mode automatically enables LDAP service on this role policy. By default LDAP service is disabled.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-query [self|through-controller]
```

Parameters

- ldap-query [self|through-controller]

| | |
|--------------------|--|
| self | Configures LDAP query mode as self. The AP directly queries the LDAP server for user information. Select 'self' to use local LDAP server resources configured using the <i>ldap-server</i> command. |
| through-controller | Configures LDAP query mode as through-controller. The AP queries the LDAP server, for user information, through the controller. Use this option when the AP is layer 2 adopted to the controller. |

Example

```
rfs6000-37FABE(config-role-policy-test)#ldap-query self

rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
ldap-query self
ldap-deadperiod 100
rfs6000-37FABE(config-role-policy-test)#
```

18.1.4 ldap-server

► *role-policy*

Associates a specified LDAP server with this role policy. Use this command to configure the credentials needed to bind with the LDAP server.

When enabled, LDAP service allows the AP or controller to bind with the LDAP server and retrieve user details. This information is matched with the user-defined roles within the role policy. If a match is made, the user is assigned the role and allowed or denied access to the controller managed network.

You can associate two LDAP servers with a role policy, allowing failover in case the primary server is unreachable.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-server <1-2> host [<IP>|<FQDN>] bind-dn <BIND-DN> base-dn <BASE-DN>
bind-password <PASSWORD> {port <1-65535>} {(server-type [active-directory|
openldap])}
```

Parameters

```
• ldap-server <1-2> host [<IP>|<HOSTNAME>] bind-dn <BIND-DN> base-dn <BASE-DN>
bind-password <PASSWORD> {port <1-65535>} {(server-type [active-directory|
openldap])}
```

| | |
|---|---|
| ldap-server <1-2> | Specify the LDAP server ID from 1 - 2. The primary LDAP server (ID 1) is used to bind and query. The secondary LDAP server (ID 2) is for failover. |
| host [<IP> <FQDN>] | Specify the LDAP server's IP address or <i>Fully Qualified Domain Name</i> (FQDN). |
| bind-dn <BIND-DN> | Specify the bind distinguished name (used for binding with the server). |
| base-dn <BASE-DN> | Specify the base distinguished name (used for searching). This should not exceed 127 characters. |
| bind-password <PASSWORD> | Specify the LDAP server password associated with the bind DN. |
| port <1-65535> | Optional. Specify the LDAP server port from 1 - 65535. (default is 389). |
| server-type [active-directory openldap] | The following keywords are common to the 'port' parameter: <ul style="list-style-type: none"> • server-type - Optional. Specifies the LDAP server type <ul style="list-style-type: none"> • active-directory - Enables support for active directory attribute search. This is the default setting. • openldap - Enables support for openLDAP attribute search |

Usage Guidelines

Use the ldap-query command to enable LDAP service on a role policy.

Use the show > role > ldap-stats command to view LDAP server status and state.

Example

```
rfs6000-37FABE(config-role-policy-test)#ldap-server 1 host 192.168.13.7 bind-dn
"CN=Administrator,CN=Users,DC=TechPub,DC=com" base-dn "CN=Administrator,CN=Users,
DC=TechPub,DC=com" bind-password 0 superuser port 2
rfs6000-37FABE(config-role-policy-test)#
```

```
rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
 default-role use ip-access-list in test precedence 1
 ldap-query self
 ldap-deadperiod 100
 ldap-server 1 host 192.168.13.7 bind-dn
 CN=Administrator,CN=Users,DC=TechPub,DC=com base-dn
 CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2
rfs6000-37FABE(config-role-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes or resets the LDAP server settings |
|-----------|--|

18.1.5 ldap-timeout

► *role-policy*

Configures the LDAP timeout interval. This is the interval after which a LDAP query is timed out.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ldap-timeout <1-5>
```

Parameters

- ldap-timeout <1-5>

| | |
|--------------------|--|
| ldap-timeout <1-5> | <p>Configures the LDAP query timeout interval from 1 - 5 seconds (default is 2 seconds)</p> <p>When enabled, LDAP service allows the AP or controller to bind with the LDAP server and query it for user details. The LDAP query timeout is the interval between a request to and the response from the LDAP server. Once this interval is exceeded, the LDAP bind and query is timed out.</p> |
|--------------------|--|

Example

```
rfs6000-37FABE(config-role-policy-test)#ldap-timeout 1

rfs6000-37FABE(config-role-policy-test)#show context
role-policy test default-role use ip-access-list in test precedence 1
  ldap-query self
    ldap-timeout 1
    ldap-deadperiod 100
    ldap-server 1 host 192.168.13.7 bind-dn
    CN=Adminstrator,CN=Users,DC=TechPub,DC=com base-dn
    CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2
rfs6000-37FABE(config-role-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes or resets the LDAP query timeout to default (2 seconds) |
|-----------|---|

18.1.6 no

► *role-policy*

Negates a command or resets settings to their default. When used in the config role policy mode, the *no* command removes or resets the role policy settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [default-role|ldap-deadperiod|ldap-query|ldap-server <1-2>|ldap-timeout|user-
role]

no [ldap-deadperiod|ldap-query|ldap-server <1-2>|ldap-timeout]

no default-role use [ip-access-list|ipv6-access-list|mac-access-list]
no default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]
<IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>

no user-role <ROLE-NAME>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Negates a command or resets settings to their default. When used in the config role policy mode, the <i>no</i> command removes or resets the role policy settings. |
|-----------------|--|

Example

The following example shows the role policy 'test' setting before the 'no' commands are executed:

```
rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
ldap-query self
ldap-timeout 1
ldap-deadperiod 100
ldap-server 1 host 192.168.13.7 bind-dn
CN=Adminstrator,CN=Users,DC=TechPub,DC=com base-dn
CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2

rfs6000-37FABE(config-role-policy-test)#

rfs6000-37FABE(config-role-policy-test)#no ldap-deadperiod
rfs6000-37FABE(config-role-policy-test)#no ldap-timeout
rfs6000-37FABE(config-role-policy-test)#no ldap-server 1
```

The following example shows the role policy 'test' setting after the 'no' commands are executed:

```
rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
ldap-query self
rfs6000-37FABE(config-role-policy-test)#
```

18.1.7 user-role

▶ *role-policy*

This command creates a user-defined role. Each user-defined role has a set of Active Directory attributes. Each attribute is matched against the information returned by the LDAP server, until a complete match of role is found.

The following table summarizes user role configuration commands:

Table 18.2 *User-Role-Config Commands*

| | | |
|---------------------------|---|-------------------|
| <i>user-role</i> | Creates a new user role and enters its configuration mode | <i>page 18-12</i> |
| <i>user-role commands</i> | Summarizes user role configuration mode commands | <i>page 18-14</i> |

18.1.7.1 user-role

▶ *user-role*

Creates a user-defined role. Each role consists of a set of filters and action. The filters are match criteria used to filter wireless clients. And the action defines the action taken when a client matches the specified filters.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
user-role <ROLE-NAME> precedence <1-10000>
```

Parameters

- user-role <ROLE-NAME> precedence <1-10000>

| | |
|-----------------------|---|
| user-role <ROLE-NAME> | Configures the user role name <ul style="list-style-type: none"> • <ROLE-NAME> - Specify a name for this user role. |
| precedence <1-10000> | Sets the precedence for this role Lower the precedence, higher is the role priority. Precedence determines the order in which a role is applied. If a wireless client matches multiple roles, the role with the lower precedence is applied before those with higher precedence. While there is no default precedence for a role, two or more roles can share the same precedence. |

Example

```
rfs6000-37FABE(config-role-policy-test)#user-role testing precedence 10
rfs6000-37FABE(config-role-policy-test)#show context
role-policy test
  user-role testing precedence 10
  default-role use ip-access-list in test precedence 1
rfs6000-37FABE(config-role-policy-test)#

rfs6000-37FABE(config-role-policy-test-user-role-testing)#?
Role Mode commands:
  ap-location          AP Location configuration
  assign               Assign parameters to the role
  authentication-type  Type of Authentication
  captive-portal       Captive-portal based Role Filter
  city                 City configuration

18.1.7.2 user-role commands

► *user-role*

The following table summarizes user role configuration mode commands:

Table 18.3 *User-Role-Mode Commands*

| Commands | Description | Reference |
|----------------------------|--|-------------------|
| <i>ap-location</i> | Configures an AP deployment location based filter | <i>page 18-15</i> |
| <i>assign</i> | Configures upstream/downstream rate limits and VLAN ID assigned to clients matching the filters defined in the user-defined role | <i>page 18-16</i> |
| <i>authentication-type</i> | Configures an authentication type based filter | <i>page 18-18</i> |
| <i>captive-portal</i> | Configures a captive portal based filter | <i>page 18-20</i> |
| <i>city</i> | Configures a city name based filter | <i>page 18-21</i> |
| <i>client-identity</i> | Associates a client-identity (device fingerprinting) based filter | <i>page 18-22</i> |
| <i>company</i> | Configures a company name based filter | <i>page 18-23</i> |
| <i>country</i> | Configures a country name based filter | <i>page 18-25</i> |
| <i>department</i> | Configures a department name based filter | <i>page 18-27</i> |
| <i>emailid</i> | Configures a e-mail ID based filter | <i>page 18-29</i> |
| <i>employee-type</i> | Configures a employee type ID based filter | <i>page 18-31</i> |
| <i>employeeid</i> | Configures a employee ID based filter | <i>page 18-32</i> |
| <i>encryption-type</i> | Configures an encryption type filter | <i>page 18-34</i> |
| <i>group</i> | Configures a RADIUS group based filter | <i>page 18-36</i> |
| <i>memberOf</i> | Assigns an <i>Active Directory</i> (AD) group to this user-defined role | <i>page 18-38</i> |
| <i>mu-mac</i> | Configures MAC address and mask based filter | <i>page 18-39</i> |
| <i>no</i> | Removes or resets the filters configured on this user-defined role | <i>page 18-40</i> |
| <i>radius-user</i> | Configures a wireless client filter based on the RADIUS user name | <i>page 18-42</i> |
| <i>ssid</i> | Configures a SSID based filter | <i>page 18-44</i> |
| <i>state</i> | Configures a user role state to match | <i>page 18-46</i> |
| <i>title</i> | Configures a 'title' string to match | <i>page 18-48</i> |
| <i>use</i> | Associates a IP and/or MAC ACL with this role. These ACLs specify the action taken when a client matches this user-defined role. | <i>page 18-49</i> |
| <i>user-defined</i> | Defines a filter based on an attribute defined in the Active Directory or the OpenLDAP server | <i>page 18-52</i> |

18.1.7.2.1 ap-location

▶ *user-role commands*

Configures an AP's deployment location based filter for this user-defined role

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap-location [any|contains|exact|not-contains]
ap-location any
ap-location [contains|exact|not-contains] <WORD>
```

Parameters

- ap-location any

| | |
|--|--|
| ap-location any | Specifies the AP location to match (in a RF Domain) or the AP's resident configuration <ul style="list-style-type: none"> • any - Defines an AP's location as any |
| <ul style="list-style-type: none"> • ap-location [contains exact not-contains] <WORD> | |
| ap-location | Specifies the AP location to match (in a RF Domain) or the AP's resident configuration. Select one of the following filter options: contains, exact, or not-contains. |
| contains <WORD> | Applies role if the associating AP's location contains the location string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the location string to match. |
| exact <WORD> | Applies role if the associating AP's location exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact location string to match. |
| not-contains <WORD> | Applies role if the associating AP's location does not contain the location string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the location string not to match. |

Example

```
rfs6000-37FABE (config-role-policy-test-user-role-testing) #ap-location contains
office

rfs6000-37FABE (config-role-policy-test-user-role-testing) #show context
user-role testing precedence 10
  ap-location contains office
rfs6000-37FABE (config-role-policy-test-user-role-testing) #
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes an AP's deployment location string from this user-defined role |
|-----------|--|

18.1.7.2.2 assign

▶ *user-role commands*

Configures upstream/downstream rate limits and VLAN ID. Clients matching this user-defined role filters are associated with the specified VLAN, and assigned the specified data rates.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
assign [rate-limit|VLAN]

assign rate-limit [from-client|to-client] <1-65536>
assign vlan <1-4094>
```

Parameters

- assign rate-limit [from-client|to-client] <1-65536>

| | |
|--|---|
| <pre>assign rate-limit [from-client to-client] <1-65536></pre> | <p>Assigns an upstream and downstream traffic rate limit</p> <ul style="list-style-type: none"> • from-client - Assigns a rate limit, in Kbps, for the upstream (from client) traffic • to-client - Assigns a rate limit, in Kbps, for the downstream (to client) traffic <ul style="list-style-type: none"> • <1-65536> - Specify upstream and/or downstream rate limits from 1 - 65536 Kbps. <p>Wireless clients matching this user-defined role are assigned the configured rate limits.</p> |
|--|---|

- assign vlan <1-4094>

| | |
|---------------------------------------|--|
| <pre>assign vlan <1-4094></pre> | <p>Assigns a VLAN (identified by VLAN's ID). Clients matching this user-defined role are associated with the specified VLAN. The VLAN ID represents the shared SSID each user employs to interoperate within the network (once authenticated by the local RADIUS server).</p> <p>This feature is disabled by default.</p> <ul style="list-style-type: none"> • <1-4094> - Specify the VLAN ID from 1 - 4094. <p>A wireless client that fails to match any user-defined role is assigned to the default role (configured as a role policy setting) and is mapped to the default VLAN under the WLAN.</p> |
|---------------------------------------|--|

Usage Guidelines

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

In case of bridge VLAN, the default bridging mode is 'auto'. Change the bridging mode to 'tunnel'. This extends the controller's existing VLAN onto the AP and ensures that wireless clients are served IP addresses.

The VLAN configured under the user-defined role need not exist under the WLAN. But, when using tunneled VLAN bridges, configure an additional bridge VLAN. If the VLAN bridging mode is 'local', no additional VLAN configuration is required.

Example

```
rfs4000-229D58(config-role-policy-test-user-role-test)#assign rate-limit to-
client 200

rfs4000-229D58(config-role-policy-test-user-role-test)#commit

rfs4000-229D58(config-role-policy-test-user-role-test)#show context
user-role test precedence 1
assign vlan 1
assign rate-limit to-client 200
rfs4000-229D58(config-role-policy-test-user-role-test)#
```

The following examples define a role used to forward the IP traffic from all engineers in Test_Company, Santa Clara, USA onto VLAN 2.

- 1 Create a new role policy with name 'test-policy'.

```
<DEVICE>(config)#role-policy test-policy
```
- 2 Specify the LDAP server used for this role policy.

```
<DEVICE>(config-role-policy-test-policy)#ldap-query self
<DEVICE>(config-role-policy-test-policy)#ldap-server 1 host 192.160.1.1 bind-dn
CN=Administrator,CN=Users,DC=testtest,DC=com base-dn
CN=Administrator,CN=Users,DC=com bind-password 0 test port 389
<DEVICE>(config-role-policy-test-policy)#ldap-timeout 2
```
- 3 Create a user defined role.

```
<DEVICE>(config-role-policy-test-policy)#user-role SCEngineer precedence 100
```
- 4 Define the role by adding appropriate values and match operators.

```
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#city exact santa-
clara
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#company exact
ExampleCompany
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#country exact usa
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#title contains
engineer
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#assign vlan-id 2
```
- 5 Apply role policy to an access point.

```
ap7131-99BFA8(config-device-ap7131)# use role-policy test-policy
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the upstream and/or downstream rate limits applied to this user-defined role. Also removes the VLAN ID. |
|-----------|---|

18.1.7.2.3 authentication-type

▶ *user-role commands*

Configures the authentication type based filter for this user-defined role

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
authentication-type [any|eq|neq]
authentication-type any
authentication-type [eq|neq] [eap|kerberos|mac-auth|none]
    { (eap|kerberos|mac-auth|none) }
```

Parameters

- authentication-type any

| | |
|-------------------------------------|---|
| any | The authentication type is any (eq or neq). This is the default setting. |
| | <ul style="list-style-type: none"> • authentication-type [eq neq] [eap kerberos mac-auth none] { (eap kerberos mac-auth none) } |
| eq [eap kerberos mac-auth none] | <p>The role is applied only when the authentication type matches (equals) one or more than one of the following types:</p> <ul style="list-style-type: none"> • eap – Extensible authentication protocol • kerberos – Kerberos authentication • mac-auth – MAC authentication protocol • none – no authentication used <p>These parameters are recursive, and you can configure more than one unique authentication type for this user-defined role.</p> |
| neq [eap kerberos mac-auth none] | <p>The role is applied only when the authentication type does not match (not equals) any of the following types:</p> <ul style="list-style-type: none"> • eap – Extensible authentication protocol • kerberos – Kerberos authentication • mac-auth – MAC authentication protocol • none – no authentication used <p>These parameters are recursive, and you can configure more than one unique ‘not equal to’ authentication type for this user-defined role.</p> |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#authentication-type eq
kerberos

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
    authentication-type eq kerberos
    ap-location contains office
rfs6000-37FABE(config-role-policy-test-user-role-testing)#
```

18.1.7.2.4 captive-portal

▶ *user-role commands*

Configures a captive portal based filter for this user-defined role. A captive portal is a guest access policy that provides temporary and restrictive access to the wireless network. When applied to a WLAN, a captive portal policy ensures secure guest access.

This command defines user-defined role filters based on a wireless client’s state of authentication.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
captive-portal authentication-state [any|post-login|pre-login]
```

Parameters

- captive-portal authentication-state [any|post-login|pre-login]

| | |
|----------------------|---|
| authentication-state | Defines the authentication state of a client connecting to a captive portal |
| any | Specifies any authentication state (authenticated and pending authentication). This is the default setting. This option makes no distinction on whether authentication is conducted before or after the wireless client has logged in. |
| post-login | Specifies authentication is completed successfully This option requires the wireless client to share authentication credentials after logging into the managed network. |
| pre-login | Specifies authentication is pending This option enables captive portal client authentication before the client is logged into the controller. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#captive-portal
authentication-state pre-login

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
ap-location contains office
captive-portal authentication-state pre-login
rfs6000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the captive portal based role filter settings |
|-----------|---|

18.1.7.2.5 city

▶ *user-role commands*

Configures a wireless client filter based on the city name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
city [any|contains|exact|not-contains]
city [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- city [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|---------------------|---|
| city | Specifies a wireless client filter based on how the 'city' name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains. |
| any | No specific city associated with this user-defined role. This role can be applied to any wireless client from any city. |
| contains <WORD> | The role is applied only when the city name, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the city name returned by the RADIUS server). It should contain the provided expression. |
| exact | The role is applied only when the city name, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the city name returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the city name, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the city name returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#city exact SanJose

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
ap-location contains office
captive-portal authentication-state pre-login
city exact SanJose
rfs6000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

| <i>no</i> | Removes the city name configured with this user-defined role |
|-----------|--|

18.1.7.2.6 client-identity

▶ *user-role commands*

Associates a client-identity (device fingerprinting) based filter. The role is assigned to a wireless client matching any of the defined client identities.

For more information on configuring client identity fingerprints, see [client-identity](#).

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
client-identity <CLIENT-IDENTITY-NAME> {<CLIENT-IDENTITY-NAME>}
```

Parameters

- `client-identity <CLIENT-IDENTITY-NAME> {<CLIENT-IDENTITY-NAME>}`

| | |
|---|---|
| <code>client-identity <CLIENT-IDENTITY-NAME></code> | Specifies the client-identity fingerprint to match (should be existing and configured) <ul style="list-style-type: none"> • <code><CLIENT-IDENTITY-NAME></code> - Specify the client identity signature name. Multiple client identities can be configured with a role policy. |
|---|---|

Usage Guidelines

When associating a single or multiple client identities with a role policy, ensure that in a client identity group, all the client identities used by the role policy, is attached to the device or profile using the role policy. In other words, group all the client identities (used in this role policy) in a client identity group, and associate this group to the profile or device using this role policy.

For more information on configuring client identities and client identity groups, see [client-identity](#) and [client-identity-group](#).

For more information on associating a client identity group and a role policy to a profile or a device, see [use](#).

Example

```
rfs4000-229D58 (config-role-policy-test-user-role-test) #client-identity
TestClientIdentity
rfs4000-229D58 (config-role-policy-test-user-role-test) #commit

rfs4000-229D58 (config-role-policy-test-user-role-test) #client-identity
ClientIdentityWindows
rfs4000-229D58 (config-role-policy-test-user-role-test) #

rfs4000-229D58 (config-role-policy-test-user-role-test) #show context
user-role test precedence 1
  client-identity TestClientIdentity
  client-identity ClientIdentityWindows
rfs4000-229D58 (config-role-policy-test-user-role-test) #
```

Related Commands

18.1.7.2.7 company

▶ *user-role commands*

Configures a wireless client filter based on the company name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
company [any|contains|exact|not-contains]
company [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- company [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|---------------------|---|
| company | Specifies a wireless client filter based on how the ‘company’ name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains |
| any | No specific company associated with this user-defined role. This role is applied to any wireless client from any company (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the company name, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the company name returned by the RADIUS server). It should contain the provided expression. |
| exact | The role is applied only when the company name, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the company name returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the company name, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the company name returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#company exact
ExampleCompany

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
ap-location contains office
captive-portal authentication-state pre-login
city exact SanJose
company exact ExampleCompany

```

Related Commands

no

Removes the company name configured with this user-defined role

18.1.7.2.8 country

▶ *user-role commands*

Configures a wireless client filter based on the country name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
country [any|contains|exact|not-contains]
country [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- country [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|---------------------|---|
| country | Specifies a wireless client filter based on how the 'country' name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains |
| any | No specific country associated with this user-defined role. This role is applied to any wireless client from any country (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the country name, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the country name returned by the RADIUS server). It should contain the provided expression. |
| exact | The role is applied only when the country name, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the country name returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the country name, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the country name returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#country exact America

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context

18.1.7.2.9 department

▶ *user-role commands*

Configures a wireless client filter based on the department name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
department [any|contains|exact|not-contains]
department [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- department [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|---------------------|---|
| department | Specifies a wireless client filter based on how the 'department' name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains |
| any | No specific department associated with this user-defined role. This role can be applied to any wireless client from any department (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the department name, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the department name returned by the RADIUS server). It should contain the provided expression. |
| exact | The role is applied only when the department name, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the department name returned by the RADIUS server). 18.1.7.2.10 emailid

▶ *user-role commands*

Configures a wireless client filter based on the e-mail ID

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
emailid [any|contains|exact|not-contains]
emailid [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- emailid [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|---------------------|---|
| emailid | Specifies a wireless client filter based on how the 'e-mail ID', returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains |
| any | No specific e-mail ID associated with this user-defined role. This role can be applied to any wireless client having any e-mail ID (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the e-mail ID, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the e-mail ID returned by the RADIUS server). It should contain the provided expression. |
| exact | The role is applied only when the e-mail ID, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the e-mail ID returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the e-mail ID, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the e-mail ID returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#emailid exact testing@  
examplecompany.com
```

18.1.7.2.11 employee-type

▶ *user-role commands*

Configures a wireless client filter based on the employee type

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
employee-type [any|contains|exact|not-contains]
employee-type [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- employee-type [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|---------------------|---|
| employee-type | Specifies a wireless client filter based on how the 'employee type', returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains. |
| any | No specific employee type associated with this user-defined role. This role can be applied to any wireless client having any employee type (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the employee type, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the employee type returned by the RADIUS server). It should contain the provided expression. |
| exact | The role is applied only when the employee type, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the employee type returned by the RADIUS server). It should be an exact match. |

18.1.7.2.13 encryption-type

▶ *user-role commands*

Selects the encryption type for this user-defined role. Encryption ensures privacy between access points and wireless clients. There are various modes of encrypting communication on a WLAN, such as *Counter-model CBC-MAC Protocol* (CCMP), *Wired Equivalent Privacy* (WEP), *keyguard*, *Temporal Key Integrity Protocol* (TKIP), etc.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
encryption-type [any|eq|neq]
encryption-type any

encryption-type [eq|neq] [ccmp|keyguard|none|tkip|wep128|wep64]
(ccmp|keyguard|none|tkip|tkip-ccmp|wep128|wep64) }
```

Parameters

- encryption-type any

| | |
|--|--|
| any | The encryption type can be any one of the listed options (ccmp keyguard tkip wep128 wep64). This is the default setting. |
| <ul style="list-style-type: none"> • encryption-type [eq neq] [ccmp keyguard none tkip wep128 wep64] { (ccmp keyguard none tkip tkip-ccmp wep128 wep64) } | |
| eq [ccmp keyguard none tkip wep128 wep64] | <p>The role is applied only if the encryption type equals to one of the following options:</p> <ul style="list-style-type: none"> • ccmp – Encryption mode is CCMP • keyguard – Encryption mode is keyguard. Keyguard encryption shields the master encryption keys from being discovered. • none – No encryption mode specified • tkip – Encryption mode is TKIP • wep128 – Encryption mode is WEP128 • wep64 – Encryption mode is WEP64 <p>These parameters are recursive, and you can configure more than one encryption type for this user-defined role.</p> |
| neq [ccmp keyguard none tkip wep128 wep64] | <p>The role is applied only if encryption type is not equal to any of the following options:</p> <ul style="list-style-type: none"> • ccmp – Encryption mode is not equal to CCMP • keyguard – Encryption mode is not equal to keyguard • none: Encryption mode is not equal to none • tkip – Encryption mode is not equal to TKIP <p>Contd..</p> |

| | |

18.1.7.2.14 group

▶ *user-role commands*

Configures a wireless client filter based on the RADIUS group name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
group [any|contains|exact|not-contains]
group [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

Parameters

- group [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

| | |
|---------------------|--|
| group | Specifies a wireless client filter based on how the RADIUS group name matches the provided expression. Select one of the following options: any, contains, exact, or not-contains |
| any | This user-defined role can fit into any group (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the RADIUS group name contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the group name returned by the RADIUS server). It should contain the provided expression. |
| exact <WORD> | The role is applied only when the RADIUS group name exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the group name returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the RADIUS group name does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the group name returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#group contains
testgroup

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
encryption-type eq wep128
ap-location contains office
group contains testgroup
captive-portal authentication-state pre-login
city exact SanJose
company exact Example_company
country exact America
department exact TnV
emailid exact testing@examplecompany.com
employeeid contains TnVTest1

18.1.7.2.15 memberOf

▶ *user-role commands*

Applies an *Active Directory* (AD) group filter to this user-defined role. A wireless client can be a member of more than one group within the AD database. This command applies a AD group based firewall, which applies a role to a wireless client only if it belongs to the specified AD group.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
memberOf <AD-GROUP-NAME>
```

Parameters

- memberOf <AD-GROUP-NAME>

| | |
|-----------------------------|---|
| memberOf <AD-GROUP-NAME> | Applies this user-defined role to a client only if the client belongs to the specified AD group • <AD-GROUP-NAME> - Specify the AD group name. |
|-----------------------------|---|

Example

```
rfs4000-229D58 (config-role-policy-test-user-role-test) #memberOf ADTestgroup

rfs4000-229D58 (config-role-policy-test-user-role-test) #show context
user-role test precedence 1
  assign vlan 1
  assign rate-limit to-client 200
  memberOf ADTestgroup
rfs4000-229D58 (config-role-policy-test-user-role-test) #
```

18.1.7.2.16 mu-mac

▶ *user-role commands*

Configures a MAC address and mask based filter for this role policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mu-mac [<MAC>|any]

mu-mac any

mu-mac <MAC> {mask <MAC>}
```

Parameters

- mu-mac any

| | |
|-----------------------------|--|
| any | Applies role to any wireless client (no MAC address to match). This is the default setting. |
| • mu-mac <MAC> {mask <MAC>} | |
| <MAC> | Applies role to the wireless client having specified MAC address <ul style="list-style-type: none"> • <MAC> - Sets the MAC address in the AA-BB-CC-DD-EE-FF format |
| mask <MAC> | Optional. After specifying the client's MAC address, specify the mask in the AA-BB-CC-DD-EE-FF format. The role is applied to the wireless client exactly matching the specified MAC address and MAC mask. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#mu-mac 11-22-33-44-55-66

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
encryption-type eq wep128

18.1.7.2.17 no**▶ user-role commands**

Negates a command or resets configured settings to their default. When used in the config role policy user-defined role mode, the `no` command removes or resets settings, such as AP location, authentication type, encryption type, captive portal, etc.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [ap-location|assign|authentication-type|captive-portal|city|client-identity|
company|country|department|emailid|employee-type|employeeid|encryption-type|
group|memberOf|mu-mac|radius-user|ssid|state|title|use|user-defined]
```

```
no [ap-location|assign|authentication-type|city|client-identity|company|country|
department|emailid|employee-type|employeeid|encryption-type|group|mu-
mac|memberOf|
ssid|radius-user|state|title|user-defined]
```

```
no captive-portal authentication-state
```

```
no use [application-policy|bonjour-gw-discovery-policy|ip-access-list|
ipv6-access-list|mac-access-list|url-filter]
```

```
no use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]
<IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>
```

```
no use [application-policy|bonjour-gw-discovery-policy|url-filter]
```

Parameters

- `no <PARAMETERS>`

| | |
|-----------------|---|
| no <PARAMETERS> | Negates a command or resets configured settings to their default. When used in the config role policy user-defined role mode, the <code>no</code> command removes or resets settings, such as AP location, authentication type, encryption type, captive portal, etc. |
|-----------------|---|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following example shows the Role Policy 'test' User Role 'testing' configuration before the 'no' commands are executed:

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
encryption-type eq wep128
ap-location contains office
mu-mac 11-22-33-44-55-66
group contains testgroup
captive-portal authentication-state pre-login
city exact SanJose
company exact ExampleCompany
country exact America
department exact TnV
emailid exact testing@examplecompany.com
employeeid contains TnVTest1
rfs6000-37FABE(config-role-policy-test-user-role-testing)#

rfs6000-37FABE(config-role-policy-test-user-role-testing)#no authentication-type
rfs6000-37FABE(config-role-policy-test-user-role-testing)#no encryption-type
rfs6000-37FABE(config-role-policy-test-user-role-testing)#no group
rfs6000-37FABE(config-role-policy-test-user-role-testing)#no mu-mac
rfs6000-37FABE(config-role-policy-test-user-role-testing)#no ap-location
rfs6000-37FABE(config-role-policy-test-user-role-testing)#no employeeid
```

The following example shows the Role Policy 'test' User Role 'testing' configuration after the 'no' commands are executed:

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
captive-portal authentication-state pre-login
city exact SanJose
company exact ExampleCompany
country exact America
department exact TnV
emailid exact testing@examplecompany.com
rfs6000-37FABE(config-role-policy-test-user-role-testing)#
```

18.1.7.2.18 radius-user

▶ *user-role commands*

Configures a wireless client filter based on the RADIUS user name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
radius-user [any|contains|ends-with|exact|not-contains|starts-with]
```

Parameters

- radius-user [any|contains|ends-with|exact|not-contains|starts-with]

| | |
|---------------------|--|
| radius-user | Specifies a wireless client filter based on how the 'radius-user' name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains. |
| any | No specific RADIUS user name associated with this user-defined role. This role can be applied to any wireless client (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the 'radius-user' name, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the 'radius-user' name returned by the RADIUS server). It should contain the provided expression. <p>You can use the realm or any sub-string of the user name.</p> |
| ends-with <WORD> | Enables role assignment on the basis of the wireless client's "department" and/or "group" <ul style="list-style-type: none"> • <WORD> - Specify the string (could be department/group code). For example: 1005000002. In this the last three digits represent the department/group code. The remaining digits represent user's badge number. <p>The role is applied only when the 'radius-user' name, returned by the RADIUS server, ends with the string specified here.</p> |
| exact <WORD> | The role is applied only when the 'radius-user' name, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the 'radius-user' name returned by the RADIUS server). It should be an exact match. <p>Provide the complete user name along with the realm.</p> |
| not-contains <WORD> | The role is applied only when the 'radius-user' name, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the 'radius-user' name returned by the RADIUS server). It should not contain the provided expression. |

| | |
|--------------------|---|
| starts-with <WORD> | <p>Enables role assignment on the basis of the wireless client's "department" and/or "group" code</p> <ul style="list-style-type: none"> • <WORD> - Specify the string (could be department/group code). For example: 0026100573. The first three digits represent the department/group code. The remaining digits represent user's badge number. <p>The role is applied only when the 'radius-user' name, returned by the RADIUS server, starts with the string specified here.</p> |
|--------------------|---|

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#radius-user contains
test.com

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 1
radius-user contains test.com
company exact ExampleCompany
emailid exact testing@examplecompany.com
rfs6000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

18.1.7.2.19 ssid

▶ *user-role commands*

Configures a SSID based filter

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ssid [any|exact|contains|not-contains]
ssid any
ssid [exact|contains|not-contains] <WORD>
```

Parameters

- ssid any

| | |
|---|---|
| ssid any | Specifies a wireless client filter based on how the SSID is specified in a WLAN <ul style="list-style-type: none"> • any – The role is applied to any SSID location. This is the default setting. |
| <ul style="list-style-type: none"> • ssid [exact contains not-contains] <WORD> | |
| ssid | Specifies a wireless client filter based on how the SSID is specified in a WLAN. This options are: contains, exact, or not-contains |
| exact <WORD> | The role is applied only when the SSID, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> – Specify the SSID string to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN. |
| contains <WORD> | The role is applied only when the SSID, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> – Specify the SSID string to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN. |
| not-contains <WORD> | The role is applied only when the SSID, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> – Specify the SSID string not to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#ssid not-contains
DevUser

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  ssid not-contains DevUser
  captive-portal authentication-state pre-login
  city exact SanJose
  company exact ExampleCompany

18.1.7.2.20 state

▶ *user-role commands*

Configures a user role state to match with this user-defined role

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
state [any|contains|exact|not-contains]
state [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

Parameters

- state [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

| | |
|---------------------|--|
| state | Specifies a wireless client filter option based on how the RADIUS state matches the provided expression. Select one of the following options: any, contains, exact, or not-contains. |
| any | This user role can fit any wireless client irrespective of the state (no strings to match). |
| contains <WORD> | The user role is applied only when the RADIUS state contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should contain the provided expression. |
| exact <WORD> | The role is applied only when the RADIUS state exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the RADIUS state does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs6000-37FABE(config-role-policy-test-user-role-testing)#state exact active

rfs6000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
ssid not-contains DevUser
captive-portal authentication-state pre-login
city exact SanJose
company exact ExampleCompany
country exact America
department exact TnV
emailid exact testing@examplecompany.com
state exact active
rfs6000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

18.1.7.2.1 title

▶ *user-role commands*

Configures a 'title' string to match

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
title [any|contains|exact|not-contains]
title [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

Parameters

- title [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

| | |
|---------------------|--|
| title | Specifies a wireless client filter based on how the title string, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains. |
| any | This user role can fit any wireless client irrespective of the title (no strings to match). |
| contains <WORD> | The user role is applied only when the title string, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should contain the provided expression. |
| exact <WORD> | The role is applied only when the title string, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the title string, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rf6000-37FABE (config-role-policy-test-user-role-testing)#title any
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the 'title' filter string configured with a user role |
|-----------|---|

18.1.7.2.22 use

▶ *user-role commands*

Configures an access list based firewall with this user role

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, firewalls are mechanisms both *blocking* and *permitting* data traffic based on inbound and outbound IP and MAC rules.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to packet traffic.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use [application-policy|bonjour-gw-discovery-policy|ip-access-list|ipv6-access-list|mac-access-list|url-filter]

use bonjour-gw-discovery-policy <POLICY-NAME>

use [ip-access-list|ipv6-access-list] [in|out] <IP/ipv6-ACCESS-LIST-NAME>
precedence <1-100>

use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME> precedence <1-100>

use url-filter <URL-FILTER-NAME>
```

Parameters

- use application-policy|bonjour-gw-discovery-policy] <POLICY-NAME>

| | |
|--|--|
| <p>application-policy <POLICY-NAME></p> | <p>Uses an existing Application policy with a user role. When associated, the Application policy enforces application assurance for all users using this role.</p> <ul style="list-style-type: none"> • <POLICY-NAME> - Specify the Application policy name (should be existing and configured). <p>For more information on Application policy, see <i>application-policy</i>.</p> |
| <p>bonjour-gw-discovery-policy <POLICY-NAME></p> | <p>Uses an existing Bonjour GW Discovery policy with a user role. When associated, the Bonjour GW Discovery policy is applied for the Bonjour requests coming from this specific user roles.</p> <ul style="list-style-type: none"> • <POLICY-NAME> - Specify the Bonjour GW Discovery policy name (should be existing and configured). <p>For more information on Bonjour GW Discovery policy, see <i>bonjour-gw-discovery-policy</i>.</p> |

- use [ip-access-list|ipv6-access-list] [in|out] <IP/IPv6-ACCESS-LIST-NAME> precedence <1-100>

| | |
|--|--|
| ip-access-list [in out] | Uses an IPv4 or IPv6 ACL with this user role <ul style="list-style-type: none"> • in - Applies the rule to incoming packets • out - Applies the rule to outgoing packets |
| <IPv4/IPv6-ACCESS-LIST-NAME> | Specify the IPv4/IPv6 access list name. |
| precedence <1-100> | After specifying the name of the access list, specify the precedence applied to it. Based on the packets received, a lower precedence value is evaluated first. <ul style="list-style-type: none"> • <1-100> - Sets a precedence from 1 - 100 |
| <ul style="list-style-type: none"> • use mac-access-list [in out] <MAC-ACCESS-LIST-NAME> precedence <1-100> | |
| mac-access-list [in out] | Uses a MAC access list with this user role <ul style="list-style-type: none"> • in - Applies the rule to incoming packets • out - Applies the rule to outgoing packets |
| <MAC-ACCESS-LIST-NAME> | Specify the MAC access list name. |
| precedence <1-100> | After specifying the name of the access list, specify the precedence applied to it. Based on the packets received, a lower precedence value is evaluated first <ul style="list-style-type: none"> • <1-100> - Sets a precedence from 1 - 100 |
| <ul style="list-style-type: none"> • use url-filter <URL-FILTER-NAME> | |
| use url-filter <URL-FILTER-NAME> | Uses an existing URL filter that acts as a Web content filter firewall rule. <ul style="list-style-type: none"> • <POLICY-NAME> - Specify the URL filter name (should be existing and configured). |

| <i>no</i> | Removes an IP, MAC access list, or a Bonjour GW Discovery policy from use with a user role |
|-----------|--|

18.1.7.2.23 user-defined

▶ *user-role commands*

Enables you to define a filter based on an attribute defined in the Active Directory or the OpenLDAP server

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
user-defined <ATTR-STRING> [any|contains|exact|not-contains]
```

```
user-defined <ATTR-STRING> [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

Parameters

- user-defined <ATTR-STRING> [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| | |
|----------------------------|--|
| user-defined <ATTR-STRING> | Specify a filter based on an attribute defined in the AD or OpenLDAP server. <ul style="list-style-type: none"> • <ATTR-NAME> - Specify the attribute string. After specifying the attribute name, specify the match type. |
| any | No specific string to match. This role can be applied to any wireless client. This is the default setting. |
| contains <WORD> | The role is applied only when the user-defined attribute value, returned by the RADIUS server, contains the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string to match (this is case sensitive, and is compared against the value returned by the RADIUS server). It should contain the provided expression. |
| exact <WORD> | The role is applied only when the user-defined attribute value, returned by the RADIUS server, exactly matches the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the exact string to match (this is case sensitive, and is compared against the value returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the user-defined attribute value, returned by the RADIUS server, does not contain the string specified in the role. <ul style="list-style-type: none"> • <WORD> - Specify the string not to match (this is case sensitive, and is compared against the value returned by the RADIUS server). It should not contain the provided expression. |

Example

```
rfs4000-229D58(config-role-policy-test-user-role-user1)#user-defined office-  
location exact EcoSpace  
  
rfs4000-229D58(config-role-policy-test-user-role-user1)#show context  
user-role user1 precedence 1  
employee-type exact consultant  
user-defined office-location exact EcoSpace  
rfs4000-229D58(config-role-policy-test-user-role-user1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the user-defined filter configured with this user role |
|-----------|--|

19 SMART-RF-POLICY

This chapter summarizes *Self Monitoring at Run Time RF* (Smart RF) management policy commands in the CLI command structure.

A Smart RF management policy defines operating and recovery parameters that can be assigned to groups of access points. A Smart RF policy is designed to scan the network to identify the best channel and transmit power for each access point radio.

A Smart RF policy reduces deployment costs by scanning the RF environment to determine the best channel and transmit power configuration for each managed radio. Smart RF policies when applied to specific RF Domains, apply site specific deployment configurations and self-healing values to groups of devices within pre-defined physical RF coverage areas.

Smart RF centralizes the decision process and makes intelligent RF configuration decisions using information obtained from the RF environment. Smart RF helps reduce ongoing management and maintenance costs through the periodic re-calibration of the network. Re-calibration can be initiated manually or can be automatically scheduled to ensure the RF configuration is optimized to factor for RF environment changes (such as new sources of interference, or neighboring access points).

Smart RF also provides self-healing functions by monitoring the network in real-time, and provides automatic mitigation from potentially problematic events such as radio interference, coverage holes and radio failures. Smart RF employs self-healing to enable a WLAN to better maintain wireless client performance and site coverage during dynamic RF environment changes, which typically require manual re-configuration to resolve.

Smart RF is supported on any RF Domain manager. In standalone environments, an individual wireless controller manages the calibration and monitoring phases. In clustered environments, a single wireless controller is elected a Smart RF master and the remaining cluster members operate as Smart RF clients. In cluster operation, the Smart RF master co-ordinates the calibration and configuration and during the monitoring phase receives information from the Smart RF clients.

Before defining a Smart RF policy, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- The Smart RF calibration process impacts associated users and should not be run during business or production hours. The calibration process should be performed during scheduled maintenance intervals or non-business hours.
- For Smart RF to provide effective recovery, RF planning must be performed to ensure overlapping coverage exists at the deployment site. Smart RF can only provide recovery when access points are deployed appropriately. Smart RF is not a solution, it's a temporary measure. Administrators need to determine the root cause of RF deterioration and fix it. Smart RF history/events can assist.

Keep in mind that if a Smart RF managed radio is operating in WLAN mode on a channel requiring DFS, it will switch channels if radar is detected.

- If Smart RF is enabled, the radio picks a channel defined in the Smart RF policy.
- If Smart RF is disabled, but a Smart RF policy is mapped, the radio picks channels specified in the Smart RF policy
- If no SMART RF policy is mapped, the radio selects a random channel

If the radio is a dedicated sensor, it stops termination on that channel if a neighboring access point detect radar. The access point attempts to come back to its original channel (statically configured or selected by Smart RF) after the channel evacuation period has expired.

Change this behavior using the *dfs-rehome* command from the controller or service platform CLI. This keeps the radio on the newly selected channel and prevents the radio from coming back to the original channel, even after the channel evacuation period.

NOTE: Perform RF planning to ensure overlapping coverage exists at a deployment site, for Smart RF to be a viable network performance tool. Smart RF can only provide recovery when access points are deployed appropriately. Smart RF is not a solution, it is a temporary measure. You need to determine the root cause of RF deterioration and fix it. Smart RF history/ events can assist in trouble shooting.

Use the (config) instance to configure Smart RF Policy related configuration commands. To navigate to the Smart RF policy instance, use the following commands:

```
<DEVICE>(config)#smart-rf-policy <POLICY-NAME>
rfs6000-37FABE(config)#smart-rf-policy test
rfs6000-37FABE(config-smart-rf-policy-test)#?
Smart RF Mode commands:
  area                Specify channel list/ power for an area
  assignable-power    Specify the assignable power during power-assignment
  avoidance-time      Time to avoid a channel once dfs/adaptivity
                    avoidance is necessary
  channel-list        Select channel list for smart-rf
  channel-width       Select channel width for smart-rf
  coverage-hole-recovery Recover from coverage hole
  enable              Enable this smart-rf policy
  group-by            Configure grouping parameters
  interference-recovery Recover issues due to excessive noise and
                    interference
  neighbor-recovery   Recover issues due to faulty neighbor radios
  no                  Negate a command or set its defaults
  sensitivity          Configure smart-rf sensitivity (Modifies various
                    other smart-rf configuration items)
  smart-ocs-monitoring Smart off channel scanning

  clrscr              Clears the display screen
  commit              Commit all changes made in this session
  end                  End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert              Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or terminal

rfs6000-37FABE(config-smart-rf-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

19.1 smart-rf-policy

► SMART-RF-POLICY

The following table summarizes Smart RF policy configuration commands:

Table 19.1 *Smart-RF-Policy-Config Commands*

| Command | Description | Reference |
|-------------------------------|--|-------------------|
| <i>area</i> | Configures the channel list and power for a specified area | <i>page 19-4</i> |
| <i>assignable-power</i> | Specifies the power range during power assignment | <i>page 19-5</i> |
| <i>avoidance-time</i> | Allows Smart RF-enabled radios to avoid <i>Dynamic Frequency Selection</i> (DFS) and/or <i>adaptivity</i> regulated channels on detection of interference or radar. This command configures the period for which the channel is avoided. | <i>page 19-5</i> |
| <i>channel-list</i> | Assigns the channel list for the selected frequency | <i>page 19-8</i> |
| <i>channel-width</i> | Selects the channel width for Smart RF configuration | <i>page 19-9</i> |
| <i>coverage-hole-recovery</i> | Enables recovery from errors | <i>page 19-11</i> |
| <i>enable</i> | Enables a Smart RF policy | <i>page 19-13</i> |
| <i>group-by</i> | Configures grouping parameters | <i>page 19-14</i> |
| <i>interference-recovery</i> | Recovers issues due to excessive noise and interference | <i>page 19-15</i> |
| <i>neighbor-recovery</i> | Enables recovery from errors due to faulty neighbor radios | <i>page 19-17</i> |
| <i>no</i> | Negates a command or reverts settings to their default | <i>page 19-19</i> |
| <i>sensitivity</i> | Configures Smart RF sensitivity | <i>page 19-21</i> |
| <i>smart-ocs-monitoring</i> | Applies smart off-channel scanning instead of dedicated detectors | <i>page 19-23</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

19.1.1 area

▶ *smart-rf-policy*

Configures the channel list and power for a specified area

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
area <AREA-NAME/STRING-ALIAS> channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

Parameters

- area <AREA-NAME/STRING-ALIAS> channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

| | |
|---|--|
| area <AREA-NAME/ STRING-ALIAS> | <p>Specifies the area name</p> <ul style="list-style-type: none"> • <AREA-NAME/STRING-ALIAS> - Specify the area name as clear text. Alternately, use a string-alias to specify the area name. If using a string-alias, ensure that the string-alias is existing and configured. |
| channel-list [2.4GHz 5GHz] <CHANNEL-LIST> | <p>Selects the channels for the specified area in the 2.4 GHz or 5.0 GHz band</p> <ul style="list-style-type: none"> • 2.4GHz - Selects the channels for the specified area in the 2.4 GHz band • 5GHz - Selects the channels for the specified area in the 5.0 GHz band <p>The following keyword is common to the 2.4 GHz and 5.0 GHz bands:</p> <ul style="list-style-type: none"> • <CHANNEL-LIST> - Enter a comma-separated list of channels for the selected band. |

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#area test channel-list 2.4GHz 1,2,3

rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
rfs6000-37FABE(config-smart-rf-policy-test)#

nx9500-6C8809(config)#alias string $AREA Ecospace
nx9500-6C8809(config)#commit
nx9500-6C8809(config-smart-rf-policy-test)#exit

nx9500-6C8809(config-smart-rf-policy-Ecospace)#area $AREA channel-list 5GHz 36,44

nx9500-6C8809(config-smart-rf-policy-Ecospace)#show context
smart-rf-policy Ecospace
  area $AREA channel-list 5GHz 36,44
nx9500-6C8809(config-smart-rf-policy-Ecospace)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes channel list/power configuration for an area |
|-----------|--|

19.1.2 assignable-power

► *smart-rf-policy*

Configures the Smart RF power settings over both 2.4 GHz and 5.0 GHz radios

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
assignable-power [2.4GHz|5GHz] [max|min] <1-20>
```

Parameters

```
• assignable-power [2.4GHz|5GHz] [max|min] <1-20>
```

| | |
|----------------------------|--|
| 2.4GHz [max min] <1-20> | <p>Assigns a power range on the 2.4 GHz band</p> <ul style="list-style-type: none"> • max <1-20> - Sets the upper limit in the range from 1 dBm - 20 dBm (default is 17 dBm) • min <1-20> - Sets the lower limit in the range from 1 dBm - 20 dBm (default is 4 dBm) |
| 5GHz [max min] <1-20> | <p>Assigns a power range on the 5.0 GHz band</p> <ul style="list-style-type: none"> • max <1-20> - Sets the upper limit in the range from 1 dBm - 20 dBm (default is 17 dBm) • min <1-20> - Sets the lower limit in the range from 1 dBm - 20 dBm (default is 4 dBm) |

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#assignable-power 5GHz max 20
rfs6000-37FABE(config-smart-rf-policy-test)#assignable-power 5GHz min 8
rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
assignable-power 5GHz min 8
assignable-power 5GHz max 20
rfs6000-37FABE(config-smart-rf-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets assignable power to its default |
|-----------|--|

19.1.3 avoidance-time

▶ *smart-rf-policy*

Allows *Smart-RF enabled* radios to avoid channels with high levels of *interference* and channels where *radar* has been detected

This command configures the interval for which a channel is avoided on detection of interference or radar, and is applicable only if the channel selection mode is set to Smart and a Smart-RF policy is applied to the access point's RF Domain. For more information on configuring a radio's channel of operation, see [channel](#).

Certain 5.0 GHz channels are subject to FCC / ETSI DFS regulations that require channels transmitting critical radar signals to be free of interference from radio signals. Consequently, DFS-enabled 5.0 GHz radios scan and switch channels if radar is detected on their current channel of operation. If radar-free channels are not available, the radio stops transmitting until it identifies a radar-free channel.

Adaptivity is a new *European Union* (EU) stipulation that requires access points to monitor interference levels on their current channel of operation, and stop functioning on channels with interference levels exceeding ETSI-specified threshold values. When enabled, this feature ensures recovery by switching the radio to a new channel with less interference.

Once adaptivity or DFS is triggered, the radio's channel is switched based on the channel selection mode specified. If the channel is fixed, the radio attempts to come back to its specified channel of operation after the DFS/adaptivity channel evacuation period has expired.

NOTE: To optionally disable the radio from switching back to its original channel of operation, execute the `no > dfs-rehome` command in the radio interface configuration mode of the access point's profile or device. For more information, see [dfs-rehome](#).

NOTE: For radio's having channel selection mode set to ACS, Random, or Fixed adaptivity timeout can be configured in the access point's radio interface mode. For more information, see [adaptivity](#).

On the other hand, if the radio's channel selection mode is set to Smart or ACS, once adaptivity or DFS is triggered, the channel is avoided until the avoidance-time, specified here, expires. Once the evacuation period has expired, the channel is free for use by both Smart-RF and ACS.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
avoidance-time [adaptivity|dfs] <30-3600>
```

Parameters

- `avoidance-time [adaptivity|dfs] <30-3600>`

| | |
|------------------------------------|--|
| avoidance-time [adaptivity dfs] | <p>Configures the time for which a channel is avoided after dfs or adaptivity is triggered</p> <ul style="list-style-type: none"> • <code>adaptivity</code> – Sets the time, in minutes, for which a radio avoids an adaptivity-regulated channel detected with interference • <code>dfs</code> – Sets the time, in minutes, for which a radio avoids a DFS-regulated channel detected with radar • <code><30-3600></code> – Specify a value from 30 - 3600 minutes. The default for both parameters is 90 minutes. |
|------------------------------------|--|

Example

```

nx4500-5CFA2B(config-smart-rf-policy-test)#avoidance-time adaptivity 200
nx4500-5CFA2B(config-smart-rf-policy-test)#avoidance-time dfs 300

nx4500-5CFA2B(config-smart-rf-policy-test)#show context
smart-rf-policy test
  avoidance-time dfs 300
  avoidance-time adaptivity 200
nx4500-5CFA2B(config-smart-rf-policy-test)#

nx4500-5CFA2B(config-smart-rf-policy-test)#no avoidance-time adaptivity

nx4500-5CFA2B(config-smart-rf-policy-test)#show context include-factory | include
avoidance-time
  avoidance-time dfs 300
  avoidance-time adaptivity 90
nx4500-5CFA2B(config-smart-rf-policy-test)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Reverts the DFS/adaptivity regulated channel avoidance time to default (90 minutes) |
|-----------|---|

19.1.4 channel-list

▶ *smart-rf-policy*

Assigns a list of channels, for the selected frequency, used in Smart RF scans

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
channel-list [2.4GHz|5GHz] <WORD>
```

Parameters

- `channel-list [2.4GHz|5GHz] <WORD>`

| | |
|---------------|---|
| 2.4GHz <WORD> | Assigns a channel list for the 2.4 GHz band <ul style="list-style-type: none"> • <WORD> - Specify a comma separated list of channels |
| 5GHz <WORD> | Assigns a channel list for the 5.0 GHz band <ul style="list-style-type: none"> • <WORD> - Specify a comma separated list of channels |

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#channel-list 2.4GHz 1,12

rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
rfs6000-37FABE(config-smart-rf-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the channel list for the selected frequency |
|-----------|---|

19.1.5 channel-width

► *smart-rf-policy*

Selects the channel width for Smart RF configuration

NOTE: In addition to 20 MHz and 40 MHz, AP82XX also provides support for 80 MHz channels.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
channel-width [2.4GHz|5GHz]

channel-width 2.4GHz [20MHz|40MHz|auto]
channel-width 5GHz [20MHz|40MHz|80MHz|auto]
```

Parameters

- `channel-width 2.4GHz [20MHz|40MHz|auto]`

| | |
|----------------------------------|---|
| 2.4GHz [20MHz 40MHz] auto] | Assigns the channel width for the 2.4 GHz band <ul style="list-style-type: none"> • 20MHz – Assigns the 20 MHz channel width. This is the default setting. • 40MHz – Assigns the 40 MHz channel width • auto – Assigns the best possible channel in the 20 MHz or 40 MHz channel width |
|----------------------------------|---|

- `channel-width 5GHz [20MHz|40MHz|auto]`

| | |
|--------------------------------------|---|
| 5GHz [20MHz 40MHz 80MHz] auto] | Assigns the channel width for the 5.0 GHz band <ul style="list-style-type: none"> • 20MHz – Assigns the 20 MHz channel width • 40MHz – Assigns the 40 MHz channel width. This is the default setting. • 80MHz – Assigns the 80 MHz channel width (supported only on AP8232) • auto – Assigns the best possible channel in the 20 MHz, 40 MHz, or 80 MHz channel width |
|--------------------------------------|---|

Usage Guidelines

The 20/40 MHz operation allows the access point to receive packets from clients using 20 MHz, and transmit using 40 MHz. This mode is supported for 802.11n users on both the 2.4 GHz and 5.0 GHz radios. If an 802.11n user selects two channels (a primary and secondary channel), the system is configured for dynamic 20/40 operation. When 20/40 is selected, clients can take advantage of wider channels. 802.11n clients experience improved throughput using 40 MHz while legacy clients (either 802.11a or 802.11b/g depending on the radio selected) can still be serviced without interruption using 20 MHz. Select *auto* to enable automatic assignment of channels to working radios to avoid channel overlap and avoid interference from external RF sources.

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#channel-width 5GHz auto

rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
channel-width 5GHz auto
rfs6000-37FABE(config-smart-rf-policy-test)#
```

Related Commands*no*

Resets channel width for the selected frequency to its default

19.1.6 coverage-hole-recovery

▶ *smart-rf-policy*

Enables recovery from coverage hole errors detected by Smart RF. Use this command to configure the coverage hole recovery settings.

When coverage hole recovery is enabled, on detection of a coverage hole, Smart RF first determines the power increase needed based on the *signal-to-noise ratio* (SNR) for a client as seen by the access point radio. If a client's SNR is above the specified threshold, the transmit power is increased until the SNR falls below the threshold.

NOTE: The coverage-hole-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information, see *sensitivity*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
coverage-hole-recovery {client-threshold|coverage-interval|interval|snr-threshold}
```

```
coverage-hole-recovery {client-threshold [2.4GHz|5GHz] <1-255>}
```

```
coverage-hole-recovery {coverage-interval|interval} [2.4GHz|5GHz] <1-120>
```

```
coverage-hole-recovery {snr-threshold [2.4Ghz|5Ghz] <1-75>}
```

Parameters

- coverage-hole-recovery {client-threshold [2.4GHz|5GHz] <1-255>}

| | |
|---|--|
| client-threshold | Optional. Specifies the minimum number of clients associated to a radio in order to trigger coverage hole recovery. |
| 2.4GHz <1-255> | Specifies the minimum number of clients on the 2.4 GHz band <ul style="list-style-type: none"> • <1-255> – Sets a value from 1 - 255. The default is 1. |
| 5GHz <1-255> | Specifies the minimum number of clients on the 5.0 GHz band <ul style="list-style-type: none"> • <1-255> – Sets a value from 1 - 255. The default is 1. |
| <ul style="list-style-type: none"> • coverage-hole-recovery {coverage-interval interval} [2.4GHz 5GHz] <1-120> | |
| coverage-interval | Optional. Specifies the interval between the discovery of a coverage hole and the initiation of coverage hole recovery |
| interval | Optional. Specifies the interval at which coverage hole recovery is performed even before a coverage hole is detected |

| | |
|---|---|
| 2.4GHz <1-120> | <p>The following keywords are common to the 'coverage-interval' and 'interval' parameters:</p> <ul style="list-style-type: none"> • 2.4GHz <1-120> - Specifies the coverage hole recovery interval on the 2.4 GHz band • <1-120> - Specify a value from 1 - 120 seconds. <p>Note: coverage-interval - The default is 10 seconds. Note: interval - The default is 30 seconds.</p> |
| 5GHz <1-120> | <p>The following keywords are common to the 'coverage-interval' and 'interval' parameters:</p> <ul style="list-style-type: none"> • 5GHz <1-120> - Specifies a coverage hole recovery interval on the 5.0 GHz band • <1-120> - Specify a value from 1 - 120 seconds. <p>Note: coverage-interval - The default is 10 seconds. Note: interval - The default is 30 seconds.</p> |
| <ul style="list-style-type: none"> • coverage-hole-recovery {snr-threshold} [2.4Ghz 5Ghz] <1-75> | |
| snr-threshold | Optional. Specifies the SNR threshold. This value is the SNR threshold for an associated client as seen by its associated AP radio. When the SNR threshold is exceeded, the radio increases its transmit power to increase coverage for the associated client. |
| 2.4GHz <1-75> | Specifies SNR threshold on the 2.4 GHz band <ul style="list-style-type: none"> • <1-75> - Sets a value from 1 dB - 75 dB. The default is 20 dB. |
| 5GHz <1-75> | Specifies SNR threshold on the 5.0 GHz band <ul style="list-style-type: none"> • <1-75> - Sets a value from 1 - 75. The default is 20 dB. |

Example

```
rfs6000-37FABE (config-smart-rf-policy-test)#coverage-hole-recovery snr-threshold
5GHz 1

rfs6000-37FABE (config-smart-rf-policy-test)#show context

19.1.7 enable

▶ *smart-rf-policy*

Enables a Smart RF policy

Use this command to enable this Smart RF policy. Once enabled, the policy can be assigned to a RF Domain supporting a network.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
enable
```

Parameters

None

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#enable
```

Related Commands

| | |
|-----------|----------------------------|
| <i>no</i> | Disables a Smart RF policy |
|-----------|----------------------------|

19.1.8 group-by

▶ *smart-rf-policy*

Enables grouping of APs on the basis of their location in a building (floor) or an area

Within a large RD Domain, grouping of APs (within an area or on the same floor in a building) facilitates statistics gathering and troubleshooting.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
group-by [area|floor]
```

Parameters

- group-by [area|floor]

| | |
|-------|---|
| area | Groups radios based on their area of location |
| floor | Groups radios based on their floor location |
| | Both options are disabled by default. |

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#group-by floor

rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
channel-width 5GHz auto
coverage-hole-recovery snr-threshold 5GHz 1
rfs6000-37FABE(config-smart-rf-policy-test)#
```

Related Commands

| <i>no</i> | Removes Smart RF group settings |
|-----------|---------------------------------|

19.1.9 interference-recovery

▶ *smart-rf-policy*

Enables interference recovery from neighboring radios and other sources of WiFi and non-WiFi interference. Interference is the excess noise detected within the Smart RF supported radio coverage area. Smart RF provides mitigation from interfering sources by monitoring the noise levels and other RF parameters on an access point radio's current channel. When a noise threshold is exceeded, Smart RF selects an alternative channel with less interference. To avoid channel flapping a hold timer is defined, which disables interference avoidance for a specific period of time upon detection. Interference recovery is enabled by default.

NOTE: The interference-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information, see *sensitivity*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
interference-recovery {channel-hold-time|channel-switch-delta|client-threshold|
interference|neighbor-offset|noise|noise-factor}
```

```
interference-recovery {channel-switch-delta [2.4GHz|5GHz] <5-35>}
```

```
interference-recovery {channel-hold-time <0-86400>|client-threshold <1-255>|
interference|neighbor-offset <3-10>|noise|noise-factor <1.0-3.0>}
```

Parameters

- `interference-recovery {channel-switch-delta [2.4GHz|5GHz] <5-35>}`

| | |
|---|--|
| channel-switch-delta | Optional. Configures a threshold value for the difference between interference levels on the current channel and the prospective channel needed to trigger a channel change. If the difference in noise levels on the current channel and the prospective channel is below the configured threshold, the channel is not changed. |
| [2.4GHz 5GHz] | Selects the band <ul style="list-style-type: none"> • 2.4GHz - Selects the 2.4 GHz band • 5GHz - Selects the 5.0 GHz band |
| <5-35> | Specifies the threshold value for the difference between the current and prospective channel interference levels <ul style="list-style-type: none"> • <5-35> - Sets a value from 5 dBm - 35 dBm. The default setting is 20 dBm for both 2.4 GHz and 5.0 GHz bands. |
| <pre>• interference-recovery {channel-hold-time <0-86400> client-threshold <1-255> interference neighbor-offset <3-10> noise noise-factor <1.0-3.0>}</pre> | |
| channel-hold-time <0-86400> | Optional. Defines the minimum time between two channel change recoveries <ul style="list-style-type: none"> • <0-86400> - Sets the time, in seconds, between channel change assignments based on interference or noise. The default is 7,200 seconds. |

| | |
|--------------------------|---|
| client-threshold <1-255> | Optional. Specifies client thresholds needed to avoid channel change. If the specified threshold number of clients are connected to a radio, the radio avoids changing channels even if the Smart RF master determines that a channel change is required. <ul style="list-style-type: none"> • <1-255> - Sets the number of clients from 1 - 255. The default is 50. |
| interference | Optional. Considers external interference values to perform interference recovery. This feature allows the Smart RF policy to scan for excess interference from supported radio devices. WLANs are susceptible to sources of interference, such as neighboring radios, cordless phones, microwave ovens and Bluetooth devices. When interference for WiFi sources is detected, Smart RF supported devices can change the channel and move to a cleaner channel. This feature is enabled by default. |
| neighbor-offset <3-10> | Optional. Configures a noise factor value, which is taken into consideration when switching channels to avoid interference from neighboring access points. Smart RF enabled access points consider the difference in noise between candidate channels. <ul style="list-style-type: none"> • <3-10> - Specify a noise factor value from 3 - 10. |
| noise | Optional. Considers noise values to perform interference recovery. This feature allows the Smart RF policy to scan for excess noise from WiFi devices. When detected, Smart RF supported devices can change their channel and move to a cleaner channel. This feature is enabled by default. |
| noise-factor <1.0-3.0> | Optional. Configures additional noise factor (the level of network interference detected) for non WiFi interference <ul style="list-style-type: none"> • <1.0-3.0> - Specify the noise factor from 1.0 - 3.0. The default is 1.50. |

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#interference-recovery channel-switch-
delta 5GHz 5

rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
assignable-power 5GHz min 8
assignable-power 5GHz max 20

| <i>no</i> | Disables recovery from excessive noise and interference |
|-----------|---|

19.1.10 neighbor-recovery

▶ *smart-rf-policy*

Enables recovery from errors due to faulty neighboring radios. Enabling neighbor recovery ensures automatic recovery from failed radios within the radio coverage area. Smart RF instructs neighboring access points to increase their transmit power to compensate for the failed radio. Neighbor recovery is enabled by default when the sensitivity setting is medium.

NOTE: The neighbor-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information, see [sensitivity](#).

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
neighbor-recovery {dynamic-sampling|power-hold-time|power-threshold}
neighbor-recovery {dynamic-sampling} {retries <1-10>|threshold <1-30>}
neighbor-recovery {power-hold-time <0-3600>}
neighbor-recovery {power-threshold [2.4Ghz|5Ghz] <-85--55>}
```

Parameters

- neighbor-recovery {dynamic-sampling} {retries <1-10>|threshold <1-30>}

| | |
|--|---|
| dynamic-sampling | Optional. Enables dynamic sampling on this Smart RF policy. Dynamic sampling allows you to define how Smart RF adjustments are triggered by locking the 'retry' and 'threshold' values. Dynamic sampling is disabled by default. |
| retries <1-10> | Optional. Specifies the number of retries before allowing a power level adjustments to compensate for a potential coverage hole. <ul style="list-style-type: none"> • <1-10> - Sets the number of retries from 1 - 10. The default is 3. |
| threshold <1-30> | Optional. Specifies the minimum number of sample reports before which a power change requires dynamic sampling <ul style="list-style-type: none"> • <1-30> - Sets the minimum number of reports from 1 - 30. The default is 5. |
| <ul style="list-style-type: none"> • neighbor-recovery {power-hold-time <0-3600>} | |
| power-hold-time | Optional. Specifies the minimum time, in seconds, between two power changes on a radio during neighbor-recovery |
| <0-3600> | Sets the time from 0 - 3600 sec. The default is 0 seconds. |

- `neighbor-recovery {power-threshold [2.4Ghz|5Ghz] <-85--55>}`

| | |
|-----------------|--|
| power-threshold | Optional. Specifies the power threshold based on which recovery is performed The 2.4 GHz/5.0 GHz radio uses the value specified here as the maximum power increase threshold if the radio is required to increase its output power to compensate for a failed radio within its coverage area. |
| [2.4GHz 5GHz] | Selects the band <ul style="list-style-type: none"> • 2.4GHz - Selects the 2.4 GHz band • 5GHz - Selects the 5.0 GHz band |
| <-85--55> | Specify the threshold value <ul style="list-style-type: none"> • <-85--55> - Sets the power threshold from -85 dBm - -55 dBm. The default is -70 dBm for both the 2.4 GHz and 5.0 GHz bands. |

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#neighbor-recovery power-threshold
2.4GHz
-82

rfs6000-37FABE(config-smart-rf-policy-test)#neighbor-recovery power-threshold

19.1.11 no

▶ *smart-rf-policy*

Negates a command or sets its default. When used in the config Smart RF policy mode, the `no` command disables or resets Smart RF settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [area|assignable-power|avoidance-time|channel-list|channel-width|
coverage-hole-recovery|enable|group-by|interference-recovery|neighbor-recovery|
smart-ocs-monitoring]
```

```
no area <AREA-NAME> channel-list [2.4GHZ|5GHZ]
```

```
no assignable-power [2.4GHZ|5GHZ] [max|min]
```

```
no [channel-list|channel-width] [2.4GHZ|5GHZ]

```

```
no neighbor-recovery {dynamic-sampling {retries|threshold}|power-hold-time|
power-threshold [2.4GHZ|5GHZ]}
```

```
no smart-rf-monitoring {awareness-override [schedule <1-3>|threshold]|client-
aware [2.4GHZ|5GHZ]|extended-scan-frequency [2.4GHZ|5GHZ]|frequency
[2.4GHZ|5GHZ]|off-channel-duration [2.4GHZ|5GHZ]|power-save-aware
[2.4GHZ|5GHZ]|sample-count [2.4GHZ|5GHZ]|voice-aware [2.4GHZ|5GHZ]}
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Negates a command or sets its default. When used in the config Smart RF policy mode, the <code>no</code> command disables or resets the Smart RF policy settings. |
|-----------------|---|

Example

The following example shows the Smart RF policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
channel-width 5GHz auto
interference-recovery channel-switch-delta 5GHz 5
neighbor-recovery power-threshold 5GHz -65
neighbor-recovery power-threshold 2.4GHz -82
coverage-hole-recovery snr-threshold 5GHz 1
rfs6000-37FABE(config-smart-rf-policy-test)#
rfs6000-37FABE(config-smart-rf-policy-test)#no interference-recovery channel-
switch-delta 5GHz
rfs6000-37FABE(config-smart-rf-policy-test)#no neighbor-recovery power-threshold
2.4GHz
rfs6000-37FABE(config-smart-rf-policy-test)#no neighbor-recovery power-threshold
5GHz
rfs6000-37FABE(config-smart-rf-policy-test)#no assignable-power 5GHz min
rfs6000-37FABE(config-smart-rf-policy-test)#no assignable-power 5GHz max
```

The following example shows the Smart RF policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
channel-list 2.4GHz 1,12
channel-width 5GHz auto
coverage-hole-recovery snr-threshold 5GHz 1
rfs6000-37FABE(config-smart-rf-policy-test)#
```

19.1.12 sensitivity

▶ *smart-rf-policy*

Configures Smart RF sensitivity level. The sensitivity level determines Smart RF scanning and sampling aggressiveness. For example, a low sensitivity level indicates a less aggressive Smart-RF policy. This translates to fewer samples taken during off-channel scanning and short off-channel durations. When the sensitivity level is set to high, Smart-RF collects more samples, and remains off-channel longer.

The Smart RF sensitivity level options include low, medium, high, and custom. Medium, is the default setting. The custom option allows an administrator to adjust the parameters and thresholds for interference recovery, coverage hole recovery, and neighbor recovery. However, the low, medium, and high settings still allow utilization of these features.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
sensitivity [custom|high|low|medium]
```

Parameters

- `sensitivity` [custom|high|low|medium]

| | |
|-------------|--|
| sensitivity | Configures Smart RF sensitivity levels. The options available are: custom, high, low, and medium. |
| custom | Enables custom interference recovery, coverage hole recovery, and neighbor recovery as additional Smart RF options |
| high | High sensitivity |
| low | Low sensitivity |
| medium | Medium sensitivity. This is the default setting. |

Usage Guidelines

To enable the *power* and *channel setting* parameters, set *sensitivity* to *custom* or *medium*.

To enable the *monitoring* and *scanning* parameters, set *sensitivity* to *custom*.

To enable the *neighbor recovery*, *interference* and *coverage hole recovery* parameters, set *sensitivity* to *custom*.

Example

```
rfs6000-37FABE(config-smart-rf-policy-test)#sensitivity high

rfs6000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity high
channel-list 2.4GHz 1,12
channel-width 5GHz auto
smart-ocs-monitoring frequency 5GHz 3
smart-ocs-monitoring frequency 2.4GHz 3
smart-ocs-monitoring sample-count 5GHz 3
smart-ocs-monitoring sample-count 2.4GHz 3
--More--
rfs6000-37FABE(config-smart-rf-policy-test)#
```

19.1.13 smart-ocs-monitoring

► smart-rf-policy

Applies smart *Off Channel Scanning* (OCS) instead of dedicated detectors

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
smart-ocs-monitoring {awareness-override|client-aware|extended-scan-frequency|
frequency|off-channel-duration|power-save-aware|sample-count|tx-load-aware|
voice-aware}

smart-ocs-monitoring {awareness-override [schedule|threshold]}
smart-ocs-monitoring {awareness-override schedule <1-3> <START-TIME> <END-TIME>
<DAY>}

smart-ocs-monitoring {awareness-override threshold <10-10000>}

smart-ocs-monitoring {client-aware [2.4GHz|5GHz] <1-255>}

smart-ocs-monitoring {extended-scan-frequency [2.4GHz|5GHz] <0-50>}

smart-ocs-monitoring {frequency [2.4GHz|5GHz] <1-120>}

smart-ocs-monitoring {off-channel-duration [2.4GHz|5GHz] <20-150>}

smart-ocs-monitoring {power-save-aware [2.4GHz|5GHz] [disable|dynamic|strict]}

smart-ocs-monitoring {sample-count [2.4GHz|5GHz] <1-15>}

smart-ocs-monitoring {tx-load-aware [2.4GHz|5GHz] <1-100>}

smart-ocs-monitoring {voice-aware [2.4GHz|5GHz] [disable|dynamic|strict]}
```

Parameters

- smart-ocs-monitoring {awareness-override schedule <1-3> <START-TIME> <END-TIME> <DAY>}

| | |
|---|---|
| awareness-override | Optional. Use this parameter to configure client awareness settings overrides |
| schedule <1-3> <START-TIME> <END-TIME> {<DAY>} | <p>Configures a time and day schedule when awareness settings are overridden</p> <ul style="list-style-type: none"> • <1-3> - Sets the awareness override schedule index. A maximum of three overrides can be configured. • <START-TIME> - Sets the override start time in HH:MM format • <END-TIME> - Sets the override end time in HH:MM format • DAY - Optional. Set the day when the override is active. Use one of the following formats: <ul style="list-style-type: none"> • all - Override is active on all days • sun - Override is active only on Sundays • mon - Override is active only on Mondays <p>Contd..</p> |

| | |
|---|---|
| | <ul style="list-style-type: none"> tue - Override is active only on Tuesdays wed - Override is active only on Wednesdays thu - Override is active only on Thursdays fri - Override is active only on Fridays sat - Override is active only on Saturdays |
| | <ul style="list-style-type: none"> smart-ocs-monitoring {awareness-override threshold <10-10000>} |
| awareness-override threshold <10-10000> | <p>Optional. Use this parameter to configure client awareness settings overrides</p> <ul style="list-style-type: none"> threshold - Specifies the threshold after which client awareness settings are overridden. When the specified threshold is reached, awareness settings are overridden. <ul style="list-style-type: none"> <10-10000> - Specify a threshold value from 10 -10000. The default is 10. |
| | <ul style="list-style-type: none"> smart-ocs-monitoring {client-aware [2.4GHz 5GHz] <1-255>} |
| client-aware | <p>Optional. Enables client aware scanning on this Smart RF policy</p> <p>Use this parameter to configure a client threshold number. When the number of clients connected to a radio equals this threshold number, the radio avoids channel scanning.</p> <p>This feature is disabled by default.</p> |
| 2.4GHz <1-255> | <p>Enables client aware scanning on the 2.4 GHz band</p> <p>Avoids radio scanning when a specified minimum number of clients are present</p> <ul style="list-style-type: none"> <1-255> - Sets the minimum number of clients from 1 - 255. The default is 1 client. |
| 5GHz <1-255> | <p>Enables client aware scanning on the 5.0 GHz band</p> <p>Avoids radio scanning when a specified minimum number of clients are present</p> <ul style="list-style-type: none"> <1-255> - Sets the minimum number of clients from 1 - 255. The default is 1 client. |
| | <ul style="list-style-type: none"> smart-ocs-monitoring {extended-scan-frequency [2.4GHz 5GHz] <0-50>} |
| extended-scan-frequency | <p>Optional. Enables an extended scan, as opposed to a neighbor only scan, on this Smart RF policy. This is the frequency radios use to scan for non-peer radios.</p> |
| 2.4GHz <0-50> | <p>Enables extended scan on the 2.4 GHz band</p> <ul style="list-style-type: none"> <0-50> - Sets the number of trails from 0 - 50. The default is 5. |
| 5GHz <0-50> | <p>Enables extended scan on the 5.0 GHz band</p> <ul style="list-style-type: none"> <0-50> - Sets the number of trails from 0 - 50. The default is 5. |
| | <ul style="list-style-type: none"> smart-ocs-monitoring {frequency [2.4GHz 5GHz] <1-120>} |
| frequency | <p>Optional. Specifies the scan frequency. This is the frequency, in seconds, in which smart-ocs-monitoring changes channels for an off channel scan.</p> |
| 2.4GHz <1-120> | <p>Selects the 2.4 GHz band</p> <ul style="list-style-type: none"> <1-120> - Sets a scan frequency from 1 - 120 sec. The default is 6 seconds. |
| 5GHz <1-120> | <p>Selects the 5.0 GHz band</p> <ul style="list-style-type: none"> <1-120> - Sets a scan frequency from 1 - 120 sec. The default is 6 seconds. |

- `smart-ocs-monitoring {off-channel-duration [2.4GHz|5GHz] <20-150>}`

| | |
|----------------------|---|
| off-channel-duration | Optional. Specifies the duration to scan off channel This is the duration access point radios use to monitor devices within the network and, if necessary, perform self healing and neighbor recovery to compensate for coverage area losses within a RF Domain. |
| 2.4GHz <20-150> | Selects the 2.4 GHz band (in milliseconds) <ul style="list-style-type: none"> • <20-150> - Sets the off channel duration from 20 - 150 msec. The default is 50 milliseconds. |
| 5GHz <20-150> | Selects the 5.0 GHz band (in milliseconds) <ul style="list-style-type: none"> • <20-150> - Sets the off channel duration from 20 - 150 msec. The default is 50 milliseconds. |

- `smart-ocs-monitoring {power-save-aware [2.4GHz|5GHz] [disable|dynamic|strict]}`

| | |
|------------------------------------|--|
| power-save-aware | Optional. Enables power save awareness scanning mode on this Smart RF policy. The options are: disable, dynamic, and strict. This setting allows Smart RF to detect power save clients and take them into consideration when performing off channel scans. Strict disables smart monitoring as long as a power save capable client is associated to a radio. Dynamic disables smart monitoring as long as there is data buffered for a power save client at the radio. |
| 2.4GHz [disable dynamic strict] | Sets power save awareness scanning mode on the 2.4 GHz band <ul style="list-style-type: none"> • disable - Disables power save awareness scanning • dynamic - Dynamically avoids scanning based on traffic for power save (PSP) clients • strict - Strictly avoids scanning when PSP clients are present The default is dynamic. |
| 5GHz [disable dynamic strict] | Sets power save awareness scanning mode on the 5.0 GHz band <ul style="list-style-type: none"> • disable - Disables power save awareness scanning • dynamic - Dynamically avoids scanning based on traffic for PSP clients • strict - Strictly avoids scanning when PSP clients are present The default is dynamic. |

- `smart-ocs-monitoring {sample-count [2.4GHz|5GHz] <1-15>}`

| | |
|---------------|--|
| sample-count | Optional. Specifies the number of samples to collect before reporting an issue to the Smart RF master |
| 2.4GHz <1-15> | Selects the 2.4 GHz band <ul style="list-style-type: none"> • <1-15> - Specifies the number of samples to collect from 1 - 15. The default is 10. |
| 5GHz <1-15> | Selects the 5.0 GHz band <ul style="list-style-type: none"> • <1-15> - Specifies the number of samples to collect from 1 - 15. The default is 5. |

- `smart-ocs-monitoring {tx-load-aware [2.4GHz|5GHz] <1-100>}`

| | |
|---------------|---|
| tx-load-aware | Optional. Specifies a transmit load percentage that serves as a threshold before scanning is avoided for an access point's 2.4 GHz or 5.0 GHz band. This option is disabled for both 2.4 GHz and 5.0 GHz bands. |
|---------------|---|

| | |
|--|---|
| 2.4GHz <1-100> | Selects the 2.4 GHz band <ul style="list-style-type: none"> <1-100> - Specify a transmit load percentage from 1 - 100%. When enabled, the default is 1%. |
| 5GHz <1-100> | Selects the 5.0 GHz band <ul style="list-style-type: none"> <1-100> - Specify a transmit load percentage from 1 - 100%. When enabled, the default is 1%. |
| <ul style="list-style-type: none"> <code>smart-ocs-monitoring {voice-aware [2.4GHz 5GHz] [disable dynamic strict]}</code> | |
| voice-aware | Optional. Enables voice awareness scanning mode on this Smart RF policy. The options are: disable, dynamic, and strict. Strict disables smart monitoring as long as a voice client is associated to a radio. Dynamic disables smart monitoring as long as there is data buffered for a voice client at the radio. |
| 2.4GHz [disable dynamic strict] | Specifies the scanning mode on the 2.4 GHz band <ul style="list-style-type: none"> disable - Disables voice awareness scanning dynamic - Dynamically avoids scanning based on traffic for voice clients strict - Strictly avoids scanning when voice clients are present Note: The default is dynamic. |
| 5GHz [disable dynamic strict] | Specifies the scanning mode on the 5.0 GHz band <ul style="list-style-type: none"> disable - Disables voice awareness scanning dynamic - Dynamically avoids scanning based on traffic for voice clients strict - Strictly avoids scanning when voice clients are present. Note: The default is dynamic. |

20 WIPS-POLICY

This chapter summarizes the *Wireless Intrusion Protection Systems* (WIPS) policy commands in the CLI command structure.

WIPS is an additional measure of security designed to continuously monitor the network for threats and intrusions. Along with wireless VPNs, encryptions, and authentication policies WIPS enhances the security of a WLAN.

The WIPS policy enables detection of intrusions and threats that a managed network is likely to encounter. However, the WIPS policy does not include threat mitigation configurations. These intrusions and threats are available within the WIPS policy configuration mode as pre configured, fixed events. Each event consists of a set of frames or anomalies that may be harmful to the managed network. You can enable/disable various aspects of each individual event.

Events are broadly grouped into the following three categories:

- Excessive/Thresholdable events: These events detect DOS attacks, like excessive deauths, EAP floods, etc. Threshold limits for such events can be configured for *mobile units* (MU) and radios. Once these threshold limits are exceeded, an event is triggered. Stations triggering an event are usually filtered. You can configure a filter ageout specifying the time for which the station, triggering the event, is filtered. However, the filter ageout only applies when the MU-threshold is exceeded. When radio threshold is reached, the system raises a warning about the same and updates event history with event details.
- Station/MU anomalies: These events are triggered when a MU performs suspicious activities that can compromise the security and stability of the managed network. You can configure a filter ageout, similar to the above class of events, to filter the station triggering such events.
- AP/neighbor anomalies: These events are triggered when an AP or neighbor sends suspicious frames. The system cannot filter APs or neighbors triggering such events. However, the system warns you about such attacks, allowing you to take further actions against such APs and neighbors.

In addition to event monitoring configuration, the WIPS policy allows you to configure a list of signatures. Unlike events, signatures are not fixed. You are free to define your own signatures based on a specific set of parameters. A signature is a rule, consisting of a set of fields to match and a corresponding set of actions in case of a match. By default, whenever a signature is matched an event log is triggered. This event log is similar to the one triggered upon an event. In addition to an event log, you can also configure other actions. Signatures have all the features supported by events. In fact most events are internally implemented as signatures.

Signature rules are of the following three types:

- ssid, ssid length rule: This signature matches a specified SSID or SSID length. It is mandatory to configure the frame type to match for this signature. When configured, only frame types allowed are beacons, probe requests, and probe responses. Example rule: ssid : AirJack and frame type beacon : Signature for AirJack attack.
- payload rule: This signature matches a particular payload at a particular frame offset. You can restrict these matches based on frame type. Example rule: Payload : 0x00601d Offset 3 : Netstumbler
- address-match rule: This signature matches one or more address fields. The address fields supported are BSSID, source-MAC, and destination-MAC. You can also specify frame types to

match. The frame types supported are assoc, auth, beacon, data, deauth, disassoc, mgmt, probe-request, and probe-response.

A WIPS policy, once configured, has to be attached to a RF Domain to take effect. Multiple WIPS policies can be configured at the same time, but only one policy can be attached to a given RF Domain at any time.

NOTE: To attach a WIPS policy to a RF Domain, in the RF Domain configuration mode, execute the `use > wips-policy <WIPS-POLICY-NAME>` command. For more information, see [use](#).

NOTE: With this most recent release, AP7522 and AP7532 model Access Points can provide enhanced sensor support. AP7522 and AP7532 sensors can send data from off-channel-scans while in radio-share promiscuous/inline mode, in addition to the on-channel data captured in radio-share mode. ADSP uses the off-channel-scan data (in addition to the on-channel data) to monitor for rogue intrusions and trigger alarms. OTA Termination is triggered from ADSP to the appropriate radio-share AP to initiate termination.

NOTE: AP7522 and AP7532 models also support shared part-time scanning using WIPS in WiNG (using off-channel-scans) and no ADSP. WIPS on WiNG was enhanced to add rogue detection/classification (wired side detection based of MAC Address Offset) and *over-the-air* (OTA) termination for AP7522 and AP7532 deployments.

Use the (config) instance to configure WIPS policy commands. To navigate to the WIPS policy instance, use the following commands:

```
<DEVICE>(config)#wips-policy <POLICY-NAME>

rfs6000-37FABE(config)#wips-policy test
rfs6000-37FABE(config-wips-policy-test)#?
Wips Policy Mode commands:
  ap-detection          Rogue AP detection
  enable                Enable this wips policy
  event                 Configure an event
  history-throttle-duration  Configure the duration for which event duplicates
                           are not stored in history
  interference-event    Specify events which will contribute to smart-rf
                           wifi interference calculations
  no                    Negate a command or set its defaults
  signature              Signature to configure
  use                    Set setting to use
  clrscr                Clears the display screen
  commit                Commit all changes made in this session
  do                     Run commands from Exec mode
  end                   End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                 Write running configuration to memory or terminal
```

```
rfs6000-37FABE(config-wips-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (`_`) character. In other words, the name of a device cannot contain an underscore.

20.1 wips-policy

► WIPS-POLICY

The following table summarizes WIPS policy configuration commands:

Table 20.1 *WIPS-Policy-Config Commands*

| Command | Description | Reference |
|----------------------------------|--|-------------------|
| <i>ap-detection</i> | Defines the WIPS AP detection configuration | <i>page 20-5</i> |
| <i>enable</i> | Enables a WIPS policy | <i>page 20-7</i> |
| <i>event</i> | Configures events | <i>page 20-8</i> |
| <i>history-throttle-duration</i> | Configures the duration event duplicates are omitted from the event history | <i>page 20-12</i> |
| <i>interference-event</i> | Specifies events contributing to the Smart RF WiFi interference calculations | <i>page 20-13</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 20-14</i> |
| <i>signature</i> | Configures a WIPS policy signature and enters its configuration mode | <i>page 20-16</i> |
| <i>use</i> | Defines a WIPS policy settings | <i>page 20-33</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

20.1.1 ap-detection

► *wips-policy*

Enables the detection of unauthorized or unsanctioned APs. Unauthorized APs are untrusted access points connected to an access point managed network. These untrusted APs accept wireless client associations. It is important to detect such rogue APs and declare them unauthorized. Rogue AP detection is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap-detection {ageout|air-termination|interferer-threshold|recurring-event-
interval|wait-time}
```

```
ap-detection {ageout <30-86400>|interferer-threshold <-100--10>|recurring-event-
interval <0-10000>|wait-time <10-600>}
```

```
ap-detection air-termination {allow-channel-switch|mode [auto|manual]}
```

Parameters

- ap-detection {ageout <30-86400>|interferer-threshold <-100--10>|recurring-event-interval <0-10000>|wait-time <10-600>}

| | |
|---------------------------------------|---|
| ap-detection | Enables detection of unauthorized or unsanctioned APs |
| ageout <30-86400> | Optional. Configures the unauthorized AP ageout interval. The WIPS policy uses this value to ageout unauthorized APs. <ul style="list-style-type: none"> • <30-86400> - Sets an ageout interval from 30 - 86400 seconds. The default is 5 minutes (300 seconds). |
| recurring-event-interval <0-10000> | Configures recurring event interval help of unauthorized APs <ul style="list-style-type: none"> • <0-10000> - Configures the recurring interval between 0 - 10000 seconds. The default is 300 seconds. |
| interferer-threshold <-100--10> | Configures RSSI threshold value to determine if an unsanctioned ap is an interferer or not <ul style="list-style-type: none"> • <-100--10> - Configures the rssi threshold between -100 - -10 dBm. The default is -75 dBm. |
| wait-time <10-600> | Optional. Configures the wait time before a detected AP is declared as unauthorized and potentially removed <ul style="list-style-type: none"> • <10-600> - Sets a wait time from 10 - 600 seconds. The default is 1 minute (60 seconds). |

- `ap-detection air-termination {allow-channel-switch|mode [auto|manual]}`

| | |
|--|---|
| <code>ap-detection</code> | Enables detection of unauthorized or unsanctioned APs |
| <code>air-termination {allow-channel-switch mode [auto manual]}</code> | Enables air termination of unauthorized APs. This option is disabled by default. <ul style="list-style-type: none"> • <code>allow-channel-switch</code> – Optional. Allows channel switch of unauthorized APs based on the channel mode. This option is disabled by default. • <code>mode [auto manual]</code> – Optional. Select the mode as auto or manual to configure. The default setting is manual. |

Example

```
rfs6000-37FABE(config-wips-policy-test)#ap-detection wait-time 15
rfs6000-37FABE(config-wips-policy-test)#ap-detection age-out 50

rfs6000-37FABE(config-wips-policy-test)#show context
wips-policy test
  ap-detection-age-out 50
  ap-detection-wait-time 15
rfs6000-37FABE(config-wips-policy-test)#

nx9500-6C8809(config-wips-policy-test)#ap-detection recurring-event-interval 10

nx9500-6C8809(config-wips-policy-test)#show context
wips-policy test
  ap-detection recurring-event-interval 10
nx9500-6C8809(config-wips-policy-test)#
```

Related Commands

| | |
|-----------------|--|
| <code>no</code> | Resets unauthorized or unsanctioned AP detection settings to default |
|-----------------|--|

20.1.2 enable

► *wips-policy*

Enables this WIPS policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
enable
```

Parameters

None

Example

```
rfs6000-37FABE(config-wips-policy-test)#enable
rfs6000-37FABE(config-wips-policy-test)#
```

Related Commands

| | |
|-----------|------------------------|
| <i>no</i> | Disables a WIPS policy |
|-----------|------------------------|

20.1.3 event

► wips-policy

Configures events, filters and threshold values for this WIPS policy. Events are grouped into three categories, AP anomaly, client anomaly, and excessive. WLANs are baselined for matching criteria. Any deviation from this baseline is considered an anomaly and logged as an event.

NOTE: By default all event monitoring is disabled.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
event [ap-anomaly|client-anomaly|enable-all-events|excessive]

event ap-anomaly [ad-hoc-violation|airjack|ap-ssid-broadcast-in-beacon|asleep|
impersonation-attack|null-probe-response|transmitting-device-using-invalid-mac|
unencrypted-wired-leakage|wireless-bridge]

event client-anomaly [dos-broadcast-death|fuzzing-all-zero-macs|
fuzzing-invalid-frame-type|fuzzing-invalid-mgmt-frames|fuzzing-invalid-seq-num|
identical-src-and-dest-addr|invalid-8021x-frames|netstumbler-generic|
non-conforming-data|wellenreiter] {filter-ageout <0-86400>}

event enable-all-events

event excessive [80211-replay-check-failure|aggressive-scanning|auth-server-
failures|decryption-failures|dos-assoc-or-auth-flood|dos-eapol-start-storm|
dos-unicast-death-or-disassoc|eap-flood|eap-nak-flood|frames-from-unassoc-
station] {filter-ageout <0-86400>|threshold-client <0-65535>|threshold-radio <0-
65535>}
```

Parameters

- event ap-anomaly [ad-hoc-violation|airjack|ap-ssid-broadcast-in-beacon|asleep|impersonation-attack|null-probe-response|transmitting-device-using-invalid-mac|unencrypted-wired-leakage|wireless-bridge]

| | |
|-----------------------------|---|
| ap-anomaly | Enables AP anomaly event tracking An AP anomaly event refers to suspicious frames sent by neighboring APs. An administrator enables the filtering of each listed event and sets the thresholds for the generation of event notification and filtering. |
| ad-hoc-violation | Tracks ad-hoc network violations |
| airjack | Tracks AirJack attacks |
| ap-ssid-broadcast-in-beacon | Tracks AP SSID broadcasts in beacon events |
| asleep | Tracks ASLEAP attacks. These attacks break <i>Lightweight Extensible Authentication Protocol</i> (LEAP) passwords |
| impersonation-attack | Tracks impersonation attacks. These are also referred to as spoofing attacks, where the attacker assumes the address of an authorized device. |

| | |
|---|---|
| null-probe-response | Tracks null probe response attacks |
| transmitting-device-using-invalid-mac | Tracks the transmitting device using an invalid MAC attacks |
| unencrypted-wired-leakage | Tracks unencrypted wired leakage |
| wireless-bridge | Tracks <i>wireless bridge</i> (WDS) frames |
| <ul style="list-style-type: none"> • event client-anomaly [dos-broadcast-death fuzzing-all-zero-macs fuzzing-invalid-frame-type fuzzing-invalid-mgmt-frames fuzzing-invalid-seq-num identical-src-and-dest-addr invalid-8021x-frames netstumbler-generic non-conforming-data wellenreiter] {filter-ageout <0-86400>} | |
| client-anomaly | <p>Enables client anomaly event tracking</p> <p>These are suspicious events performed by wireless clients compromising the security of the network. An administrator can enable or disable filtering of each listed event and set the thresholds required for the generation of the event notification and filtering action applied.</p> |
| dos-broadcast-death | Tracks DoS broadcast deauthentication events |
| fuzzing-all-zero-macs | Tracks Fuzzing: All zero MAC addresses observed |
| fuzzing-invalid-frame-type | Tracks Fuzzing: Invalid frame type detected |
| fuzzing-invalid-mgmt-frames | Tracks Fuzzing: Invalid management frame detected |
| fuzzing-invalid-seq-num | Tracks Fuzzing: Invalid sequence number detected |
| identical-src-and-dest-addr | Tracks identical source and destination addresses detection |
| invalid-8021x-frames | Tracks Fuzzing: Invalid 802.1x frames detected |
| netstumbler-generic | Tracks Netstumbler (v3.2.0, 3.2.3, 3.3.0) events |
| non-conforming-data | Tracks non conforming data packets |
| wellenreiter | Tracks Wellenreiter events |
| filter-ageout <0-86400> | <p>The following keywords are common to all of the above client anomaly events:</p> <ul style="list-style-type: none"> • filter-ageout <0-86400> - Optional. Configures the filter expiration interval in seconds <ul style="list-style-type: none"> • <0-86400> - Sets the filter ageout interval from 0 - 86400 seconds. The default is 0 seconds. <p>Note: For each violation define a filter time in seconds, which determines how long the packets (received from an attacking device) are ignored once a violation has been triggered. Ignoring frames from an attacking device minimizes the effectiveness of the attack and the impact to the site until permanent mitigation can be performed.</p> <p>The filter ageout value is applicable across the entire RF Domain using this WIPS policy. If an MU is detected performing an attack and is filtered by one of the APs, the information is passed on to all APs and controllers within the RF Domain through the domain manager. Consequently the MU is filtered, for the specified period of time, across all devices.</p> |
| <ul style="list-style-type: none"> • event enable-all-events | |
| enable-all-events | Enables tracking of all intrusion events (client anomaly and excessive events) |

```

• event excessive [80211-replay-check-failure|aggressive-scanning|auth-server-
failures|decryption-failures|dos-assoc-or-auth-flood|dos-eapol-start-storm|dos-
unicast-death-or-disassoc|eap-flood|eap-nak-flood|frames-from-unassoc-station]
{filter-ageout [<0-86400>]|threshold-client [<0-5535>]|threshold-radio <0-65535>}

```

| | |
|-------------------------------|---|
| excessive | Enables the tracking of excessive events. Excessive events are actions performed continuously and repetitively. These events can impact the performance of the controller managed network. DoS attacks come under this category. |
| 80211-replay-check-failure | Tracks 802.11replay check failure |
| aggressive-scanning | Tracks aggressive scanning events |
| auth-server-failures | Tracks failures reported by authentication servers |
| decryption-failures | Tracks decryption failures |
| dos-assoc-or-auth-flood | Tracks DoS association or authentication floods |
| dos-eapol-start-storm | Tracks DoS EAPOL start storms |
| dos-unicast-death-or-disassoc | Tracks DoS dissociation or deauthentication floods |
| eap-flood | Tracks EAP floods |
| eap-nak-flood | Tracks EAP NAK floods |
| frames-from-unassoc-station | Tracks frames from unassociated clients |
| filter-ageout <0-86400> | <p>The following keywords are common to all excessive events:</p> <ul style="list-style-type: none"> filter-ageout <0-86400> - Optional. Configures a filter expiration interval in seconds. It sets the duration for which the client is filtered. The client is added to a ACL as a special entry and frames received from this client are dropped. <ul style="list-style-type: none"> <0-86400> - Sets a filter ageout interval from 0 - 86400 seconds. The default is 0 seconds. <p>Note: This value is applicable across the RF Domain. If a client is detected performing an attack and is filtered by one of the APs, the information is passed to the domain controller. The domain controller then propagates this information to all APs and wireless controllers in the RF Domain.</p> |
| threshold-client <0-65535> | <p>The following keywords are common to all excessive events:</p> <ul style="list-style-type: none"> threshold-client <0-65535> - Optional. | <i>no</i> | Disables WIPS policy events tracking |
|-----------|--------------------------------------|

20.1.4 history-throttle-duration

► *wips-policy*

Configures the duration event duplicates are omitted from the event history

The system maintains a history of all events that have occurred, on each device, within a RF Domain. Sometimes an event occurs for a prolonged period of time and tends to fill up the event history list. In such a scenario, duplicate information added to the event history list can be throttled for a specified period of time. Once this period is over, duplicate entries are once again allowed.

Event history statistics are periodically sent to the domain manager, which can be queried to ascertain the general health of the domain.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
history-throttle-duration <30-86400>
```

Parameters

- history-throttle-duration <30-86400>

| | |
|---|--|
| history-throttle-duration <30-86400> | Configures the duration event duplicates are omitted from the event history <ul style="list-style-type: none"> • <30-86400> - Sets a value from 30 - 86400 seconds. The default is 120 seconds. |
|---|--|

Example

```
rfs6000-37FABE (config-wips-policy-test)#history-throttle-duration 77

rfs6000-37FABE (config-wips-policy-test)#show context
wips-policy test
  history-throttle-duration 77
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  event client-anomaly wellenreiter filter-ageout 99
  ap-detection-ageout 50
  ap-detection-wait-time 15
rfs6000-37FABE (config-wips-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the history throttle duration to its default (120 seconds) |
|-----------|---|

20.1.5 interference-event

► *wips-policy*

Specifies events contributing to the Smart RF WiFi interference calculations

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
interference-event [non-conforming-data|wireless-bridge]
```

Parameters

- `interference-event [non-conforming-data|wireless-bridge]`

| | |
|---------------------|---|
| non-conforming-data | Considers non conforming data packets when calculating Smart RF interference |
| wireless-bridge | Considers Wireless Bridge (WDS) frames when calculating Smart RF interference |

Example

```
rfs6000-37FABE(config-wips-policy-test)#interference-event non-conforming-data
rfs6000-37FABE(config-wips-policy-test)#show context
wips-policy test
  history-throttle-duration 77
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  event client-anomaly wellenreiter filter-ageout 99
  interference-event non-conforming-data
  ap-detection-ageout 50
  ap-detection-wait-time 15
rfs6000-37FABE(config-wips-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables this WIPS policy signature as a Smart RF interference source |
|-----------|---|

20.1.6 no

► *wips-policy*

Negates a command or resets configured settings to their default. When used in the config WIPS policy mode, the `no` command negates or resets filters and thresholds.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [ap-detection|enable|event|history-throttle-duration|interference-event|
signature|use]

no [enable|history-throttle-duration]

no ap-detection {ageout <{LINE-SINK}>|air-termination|interferer-threshold <-100-
-10>|recurring-event-interval <0-10000>wait-time <{LINE-SINK}>}}

no event [ap-anomaly|client-anomaly|enable-all-events|excessive]

no event ap-anomaly [ad-hoc-violation|airjack|ap-ssid-broadcast-in-beacon|asleep|
impersonation-attack|null-porbe-response|transmitting-device-using-invalid-mac|
unencrypted-wired-leakage|wireless-bridge]

no event client-anomaly [dos-broadcast-death|fuzzing-all-zero-macs|fuzzing-
invalid-frame-type|fuzzing-invalid-mgmt-frames|fuzzing-invalid-seq-num|
identical-src-and-dest-addr|invalid-8021x-frames|netstumbler-generic|
non-conforming-data|wellenreiter] {filter-ageout <0-86400>}

no event excessive [80211-replay-check-failure|aggressive-scanning|
auth-server-failures|decryption-failures|dos-assoc-or-auth-flood|
dos-eapol-start-storm|dos-unicast-death-or-disassoc|eap-flood|eap-nak-flood|
frames-from-unassoc-station] {filter-ageout <0-86400>|threshold-client <0-65535>|
threshold-radio <0-65535>}

no interference-event [non-conforming-data|wireless-bridge]

no signature <WIPS-SIGNATURE>

no use device-categorization
```

Parameters

- `no <PARAMETERS>`

| | |
|------------------------------------|---|
| <code>no <PARAMETERS></code> | Negates a command or resets configured settings to their default. When used in the config WIPS policy mode, the <code>no</code> command negates or resets filters and thresholds. |
|------------------------------------|---|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following example shows the WIPS Policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-wips-policy-test)#show context
wips-policy test
  history-throttle-duration 77
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  event client-anomaly wellenreiter filter-ageout 99
  interference-event non-conforming-data
  ap-detection-ageout 50
  ap-detection-wait-time 15
rfs6000-37FABE(config-wips-policy-test)#

rfs6000-37FABE(config-wips-policy-test)#no event client-anomaly wellenreiter
filter-ageout 99
rfs6000-37FABE(config-wips-policy-test)#no interference-event non-conforming-data
rfs6000-37FABE(config-wips-policy-test)#no history-throttle-duration
```

The following example shows the WIPS Policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-wips-policy-test)#show context
wips-policy test
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  no event client-anomaly wellenreiter filter-ageout 99
  ap-detection-ageout 50
  ap-detection-wait-time 15
rfs6000-37FABE(config-wips-policy-test)#
```

20.1.7 signature

▶ *wips-policy*

Attack and intrusion patterns are identified and configured as signatures in a WIPS policy. The WIPS policy compares packets in the network with pre configured signatures to identify threats.

The following table summarizes WIPS policy signature configuration commands:

Table 20.2 *WIPS-Policy-Signature-Config Commands*

| | | |
|--------------------------------|--|-------------------|
| <i>signature</i> | Configures a WIPS policy signature and enters its configuration mode | <i>page 20-17</i> |
| <i>signature mode commands</i> | Summarizes WIPS signature configuration mode commands | <i>page 20-19</i> |

20.1.7.1 signature

▶ signature

Configures a WIPS policy signature. A WIPS signature is the set of parameters or patterns used by WIPS to identify and categorize particular sets of attack behaviors in order to classify them.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
signature <SIGNATURE-NAME>
```

Parameters

- signature <SIGNATURE-NAME>

| | |
|-------------------------------|---|
| signature <SIGNATURE-NAME> | Configures a WIPS policy signature <ul style="list-style-type: none"> • <SIGNATURE-NAME> - Enter a name for the WIPS policy signature. The name should not exceed 64 characters. |
|-------------------------------|---|

Example

```
rfs6000-37FABE(config-wips-policy-test)#signature test
rfs6000-37FABE(config-test-signature-test)#

rfs6000-37FABE(config-test-signature-test)#?

20.1.7.2 signature mode commands

▶ signature

The following table summarizes WIPS policy signature configuration mode commands:

Table 20.3 WIPS-Policy-Signature-Mode Commands

| Commands | Description | Reference |
|---------------------------|---|-------------------|
| <i>ssid</i> | Configures the BSSID MAC address | <i>page 20-20</i> |
| <i>dst-mac</i> | Configures the destination MAC address | <i>page 20-21</i> |
| <i>filter-ageout</i> | Configures the filter ageout interval | <i>page 20-22</i> |
| <i>frame-type</i> | Configures the frame type used for matching | <i>page 20-23</i> |
| <i>interference-event</i> | Configures this WIPS policy signature as the Smart RF interference source | <i>page 20-24</i> |
| <i>mode</i> | Enables the signature mode | <i>page 20-25</i> |
| <i>payload</i> | Configures payload settings | <i>page 20-26</i> |
| <i>src-mac</i> | Configures the source MAC address | <i>page 20-27</i> |
| <i>ssid-match</i> | Configures a match based on SSID | <i>page 20-28</i> |
| <i>threshold-client</i> | Configures the wireless client threshold limit | <i>page 20-29</i> |
| <i>threshold-radio</i> | Configures the radio threshold limit | <i>page 20-30</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 20-31</i> |

20.1.7.2.1 bssid

▸ signature mode commands

Configures a BSSID MAC address with this WIPS signature for matching

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
bssid <MAC>
```

Parameters

- bssid <MAC>

| | |
|-------------|--|
| bssid <MAC> | Configures a BSSID MAC address to match <ul style="list-style-type: none"> • <MAC> - Specify the MAC address. |
|-------------|--|

Example

```
rfs6000-37FABE (config-test-signature-test)#bssid 11-22-33-44-55-66

rfs6000-37FABE (config-test-signature-test)#show context
signature test
bssid 11-22-33-44-55-66
rfs6000-37FABE (config-test-signature-test)#
```

Related Commands

| | |
|-----------|----------------------------------|
| <i>no</i> | Disables a WIPS signature BSS ID |
|-----------|----------------------------------|

20.1.7.2.2 dst-mac

▸ signature mode commands

Configures a destination MAC address for the packet examined for matching

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dst-mac <MAC>
```

Parameters

- dst-mac <MAC>

| | |
|---------------|--|
| dst-mac <MAC> | Configures a destination MAC address to match <ul style="list-style-type: none"> • <MAC> - Specify the destination MAC address. |
|---------------|--|

Example

```
rfs6000-37FABE (config-test-signature-test)#dst-mac 55-66-77-88-99-00

rfs6000-37FABE (config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
rfs6000-37FABE (config-test-signature-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables a WIPS signature destination MAC address |
|-----------|---|

20.1.7.2.3 filter-ageout

▸ signature mode commands

Configures the filter ageout interval in seconds. This is the duration a client, triggering a WIPS event, is excluded from RF Domain manager radio association.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
filter-ageout <1-86400>
```

Parameters

- filter-ageout <1-86400>

| | |
|----------------------------|--|
| filter-ageout <1-86400> | Configures the filter ageout interval from 1 - 86400 seconds |
|----------------------------|--|

Example

```
rfs6000-37FABE(config-test-signature-test)#filter-ageout 8

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  filter-ageout 8
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the configured filter ageout interval |
|-----------|---|

20.1.7.2.4 frame-type

▸ signature mode commands

Configures the frame type used for matching with this WIPS policy signature

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
frame-type [all|assoc|auth|beacon|data|deauth|disassoc|mgmt|probe-req|probe-resp|reassoc]
```

Parameters

- frame-type [all|assoc|auth|beacon|data|deauth|disassoc|mgmt|probe-req|probe-resp|reassoc]

| | |
|------------|---|
| frame-type | Configures the frame type used for matching |
| all | Configures all frame type matching |
| assoc | Configures association frame matching |
| auth | Configures authentication frame matching |
| beacon | Configures beacon frame matching |
| data | Configures data frame matching |
| deauth | Configures deauthentication frame matching |
| disassoc | Configures disassociation frame matching |
| mgmt | Configures management frame matching |
| probe-req | Configures probe request frame matching |
| probe-resp | Configures probe response frame matching |
| reassoc | Configures re-association frame matching |

Usage Guidelines

The frame type configured determines the SSID match type configured. To configure the SSID match type as SSID, the frame type must be beacon, probe-req or probe-resp.

Example

```
rfs6000-37FABE(config-test-signature-test)#frame-type reassoc

rfs6000-37FABE(config-test-signature-test)#show context
signature test
 bssid 11-22-33-44-55-66
 dst-mac 55-66-77-88-99-00
 frame-type reassoc
 filter-ageout 8
rfs6000-37FABE(config-test-signature-test)#
```

20.1.7.2.5 interference-event

▶ *signature mode commands*

Configures this WIPS policy signature as Smart RF interference source

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
interference-event
```

Parameters

None

Example

```
rfs6000-37FABE(config-test-signature-test)#interference-event

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  interference-event
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  frame-type reassoc
  filter-ageout 8
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables this WIPS policy signature as Smart RF interference source |
|-----------|---|

20.1.7.2.6 mode▶ *signature mode commands*

Enables a WIPS policy signature

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mode enable
```

Parameters

- mode enable

| | |
|-------------|-----------------------------|
| mode enable | Enables this WIPS signature |
|-------------|-----------------------------|

Example

```
rfs6000-37FABE(config-test-signature-test)#mode enable
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |

| <i>no</i> | Disables a WIPS signature |
|-----------|---------------------------|

20.1.7.2.7 payload

▸ signature mode commands

Configures payload settings. The payload command sets a numerical index pattern and offset for this WIPS signature.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
payload <1-3> pattern <WORD> offset <0-255>
```

Parameters

```
payload <1-3> pattern <WORD> offset <0-255>
```

| | |
|----------------|--|
| payload <1-3> | Configures payload settings <ul style="list-style-type: none"> • <1-3> - Sets the payload index from 1 - 3. |
| pattern <WORD> | Specifies the pattern to match: hex or string <ul style="list-style-type: none"> • <WORD> - Sets the pattern name |
| offset <0-255> | Specifies the payload offset to start the pattern match <ul style="list-style-type: none"> • <0-255> - Sets the offset value from 0 - 255 |

Example

```
rfs6000-37FABE(config-test-signature-test)#payload 1 pattern test offset 1

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  frame-type assoc
  filter-ageout 8
  payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

|-----------|---|
| <i>no</i> | Removes payload and associated settings |
|-----------|---|

20.1.7.2.8 src-mac

▸ signature mode commands

Configures a source MAC address for a packet examined for matching

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
src-mac <MAC>
```

Parameters

- src-mac <MAC>

| | |
|---------------|--|
| src-mac <MAC> | Configures the source MAC address to match <ul style="list-style-type: none"> • <MAC> - Specify the source MAC address. |
|---------------|--|

Example

```
rfs6000-37FABE(config-test-signature-test)#src-mac 00-1E-E5-EA-1D-60

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type assoc
  filter-ageout 8
  payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a WIPS signature source MAC address |
|-----------|---|

20.1.7.2.9 ssid-match

▸ signature mode commands

Configures the SSID (and its character length) used for matching

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ssid-match [ssid|ssid-len]
ssid-match [ssid <SSID>|ssid-len <0-32>]
```

Parameters

- `ssid-match [ssid <SSID>|ssid-len <0-32>]`

| | |
|------------------------------------|---|
| <code>ssid <SSID></code> | Specifies the SSID match string <ul style="list-style-type: none"> • <code><SSID></code> - Specify the SSID string. <p>Note: Specify the correct SSID to ensure proper filtering.</p> |
| <code>ssid-len <0-32></code> | Specifies the length of the SSID <ul style="list-style-type: none"> • <code><0-32></code> - Specify the SSID length from 0 - 32 characters. |

Example

```
rfs6000-37FABE(config-test-signature-test)#ssid-match ssid PrinterLan

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
  ssid-match ssid PrinterLan
  filter-ageout 8
  payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |

| <code>no</code> | Removes the configured SSID |
|-----------------|-----------------------------|

20.1.7.2.10 threshold-client

▸ *signature mode commands*

Configures the wireless client threshold limit. When the wireless client exceeds the specified limit, an event is triggered.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
threshold-client <1-65535>
```

Parameters

- `threshold-client <1-65535>`

| | |
|-------------------------------|---|
| threshold-client <1-65535> | Configures the wireless client threshold limit <ul style="list-style-type: none"> • <1-65535> - Sets the threshold limit for a 60 second window from 1 - 65535 |
|-------------------------------|---|

Example

```
rfs6000-37FABE(config-test-signature-test)#threshold-client 88

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
  ssid-match ssid PrinterLan
  filter-ageout 8
  threshold-client 88
  payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the wireless client threshold limit configured with a WIPS policy signature |

20.1.7.2.11 threshold-radio

▶ *signature mode commands*

Configures the radio's threshold limit. When the radio exceeds the specified limit, an event is triggered.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
threshold-radio <1-65535>
```

Parameters

- threshold-radio <1-65535>

| | |
|------------------------------|---|
| threshold-radio <1-65535> | Configures the radio's threshold limit <ul style="list-style-type: none"> • <1-65535> - Specify the threshold limit for a 60 second window from 1 - 65535. |
|------------------------------|---|

Example

```
rfs6000-37FABE(config-test-signature-test)#threshold-radio 88

rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
  ssid-match ssid PrinterLan
  filter-ageout 8
  threshold-client 88
  threshold-radio 88
  payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the radio's threshold limit configured with a WIPS policy signature |
|-----------|---|

20.1.7.2.12 no

▶ *signature mode commands*

Negates a command or resets settings to their default. When used in the config WIPS policy signature mode, the `no` command resets or removes WIPS signature settings.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [bssid|dst-mac|filter-ageout|frame-type|interference-event|mode|payload|src-mac|ssid-match|threshold-client|threshold-radio]
```

```
no [bssid|dst-mac|filter-ageout|frame-type|interference-event|mode enable|payload <1-3>|src-mac|ssid-match [ssid|ssid-len]|threshold-client|threshold-radio]
```

Parameters

- `no <PARAMETERS>`

| | |
|------------------------------------|---|
| <code>no <PARAMETERS></code> | Negates a command or resets settings to their default |
|------------------------------------|---|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following is the WIPS signature 'test' settings before the execution of the 'no' command:

```
rfs6000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
  ssid-match ssid PrinterLan
  filter-ageout 8
  threshold-client 88
  threshold-radio 88
  payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)#
```

The following is the WIPS signature 'test' settings after the execution of the 'no' command:

```
rfs6000-37FABE(config-test-signature-test)#no mode enable
rfs6000-37FABE(config-test-signature-test)#no bssid
rfs6000-37FABE(config-test-signature-test)#no dst-mac
rfs6000-37FABE(config-test-signature-test)#no src-mac
rfs6000-37FABE(config-test-signature-test)#no filter-ageout
rfs6000-37FABE(config-test-signature-test)#no threshold-client
rfs6000-37FABE(config-test-signature-test)#no threshold-radio

rfs6000-37FABE(config-test-signature-test)#
signature test
no mode enable
frame-type beacon
payload 1 pattern test offset 1
rfs6000-37FABE(config-test-signature-test)
```

20.1.8 use

► *wips-policy*

Enables device categorization on this WIPS policy. This command uses an existing device categorization list. The list categorizes devices as authorized or unauthorized.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use device-categorization <DEVICE-CATEGORIZATION>
```

Parameters

- use device-categorization <DEVICE-CATEGORIZATION>

| | |
|--|--|
| device-categorization <DEVICE-CATEGORIZATION> | Configures a device categorization list <ul style="list-style-type: none"> • <DEVICE-CATEGORIZATION> - Specify the device categorization object name to associate with this profile |
|--|--|

Example

```
rfs6000-37FABE(config-wips-policy-test)#use device-categorization test

rfs6000-37FABE(config-wips-policy-test)#show context
wips-policy test

| <i>no</i> | Disables the use of a device categorization policy with a WIPS policy |
|-----------|---|

21 WLAN-QOS-POLICY

This chapter summarizes the WLAN QoS policy in the CLI command structure.

A WLAN QoS policy increases network efficiency by prioritizing data traffic. Prioritization reduces congestion. This is essential because of the lack of bandwidth for all users and applications. QoS helps ensure each WLAN on the wireless controller receives a fair share of the overall bandwidth, either equally or as per the proportion configured. Packets directed towards clients are classified into categories such as Video, Voice and Data. Packets within each category are processed based on the weights defined for each WLAN

Each WLAN QoS policy has a set of parameters which it groups into categories, such as management, voice and data. Packets within each category are processed based on the weights defined for each WLAN.

Use the (config) instance to configure WLAN QoS policy commands. To navigate to the WLAN QoS policy instance, use the following commands:

```
<DEVICE>(config)#wlan-qos-policy <POLICY-NAME>

rfs6000-37FABE(config)#wlan-qos-policy test
rfs6000-37FABE(config-wlan-qos-test)#?
WLAN QoS Mode commands:
  accelerated-multicast  Configure accelerated multicast streams address and
                        forwarding QoS classification
  classification          Select how traffic on this WLAN must be classified
                        (relative prioritization on the radio)
  multicast-mask         Egress multicast mask (frames that match bypass the
                        PSPqueue. This permits intercom mode operation
                        without delay even in the presence of PSP clients)
  no                     Negate a command or set its defaults
  qos                    Quality of service
  rate-limit             Configure traffic rate-limiting parameters on a
                        per-wlan/per-client basis
  svp-prioritization     Enable spectrallink voice protocol support on this wlan
  voice-prioritization   Prioritize voice client over other client (for
                        non-WMM clients)
  wmm                    Configure 802.11e/Wireless MultiMedia parameters

  clrscr                Clears the display screen
  commit                Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                  Write running configuration to memory or terminal
rfs6000-37FABE(config-wlan-qos-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore () character. In other words, the name of a device cannot contain an underscore.

21.1 wlan-qos-policy

► *WLAN-QOS-POLICY*

WLAN QoS configurations differ significantly from QoS policies configured for radios. WLAN QoS configurations are designed to support the data requirements of wireless clients, including the data types they support and their network permissions. Radio QoS policies are specific to the transmit and receive characteristics of the connected radio's themselves, independent from the wireless clients these access point radios support.

The following table summarizes WLAN QoS policy configuration commands:

Table 21.1 *WLAN-QoS-Policy-Config Commands*

| Command | Description | Reference |
|------------------------------|--|-------------------|
| <i>accelerated-multicast</i> | Configures accelerated multicast stream addresses and forwards QoS classifications | <i>page 21-3</i> |
| <i>classification</i> | Classifies WLAN traffic based on priority | <i>page 21-5</i> |
| <i>multicast-mask</i> | Configures the egress prioritization multicast mask | <i>page 21-7</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 21-8</i> |
| <i>qos</i> | Defines the QoS configuration | <i>page 21-9</i> |
| <i>rate-limit</i> | Configures the WLAN traffic rate limit using a WLAN QoS policy | <i>page 21-10</i> |
| <i>svp-prioritization</i> | Enables Spectralink voice protocol support on a WLAN | <i>page 21-13</i> |
| <i>voice-prioritization</i> | Prioritizes voice client over other clients | <i>page 21-14</i> |
| <i>wmm</i> | Configures 802.11e/wireless multimedia parameters | <i>page 21-15</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

21.1.1 accelerated-multicast

► wlan-qos-policy

Configures the accelerated multicast stream address and forwarding QoS classification settings

Enabling this option allows the system to automatically detect and convert multicast streams to unicast streams. When a stream is converted and queued up for transmission, there are a number of classification mechanisms that can be applied to the stream. Use the classification options to specify the traffic type to prioritize.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
accelerated-multicast [<IP>|autodetect]
```

```
accelerated-multicast [<IP>|autodetect] {classification [background|best-effort|trust|video|voice]}
```

Parameters

- accelerated-multicast [<IP>|autodetect] {classification [background|best-effort|trust|video|voice]}

| | |
|-----------------------|--|
| accelerated-multicast | Configures the accelerated multicast stream address and forwarding QoS classification |
| <IP> | Configures a multicast IP address in the A.B.C.D format. The system can configure up to 32 IP addresses for each WLAN QoS policy |
| autodetect | Allows the system to automatically detect multicast streams to be accelerated. This parameter allows the system to convert multicast streams to unicast, or to specify multicast streams converted to unicast. |
| classification | Optional. Configures the QoS classification (traffic class) settings. When the stream is converted and queued for transmission, specify the type of classification applied to the stream. The options are: background, best-effort, trust, voice, and video. |
| background | Forwards streams with background (low) priority. This parameter is common to both <IP> and auto detect. |
| best-effort | Forwards streams with best effort (normal) priority. This parameter is common to both <IP> and autodetect. |
| trust | No change to the streams forwarding traffic class. This parameter is common to both <IP> and autodetect. |
| video | Forwards streams with video traffic priority. This parameter is common to both <IP> and autodetect. |
| voice | Forwards streams with voice traffic priority. This parameter is common to both <IP> and autodetect. |

Example

```
rfs6000-37FABE(config-wlan-qos-test)#accelerated-multicast autodetect
classification voice

rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test

rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.2 classification

► wlan-qos-policy

Specifies how traffic on this WLAN is classified. This classification is based on relative prioritization on the radio.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
classification [low|non-unicast|non-wmm|normal|video|voice|wmm]
```

```
classification [low|normal|video|voice|wmm]
```

```
classification non-unicast [voice|video|normal|low|default]
```

```
classification non-wmm [voice|video|normal|low]
```

Parameters

- classification [low|normal|video|voice|wmm]

| | |
|--------|---|
| low | Optimized for background traffic. Implies all traffic on this WLAN is low priority on the radio |
| normal | Optimized for best effort traffic. Implies all traffic on this WLAN is prioritized as best effort traffic on the radio |
| video | Optimized for video traffic. Implies all traffic on this WLAN is prioritized as video traffic on the radio |
| voice | Optimized for voice traffic. Implies all traffic on this WLAN is prioritized as voice traffic on the radio |
| wmm | Uses WMM based classification, using DSCP or 802.1p tags, to classify traffic into different queues Implies WiFi Multimedia QoS extensions are enabled on this radio. This allows different traffic streams between the wireless client and the access point to be prioritized according to the type of traffic (voice, video etc). The WMM classification supports high throughput data rates required for 802.11n device support. This is the default setting. |

- classification non-unicast [voice|video|normal|low|default]

| | |
|-------------|---|
| non-unicast | Optimized for non-unicast traffic. Implies all traffic on this WLAN is designed for broadcast or multiple destinations |
| video | Optimized for non-unicast video traffic. Implies all WLAN non-unicast traffic is classified and treated as video packets |
| voice | Optimized for non-unicast voice traffic. Implies all WLAN non-unicast traffic is classified and treated as voice packets |
| normal | Optimized for non-unicast best effort traffic. Implies all WLAN non-unicast traffic is classified and treated as normal priority packets (best effort). |

| | |
|--|---|
| low | Optimized for non-unicast background traffic. Implies all WLAN non-unicast traffic is classified and treated as low priority packets (background) |
| default | Uses the default classification mode (same as unicast classification if WMM is disabled, normal if unicast classification is WMM). This is the default setting. |
| <ul style="list-style-type: none"> • <code>classification non-wmm [voice video normal low]</code> | |
| non-wmm | Specifies how traffic from non-WMM clients is classified |
| voice | Optimized for non-WMM voice traffic. Implies all WLAN non-WMM client traffic is classified and treated as voice packets |
| video | Optimized for non-WMM video traffic. Implies all WLAN non-WMM client traffic is classified and treated as video packets |
| normal | Optimized for non-WMM best effort traffic. Implies all WLAN non-WMM client traffic is classified and treated as normal priority packets (best effort). This is the default setting. |
| low | Optimized for non-WMM background traffic. Implies all WLAN non-WMM client traffic is classified and treated as low priority packets (background) |

Example

```
rfs6000-37FABE(config-wlan-qos-test)#classification wmm
rfs6000-37FABE(config-wlan-qos-test)#classification non-wmm video
rfs6000-37FABE(config-wlan-qos-test)#classification non-unicast normal
rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-wmm video
classification non-unicast normal
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.3 multicast-mask

► wlan-qos-policy

Configures an egress prioritization multicast mask for this WLAN QoS policy

Normally all multicast and broadcast packets are buffered until the periodic DTIM interval (indicated in the 802.11 beacon frame), when clients in power save mode wake to check for frames. However, for certain applications and traffic types, the administrator may want the frames transmitted immediately, without waiting for the DTIM interval. By configuring a primary or secondary prioritization multicast mask, the network administrator can indicate which packets are transmitted immediately.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
multicast-mask [primary|secondary] <MAC/MASK>
```

Parameters

- multicast-mask [primary|secondary] <MAC/MASK>

| | |
|----------------------|--|
| primary <MAC/MASK> | <p>Configures the primary egress prioritization multicast mask</p> <ul style="list-style-type: none"> • <MAC/MASK> - Provide the MAC address and the mask in the AA-BB-CC-DD-EE-FF/XX-XX-XX-XX-XX-XX format. The default value is 00-00-00-00-00-00/FF-FF-FF-FF-FF-FF. <p>Note: Setting masks is optional and only needed if there are traffic types requiring special handling.</p> |
| secondary <MAC/MASK> | <p>Configures the secondary egress prioritization multicast mask</p> <ul style="list-style-type: none"> • <MAC/MASK> - Provide the MAC address and the mask in the AA-BB-CC-DD-EE-FF/XX-XX-XX-XX-XX-XX format. The default value is 00-00-00-00-00-00/FF-FF-FF-FF-FF-FF. |

Example

```
rfs6000-37FABE(config-wlan-qos-test)#multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77

rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-wmm video
multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
classification non-unicast normal
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.4 no

► wlan-qos-policy

Negates a command or resets settings to their default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [accelerated-multicast|classification|multicast-mask|qos|rate-limit|svp-
prioritization|voice-prioritization|wmm]
```

```
no [accelerated-multicast [<IP>|autodetect]|classification {non-unicast|non-wmm}|
multicast-mask [primary|secondary]|qos trust [dscp|wmm]|svp-prioritization|voice-
prioritization]
```

```
no rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold}
no rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold
[background|best-effort|video|voice]}
```

```
no wmm [background|best-effort|power-save|qbss-load-element|video|voice]
no wmm [power-save|qbss-load-element]
no wmm [backgorund|best-effort|video|voice] [aifsn|cw-max|cw-min|txop-limit]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Negates a command or resets settings to their default |
|-----------------|---|

Example

The following example shows the WLAN QoS Policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
  classification non-wmm video
  multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
  classification non-unicast normal
  qos trust dscp
  qos trust wmm
  accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#

rfs6000-37FABE(config-wlan-qos-test)#no classification non-wmm
rfs6000-37FABE(config-wlan-qos-test)#no multicast-mask primary
rfs6000-37FABE(config-wlan-qos-test)#no qos trust dscp
```

The following example shows the WLAN QoS Policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
  classification non-unicast normal
  no qos trust dscp
  qos trust wmm
  accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.5 qos

▶ *wlan-qos-policy*

Enables QoS on this WLAN

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
qos trust [dscp|wmm]
```

Parameters

- qos trust [dscp|wmm]

| | |
|------------------|--|
| trust [dscp wmm] | Trusts the QoS values of ingressing packets. Both these options are enabled by default. <ul style="list-style-type: none"> • dscp - Trusts the IP DSCP values of ingressing packets • wmm - Trusts the 802.11 WMM QoS values of ingressing packets |
|------------------|--|

Example

```
rfs6000-37FABE(config-wlan-qos-test)#qos trust wmm
rfs6000-37FABE(config-wlan-qos-test)#qos trust dscp

rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-unicast normal
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.6 rate-limit

► wlan-qos-policy

Configures the WLAN traffic rate limits using the WLAN QoS policy

Excessive traffic causes performance issues or brings down the network entirely. Excessive traffic can be caused by numerous sources including network loops, faulty devices or malicious software such as a worm or virus that has infected one or more devices at the branch. Rate limiting limits the maximum rate sent to or received from the wireless network (and WLAN) per wireless client. It prevents any single user from overwhelming the wireless network. It can also provide differential service for service providers. The uplink and downlink rate limits are usually configured on a RADIUS server using vendor specific attributes. Rate limits are extracted from the RADIUS server's response. When such attributes are not present, settings defined on the controller (access point, wireless controller, or service platform) are applied. An administrator can set separate QoS rate limits for upstream (data transmitted from the managed network) and downstream (data transmitted to the managed network).

Before defining rate limit thresholds for WLAN upstream and downstream traffic, it is recommended that you define the normal number of ARP, broadcast, multicast and unknown unicast packets that typically transmit and receive from each supported WMM access category. If thresholds are defined too low, normal network traffic (required by end-user devices) are dropped resulting in intermittent outages and performance problems.

Connected wireless clients can also have QoS rate limit settings defined in both the upstream and downstream direction.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold}
rate-limit [client|wlan] [from-air|to-air] {max-burst-size <2-1024>|rate <50-1000000>}
rate-limit [client|wlan] [from-air|to-air] {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
```

Parameters

- rate-limit [client|wlan] [from-air|to-air] {max-burst-size <2-1024>|rate <50-1000000>}

| | |
|------------|---|
| rate-limit | Configures traffic rate limit parameters |
| client | Configures traffic rate limiting parameters on a per-client basis |
| wlan | Configures traffic rate limiting parameters on a per-WLAN basis |
| from-air | Configures traffic rate limiting from a wireless client to the network |
| to-air | Configures the traffic rate limit from the network to a wireless client |

| | |
|---|--|
| max-burst-size <2-1024> | Optional. Sets the maximum burst size from 2 - 1024 kbytes. The chances of the upstream or downstream packet transmission getting congested for the WLAN's client destination are reduced for smaller burst sizes. The default values are: - WLAN 'to-air' and 'from-air': 320 kbytes - Client 'to-air' and 'from-air': 64 kbytes |
| | Smaller the burst, lesser are the chances of upstream packet transmission resulting in congestion for the WLAN's client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, administrators should then add a 10% margin (minimally) to allow for traffic bursts at the site. |
| rate <50-1000000> | Optional. Sets the traffic rate from 50 - 1000000 Kbps. This limit is the threshold value for the maximum number of packets received or transmitted over the WLAN from all access categories. Any traffic that exceeds the specified rate is dropped and a log message is generated. The default values are: - WLAN 'to-air' and 'from-air': 5000 kbytes - Client 'to-air' and 'from-air': 1000 kbytes |
| <pre> • rate-limit [client wlan] [from-air to-air] {red-threshold [background <0-100> best-effort <0-100> video <0-100> voice <0-100>]} </pre> | |
| rate-limit | Configures traffic rate limit parameters |
| client | Configures traffic rate limiting parameters on a per-client basis |
| wlan | Configures traffic rate limiting parameters on a per-WLAN basis |
| from-air | Configures traffic rate limiting from a wireless client to the network |
| to-air | Configures the traffic rate limit from the network to a wireless client |
| red-threshold | Configures random early detection threshold values for a designated traffic class |
| background <0-100> | Optional. Sets the maximum burst size from 2 - 1024 kbytes. The chances of the upstream or downstream packet transmission getting congested for the WLAN's client destination are reduced for smaller burst sizes. The default values are: - WLAN 'to-air' and 'from-air': 320 kbytes - Client 'to-air' and 'from-air': 64 kbytes Smaller the burst, lesser are the chances of upstream packet transmission resulting in congestion for the WLAN's client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, administrators should then add a 10% margin (minimally) to allow for traffic bursts at the site. |
| best-effort <0-100> | The following is common to the 'from-air' and 'to-air' parameters: Optional. Sets a percentage value for best effort traffic in the upstream or downstream direction. Best effort traffic exceeding the defined threshold is dropped and a log message is generated. The default threshold values are: - WLAN 'to-air' and 'from-air': 50% - Client 'to-air' and 'from-air': 50% |

| | |
|---------------|--|
| video <0-100> | <p>The following is common to the 'from-air' and 'to-air' parameters:</p> <p>Optional. Sets a percentage value for video traffic in the upstream or downstream direction. Video traffic exceeding the defined threshold is dropped and a log message is generated. The default threshold values are:</p> <ul style="list-style-type: none"> - WLAN 'to-air' and 'from-air': 25% - Client 'to-air' and 'from-air': 25% |
| voice <0-100> | <p>The following is common to the 'from-air' and 'to-air' parameters:</p> <p>Optional. Sets a percentage value for voice traffic in the upstream or downstream direction. Voice traffic exceeding the defined threshold is dropped and a log message is generated. The default threshold values are:</p> <ul style="list-style-type: none"> - WLAN 'to-air' and 'from-air': 0% - Client 'to-air' and 'from-air': 0% <p>Note: A value of 0% means no early random drops.</p> |

Usage Guidelines

The following information should be taken into account when configuring rate limits:

- Background traffic consumes the least bandwidth, so this value can be set to a lower value once a general downstream rate is known by the network administrator (using a time trend analysis).
- Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis).
- Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).
- Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).

Example

```
rfs6000-37FABE(config-wlan-qos-test)#rate-limit wlan from-air max-burst-size 6
rfs6000-37FABE(config-wlan-qos-test)#rate-limit wlan from-air rate 55

rfs6000-37FABE(config-wlan-qos-test)#rate-limit wlan from-air red-threshold best-effort 10
rfs6000-37FABE(config-wlan-qos-test)#rate-limit client from-air red-threshold background 3

rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
 classification non-wmm video
 multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
 classification non-unicast normal
 rate-limit wlan from-air rate 55
 rate-limit wlan from-air max-burst-size 6
 rate-limit wlan from-air red-threshold best-effort 10
 rate-limit client from-air red-threshold background 3
 qos trust dscp
 qos trust wmm
 accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.7 svp-prioritization

► *wlan-qos-policy*

Enables WLAN SVP support on this WLAN QoS policy. SVP support enables the identification and prioritization of traffic from Spectralink/Ploycomm phones. This gives priority to voice, with voice management packets supported only on certain legacy VOIP phones. If the wireless client classification is WMM, non-WMM devices recognized as voice devices have all their traffic transmitted at voice priority. Devices are classified as voice, when they emit SIP, SCCP, or H323 traffic. Thus, selecting this option has no effect on devices supporting WMM.

This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
svp-prioritization
```

Parameters

None

Example

```
rfs6000-37FABE(config-wlan-qos-test)#svp-prioritization

rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-wmm video
svp-prioritization
multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
classification non-unicast normal
rate-limit wlan from-air rate 55
rate-limit wlan from-air max-burst-size 6
rate-limit wlan from-air red-threshold best-effort 10
rate-limit client from-air red-threshold background 3
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.8 voice-prioritization

▶ *wlan-qos-policy*

Prioritizes voice clients over other clients (for non-WMM clients). This gives priority to voice and voice management packets and is supported only on certain legacy VOIP phones. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
voice-prioritization
```

Parameters

None

Example

```
rfs6000-37FABE(config-wlan-qos-test)#voice-prioritization

rfs6000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-wmm video
svp-prioritization

qos trust wmm
accelerated-multicast autodetect classification voice
rfs6000-37FABE(config-wlan-qos-test)#
```

21.1.9 wmm

► wlan-qos-policy

Configures 802.11e/*Wireless Multimedia* (WMM) parameters for this WLAN QoS policy

WMM makes it possible for both home networks and Enterprises to decide which data streams are most important and assign them a higher traffic priority.

WMM's prioritization capabilities are based on the four access categories (background, best-effort, video, and voice). Higher the *Access Category* (AC) higher is the transmission probability over the controller managed WLAN. ACs correspond to the 802.1d priorities, facilitating interoperability with QoS policy management mechanisms. WMM enabled controllers coexist with legacy devices (not WMM-enabled).

Packets not assigned to a specific access category are categorized as best effort by default. Applications assign each data packet to a given access category. Categorized packets are added to one of four independent transmit queues (one per access category). The client has an internal collision resolution mechanism to address collision among different queues, which selects the frames with the highest priority to transmit.

The same mechanism deals with external collision, to determine which client should be granted the *Opportunity to Transmit* (TXOP). The collision resolution algorithm responsible for traffic prioritization is probabilistic and depends on two timing parameters that vary for each access category. These parameters are:

- The minimum interframe space, or *Arbitrary Inter-Frame Space Number* (AIFSN)
- The contention window, sometimes referred to as the random back off wait

Both values are smaller for high-priority traffic. The value of the contention window varies through time. Initially the contention window is set to a value that depends on the AC. As frames with the highest AC tend to have the lowest back off values, they are more likely to get a TXOP.

After each collision the contention window is doubled until a maximum value (also dependent on the AC) is reached. After successful transmission, the contention window is reset to its initial, AC dependant value. The AC with the lowest back off value gets the TXOP.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
wmm [background|best-effort|power-save|qbss-load-element|video|voice]
```

```
wmm [power-save|qbss-load-element]
```

```
wmm [background|best-effort|video|voice] [aifsn <2-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]
```

Parameters

- wmm [power-save|qbss-load-element]

| | |
|-----|---|
| wmm | Configures 802.11e/wireless multimedia parameters |
|-----|---|

| | |
|---|---|
| power-save | Enables support for the WMM-Powersave mechanism. This mechanism, also known as <i>Unscheduled Automatic Power Save Delivery</i> (U-APSD), is specifically designed for WMM voice devices. This feature is enabled by default. |
| qbss-load-element | Enables support for the <i>QOS Basic Service Set</i> (QBSS) load information element in beacons and probe response packets advertised by access packets. This feature is enabled by default. |
| <ul style="list-style-type: none"> • <code>wmm [background best-effort video voice] [aifsn <2-15> cw-max <0-15> cw-min <0-15> txop-limit <0-65535>]</code> | |
| wmm | Configures 802.11e/wireless multimedia parameters. This parameter enables the configuration of four access categories. Applications assign each data packet to one of these four access categories and queues them for transmission. |
| background | Configures background access category parameters |
| best-effort | Configures best effort access category parameters. Packets not assigned to any particular access category are categorized by default as having best effort priority |
| video | Configures video access category parameters |
| voice | Configures voice access category parameters |
| aifsn <2-15> | <p>Configures <i>Arbitrary Inter-Frame Space Number</i> (AIFSN) from 2 - 15. AIFSN is the wait time between data frames. This parameter is common to background, best effort, video and voice.</p> <p>The default for traffic voice categories is 2</p> <p>The default for traffic video categories is 2</p> <p>The default for traffic best effort (normal) categories is 3</p> <p>The default for traffic background (low) categories is 7</p> <ul style="list-style-type: none"> • <2-15> – Sets a value from 2 - 15 |
| cw-max <0-15> | <p>Configures the maximum contention window. Wireless clients pick a number between 0 and the minimum contention window to wait before retransmission. Wireless clients then double their wait time on a collision, until it reaches the maximum contention window. This parameter is common to background, best effort, video and voice.</p> <p>The default for traffic voice categories is 3</p> <p>The default for traffic video categories is 4</p> <p>The default for traffic best effort (normal) categories 10</p> <p>The default for traffic background (low) categories is 10</p> <ul style="list-style-type: none"> • <0-15> – ECW: the contention window. The actual value used is $(2^{ECW} - 1)$. Set a value from 0 - 15. |

| | |
|----------------------|---|
| cw-min <0-15> | <p>Configures the minimum contention window. Wireless clients pick a number between 0 and the min contention window to wait before retransmission. Wireless clients then double their wait time on a collision, until it reaches the maximum contention window. This parameter is common to background, best effort, video and voice.</p> <p>The default for traffic voice categories is 2</p> <p>The default for traffic video categories is 3</p> <p>The default for traffic best effort (normal) categories is 4</p> <p>The default for traffic background (low) categories is 4</p> <ul style="list-style-type: none"> • <0-15> - ECW: the contention window. The actual value used is $(2^{\text{ECW}} - 1)$. Set a value from 0 - 15. |
| txop-limit <0-65535> | <p>Configures the transmit-opportunity (the interval of time during which a particular client has the right to initiate transmissions). This parameter is common to background, best effort, video and voice.</p> <p>The default for traffic voice categories is 47</p> <p>The default for traffic video categories is 94</p> <p>The default for traffic best effort (normal) categories is 0</p> <p>The default for traffic background (low) categories is 0</p> <ul style="list-style-type: none"> • <0-65535> - Set a value from 0 - 65535 to configure the transmit-opportunity in 32 microsecond units. |

Example

```

rfs6000-37FABE(config-wlan-qos-test)#wmm video txop-limit 9

```

22 L2TPV3-POLICY

This chapter summarizes *Layer 2 Tunnel Protocol Version 3* (L2TPv3) policy commands in the CLI command structure.

L2TPv3 is an IETF standard used for transporting different types of layer 2 frames over an intermediate IP network. L2TPv3 defines control and encapsulation protocols for tunneling layer 2 frames between two IP nodes. Use L2TPv3 to create tunnels for transporting layer 2 frames. L2TPv3 enables WING supported controllers and access points to create tunnels for transporting Ethernet frames to and from bridge VLANs and physical ports. L2TPv3 tunnels can be defined between WING devices and other vendor devices supporting the L2TPv3 protocol.

Multiple pseudowires can be created within an L2TPv3 tunnel. WING supported devices support an Ethernet VLAN pseudowire type exclusively. A pseudowire is an emulation of a layer 2 point-to-point connection over a *packet-switching network* (PSN). A pseudowire was developed out of the necessity to encapsulate and tunnel layer 2 protocols across a layer 3 network. Ethernet VLAN pseudowires transport Ethernet frames to and from a specified VLAN. One or more L2TPv3 tunnels can be defined between tunnel end points. Each tunnel can have one or more L2TPv3 sessions. Each tunnel session corresponds to one pseudowire. An L2TPv3 control connection (an L2TPv3 tunnel) needs to be established between the tunneling entities before creating a session.

NOTE: A pseudowire is an emulation of a layer 2 point-to-point connection over a *packet-switching network* (PSN). A pseudowire was developed out of the necessity to encapsulate and tunnel layer 2 protocols across a layer 3 network.

Ethernet VLAN pseudowires transport Ethernet frames to and from a specified VLAN. One or more L2TPv3 tunnels can be defined between tunnel end points. Each tunnel can have one or more L2TPv3 sessions. Each tunnel session corresponds to one pseudowire. An L2TPv3 control connection (a L2TPv3 tunnel) needs to be established between the tunneling entities before creating a session.

For optimal pseudowire operation, both the L2TPv3 session originator and responder need to know the pseudowire type and identifier. These two parameters are communicated during L2TPv3 session establishment. An L2TPv3 session created within an L2TPv3 connection also specifies multiplexing parameters for identifying a pseudowire type and ID.

The working status of a pseudowire is reflected by the state of the L2TPv3 session. If a L2TPv3 session is down, the pseudowire associated with it must be shut down. The L2TPv3 control connection keep-alive mechanism can serve as a monitoring mechanism for the pseudowires associated with a control connection.

NOTE: If connecting an Ethernet port to another Ethernet port, the pseudowire type must be *Ethernet port*, if connecting an Ethernet VLAN to another Ethernet VLAN, the pseudowire type must be *Ethernet VLAN*.

This chapter is organized into the following sections:

- [*l2tpv3-policy-commands*](#)
- [*l2tpv3-tunnel-commands*](#)
- [*l2tpv3-manual-session-commands*](#)

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

22.1 l2tpv3-policy-commands

► L2TPV3-POLICY

Use the (config) instance to configure L2TPv3 policy parameters. To navigate to the L2TPv3 policy instance, use the following commands:

```
<DEVICE>(config)#l2tpv3 policy <L2TPV3-POLICY-NAME>

rfs6000-37FABE(config)#l2tpv3 policy L2TPV3Policy1
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#?
L2tpv3 Policy Mode commands:
  cookie-size           Size of the cookie field present in each l2tpv3 data
                        message
  failover-delay        Time interval for re-establishing the tunnel after
                        the failover (RF-Domain
                        manager/VRRP-master/Cluster-master failover)
  force-l2-path-recovery Enables force learning of servers, gateways etc.,
                        behind the l2tpv3 tunnel when the tunnel is
                        established
  hello-interval        Configure the time interval (in seconds) between
                        l2tpv3 Hello keep-alive messages exchanged in l2tpv3
                        control connection
  no                    Negate a command or set its defaults
  reconnect-attempts    Maximum number of attempts to reestablish the
                        tunnel.
  reconnect-interval    Time interval between the successive attempts to
                        reestablish the l2tpv3 tunnel
  retry-attempts        Configure the maximum number of retransmissions for
                        signaling message
  retry-interval        Time interval (in seconds) before the initiating a
                        retransmission of any l2tpv3 signaling message
  rx-window-size        Number of signaling messages that can be received
                        without sending the acknowledgment
  tx-window-size        Number of signaling messages that can be sent
                        without receiving the acknowledgment

  clrscr               Clears the display screen
  commit               Commit all changes made in this session
  end                  End current mode and change to EXEC mode
  exit                 End current mode and down to previous mode
  help                 Description of the interactive help system
  revert               Revert changes
  service              Service Commands
  show                 Show running system information
  write                Write running configuration to memory or terminal

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

The following table summarizes L2TPv3 policy configuration commands:

Table 22.1 L2TPV3-Tunnel-Policy-Config Commands

| Command | Description | Reference |
|-------------------------------|--|---------------------------|
| <i>cookie-size</i> | Configures the cookie field size for each L2TPv3 data packet | page 22-5 |
| <i>failover-delay</i> | Configures the L2TPv3 tunnel failover delay in seconds | page 22-6 |
| <i>force-l2-path-recovery</i> | Enables the forced detection of servers and gateways behind the L2TPv3 tunnel | page 22-7 |
| <i>hello-interval</i> | Configures the interval, in seconds, between L2TPv3 “Hello” keep-alive messages exchanged in the L2TPv3 control connection | page 22-8 |

Table 22.1 *L2TPV3-Tunnel-Policy-Config Commands*

| Command | Description | Reference |
|---------------------------|---|-------------------|
| <i>no</i> | Negates or reverts L2TPv3 tunnel commands | <i>page 22-9</i> |
| <i>reconnect-attempts</i> | Configures the maximum number of retransmissions for signalling messages | <i>page 22-10</i> |
| <i>reconnect-interval</i> | Configures the interval, in seconds, between successive attempts to re-establish a failed tunnel connection | <i>page 22-11</i> |
| <i>retry-attempts</i> | Configures the maximum number of retransmissions of signalling messages | <i>page 22-12</i> |
| <i>retry-interval</i> | Configures the interval, in seconds, before initiating a retransmission of any L2TPv3 signalling message | <i>page 22-13</i> |
| <i>rx-window-size</i> | Configures the number of signalling messages received without sending an acknowledgment | <i>page 22-14</i> |
| <i>tx-window-size</i> | Configures the number of signalling messages transmitted without receiving an acknowledgment | <i>page 22-15</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

22.1.1 cookie-size

► *l2tpv3-policy-commands*

Configures the size of the cookie field present in each L2TPv3 data packet. L2TPv3 data packets contain a session cookie that identifies the session (pseudowire) corresponding to it. In a tunnel, the cookie is a 4-byte or 8-byte signature shared between the two tunnel endpoints. This signature is configured at both the source and destination routers. If the signature at both ends do not match, the data is dropped. All sessions within a tunnel have the same session cookie size.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cookie-size [0|4|8]
```

Parameters

- `cookie-size [0|4|8]`

| | |
|----------------------------------|--|
| <code>cookie-size [0 4 8]</code> | <p>Configures the cookie-field size for each data packet. Select one of the following options:</p> <ul style="list-style-type: none"> • 0 - No cookie field present in each L2TPv3 data message (this is the default setting) • 4 - 4 byte cookie field present in each L2TPv3 data message • 8 - 8 byte cookie field present in each L2TPv3 data message |
|----------------------------------|--|

Example

```
rfs6000-37FABE (config-l2tpv3-policy-L2TPV3Policy1)#cookie-size 8

rfs6000-37FABE (config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  cookie-size 8
rfs6000-37FABE (config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets the cookie-field size to its default (0 - no cookie field present in each L2TPv3 data packet) |
|-----------|--|

22.1.2 failover-delay

► *l2tpv3-policy-commands*

Configures the L2TPv3 tunnel failover delay in seconds. This is the interval after which a failed over tunnel is re-established.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
failover-delay <5-60>
```

Parameters

- failover-delay <5-60>

| | |
|-----------------------|---|
| failover-delay <5-60> | Sets the delay interval to re-establish a failed L2TPv3 tunnel (RF-Domain manager/VRRP-master/Cluster-master failover) <ul style="list-style-type: none"> • <5-60> - Specify a failover delay from 5 - 60 seconds. The default is 5 seconds. |
|-----------------------|---|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#failover-delay 30

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
failover-delay 30
retry-attempts 10
retry-interval 30
cookie-size 8
rx-window-size 9
tx-window-size 9
reconnect-interval 100
reconnect-attempts 8
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the failover interval to its default (5 seconds) |
|-----------|---|

22.1.3 force-l2-path-recovery

► *l2tpv3-policy-commands*

Enables the forced detection of servers and gateways behind the L2TPv3 tunnel. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
force-l2-path-recovery
```

Parameters

None

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#force-l2-path-recovery

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
failover-delay 30
retry-attempts 10
retry-interval 30
cookie-size 8
rx-window-size 9
tx-window-size 9
reconnect-interval 100
reconnect-attempts 8
force-l2-path-recovery
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables the forced detection of servers and gateways behind the L2TPv3 tunnel |
|-----------|--|

22.1.4 hello-interval

► *l2tpv3-policy-commands*

Configures the interval, in seconds, between L2TPv3 “Hello” keep-alive messages exchanged in a L2TPv3 control connection.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
hello-interval <1-3600>
```

Parameters

- hello-interval <1-3600>

| | |
|-------------------------|--|
| hello-interval <1-3600> | Configures the interval for L2TPv3 “Hello” keep-alive messages <ul style="list-style-type: none"> • <1-3600> – Specify a value from 1 - 3600 seconds (default is 60 seconds). |
|-------------------------|--|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#hello-interval 200

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  cookie-size 8
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the “Hello” keep-alive message interval to its default of 60 seconds |
|-----------|---|

22.1.5 no

► *l2tpv3-policy-commands*

Negates or reverts L2TPv3 policy settings to default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [cookie-size|failover-delay|force-l2-path-recovery|hello-interval|reconnect-
attempts|reconnect-interval|retry-attempts|retry-interval|rx-window-size|tx-
window-size]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Negates or reverts L2TPv3 policy settings to default |
|-----------------|--|

Example

The following example shows the l2tpv3 policy 'L2TPV3Policy1' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  retry-attempts 10
  retry-interval 30
  cookie-size 8
  reconnect-interval 100
  reconnect-attempts 50
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no hello-interval
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no reconnect-attempts
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no reconnect-interval
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no retry-attempts
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no retry-interval
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no cookie-size
```

The following example shows the l2tpv3 policy 'L2TPV3Policy1' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

22.1.6 reconnect-attempts

► *l2tpv3-policy-commands*

Configures the maximum number of attempts made to re-establish a tunnel connection

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
reconnect-attempts <0-8>
```

Parameters

- `reconnect-attempts <0-8>`

| | |
|-----------------------------|---|
| reconnect-attempts <0-8> | Configures the maximum number of attempts made to re-establish a tunnel connection <ul style="list-style-type: none"> • <0-8> – Specify a value from 0 - 8 (default is 0: configures infinite reconnect attempts). |
|-----------------------------|---|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#reconnect-attempts 8

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
cookie-size 8
reconnect-attempts 8
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets the maximum number of reconnect attempts to default (0: configures infinite reconnect attempts) |
|-----------|--|

22.1.7 reconnect-interval

► *l2tpv3-policy-commands*

Configures the interval, in seconds, between two successive attempts to re-establish a failed tunnel connection

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
reconnect-interval <1-3600>
```

Parameters

- `reconnect-interval <1-3600>`

| | |
|--|--|
| <code>reconnect-interval <1-3600></code> | Configures the interval between successive attempts to re-establish a failed tunnel connection <ul style="list-style-type: none"> • <code><1-3600></code> – Specify a value from 1 - 3600 seconds (default is 120 seconds). |
|--|--|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#reconnect-interval 100

l2tpv3 policy L2TPV3Policy1
hello-interval 200
cookie-size 8
reconnect-interval 100
reconnect-attempts 8
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

| <i>no</i> | Resets the interval between successive attempts to re-establish a failed tunnel connection to default (120 seconds) |
|-----------|---|

22.1.8 retry-attempts

► *l2tpv3-policy-commands*

Configures the maximum number of attempts made to retransmit signalling messages. Use this command to specify how many retransmission cycles occur before determining the target tunnel peer is not reachable.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
retry-attempts <1-10>
```

Parameters

- `retry-attempts <1-10>`

| | |
|--|---|
| <code>retry-attempts <1-10></code> | Configures the maximum number of attempts made to retransmit signalling messages <ul style="list-style-type: none"> • <code><1-10></code> - Specify a value from 1 - 10 (default is 5 attempts). |
|--|---|

Example

```
rfs6000-37FABE (config-l2tpv3-policy-L2TPV3Policy1)#retry-attempts 10

rfs6000-37FABE (config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
cookie-size 8
reconnect-interval 100
reconnect-attempts 8
rfs6000-37FABE (config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the maximum number of retransmissions of signalling messages to default (5 attempts) |
|-----------|---|

22.1.9 retry-interval

► *l2tpv3-policy-commands*

Configures the interval, in seconds, between two successive attempts at retransmitting a L2TPV3 signalling message

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
retry-interval <1-250>
```

Parameters

- `retry-interval <1-250>`

| | |
|---|---|
| <code>retry-interval <1-250></code> | Configures the interval, in seconds, between two successive retransmission attempts <ul style="list-style-type: none"> • <code><1-250></code> – Specify a value from 1 - 250 seconds (default is 5 seconds). |
|---|---|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#retry-interval 30

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
retry-interval 30
cookie-size 8
reconnect-interval 100
reconnect-attempts 8
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

22.1.10 rx-window-size

► *l2tpv3-policy-commands*

Configures the number of signalling packets received without sending an acknowledgment

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
rx-window-size <1-15>
```

Parameters

- rx-window-size <1-15>

| | |
|-----------------------|---|
| rx-window-size <1-15> | Configures the number of packets received without sending an acknowledgment <ul style="list-style-type: none"> • <1-15> - Specify a value from 1 - 15 (default is 10 packets). |
|-----------------------|---|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#rx-window-size 9

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
retry-interval 30
cookie-size 8
rx-window-size 9
reconnect-interval 100
reconnect-attempts 8

22.1.11 tx-window-size

► *l2tpv3-policy-commands*

Configures the number of signalling packets transmitted without receiving an acknowledgment

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
tx-window-size <1-15>
```

Parameters

- tx-window-size <1-15>

| | |
|-----------------------|--|
| tx-window-size <1-15> | Configures the number of packets transmitted without receiving an acknowledgment <ul style="list-style-type: none"> • <1-15> - Specify a value from 1 - 15 (default is 10 packets). |
|-----------------------|--|

Example

```
rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#tx-window-size 9

rfs6000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
retry-interval 30
cookie-size 8

22.2 l2tpv3-tunnel-commands

► L2TPV3-POLICY

Use the (profile or device context) instance to configure a L2TPv3 tunnel. To navigate to the tunnel configuration mode, use the following command in the profile context:

```
<DEVICE>(config-profile-default-rfs7000)#l2tpv3 tunnel <TUNNEL-NAME>

rfs6000-37FABE(config-profile-default-rfs7000)#l2tpv3 tunnel Tunnel1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#?
L2tpv3 Tunnel Mode commands:
  establishment-criteria  Set tunnel establishment criteria
  fast-failover           Configure fast failover for l2tpv3 tunnels
  hostname                Tunnel specific local hostname
  local-ip-address        Configure the IP address for tunnel. If not
                          specified, tunnel source ip address would be chosen
                          automatically based on the tunnel peer ip address
  mtu                     Configure the mtu size for the tunnel
  no                       Negate a command or set its defaults
  peer                    Configure the l2tpv3 tunnel peers. At least one peer
                          must be specified
  router-id               Tunnel specific local router ID
  session                 Create / modify the specified l2tpv3 session
  use                      Set setting to use

  clrscr                  Clears the display screen
  commit                  Commit all changes made in this session
  end                      End current mode and change to EXEC mode
  exit                    End current mode and down to previous mode
  help                    Description of the interactive help system
  revert                  Revert changes
  service                 Service Commands
  show                    Show running system information
  write                   Write running configuration to memory or terminal

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

The following table summarizes L2TPv3 tunnel configuration commands:

Table 22.2 L2TPV3-Tunnel-Config Commands

| Command | Description | Reference |
|-------------------------------|---|----------------------------|
| <i>establishment-criteria</i> | Configures L2TPv3 tunnel establishment criteria | page 22-17 |
| <i>fast-failover</i> | Configures fast-failover support on the L2TPv3 tunnel | page 22-19 |
| <i>hostname</i> | Configures tunnel specific local hostname | page 22-20 |
| <i>local-ip-address</i> | Configures the tunnel's IP address | page 22-21 |
| <i>mtu</i> | Configures the tunnel's <i>Maximum Transmission Unit</i> (MTU) size | page 22-22 |
| <i>no</i> | Negates or reverts L2TPv3 tunnel commands | page 22-23 |
| <i>peer</i> | Configures the tunnel's peers | page 22-24 |
| <i>router-id</i> | Configures the tunnel's local router ID | page 22-28 |
| <i>session</i> | Creates/modifies specified L2TPv3 session | page 22-29 |
| <i>use</i> | Configures a tunnel to use a specified L2TPv3 tunnel policy | page 22-31 |

22.2.1 establishment-criteria

► *l2tpv3-tunnel-commands*

Configures L2TPv3 tunnel establishment criteria

A L2TPv3 tunnel is established from the current device to the NOC controller when the current device becomes the VRRP master, cluster master, or RF Domain manager. Similarly, the L2TPv3 tunnel is closed when the current device switches to standby or backup mode.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]
```

Parameters

```
• establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]
```

| | |
|---------------------|--|
| always | Always establishes a L2TPv3 tunnel from the current device to the NOC controller. This is the default setting. The 'always' option indicates the device need not be a cluster-master, rf-domain-manager, or vrrp-master to establish a tunnel. |
| cluster-master | Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the cluster master Note: The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode. |
| rf-domain-manager | Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the RF Domain manager Note: The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode. |
| vrrp-master <1-255> | Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the VRRP master • <1-255> - Specify the VRRP group number from 1 - 255. Note: The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-
Tunnel1)#establishment-criteria cluster-master

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

| | |
|-----------|----------------------------|
| <i>no</i> | Resets to default (always) |
|-----------|----------------------------|

22.2.2 fast-failover

► *l2tpv3-tunnel-commands*

Configures fast-failover support on the L2TPv3 tunnel. When configured, devices, using this profile, send tunnel requests to both peers, and in turn, establish tunnels with both peers. If not configured, tunnel establishment occurs on one peer, with failover and other functionality the same as legacy behavior. In case fast failover is configured when an active tunnel, with one peer, already exists, the tunnel establishment process is re-initiated with both peers. Of the two tunnels established, one is marked active while the other is standby. The sessions and routes from the active tunnel are only pushed to the dataplane, resulting in creation of data sessions. However, if the active tunnel fails, sessions and routes from the standby tunnel are pushed to the dataplane thereby providing almost immediate fail over. Both tunnels individually perform connection health checkups through hello intervals. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
fast-failover {aggressive}
```

Parameters

- `fast-failover {aggressive}`

| | |
|---------------|--|
| fast-failover | Configures fast-failover support on the L2TPv3 tunnel |
| aggressive | Optional. When enabled, tunnel initiation hello requests are set to zero. For failure detections, hello attempts are not retried, regardless of the number of retry attempts configured. This option is disabled by default. Note: The <i>hello-interval</i> and <i>retry-attempts</i> parameters are defined in the L2TPv3 Policy context. For more information on configuring an L2TPv3 policy, see <i>l2tpv3-policy-commands</i> . For more information on associating an L2TPv3 policy to an L2TPv3 tunnel, see <i>use</i> . |

Example

```
nx9500-6C8809(config-profile testNX9500-l2tpv3-tunnel-TestTunnel2)#show context
include-factory | include fast-failover
  no fast-failover
nx9500-6C8809(config-profile testNX9500-l2tpv3-tunnel-TestTunnel2)#

nx9500-6C8809(config-profile testNX9500-l2tpv3-tunnel-TestTunnel2)#fast-failover
aggressive

nx9500-6C8809(config-profile testNX9500-l2tpv3-tunnel-TestTunnel2)#show context
l2tpv3 tunnel TestTunnel2
  fast-failover aggressive
nx9500-6C8809(config-profile testNX9500-l2tpv3-tunnel-TestTunnel2)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes fast-failover support on the L2TPv3 tunnel |
|-----------|--|

22.2.3 hostname

► *l2tpv3-tunnel-commands*

Configures the tunnel's local hostname

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
hostname <WORD>
```

Parameters

- hostname <WORD>

| | |
|-----------------|--|
| hostname <WORD> | Configures the tunnel's local hostname <ul style="list-style-type: none"> • <WORD> - Specify the tunnel's local hostname. |
|-----------------|--|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#hostname
TunnelHost1

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  hostname TunnelHost1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

| | |
|-----------|-------------------------------------|
| <i>no</i> | Removes the tunnel's local hostname |
|-----------|-------------------------------------|

22.2.4 local-ip-address

► *l2tpv3-tunnel-commands*

Configures the tunnel's source IP address. If no IP address is specified, the tunnel's source IP address is automatically configured based on the tunnel's peer IP address.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
local-ip-address <IP>
```

Parameters

- `local-ip-address <IP>`

| | |
|-----------------------|--|
| local-ip-address <IP> | <p>Configures the L2TPv3 tunnel's source IP address</p> <ul style="list-style-type: none"> • <IP> - Specify the tunnel's IP address. Ensure the IP address is available (or will become available - virtual IP) on an interface. Modifying a tunnel's local IP address re-establishes the tunnel. |
|-----------------------|--|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#local-ip-
address 172.16.10.2

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  hostname TunnelHost1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets the tunnel's local IP address and re-establishes the tunnel |
|-----------|--|

22.2.5 mtu

► *l2tpv3-tunnel-commands*

Configures the MTU size for this tunnel. This value determines the packet size transmitted over this tunnel.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mtu <128-1460>
```

Parameters

- mtu <128-1460>

| | |
|----------------|--|
| mtu <128-1460> | Configures the MTU size for this tunnel • <128-1460> - Specify a value from 128 - 1460 bytes (default is 1460 bytes). |
|----------------|--|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#mtu 1280
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  mtu 1280
  hostname TunnelHost1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the MTU size for this tunnel to default (1460 bytes) |
|-----------|---|

22.2.6 no

► *l2tpv3-tunnel-commands*

Negates or reverts a L2TPv3 tunnel settings to default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [establishment-criteria|fast-failover|hostname|local-ip-address|mtu|peer <1-2>|router-id|session|use]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Negates or reverts a L2TPv3 tunnel settings to default |
|-----------------|--|

Example

The tunnel settings before the 'no' command is executed:

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  mtu 1280
  hostname TunnelHost1
  establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

The tunnel settings after the 'no' command is executed:

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no local-ip
-address
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no mtu
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no hostname

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

22.2.7 peer

► *l2tpv3-tunnel-commands*

Configures the L2TPv3 tunnel's peers. At least one peer must be specified.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
peer <1-2> {hostname|ip-address|ipsec-secure|router-id|udp}

peer <1-2> {hostname [<HOSTNAME>|any]} {ipsec-secure|router-id|udp}
peer <1-2> {ip-address <IP>} {hostname|ipsec-secure|router-id|udp}
peer <1-2> {ipsec-secure} {gw [<IP>|<WORD>]}
peer <1-2> {router-id [<IP>|<WORD>|any]} {ipsec-secure|udp}
peer <1-2> {udp} {ipsec-secure|port <1-65535>}
```

Parameters

- peer <1-2> {hostname [<HOSTNAME>|any]} {ipsec-secure|router-id|udp}

| | |
|------------------------------------|--|
| peer <1-2> | <p>Configures the tunnel's peer ID</p> <ul style="list-style-type: none"> • <1-2> – Specify the ID from 1 - 2. The peer ID identifies the primary (ID 1) secondary (ID 2) peers. The L2TPv3 tunnel is established with the primary peer. The secondary peer is used for tunnel failover. If the peer is not specified, tunnel establishment does not occur. <p>Note: At any time the tunnel is established with only one peer, unless fast-failover support is configured on the L2TPv3 tunnel. For more information, see fast-failover.</p> |
| hostname [<HOSTNAME> any] | <p>Optional. Configures the peers' hostname. The hostname options are:</p> <ul style="list-style-type: none"> • <HOSTNAME> – Specifies the hostname as <i>Fully Qualified Domain Name</i> (FQDN) or partial DN or any other name • any – Peer name is not specified. If the hostname is 'any' this tunnel is considered as responder only and will allow incoming connection from any host. |
| ipsec-secure {gw [<IP> <WORD>]} | <p>After specifying the peer hostname, optionally specify the IPSec settings:</p> <ul style="list-style-type: none"> • ipsec-secure – Optional. Enables auto IPSec on the L2TPv3 tunnel <ul style="list-style-type: none"> • gw – Optional. Configures the IPSec gateway. Use one of the following options to configure the IPSec gateway: <ul style="list-style-type: none"> • <IP> – Configures IPSec gateway's IP address • <WORD> – Configures IPSec gateway's hostname |
| router-id [<IP> <WORD> any] | <p>After specifying the peer hostname, optionally specify router ID settings:</p> <ul style="list-style-type: none"> • router-id – Optional. Configures the peer's router ID in one of the following formats: <ul style="list-style-type: none"> • <IP> – Peer router ID in the IP address (A.B.C.D) format • <WORD> – Peer router ID range (for example, 100-120) • any – Peer router ID is not specified. This allows incoming connection from any router ID. |

| | |
|---|--|
| <pre>udp {ipsec-secure gw port <1-65535> {ipsec-secure}}</pre> | <p>After specifying the peer hostname, optionally specify UDP settings:</p> <p>The UDP option configures the encapsulation mode for this tunnel.</p> <ul style="list-style-type: none"> • UDP – Optional. Configures UDP encapsulation (default encapsulation is IP) <ul style="list-style-type: none"> • ipsec-secure gw – Optional. Enables auto IPsec • port <1-65535> {ipsec-secure} – Optional. Configures the peer’s UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPsec settings. |
| <pre>• peer <1-2> {ip-address <IP>} {hostname ipsec-secure router-id udp}</pre> | |
| <pre>peer <1-2></pre> | <p>Configures the tunnel’s peer ID from 1 - 2. At any time the tunnel is established with only one peer.</p> |
| <pre>ip-address <IP></pre> | <p>Optional. Configures the peer’s IP address in the A.B.C.D format</p> <ul style="list-style-type: none"> • <IP> – Specify the peer’s IP address. |
| <pre>hostname [<FQDN> any]</pre> | <p>After specifying the peer IP address, optionally specify the peer’s hostname:</p> <ul style="list-style-type: none"> • hostname – Optional. Configures the peers’ hostname. The hostname options are: <ul style="list-style-type: none"> • <FQDN> – Specifies the hostname as FQDN or partial DN • any – Peer name is not specified. If the hostname is ‘any’ this tunnel is considered as responder only and will allow incoming connection from any host. |
| <pre>ipsec-secure {gw [<IP> <WORD>]}</pre> | <p>After specifying the peer IP address, optionally specify the IPsec settings:</p> <ul style="list-style-type: none"> • ipsec-secure – Optional. Enables auto IPsec • gw – Optional. Configures the IPsec gateway. Use one of the following options to configure the IPsec gateway: <ul style="list-style-type: none"> • <IP> – Configures IPsec gateway’s IP address • <WORD> – Configures IPsec gateway’s hostname |
| <pre>router-id [<A.B.C.D> <WORD> any]</pre> | <p>After specifying the peer IP address, optionally specify the router ID using one of the following options:</p> <ul style="list-style-type: none"> • router-id – Optional. Configures the peer’s router-id in one of the following formats: <ul style="list-style-type: none"> • <A.B.C.D> – Peer router ID in the IP address (A.B.C.D) format • <WORD> – Peer router ID range (for example, 100-120) • any – Peer router ID is not specified. This allows incoming connection from any router ID. |
| <pre>udp {ipsec-secure gw port <1-65535> {ipsec-secure}}</pre> | <p>After specifying the peer IP address, optionally specify the peer’s UDP port settings:</p> <p>The UDP option configures the encapsulation mode for this tunnel.</p> <ul style="list-style-type: none"> • UDP – Optional. Configures UDP encapsulation (default encapsulation is IP) <ul style="list-style-type: none"> • ipsec-secure gw – Optional. Enables auto IPsec • port <1-65535> – Optional. Configures the peer’s UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPsec settings. |
| <pre>• peer <1-2> {ipsec-secure} {gw [<IP> <WORD>]}</pre> | |
| <pre>peer <1-2></pre> | <p>Configures the tunnel’s peer ID from 1 - 2. At any time the tunnel is established with only one peer.</p> |

| | |
|---|--|
| ipsec-secure {gw [<IP> <WORD>]} | Optional. Enables auto IPsec for this peer <ul style="list-style-type: none"> gw - Optional. Configures the IPsec gateway. Use one of the following options to configure the IPsec gateway: <ul style="list-style-type: none"> <IP> - Configures IPsec gateway's IP address <WORD> - Configures IPsec gateway's hostname |
| <ul style="list-style-type: none"> peer <1-2> {router-id [<IP> <WORD> any]} {ipsec-secure udp} | |
| peer <1-2> | Configures the tunnel peer ID from 1 - 2. At any time the tunnel is established with only one peer. |
| router-id [<A.B.C.D> <WORD> any] | Optional. Configures the peer's router-id in one of the following formats: <ul style="list-style-type: none"> <A.B.C.D> - Peer router ID in the IP address (A.B.C.D) format <WORD> - Peer router ID range (for example, 100-120) any - Peer router ID is not specified. This allows incoming connection from any router ID. |
| ipsec-secure {gw [<IP> <WORD>]} | After specifying the peer's router ID, optionally specify the IPsec settings. <ul style="list-style-type: none"> ipsec-secure - Optional. Enables auto IPsec <ul style="list-style-type: none"> gw - Optional. Configures the IPsec gateway. Use one of the following options to configure the IPsec gateway: <ul style="list-style-type: none"> <IP> - Configures IPsec gateway's IP address <WORD> - Configures IPsec gateway's hostname |
| udp {ipsec-secure gw port <1-65535> {ipsec-secure}} | After specifying the peer's router ID, optionally specify the IPsec settings. The UDP option configures the encapsulation mode for this tunnel. <ul style="list-style-type: none"> UDP - Optional. Configures UDP encapsulation (default encapsulation is IP) <ul style="list-style-type: none"> ipsec-secure gw - Optional. Enables auto IPsec port <1-65535> - Optional. Configures the peer's UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPsec settings. |
| <ul style="list-style-type: none"> peer <1-2> {udp} {ipsec-secure port <1-65535>} | |
| peer <1-2> | Configures the tunnel peer ID from 1 - 2. At any time the tunnel is established with only one peer. |
| udp {ipsec-secure port <1-65535> {ipsec-secure}} | Optional. Configures UDP encapsulation for this tunnel's peer (default encapsulation is IP) <ul style="list-style-type: none"> ipsec-secure - Optional. Configures IPsec gateway on this peer UDP port port <1-65535> - Optional. Configures the peer's UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPsec settings. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#peer 2
hostname tunnellopeer1 udp port 100

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnellopeer1 udp port 100
  establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

22.2.8 router-id

► *l2tpv3-tunnel-commands*

Configures the tunnel's local router ID

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
router-id [<1-4294967295>|<IP>]
```

Parameters

- router-id [<1-4294967295>|<IP>]

| | |
|------------------------------------|---|
| router-id [<1-4294967295> <IP>] | Configures the tunnel's local router ID in one of the following formats: <ul style="list-style-type: none"> • <1-4294967295> - Router ID in the number format (from 1 - 4294967295) • <IP> - Router ID in IP address format (A.B.C.D) |
|------------------------------------|---|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#router-id
2000

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnelp1peer1 udp port 100
  router-id 2000
  establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

| | |

| <i>no</i> | Removes the tunnel's router ID |
|-----------|--------------------------------|

22.2.9 session

▸ l2tpv3-tunnel-commands

Configures a session's pseudowire ID, which describes the session's purpose. The session established message sends this pseudowire ID to the L2TPv3 peer.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
session <L2TPV3-SESSION-NAME> [pseudowire-id|rate-limit]

session <L2TPV3-SESSION-NAME> pseudowire-id <1-4294967295> traffic-source
vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}
session <L2TPV3-SESSION-NAME> rate-limit [egress|ingress] rate <50-1000000>
max-burst-size <2-1024>
```

Parameters

- session <L2TPV3-SESSION-NAME> pseudowire-id <1-4294967295> traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}

| | |
|---|---|
| session <L2TPV3-SESSION-NAME> | Configures this session's name <ul style="list-style-type: none"> • <L2TPV3-SESSION-NAME> - Specify the L2TPV3 session name (should not exceed 31 characters in length). A tunnel is usable only if it has one or more session(s) (having specific session names) configured. The L2TPv3 tunnel has no idle timeout, it closes when the last tunnel session is closed. |
| pseudowire-id <1-4294967295> | Configures the pseudowire ID for this session from 1- 4204067295 A pseudowire is an emulation of a layer 2 point-to-point connection over a <i>packet-switching network</i> (PSN). A pseudowire is needed to encapsulate and tunnel layer 2 protocols across a layer 3 network. |
| traffic-source vlan <VLAN-ID-RANGE> | Configures VLAN as the traffic source for this tunnel <ul style="list-style-type: none"> • <VLAN-ID-RANGE> - Configures VLAN range list of traffic source. Specify the VLAN IDs as a range (for example, 10-20, 25, 30-35). |
| native-vlan <1-4094> | Optional - Configures the native VLAN ID for this session, which is not tagged <ul style="list-style-type: none"> • <1-4094> - Specify the native VLAN ID from 1- 4094. |
| <ul style="list-style-type: none"> • session <L2TPV3-SESSION-NAME> rate-limit [egress ingress] rate <50-1000000> max-burst-size <2-1024> | |
| session <L2TPV3-SESSION-NAME> | Configures this session's name <ul style="list-style-type: none"> • <L2TPV3-SESSION-NAME> - Specify the L2TPV3 session name (should not exceed 31 characters in length). A tunnel is usable only if it has one or more session(s) (having specific session names) configured. The L2TPv3 tunnel has no idle timeout, it closes when the last tunnel session is closed. |

| | |
|--------------------------------|--|
| rate-limit [egress ingress] | Configures a rate for incoming and/or outgoing traffic on this L2TPv3 tunnel. When configured, this option limits the rate at which data is sent to or received from L2TPv3 tunnel members. <ul style="list-style-type: none"> egress - Applies the specified rate to outbound traffic, from the L2TPv3 tunnel (going out from access points, wireless controllers, and service platforms) to the network ingress - Applies the specified rate to inbound traffic, from the network to the L2TPv3 tunnel (coming in to access points, wireless controllers, and service platforms) |
| rate <50-1000000> | Specify the data rate, in kilobits per second, for the incoming and/or outgoing traffic <ul style="list-style-type: none"> <50-1000000> - Specify a value from 50 - 1000000 kbps. The default is 5000 Kbps. |
| max-burst-size <2-1024> | Configures the maximum burst size, in kilobytes, for incoming/outgoing traffic rate limiting (depending on the direction selected) on a L2TPv3 tunnel. <ul style="list-style-type: none"> <2-1024> - Specify the maximum burst size from 2 - 1024 kbytes. Smaller the burst size, lesser are the chances of the upstream packet transmission resulting in congestion of the L2TPv3 tunnel traffic. The default setting is 320 kbytes. |

Usage Guidelines

The working status of a pseudowire is reflected by the state of the L2TPv3 session. If the corresponding session is L2TPv3 down, the pseudowire associated with it must be shut down.

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#session
tunnellpeer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-vlan 1

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnellpeer1 udp port 100
  session tunnellpeer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-
vlan 1
  router-id 2000
  establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

| <i>no</i> | Removes a session |
|-----------|-------------------|

22.2.10 use

► *l2tpv3-tunnel-commands*

Configures a tunnel to use a specified L2TPv3 tunnel policy and specified critical resources

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use [critical-resource|l2tpv3-policy]
use critical-resource <CRM-NAME1> {<CRM-NAME2>} <CRM-NAME3> <CRM-NAME4>}
use l2tpv3-policy <L2TPV3-POLICY-NAME>
```

Parameters

- use critical-resource <CRM-NAME1> {<CRM-NAME2>} {<CRM-NAME3>} {<CRM-NAME4>}

| | |
|--|---|
| <pre>use critical-resource <CRM-NAME1> {<CRM-NAME2>} {<CRM-NAME3>} {<CRM-NAME4>}</pre> | <p>Specifies the critical resource(s) to use with this tunnel</p> <ul style="list-style-type: none"> • <CRM1-NAME> - Specify the first critical resource name (should be existing). • <CRM-NAME2/3/4> - Optional. Specify the second/third/fourth critical resource names. Maximum of four critical resources can be monitored. <p>Note: In case of tunnel initiator, L2TPv3 tunnel is established only if the critical resources identified by the <CRM-NAME1>..... <CRM-NAME4> arguments are available at the time of tunnel establishment.</p> <p>Note: In case of L2TPv3 tunnel termination, all incoming tunnel establishment requests are rejected if the critical resources specified by the <CRM-NAME1>..... <CRM-NAME4> arguments are not available.</p> |
| <pre>• use l2tpv3-policy <L2TPV3-POLICY-NAME></pre> | |
| <pre>use l2tpv3-policy <L2TPV3-POLICY-NAME></pre> | <p>Associates a specified L2TPv3 policy with this tunnel</p> <ul style="list-style-type: none"> • <L2TPV3-POLICY-NAME> - Specify the policy name (should be existing and configured). |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#use l2tpv3-
policy L2TPV3Policy1

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnel1peer1 udp port 100
  use l2tpv3-policy L2TPV3Policy1
  session tunnel1peer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-
vlan 1
  router-id 2000
  establishment-criteria cluster-master
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

|---------------|--|

22.3 l2tpv3-manual-session-commands

► L2TPV3-POLICY

After a successful tunnel connection and establishment, individual sessions can be created. Each session is a single data stream. After successful session establishment, data corresponding to that session (pseudowire) can be transferred. If a session is down, the pseudowire associated with it is shut down as well.

Use the (profile-context) instance to manually configure a L2TPv3 session. To navigate to the L2TPv3 manual session configuration mode, use the following command in the profile context:

```
<DEVICE>(config-profile-default-rfs7000)#l2tpv3 manual-session <SESSION-NAME>

rfs6000-37FABE(config-profile-default-rfs7000)#l2tpv3 manual-session test
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#?
L2tpv3 Manual Session Mode commands:
  local-cookie          The local cookie for the session
  local-ip-address      Configure the IP address for tunnel. If not specified,
                        tunnel source ip address would be chosen automatically
                        based on the tunnel peer ip address
  local-session-id      Local session id for the session
  mtu                   Configure the mtu size for the tunnel
  no                    Negate a command or set its defaults
  peer                  Configure L2TPv3 manual session peer
  remote-cookie         The remote cookie for the session
  remote-session-id     Remote session id for the session
  traffic-source        Traffic that is tunneled

  clrscr                Clears the display screen
  commit                Commit all changes made in this session
  end                   End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                 Write running configuration to memory or terminal

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

The following table summarizes L2TPv3 manual session configuration commands:

Table 22.3 L2TPV3-Manual-Session-Config Commands

| Command | Description | Reference |
|-------------------------|--|----------------------------|
| <i>local-cookie</i> | Configures the manual session's local cookie field size | page 22-34 |
| <i>local-ip-address</i> | Configures the manual session's local source IP address | page 22-35 |
| <i>local-session-id</i> | Configures the manual session's local session ID | page 22-36 |
| <i>mtu</i> | Configures the MTU size for the manual session tunnel | page 22-37 |
| <i>no</i> | Negates or reverts L2TPv3 manual session commands to default | page 22-23 |
| <i>peer</i> | Configures the manual session's peers | page 22-39 |
| <i>remote-cookie</i> | Configures the remote cookie for the manual session | page 22-40 |

Table 22.3 *L2TPV3-Manual-Session-Config Commands*

| Command | Description | Reference |
|--------------------------|--|-------------------|
| <i>remote-session-id</i> | Configures the manual session's remote session ID | <i>page 22-41</i> |
| <i>traffic-source</i> | Configures the traffic source tunneled by the manual session | <i>page 22-42</i> |

22.3.1 local-cookie

► *l2tpv3-manual-session-commands*

Configures the local cookie field size for the manual session

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
local-cookie size [4|8] <1-4294967295> {<1-4294967295>}
```

Parameters

- local-cookie size [4|8] <1-4294967295> {<1-4294967295>}

| | |
|-------------------------|---|
| local-cookie size [4 8] | Configures the local cookie field size for this manual session. The options are: <ul style="list-style-type: none"> • 4 - 4 byte local cookie field • 8 - 8 byte local cookie field |
| <1-4294967295> | Configures the local cookie value first word. Applies to both the 4 byte and 8 byte local cookies |
| <1-4294967295> | Optional - Configures the local cookie value second word. Applicable to only 8 byte cookies. This parameter is ignored for 4 byte cookies. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-
cookie size 8 200 300

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
  local-cookie size 8 200 300
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the local cookie size configured for a manual session |
|-----------|---|

22.3.2 local-ip-address

► *l2tpv3-manual-session-commands*

Configures the manual session's source IP address. If no IP address is specified, the tunnel's source IP address is automatically configured based on the tunnel peer IP address. This parameter is applicable when establishing the session and responding to incoming requests.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
local-ip-address <IP>
```

Parameters

- local-ip-address <IP>

| | |
|-----------------------|---|
| local-ip-address <IP> | Configures the manual session's source IP <ul style="list-style-type: none"> • <IP> - Specify the IP address in the A.B.C.D format. |
|-----------------------|---|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-
ip-address 1.2.3.4

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
local-cookie size 8 200 300
local-ip-address 1.2.3.4
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the manual session's local source IP address. This re-establishes the session. |
|-----------|---|

22.3.3 local-session-id

► *l2tpv3-manual-session-commands*

Configures the manual session's local session ID

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
local-session-id <1-63>
```

Parameters

- local-session-id <1-63>

| | |
|-------------------------|---|
| local-session-id <1-63> | Configures this manual session's local session ID <ul style="list-style-type: none"> • <1-63> - Specify the ID from 1 - 63. This is the pseudowire ID for the session. This pseudowire ID is sent in a session establishment message to the L2TP peer. |
|-------------------------|---|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-session-id 1

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context
l2tpv3 manual-session test
local-cookie size 8 200 300
local-ip-address 1.2.3.4
local-session-id 1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the manual session's local session ID |
|-----------|---|

22.3.4 mtu

► *l2tpv3-manual-session-commands*

Configures the MTU size for the manual session tunnel. The MTU is the size (in bytes) of the largest protocol data unit the layer can pass between tunnel peers in this session. A larger MTU means processing fewer packets for the same amount of data.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mtu <128-1460>
```

Parameters

- mtu <128-1460>

| | |
|----------------|--|
| mtu <128-1460> | Configures the MTU size for this manual session tunnel <ul style="list-style-type: none"> • <128-1460> - Specify a value from 128 - 1460 bytes (default is 1460 bytes). |
|----------------|--|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#mtu 200

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
  local-cookie size 8 200 300
  local-ip-address 1.2.3.4
  mtu 200
  local-session-id 1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the MTU size for this manual session to default (1460 bytes) |
|-----------|---|

22.3.5 no

► *l2tpv3-manual-session-commands*

Negates or reverts L2TPv3 manual session settings to default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [local-cookie|local-ip-address|local-session-id|mtu|peer|remote-cookie|remote-session-id|traffic-source]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Negates or reverts L2TPv3 manual session settings to default |
|-----------------|--|

Example

The following example shows the manual session 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
  local-ip-address 1.2.3.4
  peer ip-address 5.6.7.8 udp port 150
  traffic-source vlan 50-60 native-vlan 2
  local-session-id 1
  remote-session-id 200
  remote-cookie size 8 400 700
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#no
local-ip-address
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#no
local-session-id
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#no
remote-session-id
```

The following example shows the manual session 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
  peer ip-address 5.6.7.8 udp port 150
  traffic-source vlan 50-60 native-vlan 2
  remote-cookie size 8 400 700
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

22.3.6 peer

► *l2tpv3-manual-session-commands*

Configures peer(s) allowed to establish the manual session tunnel. The peers are identified by their IP addresses.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
peer ip-address <IP> {udp {port <1-65535>}}
```

Parameters

- peer ip-address <IP> {udp {port <1-65535>}}

| | |
|----------------------|--|
| peer ip-address <IP> | Configures the tunnel's peer IP address in the A.B.C.D format |
| udp {port <1-65535>} | Optional. Configures the UDP encapsulation mode for this tunnel (default encapsulation is IP) <ul style="list-style-type: none"> • port <1-65535> - Optional. Configures the peer's UDP port running the L2TPv3 service. • <1-65535> - Specify a value from 1 - 65535. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#peer
ip-address 5.6.7.8 udp port 150

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
local-cookie size 8 200 300
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
mtu 200
local-session-id 1
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|-----------------------------------|
| <i>no</i> | Removes the manual session's peer |
|-----------|-----------------------------------|

22.3.7 remote-cookie

► *l2tpv3-manual-session-commands*

Configures the manual session's remote cookie field size

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
remote-cookie size [4|8] <1-4294967295> {<1-4294967295>}
```

Parameters

- remote-cookie size [4|8] <1-4294967295> {<1-4294967295>}

| | |
|--------------------------|--|
| remote-cookie size [4 8] | Configures the remote cookie field size for this manual session. The options are: <ul style="list-style-type: none"> • 4 - 4 byte remote cookie field • 8 - 8 byte remote cookie field |
| <1-4294967295> | Configures the remote cookie value first word. Applies to both the 4 byte and 8 byte local cookies |
| <1-4294967295> | Optional - Configures the remote cookie value second word. Applicable to only 8 byte cookies. This parameter is ignored for 4 byte cookies. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#remote-
cookie size 8 400 700

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
 local-ip-address 1.2.3.4
 peer ip-address 5.6.7.8 udp port 150
 mtu 200
 local-session-id 1
 remote-cookie size 8 400 700
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the manual session's remote cookie field size |
|-----------|---|

22.3.8 remote-session-id

► *l2tpv3-manual-session-commands*

Configures the manual session's remote ID. This ID is passed in the establishment of the tunnel session.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
remote-session-id <1-4294967295>
```

Parameters

- remote-session-id <1-4294967295>

| | |
|-------------------------------------|---|
| remote-session-id <1-4294967295> | Configures this manual session's remote ID • <1-4294967295> - Specify a value from 1 - 4294967295. |
|-------------------------------------|---|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#remote-
session-id 200

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
local-session-id 1
remote-session-id 200
remote-cookie size 8 400 700
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the manual session's remote ID |
|-----------|--|

22.3.9 traffic-source

► *l2tpv3-manual-session-commands*

Configures the traffic source tunneled by this session

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}
```

Parameters

```
• traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}
```

| | |
|--|---|
| traffic-source vlan <VLAN-ID-RANGE> | Configures VLAN as the traffic source for this tunnel <ul style="list-style-type: none"> • <VLAN-ID-RANGE> - Configures VLAN range list of traffic source. Specify the VLAN IDs as a range (for example, 10-20, 25, 30-35) |
| native-vlan <1-4094> | Optional - Configures the native VLAN ID for this session, which is not tagged <ul style="list-style-type: none"> • <1-4094> - Specify the native VLAN ID from 1- 4094. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-
test)#traffic-source vlan 50-60 native-vlan 2

rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show
context
l2tpv3 manual-session test
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
traffic-source vlan 50-60 native-vlan 2
local-session-id 1
remote-session-id 200
remote-cookie size 8 400 700
rfs6000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

| <i>no</i> | Removes the traffic source configured for a tunnel |
|-----------|--|

23 ROUTER-MODE COMMANDS

This chapter summarizes *Open Shortest Path First* (OSPF) router mode commands in the CLI command structure. All router-mode commands are available on both device and profile modes.

OSPF is an *interior gateway protocol* (IGP) used within large autonomous systems to distribute routing information. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets.

OSPF detects changes in the topology, like a link failure, and plots a new loop-free routing structure. It computes the shortest path for each route using a shortest path first algorithm. Link state data is maintained on each router and is periodically updated on all OSPF member routers. This enables routers to synchronize routing tables.

OSPF uses a route table managed by the link cost (external metrics) defined for each routing interface. The cost could be the distance of a router (round-trip time), link throughput or link availability.

Use the (config) instance to configure router commands. To navigate to the (config-router-mode) instance, use the following command:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#router ospf
<DEVICE>(config-profile <PROFILE-NAME>-router-ospf)#

rfs6000-37FABE(config-profile-default-rfs7000)#router ospf
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#?
Router OSPF Mode commands:
  area                OSPF area
  auto-cost            OSPF auto-cost
  default-information  Distribution of default information
  ip                  Internet Protocol (IP)
  network             OSPF network
  no                  Negate a command or set its defaults
  ospf                OSPF
  passive             Make OSPF Interface as passive
  redistribute         Route types redistributed by OSPF
  route-limit         Limit for number of routes handled OSPF process
  router-id           Router ID

  clrscr              Clears the display screen
  commit              Commit all changes made in this session
  do                  Run commands from Exec mode
  end                 End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert              Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or terminal

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore () character. In other words, the name of a device cannot contain an underscore.

23.1 router-mode

► ROUTER-MODE COMMANDS

The following table summarizes router configuration commands:

Table 23.1 OSPF-Router Config Commands

| Command | Description | Reference |
|----------------------------|---|-------------------|
| <i>area</i> | Specifies OSPF enabled interfaces | <i>page 23-3</i> |
| <i>auto-cost</i> | Specifies the reference bandwidth in terms of Mbits per second | <i>page 23-12</i> |
| <i>default-information</i> | Controls the distribution of default information | <i>page 23-13</i> |
| <i>ip</i> | Configures <i>Internet Protocol</i> (IP) default gateway priority | <i>page 23-14</i> |
| <i>network</i> | Defines OSPF network settings | <i>page 23-15</i> |
| <i>ospf</i> | Enables OSPF | <i>page 23-16</i> |
| <i>passive</i> | Specifies the configured OSPF interface as passive interface | <i>page 23-17</i> |
| <i>redistribute</i> | Specifies the route types redistributed by OSPF | <i>page 23-18</i> |
| <i>route-limit</i> | Specifies the limit for the number of routes managed by OSPF | <i>page 23-19</i> |
| <i>router-id</i> | Specifies the router ID for OSPF | <i>page 23-21</i> |
| <i>no</i> | Negates a command or sets its defaults | <i>page 23-22</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

23.1.1 area

▶ *router-mode*

Configures OSPF network area (OSPF enabled interfaces) settings

The following table lists the OSPF Area configuration mode commands:

Table 23.2 *OSPF Area Config Commands*

| Command | Description | Reference |
|-----------------------|---|------------------|
| <i>area</i> | Creates a new OSPF area and enters its configuration mode | <i>page 23-4</i> |
| <i>OSPF-area-mode</i> | Summarizes OSPF area configuration commands | <i>page 23-6</i> |

23.1.1.1 area

▶ area

Configures OSPF network areas (OSPF enables interfaces)

An OSPF network can be subdivided into routing areas to simplify administration and optimize traffic utilization. Areas are logical groupings of hosts and networks, including routers having interfaces connected to an included network. Each area maintains a separate link state database whose information may be summarized towards the rest of the network by the connecting router. Areas are identified by 32-bit IDs, expressed either in decimal, or octet-based dot-decimal notation. Areas can be defined as: *stub area*, *totally-stub*, *non-stub*, *nssa*, *totally nssa*. Each of these area types has been discussed further in the *area-type* section of this chapter.

At least one default area, bearing number '0', should be configured for every OSPF network. In case of multiple areas, the default area 0 forms the backbone of the network. The default area 0 is used as a link to the other areas. Each area has its own link-state database.

A router running OSPF sends hello packets to discover neighbors and elect a designated router. The hello packet includes link state information and list of neighbors. OSPF is savvy with layer 2 topologies. If on a point-to-point link, OSPF knows it is sufficient, and the link stays up. If on a broadcast link, the router waits for election before determining if the link is functional.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
area [<0-4294967295>|<IP>]
```

Parameters

- area [<0-4294967295>|<IP>]

| | |
|----------------|--|
| area | Defines an OSPF area |
| <0-4294967295> | Defines an OSPF area in the form of a 32 bit integer <ul style="list-style-type: none"> • <0-4294967295> - Specify the value from 0 - 4294967295. |
| <IP> | Defines an OSPF area in the form of an IP address <ul style="list-style-type: none"> • <IP> - Specify the IP address. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#area 4 ?
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.4)#?
Router OSPF Area Mode commands:
  area-type           OSPF area type
  authentication      Authentication scheme for OSPF area
  no                  Negate a command or set its defaults
  range              Routes matching this range are considered for summarization
                    (ABR only)

  clrscr             Clears the display screen
  commit             Commit all changes made in this session
  do                 Run commands from Exec mode
  end                End current mode and change to EXEC mode
  exit               End current mode and down to previous mode
```

```

help          Description of the interactive help system
revert        Revert changes
service       Service Commands

23.1.1.2 OSPF-area-mode

▶ *area*

The following table summarizes OSPF area mode configuration commands:

Table 23.3 *OSPF-Area-Mode Commands*

| Command | Description | Reference |
|-----------------------|--|-------------------|
| <i>area-type</i> | Configures a particular OSPF area as STUB or NSSA | <i>page 23-7</i> |
| <i>authentication</i> | Specifies the authentication scheme used for the OSPF area | <i>page 23-9</i> |
| <i>range</i> | Specifies the routes matching address/mask for summarization | <i>page 23-10</i> |
| <i>no</i> | Negates a command or sets its defaults | <i>page 23-11</i> |

23.1.1.2.1 area-type

▶ *OSPF-area-mode*

Configures a particular OSPF area type as STUB, Totally STUB, NSSA or Totally NSSA

Areas can be defined as:

- stub area - Is an area that does not receive route advertisements external to the *autonomous system* (AS), and routing from within the area is based entirely on a default route.
- totally-stub - Is an area that does not allow summary routes and external routes. A default route is the only way to route traffic outside of the area. When there is only one route out of the area, fewer routing decisions are needed, lowering system resource utilization.
- non-stub - Is an area that imports autonomous system external routes and forwards to other areas. However, it still cannot receive external routes from other areas.
- nssa - A *Not-So-Stubby Area* (NSSA) is an extension of a stub that allows the injection of limited external routes into a stub area. If selecting NSSA, no external routes, except a default route, enter the area.
- totally-nssa - Is a NSSA using 3 and 4 summary routes are not flooded into this type of area. It is also possible to declare an area both totally stubby and not-so-stubby, which means that the area will receive only the default route from area 0.0.0.0, but can also contain an *Autonomous System Boundary Router* (ASBR) that accepts external routing information and injects it into the local area, and from the local area into area 0.0.0.0.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
area-type [nssa|stub]

area-type nssa {default-cost|no-summary|translate-always|translate-candidate|
translate-never}

area-type nssa {default-cost <0-16777215> {no-summary}|no-summary {default-cost
<0-16777215>}}

area-type nssa {translate-always|translate-candidate|translate-never} {(default-
cost <0-16777215>|no-summary)}

area-type stub {default-cost <0-16777215> {no-summary}|no-summary {default-cost
<0-16777215>}}
```

Parameters

- area-type [nssa|stub] {default-cost|no-summary|translate-always|translate-candidate|translate-never}

| | |
|---------------------------|---|
| area-type | Configures a particular OSPF area type as STUB, Totally STUB, NSSA or Totally NSSA |
| nssa | Configures the OSPF area as NSSA |
| stub | Configures the OSPF area as <i>Stubby Area</i> (STUB) |
| default-cost <0-16777215> | Specifies the default summary cost that will be advertised, if the OSPF area is a STUB or NSSA <ul style="list-style-type: none"> • <0-16777215> - Specify the default summary cost value from 0 - 16777215. |

| | |
|---------------------|--|
| no-summary | Configures the OSPF area as totally STUB if the area-type is STUB or totally NSSA if the area-type is NSSA |
| translate-always | Always translates type-7 <i>Link State Advertisements</i> (LSAs) into type-5 LSAs |
| translate-candidate | Defines it as default behavior |
| translate-never | Never translates type-7 LSAs into type-5 LSAs |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#area-type
stub default-cost 1

rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show
context
area 0.0.0.1
  area-type stub default-cost 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Removes configured area-type settings |
|-----------|---------------------------------------|

23.1.1.2.2 authentication

▶ *OSPF-area-mode*

Specifies an authentication scheme used for an OSPF area used with the OSPF dynamic route

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
authentication [message-digest|simple-password]
```

Parameters

- authentication [message-digest|simple-password]

| | |
|-----------------|--|
| message-digest | Configures the message-digest (MD-5) authentication scheme |
| simple-password | Configures the simple password authentication scheme |

Usage Guidelines

OSPF packet authentication enables routers to use predefined passwords and participate within a routing domain. The two authentication modes are:

- MD-5 – MD-5 authentication is a cryptographic authentication mode, where every router has a key (password) and key-id configured on it. This key and key-id together form the message digest that is appended to the OSPF packet.
- Simple Password – Simple password authentication allows a password (key) to be configured per area. Routers in the same area and participating in the routing domain have to be configured with the same key.

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-
0.0.0.1)#authentication simple-password

rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show
context
area 0.0.0.1
  authentication simple-password
  area-type stub default-cost 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

Related Commands

| | |
|-----------|-----------------------------------|
| <i>no</i> | Removes the authentication scheme |
|-----------|-----------------------------------|

23.1.1.2.3 range

▶ *OSPF-area-mode*

Specifies a range of addresses for routes matching address/mask for OSPF summarization

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
range <IP/M>
```

Parameters

- range <IP/M>

| | |
|---------------------------|--|
| <code><IP/M></code> | Specifies the routes matching address/mask for summarization. Note: This command is applicable for a <i>Area Border Router</i> (ABR) only. |
|---------------------------|--|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#range
172.16.10.0/24

rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show
context
  area 0.0.0.1
    authentication simple-password
    range 172.16.10.0/24
    area-type stub default-cost 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the configured network IP range |
|-----------|---|

23.1.1.2.4 no▶ *OSPF-area-mode*

Negates a command or set its defaults

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
no [area-type|authentication|range]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---------------------------------------|
| no <PARAMETERS> | Negates a command or set its defaults |
|-----------------|---------------------------------------|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following example shows the OSPF router settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show
context
  area 0.0.0.1
    authentication simple-password
    range 172.16.10.0/24
    area-type stub default-cost 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#

rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#no
authentication
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#no range
172.16.10.0/24
```

The following example shows the OSPF router settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show
context
  area 0.0.0.1
    area-type stub default-cost 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

23.1.2 auto-cost

► *router-mode*

Configures the reference bandwidth in terms of megabits per second. Specifying the reference bandwidth allows you to control the default metrics for an interface, which is calculated by OSPF.

The formula used to calculate default metrics is: *ref-bw* divided by the *bandwidth*.

Use the '*no > auto-cost > reference-bandwidth*' command to configure default metrics calculation based on interface type.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
auto-cost reference-bandwidth <1-4294967>
```

Parameters

- `auto-cost reference-bandwidth <1-4294967>`

| | |
|------------------------------------|---|
| reference-bandwidth <1-4294967> | Defines the reference bandwidth in Mbps <ul style="list-style-type: none"> • <1-4294967> - Specify the reference bandwidth value from 1 - 4294967. |
|------------------------------------|---|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#auto-cost reference-bandwidth 1
```

Ensure that the auto-cost reference-bandwidth is configured uniformly on all routers.

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
area 0.0.0.4
  auto-cost reference-bandwidth 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes auto-cost reference bandwidth settings |
|-----------|--|

23.1.3 default-information

► *router-mode*

Controls the distribution of default route information. Use the *default-information > originate* command to advertise a default route in the routing table.

This option is disabled by default. When enabled, the default route becomes a distributed route.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
default-information originate {always|metric|metric-type}
default-information originate {always|metric <0-16777214>|metric-type [1|2]}
{(metric <0-16777214>|metric-type [1|2])}
```

Parameters

- default-information originate {always|metric <0-16777214>|metric-type [1|2]} {(metric <0-16777214>|metric-type [1|2])}

| | |
|---------------------|--|
| originate | Originates default route information. Enabling this feature makes the default route a distributed route. This option is disabled by default. |
| always | Optional. Always distributes default route information (will continue to advertise default route information even if that information has been removed from the routing table for some reason). This option is disabled by default. |
| metric <0-16777214> | This is a recursive parameter and can be optionally configured along with the metric-type option. <ul style="list-style-type: none"> • metric <0-16777214> - Optional. Specifies OSPF metric value for redistributed routes (this value is used to generate the default route) <ul style="list-style-type: none"> • <0-16777214> - Specify a value from 0 - 16777214. |
| metric-type [1 2] | This is a recursive parameter and can be optionally configured along with the metric option. <ul style="list-style-type: none"> • metric-type [1 2] - Optional. Sets OSPF exterior metric type for redistributed routes (this information is advertised with the OSPF routing domain) <ul style="list-style-type: none"> • 1 - Sets OSPF external type 1 metrics • 2 - Sets OSPF external type 2 metrics |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#default-information
originate metric-type 2 metric 1

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
 area 0.0.0.4
 auto-cost reference-bandwidth 1
 default-information originate metric 1 metric-type 2
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables advertising of default route information available in the routing table |
|-----------|--|

23.1.4 ip

► *router-mode*

Configures IP default gateway priority

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
ip default-gateway priority <1-8000>
```

Parameters

- ip default-gateway priority <1-8000>

| | |
|-------------------|--|
| default-gateway | Configures the default gateway |
| priority <1-8000> | Sets the priority for the default gateway acquired via OSPF <ul style="list-style-type: none"> • <1-8000> - Specify an integer from 1 - 8000. The default is 7000. <p>Note: Lower the value, higher is the priority.</p> |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#ip default-gateway
priority 1

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
 area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes default gateway priority settings |
|-----------|---|

23.1.5 network

► *router-mode*

Assigns networks to specified areas (defines the OSPF interfaces and their associated area IDs)

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
network <IP/M> area [<0-4294967295>|<IP>]
```

Parameters

- network <IP/M> area [<0-4294967295>|<IP>]

| | |
|-------------------------------|--|
| <IP/M> | Specifies an OSPF network address/mask value. Defines networks (IP addresses and mask) participating in OSPF. |
| area [<0-4294967295> <IP>] | Specifies an OSPF area, associated with the OSPF address range, in one of the following formats: <ul style="list-style-type: none"> • <0-4294967295> - Specifies a 32 bit OSPF area ID from 0 - 4294967295 • <IP> - Defines an OSPF area ID in the form of an IPv4 address |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#network 1.2.3.0/24
area 4.5.6.7

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the OSPF network to area ID association |
|-----------|---|

23.1.6 ospf

► *router-mode*

Enables OSPF routing on a profile or device

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
ospf enable
```

Parameters

- ospf enable

| | |
|-------------|---|
| ospf enable | Enables OSPF routing on devices using this profile. This option is disabled by default. |
|-------------|---|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#ospf enable

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables OSPF routing on a profile or device |
|-----------|--|

23.1.7 passive

► *router-mode*

Configures specified OSPF interface as passive. This option is disabled by default.

A passive interface receives routing updates, but does not transmit them.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
passive [<WORD>|all|vlan <1-4094>]
```

Parameters

- `passive [<WORD>|all|vlan <1-4094>]`

| | |
|---------------|---|
| <WORD> | Enables the OSPF passive mode on the interface specified by the <WORD> parameter |
| all | Enables the OSPF passive mode on all the L3 interfaces |
| vlan <1-4094> | Enables the OSPF passive mode on the specified VLAN interface <ul style="list-style-type: none"> • <1-4094> - Specify the VLAN interface ID from 1 - 4094. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#passive vlan 1

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  passive vlan1
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables the OSPF passive mode on a specified interface |
|-----------|---|

23.1.8 redistribute

► *router-mode*

Specifies the route types redistributed by OSPF

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
redistribute [bgp|connected|kernel|static] {metric <0-16777214>|metric-type [1|2]}
```

Parameters

- redistribute [connected|kernel|static] {metric <0-16777214>|metric-type [1|2]}

| | |
|---------------------|--|
| bgp | Redistributes all BGP routes by OSPF |
| connected | Redistributes all connected interface routes by OSPF |
| kernel | Redistributes all routes that are neither connected, static, dynamic, nor bgp |
| static | Redistributes static routes by OSPF |
| metric <0-16777214> | The following keywords are common to the 'bgp', 'connected', 'kernel', and 'static' parameters: <ul style="list-style-type: none"> • metric <0-16777214> - Optional. Specifies the OSPF metric value for redistributed routes. • <0-16777214> - Specify a value from 0 - 16777214. |
| metric-type [1 2] | The following keywords are common to the 'connected', 'kernel', and 'static' parameters: <ul style="list-style-type: none"> • metric-type [1 2] - Optional. Sets the OSPF exterior metric type for redistributed routes • 1 - Sets the OSPF external type 1 metrics • 2 - Sets the OSPF external type 2 metrics |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#redistribute static
metric-type 1

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the OSPF redistribution of various route types |
|-----------|--|

23.1.9 route-limit

► *router-mode*

Limits the number of routes managed by OSPF. The maximum limit supported by the platform is the default configuration defined under the router-ospf context.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
route-limit [num-routes|reset-time|retry-count|retry-timeout]
```

```
route-limit [num-routes <DYNAMIC-ROUTE-LIMIT>|reset-time <1-86400>|retry-count <1-32>|retry-timeout <1-3600>] { (num-routes|reset-time|retry-count|retry-timeout) }
```

Parameters

- route-limit [num-routes <DYNAMIC-ROUTE-LIMIT>|reset-time <1-86400>|retry-count <1-32>|retry-timeout <1-3600>] { (num-routes|reset-time|retry-count|retry-timeout) }

| | |
|----------------------------------|--|
| num-routes <DYNAMIC-ROUTE-LIMIT> | Specifies the maximum number of non self-generated LSAs this process can receive <ul style="list-style-type: none"> • <DYNAMIC-ROUTE-LIMIT> - Specify the dynamic route limit. |
| reset-time <1-86400> | Specifies the time, in seconds, after which the retry-count is reset to zero <ul style="list-style-type: none"> • <1-86400> - Specify a value from 1 - 86400 seconds. The default is 360 seconds. |
| retry-count <1-32> | Specifies the maximum number of times adjacencies can be suppressed. Each time OSPF gets into an ignore state, a counter increments. If the counter exceeds the timeout configured by the retry-count parameter, OSPF stays in the same ignore state. Manual intervention is required to get OSPF out of the ignore state. <ul style="list-style-type: none"> • <1-32> - Specify a value from 1 - 32. The default is 5. |
| retry-timeout <1-3600> | Specifies the retry time in seconds. During this time, OSPF remains in ignore state and all adjacencies are suppressed. <ul style="list-style-type: none"> • <1-3600> - Specify a value from 1 - 3600 seconds. The default is 60 seconds. |

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#route-limit num-routes
10 retry-count 5 retry-timeout 60 reset-time 10

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  route-limit num-routes 10 retry-count 5 retry-timeout 60 reset-time 10
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

*no*Removes the limit on the number of routes managed by OSPF

23.1.10 router-id

► *router-mode*

Specifies the OSPF router ID

This ID must be established in every OSPF instance. If not explicitly configured, the highest logical IP address is duplicated as the router identifier. However, since the router identifier is not an IP address, it does not have to be a part of any routable subnet in the network.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
router-id <IP>
```

Parameters

- router-id <IP>

| | |
|------|--|
| <IP> | Identifies the OSPF router by its IP address <ul style="list-style-type: none"> • <IP> - Specify the router ID in the IP <A.B.C.D> format |
|------|--|

Example

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#router-id 172.16.10.8
Reload, or execute "clear ip ospf process" command, for this to take effect
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Removes the configured OSPF router ID |
|-----------|---------------------------------------|

23.1.11 no

► *router-mode*

Negates a command or reverts settings to their default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
no [area|auto-cost|default-information|ip|network|ospf|passive|redistribute|
route-limit|router-id]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---------------------------------------|
| no <PARAMETERS> | Negates a command or set its defaults |
|-----------------|---------------------------------------|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following example shows the OSPF router interface settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  route-limit num-routes 10 reset-time 10
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#

rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#no area 4
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#no auto-cost
reference-bandwidth
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#no network 1.2.3.0/24
area 4.5.6.7
```

The following example shows the OSPF router interface settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  route-limit num-routes 10 reset-time 10
  ip default-gateway priority 1
rfs6000-37FABE(config-profile default-rfs7000-router-ospf)#
```

24 ROUTING-POLICY

This chapter summarizes routing-policy commands in the CLI command structure.

Routing policies enable network administrators to control data packet routing and forwarding. *Policy-based routing* (PBR) always overrides protocol-based routing. Network administrators can define routing policies based on parameters, such as access lists, packet size, etc. For example, a routing policy can be configured to route packets along user-defined routes.

In addition to the above, PBR facilitates the provisioning of preferential service to specific traffic. PBR minimally provides the following:

- A means to use source address, protocol, application, and traffic class as traffic routing criteria
- A means to load balance multiple WAN uplinks
- A means to selectively mark traffic for *Quality of Service* (QoS) optimization

Use the (config) instance to configure router-policy commands. To navigate to the (config-routing-policy mode) instance, use the following commands:

```
<DEVICE>(config)#routing-policy <ROUTING-POLICY-NAME>
rfs6000-37FABE(config)#routing-policy testpolicy
rfs6000-37FABE(config-routing-policy-testpolicy)#?
Routing Policy Mode commands:
  apply-to-local-packets  Use Policy Based Routing for packets generated by
                          the device
  logging                 Enable logging for this Route Map
  no                      Negate a command or set its defaults
  route-map              Create a Route Map
  use                     Set setting to use

  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                      Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

rfs6000-37FABE(config-routing-policy-testpolicy)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

24.1 routing-policy-commands

► ROUTING-POLICY

The following table summarizes routing policy configuration commands:

Table 24.1 *Routing-Policy-Config Commands*

| Command | Description | Reference |
|-------------------------------|---|-------------------|
| <i>apply-to-local-packets</i> | Enables PBR for locally generated packets | <i>page 24-3</i> |
| <i>logging</i> | Enables logging for a specified route map | <i>page 24-4</i> |
| <i>route-map</i> | Creates a route map entry | <i>page 24-5</i> |
| <i>use</i> | Defines default settings to use | <i>page 24-18</i> |
| <i>no</i> | Negates a command or sets its defaults | <i>page 24-19</i> |

NOTE: For more information on common commands (clear, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

24.1.1 apply-to-local-packets

► *routing-policy-commands*

Enables PBR for locally generated packets (packets generated by the device). When enabled, this option implements the match and action clauses defined within route maps. This option is enabled by default.

To disable PBR, use the *no > apply-to-local-packets* command.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
apply-to-local-packets
```

Parameters

None

Example

```
rfs6000-37FABE (config-routing-policy-testpolicy) #apply-to-local-packets
rfs6000-37FABE (config-routing-policy-testpolicy) #
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables PBR for locally generated packets |
|-----------|--|

24.1.2 logging

► *routing-policy-commands*

Enables logging for a specified route map. When enabled, this option logs events generated by the enforcement of route-maps. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
logging
```

Parameters

None

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy)#logging
rfs6000-37FABE(config-routing-policy-testpolicy)#show context
routing-policy testpolicy
  logging
rfs6000-37FABE(config-routing-policy-testpolicy)#
```

Related Commands

| | |
|-----------|----------------------------|
| <i>no</i> | Disables route map logging |
|-----------|----------------------------|

24.1.3 route-map

► *routing-policy-commands*

Creates a route map entry and enters the route map configuration mode

In *policy-based routing* (PBR), route maps control the flow of traffic within the network. They override route tables and direct traffic along a specific path.

Route-maps contain a set of filters that select traffic (*match* clauses) and associated actions (*mark* clauses) for routing. Every route-map entry has a precedence value. Lower the precedence, higher is the route-map's priority. All incoming packets are matched against these route-maps entries. The route-map entry with highest precedence (lowest numerical value) is applied first. In case of a match, action is taken based on the mark clause specified in the route-map. In case of no match, the route-map entry with the next highest precedence is applied. If the incoming packet does not match any of the route-map entries, it is subjected to typical destination-based routing. Each route-map entry can optionally enable/disable logging.

The following criteria can optionally be used as traffic selection segregation criteria:

- *IP Access List* - A typical IP ACL can be used for routing traffic. The mark and log actions in ACL rules however are neglected. Route-map entries have separate logging. Only one ACL can be configured per route map entry.

ACL rules configured under route map entries merge to create a single ACL. Route map precedence values determine the prioritization of the rules in this merged ACL. An IP DSCP value is also added to the ACL rules.

- *IP DSCP* - Packet filtering can be performed by traffic class, as determined from the IP *Differentiated Services Code Point* (DSCP) field. One DSCP value can be configured per route map entry. If IP ACLs on a WLAN, ports or SVI mark packets, the new/marked DSCP value is used for matching.
- *Incoming WLAN* - Packets can be filtered on the basis of the incoming WLAN. Depending on whether the receiving device has an onboard radio or not, the following two scenarios are possible:
 - Device *with* an onboard radio: If a device having an onboard radio and capable of PBR receives a packet on a local WLAN, this WLAN is used for selection.
 - Device *without* an onboard radio: If a device, without an onboard radio, capable of PBR receives a packet from an extended VLAN, it passes the WLAN information in the MiNT packet to the PBR router. The PBR router uses this information as match criteria.
- *Client role* - The client role can be used as match criteria, similar to a WLAN. Each device has to agree on a unique identifier for role definition and pass the same MINT tunneled packets.
- *Incoming SVI* - A source IP address qualifier in an ACL typically satisfies filter requirements. But if the source host (where the packet originates) is multiple hops away, the incoming SVI can be used as match criteria. In this context the SVI refers to the device interface performing PBR, and not to the source device.

Mark (or action) clauses determine the routing function when a packet satisfies match criteria. If no mark clauses are defined, the default is to fallback to destination-based routing for packets satisfying the match criteria. If no mark clause is configured and fallback to destination-based routing is disabled, then the packet is dropped. The mark clause defines one of following actions:

- *Next hop* - The IP address of the next hop or the outgoing interface through which the packet should be routed. Up to two next hops can be specified. The outgoing interface should be a PPP, a tunnel interface or a SVI which has DHCP client configured. The first reachable hop should be used. But if all next hops are unreachable, typical destination-based route lookup is performed.

- *Default next hop* - If a packet subjected to PBR does not have an explicit route to the destination, the configured default next hop is used. This can be either the IP address of the next hop or the outgoing interface. Only one default next hop can be defined. The difference between the *next hop* and the *default next-hop* is: in case of the former, PBR occurs first, then destination-based routing. In case of the latter, the order is reversed. In both cases:
 - a If a defined next hop is reachable, it is used. If fallback is configured refer to (b).
 - b Perform normal destination-based route lookup. If a next hop is found, it is used, if not refer to (c).
 - c If default next hop is configured and reachable, it is used, if not, packet is dropped.
 - *Fallback* - Enables fallback to destination-based routing if none of the configured next hops are reachable (or not configured). This is enabled by default.
 - *Mark IP DSCP* - Configures IP DSCP bits for QoS using an ACL. The mark action of the route maps takes precedence over the mark action of an ACL.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
route-map <1-100>
```

Parameters

- route-map <1-100>

| | |
|-------------------|--|
| route-map <1-100> | <p>Creates a route map entry, sets a precedence value for the route map, and enters the route map configuration mode</p> <ul style="list-style-type: none"> • <1-100> - Specify a precedence value from 1 - 100. <p>Note: Lower the sequence number, higher is the precedence.</p> |
|-------------------|--|

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy)#route-map 1

rfs6000-37FABE(config-routing-policy-testpolicy)#show context
routing-policy testpolicy
logging
route-map 1
rfs6000-37FABE(config-routing-policy-testpolicy)#

rfs6000-37FABE(config-routing-policy-testpolicy)#route-map 1
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#?
Route Map Mode commands:
  default-next-hop  Default next-hop configuration (aka
                    gateway-of-last-resort)
  fallback          Fallback to destination based routing if no next-hop is
                    configured or all are unreachable
  mark              Mark action for route map
  match             Match clause configuration for Route Map
  next-hop          Next-hop configuration
  no                Negate a command or set its defaults

  clrscr           Clears the display screen
  commit           Commit all changes made in this session
  do                Run commands from Exec mode
  end              End current mode and change to EXEC mode
  exit             End current mode and down to previous mode
  help             Description of the interactive help system
```

| | |

|-----------|---------------------|

24.1.4 route-map-mode

► *route-map*

The following table summarizes route-map configuration commands:

Table 24.2 *Route-Map-Config Commands*

| Command | Description | Reference |
|-------------------------|---|-------------------|
| <i>default-next-hop</i> | Sets the default next hop for packets satisfying match criteria | <i>page 24-9</i> |
| <i>fallback</i> | Configures a fallback to the next destination | <i>page 24-10</i> |
| <i>mark</i> | Marks action clause for packets satisfying match criteria | <i>page 24-11</i> |
| <i>match</i> | Sets match clauses for the route map | <i>page 24-12</i> |
| <i>next-hop</i> | Sets the next hop for packets satisfying match criteria | <i>page 24-15</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 24-17</i> |

24.1.4.1 default-next-hop

► *route-map-mode*

Sets the default next hop for packets satisfying match criteria

If a packet, subjected to PBR, does not have an explicit route to the destination, the configured default next hop is used. This value is set as either the IP address of the next hop or the outgoing interface. Only one default next hop can be defined. The difference between the next hop and the default next-hop is: in case of the former, PBR occurs first, then destination-based routing. In case of the latter, the order is reverse. Use this command to set either the default next hop IP address or define either a WWAN1, PPPoE1, or VLAN interface.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7562, AP7602, AP7612, AP7622, AP7632, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
default-next-hop [<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID>
<CHANNEL-GROUP-ID>|vlan <1-4094>|wwan1]
```

Parameters

- default-next-hop [<IP>|<ROUTER-IF-NAME>|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|pppoe1|vlan <1-4094>|wwan1]

| | |
|---|---|
| default-next-hop | Sets the next hop router to which packets are sent in case the next hop is not the adjacent router |
| <IP> | Specifies next hop router's IP address |
| <ROUTER-IF-NAME> | Specifies the outgoing interface name (router interface name) |
| pppoe1 | Specifies the PPPoE interface |
| serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID> | Specifies the serial interface's slot, port, and channel group IDs |
| vlan <1-4094> | Specifies a VLAN interface ID <ul style="list-style-type: none"> • <1-4094> - Specify a value from 1 - 4094. |
| wwan1 | Specifies the WAN interface |

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#default-next-hop
wwan1

rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  default-next-hop wwan1
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes default next hop router settings |
|-----------|--|

24.1.4.2 fallback

► *route-map-mode*

Enables fallback to destination-based routing. This option is enabled by default. To disable fallback, use the *no > fallback* command.

The action taken for packets satisfying the match criteria is determined by the mark (action) clauses. If no action is defined, the default is to fallback to destination-based routing.

NOTE: If no mark clause is configured and fallback to destination-based routing is disabled, then the packet is dropped.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
fallback
```

Parameters

None

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#fallback
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables fallback to destination-based routing, if no next hop is configured or are unreachable |
|-----------|---|

24.1.4.3 mark

► *route-map-mode*

Enables the marking of the DSCP field in the IP header

Use this command to set the IP DSCP bits for QoS using an ACL. The mark action of the route maps takes precedence over the mark action of an ACL.

The DSCP field in an IP header enables packet classification. Packet filtering can be done based on traffic class, determined from the IP DSCP field. One DSCP value can be configured per route map entry.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mark ip dscp <0-63>
```

Parameters

- mark ip dscp <0-63>

| | |
|----------------|--|
| ip dscp <0-63> | Marks the DSCP field in the IP header <ul style="list-style-type: none"> • <0-63> - Specify a DSCP value from 0 - 63. |
|----------------|--|

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#mark ip dscp 7

rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  default-next-hop wwan1
  mark ip dscp 7
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

| | |
|-----------|--------------------------------|
| <i>no</i> | Disables marking of IP packets |
|-----------|--------------------------------|

24.1.4.4 match

► *route-map-mode*

Sets the match clauses

Each route map entry has a set of *match* clauses used to segregate and filter packets. Packets can be segregated using any one of the following criteria:

- *IP Access List* - A typical IP ACL can be used for routing traffic. The mark and log actions in ACL rules however are neglected. Route-map entries have separate logging. Only one ACL can be configured per route map entry.

ACL rules configured under route map entries merge to create a single ACL. Route map precedence values determine the prioritization of the rules in this merged ACL. An IP DSCP value is also added to the ACL rules.

- *IP DSCP* - Packet filtering can be performed by traffic class, as determined from the IP *Differentiated Services Code Point* (DSCP) field. One DSCP value can be configured per route map entry. If IP ACLs on a WLAN, ports or SVI mark packets, the new/marked DSCP value is used for matching.
- *Incoming WLAN* - Packets can be filtered on the basis of the incoming WLAN. Depending on whether the receiving device has an onboard radio or not, the following two scenarios are possible:
 - Device *with* an onboard radio: If a device having an onboard radio and capable of PBR receives a packet on a local WLAN, this WLAN is used for selection.
 - Device *without* an onboard radio: If a device, without an onboard radio, capable of PBR receives a packet from an extended VLAN, it passes the WLAN information in the MiNT packet to the PBR router. The PBR router uses this information as match criteria.
- *Client role* - The client role can be used as match criteria, similar to a WLAN. Each device has to agree on a unique identifier for role definition and pass the same MINT tunneled packets.
- *Incoming SVI* - A source IP address qualifier in an ACL typically satisfies filter requirements. But if the source host (where the packet originates) is multiple hops away, the incoming SVI can be used as match criteria. In this context the SVI refers to the device interface performing PBR, and not to the source device.

The action taken for filtered packets is determined by the mark (action) clauses. If no action is defined, the default is to fallback to destination-based routing for packets satisfying the match criteria. For more information on configuring mark clauses, see *mark*. And for more information on fallback action, see *fallback*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
match [incoming-interface|ip|ip-access-list|wireless-client-role|wlan]
```

```
match incoming-interface [<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID>
<CHANNEL-GROUP-ID>|vlan <1-4094>|wwan1]
```

```
match ip dscp <0-63>
```

```

match ip-access-list <IP-ACCESS-LIST-NAME>

match wireless-client-role <ROLE-POLICY-NAME> <ROLE-NAME>

match wlan <WLAN-NAME>

```

Parameters

- `match incoming-interface` [`<ROUTER-IF-NAME>`|`pppoe1`|`serial<SLOT-ID>` `<PORT-ID>` `<CHANNEL-GROUP-ID>`|`vlan <1-4094>`|`wwan1`]

| | |
|--|---|
| <code>incoming-interface</code> | Sets the incoming SVI match clause. Specify an interface name. |
| <code><ROUTER-IF-NAME></code> | Specifies the layer 3 interface name (route interface) |
| <code>pppoe1</code> | Specifies the PPP over Ethernet interface |
| <code>serial <SLOT-ID></code> <code><PORT-ID></code> <code><CHANNEL-GROUP-ID></code> | Specifies the serial interface's slot, port, and channel group IDs. |
| <code>vlan <1-4094></code> | Specifies the VLAN interface ID <ul style="list-style-type: none"> • <code><1-4094></code> – Specify a VLAN ID from 1 - 4094. |
| <code>wwan1</code> | Specifies the WAN interface name |
| <ul style="list-style-type: none"> • <code>match ip dscp <0-63></code> | |
| <code>ip dscp <0-63></code> | Sets the DSCP match clause <ul style="list-style-type: none"> • <code><0-63></code> – Specify a value from 0 - 63. The defined DSCP value is used as a matching clause for this route map. |
| <ul style="list-style-type: none"> • <code>match ip-access-list <IP-ACCESS-LIST-NAME></code> | |
| <code>ip-access-list <IP-ACCESS-LIST-NAME></code> | Sets the match clause using a pre-configured IP access list <ul style="list-style-type: none"> • <code><IP-ACCESS-LIST-NAME></code> – Specify a pre-configured IP access list name. |
| <ul style="list-style-type: none"> • <code>match wireless-client-role <ROLE-POLICY-NAME> <ROLE-NAME></code> | |
| <code>wireless-client-role <ROLE-POLICY-NAME></code> <code><ROLE-NAME></code> | Sets the wireless client role match clause <ul style="list-style-type: none"> • <code><ROLE-POLICY-NAME></code> – Specify a pre-configured role policy. • <code><ROLE-NAME></code> – Specify a pre-configured role within it. |
| <ul style="list-style-type: none"> • <code>match wlan <WLAN-NAME></code> | |
| <code>wlan <WLAN-NAME></code> | Sets the incoming WLAN match clause <ul style="list-style-type: none"> • <code><WLAN-NAME></code> – Specify a WLAN name. |

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#match incoming-  
interface pppoe1  
  
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context  
route-map 1  
  match incoming-interface pppoe1  
  default-next-hop wwan1  
  mark ip dscp 7  
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables match clause settings for this route map |
|-----------|---|

24.1.4.5 next-hop

► *route-map-mode*

Sets the next hop for packets satisfying match criteria

This command allows you to configure the primary and secondary hop priority requests.

Define the primary and secondary hop settings. When defined, the primary hop resource is used with no additional considerations when ever it is available.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
next-hop [<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-
ID>|vlan <1-4094>|wwlan1] {<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-
ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1}
```

Parameters

- next-hop [<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1] {<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1}

| | |
|---|---|
| next-hop | Sets the next hop (primary and secondary) for packets satisfying match criteria It is not mandatory to define the secondary hop interface. The secondary hop is used in case the primary hop is unavailable. |
| <IP> | Specifies the primary and secondary next hop router's IP address |
| <WORD> | Specifies the layer 3 Interface name (router interface) |
| pppoe1 | Specifies the PPP over Ethernet interface |
| serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID> | Specifies the serial interface's slot, port, and channel group IDs. |
| vlan <1-4094> | Specifies the VLAN interface ID <ul style="list-style-type: none"> • <1-4094> - Specify a VLAN ID from 1 - 4094. The VLAN interface should be a DHCP client. |
| wwan1 | Specifies the WAN interface |

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#next-hop vlan 1

rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  match incoming-interface pppoe1
  next-hop vlan1
  default-next-hop wwan1
  mark ip dscp 7
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Disables the next hop router settings |
|-----------|---------------------------------------|

24.1.4.6 no

► *route-map-mode*

Negates a command or sets its defaults

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [default-next-hop|fallback|mark|match|next-hop]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---------------------------------------|
| no <PARAMETERS> | Negates a command or set its defaults |
|-----------------|---------------------------------------|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following example shows the route-map '1' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  match incoming-interface pppoe1
  next-hop vlan1
  default-next-hop wwan1
  mark ip dscp 7
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#

rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#no default-next-hop
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#no next-hop
```

The following example shows the route-map '1' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  match incoming-interface pppoe1
  mark ip dscp 7
rfs6000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

24.1.5 use

► *routing-policy-commands*

Uses *Critical Resource Management* (CRM) to monitor link status

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use critical-resource-monitoring
```

Parameters

- use critical-resource-monitoring

| | |
|----------------------------------|--|
| use critical-resource-monitoring | Uses CRM to monitor the status of a link. Selecting this option determines the disposition of the route-map next hop via monitored critical resources. Link monitoring is the function used to determine a potential fail over to the secondary next hop. This option is enabled by default. |
|----------------------------------|--|

Example

```
rfs6000-37FABE(config-routing-policy-testpolicy)#use critical-resource-monitoring
rfs6000-37FABE(config-routing-policy-testpolicy)#
```

Related Commands

| | |
|-----------|-------------------------------------|
| <i>no</i> | Disables CRM link status monitoring |
|-----------|-------------------------------------|

24.1.6 no

► *routing-policy-commands*

Negates a command or sets its defaults

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [apply-to-local-packets|logging|route-map|use]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---------------------------------------|
| no <PARAMETERS> | Negates a command or set its defaults |
|-----------------|---------------------------------------|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

The following example shows the routing policy ‘testpolicy’ settings before the ‘no’ commands are executed:

```
rfs6000-37FABE (config-routing-policy-testpolicy) #show context
routing-policy testpolicy
  logging
  route-map 1
    match incoming-interface pppoe1
    default-next-hop wwan1 mark ip dscp 7
rfs6000-37FABE (config-routing-policy-testpolicy) #
```

```
rfs6000-37FABE (config-routing-policy-testpolicy) #no logging
rfs6000-37FABE (config-routing-policy-testpolicy) #no route-map 1
rfs6000-37FABE (config-routing-policy-testpolicy) #no apply-to-local-packets
```

The following example shows the routing policy ‘testpolicy’ settings after the ‘no’ commands are executed:

```
rfs6000-37FABE (config-routing-policy-testpolicy) #show context
routing-policy testpolicy
  no apply-to-local-packets
rfs6000-37FABE (config-routing-policy-testpolicy) #
```

25 AAA-TACACS-POLICY

This chapter summarizes the *accounting, authentication, and authorization (AAA) Terminal Access Control Access-Control System (TACACS)* policy commands in the CLI command structure.

TACACS is a network security application that provides additional network security by providing a centralized authentication, authorization, and accounting platform. TACACS implementation requires configuration of the TACACS authentication server and database.

Use the (config) instance to configure AAA-TACACS policy commands. To navigate to the config-aaa-tacacs-policy instance, use the following commands:

```
<DEVICE>(config)#aaa-tacacs-policy <POLICY-NAME>

rfs6000-37FABE(config)#aaa-tacacs-policy test
rfs6000-37FABE(config-aaa-tacacs-policy-test)#?
AAA TACACS Policy Mode commands:
  accounting      Configure accounting parameters
  authentication   Configure authentication parameters
  authorization    Configure authorization parameters
  no              Negate a command or set its defaults

  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit           End current mode and down to previous mode
  help           Description of the interactive help system
  revert         Revert changes
  service        Service Commands
  show           Show running system information
  write          Write running configuration to memory or terminal

rfs6000-37FABE(config-aaa-tacacs-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore () character. In other words, the name of a device cannot contain an underscore.

25.1 aaa-tacacs-policy

▶ AAA-TACACS-POLICY

The following table summarizes AAA-TACACS policy configuration commands:

Table 25.1 AAA-TACACS-Policy-Config Commands

| Command | Description | Reference |
|-----------------------|---|-------------------|
| <i>accounting</i> | Configures TACACS accounting parameters | <i>page 25-3</i> |
| <i>authentication</i> | Configures TACACS authentication parameters | <i>page 25-6</i> |
| <i>authorization</i> | Configures TACACS authorization parameters | <i>page 25-9</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 25-12</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

25.1.1 accounting

▶ *aaa-tacacs-policy*

Configures the server type and interval at which interim accounting updates are sent to the server. Up to 2 accounting servers can be configured.

This feature tracks user activities on the network, and provides information such as, resources used and usage time. This information can be used for audit and billing purposes.

TACACS accounting tracks user activity and is useful for security audit purposes.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
accounting [access-method|auth-fail|commands|server|session]
accounting access-method [all|console|ssh|telnet] {(console|ssh|telnet)}
accounting [auth-fail|commands|session]
accounting server [<1-2>|preference]
accounting server preference [authenticated-server-host|authenticated-server-number|authorized-server-host|authorized-server-number|none]
accounting server <1-2> [host|retry-timeout-factor <50-200>|timeout]
accounting server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}
accounting server <1-2> timeout <3-5> {attempts <1-3>}
```

Parameters

- accounting access-method [all|console|ssh|telnet] {(console|ssh|telnet)}

| | |
|---------------|---|
| access-method | Configures TACACS accounting access mode. The options are: console, SSH, Telnet, and all. |
| all | Configures TACACS accounting for all access modes |
| console | Configures TACACS accounting for console access only |
| ssh | Configures TACACS accounting for SSH access only |
| telnet | Configures TACACS accounting for Telnet access only |

- accounting [auth-fail|commands|session]

| | |
|-----------|--|
| auth-fail | Enables accounting for authentication fail details. This option is disabled by default. |
| commands | Enables accounting of commands executed. This option is disabled by default. |
| session | Enables accounting for session start and stop details. This option is disabled by default. |

- `accounting server preference [authenticated-server-host|authenticated-server-number|authorized-server-host|authorized-server-number|none]`

| | |
|-----------------------------|--|
| server | Configures a TACACS accounting server |
| preference | Configures the accounting server preference (specifies the method of selecting a server, from the pool, to send the request) |
| authenticated-server-host | Sets the authentication server as the accounting server. This is the default setting. This parameter indicates the same server is used for authentication and accounting. The server is referred to by its hostname. |
| authenticated-server-number | Sets the authentication server as the accounting server. This parameter indicates the same server is used for authentication and accounting. The server is referred to by its index or number. |
| authorized-server-host | Sets the authorization server as the accounting server. This parameter indicates the same server is used for authorization and accounting. The server is referred to by its hostname. |
| authorized-server-number | Sets the authorized server as the accounting server. This parameter indicates the same server is used for authorization and accounting. The server is referred to by its index number. |
| none | Indicates the accounting server is independent of the authentication and authorization servers |

- `accounting server <1-2> retry-timeout-factor <50-200>`

| | |
|-------------------------------|---|
| server <1-2> | Configures an accounting server. Up to 2 accounting servers can be configured |
| retry-timeout-factor <50-200> | <p>Sets the scaling factor for retry timeouts</p> <ul style="list-style-type: none"> • <50-200> - Specify a value from 50 - 200. The default is 100. <p>A value of 100 indicates the time gap between two consecutive retries remains the same irrespective of the number of retries.</p> <p>A value lesser than 100 indicates the time gap between two consecutive retries reduces with each successive retry.</p> <p>A value greater than 100 indicates the time gap between two consecutive retries increases with each successive retry.</p> |

- `accounting server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}`

| | |
|---|---|
| server <1-2> | Configures an accounting server. Up to 2 accounting servers can be configured |
| host <IP/HOSTNAME> | Configures the accounting server's IP address or hostname |
| secret [0 <SECRET> 2 <SECRET> <SECRET>] | <p>Optional. Configures a common secret key used to authenticate with the accounting server</p> <ul style="list-style-type: none"> • 0 <SECRET> - Configures a clear text secret key • 2 <SECRET> - Configures an encrypted secret key • <SECRET> - Specify the secret key. This shared secret should not exceed 127 characters. |
| port <1-65535> | <p>Optional. Configures the accounting server port (the port used to connect to the accounting server)</p> <ul style="list-style-type: none"> • <1-65535> - Specify the TCP accounting port number from 1 - 65535. The default port is 49. |

- `accounting server <1-2> timeout <3-5> {attempts <1-3>}`

| | |
|----------------|---|
| server <1-2> | Configures an accounting server. Up to 2 accounting servers can be configured |
| timeout <3-5> | Configures the timeout for each request sent to the TACACS accounting server. This is the time allowed to elapse before another request is sent to the TACACS accounting server. If a response is received from the server within this time, no retry is attempted. <ul style="list-style-type: none"> • <3-5> - Specify a value from 3 - 5 seconds. The default is 3 seconds. |
| attempts <1-3> | Optional. Specifies the number of times a transmission request is attempted. This is the maximum number of times a request is sent to the TACACS accounting server before getting discarded. <ul style="list-style-type: none"> • <1-3> - Specify a value from 1 - 3. The default is 3. |

Example

```
rfs6000-37FABE(config-aaa-tacacs-policy-test)#accounting auth-fail
rfs6000-37FABE(config-aaa-tacacs-policy-test)#accounting commands
rfs6000-37FABE(config-aaa-tacacs-policy-test)#accounting server preference
authorized-server-number

rfs6000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
  accounting server preference authorized-server-number
  accounting auth-fail
  accounting commands
rfs6000-37FABE(config-aaa-tacacs-policy-test)#
```

Related Commands

| | |
|-----------|------------------------------------|
| <i>no</i> | Resets values or disables commands |
|-----------|------------------------------------|

25.1.2 authentication

▶ *aaa-tacacs-policy*

Configures user authentication parameters. Users are allowed or denied access to the network based on the authentication parameters set.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
authentication [access-method|directed-request|server|service]
authentication access-method [all|console|ssh|telnet|web] {(console|ssh|telnet|web)}
authentication directed-request
authentication server <1-2> [host|retry-timeout-factor|timeout]
authentication server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}
authentication server <1-2> retry-timeout-factor <50-200>
authentication server <1-2> timeout <3-60> {attempts <1-10>}
authentication service <SERVICE-NAME> {protocol <AUTHENTICATION-PROTO-NAME>}
```

Parameters

- authentication access-method [all|console|ssh|telnet|web] {(console|ssh|telnet|web)}

| | |
|---------------|---|
| access-method | Configures access modes for TACACS authentication. The options are: console, SSH, Telnet, Web, and all. |
| all | Authenticates users using all access modes (console, SSH, and Telnet) |
| console | Authenticates users using console access only |
| ssh | Authenticates users using SSH access only |
| telnet | Authenticates users using Telnet access only |
| web | Authenticates users using Web interface only |

- authentication directed-request

| | |
|------------------|--|
| directed-request | Enables user to specify TACACS server to use with '@server'. This option is disabled by default. The specified server should be present in the configured servers list. |
|------------------|--|

- authentication server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}

| | |
|--------------|---|
| server <1-2> | Configures a TACACS authentication server. Up to 2 TACACS servers can be configured <ul style="list-style-type: none"> • <1-2> - Specify the TACACS server index from 1 - 2. |
|--------------|---|

| | |
|--|---|
| host <IP/HOSTNAME> | Sets the TACACS server's IP address or hostname |
| secret [0 <SECRET> 2 <SECRET> <SECRET>] | Configures the secret key used to authenticate with the TACACS server <ul style="list-style-type: none"> • 0 <SECRET> - Configures a clear text secret • 2 <SECRET> - Configures an encrypted secret • <SECRET> - Specify the secret key. The shared key should not exceed 127 characters. |
| port <1-65535> | Optional. Specifies the port used to connect to the TACACS server <ul style="list-style-type: none"> • <1-65535> - Specify a value for the TCP authentication port from 1 - 65535. The default port is 49. |
| <ul style="list-style-type: none"> • authentication server <1-2> retry-timeout-factor <50-200> | |
| server <1-2> | Configures a TACACS authentication server. Up to 2 TACACS servers can be configured <ul style="list-style-type: none"> • <1-2> - Specify the TACACS server index from 1 - 2. |
| retry-timeout-factor <50-200> | Configures timeout scaling between two consecutive TACACS authentication retries <ul style="list-style-type: none"> • <50-200> - Specify the scaling factor from 50 - 200. The default is 100. <p>A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.</p> <p>A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.</p> <p>A value greater than 100 indicates the interval between consecutive retries increases with each successive retry.</p> |
| <ul style="list-style-type: none"> • authentication server <1-2> timeout <3-60> {attempts <1-10>} | |
| server <1-2> | Configures a TACACS authentication server. Up to 2 TACACS servers can be configured <ul style="list-style-type: none"> • <1-2> - Specify the TACACS server index from 1- 2. |
| timeout <3-60> | Configures the timeout, in seconds, for each request sent to the TACACS server. This is the time allowed to elapse before another request is sent to the TACACS server. If a response is received from the TACACS server within this time, no retry is attempted. <ul style="list-style-type: none"> • <3-60> - Specify a value from 3- 60 seconds. The default is 3 seconds. |
| attempts <1-10> | Optional. Indicates the number of retry attempts to make before giving up <ul style="list-style-type: none"> • <1-10> - Specify a value from 1-10. The default is 3. |
| <ul style="list-style-type: none"> • authentication service <SERVICE-NAME> {protocol <AUTHENTICATION-PROTO-NAME>} | |
| service <SERVICE-NAME> | Configures the TACACS authentication service name |
| protocol <AUTHENTICATION- PROTO-NAME> | Optional. Specify the authentication protocol used with this TACACS policy. A maximum of five entries is allowed. |

Example

```
rfs6000-37FABE(config-aaa-tacacs-policy-test)#authentication directed-request
rfs6000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
  authentication directed-request
  accounting server preference authorized-server-number
  accounting auth-fail
  accounting commands
rfs6000-37FABE(config-aaa-tacacs-policy-test)#
```

25.1.3 authorization

► *aaa-tacacs-policy*

Configures authorization parameters

This feature allows network administrators to limit user accessibility and configure varying levels of accessibility for different users.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
authorization [access-method|allow-privileged-commands|server]
authorization access-method [all|console|telnet|ssh] { (console|ssh|telnet) }
authorization server [<1-2>|preference]
authorization server <1-2> [host|retry-timeout-factor|timeout]
authorizationserver <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|
<SECRET>]} {port <1-65535>}
authorization server <1-2> retry-timeout-factor <50-200>
authorization server <1-2> timeout <3-5> {attempts <1-3>}
authorization server preference [authenticated-server-host|authenticated-server-
number|none]
```

Parameters

- authorization access-method [all|console|telnet|ssh] { (console|ssh|telnet) }

| | |
|----------------------|--|
| access-method | Configures the access method for command authorization |
| all | Authorizes commands from all access methods |
| console | Authorizes commands from the console only |
| telnet | Authorizes commands from Telnet only |
| ssh | Authorizes commands from SSH only |
| {console ssh telnet} | Optional. Configures more than one access method for command authorization |

- authorization allow-privileged-commands

| | |
|---------------------------|---|
| allow-privileged-commands | Allows privileged commands execution without command authorization. This option is disabled by default. |
|---------------------------|---|

- authorization server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}

| | |
|--------------|--|
| server <1-2> | Configures a TACACS authorization server. Up to 2 TACACS servers can be configured <ul style="list-style-type: none"> • <1-2> - Specify the TACACS server index from 1 - 2. |
|--------------|--|

| | |
|--|--|
| host <IP/HOSTNAME> | Sets the TACACS server's IP address or hostname |
| secret [0 <SECRET>] 2 <SECRET> <SECRET>] | Optional. Configures the secret used to authorize with the TACACS server <ul style="list-style-type: none"> • 0 <SECRET> - Configures a clear text secret • 2 <SECRET> - Configures an encrypted secret • <SECRET> - Specify the secret key. The shared key should not exceed 127 characters. |
| port <1-65535> | Optional. Specifies the port used to connect to the TACACS server <ul style="list-style-type: none"> • <1-65535> - Specify a value for the TCP authorization port from 1 - 65535. The default port is 49. |
| <ul style="list-style-type: none"> • authorization server <1-2> retry-timeout-factor <50-200> | |
| server <1-2> | Configures a TACACS authorization server. Up to 2 TACACS servers can be configured <ul style="list-style-type: none"> • <1-2> - Specify the TACACS server index from 1 - 2. |
| retry-timeout-factor <50-200> | Configures the scaling of timeouts between consecutive TACACS authorization retries <ul style="list-style-type: none"> • <50-200> - Specify the scaling factor from 50 - 200. The default is 100. <p>A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.</p> <p>A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.</p> <p>A value greater than 100 indicates the interval between consecutive retries increases with each successive retry.</p> |
| <ul style="list-style-type: none"> • authorization server <1-2> timeout <3-5> {attempts <1-3>} | |
| server <1-2> | Configures a TACACS authorization server. Up to 2 TACACS servers can be configured <ul style="list-style-type: none"> • <1-2> - Specify the TACACS server's index from 1- 2. |
| timeout <3-5> | Configures the timeout, in seconds, for each request sent to the TACACS server. This is the time allowed to elapse before another request is sent to the TACACS server. If a response is received from the TACACS server within this time, no retry is attempted. <ul style="list-style-type: none"> • <3-5> - Specify a value from 3 - 5 seconds. The default is 3 seconds. |
| attempts <1-3> | Optional. Indicates the number of retry attempts to make before giving up <ul style="list-style-type: none"> • <1-3> - Specify a value from 1 - 3. The default is 3. |
| <ul style="list-style-type: none"> • authorization server preference [authenticated-server-host authenticated-server-number none] | |
| preference | Configures the authorization server preference |
| authenticated-server-host | Sets the authentication server as the authorization server This parameter indicates the same server is used for authentication and authorization. The server is referred to by its hostname. |

| | |
|-----------------------------|--|
| authenticated-server-number | Sets the authentication server as the authorization server This parameter indicates the same server is used for authentication and authorization. The server is referred to by its index or number. |
| none | Indicates the authorization server is independent of the authentication |

Example

```
rfs6000-37FABE(config-aaa-tacacs-policy-test)#authorization allow-privileged-
commands

rfs6000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
authentication directed-request
accounting server preference authorized-server-number
authorization allow-privileged-commands
accounting auth-fail
accounting commands
rfs6000-37FABE(config-aaa-tacacs-policy-test)#
```

Related Commands

| | |
|-----------|------------------------------------|
| <i>no</i> | Resets values or disables commands |
|-----------|------------------------------------|

25.1.4 no

► *aaa-tacacs-policy*

Negates a AAA TACACS policy command or sets its default

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622,, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [accounting|authentication|authorization]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Provide the parameters needed to reset or disable the desired AAA-TACACS policy setting. |
|-----------------|--|

Example

The following example shows the AAA-TACACS policy 'test' settings before the 'no' commands are executed:

```
rfs6000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
authentication directed-request
accounting server preference authorized-server-number
authorization allow-privileged-commands
accounting auth-fail
accounting commands
rfs6000-37FABE(config-aaa-tacacs-policy-test)#

rfs6000-37FABE(config-aaa-tacacs-policy-test)#no authentication directed-request
rfs6000-37FABE(config-aaa-tacacs-policy-test)#no accounting auth-fail
rfs6000-37FABE(config-aaa-tacacs-policy-test)#no authorization allow-privileged-
commands
```

The following example shows the AAA-TACACS policy 'test' settings after the 'no' commands are executed:

```
rfs6000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
accounting server preference authorized-server-number
accounting commands
rfs6000-37FABE(config-aaa-tacacs-policy-test)#
```

| <i>accounting</i> | Configures TACACS accounting parameters |
| <i>authentication</i> | Configures TACACS authentication parameters |
| <i>authorization</i> | Configures TACACS authorization parameters |

26 MESHPOINT

This chapter summarizes the Meshpoint commands in the CLI command structure.

Meshpoints are detector radios that monitor their coverage areas for potential failed peers or coverage area holes requiring transmission adjustments for coverage compensation.

This chapter is organized as follows:

- *meshpoint-config-instance*
- *meshpoint-qos-policy-config-instance*
- *meshpoint-device-config-instance*

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

26.1 meshpoint-config-instance

► MESHPOINT

MeshConnex (MCX) is a mesh networking technology that is comparable to the 802.11s mesh networking specification. MCX meshing uses a hybrid proactive/on-demand path selection protocol, similar to *Ad hoc On Demand Distance Vector* (AODV) routing protocols. This allows it to form efficient paths using multiple attachment points to a distribution WAN, or form purely ad-hoc peer-to-peer mesh networks in the absence of a WAN. Each device in the MCX mesh proactively manages its own path to the distribution WAN, but can also form peer-to-peer paths on demand to improve forwarding efficiency.

MCX is not compatible with MiNT Based meshing, though the two technologies can be enabled simultaneously in certain circumstances.

MCX is designed for large-scale, high-mobility outdoor mesh deployments. MCX continually gathers data from beacons and transmission attempts to estimate the efficiency and throughput of each MP-to-MP link. MCX uses this data to dynamically form and continually maintain paths for forwarding network frames.

In MCX systems, a *meshpoint* (MP) is a virtual mesh networking instance on a device, similar to a WLAN AP. On each device, up to 4 MPs can be created and 2 can be created per radio. MPs can be configured to use one or both radios in the device. If the MP is configured to use both radios, the path selection protocols will continually select the best radio to reach each destination. Each MP participates in a single Mesh Network, defined by the MeshID. The MeshID is typically a descriptive network name, similar to the SSID of a WLAN. All MPs configured to use the same MeshID attempt to form a mesh and interoperate. The MeshID allows overlapping mesh networks to discriminate and disregard MPs belonging to different networks.

Use the (config) instance to configure a meshpoint. To navigate to the meshpoint configuration instance, use the following command:

```
<DEVICE>(config)#meshpoint <MESHPOINT-NAME>

rfs6000-37FABE(config)#meshpoint test
rfs6000-37FABE(config-meshpoint-test)#?
Mesh Point Mode commands:
  allowed-vlans  Set the allowed VLANs
  beacon-format  The beacon format of this meshpoint
  control-vlan   VLAN for meshpoint control traffic
  data-rates     Specify the 802.11 rates to be supported on this meshpoint
  description    Configure a description of the usage of this meshpoint
  force          Force suboptimal paths
  meshid        Configure the Service Set Identifier for this meshpoint
  neighbor      Configure neighbor specific parameters
  no            Negate a command or set its defaults
  root          Set this meshpoint as root
  security-mode  The security mode of this meshpoint
  shutdown      Shutdown this meshpoint
  use           Set setting to use
  wpa2          Modify ccmp wpa2 related parameters

  clrscr        Clears the display screen
  commit        Commit all changes made in this session
  do            Run commands from Exec mode
  end           End current mode and change to EXEC mode
  exit          End current mode and down to previous mode
  help          Description of the interactive help system
  revert        Revert changes
  service       Service Commands
  show          Show running system information
```

```

write          Write running configuration to memory or terminal
rfs6000-37FABE(config-meshpoint-test)#

```

The following table summarizes meshpoint configuration commands:

Table 26.1 *Meshpoint-Config commands*

| Command | Description | Reference |
|----------------------|---|-------------------|
| <i>allowed-vlans</i> | Configures VLANs allowed on the meshpoint | <i>page 26-4</i> |
| <i>beacon-format</i> | Configures the beacon format for the meshpoint AP | <i>page 26-5</i> |
| <i>control-vlan</i> | Configures the VLAN where meshpoint control traffic traverses | <i>page 26-6</i> |
| <i>data-rates</i> | Configures the data rates supported per frequency band | <i>page 26-7</i> |
| <i>description</i> | Configures a human friendly description for this meshpoint | <i>page 26-11</i> |
| <i>force</i> | Forces formation of sub-optimal paths through the meshpoint's root node | <i>page 26-12</i> |
| <i>meshid</i> | Configures a unique ID for this meshpoint | <i>page 26-13</i> |
| <i>neighbor</i> | Configures the neighbor inactivity time out for this meshpoint | <i>page 26-14</i> |
| <i>no</i> | Negates a command or reverts settings to their default | <i>page 26-15</i> |
| <i>root</i> | Configures a meshpoint as the root meshpoint | <i>page 26-17</i> |
| <i>security-mode</i> | Configures the security mode on the meshpoint. | <i>page 26-19</i> |
| <i>service</i> | Allows only 802.11n capable neighbors to create a mesh connection | <i>page 26-20</i> |
| <i>shutdown</i> | Shuts down the meshpoint | <i>page 26-21</i> |
| <i>use</i> | Configures a QoS policy for use with this meshpoint | <i>page 26-22</i> |
| <i>wpa2</i> | Configures WPA2 encryption settings | <i>page 26-23</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

26.1.1 allowed-vlans

► *meshpoint-config-instance*

Defines VLANs allowed to pass traffic on the mesh network. Use this command to add and remove VLANs from the list of allowed VLANs.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
allowed-vlans [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]
```

Parameters

- allowed-vlans [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]

| | |
|------------------|--|
| allowed-vlans | Defines VLANs allowed access on the mesh network |
| <VLAN-ID> | The VLAN ID or the range of IDs to be managed. A single VLAN or multiple VLANs can be added to the list of allowed VLANs. When adding multiple VLANs, specify the range (for example, 10-20, 25, 30-35). Use this command to create a VLAN list on a new meshpoint. |
| add <VLAN-ID> | Adds a single VLAN or a range of VLANs to the list of allowed VLANs. To specify a range of VLANs, specify the first and last VLAN ID in the range separated by a hyphen (for example, 1-10). • <VLAN-ID> - Specify the VLAN ID or the range of IDs to add. |
| remove <VLAN-ID> | Removes a single VLAN or a range of VLANs from the list of allowed VLANs • <VLAN-ID> - Specify the VLAN ID or the range of IDs to remove. |

Example

```
rfs6000-37FABE (config-meshpoint-test)#allowed-vlans 1
rfs6000-37FABE (config-meshpoint-test)#allowed-vlans add 10-23
rfs6000-37FABE (config-meshpoint-test)#allowed-vlans remove 17

rfs6000-37FABE (config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
security-mode none
no root
rfs6000-37FABE (config-meshpoint-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Clears the list of VLANs allowed access to the mesh network |
|-----------|---|

26.1.2 beacon-format

► *meshpoint-config-instance*

Configures the beacon transmission format for this meshpoint. Beacons are transmitted periodically to advertise that a wireless network is available. It contains all the required information for a device to connect to the network.

The beacon format advertises how a mesh capable AP7161 acts. APs can act either as an access point or a meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
beacon-format [access-point|mesh-point]
```

Parameters

- `beacon-format [access-point|mesh-point]`

| | |
|---------------|---|
| beacon-format | Configures how a mesh capable AP71XX acts in a mesh network |
| access-point | Uses access point style beacons |
| mesh-point | Uses meshpoint style beacons (this is the default setting) |

Example

```
rfs6000-37FABE(config-meshpoint-test)#beacon-format mesh-point

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
security-mode none
no root
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the beacon format for this meshpoint to its default (mesh-point) |
|-----------|---|

26.1.3 control-vlan

► *meshpoint-config-instance*

Configures a VLAN as the dedicated control VLAN

Mesh management traffic can be sent over a dedicated VLAN. This dedicated VLAN is known as the control VLAN, and should be configured in the backhaul port of all the access points configured as meshpoint roots. Once configured, the control VLAN enables communication between meshpoint's root APs.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

Parameters

- control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]

| | |
|------------------------------|--|
| control-vlan | Configures a VLAN as a dedicated carrier of mesh management traffic |
| [<1-4094> <VLAN-ALIAS-NAME>] | <p>Configures the control VLAN</p> <ul style="list-style-type: none"> • <1-4094> – Specify the control VLAN from 1 - 4094. The default is VLAN 1. • <VLAN-ALIAS-NAME> – Uses a vlan-alias to specify the control vlan. If using a vlan-alias, ensure that it is existing and configured. <p>If VLAN 1 is configured as the control VLAN, ensure that the VLAN is configured in the wired port of all access points belonging to same meshpoint.</p> <p>Note: Control VLAN need not necessarily be added in the allowed VLAN list.</p> |

Example

```
rfs6000-37FABE(config-meshpoint-test)#control-vlan 1

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
security-mode none
no root
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets the control VLAN for this meshpoint to its default of 1 |
|-----------|--|

26.1.4 data-rates

► *meshpoint-config-instance*

Configures individual data rates for the 2.4 GHz and 5.0 GHz frequency bands. In Mesh network, a mesh point is a virtual mesh networking instance on a device, similar to a WLAN AP. On each device, up to 4 mesh points can be created and 2 can be created per radio. Each mesh point radio can have carefully administrated radio rates specific to the 2.4 or 5 GHz band. Use this command to configure these radio rates.

NOTE: Ensure that the basic data rates configured on a meshpoint's root and non-root access points is the same.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
data-rates [2.4GHz|5GHz]
```

```
data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]
```

```
data-rates 2.4GHz custom (1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|
basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|
basic-9|mcs0-15|mcs0-7|mcs8-15|basic-mcs0-7)
```

```
data-rates 5GHz [a-only|an|default]
```

```
data-rates 5GHz custom (12|18|24|36|48|54|6|9|basic-1|basic-11|basic-12|basic-
18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|mcs0-
15|mcs0-7|mcs8-15|basic-mcs0-7)
```

Parameters

- `data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]`

| | |
|---|--|
| <code>data-rates 2.4GHz</code> | Configures preset data rates for the 2.4 GHz frequency. |
| <code>b-only</code> | Configures data rate for the meshpoint using 802.11b only rates. |
| <code>bg</code> | Configures data rate for the meshpoint using 802.11b and 802.11g rates. |
| <code>default</code> | Configures data rate for the meshpoint at a pre-configured default rate for this frequency. |
| <code>g-only</code> | Configures data rate for the meshpoint using 802.11g only rates. |
| <code>gn</code> | Configures data rate for the meshpoint using 802.11g and 802.11n rates. |
| <ul style="list-style-type: none"> • <code>data-rates 2.4GHz custom (1 11 12 18 2 24 36 48 5.5 54 6 9 basic-1 basic-11 basic-12 basic-18 basic-2 basic-24 basic-36 basic-48 basic-5.5 basic-54 basic-6 basic-9 mcs0-15 mcs0-7 mcs8-15 basic-mcs0-7)</code> | |
| <code>data-rates 2.4GHz</code> | Configures the preset data rates for the 2.4 GHz frequency Define both minimum <i>Basic</i> and optimal <i>Supported</i> rates as required for the 802.11b rates, 802.11g rates and 802.11n rates supported by the 2.4 GHz band. Contd.. |

| | |
|---|---|
| | <p>These are the rates wireless client traffic is supported within this mesh point. If supporting 802.11n, select a supported MCS index. Set a <i>Modulation and Coding Scheme</i> (MCS) in respect to the radio's channel width and guard interval. A MCS defines (based on RF channel conditions) an optimal combination of 8 data rates, bonded channels, multiple spatial streams, different guard intervals and modulation types.</p> <p>Meshpoints can communicate as long as they support the same basic MCS (as well as non-802.11n basic rates). The selected rates apply to associated client traffic within this mesh point only.</p> |

Resets data rates for each frequency band for this meshpoint

26.1.5 description

► *meshpoint-config-instance*

Configures a brief description for this meshpoint. Use this command to describe this meshpoint and its features.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
description <DESCRIPTION>
```

Parameters

- `description <DESCRIPTION>`

| | |
|---------------|---|
| description | Configures a description for this meshpoint |
| <DESCRIPTION> | The text describing this meshpoint |

Example

```
rfs6000-37FABE(config-meshpoint-test)#description "This is an example of a
meshpoint description"

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
  description "This is an example of a meshpoint description"
  meshid test
  beacon-format mesh-point
  control-vlan 1
  allowed-vlans 1,10-16,18-23
  data-rates 2.4GHz bgn
  data-rates 5GHz an
  security-mode none
  no root
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| <i>no</i> | Removes the human friendly description provided for this meshpoint |
|-----------|--|

26.1.6 force

► *meshpoint-config-instance*

Forces formation of sub-optimal paths through the meshpoint's root node. As per legacy behavior, non-root devices under the same root, communicated by forming direct paths through the network. This option allows

non-root devices, within the meshpoint, to communicate by forming paths through the root node.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
force peer-paths-through-root
```

Parameters

- `force peer-paths-through-root`

| | |
|-------------------------|--|
| force | Enables formation of sub-optimal paths through the meshpoint root node. This option is disabled by default |
| peer-paths-through-root | Enables non-root devices to communicate by forming sub-optimal paths through the root node |

Example

```
nx9500-6C8809(config-meshpoint-test)#force peer-paths-through-root

nx9500-6C8809(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
security-mode none
no root
force peer-paths-through-root
nx9500-6C8809(config-meshpoint-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables formation of sub-optimal paths through the meshpoint's root node |
|-----------|---|

26.1.7 meshid

► *meshpoint-config-instance*

Configures a unique *Service Set Identifier* (SSID) for this meshpoint. This ID is used to uniquely identify this meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
meshid <MESH-SSID>
```

Parameters

- meshid <MESH-SSID>

| | |
|-------------|--|
| meshid | Configures a unique SSID for the meshpoint |
| <MESH-SSID> | The unique SSID configured for this meshpoint Note: The mesh SSID is case sensitive and should not exceed 32 characters. |

Example

```
rfs6000-37FABE(config-meshpoint-test)#meshid TestingMeshPoint

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode none
no root
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the SSID configured for this meshpoint |
|-----------|--|

26.1.8 neighbor

► *meshpoint-config-instance*

This command configures the inactivity time out value for neighboring devices. If a frame is not received from the neighbor device for the configured time, then client resources are removed.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
neighbor inactivity-timeout <60-86400>
```

Parameters

- neighbor inactivity-timeout <60-86400>

| | |
|--|--|
| neighbor inactivity-timeout <60-86400> | Configures the neighbor inactivity timeout in seconds. This represents the allowed interval between frames received from a neighbor before their client privileges are revoked. • <60-86400> - Specify a value from 60 - 86400 seconds. The default is 120 seconds. |
|--|--|

Example

```
rfs6000-37FABE(config-meshpoint-test)#neighbor inactivity-timeout 300

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode none
no root
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured neighbor inactivity time out value for this meshpoint |
|-----------|--|

26.1.9 no

► *meshpoint-config-instance*

Negates meshpoint commands or resets their values to default

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [allowed-vlans|beacon-format|control-vlan|description|force|meshid|root|
security-mode|shutdown]

no data-rates [2.4GHz|5GHz]
no force peer-paths-through-root
no neighbor inactivity-timeout
no use [aaa-policy|meshpoint-qos-policy]

no wpa2 [eap|key-rotation|psk]
no wpa2 eap [auth-type|identity|peap-mschapv2|tls trustpoint]
no wpa2 key-rotation [broadcast|unicast]
no wpa2 psk

no service allow-ht-only
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes or reverts this meshpoint settings to default based on the parameters passed |
|-----------------|--|

Example

```
rfs6000-37FABE(config-meshpoint-test)#show context

26.1.10 root

► *meshpoint-config-instance*

Configures this meshpoint as the root meshpoint. Root meshpoints are generally tied to an Ethernet backhaul for wired connectivity. By default this option is disabled.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
root
```

Parameters

None

Example

There are two ways of configuring root access points within a meshpoint.

1 First method:

- Configure two meshpoints, having the *same meshid*, one with the *root* option enabled and the other configured as *no root*:
- Apply the root meshpoint to the *root* access point and the *no-root* meshpoint to the *non-root* access points.

The following examples show the configuration of a meshpoint for the *root* access point:

```
rfs6000-37FABE(config)#meshpoint root
rfs6000-37FABE(config-meshpoint-root)#

rfs6000-37FABE(config-meshpoint-root)#meshid test
rfs6000-37FABE(config-meshpoint-root)#root
rfs6000-37FABE(config-meshpoint-root)#security-mode eap
rfs6000-37FABE(config-meshpoint-root)#commit

rfs6000-37FABE(config-meshpoint-root)#show context
meshpoint test-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
root
rfs6000-37FABE(config-meshpoint-root)#
```

The following examples show the configuration of a meshpoint for *non-root* access points:

```
rfs6000-37FABE(config)#meshpoint no-root
rfs6000-37FABE(config-meshpoint-no-root)#

rfs6000-37FABE(config-meshpoint-no-root)#meshid test
rfs6000-37FABE(config-meshpoint-no-root)#security-mode eap

rfs6000-37FABE(config-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
no root
rfs6000-37FABE(config-meshpoint-no-root)#
```

2 Second method:

- Configure a *no-root* meshpoint and apply to all access points in the meshpoint.
- Log into the *meshpoint-device* > *no-root* configuration mode of the *root* access point and *enable root*.

```

rfs6000-37FABE(config-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
no root
rfs6000-37FABE(config-meshpoint-no-root)#

rfs6000-37FABE(config)#ap81xx B4-C7-99-71-17-28

rfs6000-37FABE(config-device-B4-C7-99-71-17-28)#meshpoint-device no-root
rfs6000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#

rfs6000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap

rfs6000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#root

rfs6000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
root
rfs6000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the configuration of this meshpoint as a root meshpoint |
|-----------|---|

26.1.11 security-mode

► *meshpoint-config-instance*

Configures the security mode for this meshpoint

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
security-mode [eap|none|psk]
```

Parameters

- security-mode [eap|none|psk]

| | |
|---------------|---|
| security-mode | Configures the security mode for this meshpoint |
| eap | Uses 802.1X/EAP as the security mode. When using this option, use the <i>wpa2</i> command to specify the EAP authentication type and related parameters. |
| none | No security is configured for this meshpoint |
| psk | Uses <i>Pre Shared Key</i> (PSK) as the security mode. When using this option, use the <i>wpa2</i> command to enter a 64 character HEX or an 8-63 ASCII character passphrase used for authentication on the mesh point. |

Example

The following example shows *root meshpoint* configuration with PSK authentication enabled:

```
rfs6000-37FABE(config-meshpoint-test)#security-mode psk

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode psk
root
rfs6000-37FABE(config-meshpoint-test)#
```

The following example shows *root meshpoint* configuration with EAP authentication enabled:

```
rfs6000-37FABE(config-meshpoint-root)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 101
allowed-vlans 101,103
use aaa-policy test
security-mode eap
root
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the security configuration for this meshpoint to “none”. This indicates that no security is configured for this meshpoint. |
|-----------|---|

26.1.12 service

► *meshpoint-config-instance*

Use this command to allow only those neighbors who are capable of 802.11n data rates to associate with this meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
service [allow-ht-only|show cli]
```

Parameters

- `service [allow-ht-only|show cli]`

| | |
|------------------------------------|--|
| <code>service allow-ht-only</code> | Allows only those neighbors who are capable of high throughput data rates (802.11n data rates) to associate with the meshpoint |
| <code>service show cli</code> | Displays running system configuration |

Example

```
rfs6000-37FABE(config-meshpoint-test)#service allow-ht-only

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
shutdown
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode psk
wpa2 psk 0 Test Company
wpa2 key-rotation unicast 1200
wpa2 key-rotation broadcast 600
root
service allow-ht-only
rfs6000-37FABE(config-meshpoint-test)#
```

Related Commands

| | |
|----------------|--|
| <i>no</i> | Removes the restriction that only 802.11n capable neighbor devices can associate with this meshpoint |
| <i>service</i> | Invokes service commands to troubleshoot or debug |

26.1.13 shutdown

▶ *meshpoint-config-instance*

Shuts down this meshpoint. Use this command to prevent an AP from participating in a mesh network.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
shutdown
```

Parameters

None

Example

```
rfs6000-37FABE (config-meshpoint-test) #shutdown  
rfs6000-37FABE (config)
```

26.1.14 use

► *meshpoint-config-instance*

Uses a *Quality of Service* (QoS) policy defined specifically for meshpoints. To use this QoS policy, it must be defined. To define a meshpoint QoS policy, see *meshpoint-qos-policy-config-instance*.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use [aaa-policy <AAA-POLICY-NAME>|meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>]
```

Parameters

- use [aaa-policy <AAA-POLICY-NAME>|meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>]

| | |
|--|---|
| use meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME> | Configures this meshpoint to use a predefined meshpoint QoS policy <ul style="list-style-type: none"> • <MESHPOINT-QOS-POLICY-NAME> - Specify the meshpoint QoS policy name (should be existing and configured). |
| use aaa-policy <AAA-POLICY-NAME> | Configures this meshpoint to use a predefined aaa-policy <ul style="list-style-type: none"> • <AAA-POLICY-NAME> - Specify the aaa-policy name (should be existing and configured). |

Example

```
rfs6000-37FABE(config-meshpoint-test)#use meshpoint-qos-policy test

rfs6000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
shutdown
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode psk
root
use meshpoint-qos-policy test
rfs6000-37FABE(config-meshpoint-test)#
```

26.1.15 wpa2

► *meshpoint-config-instance*

Use this command to configure the parameters of authentication mode specified using the 'security-mode' keyword. This command also allows you to set a unicast and broadcast key rotation interval.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
wpa2 [eap|psk|key-rotation]
wpa2 key-rotation [broadcast|unicast] <30-86400>
wpa2 psk [0 <SECRET>|2 <SECRET>|<SECRET>]
wpa2 eap [auth-type|identity|peap-mschapv2|tls]
wpa2 eap [auth-type [peap-mschapv2|tls]]|identity <WORD>]
wpa2 eap peap-mschapv2 user <USER-NAME> password [0 <WORD>|2 <WORD>|<WORD>]
{trustpoint <TRUSTPOINT-NAME>}
wpa2 eap tls trustpoint <TRUSTPOINT-NAME>
```

Parameters

- wpa2 key-rotation [broadcast|unicast] <30-86400>

| | |
|-------------------|---|
| wpa2 key-rotation | Enables periodic rotation of encryption keys used for broadcast and unicast traffic |
| broadcast | Configures key rotation interval for broadcast and multicast traffic. This option is disabled by default. When enabled, the key indices used for encrypting/decrypting broadcast traffic is alternatively rotated based on the defined interval. Key rotation enhances the broadcast traffic security on the WLAN. |
| unicast | Configures key rotation interval for unicast traffic. This option is disabled by default. |
| <30-86400> | Configures key rotation interval from 30 - 86400 seconds for unicast or broadcast transmission |

- wpa2 psk [0 <SECRET>|2 <SECRET>|<SECRET>]

| | |
|---|--|
| wpa2 psk | Configures the shared key for authentication mode PSK. If the security mode is set as 'psk' using the 'security-mode' keyword, use this command to configure the pre-shared key. |
| secret [0 <SECRET> 2 <SECRET> <SECRET>] | Configures the PSK used to authenticate this meshpoint with other meshpoints in the network <ul style="list-style-type: none"> • 0 <SECRET> - Configures a clear text secret • 2 <SECRET> - Configures an encrypted secret • <SECRET> - Specify the secret key. The pre-shared key can be in ASCII (8 to 63 characters in length) or Hexadecimal (not exceeding 64 characters in length) formats. |

- wpa2 eap [auth-type [peap-mschapv2|tls]]identity <WORD>]

| | |
|-------------------------------|--|
| wpa2 eap | Configures the 802.1X/EAP based authentication type for this meshpoint. If the security mode is set as 'eap' using the 'security-mode' keyword, use this command to specify the EAP type. The options are: peap-mschapv2 and tls. |
| auth-type [peap-mschapv2 tls] | Specifies the EAP authentication type. The options are: <ul style="list-style-type: none"> • peap-mschapv2 - Configures EAP authentication type as <i>Protected Extensible Authentication Protocol</i> (PEAP) with default auth type MSCHAPv2. This is the default setting. <p>If using auth-type as 'peap-mschapv2', use the 'peap-mschapv2' keyword to configure user credentials and trustpoint details.</p> <ul style="list-style-type: none"> • tls - Configures EAP authentication type as <i>Transport Layer Security</i> (TLS) <p>If using auth-type as 'tls', use the 'tls' keyword to configure trustpoint details.</p> <p>Note: The certificate should be issued from an Enterprise or public certificate authority to allow 802.1X clients to validate the identity of the authentication server prior to forwarding credentials.</p> |
| identity <WORD> | Configures identity to be used during phase1 authentication <ul style="list-style-type: none"> • <WORD> - Enter a string up to 256 characters in length (this should not be actual identity of user but some anonymous/bogus username) |

- wpa2 eap peap-mschapv2 user <USER-NAME> password [0 <WORD>|2 <WORD>|<WORD>] {trustpoint <TRUSTPOINT-NAME>}

| | |
|--|--|
| wpa2 eap peap-mschapv2 | Configures PEAP-related user credentials and trustpoint details |
| user <USER-NAME> password [0 <WORD> 2 <WORD> <WORD>] | Specify the user credentials used for authentication <ul style="list-style-type: none"> • user <USER-NAME> - Specify the user name. • password [0 <WORD> 2 <WORD> <WORD>] - Specify the password associated with the specified user. |
| trustpoint <TRUSTPOINT-NAME> | Optional. Associates a trustpoint used for installing CA certificate and verifying server certificate <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name (should be existing and configured). |

- wpa2 eap tls trustpoint <TRUSTPOINT-NAME>

| | |
|------------------------------|---|
| wpa2 eap tls | Configures TLS client related parameters |
| trustpoint <TRUSTPOINT-NAME> | Configures trustpoint details <ul style="list-style-type: none"> • trustpoint <TRUSTPOINT-NAME> - Assigns a trustpoint to be used for installing TLS client certificate, client private key, and CA certificate • <TRUSTPOINT-NAME> - Specify the trustpoint name (should be existing and configured) |

Example

```
rfs6000-37FABE (config-meshpoint-test)#wpa2 key-rotation broadcast 600
rfs6000-37FABE (config-meshpoint-test)#wpa2 key-rotation unicast 1200
rfs6000-37FABE (config-meshpoint-test)#wpa2 psk Test Company

rfs6000-37FABE (config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
```

```

26.2 meshpoint-qos-policy-config-instance

► MESHPOINT

Mesh QoS provides a data traffic prioritization scheme. QoS reduces congestion from excessive traffic. If there is enough bandwidth for all users and applications (unlikely because excessive bandwidth comes at a very high cost), then applying QoS has very little value. QoS provides policy enforcement for mission-critical applications and/or users that have critical bandwidth requirements when bandwidth is shared by different users and applications.

Mesh QoS helps ensure each mesh point on the mesh network receives a fair share of the overall bandwidth, either equally or as per the proportion configured. Packets directed towards clients are classified into categories such as video, voice and data. Packets within each category are processed based on the weights defined for each mesh point.

To create a meshpoint, see [meshpoint-config-instance](#). A meshpoint QoS policy is created from the (config) instance. To create a meshpoint QoS policy use the following command:

```
<DEVICE>(config)#meshpoint-qos-policy <POLICYNAME>

rfs6000-37FABE(config)#meshpoint-qos-policy test
rfs6000-37FABE(config-meshpoint-qos-test)#

rfs6000-37FABE(config-meshpoint-qos-test)#?
Mesh Point QoS Mode commands:
  accelerated-multicast  Configure accelerated multicast streams address and
                        forwarding QoS classification
  no                     Negate a command or set its defaults
  rate-limit             Configure traffic rate-limiting parameters on a
                        per-meshpoint/per-neighbor basis

  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                      Run commands from Exec mode
  end                     End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

rfs6000-37FABE(config-meshpoint-qos-test)#
```

The following table summarizes the meshpoint-qos-policy configuration commands:

Table 26.2 Meshpoint-QoS-Policy Config Commands

| Command | Description | Reference |
|------------------------------|--|----------------------------|
| <i>accelerated-multicast</i> | Configures accelerated multicast parameters | page 26-27 |
| <i>no</i> | Negates a command or reverts settings to their default | page 26-29 |
| <i>rate-limit</i> | Configures the rate limits for this QoS policy | page 26-30 |

26.2.1 accelerated-multicast

► *meshpoint-qos-policy-config-instance*

Configures the accelerated multicast stream's address and forwarding QoS classification

NOTE: For accelerated multicast feature to work, IGMP querier must be enabled.

When a user joins a multicast stream, an entry is created in the device's (AP or wireless controller) snoop table and the entry is set to expire after a set time period. Multicast packets are forwarded to the appropriate wireless LAN or mesh until this entry is available in the snoop table.

Snoop querier keeps the snoop table current by updating entries that are set to expire. It also keeps an entry for each multicast stream till there are users registered for the stream.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
accelerated-multicast [<MULTICAST-IP>|autodetect] {classification [background|best-effort|trust|video|voice]}
```

Parameters

- accelerated-multicast [<MULTICAST-IP>|autodetect] {classification [background|best-effort|trust|video|voice]}

| | |
|-----------------------|--|
| accelerated-multicast | Configures the accelerated multicast stream address and forwarding QoS classification |
| <MULTICAST-IP> | Specify a list of multicast addresses and classifications. Packets are accelerated when the destination address matches. |
| autodetect | Lets the system to automatically detect multicast streams to be accelerated This option allows the administrator to convert multicast packets to unicast in order to provide better overall airtime utilization and performance. The system can be configured to automatically detect multicast streams and convert them to unicast, or specify which multicast streams are to be converted to unicast. When the stream is converted and being queued up for transmission, there are a number of classification mechanisms applied to the stream and the administrator can select what type of classification they would want. Classification types are trust, voice, video, best effort, and background. |
| classification | Optional. Defines the QoS classification to apply to a multicast stream. The following options are available: <ul style="list-style-type: none"> • background • best effort • trust • video • voice |

Example

```
rfs6000-37FABE(config-meshpoint-qos-test)#accelerated-multicast 224.0.0.1
classification video

rfs6000-37FABE(config-meshpoint-qos-test)#show context
meshpoint-qos-policy test
accelerated-multicast 224.0.0.1 classification video
rfs6000-37FABE(config-meshpoint-qos-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets accelerated multicast configurations for this meshpoint QoS policy |
|-----------|---|

26.2.2 no

► *meshpoint-qos-policy-config-instance*

Negates the commands for meshpoint QoS policy or resets their values to their default

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [accelerated-multicast|rate-limit]

no accelerated-multicast [<MULTICAST-IP>|autodetect]
no rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size|rate}
no rate-limit [meshpoint|neighbor] [from-air|to-air] {red-threshold [background|
best-effort|video|voice]}
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes or reverts this meshpoint QoS policy settings to default based on the parameters passed |
|-----------------|---|

Example

```
rfs6000-37FABE(config-meshpoint-qos-test)#show context
meshpoint-qos-policy test
  rate-limit meshpoint from-air rate 80000
  rate-limit meshpoint from-air red-threshold video 80
  rate-limit meshpoint from-air red-threshold voice 70
  accelerated-multicast 224.0.0.1 classification video

rfs6000-37FABE(config-meshpoint-qos-test)#no rate-limit meshpoint from-air rate
rfs6000-37FABE(config-meshpoint-qos-test)#no rate-limit meshpoint from-air red-
threshold video 80
rfs6000-37FABE(config-meshpoint-qos-test)#no rate-limit meshpoint from-air red-
threshold voice 70

rfs6000-37FABE(config-meshpoint-qos-test)#show context
meshpoint-qos-policy test
  accelerated-multicast 224.0.0.1 classification video
rfs6000-37FABE(config-meshpoint-qos-test)#
```

26.2.3 rate-limit

► *meshpoint-qos-policy-config-instance*

Configures the rate limiting of traffic on a per meshpoint or per neighbor basis

Excessive traffic can cause performance issues or bring down the network entirely. Excessive traffic, bombardments and interference are caused by numerous sources, such as network loops, faulty devices, or malicious software (such as a worm or virus) that has infected one or more branch-level devices. Rate limiting limits the maximum rate sent to or received from the wireless network (and meshpoint) per neighbor. It prevents any single user from overwhelming the wireless network. It also provides differential service for service providers. An administrator can set separate QoS rate limit configurations for data transmitted from the network and data transmitted from a mesh point's neighbor.

Before defining rate limit thresholds for meshpoint transmit and receive traffic, it is recommended that you define the normal number of ARP, broadcast, multicast, and unknown unicast packets that typically transmit and receive from each supported WMM access category. If thresholds are defined too low, normal network traffic (required by end-user devices) is dropped, resulting in intermittent outages and performance problems.

A connected neighbor can also have QoS rate limit settings defined in both the transmit and receive direction.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS6000
- Service Platforms — NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
rate-limit [meshpoint|neighbor]

rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size <2-1024>|rate
<50-1000000>}

rate-limit [meshpoint|neighbor] [from-air|to-air] {red-threshold [background <0-
100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
```

Parameters

```
• rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size <2-1024>|
rate <50-1000000>}
```

| | |
|-----------|---|
| meshpoint | Configures rate limit parameters for all data received from any meshpoint in the mesh network. This option is disabled by default. |
| neighbor | Configures rate limit parameters for neighboring meshpoint devices. Enables rate limiting for data transmitted from the client to its associated access point radio and connected controller. This option is disabled by default. |
| from-air | Configures rate limits for traffic from the wireless neighbor to the network. |
| to-air | Configures rate limits for traffic from the network to the wireless neighbor. |

| | |
|--|---|
| max-burst-size <2-1024> | <p>Optional. Configures the maximum burst size in kilobytes.</p> <ul style="list-style-type: none"> <2-1024> - Set a value from 2 - 1024 kbytes. <p>For a meshpoint: The smaller the burst, the less likely that the transmit packet transmission results in congestion for the meshpoint's client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, administrators should then add a 10% margin (minimally) to allow for traffic bursts at the site. The default burst size is 320 kbytes.</p> <p>For a neighbor: The smaller the burst, the less likely the transmit packet transmission will result in congestion for the wireless client. The default burst size is 64 kbytes.</p> |
| rate <50-1000000> | <p>Optional. Defines a receive or transmit rate limit in kilobytes per second</p> <ul style="list-style-type: none"> <50-1000000> - Set a value from 50 - 1000000 kbps. <p>For a meshpoint: This limit constitutes a threshold for the maximum number of packets transmitted or received over the meshpoint (from all access categories). Traffic that exceeds the defined rate is dropped and a log message is generated. The default setting is 5000 kbps.</p> <p>For a neighbor: This limit constitutes a threshold for the maximum the number of packets transmitted or received (from all access categories). Traffic that exceeds the defined rate is dropped by the client and a log message is generated. The default rate is 1,000 kbps.</p> |
| <ul style="list-style-type: none"> rate-limit [meshpoint neighbor] [from-air to-air] {red-threshold [background <0-100> best-effort <0-100> video <0-100> voice <0-100>]} | |
| meshpoint | Configures rate limit parameters for a meshpoint |
| neighbor | Configures rate limit parameters for neighboring meshpoint devices |
| from-air | Configures rate limits for traffic from the wireless neighbor to the network |
| to-air | Configures rate limit value for traffic from the network to the wireless neighbor |
| red-threshold | Optional. Configures <i>random early detection</i> threshold (RED threshold) for traffic class |
| background <0-100> | <p>The following keyword is applicable to the 'from-air' and 'to-air' traffics.</p> <ul style="list-style-type: none"> background <0-100> - Configures the threshold for low priority (background) traffic <ul style="list-style-type: none"> <0-100> - Specify a value from 0 - 100. <p>For a meshpoint: This is a percentage of the maximum burst size for low priority traffic. Background traffic exceeding the defined threshold is dropped and a log message is generated. Background traffic consumes the least bandwidth of any access category, so this value can be set to a lower value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 50%.</p> <p>For a neighbor: This is a percentage of the maximum burst size for low priority traffic. Background traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 50%.</p> |

| | |
|---------------------|--|
| best-effort <0-100> | <p>The following keyword is applicable to the 'from-air' and 'to-air' traffics.</p> <ul style="list-style-type: none"> • best-effort <0-100> - Configures the threshold for best effort traffic <ul style="list-style-type: none"> • <0-100> - Specify a value from 0 - 100. <p>For a meshpoint: This is a percentage of the maximum burst size for normal priority traffic. Best effort traffic exceeding the defined threshold is dropped and a log message is generated. Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 50%.</p> <p>For a neighbor: This is a percentage of the maximum burst size for normal traffic. Best effort traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 50%.</p> |
| video <0-100> | <p>The following keyword is applicable to the 'from-air' and 'to-air' traffics.</p> <ul style="list-style-type: none"> • video <0-100> - Configures the threshold for video traffic <ul style="list-style-type: none"> • <0-100> - Specify a value from 0 - 100. <p>For a meshpoint: This is a percentage of the maximum burst size for video traffic. Video traffic exceeding the defined threshold is dropped and a log message is generated. Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 25%.</p> <p>For a neighbor: This is a percentage of the maximum burst size for video traffic. Video traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 25%.</p> |
| voice <0-100> | <p>The following keyword is applicable to the 'from-air' and 'to-air' traffics.</p> <ul style="list-style-type: none"> • voice <0-100> - Configures the threshold for voice traffic <ul style="list-style-type: none"> • <0-100> - Specify a value from 0 - 100. <p>For a meshpoint: This is a percentage of the maximum burst size for voice traffic. Voice traffic exceeding the defined threshold is dropped and a log message is generated. Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis). The default threshold is 0%.</p> <p>For a neighbor: This is a percentage of the maximum burst size for voice traffic. Voice traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 0% and implies no early random drops will occur.</p> |

Example

```
rfs6000-37FABE (config-meshpoint-qos-test)#rate-limit meshpoint from-air max-burst-size 800

rfs6000-37FABE (config-meshpoint-qos-test)#show context
meshpoint-qos-policy test
  rate-limit meshpoint from-air max-burst-size 800
  accelerated-multicast 224.0.0.1 classification video

rfs6000-37FABE (config-meshpoint-qos-test)#rate-limit meshpoint from-air rate 80000

rfs6000-37FABE (config-meshpoint-qos-test)#rate-limit meshpoint from-air red-threshold video 80

rfs6000-37FABE (config-meshpoint-qos-test)#rate-limit meshpoint from-air red-threshold voice 70
```

```
rfs6000-37FABE(config-meshpoint-qos-test)#show context
meshpoint-qos-policy test
  rate-limit meshpoint from-air rate 80000

26.3 meshpoint-device-config-instance

► *MESHPOINT*

The following table lists the meshpoint device configuration commands:

Table 26.3 *Other meshpoint-related commands*

| Command | Description | Reference |
|----------------------------------|--|-------------------|
| <i>meshpoint-device</i> | Configures an access point as a meshpoint device and enters its configuration mode | <i>page 26-35</i> |
| <i>meshpoint-device-commands</i> | Invokes the meshpoint-device configuration commands | <i>page 26-37</i> |

26.3.1 meshpoint-device

▸ *meshpoint-device-config-instance*

This command configures an access point to use a defined meshpoint. To configure this feature use one of the following options:

- navigate to the device profile config context (used when configuring access point profile on a controller)
- navigate to the device's config context using the self command (used when configuring a logged on access point)

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
meshpoint-device <MESHPOINT-NAME>
```

Parameters

- meshpoint-device <MESHPOINT-NAME>

| | |
|------------------|--|
| meshpoint-device | Configures the AP as a meshpoint device and sets its parameters |
| <MESHPOINT-NAME> | The meshpoint to configure the AP with (should be existing and configured) |

Example

```
rfs6000-37FABE(config)#profile ap71xx AP71XXTestProfile
rfs6000-37FABE(config-profile-AP71XXTestProfile)#meshpoint-device test
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#

rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#?

26.3.2 meshpoint-device-commands

► *meshpoint-device-config-instance*

The following table lists the meshpoint-device configuration mode commands:

Table 26.4 *Meshpoint-Device Config Commands*

| Command | Description | Reference |
|--------------------|--|-------------------|
| <i>acs</i> | Enables <i>Automatic Channel Selection</i> (ACS) on this meshpoint device (access point) | <i>page 26-38</i> |
| <i>exclude</i> | Excludes neighboring mesh devices | <i>page 26-43</i> |
| <i>hysteresis</i> | Configures path selection SNR hysteresis values on this meshpoint-device (access point) | <i>page 26-44</i> |
| <i>monitor</i> | Enables monitoring of critical resource and primary port links on a meshpoint device | <i>page 26-46</i> |
| <i>path-method</i> | Configures the method used to select the path to the root node in a mesh network | <i>page 26-47</i> |
| <i>preferred</i> | Configures the preferred path parameters for a meshpoint device | <i>page 26-48</i> |
| <i>root</i> | Configures a meshpoint device as the root meshpoint | <i>page 26-49</i> |
| <i>root-select</i> | Configures this meshpoint device as the cost root | <i>page 26-51</i> |
| <i>no</i> | Negates the commands for a meshpoint device or resets values to default | <i>page 26-52</i> |

26.3.2.1 acs

► *meshpoint-device-commands*

Enables *Automatic Channel Selection* (ACS) on this meshpoint device (access point). When enabled, this feature automatically selects the best channel for a meshpoint-device radio based on the device configuration, channel conditions, and network layout.

In a wireless network deployment, it is advantageous for network devices to have the ability to operate in multiple channels and not be limited to only a single channel. Multiple channels increase the bandwidth and throughput of the wireless network. In such a scenario, each network device must have a mechanism to dynamically select a suitable channel of operation. ACS provides the required mechanism for a MCX enabled device.

Use this command to configure the ACS settings and override the default meshpoint configurations.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
acs [channel-hold-time|channel-switch-delta|channel-width|ocs-duration|ocs-
frequency|path-min|path-threshold|preferred-interface-tolerance-period|
preferred-radio-interface|priority-meshpoint|sample-count|snr-delta|signal-
threshold|tolerance-period]
```

```
acs channel-hold-time [2.4GHz|5GHz] <0-86400>
```

```
acs channel-switch-delta [2.4GHz|5GHz] <5-35>
```

```
acs channel-width [2.4GHz|5GHz] [20MHz|40MHz|80MHz|auto]
```

```
acs ocs-duration [2.4GHz|5GHz] <20-250>
```

```
acs ocs-frequency [2.4GHz|5GHz] <1-60>
```

```
acs path-min [2.4GHz|5GHz] <100-20000>
```

```
acs path-threshold [2.4GHz|5GHz] <800-65535>
```

```
acs preferred-interface-tolerance-period [2.4GHz|5GHz] <10-600>
```

```
acs preferred-radio-interface [2.4GHz|5GHz] <0-2>
```

```
acs priority-meshpoint [2.4GHz|5GHz] <MESHPOINT-NAME>
```

```
acs sample-count [2.4GHz|5GHz] <1-10>
```

```
acs snr-delta [2.4GHz|5GHz] <1-100>
```

```
acs signal-threshold [2.4GHz|5GHz] <-100-0>
```

```
acs tolerance-period [2.4GHz|5GHz] <10-600>
```

Parameters

- `acs channel-hold-time [2.4GHz|5GHz] <0-86400>`

| | |
|-----|--|
| acs | Configures ACS settings and overrides on the selected meshpoint-device |
|-----|--|

| | |
|---|---|
| channel-hold-time [2.4GHz 5GHz] <0-86400> | <p>Configures the minimum time, in seconds, before a periodic scan, to assess channel conditions for a meshpoint root, is triggered.</p> <ul style="list-style-type: none"> • 2.4GHz – Configures the channel hold interval for the 2.4GHz radio band • 5.0GHz – Configures the channel hold interval for the 5.0GHz radio band <p>The following keyword is common to the ‘2.4GHz’ and ‘5.0GHz’ bands:</p> <ul style="list-style-type: none"> • <0-86400> – Specify a value from 0 - 86400 seconds. The default is 1800 seconds. <p>A value of ‘0’ disables periodic channel assessment.</p> |

Related Commands

| | |
|-----------------|--|
| <code>no</code> | Reverts the configured ACS settings to default |
|-----------------|--|

26.3.2.2 exclude

► *meshpoint-device-commands*

Enables wired-peer (that are wired MiNT level-1 neighbors) exclusion

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
exclude wired-peer mint-level-1
```

Parameters

- `exclude wired-peer mint-level-1`

| | |
|--------------------------------------|---|
| <code>exclude wired-peer</code> | Excludes neighboring mesh devices |
| <code>wired-peer mint-level-1</code> | Excludes neighboring wired mesh devices with MiNTlevel-1 link When enabled, all neighboring wired mesh devices are excluded from mesh links. |

Example

```
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#exclude wired-peer mint-
level-1

rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#show context
meshpoint-device test
  exclude wired-peer mint-level-1
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables wired-peer exclusion on this meshpoint |
|-----------|---|

26.3.2.3 hysteresis

► *meshpoint-device-commands*

Configures path selection SNR hysteresis values on this meshpoint-device (access point). These are settings that facilitate dynamic path selection. Configuring hysteresis prevents frequent re-ranking of the shortest path cost.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
hysteresis [min-threshold|period|root-sel-snr-delta|snr-delta]
```

```
hysteresis [min-threshold <-100-0>|period <0-600>|root-sel-snr-delta <1-100>|snr-delta <1-100>]
```

Parameters

- hysteresis [min-threshold <-100-0>|period <0-600>|root-sel-snr-delta <1-100>|snr-delta <1-100>]

| | |
|----------------------------|--|
| min-threshold <-100-0> | Configures the minimum signal strength that a device should have to be considered a likely candidate in the mesh route (to the mesh root node) selection process. • <-100-0> – Specify a value from -100 - 0 dB. The default is 0 dB. |
| period <0-600> | Configures the interval, in seconds, for which a likely candidate's path method hysteresis is sustained. In other words a device capable of sustaining the signal strength for the specified period of time is a likely candidate in the mesh route (to the mesh root node) selection process. • <0-600> – Specify a value from 0 - 600 seconds. The default is 1 second. |
| root-sel-snr-delta <1-100> | Configures the signal strength, in dB, that a device has to sustain, within the delta range, to be considered a likely candidate in the mesh route (to the mesh root node) selection process. • <1-100> – Specify a value from 1 - 100 dB. |
| snr-delta <1-100> | Configures the SNR delta. The device with must have a SNR of a greater delta than its current neighbor to be considered a likely candidate in the mesh route (to the mesh root) selection process. • <1-100> – Specify a value from 1 - 100 dB. The default is 1 dB. |

Example

```
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis period 15
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis root-sel-snr
-delta 12
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis snr-delta 3
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis min-threshold
-65

rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#show context
meshpoint-device test
  hysteresis period 15
  hysteresis snr-delta 3
  hysteresis min-threshold -65
  hysteresis root-sel-snr-delta 12
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#
```

Related Commands*no*

Removes the configured path selection SNR hysteresis values

26.3.2.4 monitor

► *meshpoint-device-commands*

Enables monitoring of critical resource and primary port links. It also configures the action taken in case a critical resource goes down or a primary port link is lost.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
monitor [critical-resource|primary-port-link-loss] action no-root
```

Parameters

- monitor [critical-resource|primary-port-link-loss] action no-root

| | |
|------------------------|--|
| critical-resource | Enables critical resource down event monitoring |
| primary-port-link-loss | Enables primary port link loss event monitoring |
| action no-root | The following are common to all of the above: <ul style="list-style-type: none"> • action - Sets the action taken if a critical resource goes down or if a primary port link is lost • no-root - Changes the meshpoint to be non root (this is the action taken in case any of the above mentioned two events occur) |

Example

```
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#monitor critical-
resource action no-root

rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
name test
monitor critical-resource action no-root
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#

| | |
|-----------|--|
| <i>no</i> | Disables monitoring of critical resource and primary port links. |
|-----------|--|

26.3.2.5 path-method

► *meshpoint-device-commands*

Configures the path selection method used on a meshpoint device. This is the method used to select the route to the root node within a mesh network.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
path-method [bound-pair|mobile-snr-leaf|snr-leaf|uniform]
```

Parameters

- path-method [bound-pair|mobile-snr-leaf|snr-leaf|uniform]

| | |
|-----------------|---|
| path-method | Sets the method used to select the path to the root node in a mesh network |
| bound-pair | Enables a meshpoint to form an exclusive path with only one other meshpoint. Select this option to bind one mesh point connection at a time. Once established, other mesh point connection requests are denied. |
| mobile-snr-leaf | Configures the path selection method as mobile-snr-leaf. When selected, the path to the root node is selected based on the <i>Signal-to-Noise Ratio</i> (SNR) to a neighboring device. This option allows meshpoint devices to select a neighbor with the strongest SNR. Meshpoint devices using the mobile-snr-leaf method are non-forwarding nodes in the meshpoint traffic. Note: Select this option for <i>Vehicular Mounted Modem</i> (VMM) access points or other mobile devices. Note: VMM is supported only on the AP7161 model access point. |
| snr-leaf | This option allows meshpoints to select a neighbor with the strongest SNR. It is similar to the mobile-snr-leaf option, but is not applicable to mobile devices, such as VMMs. |
| uniform | Indicates the path selection method is uniform. When selected, two paths will be considered equivalent if the average goodput is the same for both paths. This is the default setting. Note: Select this option for infrastructure devices. |

Example

```
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#path-method
mobile-snr-leaf

rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device TEST
name TEST
path-method mobile-snr-leaf
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Resets the path selection method on a meshpoint device |
|-----------|--|

26.3.2.6 preferred

► *meshpoint-device-commands*

Configures the preferred path parameters for this meshpoint device

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
preferred [neighbor <MAC>|root <MAC>|interface [2.4GHz|4.9GHz|5GHz]]
```

Parameters

- preferred [neighbor <MAC>|root <MAC>|interface [2.4GHz|4.9GHz|5GHz]]

| | |
|--------------------------------|--|
| preferred | Configures the preferred path parameters |
| neighbor <MAC> | Adds the MAC address of a neighbor meshpoint as a preferred neighbor |
| root <MAC> | Adds the MAC address of a root meshpoint as a preferred root |
| interface [2.4GHz 4.9GHz 5GHz] | Sets the preferred interface |

Example

```
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred
neighbor 11-22-33-44-55-66

rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred root
22-33-44-55-66-77

rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred
interface 5GHz

rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
name test
preferred root 22-33-44-55-66-77
preferred neighbor 11-22-33-44-55-66
preferred interface 5GHz
monitor critical-resource action no-root
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

Related Commands

| | |

| <i>no</i> | Removes the configuration of preferred paths for this meshpoint device |
|-----------|--|

26.3.2.7 root

► *meshpoint-device-commands*

Configures this meshpoint device as the root meshpoint

You can optionally use the `select-method` option to enable dynamic mesh selection. When enabled, this option overrides root or no-root configuration and uses the selection method.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
root {select-method [auto-mint|auto-proximity]}
```

Parameters

- `root {select-method [auto-mint|auto-proximity]}`

| | |
|-------------------------|---|
| root | Configures this meshpoint device as the root meshpoint |
| select-method auto-mint | <p>Optional. Enables dynamic mesh selection. When enabled, this option overrides root or no-root configuration and chooses the selection method.</p> <ul style="list-style-type: none"> • auto-mint – Enables dynamic root selection using Auto-MiNT (based on path cost) <p>The Auto-Mint or Cost Method dynamically determines the root/non-root configuration of a meshpoint by:</p> <ul style="list-style-type: none"> • Monitoring and ranking the signal strength and path cost of neighboring mesh points. • Setting the configuration to: <ul style="list-style-type: none"> • non-root: If the link with the shortest path to the cost-root mesh device is a MCX meshpoint link • root: If the link with the shortest path to the cost-root mesh device is a non MCX meshpoint link (wired link). • This requires that the meshpoint device, in the brain car, be configured as the 'cost root' and the 'cost root' meshpoint-device be the I2 gateway to the controller. Use the <code>root-select > cost-root</code> command to configure a meshpoint-device as 'cost-root'. • Using signal strength of neighboring meshpoint as the sole metric to determine the next mesh hop to the root. • Loop detection with both meshpoints in a car select non-root and form a mesh link with the same root <ul style="list-style-type: none"> • auto-proximity – Enables dynamic root selection using meshpoint proximity. When auto-proximity is selected, root selection is based on signal strength of candidate roots. |

Example

```

rfs6000-37FABE (config-profile-AP71XXTestProfile-meshpoint-test)#root

rfs6000-37FABE (config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
  name test
  root
  preferred root 22-33-44-55-66-77
  preferred neighbor 11-22-33-44-55-66
  preferred interface 5GHz
  monitor critical-resource action no-root
rfs6000-37FABE (config-profile-AP71XXTestProfile-meshpoint-test)#

ap7131-11E6C4 (config-device-00-23-68-11-E6-C4-meshpoint-test)#root select-method
auto-mint

ap7131-11E6C4 (config-device-00-23-68-11-E6-C4-meshpoint-test)#show context
meshpoint-device test
  root select-method auto-mint
ap7131-11E6C4 (config-device-00-23-68-11-E6-C4-meshpoint-test)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the configuration of this meshpoint device as a root meshpoint. Also allows you to disable dynamic mesh selection (if enabled). |
|-----------|---|

26.3.2.8 root-select

► *meshpoint-device-commands*

Configures this meshpoint device as the cost root

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
root-select cost-root
```

Parameters

- `root-select cost-root`

| | |
|-----------------------|---|
| root-select cost-root | Configures this meshpoint device as the cost root. This is necessary for dynamic root selection process. Select this option to set the meshpoint as the cost root for meshpoint root selection. This setting is disabled by default. |
|-----------------------|---|

Example

```
ap7131-11E6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#root-select cost-root
ap7131-11E6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#show context
meshpoint-device test
root select-method auto-mint
root-select cost-root
ap7131-11E6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#
```

Related Commands

| | |

| <i>no</i> | Removes this meshpoint-device as the cost-root |
|-----------|--|

26.3.2.9 no

► *meshpoint-device-commands*

Negates the commands for a meshpoint device or resets values to default

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX

Syntax

```
no [acs|exclude|hysteresis|monitor|path-method|preferred|root|root-select]

no acs [channel-hold-time|channel-switch-delta|channel-width|ocs-duration|
ocs-frequency|path-min|path-threshold|preferred-interface-tolerance-period|
preferred-radio-interface|priority-meshpoint|sample-count|snr-delta|signal-
threshold|tolerance-period] [2.4GHZ|5GHz]

no exclude wired-peer mint-level-1

no hysteresis [min-threshold|period|root-sel-snr-delta|snr-delta]

no monitor [critical-resource|primary-port-link-loss]

no [path-method|root {select-method}]

no root-select cost-root

no preferred [interface|root|neighbor]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes or reverts this meshpoint device settings to default based on the parameters passed |
|-----------------|---|

Example

```
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
  name test
  root
  preferred root 22-33-44-55-66-77
  preferred neighbor 11-22-33-44-55-66
  preferred interface 5GHz
  monitor critical-resource action no-root

  preferred root 22-33-44-55-66-77
rfs6000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

27 PASSPOINT POLICY

A passpoint policy provides an interoperable platform for streamlining Wi-Fi access to access points deployed as public hotspots. Passpoint is supported across a wide range of wireless network deployment scenarios and client devices. Passpoint makes connecting to Wi-Fi networks easier by authenticating the user with an account based on an existing relationship, such as the user's mobile carrier or broadband ISP.

To migrate to the Passpoint policy configuration mode, use the following command:

```
<DEVICE>(config)#passpoint-policy <POLICY-NAME>

rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#

rfs4000-229D58(config-passpoint-policy-test)#?
Passpoint Policy Mode commands:
 3gpp                Configure a 3gpp plmn (public land mobile network) id
access-network-type  Set the access network type for the hotspot
connection-capability  Configure the connection capability for the hotspot
domain-name          Add a domain-name for the hotspot
hessid               Set a homogeneous ESSID value for the hotspot
internet             Advertise the hotspot having internet access
ip-address-type       Configure the advertised ip-address-type
nai-realm             Configure a NAI realm for the hotspot
net-auth-type        Add a network authentication type to the hotspot
no                   Negate a command or set its defaults
operator             Add configuration related to the operator of the
                    hotspot
osu                  Online signup
roam-consortium      Add a roam consortium for the hotspot
venue                Set the venue parameters of the hotspot
wan-metrics          Set the wan-metrics of the hotspot

clrscr               Clears the display screen
commit               Commit all changes made in this session
do                   Run commands from Exec mode
end                  End current mode and change to EXEC mode
exit                 End current mode and down to previous mode
help                 Description of the interactive help system
revert               Revert changes
service              Service Commands
show                 Show running system information
write                Write running configuration to memory or terminal

rfs4000-229D58(config-passpoint-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

27.1 passpoint-policy

► PASSPOINT POLICY

The following table summarizes passpoint policy configuration mode commands:

Table 27.1 *Hotspot-Policy-Config Commands*

| Command | Description | Reference |
|------------------------------|---|-------------------|
| <i>3gpp</i> | Configures a <i>3rd Generation Partnership Project (3gpp) Public Land Mobile Network (PLMN)</i> ID | <i>page 27-3</i> |
| <i>access-network-type</i> | Configures the access network type element in this hotspot | <i>page 27-4</i> |
| <i>connection-capability</i> | Configures the connection capability element in this passpoint policy | <i>page 27-5</i> |
| <i>domain-name</i> | Configures the RF Domains to which this hotspot is applicable | <i>page 27-7</i> |
| <i>hessid</i> | Configures the <i>Homogeneous Extended Service Set Identifier (HESSID)</i> for a specified hotspot zone | <i>page 27-8</i> |
| <i>internet</i> | Advertises the availability of Internet access in this hotspot | <i>page 27-9</i> |
| <i>ip-address-type</i> | Advertises the IP address type used in this hotspot. | <i>page 27-10</i> |
| <i>nai-realm</i> | Configures a <i>Network Access Identifier (NAI)</i> realm name and enters its configuration mode | <i>page 27-12</i> |
| <i>net-auth-type</i> | Configures the network authentication type used in this hotspot | <i>page 27-18</i> |
| <i>no</i> | Removes or reverts passpoint policy configuration | <i>page 27-19</i> |
| <i>operator</i> | Configures the operator friendly name for this hotspot | <i>page 27-20</i> |
| <i>osu</i> | Configures an <i>online sign up (OSU)</i> SSID/provider and enters its configuration mode | <i>page 27-21</i> |
| <i>roam-consortium</i> | Configures the list of Roaming Consortium <i>Organization Identifiers (OIs)</i> supported on this hotspot | <i>page 27-31</i> |
| <i>venue</i> | Configures the venue group and type for this passpoint policy | <i>page 27-32</i> |
| <i>wan-metrics</i> | Configures the WAN performance metrics for this hotspot | <i>page 27-36</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

27.1.1 3gpp

► *passpoint-policy*

Configures a *3rd Generation Partnership Project (3GPP) Public Land Mobile Network (PLMN)* information. The 3GPP PLMN information is a combination of the *Mobile Country Code (MCC)* and *Mobile Network Code (MNC)*. This MCC and MNC combination uniquely identifies a cellular operator. For example, Telstar Corporation Ltd. in Australia is identified by MCC 505 and MNC 001.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
3gpp mcc <MOBILE-COUNTRY-CODE> mnc <MOBILE-NETWORK-CODE> {description <LINE>}
```

Parameters

- 3gpp mcc <MOBILE-COUNTRY-CODE> mnc <MOBILE-NETWORK-CODE> {description <LINE>}

| | |
|---------------------------|---|
| 3gpp | Configures the 3GPP PLMN information that is returned in response to an ANQP query |
| mcc <MOBILE-COUNTRY-CODE> | Specifies the MCC. The MCC is a two or three digit decimal value. For example, the MCC for Australia is 505. |
| mnc <MOBILE-NETWORK-CODE> | Specifies the MNC. The MNC is a two or three decimal value used in combination with the MCC to uniquely identify a mobile network operator. The MNC and MCC combination (also known as the MCC/MNC tuple) forms the first five or six digits of the <i>International Mobile Subscriber's Identity (IMSI)</i> . If the MCC and MNC values are not configured, the hotspot will not return the element in an ANQP capability request and ignores any ANQP query for the element. |
| description <LINE> | Optional. Configures a description that uniquely identifies this PLMN. Provide a description not exceeding 64 characters in length. |

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#3gpp mcc 505 mnc 14
rfs4000-229D58 (config-passpoint-policy-test)#3gpp mcc 310 mnc 970
rfs4000-229D58 (config-passpoint-policy-test)#show context
hotspot2-policy test
  3gpp mcc 310 mnc 970
  3gpp mcc 505 mnc 14
rfs4000-229D58 (config-passpoint-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the specified 3gpp PLMN information and its corresponding MCC/MNC settings |
|-----------|--|

27.1.2 access-network-type

► *passpoint-policy*

Configures the access network type for this hotspot. The beacons and probe responses communicate the type of hotspot (public, private, guest-use, emergency, etc.) to clients seeking access.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
access-network-type [chargeable-public|emergency-services|experimental|free-
public|personal-device|private|private-guest|wildcard]
```

Parameters

- `access-network-type` [chargeable-public|emergency-services|experimental|free-public|personal-device|private|private-guest|wildcard]

| | |
|---------------------|---|
| access-network-type | <p>Select the access network type for this hotspot. The options are:</p> <ul style="list-style-type: none"> • chargeable-public - The network type is a chargeable public network • emergency-services - The network is used to provide emergency services only • experimental - The network is used for test or experimental purposes only • free-public - The network type is a free public • personal-device - The network is used for personal devices only • private - The network is a private network • private-guest - The network is a private network with guest access (default setting) • wildcard - Includes all access network types <p>If the network type is set to chargeable-public, probe responses advertise this hotspot as a chargeable-public hotspot.</p> |
|---------------------|---|

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#access-network-type chargeable-
public

rfs4000-229D58 (config-passpoint-policy-test)#show context
hotspot2-policy test
  access-network-type chargeable-public
  3gpp mcc 310 mnc 970
  3gpp mcc 505 mnc 14
rfs4000-229D58 (config-passpoint-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Reverts to the default access network type setting (private) |
|-----------|--|

27.1.3 connection-capability

► *passpoint-policy*

Configures the connection capability element in this passpoint policy. When configured, it communicates which ports are open or closed on the Hotspot, in response to an ANQP query.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
connection-capability [ftp|http|icmp|ip-protocol|ipsec-vpn|pptp-vpn|sip|ssh|tls-
vpn]
```

```
connection-capability [ftp|http|icmp|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn]
[closed|open|unknown]
```

```
connection-capability ip-protocol <0-255> port <0-65535> [closed|open|unknown]
```

Parameters

- connection-capability [ftp|http|icmp|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn] [closed|open|unknown]

| | |
|--|---|
| connection-capability | Configures the connection capability element in this passpoint policy |
| ftp | Specifies the protocol type as FTP. Configures TCP port 20. |
| http | Specifies the protocol type as HTTP. Configures TCP port 80. |
| icmp | Specifies the protocol type as ICMP |
| ipsec-vpn | Specifies the protocol type as IPSEC VPN. Configures ESP and UDP ports 500 and 4500. |
| pptp-vpn | Specifies the protocol type as PPTP VPN. Configures TCP port 1723. |
| sip | Specifies the protocol type as SIP. Configures TCP port 5060 and UDP port 5060. |
| ssh | Specifies the protocol type as SSH. Configures TCP port 20 |
| tls-vpn | Specifies the protocol type as TLS VPN. Configures TCP port 443. |
| port <0-65535> [closed open unknown] | <p>After specifying the protocol type, specify the port (associated with the selected protocol) and its status.</p> <ul style="list-style-type: none"> • closed – Specifies that the port(s) is/are closed • open – Specifies that the port(s) is/are open • unknown – Specifies that the port(s) status is not known <p>When the connection capability element is not configured, the hotspot does not return the element in an ANQP capability request and ignores any ANQP query for the element.</p> |
| <ul style="list-style-type: none"> • connection-capability ip-protocol <0-255> port <0-65535> [closed open unknown] | |
| connection-capability | Configures the connection capability element in this passpoint policy |
| ip-protocol <0-255> | Identifies the IP protocol by the protocol's number. For example, for <i>simple message protocol</i> (SMP) specify 121. |

| | |
|---|---|
| <p>port <0-65535> [closed open unknown]</p> | <p>After specifying the IP protocol type, specify the port number.</p> <ul style="list-style-type: none"> • port <0-65535> - Select a port for the IP protocol identified. <p>After specifying the port number, specify the port status.</p> <ul style="list-style-type: none"> • closed - Specifies that the port(s) is/are closed • open - Specifies that the port(s) is/are open • unknown - Specifies that the port(s) status is not known <p>When the connection capability element is not configured, the hotspot does not return the element in an ANQP capability request and ignores any ANQP query for the element.</p> |
|---|---|

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#connection-capability 1 ip-protocol
2 port 10 closed

rfs4000-229D58 (config-passpoint-policy-test)#show context
hotspot2-policy test
access-network-type chargeable-public
connection-capability ip-protocol 2 port 10 closed
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58 (config-passpoint-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured connection capability element on the passpoint policy |
|-----------|--|

27.1.4 domain-name

► *passpoint-policy*

Configures the RF Domain(s) that are returned in response to an ANQP query

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
domain-name <DOMAIN-NAME>
```

Parameters

- domain-name <DOMAIN-NAME>

| | |
|------------------------------|---|
| domain-name <DOMAIN-NAME> | Specify the RF Domain name An hotspot can be applied across multiple RF Domains. |
|------------------------------|---|

Example

```
rfs4000-229D58(config-passpoint-policy-test)#domain-name TechPubs

27.1.5 hessid

► *passpoint-policy*

Configures the *Homogeneous Extended Service Set Identifier* (HESSID) for the hotspot. The HESSID uniquely identifies a hotspot provider within a zone. This is essential in zones (such as an airport or shopping mall) having multiple hotspot service providers with overlapping coverage.

An HESSID is a 6 (six) byte identifier that uniquely identifies a set of APs belonging to the same network and exhibiting same network behavior. It is the BSSID (MAC address) of one of the devices (AP) in the zone. When not configured, the radio's BSSID is used as the HESSID.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
hessid <MAC>
```

Parameters

- hessid <MAC>

| | |
|--------------|---|
| hessid <MAC> | Specify a unique 6 (six) byte identifier for this passpoint policy. |
|--------------|---|

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#hessid 00-23-68-88-0D-A7

rfs4000-229D58 (config-passpoint-policy-test)#show context
hotspot2-policy test
access-network-type chargeable-public
connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
hessid 00-23-68-88-0D-A7
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58 (config-passpoint-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the HESSID configured with this passpoint policy and reverts back to using the radio's BSSID |
|-----------|--|

27.1.6 internet

▶ *passpoint-policy*

Advertises the availability of Internet access on this hotspot. The Internet bit in the hotspot's beacon and probe responses indicates if Internet access is available or not. By default this feature is enabled.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
internet
```

Parameters

None

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#internet
rfs4000-229D58 (config-passpoint-policy-test)#
```

Related Commands

| | |

27.1.7 ip-address-type

► *passpoint-policy*

Advertises the IP address type used in this hotspot. This information is returned in response to ANQP queries.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
ip-address-type [ipv4|ipv6]
```

```
ip-address-type ipv4 [double-nat|not-available|port-restricted|port-restricted-  
double-nat|port-restricted-single-nat|public|single-nat|unknown]
```

```
ip-address-type ipv6 [available|not-available|unknown]
```

Parameters

- `ip-address-type ipv4 [double-nat|not-available|port-restricted|port-restricted-double-nat|port-restricted-single-nat|public|single-nat|unknown]`

| | |
|---|---|
| <code>ip-address-type ipv4</code> | Configures the as IPv4 address type availability information |
| <code>double-nat</code> | Specifies double NATed private IPv4 address is available |
| <code>not-available</code> | Specifies IPv4 address is not available |
| <code>port-restricted</code> | Specifies port-restricted IPV4 address is available |
| <code>port-restricted-double-nat</code> | Specifies port-restricted IPv4 address and double NATed IPv4 address is available |
| <code>port-restricted-single-nat</code> | Specifies port-restricted IPv4 address and single NATed IPv4 address is available |
| <code>public</code> | Specifies public IPv4 address is available |
| <code>single-nat</code> | Specifies single NATed IPv4 address is available |
| <code>unknown</code> | Specifies no information configured regarding the IPv4 address availability |

- `ip-address-type ipv6 [available|not-available|unknown]`

| | |
|-----------------------------------|---|
| <code>ip-address-type ipv6</code> | Configures the IPv6 address type availability information |
| <code>available</code> | Specifies IPv6 address is available |
| <code>not-available</code> | Specifies IPv6 address is not available |
| <code>unknown</code> | Specifies no information configured regarding the IPv6 address availability |

Example

```
rfs4000-229D58(config-passpoint-policy-test)#ip-address-type ipv6 available

rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
access-network-type chargeable-public
connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
hessid 00-23-68-88-0D-A7
ip-address-type ipv6 available
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

Related Commands

27.1.8 nai-realm

► *passpoint-policy*

A *Network Access Identifier* (NAI) realm element in the passpoint policy identifies a hotspot service provider by the unique NAI realm name.

The following table lists NAI realm configuration mode commands:

Table 27.2 *NAI-Realm-Config Commands*

| Command | Description | Reference |
|---------------------------------------|---|-------------------|
| <i>nai-realm</i> | Creates a NAI realm name for this hotspot and enters its configuration mode | <i>page 27-13</i> |
| <i>nai-realm-config-mode commands</i> | Invokes the NAI realm configuration mode commands | <i>page 27-15</i> |

27.1.8.1 nai-realm

► *nai-realm*

Configures a NAI realm name and enters its configuration mode. The NAI realm name identifies the accessible hotspot service providers. You can configure a list of NAI realm names of service providers operating within a specific hotspot zone. This NAI realm name list is presented in ANQP response to a NAI realm and NAI home realm query.

The configured NAI realm name list is presented in ANQP response to a NAI realm and NAI home realm query.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
nai-realm <HOTSPOT2-NAI-REALM-NAME>
```

Parameters

- `nai-realm <HOTSPOT2-NAI-REALM-NAME>`

| | |
|--|---|
| <code>nai-realm <HOTSPOT2-NAI-REALM-NAME></code> | <p>Configures the NAI realm name for this passpoint policy</p> <ul style="list-style-type: none"> • <code><HOTSPOT2-NAI-REALM-NAME></code> - Specify the NAI realm name for this passpoint policy. |
|--|---|

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#nai-realm mail.example.com

27.1.8.2 nai-realm-config-mode commands

▶ *nai-realm*

The following table summarizes NAI realm configuration mode commands:

Table 27.3 *NAI-Realm-Config-Mode Commands*

| Command | Description | Reference |
|-------------------|--|-------------------|
| <i>eap-method</i> | Specifies the <i>Extensible Authentication Protocol</i> (EAP) authentication mechanisms supported by each of the service providers associated with this passpoint policy | <i>page 27-16</i> |

27.1.8.2.1 eap-method

► *nai-realm-config-mode commands*

Specifies the EAP authentication mechanisms supported by each of the service providers associated with this passpoint policy

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
eap-method <1-10> [<1-255>|fast|gtc|identity|ikev2|ms-auth|mschapv2|otp|peap|
psk|rsa-public-key|sim|tls|ttls] auth-param [credential|expanded-eap|
expanded-inner-eap|inner-eap|non-eap-inner|tunn-eap-credential|vendor] [cert|hw-
token|nfc-secure-elem|none|sim|soft-token|username-password|usim|vendor]
```

Parameters

- eap-method <1-10> [<1-255>|fast|gtc|identity|ikev2|ms-auth|mschapv2|otp|peap|psk|rsa-public-key|sim|tls|ttls] auth-param [credential|expanded-eap|expanded-inner-eap|inner-eap|non-eap-inner|tunn-eap-credential|vendor] [cert|hw-token|nfc-secure-elem|none|sim|soft-token|username-password|usim|vendor]

| | |
|-------------------|--|
| eap-method <1-10> | Creates an EAP authentication method and assigns it an index number <ul style="list-style-type: none"> • <1-10> - Specify a identifier for this EAP method from 1 - 10. A maximum of 10 (ten) authentication methods can be specified for every NAI realm. After creating the EAP authentication method, specify the associated authentication mechanisms (method types). |
| <1-255> | Identifies the EAP authentication method type from the corresponding <i>Internet Assigned Numbers Authority</i> (IANA) number <1-255> - Specify the IANA identity number for the authentication protocol from 1 - 255. |
| fast | Specifies the EAP authentication method type as <i>Flexible Authentication via Secure Tunneling</i> (FAST) |
| gtc | Specifies the EAP authentication method type as <i>Generic Token Card</i> (GTC) |
| identity | Specifies the EAP authentication method type as Identification |
| ikev2 | Specifies the EAP authentication method type as <i>Internet Key Exchange Protocol version 2</i> (IKEv2) |
| ms-auth | Specifies the EAP authentication method type as <i>Microsoft Authentication</i> (MS-Auth) |
| mschapv2 | Specifies the EAP authentication method type as <i>Microsoft Challenge Handshake Authentication Protocol</i> version 2 (MSCHAPv2) |
| otp | Specifies the EAP authentication method type as <i>One Time Password</i> (OTP) |
| peap | Specifies the EAP authentication method type as <i>Protected Extensible Authentication Protocol</i> (PEAP) |
| psk | Specifies the EAP authentication method type as <i>Pre-shared Key</i> (PSK) |
| rsa-public-key | Specifies the EAP authentication method type as RSA public key protocol |
| sim | Specifies the EAP authentication method type as <i>GSM Subscriber Identity Module</i> (SIM) |

| | |
|---|---|
| tls | Specifies the EAP authentication method type as <i>Transport Layer Security</i> (TLS) |
| ttls | Specifies the EAP authentication method type as <i>Tunneled Transport Layer Security</i> (TTLS) |
| auth-param | After specifying the EAP authentication method type, specify the authentication parameters. These parameters depend on the EAP authentication mechanism selected. |
| [cert hw-token nfc-secure-elem none sim soft-token username-password usim vendor] | The following parameters are common to all the above authentication parameters: <ul style="list-style-type: none"> • cert – Certificate • hw-token – Hardware token • nfc-secure-elem – NFC secure element • none – No credential • sim – Subscriber identity module • soft-token – Soft token • username-password – Username and password • usim – Universal subscriber identity module • vendor – Vendor specific credential |

Example

The following examples show four EAP authentication methods associated with the NAI realm 'mail.example.com'. Each method supports a different EAP authentication mechanism:

```
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 1 ttls auth-param vendor hex 00001E
```

```
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 2 rsa-public-key auth-param credential cert
```

```
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 4 peap auth-param credential cert
```

```
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#show context
nai-realm mail.example.com
  eap-method 1 ttls auth-param vendor hex 00121F
  eap-method 2 rsa-public-key auth-param credential cert
  eap-method 3 otp auth-param credential username-password
  eap-method 4 peap auth-param credential cert
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#
```

27.1.9 net-auth-type

► *passpoint-policy*

Configures the network authentication type used in this hotspot. The details configured are returned in response to an ANQP query.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
net-auth-type [accept-terms|dns-redirect|http-redirect|online-enroll] {url <URL>}
```

Parameters

- `net-auth-type` [accept-terms|dns-redirect|http-redirect|online-enroll] {url <URL>}

| | |
|---------------|--|
| net-auth-type | Specifies the network authentication type used with this passpoint policy. The options are: accept-terms, dns-redirect, http-redirect, and online-enroll |
| accept-terms | Enables user acceptance of terms and conditions |
| dns-redirect | Enables DNS redirection of user |
| http-redirect | Enables HTTP redirection of user |
| online-enroll | Enables online user enrolment |
| url <URL> | Optional. Specify the location for each of above network authentication types. |

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#net-auth-type accept-terms url
"www.test.com"
rfs4000-229D58 (config-passpoint-policy-test)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the network authentication type configured with this passpoint policy |
|-----------|---|

27.1.10 no

► *passpoint-policy*

Removes or reverts the passpoint policy settings

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
no [3gpp|access-network-type|connection-capability|domain-name|hessid|internet|
ip-address-type|nai-realm|net-auth-type|operator|osu|roam-consortium|venue|wan-
metrics]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes or reverts the passpoint policy settings |
|-----------------|--|

Example

The following example shows the passpoint policy 'test' settings before the 'no' commands are executed:

```

27.1.11 operator

► *passpoint-policy*

Configures the operator friendly name for this hotspot. The name can be configured in English or in any language other than English. When the name is specified in English, the system allows an ASCII input. If you are using a language other than English, first specify the ISO-639 language code, and then specify the name as a hexadecimal code.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
operator name <OPERATOR-NAME>
```

Parameters

- operator name <OPERATOR-NAME>

| | |
|----------------------|---|
| name <OPERATOR-NAME> | Configures the operator's name in English <ul style="list-style-type: none"> • <OPERATOR-NAME> - Specify the operator friendly name in ASCII format. |
|----------------------|---|

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#operator name emergencyservices

rfs4000-229D58 (config-passpoint-policy-test)#show context
hotspot2-policy test
connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
no internet
ip-address-type ipv6 available
nai-realm mai.testrealm.com
net-auth-type accept-terms url www.test.com
operator name emergencyservices
3gpp mcc 505 mnc 14

27.1.12 osu

▶ *passpoint-policy*

The following table lists the OSU SSID/provider configuration commands:

Table 27.4 *OSU-SSID/Provider Config Commands*

| Command | Description | Reference |
|---------------------------------|---|-------------------|
| <i>osu</i> | Configures an <i>online sign up</i> (OSU) SSID/provider and enters its configuration mode | <i>page 27-22</i> |
| <i>osu-config-mode commands</i> | Summarizes the OSU SSID/provider configuration mode commands | <i>page 27-23</i> |

27.1.12.1 osu

► *osu*

Adds an *online sign up* (OSU) SSID (WLAN)/OSU provider and enters its configuration mode

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
osu [provider <PASSPOINT-OSU-PROVIDER>|ssid <SSID>]
```

Parameters

- `osu [provider <PASSPOINT-OSU-PROVIDER>|ssid <SSID>]`

| | |
|--------------------------------------|--|
| osu | Use this command to configure an <i>online sign up</i> (OSU) SSID/OSU provider. In the OSU SSID/provider configuration mode, specify OSU details, such as names, descriptions, servers, methods, and icons available. This information is returned in response to a station's Hotspot 2.0 query. When configured, this option enables a station to obtain credentials for an Hotspot 2.0 enabled SSID. |
| provider <PASSPOINT-OSU-PROVIDER> | Creates an OSU provider for this passpoint and enters its configuration mode <ul style="list-style-type: none"> • <PASSPOINT-OSU-PROVIDER> - Specify an identification for this OSU passpoint provider. |
| ssid <SSID> | Configures an OSU WLAN's SSID. This is the open authentication SSID that a user can use to obtain credentials for the passpoint SSID. <ul style="list-style-type: none"> • <SSID> - Specify the SSID. |

Example

```
nx9500-6C8809 (config-passpoint-policy-test-osu-provider-WiFi)#
nx9500-6C8809 (config-passpoint-policy-test-osu-provider-WiFi)#?
Passpoint OSU Provider Mode commands:
  description  Configure the english description of the online signup provider
  icon         Add an icon for the online signup provider
  method       Specify the online signup method supported by provider
  nai         Configure the NAI for the online signup provider
  name        Configure the english name of the online signup provider
  no          Negate a command or set its defaults
  server-url   Configure the signup url for the online signup provider

  clrscr      Clears the display screen

27.1.12.2 osu-config-mode commands

► *osu*

The following table summarizes OSU SSID/provider configuration mode commands:

Table 27.5 *OSU-SSID/Provider-Config-Mode Commands*

| Command | Description | Reference |
|--------------------|--|-------------------|
| <i>description</i> | Configures the OSU provider's description | <i>page 27-24</i> |
| <i>icon</i> | Adds the OSU provider's icon | <i>page 27-25</i> |
| <i>method</i> | Configures the open sign up methods available on this OSU provider | <i>page 27-26</i> |
| <i>nai</i> | Configures the OSU provider's NAI | <i>page 27-27</i> |
| <i>name</i> | Configures the OSU provider's name | <i>page 27-28</i> |
| <i>no</i> | Removes the settings configured for this OSU provider | <i>page 27-29</i> |
| <i>server-url</i> | Configures the OSU provider server's URL | <i>page 27-30</i> |

27.1.12.2.2 description

▶ *osu-config-mode commands*

Configures the OSU SSID/provider's description. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
description [<DESCRIPTION>|iso-lang <ISO-LANG-CODE>]
```

Parameters

- description [<DESCRIPTION>|iso-lang <ISO-LANG-CODE>]

| | |
|-----------------------------|---|
| <DESCRIPTION> | Provides a description for the OSU provider. It should not exceed 253 characters in length. <ul style="list-style-type: none"> • <DESCRIPTION> - Specify the description in one or more languages. By default the system configures the name in English. |
| iso-lang <ISO-LANG-CODE> | Identifies the language by its ISO 639 language code (for example, 'chi-chinese' or 'spa-spanish'). By default the language is set to English. If specifying the description in any language other than English, specify the ISO language code. |

Example

```

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#description
"Provides free service for testing purposes"

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
  description "Provides free service for testing purposes"
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this OSU provider's description |
|-----------|---|

27.1.12.2.3 icon

► *osu-config-mode commands*

Adds the OSU provider's icon. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
icon iso-lang <ISO-LANG-CODE> width <0-65535> height <0-65535> mime-type <FILE-MIME-TYPE> file [<IMAGE-FILE-NAME/PATH>|<FILE-NAME>]
```

Parameters

```
• icon iso-lang <ISO-LANG-CODE> width <0-65535> height <0-65535> mime-type <FILE-MIME-TYPE> file [<IMAGE-FILE-NAME/PATH>|<FILE-NAME>]
```

| | |
|---|--|
| icon iso-lang <ISO-LANG-CODE> | Configures an icon representing the OSU provider <ul style="list-style-type: none"> • iso-lang <ISO-LANG-CODE> - Identifies the language by its ISO 639 language code (for example, 'chi-chinese' or 'spa-spanish'). By default the language is set to English. If specifying the image file name and path in any language other than English, specify the ISO language code. |
| width <0-65535> | Configures the icon's width in pixels <ul style="list-style-type: none"> • <0-65535> - Specify a value from 0 - 65535 pixels. |
| height <0-65535> | Configures the icon's height in pixels <ul style="list-style-type: none"> • <0-65535> - Specify a value from 0 - 65535 pixels. |
| mime-type <FILE-MIME-TYPE> | Configures a string describing the icon's standard mime type. For example, image/png <ul style="list-style-type: none"> • <FILE-MIME-TYPE> - Specify the icon's mime type. |
| file [<IMAGE-FILE-NAME/PATH> <FILE-NAME>] | Configures the location and name of the image file <ul style="list-style-type: none"> • <IMAGE-FILE-NAME/PATH> - Specify the path and filename. For example, flash:/icon.png • <FILE-NAME> - Use this option to specify the filename in the flash:/ directory |

Example

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#icon iso-lang eng
width 128 height 128 mime-type image/png file flash:/wifi_icon

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
description "Provides free service for testing purposes"
icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
```

27.1.12.2.4 method

▶ *osu-config-mode commands*

Configures the open sign up methods available on this OSU provider. This value is returned, in the specified order of precedence, in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
method [oma-dm|soap-xml-spp] priority <1-2>
```

Parameters

- method [oma-dm|soap-xml-spp] priority <1-2>

| | |
|---|--|
| method [oma-dm soap-xml-spp] priority <1-2> | <p>Configures the online sign up methods supported by this OSU provider</p> <ul style="list-style-type: none"> • oma-dm - Configures the OSU method used as <i>Open Mobile Alliance</i> (OMA) device management • soap-xml-spp - Configures the OSU method used as Soap-xml subscription provisioning protocol <ul style="list-style-type: none"> • priority <1-2> - Sets the priority of the specified method. Select a value from 1 - 2. The default is one (1). |
|---|--|

Example

```

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#method soap-xml-spp
priority 1

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context

27.1.12.2.5 nai

▶ *osu-config-mode commands*

Configures the OSU provider's NAI. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
nai <WORD>
```

Parameters

- nai <WORD>

| | |
|------------|--|
| nai <WORD> | Configures the OSU provider's NAI • <WORD> - Specify the NAI. |
|------------|--|

Example

```

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#nai wifi.org

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
description "Provides free service for testing purposes"
icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
method soap-xml-spp priority 1
nai wifi.org

27.1.12.2.6 name

▶ *osu-config-mode commands*

Configures the OSU provider's name. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
name [<NAME>|iso-lang <ISO-LANG-CODE>]
```

Parameters

- name [<NAME>|iso-lang <ISO-LANG-CODE>]

| | |
|-----------------------------|--|
| <NAME> | Configures the OSU provider's name. It should not exceed 253 characters in length. <ul style="list-style-type: none"> • <NAME> - Specify the name in one or more languages. By default the system configures the name in English. |
| iso-lang <ISO-LANG-CODE> | Identifies the language by its ISO 639 language code (for example, 'chi-chinese' or 'spa-spanish'). By default the language is set to English. If specifying the name in any language other than English, specify the ISO language code. |

Example

```

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#name "WIFI Alliance
OSU"

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
  name "WIFI Alliance OSU"
  description "Provides free service for testing purposes"
  icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
  method soap-xml-spp priority 1

27.1.12.2.7 no▶ *osu-config-mode commands*

Removes the settings configured for this OSU provider. Once removed the information is not included in the ANQP providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
no [description|icon|method|nai|name|server-url]
no [description|icon|name] {iso-lang <ISO-LANG-CODE>}
no [nai|server-url]
no method [oma-dm|soap-xml-spp]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes the settings configured for this OSU provider |
|-----------------|---|

Example

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context

```

27.1.12.2.8 server-url

▶ *osu-config-mode commands*

Configures the OSU provider server's URL. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
server-url <URL>
```

Parameters

- server-url <URL>

| | |
|------------------|---|
| server-url <URL> | Configures the OSU provider server's URL • <URL> - Specify the server's url. |
|------------------|---|

Example

```

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#server-url
osu-server.wifi.org

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
name "WIFI Alliance OSU"
description "Provides free service for testing purposes"
icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
method soap-xml-spp priority 1
nai wifi.org
server-url osu-server.wifi.org

27.1.13 roam-consortium

► *passpoint-policy*

Configures a list of *Roaming Consortium (RC) Organization Identifiers* (OIs) supported on this hotspot. The beacons and probe responses communicate this Roaming Consortium list to devices. This information enables a device to identify the networks available through this AP.

Each OI identifies a either a group of *Subscription Service Providers* (SSPs) or a single SSP.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
roam-consortium hex <WORD>
```

Parameters

- roam-consortium hex <WORD>

| | |
|----------------------------|--|
| roam-consortium hex <WORD> | Adds a Roaming Consortium OI to this hotspot in hexadecimal format <ul style="list-style-type: none"> • <WORD> - Specify the Roaming Consortium OI in hexadecimal format (should not exceed 128 characters) |
| hex <WORD> | Configures a hexadecimal input <ul style="list-style-type: none"> • <WORD> - Specify the Roaming Consortium OI in hexadecimal format (should not exceed 128 characters) |

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#roam-consortium hex 223344

rfs4000-229D58 (config-passpoint-policy-test)#show context

|-----------|---|
| <i>no</i> | Removes the Roaming Consortium OIs supported on this passpoint policy |
|-----------|---|

27.1.14 venue

► *passpoint-policy*

Configures the venue where this hotspot is located. The hotspot venue configuration informs prospective clients about the hotspot's nature of activity, such as educational, institutional, residential, etc.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms —NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
venue [group|name]
```

```
venue group [assembly|business|educational|industrial|institutional|mercantile|outdoor|residential|storage|unspecified|utility-and-misc|vehicular] type
```

```
venue name [<VENUE-NAME>|iso-lang]
```

```
venue name <VENUE-NAME>
```

```
venue name iso-lang <ISO-LANG-CODE> <VENUE-NAME>
```

Parameters

- venue group
[assembly|business|educational|industrial|institutional|mercantile|outdoor|residential|storage|unspecified|utility-and-misc|vehicular] type

| | |
|---------------|--|
| venue group | Configures the venue group associated with this hotspot |
| assembly type | Configures the venue group as assembly (1). This hotspot type is applicable to public assembly venues. <ul style="list-style-type: none"> • type – Specifies the venue type for this group. The options are: <ul style="list-style-type: none"> • <0-255> – Specifies an unlisted venue type number from 0 -255 • amphitheater – Specifies the venue type as amphitheater (4) • amusement-park – Specifies the venue type as amusement park (5) • arena – Specifies the venue type as arena (1) • bar – Specifies the venue type as bar (12) • coffee-shop – Specifies the venue type as a coffee shop (13) • convention-centre – Specifies the venue type as a convention center (7) • emergency-coordination-center – Specifies the venue type as a emergency coordination center (15) • library – Specifies the venue type as a library (8) • museum – Specifies the venue type as a museum (9) • passenger-terminal – Specifies the venue type as a passenger terminal (3) • place-of-worship – Specifies the venue type as a place of worship (6) • restaurant – Specifies the venue type as a restaurant (10) • stadium – Specifies the venue type as a stadium (2) • theater – Specifies the venue type as a theater (11) • unspecified – Specifies the venue type as not specified (0) • zoo – Specifies the venue type as a zoo (14) |

| | |
|---------------|--|
| business type | <p>Configures the venue group as business (2). This hotspot type is applicable to business venues.</p> <ul style="list-style-type: none"> • type – Specifies the venue type for this group. The options are: <ul style="list-style-type: none"> • <0-255> – Specifies an unlisted venue type number from 0 -255 • attorney – Specifies the venue type as the attorney’s office (9) • bank – Specifies the venue type as a bank (2) • doctor – Specifies the venue type as a doctor or dentist’s office (1) • fire-station – Specifies the venue type as a fire station (3) • police-station – Specifies the venue type as a police station (4) • post-office – Specifies the venue type as a post office (5) • professional-office – Specifies the venue type as a professional office (7) • research-and-development-facility – Specifies the venue type as a research facility (8) • unspecified – Specifies the venue type as not specified (0) |
| educational | <p>Configures the venue group as educational (3). This hotspot type is applicable to educational institutions.</p> <ul style="list-style-type: none"> • type – Specifies the venue type for this group. The options are: <ul style="list-style-type: none"> • <0-255> – Specifies an unlisted venue type number from 0 -255 • school-primary – Specifies the venue type as a primary school (1) • school-secondary – Specifies the venue type as a secondary school (2) • university – Specifies the venue type as a university or college (3) • unspecified – Specifies the venue type as not specified (0) |
| industrial | <p>Configures the venue group as industrial (4). This hotspot type is applicable to industrial venues.</p> <ul style="list-style-type: none"> • type – Specifies the venue type for this group. 27.1.15 wan-metrics

► *passpoint-policy*

Configures the WAN performance metrics for this hotspot. This command configures the upstream and downstream speeds associated with this hotspot. The upstream and downstream speed values (in Kbps) are estimates of the bandwidth available on the WAN. This information is returned in response to client ANQP query, and is useful for clients having a minimum and/or large bandwidth requirement.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX95XX, NX9600, VX9000

Syntax

```
wan-metrics down-speed <0-4294967295> up-speed <0-4294967295>
```

Parameters

- wan-metrics down-speed <0-4294967295> up-speed <0-4294967295>

| | |
|---------------------------|---|
| wan-metrics | Specifies the WAN metrics for the up and down traffic |
| down-speed <0-4294967295> | Configures the down stream traffic speed <ul style="list-style-type: none"> • <0-4294967295> - Specify a value from 0 - 4294967295 Kbps. |
| up-speed <0-4294967295> | Configures the up stream traffic speed <ul style="list-style-type: none"> • <0-4294967295> - Specify a value from 0 - 4294967295 Kbps. |

Example

```
rfs4000-229D58 (config-passpoint-policy-test)#wan-metrics down-speed 2000 up-speed 2000

rfs4000-229D58 (config-passpoint-policy-test)#show context

28 BORDER GATEWAY PROTOCOL

This chapter summarizes the *Border Gateway Protocol* (BGP) related configuration commands in the CLI command structure.

BGP is a routing protocol, which establishes routing between ISPs. ISPs use BGP to exchange routing information between *Autonomous Systems* (ASs) on the Internet. The routing information shared includes details, such as ASs traversed to a particular destination, reachable ASs, best paths available, network policies and rules applied on a route, etc. These details appear as BGP attributes carried in routing update packets. BGP uses this information to make routing decisions. Therefore, the primary role of a BGP system is to exchange routing information with other BGP peers.

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgement, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a *graceful* close (all outstanding data is delivered before the connection is closed). Routing information exchanged through BGP supports only destination-based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

An AS is a set of routers under the same administration that use *Interior Gateway Protocol* (IGP) and common metrics to define how to route packets within the AS. There are two types of BGP systems: *external BGP* (eBGP) and *internal BGP* (iBGP). iBGP represents the exchange of routing information between BGP peers within an AS. Whereas, when two BGP peers, belonging to different ASs, are connected you have an eBGP setup.

BGP peers (also referred to as neighbors) are BGP enabled devices that are directly connected through an established TCP connection. When two BGP enabled peers establish a TCP connection the first time, they exchange their BGP routing tables. All subsequent route table modifications are exchanged as route updates. BGP tracks these route updates by maintaining route table version numbers. With every update the version number changes. At any given point in time, all BGP peers should have the same route table version. The peer-to-peer TCP connections are kept alive through keepalive packets exchanged at specified intervals. Errors and special events are communicated between peers as notification packets.

This chapter is organized as follows:

- *bgp-ip-prefix-list-config commands*
- *bgp-ip-access-list-config commands*
- *bgp-as-path-list-config commands*
- *bgp-community-list-config commands*
- *bgp-extcommunity-list-config commands*
- *bgp-route-map-config commands*
- *bgp-router-config commands*
- *bgp-neighbor-config commands*

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

28.1 bgp-ip-prefix-list-config commands

► *BORDER GATEWAY PROTOCOL*

IP prefix lists are a convenient way to filter prefixes (contained in route update packets) transmitted to (or received from) other BGP supported routers. IP prefix lists are similar to access lists. They contain ordered entries (deny or permit prefix rules), identified by their sequence numbers. Each rule specifies match criteria (network and subnet prefixes and prefix masks) to match. When a prefix (received or transmitted) matches the prefix specified in one of the rules, it is filtered and an action is applied depending on where the IP prefix list is used. For example, when used in the BGP neighbor context, the prefixes received from the neighbor are filtered and the filtered prefixes are either rejected or accepted depending on the rule type (deny or permit).

IP prefix lists are also used in the BGP route map context to filter prefixes. The action applied, on filtered prefixes is set within the route map. Another use case for IP prefix lists is to filter prefixes before redistribution of local OSPF routes to eBGP enabled ASs.

Like in access lists, these deny and permit prefix rules are processed sequentially, in ascending order of their sequence number. Once a match is made, the BGP enabled router stops processing all subsequent rules in the ip-prefix-list.

IP prefix lists are used as match criteria in the following contexts:

- BGP neighbor. For more information, see *use*.
- BGP route-map context. For more information, see *match*.

To navigate to the ip-prefix-list configuration instance, use the following command:

```
<DEVICE>(config)#bgp ip-prefix-list <IP-PREFIX-LIST-NAME>

<DEVICE>(config-bgp-ip-prefix-list-test)#?
BGP IP Prefix List Mode commands:
deny      IP Prefix deny rule to specify packets to reject
no        Negate a command or set its defaults
permit    IP Prefix permit rule to specify packets to forward

The following table summarizes the BGP IP prefix list configuration commands:

Table 28.1 *BGP-IP-Prefix-List-Config Commands*

| Command | Description | Reference |
|----------------|--|------------------|
| <i>deny</i> | Creates and configures a deny prefix-list rule | <i>page 28-4</i> |
| <i>permit</i> | Creates and configures a permit prefix-list rule | <i>page 28-5</i> |
| <i>no</i> | Removes the specified deny or permit prefix-list rule from this IP prefix list | <i>page 28-6</i> |

28.1.1 deny

► *bgp-ip-prefix-list-config commands*

Creates and configures a deny prefix-list rule. The deny rule specifies match criteria based on which prefixes received from (or transmitted to) a BGP neighbor are filtered. A deny action is applied on these filtered prefixes. For example, in the BGP router neighbor context a filter is applied using a IP prefix list. The list contains a deny rule with a prefix to match as 192.168.13.0/24. All prefixes received from the neighbor matching this prefix are denied.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
deny prefix-list <1-4292967294> [<PREFIX-TO-MATCH/MASK>|any]

deny prefix-list <1-4292967294> [<PREFIX-TO-MATCH/MASK> {ge <0-32>|le <0-32>}|
any]
```

Parameters

- deny prefix-list <1-4292967294> [<PREFIX-TO-MATCH/MASK> {ge <0-32>|le <0-32>}|any]

| | |
|---|---|
| <pre>deny prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK> any]</pre> | <p>Creates and configures a deny prefix-list rule</p> <ul style="list-style-type: none"> • <1-4294967295> - Configures a sequence number for this deny rule. Specify a value from 1 - 4294967295. Within a prefix list, rules are applied in an ascending order of their sequence number. Rules with lower sequence number are applied first. • <PREFIX-TO-MATCH/MASK> - Specify the prefix to match. For example 10.0.0.0/8 or 192.168.13.0/24. Routes matching the specified prefix are filtered. <ul style="list-style-type: none"> • ge <0-32> - Optional. Specifies a greater than or equal to value for the IP prefix length (subnet mask) • le <0-32> - Optional. Specifies a less than or equal to value for the IP prefix length <p>The 'ge' and 'le' options specify a IP prefix length range. Use these options to specify a more specific (granular) prefix match criteria.</p> <ul style="list-style-type: none"> • any - Sets the prefix match criteria to <i>any</i>. When selected, all routes are filtered, and the action applied is deny. At the backend, this option sets the match criteria to <i>0.0.0.0/0 le 32</i>. |
|---|---|

Example

```
nx9500-6C8809 (config-bgp-ip-prefix-list-test)#deny prefix-list 1 168.192.13.0/24

nx9500-6C8809 (config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
  deny prefix-list 1 168.192.13.0/24
nx9500-6C8809 (config-bgp-ip-prefix-list-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes a deny prefix-list rule from this IP prefix list |
|-----------|--|

28.1.2 permit

► *bgp-ip-prefix-list-config commands*

Creates and configures a permit prefix-list rule. The permit rule specifies match criteria based on which prefixes received from (or transmitted to) a BGP neighbor are filtered. A permit action is applied on these filtered prefixes. For example, in the BGP router neighbor context a filter is applied using a IP prefix list. The list contains a permit rule with a prefix to match as 172.168.10.0/24. All prefixes received from the neighbor matching this prefix are permitted.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
permit prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK>|any]
```

Parameters

- `permit prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK>|any]`

| | |
|---|---|
| <pre>deny prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK> any]</pre> | <p>Creates and configures a permit prefix-list rule</p> <ul style="list-style-type: none"> • <code><1-4294967295></code> - Configures a sequence number for this permit rule. Specify a value from 1 - 4294967295. Within a prefix list, rules are applied in an ascending order of their sequence number. Rules with lower sequence number are applied first. • <code><PREFIX-TO-MATCH/MASK></code> - Specify the prefix to match. For example 10.0.0.0/8 or 192.168.13.0/24. Routes matching the specified prefix are filtered. <ul style="list-style-type: none"> • <code>ge</code> - Optional. Specifies a greater than or equal to value for the IP prefix length (subnet mask) • <code>le</code> - Optional. Specifies a less than or equal to value for the IP prefix length <p>Use the 'ge' and 'le' options to specify a IP prefix length range. Use these options to specify a more specific (granular) prefix match criteria.</p> <ul style="list-style-type: none"> • <code>any</code> - Sets the prefix match criteria to <i>any</i>. When selected, all routes are filtered, and the action applied is permit. At the backend, this option sets the match criteria to <i>0.0.0.0/0 le 32</i>. |
|---|---|

Example

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#permit prefix-list 2 172.122.10.0/24

nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
deny prefix-list 1 168.192.13.0/24
permit prefix-list 2 172.122.10.0/24
nx9500-6C8809(config-bgp-ip-prefix-list-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a permit prefix rule from this IP prefix list |
|-----------|---|

28.1.3 no

► *bgp-ip-prefix-list-config commands*

Removes the specified deny or permit prefix-list rule from this IP prefix list

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no [deny|permit]
```

```
no [deny|permit] prefix-list <1-4294967295> {<PREFIX-TO-MATCH/MASK>|any}
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes a deny or permit rule from this IP prefix list |
|-----------------|--|

Example

The following example shows the IP prefix list 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
  deny prefix-list 1 168.192.13.0/24
  permit prefix-list 2 172.122.10.0/24
nx9500-6C8809(config-bgp-ip-prefix-list-test)#
```

The following example shows the IP prefix list 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#no deny prefix-list 1 168.192.13.0/24

nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
  permit prefix-list 2 172.122.10.0/24
nx9500-6C8809(config-bgp-ip-prefix-list-test)#
```

28.2 bgp-ip-access-list-config commands

► BORDER GATEWAY PROTOCOL

BGP peers and route maps can reference a single IP based *access control list* (ACL). Apply IP ACLs to both inbound and outbound route updates. When applied to a BGP enabled router, every route update is passed through the ACL. Each ACL contains deny and permit entries that are applied sequentially, in the order they appear within the list. When a route matches an entry, the decision to permit or deny the route is applied. Once a match is made the remaining entries in the ACL are not processed.

BGP IP ACLs are used as match criteria in the following contexts:

- BGP neighbor. For more information, see [use](#).
- BGP route-map context. For more information, see [match](#).

To navigate to the BGP IP ACL configuration instance, use the following command:

```
<DEVICE>(config)#bgp ip-access-list <IP-ACL-NAME>

<DEVICE>(config-bgp-ip-access-list-<IP-ACL-NAME>)#?
BGP IP Access List Mode commands:
deny      Specify packets to reject
no        Negate a command or set its defaults
permit    Specify packets to forward

clrscr    Clears the display screen
commit    Commit all changes made in this session
do        Run commands from Exec mode
end        End current mode and change to EXEC mode
exit      End current mode and down to previous mode

write     Write running configuration to memory or terminal

<DEVICE>(config-bgp-ip-access-list-<IP-ACL-NAME>)#
```

The following table summarizes the BGP IP access list configuration commands:

Table 28.2 BGP-IP-ACL-Config Commands

| Command | Description | Reference |
|---------------|--|----------------------------|
| <i>deny</i> | Creates and configures a deny entry rule for this BGP IP ACL | page 28-8 |
| <i>permit</i> | Creates and configures a permit entry for this BGP IP ACL | page 28-9 |
| <i>no</i> | Removes a deny or permit entry from this BGP IP ACL | page 28-10 |

28.2.1 deny

► *bgp-ip-access-list-config commands*

Creates and configures a deny entry for this BGP IP ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]
```

Parameters

- deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]

| | |
|---|--|
| deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match} any] | Creates and configures a deny entry for this BGP IP ACL <ul style="list-style-type: none"> • <PREFIX-TO-MATCH/MASK> - Specify the prefix to match. <ul style="list-style-type: none"> • exact-match - Optional. Enables an exact match of the prefix provided in the previous step. When configured, the route is denied only in case of an exact match. • any - Specifies the prefix to match as 'any'. |
|---|--|

Example

```
nx9500-6C8809(config-bgp-ip-access-list-test)#deny access-list 192.168.13.0/24
exact-match

nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
  deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the specified the deny entry in this IP BGP ACL |
|-----------|---|

28.2.2 permit

► *bgp-ip-access-list-config commands*

Creates and configures a permit entry for this BGP IP ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]
```

Parameters

- permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]

| | |
|---|--|
| permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match} any] | <p>Creates and configures a permit entry for this BGP IP ACL</p> <ul style="list-style-type: none"> • <PREFIX-TO-MATCH/MASK> - Specify the prefix to match. <ul style="list-style-type: none"> • exact-match - Optional. Enables an exact match of the prefix provided in the previous step. When configured, the route is permitted only in case of an exact match. • any - Specifies the prefix to match as 'any'. |
|---|--|

Example

```
nx9500-6C8809(config-bgp-ip-access-list-test)#permit access-list 172.168.10.0/24

nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
  permit access-list 172.168.10.0/24
  deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the specified the permit entry in this IP BGP ACL |
|-----------|---|

28.2.3 no

► *bgp-ip-access-list-config commands*

Removes a deny or permit entry from this BGP IP ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no [deny|permit]
```

```
no [deny|permit] access-list [<PREFIX-TO-MATCH/MASK>|any]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes a deny or permit entry from this BGP IP ACL |
|-----------------|---|

Example

The following example shows the BGP IP ACL 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
  permit access-list 172.168.10.0/24
  deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```

```
nx9500-6C8809(config-bgp-ip-access-list-test)#no permit access-list 172.168.10.0/24
```

The following example shows the BGP IP ACL 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
  deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```

28.3 bgp-as-path-list-config commands

► *BORDER GATEWAY PROTOCOL*

BGP enabled devices use routing updates to exchange network routing information with each other. This information includes route details, such as the network number, path specific attributes, and the list of *Autonomous System Numbers* (ASNs) that a route traverses to reach a destination. This list is contained in the *AS path*.

An AS path *access control list* (ACL) filters AS paths (routes) included in routing updates. Each AS path access list consists of deny and/or permit rules that define regular expressions (match criteria). When configured and applied on inbound and outbound routing updates, the BGP AS path attributes are matched against the regular expressions specified in the AS path ACL. In case of a match, the route is filtered and an action (deny or permit) is applied. Once a match is made subsequent rules in the AS path access list are not processed.

AS path access lists also help prevent looping within an AS. Routing loops are prevented by rejecting routing updates containing local ASNs. Since local ASNs indicate that the route has already traveled through that autonomous system, by rejecting them looping is avoided.

AS path access lists are used as match criteria in the following contexts:

- BGP neighbor. For more information, see *use*.
- BGP route map context. For more information, see *match*.

To navigate to the AS path configuration instance, use the following command:

```
<DEVICE>(config)#bgp as-path <AS-PATH-LIST-NAME>

<DEVICE>(config-bgp-as-path-list-<AS-PATH-LIST-NAME>)#?
BGP AS Path List Mode commands:
  deny      Specify packets to reject
  no        Negate a command or set its defaults
  permit    Specify packets to forward

  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode

```

The following table summarizes the BGP AS path list configuration commands:

Table 28.3 *BGP-AS-Path-List-Config Commands*

| Command | Description | Reference |
|---------------|---|-------------------|
| <i>deny</i> | Creates and configures a deny as-path-list rule | <i>page 28-12</i> |
| <i>permit</i> | Creates and configures a permit as-path-list rule | <i>page 28-13</i> |
| <i>no</i> | Removes a deny or permit rule from this AS path ACL | <i>page 28-14</i> |

28.3.1 deny

► *bgp-as-path-list-config commands*

Creates and configures a deny as-path-list rule. The deny rule specifies a regular expression to match. This regular expression, a string against the BGP AS paths contained in routing updates. AS paths matching the provided string are filtered and a deny action is applied.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
deny as-path <REG-EXP>
```

Parameters

- deny as-path <REG-EXP>

| | |
|------------------------|---|
| deny as-path <REG-EXP> | <p>Configures a match criteria (regular expression).</p> <ul style="list-style-type: none"> • <REG-EXP> - Specify the regular expression to match (should not exceed 64 characters and should be unique to the AS path list rule) <p>Regular expressions are treated as a 'ASCII string' and not as a sequence of numbers. Create a regular expression ideally suited to filter the required AS paths.</p> |
|------------------------|---|

Usage Guidelines

The following table lists some of the characters used in forming regular expressions:

| Character to use | Description |
|------------------|---|
| ^ | Indicates the start of a string |
| \$ | Indicates the end of a string |
| _ (underscore) | Indicates a comma, left brace, right brace, start and end of an input string, or a space. For example, “_ _”. |

Example

```
nx9500-6C8809(config-bgp-as-path-list-test)#deny as-path ^100$

nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
  deny as-path ^100$
nx9500-6C8809(config-bgp-as-path-list-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the specified deny as-path ACL rule |
|-----------|---|

28.3.2 permit

► *bgp-as-path-list-config commands*

Creates and configures a permit as-path-list rule. The permit rule specifies a regular expression to match. This regular expression is matched against the BGP AS paths contained in routing updates. AS paths matching the provided string are filtered and a permit action is applied.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
permit as-path <REG-EXP>
```

Parameters

- permit as-path <REG-EXP>

| | |
|-----------------------------|--|
| permit as-path <REG-EXP> | Configures a match criteria (regular expression). <ul style="list-style-type: none"> • <REG-EXP> - Specify the regular expression to match (should not exceed 64 characters and should be unique to the AS path list rule) Regular expressions are treated as a 'ASCII string' and not as a sequence of numbers. Create a regular expression which is ideally suited to filter the required AS paths. |
|-----------------------------|--|

Usage Guidelines

The following table lists some of the characters used in forming regular expressions:

| Character to use | Description |
|------------------|---|
| ^ | Indicates the start of a string |
| \$ | Indicates the end of a string |
| _ (underscore) | Indicates a comma, left brace, right brace, start and end of an input string, or a space. For example, “_ _”. |

Example

```
nx9500-6C8809(config-bgp-as-path-list-test)#permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#permit as-path _323_
nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _323_
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the specified permit as-path ACL rule |
|-----------|---|

28.3.3 no

► *bgp-as-path-list-config commands*

Removes a deny or permit rule from this AS path ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no as-path-list [deny|permit] <REG-EXP>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes a deny or permit rule from this AS path ACL |
|-----------------|---|

Example

```
nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _323_
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#

nx9500-6C8809(config-bgp-as-path-list-test)#no permit as-path _323_

nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#
```

28.4 bgp-community-list-config commands

► *BORDER GATEWAY PROTOCOL*

Creates and configures a named community list

IP BGP routes have a set of attributes, mandatory and optional. The community and extended community attributes are optional. Optional attributes are specified by network administrators to mark (color) routes received in updates containing these attributes. These marked routes are filtered and special actions applied (accepted, preferred, distributed, or advertised). For example, the NO_EXPORT community, indicates that routes attached to it are local and not to be advertised to external ASs. Similarly, a set of routes using a common routing policy can be tagged to a community, and the policy applied to the community.

A BGP community is a group of routes sharing common attributes. Route updates contain community information in the form of path attributes. These attributes help identify community members.

A BGP community list is a list of deny or permit entries. It is either assigned a name (regular expressions, predefined community names) or a number. Assigning names to communities increases the number of configurable community lists. All rules applicable to numbered communities apply to named communities too. The only difference being in the number of attributes configurable for a named community list.

Since the community attribute is optional, it is shared only between devices that understand communities and are configured to handle communities. By default the community attribute is not sent to neighbors unless the send-community command option is enabled in the BGP neighbor context. For more information, see *send-community*.

Some of the predefined, globally used communities are:

- no-export – Routes tagged to this community are not advertised to external BGP peers
- no-advertise – Routes tagged to this community are not advertised to any BGP peers
- local-as – Routes tagged to this community are not advertised outside the local AS
- internet – Routes tagged to this community are advertised to the internet community. By default all BGP enabled devices belong to this community.

BGP community lists are used in the following context as match clauses:

- BGP route map context. For more information, see *match*.

To navigate to the BGP community configuration instance, use the following command:

```
<DEVICE>(config)#bgp community-list <COMMUNITY-LIST-NAME>

<DEVICE>(config-bgp-community-list-<COMMUNITY-LIST-NAME>)#?
BGP Community List Mode commands:
deny      Add a BGP Community List deny rule to Specify community to reject
no        Negate a command or set its defaults
permit    Add a BGP Community List permit rule to Specify community to accept

clrscr    Clears the display screen
commit    Commit all changes made in this session
do        Run commands from Exec mode
end       End current mode and change to EXEC mode
exit      End current mode and down to previous mode
help      Description of the interactive help system
revert    Revert changes
service   Service Commands
```

```

show      Show running system information
write     Write running configuration to memory or terminal

```

```
<DEVICE> (config-bgp-community-list-<COMMUNITY-LIST-NAME>) #
```

The following table summarizes the BGP community list configuration commands:

Table 28.4 *BGP-Community-List-Config Commands*

| Command | Description | Reference |
|---------------|--|-------------------|
| <i>deny</i> | Creates and configures a deny community (expanded or standard) rule | <i>page 28-17</i> |
| <i>permit</i> | Creates and configures a permit community (expanded or standard) rule | <i>page 28-19</i> |
| <i>no</i> | Removes an existing deny or permit community rule from this community list | <i>page 28-21</i> |

28.4.1 deny

► *bgp-community-list-config commands*

Creates and configures a deny community (expanded or standard) rule

Standard community lists specify known communities and community numbers. Expanded community lists filter communities using a regular expression that specifies patterns to match the attributes of different communities.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
deny community [expanded|standard]
```

```
deny community expanded <LINE>
```

```
deny community standard [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

- deny community expanded <LINE>

| | |
|--|--|
| deny community expanded <LINE> | Configures a deny expanded community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the community attributes. <ul style="list-style-type: none"> • <LINE> – Provide the regular expression. |
| <ul style="list-style-type: none"> • deny community standard [AA:NN internet local-AS no-advertise no-export] | |
| deny community standard [AA:NN internet local-AS no-advertise no-export] | Configures a deny standard community list entry and associates it with a predefined, globally used, known community or community number. The options are: <ul style="list-style-type: none"> • aa:nn - Configures the community number. The first part (aa) represents the AS number. The second part (nn) represents a 2-byte number. • internet – Advertises this route to the internet community • local-AS – Prevents transmission of this route outside the local AS • no-advertise – Prevents advertisement of this route to any peer (internal or external) • no-export – Prevents advertisement of this route to external BGP peers (keeping this route within an AS) |

Example

```

nx9500-6C8809(config-bgp-community-list-test)#deny community expanded 100

nx9500-6C8809(config-bgp-community-list-test)#show context
bgp community-list test

| <i>no</i> | Removes the specified deny community rule from this community list |
|-----------|--|

28.4.2 permit

► *bgp-community-list-config commands*

Creates and configures a permit community (expanded or standard) rule

Standard community lists specify known communities and community numbers. Expanded community lists filter communities using a regular expression that specifies patterns to match the attributes of different communities.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
permit community [expanded|standard]
permit community expanded <LINE>
permit community standard [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

- permit community expanded <LINE>

| | |
|----------------------------------|---|
| permit community expanded <LINE> | Configures a permit expanded community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the community attributes. <ul style="list-style-type: none"> • <LINE> – Provide the regular expression. |
|----------------------------------|---|

- permit community standard [AA:NN|internet|local-AS|no-advertise|no-export]

| | |
|---|--|
| permit community standard [AA:NN internet local-AS no-advertise no-export] | Configures a permit standard community list entry and associates it with a predefined, globally used, known community or community number. The options are: <ul style="list-style-type: none"> • aa:nn – Configures the community number. The first part (aa) represents the AS number. The second part (nn) represents a 2-byte number. • internet – Advertises this route to the internet community • local-AS – Prevents transmission of this route outside the local AS • no-advertise – Prevents advertisement of this route to any peer (internal or external) • no-export – Prevents advertisement of this route to external BGP peers (keeping this route within an AS) |
|---|--|

Example

```
nx9500-6C8809(config-bgp-community-list-test)#permit community expanded 300
nx9500-6C8809(config-bgp-community-list-test)# show context
bgp community-list test

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the specified permit community rule from this community list |
|-----------|--|

28.4.3 no

► *bgp-community-list-config commands*

Removes a deny or permit community rule from this community list

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no [deny|permit] community expanded <LINE>
```

```
no [deny|permit] community standard [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Removes a deny or permit expanded community rule from this community list |
| | • <LINE> - Specify the regular expression associated with the rule. |

Example

The following example shows the settings of the community list 'test' before the 'no' command is executed:

```
nx9500-6C8809(config-bgp-community-list-test)#show context
bgp community-list test
  permit community expanded 300
  deny community expanded 100
nx9500-6C8809(config-bgp-community-list-test)#
```

```
nx9500-6C8809(config-bgp-community-list-test)#no deny community expanded 100
```

The following example shows the settings of the community list 'test' after the 'no' command is executed:

```
nx9500-6C8809(config-bgp-community-list-test)#show context
bgp community-list test
  permit community expanded 300
nx9500-6C8809(config-bgp-community-list-test)#
```

28.5 bgp-extcommunity-list-config commands

► *BORDER GATEWAY PROTOCOL*

Creates and configures a named extended community list

A BGP extended community is a group of routes sharing a common attribute, regardless of their network or physical boundary. By using a BGP extended community attribute, routing policies can implement inbound or outbound route filters based on the extended community tag, rather than a long list of individual permit or deny rules. A BGP extended community list is used to create groups of communities to use in a match clause of a route map. An extended community list is used to control which routes are accepted, preferred, distributed, or advertised.

The BGP extended community and standard community attributes are identical in function and structure, except that the former is an eight octet and the latter is a four octet attribute.

BGP extended community lists are used as match clauses in the following context:

- BGP route map context. For more information, see *match*.

To navigate to the extended community configuration instance, use the following command:

```
<DEVICE>(config)#bgp extcommunity-list <EXTCOMMUNITY-LIST-NAME>

<DEVICE>(config-bgp-extcommunity-list-<EXTCOMMUNITY-LIST-NAME>)#?
BGP Extcommunity List Mode commands:
deny      Add a BGP Community List deny rule to specify extcommunity to
          reject
no        Negate a command or set its defaults
permit    Add a BGP Community List permit rule to specify extcommunity to
          accept

clrscr    Clears the display screen
commit    Commit all changes made in this session
do        Run commands from Exec mode
end       End current mode and change to EXEC mode
exit      End current mode and down to previous mode
help      Description of the interactive help system
revert    Revert changes
service   Service Commands
show      Show running system information
write     Write running configuration to memory or terminal

<DEVICE>(config-bgp-extcommunity-list-<EXTCOMMUNITY-LIST-NAME>)#
```

The following table summarizes the BGP extended community list configuration commands:

Table 28.5 *BGP-Extcommunity-List-Config Commands*

| Command | Description | Reference |
|---------------|--|-------------------|
| <i>deny</i> | Creates and configures a deny extended community (expanded or standard) rule | <i>page 28-23</i> |
| <i>permit</i> | Creates and configures a permit extended community (expanded or standard) rule | <i>page 28-25</i> |
| <i>no</i> | Removes an existing deny or permit extended community rule from this extcommunity list | <i>page 28-27</i> |

28.5.1 deny

► *bgp-extcommunity-list-config commands*

Creates and configures a deny extended community (expanded or standard) rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
deny extcommunity [expanded|standard]
deny extcommunity expanded <LINE>
deny extcommunity standard [rt|soo] <COMMUNITY-NUMBER>
```

Parameters

- deny extcommunity expanded <LINE>

| | |
|-----------------------------------|---|
| deny extcommunity expanded <LINE> | Configures a deny expanded named extended community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the extended community attributes. <ul style="list-style-type: none"> • <LINE> - Provide the regular expression. |
|-----------------------------------|---|

- deny extcommunity standard [rt|soo] <COMMUNITY-NUMBER>

| | |
|--|--|
| deny extcommunity standard [rt soo] <COMMUNITY-NUMBER> | Configures a deny standard named extended community list entry. and associates it with the target or origin community attributes. <ul style="list-style-type: none"> • rt - Configures the <i>route target</i> (RT) extended community attribute • soo - Configures the <i>site-of-origin</i> (SOO) extended community attribute <ul style="list-style-type: none"> • <COMMUNITY-NUMBER> - Specify the community number in one of the following formats: <i>AA:NN</i> or <i>A.B.C.D:NN</i> |
|--|--|

Example

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#deny extcommunity standard rt
200:12

nx9500-6C8809(config-bgp-extcommunity-list-test)#show context

28.5.2 permit

► *bgp-extcommunity-list-config commands*

Creates and configures a permit extended community (expanded or standard) rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
permit extcommunity [expanded|standard]
permit extcommunity expanded <LINE>
permit extcommunity standard [rt|soo] <COMMUNITY-NUMBER>
```

Parameters

- `permit extcommunity expanded <LINE>`

| | |
|--|---|
| <pre>permit extcommunity expanded <LINE></pre> | <p>Configures a permit expanded named extended community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the extended community attributes.</p> <ul style="list-style-type: none"> • <code><LINE></code> - Provide the regular expression. |
|--|---|

- `permit extcommunity standard [rt|soo] <COMMUNITY-NUMBER>`

| | |
|--|--|
| <pre>permit extcommunity standard [rt soo] <COMMUNITY- NUMBER></pre> | <p>Configures a permit standard named extended community list entry. and associates it with the target or origin community attributes.</p> <ul style="list-style-type: none"> • <code>rt</code> - Configures the RT extended community attribute • <code>soo</code> - Configures the SOO extended community attribute • <code><COMMUNITY-NUMBER></code> - Specify the community number in one of the following formats: <i>AA:NN</i> or <i>A.B.C.D:NN</i> |
|--|--|

Example

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#permit extcommunity standard rt
192.168.13.13:12

nx9500-6C8809(config-bgp-extcommunity-list-test)#show context
bgp extcommunity-list test
  permit extcommunity standard rt 192.168.13.13:12
  deny extcommunity standard rt 200:12
nx9500-6C8809(config-bgp-extcommunity-list-test)#

28.5.3 no

► *bgp-extcommunity-list-config commands*

Removes an existing deny or permit extended community rule from this extcommunity list

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no [deny|permit] extcommunity expanded <LINE>
no [deny|permit] extcommunity standard [rt|soo] <COMMUNITY-NUMBER>
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes a deny or permit expanded extended community rule from this community list |
|-----------------|--|

Example

The following example shows the extended community 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#show context
bgp extcommunity-list test
  permit extcommunity standard rt 192.168.13.12
  deny extcommunity standard rt 200:12
nx9500-6C8809(config-bgp-extcommunity-list-test)#
```

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#no permit extcommunity standard
192.168.13.12
```

The following example shows the extended community 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#show context
bgp extcommunity-list test
  deny extcommunity standard rt 200:12
nx9500-6C8809(config-bgp-extcommunity-list-test)#
```

28.6 bgp-route-map-config commands

► *BORDER GATEWAY PROTOCOL*

BGP route maps are used to control and modify routing information. A BGP route map is a collection of deny and/or permit route rules that define and control redistribution of routes between routers and routing processes. Each rule consists of match criteria and set lines. If a route matches a criteria, the corresponding set line is applied, and the route is passed to the BGP table or to the neighbor, depending on whether the route map is set for incoming or outgoing route updates.

Use the (config) instance to configure BGP route map related parameters.

To navigate to this instance, use the following command:

```
<DEVICE>(config)#route-map <ROUTE-MAP-NAME>
```

```
<DEVICE>(config)#route-map test
<DEVICE>(config-dr-route-map-test)#?
Route Map Mode commands:
  deny      Add a deny route map rule to deny set operations
  no        Negate a command or set its defaults
  permit    Add a permit route map rule to permit set operations

  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
  service   Service Commands
  show      Show running system information
  write     Write running configuration to memory or terminal
```

```
<DEVICE>(config-dr-route-map-test)#
```

In the route-map configuration mode, use the following commands to create and configure a deny or permit route map rule:

```
<DEVICE>(config-dr-route-map-test)#deny route-map <1-65535>
<DEVICE>(config-dr-route-map-test)#permit route-map <1-65535>
```

For example:

```
<DEVICE>(config-dr-route-map-test)#permit route-map 1
<DEVICE>(config-dr-route-map-test)#deny route-map 2
```

```
<DEVICE>(config-dr-route-map-test)#show context
route-map test
  permit route-map 1
  deny route-map 2
<DEVICE>(config-dr-route-map-test)#
```

```

<DEVICE>(config-dr-route-map-test-dr-route-map-rule-1)#?
Route Map Rule Mode commands:
  description  Configure comment for this route map
  match        Match values from routing table
  no           Negate a command or set its defaults
  set          Set values in destination routing protocol

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

<DEVICE>(config-dr-route-map-test-dr-route-map-rule-1)#

```

The following table summarizes BGP deny/permit route map rules configuration mode commands:

Table 28.6 *BGP-Route-Map-Config-Mode Commands*

| Command | Description | Reference |
|--------------------|--|-------------------|
| <i>description</i> | Configures a description for this route-map rule (deny or permit) that uniquely distinguishes it from others with similar access permissions | <i>page 28-30</i> |
| <i>match</i> | Configures the match criteria associated with this deny or permit BGP route map | <i>page 28-31</i> |
| <i>no</i> | Removes or reverts the settings defined for a deny or permit route-map rule | <i>page 28-34</i> |
| <i>set</i> | Configures the values attributed to a route matching the match criteria specified in the BGP deny or permit route-map rules | <i>page 28-35</i> |

28.6.1 description

► *bgp-route-map-config commands*

Configures a description for this route map rule (deny or permit) that uniquely distinguishes it from others with similar access permissions

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
description <LINE>
```

Parameters

- description <LINE>

| | |
|--------------------|--|
| description <LINE> | Provide a description for the route map rule (should not exceed 64 characters in length) |
|--------------------|--|

Example

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#description "This is
a deny route map rule"

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#
```

Related Commands

| <i>no</i> | Removes this deny/permit route-map rule's description |
|-----------|---|

28.6.2 match

► *bgp-route-map-config commands*

Configures the match criteria associated with this deny or permit BGP route map

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
match [as-path|community|extcommunity|ip-address|ip-next-hop|ip-route-source|
metric|origin|tag]

match [as-path <AS-PATH-LIST-NAME>|community <COMMUNITY-LIST-NAME> {exact-
match}|extcommunity <EXTCOMMUNITY-LIST-NAME>]

match [ip-address|ip-next-hop|ip-route-source] [BGP-IP-ACCESS-LIST <BGP-ACL-
NAME>|prefix-list <PREFIX-LIST-NAME>]

match metric <0-4294967295>

match origin [egp|igp|incomplete]

match tag <0-65535>
```

Parameters

- match [as-path <AS-PATH-LIST-NAME>|community <COMMUNITY-LIST-NAME> {exact-match}|extcommunity <EXTCOMMUNITY-LIST-NAME>]

| | |
|---|---|
| as-path <AS-PATH-LIST-NAME> | Configures a BGP AS path list to match An AS path is a list of ASs a packet traverses to reach its destination. <ul style="list-style-type: none"> • <AS-PATH-LIST-NAME> - Specify the AS path list name (should be existing and configured) |
| community <COMMUNITY-LIST-NAME> {exact-match} | Configures the AS community list string to match <ul style="list-style-type: none"> • <COMMUNITY-LIST-NAME> - Specify the AS community list name (should be existing and configured). • exact-match - Optional. Does an exact match when matching the specified AS community string. This option is disabled by default. |
| extcommunity <EXTCOMMUNITY-LIST-NAME> | Configures the external community list string to match <ul style="list-style-type: none"> • <EXTCOMMUNITY-LIST-NAME> - Specify the external community list name (should be existing and configured). |
| <ul style="list-style-type: none"> • match [ip-address ip-next-hop ip-route-source] [BGP-IP-ACCESS-LIST <BGP-ACL-NAME> prefix-list <PREFIX-LIST-NAME>] | |
| match | Configures match criteria used to filter BGP routes when forwarding packets |
| ip-address [BGP-IP-ACCESS-LIST <BGP-ACL-NAME> prefix-list <PREFIX-LIST-NAME>] | Configures a string of IP addresses, in the route, to match The <i>IP Address</i> is a list of IP addresses in the route used to filter the route. Use one of the following options to provide a list of IP addresses: <ul style="list-style-type: none"> • BGP-IP-ACCESS-LIST <BGP-ACL-NAME> - Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured). • prefix-list <PREFIX-LIST-NAME> - Associates an existing IP address prefix list with this BGP route map. The <i>IP Address Prefix List</i> is a list of prefixes in the route used to filter route. Specify the prefix list name (should be existing and configured). |

| | |
|---|---|
| <pre>ip-next-hop [BGP-IP-ACCESS- LIST <BGP-ACL- NAME> prefix-list <PREFIX- LIST-NAME>]</pre> | <p>Configures the next-hop's IP address to match</p> <p>The <i>IP Next Hop</i> is a list of IP addresses used to filter routes based on the IP address of the next-hop in the route. Use one of the following options to provide next-hop's IP addresses:</p> <ul style="list-style-type: none"> • BGP-IP-ACCESS-LIST <BGP-ACL-NAME> – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured). • prefix-list <PREFIX-LIST-NAME> – Associates an existing IP next-hop prefix list with this BGP route map. The <i>IP Next Hop Prefix List</i> is a list of prefixes for the route's next-hop determining how the route is filtered. Specify the prefix list name (should be existing and configured). |
| <pre>ip-route-source [BGP-IP-ACCESS- LIST <BGP-ACL- NAME> prefix-list <PREFIX- LIST-NAME>]</pre> | <p>Configures the advertised route source IP address to match</p> <p>The <i>IP Route Source</i> is a list of IP addresses used to filter routes based on the advertised IP address of the source. Use one of the following options to provide route-source IP addresses:</p> <ul style="list-style-type: none"> • BGP-IP-ACCESS-LIST <BGP-ACL-NAME> – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured). • prefix-list <PREFIX-LIST-NAME> – Associates an existing IP route source prefix list with this BGP route map. The <i>IP Route Source Prefix List</i> is a list of prefixes used to filter routes based on the prefix list used for the source. Specify the prefix list name (should be existing and configured). |
| <ul style="list-style-type: none"> • match metric <0-4294967295> | |
| <pre>match metric <0-4294967295></pre> | <p>Defines the exterior metric, used for route map distribution, to match</p> <p>BGP uses a route table managed by the external metric defined. Setting a metric provides a dynamic way to load balance between routes of equal cost.</p> <ul style="list-style-type: none"> • <0-4294967295> – Specify the external metric value from 0 - 4294967295. |
| <ul style="list-style-type: none"> • match origin [egp igp incomplete] | |
| <pre>match origin [gp igp incomplete]</pre> | <p>Configures the source of the BGP route to match. Options include:</p> <ul style="list-style-type: none"> • egp – Matches if the origin of the route is from the <i>exterior gateway protocol</i> (eBGP). eBGP exchanges routing table information between hosts outside an autonomous system. • igp – Matches if the origin of the route is from the <i>interior gateway protocol</i> (iBGP). iBGP exchanges routing table information between routers within an autonomous system. • incomplete – Matches if the origin of the route is not identifiable |
| <ul style="list-style-type: none"> • match tag <0-65535> | |
| <pre>match tag <0-65535></pre> | <p>Configures the BGP route tag to match</p> <p>The <i>Tag</i> is a way to preserve a route's AS path information for routers in iBGP. This option is disabled by default.</p> <ul style="list-style-type: none"> • <0-65535> – Specify the iBGP route's tag from 0 - 65535. |

Example

The following examples show the configuration of match criteria for the deny route-map rule 1:

```

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#match as-path Filter
List_01

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#match ip-route-source
prefix-list PrefixList_01

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
  match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#

```

A permit route-map rule 2 is added to the BGP route-map "test".

```

nx9500-6C8809(config-dr-route-map-test)#permit route-map 2

```

A match criteria is added for the permit route-map rule 2.

```

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#match ip-next-hop
DL_01

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#show context
permit route-map 2
  match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#

```

The following example displays the BGP route-map "test" settings:

```

nx9500-6C8809(config-dr-route-map-test)#show context
route-map test
  deny route-map 1
  description "This is a deny route map rule"
  match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
  permit route-map 2
  match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test)#

```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes match criteria associated with a deny or permit route-map rule |
|-----------|--|

28.6.3 no

► *bgp-route-map-config commands*

Removes or reverts the settings defined for a deny or permit route-map rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no [description|match <PARAMETERS>|set <PARAMETERS>]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes the description configured for a deny or permit route-map rule |
|-----------------|--|

Example

The following example shows the 'deny route-map rule-1' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
  match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
  set aggregator-as 1 192.168.13.7
  set as-path exclude 20
  set ip next-hop peer-address
  set metric 300
  set local-preference 30
  set community internet
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#
```

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no match as-path
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no set aggregator-as
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no set metric
```

The following example shows the 'deny route-map rule-1' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
  match ip-route-source prefix-list PrefixList_01
  set as-path exclude 20
  set ip next-hop peer-address
  set local-preference 30
  set community internet
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#
```

The following example shows the route-map 'test' settings:

```
nx9500-6C8809(config-dr-route-map-test)#show context
route-map test
  deny route-map 1
    description "This is a deny route map rule"
    match ip-route-source prefix-list PrefixList_01
    set as-path exclude 20
    set ip next-hop peer-address
    set local-preference 30
    set community internet
  permit route-map 2
    match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test)#
```

28.6.4 set

► *bgp-route-map-config commands*

Configures the values attributed to a route matching the match criteria specified in the BGP deny or permit route-map rules. These attributes are applied before the route is sent out.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
set [aggregator-as|as-path|atomic-aggregate|comm-list|community|extcommunity|ip|
local-preference|metric|origin|originator-id|source-ip|tag|weight]

set aggregator-as <1-4294967295> <IP>

set as-path [exclude|prepend] <1-4294967295> {<1-4294967295>}

set atomic-aggregate

set comm-list delete <COMMUNITY-LIST-NAME>

set community [<COMMUNITY-NUMBER>|none]

set extcommunity [rt|soo] <EXTCOMMUNITY-NUMBER>

set ip next-hop [<IP>|peer-address]

set local-preference <0-4294967295>

set metric <0-4294967295>

set origin [egp|igp|incomplete]

set originatorid <IP>

set source-ip <IP>

set tag <0-65535>

set weight <0-4294967295>
```

Parameters

- set aggregator-as <1-4294967295> <IP>

| | |
|---------------------------------------|---|
| set aggregator-as <1-4294967295> <IP> | <p>Configures the BGP aggregator's ASN and IP address. Aggregates minimize the size of routing tables. Aggregation combines the characteristics of multiple routes and advertises them as a single route. The configured BGP aggregator settings are applied to filtered routes.</p> <ul style="list-style-type: none"> • <1-4294967295> – Specify the route aggregator's ASN from 1- 4294967295. This option is disabled by default. • <IP> – Specify the route aggregator's IP address. BGP allows the aggregation of specific routes into one route using an aggregate IP address. |
|---------------------------------------|---|

| | |
|--|---|
| <ul style="list-style-type: none"> • <code>set as-path [exclude prepend] <1-4294967295> {<1-4294967295>}</code> | |
| <pre>set as-path [exclude prepend] <1- 4294967295> {<1- 4294967295>}</pre> | <p>Configures the BGP transform AS path attribute to be applied to filtered routes</p> <ul style="list-style-type: none"> • <code>exclude</code> – Configures a single AS, or a list of ASs, excluded from the AS path • <code>prepend</code> – Configures a single AS, or a list of ASs, prepended to the AS path <ul style="list-style-type: none"> • <code><1-4294967295></code> – This keyword is common to the ‘exclude’ and ‘prepend’ parameters. Use it to specify the AS number. The ASs identified here are excluded or prepended depending on the option selected. <p>You can configure multiple ASNs.</p> |
| <ul style="list-style-type: none"> • <code>set atomic-aggregate</code> | |
| <pre>set atomic-aggregate</pre> | <p>Enables BGP atomic aggregate attributes</p> <p>When a BGP enabled wireless controller or service platform receives a set of overlapping routes from a peer, or if the set of routes selects a less specific route, then the local device must set this value when propagating the route to its neighbors. This option is disabled by default.</p> |
| <ul style="list-style-type: none"> • <code>set comm-list delete <COMMUNITY-LIST-NAME></code> | |
| <pre>set comm-list delete <COMMUNITY-LIST- NAME></pre> | <p>Deletes specified BGP communities. All communities matching the community list name string are deleted from the route.</p> <p>A BGP community is a group of routes sharing a common attribute.</p> <ul style="list-style-type: none"> • <code><COMMUNITY-LIST-NAME></code> – Specify the community list name. |
| <ul style="list-style-type: none"> • <code>set community [<COMMUNITY-NUMBER> none]</code> | |
| <pre>set community [<COMMUNITY- NUMBER> none]</pre> | <p>Configures a community attribute for this route</p> <ul style="list-style-type: none"> • <code><COMMUNITY-NUMBER></code> – Specify a community attribute. Use one of the following formats: <ul style="list-style-type: none"> • <code>internet</code> - Advertises this route to the Internet. This is a global community. • <code>local-AS</code> - Prevents the transmit of packets outside the local AS • <code>no-advertise</code> - Prevents advertisement of this route to any peer, either internal or external • <code>no-export</code> - Prevents advertisement of this route to BGP peers, keeping this route within an AS. • <code>aa:nn</code> - Configures the first part (aa) representing the AS number. The second part (nn) represents a 2-byte number. • <code>none</code> – Specifies community attribute as <i>none</i> |
| <ul style="list-style-type: none"> • <code>set extcommunity [rt soo] <EXTCOMMUNITY-NUMBER></code> | |
| <pre>set extcommunity [rt soo] <EXTCOMMUNITY- NUMBER></pre> | <p>Configures a extended community attribute for this route</p> <ul style="list-style-type: none"> • <code>rt</code> – Identifies the <i>route target</i> (rt) extended community • <code>soo</code> – Identifies the <i>site-of-origin</i> (soo) community. This is the origin community associated with the route reflector. <ul style="list-style-type: none"> • <code><EXTCOMMUNITY-NUMBER></code> – This keyword is common to the ‘rt’ and ‘soo’ parameters. Use it to specify the extended community number. |

| | |
|--|---|
| <ul style="list-style-type: none"> • <code>set ip next-hop [<IP> peer-address]</code> | |
| <code>set ip next-hop [<IP> peer-address]</code> | <p>Configures the next hop for this route. Use one of the following options to identify the next hop:</p> <ul style="list-style-type: none"> • <code><IP></code> - Specify the next hop's IP address • <code>peer-address</code> - Enables the identification of the next-hop address for peer devices. This option is disabled by default |
| <ul style="list-style-type: none"> • <code>set local-preference <0-4294967295></code> | |
| <code>set local-preference <0-4294967295></code> | <p>Configures the BGP local preference path attribute for this route map. When configured, enables the communication of preferred routes out of the AS between peers. This option is disabled by default</p> <ul style="list-style-type: none"> • <code><0-4294967295></code> - Specify the preference value from 0 - 4294967295. |
| <ul style="list-style-type: none"> • <code>set metric <0-4294967295></code> | |
| <code>set metric <0-4294967295></code> | <p>Configures a metric for the route</p> <p>BGP uses a route table managed by the external metric defined. Setting a metric provides a dynamic way to load balance between routes of equal cost.</p> <ul style="list-style-type: none"> • <code><0-4294967295></code> - Specify the metric from 0 - 4294967295. |
| <ul style="list-style-type: none"> • <code>set origin [egp igp incomplete]</code> | |
| <code>set origin [egp igp incomplete]</code> | <p>Configures the origin code for this BGP route map</p> <ul style="list-style-type: none"> • <code>egp</code> - Sets the origin of the route to eBGP • <code>igp</code> - Sets the origin of the route to iBGP • <code>incomplete</code> - Sets the origin of the route as not identifiable. Use this option if the route is from a source other than eBGP or iBGP. |
| <ul style="list-style-type: none"> • <code>set originatorid <IP></code> | |
| <code>set originatorid <IP></code> | <p>Configures this route map's originator IP address</p> |
| <ul style="list-style-type: none"> • <code>set source-ip <IP></code> | |
| <code>set source-ip <IP></code> | <p>Configures this route map's source IP address</p> <ul style="list-style-type: none"> • <code><IP></code> - Specify the IP address in the A.B.C.D format. |
| <ul style="list-style-type: none"> • <code>set tag <0-65535></code> | |
| <code>set tag <0-65535></code> | <p>Configures this route map's tag value</p> <p>The Tag is a way to preserve a route's AS path information for routers in iBGP.</p> <ul style="list-style-type: none"> • <code><0-65535></code> - Specify a tag value from 0 - 65535. |
| <ul style="list-style-type: none"> • <code>set weight <0-4294967295></code> | |
| <code>set weight <0-4294967295></code> | <p>Enables assignment of a weighted priority to the aggregate route</p> <ul style="list-style-type: none"> • <code><0-4294967295></code> - Specify a value from 0 - 4294967295. |

Example

```

28.7 bgp-router-config commands

► *BORDER GATEWAY PROTOCOL*

Use the (device-config) or (profile-config) instance to configure BGP router related parameters.

To navigate to the BGP router configuration instance, in the device-config mode, use the following commands:

```
<DEVICE>(config)#self
<DEVICE>(config-device-<MAC>)#router bgp
<DEVICE>config-device <MAC>-router-bgp)#

<DEVICE>config-device <MAC>-router-bgp)#?
Router BGP Mode commands:
  aggregate-address  Configure aggregate address
  asn                Configure local Autonomous System Number
  bgp                Border Gateway Protocol
  bgp-route-limit   Limit for number of routes handled by BGP process
  distance           Configure administrative distance
  ip                 Internet Protocol (IP)
  network            Configure a local network
  no                 Negate a command or set its defaults
  route- redistribute  Redistribute information from another routing protocol
  timers             Adjust routing timers

  clrscr             Clears the display screen
  commit             Commit all changes made in this session
  do                 Run commands from Exec mode
  end                End current mode and change to EXEC mode
  exit               End current mode and down to previous mode
  help               Description of the interactive help system
  revert             Revert changes
  service            Service Commands
  show               Show running system information
  write              Write running configuration to memory or terminal

<DEVICE>config-device <MAC>-router-bgp)#
```

When configured as a profile, the router settings are applied to all devices using the profile.

To navigate to the BGP router configuration instance, in the profile-config mode, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>

<DEVICE>(config-profile-<PROFILE-NAME>)#router bgp
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#

<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#?
Router BGP Mode commands:
  aggregate-address  Configure aggregate address
  asn                Configure local Autonomous System Number
  bgp                Border Gateway Protocol
  bgp-route-limit   Limit for number of routes handled by BGP process
  distance           Configure administrative distance
  ip                 Internet Protocol (IP)
  network            Configure a local network
  no                 Negate a command or set its defaults
  route- redistribute  Redistribute information from another routing protocol
  timers             Adjust routing timers

  clrscr             Clears the display screen
  commit             Commit all changes made in this session
  do                 Run commands from Exec mode
```

```

end                End current mode and change to EXEC mode
exit              End current mode and down to previous mode
help             Description of the interactive help system
revert          Revert changes
service         Service Commands
show           Show running system information
write          Write running configuration to memory or terminal

```

```
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#
```

The following table summarizes BGP router configuration mode commands:

Table 28.7 *BGP-Router-Config-Mode Commands*

| Command | Description | Reference |
|---------------------------|---|-------------------|
| <i>aggregate-address</i> | Creates and configures an aggregate address entry in the BGP database | <i>page 28-41</i> |
| <i>asn</i> | Configures this BGP router's ASN | <i>page 28-42</i> |
| <i>bgp</i> | Configures BGP router parameters | <i>page 28-43</i> |
| <i>bgp-route-limit</i> | Configures the BGP route limit parameters | <i>page 28-48</i> |
| <i>distance</i> | Configures administrative distance parameters | <i>page 28-49</i> |
| <i>ip</i> | Configures the BGP default gateway's priority | <i>page 28-50</i> |
| <i>network</i> | Configures the local network IP addresses and masks | <i>page 28-51</i> |
| <i>no</i> | Removes the BGP router settings | <i>page 28-52</i> |
| <i>route-redistribute</i> | Enables redistribution of routes learnt from other routing protocols into BGP | <i>page 28-53</i> |
| <i>timers</i> | Enables adjustment of keepalive and holdtime intervals | <i>page 28-55</i> |

28.7.1 aggregate-address

► *bgp-router-config commands*

Creates and configures an aggregate address entry in the BGP database

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
aggregate-address <IP/M> {as-set {summary-only}|summary-only}
```

Parameters

- aggregate-address <IP/M> {as-set {summary-only}|summary-only}

| | |
|-----------------------------|--|
| aggregate-address <IP/M> | Specify the aggregate IP address and mask |
| as-set {summary-only} | Optional. Summarizes the AS_PATH attributes of the individual routes aggregated <ul style="list-style-type: none"> • summary-only - Optional. Filters more specific routes from updates |

Example

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#aggregate-address
192.168.13.10/32 as-set summary-only
```

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 192.168.13.10/32 as-set summary-only
  bgp neighbor 192.168.13.199
  remote-as 1
  use route-map UnSupMap_01 in
  bgp neighbor 192.168.13.99
  remote-as 199
  timers connect 10
  timers 20 40
  maximum-prefix 9999 80 restart 50
  bgp neighbor 1.1.1.1
  remote-as 2
  timers connect 10
  timers 20 40
  maximum-prefix 1000000
  bgp-route-limit num-routes 10 reset-time 360
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```

Related Commands

| | |
|-----------|-------------------------------------|
| <i>no</i> | Removes the aggregate address entry |
|-----------|-------------------------------------|

28.7.2 asn

► *bgp-router-config commands*

Configures the ASN. The ASN represents a group of routers under the same administration and using IGP and common metrics to define how to route packets. In short the ASN represents all routers within an AS.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
asn <1-4294967295>
```

Parameters

- `asn <1-4294967295>`

| | |
|--------------------|--------------------------------------|
| asn <1-4294967295> | Specify the ASN from 1 - 4294967295. |
|--------------------|--------------------------------------|

Example

```
nx9500-6C8809(config-profile NX9500Profile-router-bgp)#asn 1
nx9500-6C8809(config-profile NX9500Profile-router-bgp)#show context
router bgp
  asn 1
nx9500-6C8809(config-profile NX9500Profile-router-bgp)#
```

28.7.3 bgp

► *bgp-router-config commands*

Configures BGP router parameters

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```

bgp [always-compare-med|bestpath|client-to-client|cluster-id|confederation|
dampening|default|deterministic-med|enable|enforce-first-as|fast-external-
failover|graceful-restart|log-neighbor-changes|neighbor|network|router-id|scan-
time]

bgp [always-compare-med|deterministic-med|enable|enforce-first-as|fast-external-
failover|log-neighbor-changes]

bgp best-path [as-path [confed|ignore]|compare-router-id|med {confed {missing-as-
worst}|missing-as-worst}]
bgp client-to-client reflection
bgp cluster <IP>
bgp confederation [identifier|peers] <1-4294967295>
bgp dampening {<1-45>} {<1-20000>} <1-20000> <1-255>
bgp default [ipv4-unicast|local-preference <0-4294967295>]
bgp graceful-restart {stalepath-time <1-3600>}
bgp neighbor <IP>
bgp network import-check
bgp router-id <IP>
bgp scan-time <5-60>

```

Parameters

- `bgp [always-compare-med|deterministic-med|enable|enforce-first-as|fast-external-failover|log-neighbor-changes]`

| | |
|--------------------|--|
| always-compare-med | <p>Enables comparison of <i>Multi-exit Discriminators</i> (MEDs) received from neighbors. This option is disabled by default.</p> <p>MED is a value used by BGP peers to select the best route among multiple routes. When enabled, the MED value encoded in the route is always compared when selecting the best route to the host network. A route with a lower MED value is preferred over a route with a higher MED value. BGP does not discriminate between iBGP and eBGP when using MED for route selection. This option is mutually exclusive to the <i>deterministic-med</i> option.</p> |
| deterministic-med | <p>Enables selection of the best MED path from amongst all paths advertised by neighboring ASs. This option is disabled by default.</p> <p>MED is used by BGP peers to select the best route among multiple routes. When enabled, MED route values (from the same AS) are compared to select the best route. This best route is then compared with other routes in the BGP route table to select the best overall route. This option is mutually exclusive to the <i>always-compare-med</i> option.</p> |
| enable | <p>Starts the BGP daemon on the device (wireless controller or service platform). BGP is disabled by default.</p> |
| enforce-first-as | <p>Enforces the first AS for all BGP routes. This option is disabled by default.</p> <p>When enforced, devices deny updates received from an external neighbor that does not have the neighbor's configured AS at the beginning of the received AS path parameter. This enhances security by not allowing traffic from an unauthorized AS.</p> |

| | |
|---|---|
| fast-external-failover | <p>Enables immediate resetting of BGP session on the interface once the BGP connection goes down. This option is enabled by default.</p> <p>When enabled, a session is reset as soon as the direct link to an external peer goes down. Normally, when a BGP connection goes down, the device waits for the expiry of the duration specified in <i>holdtime</i> parameter before bringing down the interface.</p> <p>To configure the 'holdtime', use the <i>timers > bgp > <keepalive-time> > <holdtime></i> command in this (BGP router) configuration mode.</p> |
| log-neighbor-changes | <p>Enables logging of a BGP neighbor's status change (active or not active) events. It also enables the logging of the reason for such change in status.</p> |
| <ul style="list-style-type: none"> • <code>bgp best-path [as-path [confed ignore] compare-router-id med {confed {missing-as-worst} missing-as-worst}]</code> | |
| best-path | <p>Modifies the bestpath selection algorithm. The route selection algorithm uses the following criteria when selecting the preferred route: as-path, router-id, and med.</p> |
| as-path [confed ignore] | <p>Enables an AS path from being considered as a criteria for selecting the preferred route</p> <ul style="list-style-type: none"> • <i>confed</i> – Enables comparison of path lengths (including confederation sets and sequences) when selecting a route (EXPERIMENTAL). This option is disabled by default. • <i>ignores</i> – Disables an AS path length from being considered as a criteria for selecting a preferred route. When, disabled the AS path length is ignored. This option is disabled by default. |
| compare-router-id | <p>Enables the use of router ID as a selection criteria when selecting the preferred route. When enabled, the router ID is used to select the best path between two identical BGP routes. The route with the lower router ID is selected over a route with a higher router ID. This option is disabled by default.</p> |
| med {confed {missing-as-worst} missing-as-worst} | <p>Enables comparison of AS path MED value when selecting the preferred route</p> <p>MED is a value used by BGP peers to select the best route among multiple routes. When enabled, the MED value encoded in the route is always compared to determine the best route to the host network. A route with a lower MED value is preferred over a route with a higher MED value.</p> <ul style="list-style-type: none"> • <i>confed</i> – Optional. Enables comparison of MED value among confederation paths (EXPERIMENTAL). When enabled, you can optionally enable the treatment of AS paths without the MED value as the least preferable route. This option is disabled by default. • <i>missing-as-worst</i> – Optional. Enables the treatment of AS paths without the MED value as the least preferable route. This option is disabled by default. |
| <ul style="list-style-type: none"> • <code>bgp client-to-client reflection</code> | |
| client-to-client reflection | <p>Enables client-to-client route reflection (EXPERIMENTAL)</p> <p>Route reflectors are used when all iBGP speakers are not fully meshed. If the clients are fully meshed, the route-reflectors are not required. This option is enabled by default.</p> |

| | |
|---|--|
| <ul style="list-style-type: none"> • <code>bgp cluster <IP></code> | |
| cluster <IP> | <p>Enables and sets a cluster ID, in case the BGP cluster has more than one route-reflector</p> <p>A cluster generally consists of a single route-reflector and its clients. The cluster is usually identified by the router ID of this single route-reflector. Sometimes, to increase redundancy, a cluster might have more than one route-reflector configured. In this case, all route-reflectors in the cluster are identified by the cluster ID (configured in the IP format).</p> |
| <ul style="list-style-type: none"> • <code>bgp confederation [identifier peers] <1-4294967295></code> | |
| confederation [identifier peers] <1-4294967295> | <p>Configures AS confederation (group of ASs) parameters (identifier and peers)</p> <ul style="list-style-type: none"> • identifier – Enables and sets a BGP confederation identifier to allow an AS to be divided into several ASs. In other words an AS is divided into multiple ASs, and together they form a confederation. This confederation is visible to external routers as a single AS. The ASN is usually the confederation ID. Specify a value from 1 - 4294967295. <p>Forming AS confederation reduces iBGP mesh inside an AS.</p> <ul style="list-style-type: none"> • peers – Configures the maximum number of the ASs constituting this BGP confederation. Specify the AS number from 1 - 4294967295. Multiple ASs can be added to the list of confederation members. |
| <ul style="list-style-type: none"> • <code>bgp dampening {<1-45>} {<1-20000>} <1-20000> <1-255></code> | |
| bgp dampening {<1-45>} {<1-20000>} <1-20000> <1-255> | <p>Enables dampening and configures dampening parameters. This option is disabled by default.</p> <p>Dampening minimizes the instability caused by route flapping. A penalty is added for every flap in the flapping route. As soon as the total penalty reaches the specified <i>Route Suppress Limit</i> value, the advertisement of this route is suppressed. This penalty is delayed when the time specified in <i>Half Lifetime</i> occurs. Once the penalty becomes lower than the value specified in <i>Start Route Reuse</i>, the advertisement of the route is un-suppressed.</p> <ul style="list-style-type: none"> • <1-45> – Optional. Configures the half lifetime (in minutes). A penalty is imposed on a route that flaps. This is the time for the penalty to decrease to half its current value. Specify a value from 1 - 45 minutes. The default is 1 minute. • <1-20000> – Optional. Configures the route reuse value. When the penalty for a suppressed route decays below the value specified here, the route is un-suppressed (reused). Specify a value from 1 - 20000. • <1-20000> – Configures the route suppress value. When a route flaps, a penalty is added to the route. When the penalty reaches or exceeds the value specified as the 'maximum duration to suppress a stable route'. Specify a value from 1 - 20000. <p>The maximum duration to suppress a stable route, is the next set of value configured in this command from 1 - 255.</p> <ul style="list-style-type: none"> • <1-255> – Configures the maximum duration, in minutes, a suppressed route is suppressed. This is the maximum duration for which a route remains suppressed before it is reused. Specify a value from 1 - 255 minutes. |
| <ul style="list-style-type: none"> • <code>bgp default [ipv4-unicast local-preference <0-4294967295>]</code> | |
| default | <p>Configures the following defaults for BGP neighbor-related parameters: IPv4 unicast and local preference</p> |

| | |
|---|--|
| ipv4-unicast | Enable IPv4 unicast traffic for neighbors. This option is enabled by default. |
| local-preference <0-4294967295> | Configures a local preference for the neighbor. Higher the value higher is the preference. <ul style="list-style-type: none"> <0-4294967295> – Specify a value from 0 - 4294967295. |
| <ul style="list-style-type: none"> • <code>bgp graceful-restart {stalepath-time <1-3600>}</code> | |
| default graceful-restart {stalepath-time <1-3600>} | Enables graceful restart on this BGP router. This option is disabled by default <ul style="list-style-type: none"> • <code>stalepath-time <1-3600></code> – Optional. Configures the maximum time, in seconds, to retain stale paths from restarting neighbor. This is the time the paths from a restarting neighbor are preserved. All stale paths, unless reinstated by the neighbor after re-establishment, are deleted at the expiry of the time specified here. • <1-3600> – Specify a value from 1 - 3600 seconds. |
| <ul style="list-style-type: none"> • <code>bgp neighbor <IP></code> | |
| neighbor <IP> | Configures the BGP neighbor's IP address and enters its configuration mode. Use this command to configure a BGP neighbor's parameters. <ul style="list-style-type: none"> • <IP> – Specify the IP address in the A.B.C.D format. For BGP neighbor configuration parameters, see bgp-neighbor-config commands . |
| <ul style="list-style-type: none"> • <code>bgp network import-check</code> | |
| network import-check | Enables checking of the existence of BGP network route in IGP before importing |
| <ul style="list-style-type: none"> • <code>bgp router-id <IP></code> | |
| router <IP> | Enables the device (BGP supported wireless controller or service platform) identified by the <IP> parameter as a router. The router's IP address is configured as its ID, and uniquely identifies it. When not specified, the IP address of the interface is configured as the router ID. This option is disabled by default. |
| <ul style="list-style-type: none"> • <code>bgp scan-time <5-60></code> | |
| scan-time <5-60> | Configures the scanning interval, in seconds, for updating BGP routes. This is the interval between two consecutive scans the BGP device performs in order to validate routes in its routing table. To disable scanning, set the value to Zero (0). <ul style="list-style-type: none"> • <5-60> – Specify a value from 5 - 60 seconds. The default is 60 seconds. |

Example

```

nx9500-6C8809(config-profile testNX9000-router-bgp)#bgp router-id 192.168.13.13
nx9500-6C8809(config-profile testNX9000-router-bgp)#aggregate-address
116.117.118.0/24 as-set summary-only
nx9500-6C8809(config-profile testNX9000-router-bgp)#bgp neighbor 192.168.13.99
nx9500-6C8809(config-profile testNX9000-router-bgp)#show context
router bgp
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp router-id 192.168.13.13
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
nx9500-6C8809(config-profile testNX9000-router-bgp)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the BGP router parameters. The <i>no > bgp > enable</i> command disabled BGP. |
|-----------|---|

28.7.4 bgp-route-limit

► *bgp-router-config commands*

Configures the BGP route limit parameters

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
bgp-route-limit [num-routes <VALUE>|reset-time <1-86400>|retry-count <1-32>|
retry-timeout <1-3600>]
```

Parameters

```
• bgp-route-limit [num-routes <VALUE>|reset-time <1-86400>|retry-count <1-32>|
retry-timeout <1-3600>]
```

| | |
|------------------------|--|
| num-routes <VALUE> | Configures the number of routes that can be stored on this BGP router. Set this value based on the available memory on this BGP router (wireless controller or service platform). <ul style="list-style-type: none"> • <VALUE> - Specify a value from 1 - 4,294,967,295. The default is 9216 routes. |
| reset-time <1-86400> | Configures the reset time in seconds. This is the time after which the <i>retry count</i> value is set to Zero (0). <ul style="list-style-type: none"> • <1-86400> - Specify a value from 1- 86,400 seconds. The default is 360 seconds. |
| retry-count <1-32> | Configures the maximum number of times the BGP process is reset before being permanently shut down. Once shut down, the BGP process has to be started manually. The BGP process is reset if it is flooded with route entries that exceed the maximum number of routes configured for this device. <ul style="list-style-type: none"> • <1-32> - Specify a value from 1 - 32. The default is 5 routes. |
| retry-timeout <1-3600> | Configures the duration, in seconds, the BGP process is temporarily shut down, before a reset of the process is attempted. <ul style="list-style-type: none"> • <1-3600> - Specify a value from 1 - 3600 seconds. The default is 60 seconds. |

Example

```
nx9500-6C8809(config-profile NX9500Profile-router-bgp)#bgp-route-limit num-routes
10

nx9500-6C8809(config-profile NX9500Profile-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10
nx9500-6C8809(config-profile NX9500Profile-router-bgp)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes BGP route limitations configured. Use the no command to revert back to default. |
|-----------|---|

28.7.5 distance

► *bgp-router-config commands*

Configures administrative distance parameters. The distance parameter is a rating of the trustworthiness of a route. The higher the distance, lower is the trust rating. The distance can be set for each type of route indicating its trust rating.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
distance [<IP/M> <1-255> <BGP-ACL-NAME>|bgp <1-255> <1-255> <1-255>]
```

Parameters

```
• distance [<IP/M> <1-255> <BGP-ACL-NAME>|bgp <1-255> <1-255> <1-255>]
```

| | |
|--|---|
| distance <IP/M> <1-255> <BGP-ACL-NAME> | Configures the default administrative distance, specified by the <1-255> parameter, when the route's source IP address matches the specified IP prefix- <ul style="list-style-type: none"> • <IP/M> - Specify the IP source prefix and prefix length. • <1-255> - Specify the distance from 1 - 255. • <BGP-ACL-NAME> - Optional. Specify the BGP access list name. |
| bgp <1-255> <1-255> <1-255> | Configures the default administrative distance for different route types <ul style="list-style-type: none"> • <1-255> - Configures the default administrative distance for routes external to this AS. Specify a value from 1 - 255. • <1-255> - Configures the default administrative distance for routes internal to this AS. Specify a value from 1 - 255. • <1-255> - Configures the default administrative distance for local routes. Specify a value from 1 - 255. |

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp)#distance bgp 200 100 200

nx9500-6C8809(config-profile testNX9000-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  distance bgp 200 100 200
  bgp neighbor 192.168.13.99
    remote-as 199
  maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10
nx9500-6C8809(config-profile testNX9000-router-bgp)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the administrative distance related configurations |
|-----------|--|

28.7.6 ip

► *bgp-router-config commands*

Configures the BGP default gateway's priority

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
ip default-gateway priority <1-8000>
```

Parameters

- ip default-gateway priority <1-8000>

| | |
|--------------------------------------|--|
| default-gateway priority <1-8000> | Configures the default gateway's (acquired through BGP) priority <ul style="list-style-type: none"> • <1-8000> - Specify a value from 1 - 8000. The default is 7500. Lower the value, higher is the priority. |
|--------------------------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp)#ip default-gateway priority 1
nx9500-6C8809(config-profile testNX9000-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  ip default-gateway priority 1
  bgp-route-limit num-routes 10
nx9500-6C8809(config-profile testNX9000-router-bgpp) #
```

Related Commands

|-----------|---|
| <i>no</i> | Removes the BGP default gateway configuration |
|-----------|---|

28.7.7 network

► *bgp-router-config commands*

Configures the local network IP addresses and masks. These network addresses are broadcasted to neighboring BGP peers. You can configure a single IP address or a range of IP addresses in the A.B.C.D/M notation.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
network <IP/M> {backdoor|pathlimit|route-map}

network <IP/M> {backdoor pathlimit <1-255>}
network <IP/M> {pathlimit <1-255>}
network <IP/M> {route-map <ROUTE-MAP-NAME>}
```

Parameters

- network <IP/M> {backdoor pathlimit <1-255>|pathlimit <1-255>|route-map <ROUTE-MAP-NAME>}

| | |
|----------------------------|--|
| network <IP/M> | Configures the local network's address in the A.B.C.D/M format <ul style="list-style-type: none"> • <IP/M> - Specify the network address. |
| backdoor pathlimit <1-255> | Optional. Configures a BGP backdoor route. After configuring the backdoor route, you can optionally configure the as-path hop count limit attribute for this backdoor route. <ul style="list-style-type: none"> • pathlimit <1-255> - Specify the hop count limit from 1 - 255. |
| pathlimit <1-255> | Optional. Configures the maximum path limit for this AS <ul style="list-style-type: none"> • <1-255> - Specify the hop count limit from 1 - 255. |
| route-map <ROUTE-MAP-NAME> | Optional. Associates a BGP route map with this local network. When applied, the route-map values take precedence <ul style="list-style-type: none"> • <ROUTE-MAP-NAME> - Specify the route map name. |

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp)#network 192.168.13.0/24
backdoor pathlimit 200

nx9500-6C8809(config-profile testNX9000-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  distance bgp 200 100 200
  bgp neighbor 192.168.13.99
    remote-as 199
  maximum-prefix 9999 80 restart 50
  network 1.2.3.0/24
  network 192.168.13.0/24 backdoor pathlimit 200
  bgp-route-limit num-routes 10
nx9500-6C8809(config-profile testNX9000-router-bgp)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the list of local networks configured |
|-----------|---|

28.7.8 no

► *bgp-router-config commands*

Removes the BGP router settings

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
no [aggregate-address|bgp|bgp-route-limit|distance|ip|network|route-redistribute|
timers]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---------------------------------|
| no <PARAMETERS> | Removes the BGP router settings |
|-----------------|---------------------------------|

Example

The following example shows the BGP router settings before the 'no' commands have been executed:

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10 reset-time 360
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no bgp neighbor
192.168.13.99
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no aggregate-address
116.117.118.0/24
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no bgp-route-limit
```

The following example shows the BGP router settings after the 'no' commands have been executed:

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```

28.7.9 route-redistribute

► *bgp-router-config commands*

Enables redistribution of routes learnt from other routing protocols into BGP

Large ISP networks using multiple routing protocols, need to enable redistribution of routes across routing protocols. Routing protocols differ in their basic characteristics, such as metrics, administrative distance, classful and classless capabilities, etc. When enabling redistribution, these differences have to be taken into consideration.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
route-redistribute [connected|kernel|ospf|static] {metric <0-4294967295>|route-
map <ROUTE-MAP-NAME>}
```

Parameters

- `route-redistribute [connected|kernel|ospf|static] {metric <0-4294967295>|route-map <ROUTE-MAP-NAME>}`

| | |
|--------------------|---|
| route-redistribute | Redistributes routes learnt from other protocols |
| connected | Redistributes directly connected routes <ul style="list-style-type: none"> • <code>metric <0-4294967295></code> - Optional. Specify the metric for the redistributed routes. • <code>route-map <ROUTE-MAP-NAME></code> - Optional. Specifies the route map name. The route map defines the match criteria based on which routes are filtered before redistribution. For more information on route maps, see match. |
| kernel | Redistributes kernel routes. These are routes that are neither connected, nor static, nor dynamic. <ul style="list-style-type: none"> • <code>metric <0-4294967295></code> - Optional. Specify the metric for the redistributed routes. • <code>route-map <ROUTE-MAP-NAME></code> - Optional. Specifies the route map name. The route map defines the match criteria based on which routes are filtered before redistribution. For more information on route maps, see match. |
| ospf | Redistributes OSPF routes <ul style="list-style-type: none"> • <code>metric <0-4294967295></code> - Optional. Specify the metric for the redistributed routes. • <code>route-map <ROUTE-MAP-NAME></code> - Optional. Specifies the route map name. The route map defines the match criteria based on which routes are filtered before redistribution. For more information on route maps, see match. |
| static | Redistributes static routes <ul style="list-style-type: none"> • <code>metric <0-4294967295></code> - Optional. Specify the metric for the redistributed routes. • <code>route-map <ROUTE-MAP-NAME></code> - Optional. Specifies the route map name. The route map defines the match criteria based on which routes are filtered before redistribution. For more information on route maps, see match. |

Example

```

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#route-redistribute
connected metric 200

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
    route-redistribute connected metric 200
  bgp-route-limit num-routes 10 reset-time 360
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#

```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables redistribution of routes learnt from other routing protocols into BGP |
|-----------|--|

28.7.10 timers

► *bgp-router-config commands*

Enables adjustment of keepalive and holdtime intervals

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
timers bgp <0-65535> <0-65535>
```

Parameters

- `timers bgp <0-65535> <0-65535>`

| | |
|---|--|
| <pre>timers bgp <0-65535> <0-65535></pre> | <p>Configures the keepalive and holdtime interval in seconds</p> <ul style="list-style-type: none"> • <code><0-65535></code> – Specify a keepalive interval from 0 - 65535 seconds. It is the interval, in seconds, between two successive keepalive packets exchanged with this router and its neighbor to keep the TCP connection alive. • <code><0-65535></code> – Specify a holdtime value from 0 - 65535 seconds. This is the time this router will wait without receiving a keepalive packet from its neighbor before declaring it dead. If the time since the last keepalive packet received (from its neighbor) exceeds the value set here, the neighbor is declared dead. |
|---|--|

Example

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#timers bgp 100 100

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
  timers bgp 100 100
  bgp-route-limit num-routes 10 reset-time 360
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```

Related Commands

| | |
|-----------|-------------------------------|
| <i>no</i> | Reverts BGP timers to default |
|-----------|-------------------------------|

28.8 bgp-neighbor-config commands

► *BORDER GATEWAY PROTOCOL*

BGP enabled devices connected through an established TCP connection are referred to as BGP peers or neighbors. To establish a TCP connection, BGP routers exchange open messages containing the following information: AS number, BGP version running, BGP router ID, and timer values (keepalive and holdtime). Once these values are accepted by both devices, the connection is established and the routers become neighbors. With the TCP connection established the BGP neighbors begin sharing routing information and updates. A failure in the establishment of the TCP connection indicates that the routers are not neighbors and cannot exchange routing information.

Use the (profile/device-config) instance to configure BGP neighbors.

To navigate to the BGP neighbor configuration instance, use the following commands:

```
<DEVICE>(config)#profile <PROFILE-NAME>

<DEVICE>(config-profile <PROFILE-NAME>)#router bgp
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#?

<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#bgp neighbor ?
  A.B.C.D  IP address of the bgp neighbor

<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#

<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#bgp neighbor <IP>
<DEVICE>(config-profile <PROFILE-NAME>-router--bgp-neighbor-<IP>)#?
Router BGP Neighbor Mode commands:
  activate                               Enable the Address Family for this Neighbor
                                         (EXPERIMENTAL)
  advertisement-interval                 Minimum interval between BGP routing updates
  allowas-in                             Accept as-path with my AS present in it
                                         (EXPERIMENTAL)
  attribute-unchanged                   BGP attribute is propagated unchanged to this
                                         neighbor (EXPERIMENTAL)
  capability                             Advertise capability to the peer
  default-originate                     Originate default route to this neighbor
  description                           Neighbor specific description
  disable-connected-check                One-hop away EBGp peer using loopback address
                                         (EXPERIMENTAL)
  dont-capability-negotiate              Do not perform capability negotiation
                                         (EXPERIMENTAL)
  ebgp-multihop                          Allow EBGp neighbors not on directly connected
                                         networks
  enforce-multihop                       Enforce EBGp neighbors perform multihop
                                         (EXPERIMENTAL)
  local-as                               Specify a local-as number (EXPERIMENTAL)
  maximum-prefix                         Maximum number of prefix accept from this peer
  next-hop-self                          Disable the next hop calculation for this
                                         neighbor
  no                                     Negate a command or set its defaults
  override-capability                   Override capability negotiation result
  passive                                Don't send open messages to this neighbor
  password                               Set a password
  peer-group                             Set peer-group for this neighbor (EXPERIMENTAL)
  port                                   Neighbor's BGP port (EXPERIMENTAL)
  remote-as                              Specify a BGP neighbor
  remove-private-as                     Remove private AS number from outbound updates
                                         (EXPERIMENTAL)
  route-server-client                   Configure a neighbor as Route Server client
                                         (EXPERIMENTAL)
  send-community                         Send Community attribute to this neighbor
```

| | |
|-------------------------|---|
| shutdown | Administratively shut down this neighbor |
| soft-reconfiguration | Per neighbor soft reconfiguration |
| strict-capability-match | Strict capability negotiation match (EXPERIMENTAL) |
| timers | BGP per neighbor timers |
| unsuppress-map | Route-map to selectively unsuppress suppressed routes |
| update-source | Source of routing updates |
| use | Set setting to use |
| weight | Set default weight for routes from this neighbor |
| clrscr | Clears the display screen |
| commit | Commit all changes made in this session |
| do | Run commands from Exec mode |
| end | End current mode and change to EXEC mode |
| exit | End current mode and down to previous mode |
| help | Description of the interactive help system |
| revert | Revert changes |
| service | Service Commands |
| show | Show running system information |
| write | Write running configuration to memory or terminal |

<DEVICE>(config-profile <PROFILE-NAME>-router--bgp-neighbor-<IP>)#

The following table summarizes BGP deny/permit route map rules configuration mode commands:

Table 28.8 *BGP-Neighbor-Config-Mode Commands*

| Command | Description | Reference |
|----------------------------------|---|-------------------|
| <i>activate</i> | Enables an address family for this neighbor (EXPERIMENTAL) | <i>page 28-59</i> |
| <i>advertisement-interval</i> | Configures the minimum interval between two consecutive BGP router updates | <i>page 28-60</i> |
| <i>allows-in</i> | Enables re-advertisement of all prefixes containing duplicate ASNs (EXPERIMENTAL) | <i>page 28-61</i> |
| <i>attribute-unchanged</i> | Enables the propagation of BGP attribute values unchanged to this neighbor BGP device (EXPERIMENTAL) | <i>page 28-62</i> |
| <i>capability</i> | Enables the advertisement of capability (dynamic and ORF) to BGP peers | <i>page 28-63</i> |
| <i>default-originate</i> | Enables the sending of the default route to BGP neighbors. It also allows the configuration of the default route. | <i>page 28-64</i> |
| <i>description</i> | Configures a description for a BGP neighbor device | <i>page 28-65</i> |
| <i>disable-connected-check</i> | Enables one-hop away EBGP peer using loop back address (EXPERIMENTAL) | <i>page 28-66</i> |
| <i>dont-capability-negotiate</i> | Disables capability negotiation with BGP neighbors (EXPERIMENTAL) | <i>page 28-67</i> |
| <i>ebgp-multihop</i> | Enables <i>eBGP Multihop</i> on this BGP neighbor, and configures the maximum number of hops that can be between eBGP neighbors not directly connected to each other. | <i>page 28-68</i> |
| <i>enforce-multihop</i> | Forces EBGP neighbors to perform multi-hop checks (EXPERIMENTAL) | <i>page 28-69</i> |
| <i>local-as</i> | Configures this neighbor's local AS number. Also enables the prepending of this AS number in route updates. (EXPERIMENTAL) | <i>page 28-70</i> |
| <i>maximum-prefix</i> | Configures the maximum number of prefixes that can be received from a BGP neighbor | <i>page 28-71</i> |
| <i>next-hop-self</i> | Enables next-hop calculation for this neighbor | <i>page 28-72</i> |

Table 28.8 *BGP-Neighbor-Config-Mode Commands*

| Command | Description | Reference |
|--------------------------------|---|-------------------|
| <i>no</i> | Removes this BGP neighbor's settings, or reverts them back to default | <i>page 28-73</i> |
| <i>override-capability</i> | Enables the overriding of capability negotiation results | <i>page 28-74</i> |
| <i>passive</i> | Enables this BGP neighbor device (or devices using this profile) as passive | <i>page 28-75</i> |
| <i>password</i> | Sets a password for this BGP neighbor device (or devices using this profile) | <i>page 28-76</i> |
| <i>peer-group</i> | Sets the peer group for this BGP neighbor device (or devices using this profile) (EXPERIMENTAL) | <i>page 28-77</i> |
| <i>port</i> | Configures a non-standard BGP port for this BGP neighbor (EXPERIMENTAL) | <i>page 28-78</i> |
| <i>remote-as</i> | Configures the ASN for this neighbor BGP device (or devices using this profile) | <i>page 28-79</i> |
| <i>remove-private-as</i> | Removes the private ASN from outbound updates (EXPERIMENTAL) | <i>page 28-80</i> |
| <i>route-server-client</i> | Enables this BGP neighbor device (or devices using this profile) to act as a route server client (EXPERIMENTAL) | <i>page 28-81</i> |
| <i>send-community</i> | Enables sending of the community attribute to the BGP neighbor | <i>page 28-82</i> |
| <i>shutdown</i> | Shuts down this BGP neighbor device (or devices using this profile) | <i>page 28-83</i> |
| <i>soft-reconfiguration</i> | Enables storing of updates for inbound soft reconfiguration | <i>page 28-84</i> |
| <i>strict-capability-match</i> | Enables a strict capability match before allowing a neighbor BGP peer to open a connection (EXPERIMENTAL) | <i>page 28-85</i> |
| <i>timers</i> | Configures this BGP neighbor's keepalive and holdtime durations | <i>page 28-86</i> |
| <i>unsuppress-map</i> | Uses a route-map that selectively un suppresses routes that have been suppressed using the <i>aggregate-address</i> command | <i>page 28-88</i> |
| <i>update-source</i> | Allows BGP sessions to use any operational interface to establish the TCP connection with this neighbor | <i>page 28-89</i> |
| <i>use</i> | Configures filters for this neighbor. These filters are BGP IP ACL, IP prefix list, AS path list, and route map. Based on the filters used, updates received from this neighbor are filtered. | <i>page 28-90</i> |
| <i>weight</i> | Configures a weight for all routes learned from this BGP neighbor | <i>page 28-91</i> |

28.8.1 activate

▶ *bgp-neighbor-config commands*

Enables an address family for this neighbor. This option is enabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
activate
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9500-router-bgp-neighbor-  
192.168.13.99)#activate
```

28.8.2 advertisement-interval

► *bgp-neighbor-config commands*

Configures the minimum interval, in seconds, between two consecutive BGP router updates

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
advertisement-interval <0-600>
```

Parameters

- advertisement-interval <0-600>

| | |
|--------------------------------|--|
| advertisement-interval <0-600> | Configures the minimum interval, in seconds, between two consecutive BGP router updates. Sending too many router updates creates flapping of routes leading to possible disruptions. Specify a minimum interval so that the BGP routing updates are sent after the set interval. <ul style="list-style-type: none"> • <0-600> – Specify a value from 0 - 600 seconds. The default is 5 seconds. |
|--------------------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
advertisement-interval 100

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
    advertisement-interval 100
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Reverts the advertisement interval to default (5 seconds) |
|-----------|---|

28.8.3 allowas-in

► *bgp-neighbor-config commands*

Enables re-advertisement of all prefixes containing duplicate ASNs. Use this command to configure the maximum number of times an ASN is advertised. This option is disabled by default.

When enabled, *Provider Edge* (PE) routers can re-advertise all prefixes containing duplicate ASNs. This creates a pair of *VPN Routing/Forwarding* (VRF) instances on each PE router to receive and re-advertise prefixes. The PE router receives prefixes with ASNs from all PE routers and advertises to its neighbor PE routers on one VRF. The other VRF receives prefixes with ASNs from the *Customer Edge* (CE) routers and re-advertises them to all PE routers in the configuration.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
allowas-in <1-10>
```

Parameters

- allowas-in <1-10>

| | |
|-------------------|---|
| allowas-in <1-10> | Enables and configures the maximum number of times an ASN is advertised. • <1-10> – Specify a value from 1 - 10. |
|-------------------|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
allowas-in 10

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables re-advertisement of all prefixes containing duplicate ASNs |
|-----------|---|

28.8.4 attribute-unchanged

► *bgp-neighbor-config commands*

Enables propagation of BGP attribute values unchanged to this neighbor BGP device. The BGP attributes are: as-path, med, and next-hop.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
attribute-unchanged { (as-path|med|next-hop) }
```

Parameters

- attribute-unchanged { (as-path|med|next-hop) }

| | |
|---------------------|--|
| attribute-unchanged | <p>Enables the propagation of the following BGP attribute values unchanged:</p> <ul style="list-style-type: none"> • as-path – Optional. Enables propagation of AS path BGP attribute unchanged to this neighbor BGP device. This option is disabled by default. • med – Optional. Enables propagation of MED BGP attribute unchanged to this neighbor BGP device. This option is disabled by default • next-hop – Optional. Enables propagation of the next-hop BGP attribute value unchanged to this neighbor BGP device. This option is disabled by default. |
|---------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
attribute-unchanged as-path

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
```

28.8.5 capability

► *bgp-neighbor-config commands*

Enables the advertisement of capability (dynamic and ORF) to BGP peers

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
capability [dynamic|orf]

capability dynamic
capability orf prefix-list [both|receive|send]
```

Parameters

- `capability dynamic`

| | |
|---------------------------------|---|
| <code>capability dynamic</code> | Enables the advertisement of dynamic capability Enable this option to show a neighbor device's capability to advertise or withdraw and address capability to other peers in a non-disruptive manner. This option is disabled by default. |
|---------------------------------|---|

- `capability orf prefix-list [both|receive|send]`

| | |
|---|---|
| <code>capability dynamic [both receive send]</code> | Enables the advertisement of <i>Outbound Router Filtering</i> (ORF) capability. This option is disabled by default. Enable this option to enable ORF, and advertise this capability to peer devices. ORFs send and receive capabilities to lessen the number of updates exchanged between BGP peers. By filtering updates, ORF minimizes update generation and exchange overhead. The local BGP device advertises ORF in the <i>send</i> mode. The peer BGP device receives the ORF capability in the <i>receive</i> mode. The two devices exchange updates to maintain the ORF for each router. Only a peer group or an individual BGP router can be configured to be in <i>receive</i> or <i>send</i> mode. A peer group member cannot be configured. <ul style="list-style-type: none"> • <i>both</i> – Advertises the capability to send and receive the ORF to/from this neighbor • <i>receive</i> – Advertises the capability to receive the ORF from this neighbor • <i>send</i> – Advertises the capability to send the ORF to this neighbor |
|---|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
capability orf prefix-list both

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables advertisement of capability (dynamic and ORF) to BGP peers |
|-----------|---|

28.8.6 default-originate

► *bgp-neighbor-config commands*

Enables the sending of the default route to BGP neighbors. It also allows the configuration of the default route. When enabled and configured, local BGP routers send the default route 0.0.0.0 (or a route map specified route) to its neighbor for use as the default route.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
default-originate {route-map <BGP-ROUTE-MAP-NAME>}
```

Parameters

- default-originate {route-map <BGP-ROUTE-MAP-NAME>}

| | |
|---|---|
| default-originate {route-map <BGP-ROUTE-MAP-NAME>} | <p>Enables <i>default originate</i> on this BGP neighbor. This option is disabled by default.</p> <ul style="list-style-type: none"> • route-map <BGP-ROUTE-MAP> - Optional. Use this keyword to specify a route map to use as the default originate route <p>If no route-map is specified, the default route 0.0.0.0 is sent.</p> |
|---|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#default-originate

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

Related Commands

| | |

28.8.7 description

► *bgp-neighbor-config commands*

Configures a description for this BGP neighbor device

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
description neighbor <LINE>
```

Parameters

- description neighbor <LINE>

| | |
|-----------------|---|
| neighbor <LINE> | Specify a description for this BGP neighbor device (should not exceed 80 characters). |
|-----------------|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#description neighbor "This neighbor is an external AS neighbor"

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
  description neighbor "This neighbor is an external AS neighbor"
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#

|-----------|---|

28.8.8 disable-connected-check

► *bgp-neighbor-config commands*

Enables one-hop away eBGP peer using loop back address. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
disable-connected-check
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#disable-connected-check

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
  description neighbor "This neighbor is an external AS neighbor"
  disable-connected-check
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables one-hop away eBGP peer using loop back address |
|-----------|---|

28.8.9 dont-capability-negotiate

► *bgp-neighbor-config commands*

Disables capability negotiation with BGP neighbors. This is to allow compatibility with older BGP versions that have no capability parameters used in the *open* messages between peers. Capability negotiation is enabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
dont-capability-negotiate
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
dont-capability-negotiate

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10

| <i>no</i> | Enables capability negotiation with BGP neighbors |
|-----------|---|

28.8.10 ebgp-multihop

► *bgp-neighbor-config commands*

Enables *eBGP Multihop* on this BGP neighbor. When enabled, allows neighbor connection to be established between two eBGP neighbors that are not directly connected to each other. Use this command to configure the maximum number of hops possible between two such eBGP neighbors. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
ebgp-multihop <1-255>
```

Parameters

- ebgp-multihop <1-255>

| | |
|--------------------------|--|
| ebgp-multihop <1-255> | Configures the maximum number of hops that can be between eBGP neighbors not directly connected to each other. <ul style="list-style-type: none"> • <1-255> - Specify a value from 1 - 255. The default is 255. |
|--------------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#ebgp-
multihop 20

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99

| <i>no</i> | Disables eBGP Multihop on this BGP neighbor |
|-----------|---|

28.8.11 enforce-multihop

► *bgp-neighbor-config commands*

Forces eBGP neighbors to perform multi-hop checks

A *multihop* route is a route to external peers on indirectly connected networks. When enforced, eBGP neighbors perform multi-hop check. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
enforce-multihop
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#enforce-multihop

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
    advertisement-interval 100
    allowas-in 10
    attribute-unchanged as-path
    capability orf prefix-list both
    default-originate
    description neighbor "This neighbor is an external AS neighbor"
    disable-connected-check
    dont-capability-negotiate
    ebgp-multihop 20
    enforce-multihop
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables enforcement of multihop route checks |
|-----------|---|

28.8.12 local-as

► *bgp-neighbor-config commands*

Configures this neighbor's local AS number

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
local-as <1-4294967295> {no-prepend}
```

Parameters

- local-as <1-4294967295> {no-prepend}

| | |
|--------------------------------------|--|
| local-as <1-4294967295> {no-prepend} | <p>Configures the local AS number</p> <ul style="list-style-type: none"> • <1-4294967295> - Specify a value from 1 - 4294967295. • no-prepend - Optional. Select to enable. When enabled, the local AS number is not prepended to route updates from eBGP peers. AS numbers are prepended to route updates by default. |
|--------------------------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#local-
as 20 no-prepend

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
  description neighbor "This neighbor is an external AS neighbor"
  disable-connected-check
  dont-capability-negotiate
  ebgp-multihop 20
  enforce-multihop
  local-as 20 no-prepend
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the local AS number. And also reverts prepending of AS numbers to default (allows prepending). |
|-----------|--|

28.8.13 maximum-prefix

▸ *bgp-neighbor-config commands*

Configures the maximum number of prefixes that can be received from a BGP neighbor. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
maximum-prefix <1-4294967295> {(<1-100>|restart <1-65535>|warning-only)}
```

Parameters

- maximum-prefix <1-4294967295> {(<1-100>|restart|warning-only)}

| | |
|----------------------------------|---|
| maximum-prefix <1-4294967295> | <p>Configures the maximum number of prefixes that can be received from a BGP neighbor</p> <ul style="list-style-type: none"> • <1-4294967295> - Specify a value for 1 - 4294967295. • <1-100> - Optional. Sets the threshold limit for generating a log message. This value represents a percentage of the maximum-prefix configured in the preceding step. When this value is reached, a log entry is generated. For example if the maximum-prefix is set to 100 and <i>threshold limit</i> is set to 65, then after receiving 65 prefixes, a log entry is generated. This option is disabled by default. • restart <1-65535> - Optional. Restarts BGP peer connection once the maximum-prefix limit specified is exceeded. For example, If the value specified is 10, then after receiving 10 prefixes from the neighbor, the system restarts the connection with that neighbor. Specify a value from 1 - 65535. This option is disabled by default. • warning-only - Configure to enable. When the maximum-prefix limit is exceeded, the connection is restarted. However, when this option is enabled, the connection is not restarted and an event is generated instead. This option is disabled by default. |
|----------------------------------|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#maximum-prefix 400 50 warning-only

28.8.14 next-hop-self

► *bgp-neighbor-config commands*

Enables next-hop calculation for this neighbor. This option is disabled by default.

When enabled, this device (or devices using this profile) are configured as the next hop for the BGP speaking neighbor or peer group. This allows the BGP device to change the next hop information that is sent to iBGP peers. The next hop address is set to the IP address of the interface used to communicate with the eBGP neighbor.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
next-hop-self
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #

28.8.18 password

► *bgp-neighbor-config commands*

Sets a password for this BGP neighbor device (or devices using this profile). When configured, this password is used for *Message Digest 5* (MD5) authentication between two BGP peers connected over TCP. To enable MD5 authentication between two BGP peers, configure both with the same password.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
password neighbor <LINE>
```

Parameters

- password neighbor <LINE>

| | |
|-----------------------------|-----------------------|
| password neighbor <LINE> | Specify the password. |
|-----------------------------|-----------------------|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-

28.8.19 peer-group

► *bgp-neighbor-config commands*

Sets the peer group for this BGP neighbor device (or devices using this profile). Peer groups are a set of BGP neighbors with the same update policies. This facilitates the updates of various policies, such as, distribute lists and filter lists.

The peer group can be configured as a single entity. Any changes made to the peer group is propagated to all members.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
peer-group <PEER-GROUP-NAME>
```

Parameters

- peer-group <PEER-GROUP-NAME>

| | |
|---------------------------------|--|
| peer-group <PEER-GROUP-NAME> | Specify the peer group name. Once specified, this neighbor device becomes a member of the peer group identified by the <PEER-GROUP-NAME> keyword. <ul style="list-style-type: none"> • <PEER-GROUP-NAME> - Specify the peer group name. |
|---------------------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#peer-
group eBGPPeerGrp1

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show

|-----------|--|

28.8.20 port

► *bgp-neighbor-config commands*

Configures a non-standard BGP port for this BGP neighbor

By default BGP uses port 179. Use this command to set a non standard port for this BGP neighbor.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
port <0-65535>
```

Parameters

- port <0-65535>

| | |
|----------------|---------------------------------|
| port <0-65535> | Specify a value from 0 - 65535. |
|----------------|---------------------------------|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#port
21

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context

28.8.21 remote-as

► *bgp-neighbor-config commands*

Configures the ASN for this neighbor BGP device (or devices using this profile). ASN is a set of routers under the same administration that use *Interior Gateway Protocol* (IGP) and common metrics to define how to route packets within the AS.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
remote-as <1-4294967295>
```

Parameters

- remote-as <1-4294967295>

| | |
|-----------------------------|---|
| remote-as <1-4294967295> | Specify the remote ASN from 1 - 4294967295. |
|-----------------------------|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#remote-as 100

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
    remote-as 100
    advertisement-interval 100
    peer-group eBGPPeerGrp1
    port 21
    allowas-in 10
    attribute-unchanged as-path
    capability orf prefix-list both
    default-originate
    description neighbor "This neighbor is an external AS neighbor"
    disable-connected-check
    dont-capability-negotiate
    ebgp-multihop 20
    enforce-multihop
    local-as 20 no-prepend
    maximum-prefix 400 50 warning-only
    next-hop-self
    override-capability
    passive
    password neighbor eBGPneighbor@300
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
```

28.8.22 remove-private-as

► *bgp-neighbor-config commands*

Removes the private ASN from outbound updates. By default private ASNs are included in outbound updates.

Private AS numbers are not advertised to the Internet. This option is used with external BGP (eBGP) peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
remove-private-as
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
remove-private-as

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #show
context
  bgp neighbor 192.168.13.99
    remote-as 100
    advertisement-interval 100

28.8.23 route-server-client

► *bgp-neighbor-config commands*

Enables this BGP neighbor device (or devices using this profile) to act as a route server client. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
route-server-client
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
route-server-client

28.8.24 send-community

► *bgp-neighbor-config commands*

Enables sending of the community attribute to the BGP neighbor. The community attribute groups destinations in a certain community and applies routing decisions based on the community. On receiving community attribute, the BGP router announces it to the neighbor.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
send-community [both|extended|standard]
```

Parameters

- send-community [both|extended|standard]

| | |
|--|---|
| send-community [both extended standard] | Enables sending of the community attributes to the BGP neighbor <ul style="list-style-type: none"> • both - Sends extended and standard community attributes • extended - Sends extended community attributes only • standard - Sends standard community attributes only |
|--|---|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#
send-community both

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context

| <i>no</i> | Disables sending of the community attribute to the BGP neighbor |
|-----------|---|

28.8.25 shutdown

► *bgp-neighbor-config commands*

Shuts down this BGP neighbor device (or devices using this profile). When configured, this neighbor is administratively shut down. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
shutdown
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX500-router-bgp-neighbor-
192.168.13.99)#shutdown

nx9500-6C8809(config-profile testNX500-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
    remove-private-as
    route-server-client
    shutdown
nx9500-6C8809(config-profile testNX500-router-bgp-neighbor-192.168.13.99)#

| <i>no</i> | Removes the administrative shut down of this neighbor |
|-----------|---|

28.8.26 soft-reconfiguration

► *bgp-neighbor-config commands*

Enables storing of updates for inbound soft reconfiguration. This option is disabled by default.

Soft-reconfiguration can be used in lieu of BGP route refresh capability. Enabling this option enables local storage of all received routes and their attributes. This requires additional memory on the BGP device.

When a soft reset (inbound) is performed on the neighbor device, the locally stored routes are reprocessed according to the inbound policy. The BGP neighbor connection is not affected.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
soft-reconfiguration inbound
```

Parameters

- `soft-reconfiguration inbound`

| | |
|------------------------------|--|
| soft-reconfiguration inbound | Performs a soft reconfiguration (inbound) on the BGP neighbor device |
|------------------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99) #
soft-reconfiguration inbound
```

Related Commands

| | |
|-----------|-------------------------------|
| <i>no</i> | Disables soft reconfiguration |
|-----------|-------------------------------|

28.8.27 strict-capability-match

► *bgp-neighbor-config commands*

Enforces a strict capability match before allowing a TCP connection with this neighbor. In case capabilities do not match, the BGP connection is not established. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
strict-capability-match
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-  
192.168.13.99)#strict-capability-match
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Disables a strict capability match before allowing a connection with this neighbor |
|-----------|--|

28.8.28 timers

► *bgp-neighbor-config commands*

Configures this BGP neighbor's keepalive and holdtime durations

NOTE: The keepalive and holdtime settings configured at the neighbor level override those configured on the BGP router.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
timers [<0-65535> <0-65535>|connect <0-65535>]
```

Parameters

- `timers [<0-65535> <0-65535>|connect <0-65535>]`

| | |
|---|--|
| <code>timers <0-65535> <0-65535></code> | <p>Sets the keepalive and holdtime intervals</p> <ul style="list-style-type: none"> • <code><0-65535></code> - Specifies the keepalive interval from 0 - 65535 seconds. It is the interval, in seconds, between two successive keepalive packets exchanged with this neighbor to keep the TCP connection alive. • <code><0-65535></code> - Specifies the holdtime interval from 0 - 65535. This is the time this neighbor will wait without receiving a keepalive packet from its neighbor before declaring it dead. If the time since the last keepalive packet received (from its neighbor) exceeds the value set here, the neighbor is declared dead. |
| <code>timers connect <0-65535></code> | <p>Sets the BGP connect time. This is the interval, in seconds, after which BGP tries to connect to a dead peer.</p> <ul style="list-style-type: none"> • <code><0-65535></code> - Specify a value from 1 - 65535 seconds. |

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#timers
20 40

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#timers

28.8.29 unsuppress-map

► *bgp-neighbor-config commands*

Unsuppresses map to selectively advertise routes that have been suppressed using the *aggregate-address* command

The *aggregate-address* command creates a route map with a IP/mask address that consolidates subnets under it. This reduces the number of route maps on the BGP device to one consolidated entry. Use *unsuppress-map* to selectively allow/deny a subnet or a set of subnets from this consolidated entry.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
unsuppress-map <ROUTE-MAP-NAME>
```

Parameters

- *unsuppress-map* <ROUTE-MAP-NAME>

| | |
|---|---|
| <i>unsuppress-map</i> <ROUTE-MAP-NAME> | Unsuppresses the specified route map <ul style="list-style-type: none"> • <ROUTE-MAP-NAME> - Specify the route map name. |
|---|---|

Example

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99#
unsuppress-map test

|-----------|--|

28.8.30 update-source

► *bgp-neighbor-config commands*

Allows BGP sessions to use any operational interface to establish the TCP connection with this neighbor

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
update-source <IPv4>
```

Parameters

- update-source <IPv4>

| | |
|----------------------|--|
| update-source <IPv4> | Specify the BGP enabled neighbor's IPv4 address. |
|----------------------|--|

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-
192.168.13.99)#update-source 192.168.13.1

| <i>no</i> | Removes the source of routing updates |
|-----------|---------------------------------------|

28.8.31 use

► *bgp-neighbor-config commands*

Configures filters for this neighbor. These filters are BGP IP ACL, IP prefix list, AS path list, and route map. Based on the filters used, updates received from this neighbor are filtered.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
use [distribute-list <BGP-IP-ACL-NAME>|filter-list <AS-PATH-LIST-NAME>|prefix-
list <IP-PREFIX-LIST-NAME>|route-map <BGP-ROUTE-MAP-NAME>]
```

Parameters

```
• use [distribute-list <BGP-IP-ACL-NAME>|filter-list <AS-PATH-LIST-NAME>|
prefix-list <IP-PREFIX-LIST-NAME>|route-map <BGP-ROUTE-MAP-NAME>]
```

| | |
|--|--|
| <pre>use [distribute-list <BGP-IP-ACL- NAME> filter-list <AS- PATH-LIST- NAME> prefix-list <IP-PREFIX-LIST- NAME> route-map <BGP-ROUTE-MAP- NAME>]</pre> | <p>Uses predefined and configured filters with this neighbor</p> <ul style="list-style-type: none"> • distribute-list <BGP-IP-ACL-NAME> - Uses a BGP IP ACL <ul style="list-style-type: none"> • <BGP-IP-ACL-NAME> - Specify the BGP IP ACL name. • filter-list <AS-PATH-LIST-NAME> - Uses an AS path list <ul style="list-style-type: none"> • <AS-PATH-LIST-NAME> - Specify the AS path list name. • prefix-list <IP-PREFIX-LIST-NAME> - Uses a IP prefix list <ul style="list-style-type: none"> • <IP-PREFIX-LIST-NAME> - Specify the IP prefix list name. • route-map <BGP-ROUTE-MAP-NAME> - Uses a route map <ul style="list-style-type: none"> • <BGP-ROUTE-MAP-NAME> - Specify the route map name. |
|--|--|

28.8.32 weight

► *bgp-neighbor-config commands*

Configures a weight for all routes learned from this BGP neighbor. Weight is used to decide the preferred route when the same route is learned from multiple neighbors. The highest weight is always chosen.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510, NX9600

Syntax

```
weight <0-65535>
```

Parameters

- weight <0-65535>

| | |
|------------------|--|
| weight <0-65535> | Specifies a relative weightage for all routes learned from this neighbor |
| | • <0-65535> - Specify a value from 0 - 65535. |

Example

```
nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#weight
10

nx9500-6C8809(config-profile testNX9000-router-bgp-neighbor-192.168.13.99)#show
context

29 CRYPTO-CMP-POLICY

This chapter summarizes the crypto *certificate management protocol* (CMP) policy commands in the CLI command structure.

CMP is an Internet protocol designed to enable devices (access point, wireless controller, or service platform) to obtain and manage digital certificates in a *Public Key Infrastructure* (PKI) network. A *Certificate Authority* (CA) issues the certificates using the defined CMP.

WiNG CMP implementation allows you to configure a crypto CMP policy that enables auto installation and auto management of device certificates. When configured and implemented on a device, the crypto CMP policy allows the device to automatically trigger a certification request to a configured, CMP supported CA server. Once the certificate is validated and confirmed from the CA server it is saved on the device and becomes part of the trustpoint. During the creation of the CMP policy the trustpoint is assigned a name and client information. You can use a manually created trustpoint for one service (like HTTPS) and use the CMP generated trustpoint for RADIUS EAP certificate based authentication.

Use the (config) instance to configure a crypto CMP policy. To navigate to the crypto CMP policy configuration instance, use the following commands:

```
<DEVICE>(config)#crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
ap6522-D8273A(config)#crypto-cmp-policy CMP
ap6522-D8273A(config-cmp-policy-CMP)#
ap6522-D8273A(config-cmp-policy-CMP)#?
CMP Policy Mode commands:
  ca-server          CMP CA Server configuration commands
  cert-key-size      Set key size for certificate request
  cert-renewal-timeout  Trigger a cert renewal request on timeout
  cross-cert-validate  Validate cross-cert using factory-cert
  no                 Negate a command or set its defaults
  subjectAltName     Configure subjectAltName value
  trustpoint         Trustpoint for CMP
  use                Set setting to use

  clrscr            Clears the display screen
  commit            Commit all changes made in this session
  do                Run commands from Exec mode
  end               End current mode and change to EXEC mode
  exit              End current mode and down to previous mode
  help              Description of the interactive help system
  revert            Revert changes
  service           Service Commands
  show              Show running system information
  write             Write running configuration to memory or terminal
ap6522-D8273A(config-cmp-policy-CMP)#
```

This chapter is organized as follows:

- [crypto-cmp-policy-instance](#)
- [other-cmp-related-commands](#)

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

29.1 crypto-cmp-policy-instance

► CRYPTO-CMP-POLICY

The following table summarizes crypto CMP policy configuration commands:

Table 29.1 *Crypto-CMP-Policy Commands*

| Command | Description | Reference |
|-----------------------------|--|-------------------|
| <i>ca-server</i> | Configures the CA server details | <i>page 29-3</i> |
| <i>cert-key-size</i> | Configures the size of the key associated with a certificate request | <i>page 29-5</i> |
| <i>cert-renewal-timeout</i> | Configures a certificate renewal timeout in days | <i>page 29-6</i> |
| <i>cross-cert-validate</i> | Enables validation of the cross certificate with the factory certificate | <i>page 29-7</i> |
| <i>subjectAltName</i> | Configures an alternate subject name for this CMP policy | <i>page 29-8</i> |
| <i>trustpoint</i> | Configures a trustpoint and its associated information, such as the subject name, the sender's (device requesting certification) details, and the recipient's (CA) details | <i>page 29-9</i> |
| <i>use</i> | Associates a device's autogen-uniqueid with this crypto CMP policy | <i>page 29-11</i> |
| <i>no</i> | Removes the crypto CMP policy settings | <i>page 29-12</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

29.1.1 ca-server

▶ *crypto-cmp-policy-instance*

Configures the primary and secondary CMP CA server details.

The CA is an external network authority (usually a trusted third-party server) that generates and issues digital certificates in response to requests received from network devices. Use this command to configure the primary and secondary CA server details, such as name of the device hosting the CA server, the port used to access the CA server, and the path where the certificate is stored. Once defined, devices using this CMP policy automatically send requests to the specified primary CA server, and retrieve the certificate from the specified location. If the primary CA server is not reachable, the requests are sent to the secondary CA server.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ca-server [primary|secondary] host <IP> port <1-65535> path <PATH>
```

Parameters

- `ca-server [primary|secondary] host <IP> port <1-65535> path <PATH>`

| | |
|----------------------------------|--|
| ca-server [primary secondary] | Configures the primary and secondary CMP CA server details (IPv4 address, port, and path) <ul style="list-style-type: none"> • primary – Configures the primary CMP CA server’s details • secondary – Configures the secondary CMP CA server’s details <p>The secondary CMP CA is used in case the primary CA server is not reachable. CA server settings are required to complete CMP requests.</p> |
| host <IP> | Configures IPv4 address of the device hosting the primary/secondary CA server <ul style="list-style-type: none"> • <IP/HOSTNAME> – Specify the server’s IPv4 address. |
| port <1-65535> | Configures the port on which the primary/secondary CA server can be reached <ul style="list-style-type: none"> • <1-65535> – Specify the port number from 1 - 65535. |
| path <PATH> | Configures the path or filename of the primary/secondary CMP CA certificate. Enter the complete relative path to the file on the server. <ul style="list-style-type: none"> • <PATH> – Specify the path. Once specified, the certificate is downloaded from this location and installed on the device. |

Example

```
ap6522-D8273A(config-cmp-policy-CMP)#ca-server primary host 192.168.8.74 port 8
path cmp

ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
ca-server primary host 192.168.8.74 port 80 path cmp
ap6522-D8273A(config-cmp-policy-CMP)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured primary/secondary CA server details |
|-----------|--|

29.1.2 cert-key-size

▶ *crypto-cmp-policy-instance*

Configures the size of the key associated with a certificate request

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cert-key-size [2048|3072|4096]
```

Parameters

- `cert-key-size [2048|3072|4096]`

| | |
|---|--|
| <pre>cert-key-size [2048 3072 4096]</pre> | <p>Configures the certificate request key size. The options are:</p> <ul style="list-style-type: none"> • 2048 - Sets the key size to 2048 bits. This is the default setting. • 3072 - Sets the key size to 3072 bits • 4096 - Sets the key size to 4096 bits |
|---|--|

Example

```
nx9500-6C8809(config-cmp-policy-test)#cert-key-size 3072

nx9500-6C8809(config-cmp-policy-test)#show context
crypto-cmp-policy test
  cert-key-size 3072
  trustpoint cmp-test subject-name "CN=ExampleCompany, O=Example Company" secret 2
  osr2bwjR+0L+G64ny3wfuAAAAAtTFjeFvOIixTHLDfgt7Bu reference-id 123456 sender-name
  "CN=ExampleCompany.com, O=Example Company" recipient-name "O=Example Company,
  CN=ExampleCompany.com"
nx9500-6C8809(config-cmp-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Reverts the certificate request key size to default (2048 bits) |
|-----------|---|

29.1.3 cert-renewal-timeout

▶ *crypto-cmp-policy-instance*

Configures a certificate renewal timeout in days. This is the number of days, before the expiration of the device's certificate, that a certificate renewal is triggered.

The expiration of device's certificate is checked once a day. When a certificate is about to expire a certificate renewal is initiated with the dedicated CMP CA server resource through an existing IPsec tunnel. If the tunnel is not established, the CMP renewal request is not sent. If a renewal succeeds the newly obtained certificate overwrites an existing certificate. If the renewal fails, an error is logged.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cert-renewal-timeout <1-60>
```

Parameters

- `cert-renewal-timeout <1-60>`

| | |
|--|---|
| <pre>cert-renewal-timeout <1-60></pre> | <p>Configures the certificate renewal timeout in days. This is the number of days, before the expiration of the device's certificate, that a certificate renewal is triggered. Once the configured time is completed, the device triggers a certificate renewal request.</p> <ul style="list-style-type: none"> • <code><1-60></code> - Specify a value from 1 - 60 days. The default is fourteen (14) days. Therefore, by default a device triggers certificate renewal request 14 days before its certificate expires. |
|--|---|

Example

```
ap6522-D8273A(config-cmp-policy-CMP)#cert-renewal-timeout 60

ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
  cert-renewal-timeout 60
  ca-server primary host 192.168.8.74 port 8 path cmp
ap6522-D8273A(config-cmp-policy-CMP)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Reverts the certificate renewal timeout to default (14 days) |
|-----------|--|

29.1.4 cross-cert-validate

▶ *crypto-cmp-policy-instance*

Enables validation of the cross certificate using the factory certificate. When enabled, the obtained cross-certificate is validated against the operator's certificate configured using the `trustpoint > cmp-auth-operator` command. An error message is displayed in case the cross-certificate is not obtained or if the cross-certificate is found to be invalid. This option is disabled by default.

NOTE: To the operator certificate, in the device configuration mode execute the `trustpoint > cmp-auth-operator` command. For more information, see *trustpoint (device-config-mode)*.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cross-cert-validate
```

Parameters

None

Example

```
nx9500-6C8809(config-cmp-policy-test)#cross-cert-validate

nx9500-6C8809(config-cmp-policy-test)#show context
crypto-cmp-policy test
cert-key-size 3072
cross-cert-validate
trustpoint cmp-test subject-name "CN=ExampleCompany, O=Example Company" secret 2
9piulK/GqvD+G64ny3wfuAAAAAuqCi8WJkNJwryMD9IAPk4T reference-id 123456 sender-name
"CN=ExampleCompany.com, O=Example Company" recipient-name "O=Example Company,
CN=ExampleCompany.com"
nx9500-6C8809(config-cmp-policy-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Disables validation of the cross certificate with the factory certificate |
|-----------|---|

29.1.5 subjectAltName

▶ *crypto-cmp-policy-instance*

Configures the subjectAltName identity for this CMP policy

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
subjectAltName [address <IP>|dn <DISTINGUISHED-NAME>|email <EMAIL-ID>|fqdn
<FQDN>|string <USER-DEFINED-STRING>]
```

Parameters

- subjectAltName [address <IP>|dn <DISTINGUISHED-NAME>|email <EMAIL-ID>|fqdn <FQDN>|string <USER-DEFINED-STRING>]

| | |
|--|---|
| <pre>subjectAltName [address <IP> dn <DISTINGUISHED- NAME> email <EMAIL-ID> fqdn <FQDN> string <USER-DEFINED- STRING>]</pre> | <p>Configures the subjectAltName identity using one of the following options:</p> <ul style="list-style-type: none"> • address <IP> - Uses IP address as identity <ul style="list-style-type: none"> • <IP> - Specify the IP address. • dn <DISTINGUISHED-NAME> - Uses distinguished name as identity <ul style="list-style-type: none"> • <DISTINGUISHED-NAME> - Specify the DISTINGUISHED-NAME. • email <EMAIL-ID> - Uses e-mail address as identity <ul style="list-style-type: none"> • <EMAIL-ID> - Specify the e-mail address. • fqdn <FQDN> - Uses FQDN as identity <ul style="list-style-type: none"> • <FQDN> - Specify the FQDN. • string <USER-DEFINED-STRING> - Uses a user specified name as identity <ul style="list-style-type: none"> • <USER-DEFINED-STRING> - Specify the string to use as identity. |
|--|---|

Example

```
ap6522-D8273A(config-cmp-policy-CMP)#subjectAltName dn TechPubsCA

ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
cert-update
cert-renewal-timeout 60
ca-server primary host 192.168.8.74 port 8 path cmp
subjectAltName dn TechPubsCA
ap6522-D8273A(config-cmp-policy-CMP)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the subjectAltName identity configured with this CMP policy |
|-----------|---|

29.1.6 trustpoint

▶ *crypto-cmp-policy-instance*

Configures a trustpoint and its associated information, such as the subject name, the sender's (device requesting certification) details, and the recipient's (CA) details. This information is needed to obtain the certificate from the CA server using CMP.

Each certificate is digitally signed by a *trustpoint* and contains device-specific information, such as device name, IP address, serial number. It helps to uniquely identify a device.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
trustpoint <TRUSTPOINT-NAME> subject-name <WORD> secret [0 <WORD>|2 <WORD>]
reference-id <WORD> sender-name <WORD> [recipient-name <WORD>|ca-psk <CERT-PATH>]
```

Parameters

```
• trustpoint <TRUSTPOINT-NAME> subject-name <WORD> secret [0 <WORD>|2 <WORD>]
reference-id <WORD> sender-name <WORD> [recipient-name <WORD>|ca-psk <CERT-PATH>]
```

| | |
|---------------------------------|---|
| trustpoint <TRUSTPOINT-NAME> | Configures a trustpoint name (should not exceed 32 characters) <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint's name. |
| subject-name <WORD> | Configures a subject name for this trustpoint. The subject name should uniquely identify the certificate and should not exceed 512 characters in length. |
| secret [0 <WORD> 2 <WORD>] | Configures the secret used to encrypt the trustpoint. The secret should not exceed 128 characters in length. <ul style="list-style-type: none"> • 0 <WORD> - Configures a clear text password • 2 <WORD> - Configures an encrypted password |
| reference-id <WORD> | Configures the reference ID. The CA server uses this information to identify the shared secret key used. <ul style="list-style-type: none"> • <WORD> - Specify the reference ID. |
| sender-name <WORD> | Configures the sender's name. The CA server uses this information to identify the shared secret key used. The sender's name should not exceed 512 characters in length. <ul style="list-style-type: none"> • <WORD> - Specify the sender name. |
| recipient-name | Configures the recipient's name. The CA server uses this information to validate the request. The recipient's name should not exceed 256 characters in length. |
| ca-psk <CERT-PATH> | Configures the certificate path for the server certificate <ul style="list-style-type: none"> • <CERT-PATH> - Specify the certificate path. |

Example

```

ap6522-D8273A(config-cmp-policy-CMP)#trustpoint cmp-test subject-name "CN=ExampleCompany, O=Example Company" secret 0 test-secret reference-id 123456 sender-name "CN=ExampleCompany.com, O=Example Company" recipient-name "O=Example Company, CN=ExampleCompany.com"

29.1.7 use

▶ *crypto-cmp-policy-instance*

Associates a device's autogen-uniqueid with this crypto CMP policy

A device's autogen-uniqueid is a combination of a user-defined string (prefix or suffix) and a substitution token. The WiNG software implementation provides two built-in substitution tokens: \$SN and \$MiNT-ID that represent the device's serial number and MiNT ID respectively. These substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for a device.

To auto generate the device's unique ID, in the device configuration mode execute the following command:

```
autogen-uniqueid <WORD>
```

For more information on the autogen-uniqueid command, see *autogen-uniqueid*.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use autogen-uniqueid
```

Parameters

- use autogen-uniqueid

| | |
|----------------------|--|
| use autogen-uniqueid | Associates a device's autogen-uniqueid with this crypto CMP policy. The device's autogen-uniqueid should be existing and configured. |
|----------------------|--|

Example

```
ap6522-D8273A(config-cmp-policy-CMP)#use autogen-uniqueid

ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
cert-update
cert-renewal-timeout 60
use autogen-uniqueid
ca-server primary host 192.168.8.74 port 8 path cmp

|-----------|--|

29.1.8 no

▸ *crypto-cmp-policy-instance*

Removes or reverts this crypto CMP policy settings

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [ca-server <SERVER-NAME>|cert-key-size|cert-renewal-timeout|cross-cert-
validate|subjectAltName|trustpoint <TRUSTPOINT-NAME>|use autogen-uniqueid]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes or reverts this crypto CMP policy settings |
|-----------------|--|

Example

```
ap6522-D8273A(config-cmp-policy-CMP)#show context

29.2 other-cmp-related-commands

▶ *CRYPTO-CMP-POLICY*

The following table summarizes other commands associated with the implementation of the crypto CMP policy:

Table 29.2 *Other-CMP-Related Commands*

| Command | Description | Reference |
|----------------|---|-------------------|
| <i>use</i> | Associates a crypto CMP policy with a device | <i>page 29-14</i> |
| <i>show</i> | Displays current status of CMP requests in progress. This command also displays trustpoint details (CMP and non-CMP trustpoints). | <i>page 29-15</i> |

29.2.1 use

▶ *other-cmp-related-commands*

Applies a crypto CMP policy to a device. Once CMP enabled, the device automatically requests for a certificate from the CA server and installs it. After applying the CMP policy, commit and write the change to memory. This is needed to apply this configuration across reboots.

To apply a CMP policy on a device, navigate to the device's config-device mode and execute the `use > crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>` command.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
```

Parameters

- `use crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

| | |
|--|--|
| cmp-policy <CRYPTO-CMP-POLICY-NAME> | Applies an existing crypto CMP policy on this device. When associated with a profile, the crypto CMP policy is applied to all devices using the profile. <ul style="list-style-type: none"> • <CRYPTO-CMP-POLICY-NAME> – Specify the crypto CMP policy name. Should be existing and configured. |
|--|--|

Example

```
ap6522-D8273A(config-device-00-11-3F-D8-27-3A)#use crypto-cmp-policy CMP
ap6522-D8273A(config-device-00-11-3F-D8-27-3A)#commit
```

29.2.2 show

▶ other-cmp-related-commands

Displays current status of CMP requests in progress. This command also displays trustpoint details (CMP and non-CMP trustpoints).

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP7602, AP7612, AP7622, AP7632, AP7662, AP82XX, AP8432, AP8533, WiMod
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
show crypto [cmp|pki]

show crypto cmp request status {on <DEVICE-NAME>}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {on <DEVICE-NAME>}
```

Parameters

- show crypto cmp request status {on <DEVICE-NAME>}

| | |
|---|--|
| show crypto cmp request {on <DEVICE-NAME>} | <p>Displays the current status of all on-going CMP requests</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Optionally specify the name of the AP, wireless controller, or service platform to view CMP request status on a specified device. |
| | <ul style="list-style-type: none"> • show crypto pki trustpoints {<TRUSTPOINT-NAME> all} {on <DEVICE-NAME>} |
| show pki trustpoints {<TRUSTPOINT-NAME> all} on <DEVICE-NAME> | <p>Displays all trustpoints including CMP generated trustpoints</p> <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Optional. Specify a trustpoint name. Displays details of the trustpoint identified by the <TRUSTPOINT-NAME> parameter. • all - Optional. Displays details of all configured trustpoints <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Optionally specify the name of the AP, wireless controller, or service platform to view trustpoints configured on a specified device. |

Example

```
ap6522-D8273A#show crypto pki trustpoints
-----
TRUSTPOINT                                KEY NAME                                VALID UNTIL
-----
  cmp-test                                cmp-test-key                            Fri May  9
09:44:22 2014 GMT
  default-trustpoint                       default_rsa_key                          Fri Dec 30
00:00:40 2022 GMT
-----

ap6522-D8273A#

ap6522-D8273A(config)#show crypto cmp request status
CMP Request Status:  cmp-complete

ap6522-D8273A#
```

30 ROAMING ASSIST POLICY

This chapter summarizes the Roaming Assist policy commands in the CLI command structure.

By constantly monitoring a client's packets and the *received signal strength indicator* (RSSI) of a given client by a group of access points, decision can be made on the optimal access point to which the client needs to roam. Then forcefully direct the client to the optimal access point.

The threshold intervals are configurable and can be adjusted based on the client load.

Use the (config) instance to configure a Roaming Assist policy. To navigate to the Roaming Assist policy configuration instance, use the following commands:

```
<DEVICE> (config) roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>

nx9500-6C8809(config)roaming-assist-policy test
nx9500-6C8809(config-roaming-assist-policy-test)#?
Roaming Assist Mode commands:
  action          Configure action - action is deauth / log /
                  assisted-roam
  aggressiveness  Configure the roaming aggressiveness for a wireless
                  client
  detection-threshold Configure the detection threshold - when exceeded,
                  client monitoring starts
  disassoc-time   Configure the disassociation time - time after which a
                  disassociation is sent
  handoff-count   Configure the handoff count - number of times client
                  can exceed handoff threshold
  handoff-threshold Configure the handoff threshold - when exceeds an
                  action is taken.
  monitoring-interval Configure the monitoring interval - interval at which
                  client monitoring occurs
  no              Negate a command or set its defaults
  sampling-interval Configure the sampling interval - interval at which
                  client rssi values are checked

  clrscr         Clears the display screen
  commit         Commit all changes made in this session
  end            End current mode and change to EXEC mode
  exit          End current mode and down to previous mode
  help          Description of the interactive help system
  revert        Revert changes
  service       Service Commands
  show          Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-roaming-assist-policy-test)#
```

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore () character. In other words, the name of a device cannot contain an underscore.

30.1 roaming-assist-policy-instance

► ROAMING ASSIST POLICY

The following table summarizes roaming assist policy configuration mode commands:

Table 30.1 *Crypto-CMP-Policy Commands*

| Command | Description | Reference |
|----------------------------|---|-------------------|
| <i>action</i> | Specifies the action to be invoked on the client | <i>page 30-3</i> |
| <i>aggressiveness</i> | Configures a roaming aggressiveness value for wireless clients | <i>page 30-4</i> |
| <i>detection-threshold</i> | Configures the detection-threshold value | <i>page 30-5</i> |
| <i>disassoc-time</i> | Configures the disassociation interval | <i>page 30-6</i> |
| <i>handoff-count</i> | Configures the handoff-count value | <i>page 30-7</i> |
| <i>handoff-threshold</i> | Configures the handoff-threshold value | <i>page 30-8</i> |
| <i>monitoring-interval</i> | Configures the client monitoring interval | <i>page 30-9</i> |
| <i>sampling-interval</i> | Configures the interval at which clients are sampled to determine their RSSI value | <i>page 30-10</i> |
| <i>no</i> | Removes or reverts this roaming assist policy settings based on the parameters passed | <i>page 30-11</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

30.1.1 action

▶ *roaming-assist-policy-instance*

Specifies the action invoked on the client once it reaches a specified threshold value. The threshold values are configured based on the client load.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
action [assisted-roam|deauth|log]
```

Parameters

- action [assisted-roam|deauth|log]

| | |
|---|--|
| <pre>action [assisted-roam deauth log]</pre> | <p>Configures the action invoked on the client once it reaches the specified threshold value. The options are:</p> <ul style="list-style-type: none"> • assisted-roam – Provides 802.11v assisted roaming facility to the client • deauth – De-authenticates the client. This is the default setting. • log – Generates a log <p>In all three cases an event is generated. However, the message generated differs and is based on the action specified.</p> |
|---|--|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#action log
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Removes the configured action details |
|-----------|---------------------------------------|

30.1.2 aggressiveness

▸ *roaming-assist-policy-instance*

Configures a roaming aggressiveness value for wireless clients. Configuring this value increases the client's roaming capabilities in scenarios where the client's location is likely to change drastically and suddenly. For example, when a client hops on to a train that speeds up quickly. In such a scenario, the access point receives a maximum of 2 (two) messages, from the client, having relatively low RSSI value. This results in a decaying-average, which is above the specified handover-threshold value. Consequently, the client is unable to roam.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
aggressiveness [highest|lowest|medium|medium-high|medium-low]
```

Parameters

- aggressiveness [highest|lowest|medium|medium-high|medium-low]

| | |
|---|---|
| <pre>aggressiveness [highest lowest medium medium- high medium-low]</pre> | <p>Configures a roaming aggressiveness value for wireless clients. The options are:</p> <ul style="list-style-type: none"> • highest – De-authenticates client in case of any degradation in the client's link quality. When selected, the access point considers only the RSSI value of the last message received from the client. • lowest – De-authenticates client only in case of significant degradation in the client's link quality. When selected, the access point uses a weighted average [80% of decaying average + 20% of last seen RSSI] as the final reported RSSI value. This is the default setting. • medium – This is an intermediate setting between not roaming and performance • medium-high – Allows roaming even if performance goes down. When selected, the access point calculates the client's signal strength based on average received signal as well as last received signal level, weighted towards the last received value. • medium-low – Allows roaming even if performance goes average. When selected, the access point calculates the client's signal strength based on average received signal as well as last received signal level, weighted towards the average value. |
|---|---|

Example

```
nx9500-6C8809 (config-roaming-assist-policy-test) #aggressiveness medium

nx9500-6C8809 (config-roaming-assist-policy-test) #show context
roaming-assist-policy test
  aggressiveness medium
nx9500-6C8809 (config-roaming-assist-policy-test) #
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Reverts the aggressiveness value to default (lowest) |
|-----------|--|

30.1.3 detection-threshold

▶ *roaming-assist-policy-instance*

Specifies the detection-threshold determining when a client is monitored

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
detection-threshold <-100--40>
```

Parameters

- `detection-threshold <-100--40>`

| | |
|-----------------------------------|---|
| detection-threshold <-100--40> | Configures the detection threshold value determining when a client is monitored. The clients with bad RSSI values are monitored more frequently. <ul style="list-style-type: none"> • <-100--40> – Specify the RSSI value from -100 dBm - -40 dBm. The default is -75 dBm. |
|-----------------------------------|---|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#detection-threshold -90
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured detection threshold details |
|-----------|--|

30.1.4 disassoc-time

▶ *roaming-assist-policy-instance*

Configures the disassociation time. This is time period after which a disassociation message is sent.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
disassoc-time <1-10>
```

Parameters

- `disassoc-time <1-10>`

| | |
|---|--|
| <code>disassoc-time <1-10></code> | Configures the disassociation time in seconds <ul style="list-style-type: none"> • <code><1-10></code> - Specify a value from 1 - 10 seconds. The default is 5 seconds. |
|---|--|

Example

```
nx9500-6C8809(config-roaming-assist-policy-test)#disassoc-time 7

nx9500-6C8809(config-roaming-assist-policy-test)#show context
roaming-assist-policy test
  disassoc-time 7
nx9500-6C8809(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured disassociation time |
|-----------|--|

30.1.5 handoff-count

▶ *roaming-assist-policy-instance*

Specifies the number of times a client can exceed the specified handoff-threshold value before an action is invoked

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
handoff-count <1-10>
```

Parameters

- handoff-count <1-10>

| | |
|----------------------|---|
| handoff-count <1-10> | <p>Specifies the number of times a client can exceed the specified handoff-threshold value before an action is invoked</p> <ul style="list-style-type: none"> • <1-10> - Specify a value from 1 - 10. The default is 3. <p>If the client's RSSI increases beyond the set handoff-threshold, it is removed from the queue for monitoring and action invocation.</p> |
|----------------------|---|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#handoff-count 1
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured handoff-count details |
|-----------|--|

30.1.6 handoff-threshold

▶ *roaming-assist-policy-instance*

Configures the handoff-threshold, which specifies client status for handoff-action. Once exceeded an action is invoked.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
handoff-threshold <-100--40>
```

Parameters

- handoff-threshold <-100--40>

| | |
|------------------------------|--|
| handoff-threshold <-100--40> | <p>Configures the handoff-threshold, which specifies client status for handoff-action. Once exceeded an action is invoked.</p> <ul style="list-style-type: none"> • <-100--40> – Specify the RSSI value from -100 dBm - -40 dBm. The default is -80 dBm. <p>If the client's RSSI increases beyond the set handoff-threshold, it is removed from the queue for monitoring and action invocation.</p> |
|------------------------------|--|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#handoff-threshold -78
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured handoff-threshold details |
|-----------|--|

30.1.7 monitoring-interval

▶ *roaming-assist-policy-instance*

Configures the interval, in seconds, at which clients are monitored to determine if their RSSI value is below the specified handoff-threshold value

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
monitoring-interval <1-60>
```

Parameters

- `monitoring-interval <1-60>`

| | |
|-------------------------------|---|
| monitoring interval <1-60> | Specifies the interval, in seconds, at which clients are monitored to determine if their RSSI is below the specified handoff-threshold <ul style="list-style-type: none"> • <1-60> - Specify the duration from 1 - 60 seconds. The default is 5 seconds. |
|-------------------------------|---|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#monitoring-interval 10
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured monitoring interval details |
|-----------|--|

30.1.8 sampling-interval

▶ *roaming-assist-policy-instance*

Configures the interval, in seconds, at which clients are sampled to determine their RSSI value

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
sampling-interval <5-60>
```

Parameters

- `sampling-interval <5-60>`

| | |
|--------------------------|--|
| sampling-interval <5-60> | <p>Configures the interval, in seconds, between two successive client samplings</p> <ul style="list-style-type: none"> • <5-60> - Specify a value from 5 - 60 seconds. The default value is 15 seconds. <p>Higher the RSSI value, stronger is the signal.</p> |
|--------------------------|--|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#sampling-interval 20
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes the configured sampling interval details |
|-----------|--|

30.1.9 no

▶ *roaming-assist-policy-instance*

Removes or reverts this roaming assist policy settings based on the parameters passed

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [action|aggressiveness|detection-threshold|disassoc-time|handoff-count |
handoff-threshold|monitoring-interval|sampling-interval]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes or reverts this roaming assist policy settings to default based on the parameters passed |
|-----------------|--|

Example

```
rfs6000-81742D(config-roaming-assist-policy-test)#no action
rfs6000-81742D(config-roaming-assist-policy-test)#no detection-threshold
rfs6000-81742D(config-roaming-assist-policy-test)#no handoff-threshold
rfs6000-81742D(config-roaming-assist-policy-test)#show context
roaming-assist-policy test
sampling-interval 20
monitoring-interval 10
rfs6000-81742D(config-roaming-assist-policy-test)#
```

A CONTROLLER MANAGED WLAN USE CASE

This section describes the activities required to configure a WLAN. Instructions are provided using the wireless controller CLI.

- *Creating a First Controller Managed WLAN*
 - *Assumptions*
 - *Design*
 - *Using the Command Line Interface to Configure the WLAN*

A.1 Creating a First Controller Managed WLAN

▶ *CONTROLLER MANAGED WLAN USE CASE*

This section describes the process of creating managed WLAN on an RFS4000 wireless controller.

Upon completion, you will have created a WLAN on a RFS4000 model wireless controller using a DHCP server to allocate IP addresses to associated wireless clients.

A.1.1 Assumptions

Verify the following conditions have been satisfied before attempting the WLAN configuration activities described in this section:

- It is assumed the RFS4000 wireless controller has the latest firmware version available.
- It is assumed the AP7161 access point also has the latest firmware version available.
- It is assumed there are no previous configurations on the wireless controller or access point and default factory configurations are running on the devices.
- It is assumed you have administrative access to the wireless controller and access point CLI.
- It is assumed the individual administrating the network is a professional network installer.

A.1.2 Design

This section defines the network design being implemented.

Figure A-1 Network Design

This is a simple deployment scenario, with the access points connected directly to the wireless controller. One wireless controller port is connected to an external network.

On the RFS4000 wireless controller, the GE1 interface is connected to an external network. Interfaces GE3 and GE4 are used by the access points.

On the external network, the wireless controller is assigned an IP address of 192.168.10.188. The wireless controller acts as a DHCP server for the wireless clients connecting to it, and assigns IP addresses in the range of 172.16.11.11 to 172.16.11.200. The rest of IPs in the range are reserved for devices requiring static IP addresses.

A.1.3 Using the Command Line Interface to Configure the WLAN

► *Creating a First Controller Managed WLAN*

These instructions are for configuring your first WLAN using the wireless controller CLI.

Use a serial console cable when connecting to the wireless controller for the first time. Set the following configuration when using the serial connection:

- Bits per second: 19200
- Data Bit: 8
- Parity: None
- Stop Bit: 1
- Flow Control: None

The steps involved in creating a WLAN on a wireless controller are:

- 1 *Logging Into the Controller for the First Time*
- 2 *Creating a RF Domain*

- 3 *Creating a Wireless Controller Profile*
- 4 *Creating an AP Profile*
- 5 *Creating a DHCP Server Policy*
- 6 *Completing and Testing the Configuration*

A.1.3.1 Logging Into the Controller for the First Time

▶ *Using the Command Line Interface to Configure the WLAN*

When powering on the wireless controller for the first time, you are prompted to replace the existing administrative password. The credentials for logging into the wireless controller for the first time are:

- User Name: *admin*
- Password: *admin123*

Ensure the new password created is strong enough to provide adequate security for the wireless controller managed network.

A.1.3.2 Creating a RF Domain

▶ *Using the Command Line Interface to Configure the WLAN*

A RF Domain is a collection of configuration settings specific to devices located at the same physical deployment, such as a building or a floor. Create a RF Domain and assign the country code where the devices are deployed. This is a mandatory step, and the devices will not function as intended if this step is omitted.

The instructions in this section must be performed from the Global Configuration mode of the wireless controller. To navigate to this mode:

```
rfs4000>enable
rfs4000#
rfs4000#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
rfs4000(config)#
```

- 1 Create the RF Domain using the following commands:

```
rfs4000(config)#rf-domain RFDOMAIN_UseCase1
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#
```

This command creates a profile with the name *RFDOMAIN_UseCase1*.

- 2 Set the country code for the RF Domain.

```
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#country-code us
```

This sets the country code for this RF Domain. Save this change and exit the RF Domain profile context.

```
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#commit write
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#exit
rfs4000(config)#
```

- 3 To define the wireless controller's physical location, use the same RF Domain configuration.

```
rfs4000(config)#self
rfs4000(config-device-03-14-28-57-14-28)#
rfs4000(config-device-03-14-28-57-14-28)#use rf-domain RFDOMAIN_UseCase1
```

- 4 Commit the changes and write to the running configuration. Exit this context.

```
rfs4000(config-device-03-14-28-57-14-28)#commit write
rfs4000(config-device-03-14-28-57-14-28)#exit
rfs4000(config)#
```

A.1.3.3 Creating a Wireless Controller Profile

► Using the Command Line Interface to Configure the WLAN

- 1 The first step in creating a WLAN is to configure a profile defining the parameters applied to a wireless controller.

To create a profile:

```
rfs4000(config)#profile rfs4000 RFS4000_UseCase1
rfs4000(config-profile-RFS4000_UseCase1)#
```

This creates a profile with the name `RFS4000_UseCase1` and moves the cursor into its context. Any configuration made under this profile is available when it is applied to a device.

Configure a VLAN

- 2 Create the VLAN to use with the WLAN configuration. This can be done using the following commands:

```
rfs4000(config-profile-RFS4000_UseCase1)#interface vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-vlan2)#ip address 172.16.11.1/24
```

The above command assigns the IP address 172.16.11.1 with the mask of 255.255.255.0 to VLAN 2. Exit the VLAN 2 context.

```
rfs4000(config-profile-RFS4000_UseCase1-if-vlan2)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```

- 3 The next step is to assign this newly created VLAN to a physical interface. In this case, VLAN 2 is mapped to GE3 and GE4 to support two access points, an AP6521 and an AP7161. The AP6521 is connected to the gigabit interface GE3 and the AP7161 to the GE4 interface.

```
rfs4000(config-profile-RFS4000_UseCase1)#interface ge 3
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#
```

- 4 Map VLAN 2 to this interface. This assigns the IP address to the selected physical interface.

```
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#switchport access vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```

- 5 Similarly, map the defined VLAN 2 to the GE4 interface.

```
rfs4000(config-profile-1_UseCase1)#interface ge 4
rfs4000(config-profile-RFS4000_UseCase1-if-ge4)#switchport access vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-ge4)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```

- 6 Exit the profile and save it.

```
rfs4000(config-profile-RFS4000_UseCase1)#exit
rfs4000(config)#commit write
```

Configure the Wireless Controller to use the Profile

- 7 Before the wireless controller can be further configured, the profile must be applied to the wireless controller.

```
rfs4000(config)#self
rfs4000(config-device-03-14-28-57-14-28)#
rfs4000(config-device-03-14-28-57-14-28)#use profile RFS4000_UseCase1
rfs4000(config-device-03-14-28-57-14-28)#exit
rfs4000(config)#commit write
```

Create a WLAN

- 8 Use the following commands to create a WLAN:

```
rfs4000(config)#wlan 1
rfs4000(config-wlan-1)#
```

- 9 Configure the SSID for the WLAN. This is the value that identifies and helps differentiate this WLAN.

```
rfs4000(config-wlan-1)#ssid WLAN_USECASE_01
```

- 10 Enable the SSID to be broadcast so wireless clients can find it and associate.

```
rfs4000(config-wlan-1)#broadcast-ssid
```

- 11 Associate VLAN 2 to the WLAN and exit.

```
rfs4000(config-wlan-1)#vlan 2
rfs4000(config-wlan-1)#exit
```

- 12 Commit the Changes

Once these changes have been made, they have to be committed before proceeding.

```
rfs4000(config)#commit write
```

A.1.3.4 Creating an AP Profile

▶ *Using the Command Line Interface to Configure the WLAN*

An AP profile provides a method of applying common settings to access points of the same model. The profile significantly reduces the time required to configure access points within a large deployment. For more information, see:

- [Creating an AP6521 Profile](#)
- [Creating an AP7161 Profile](#)

A.1.3.4.1 Creating an AP6521 Profile

▶ *Creating an AP Profile*

An AP6521's firmware is updated directly by its associated wireless controller. The process is automatic, and no intervention is required. To create a profile for use with an AP6521:

```
rfs4000(config)#profile ap6521 AP6521_UseCase1
rfs4000(config-profile-AP6521_UseCase1)#
```

- 1 Assign the access point to be a member of the same VLAN defined in *Creating an AP Profile on page A-5*. In this section, the VLAN was defined as VLAN 2. Configure the access point to be a member of VLAN 2.

```
rfs4000(config-profile-AP6521_UseCase1)#interface vlan 2
rfs4000(config-profile-AP6521_UseCase1-if-vlan2)#
```

- 2 Configure this VLAN to use DHCP, so any device that is associated using this access point is automatically assigned a unique IP address. Once completed, exit this context.

```
rfs4000(config-profile-AP6521_UseCase1-if-vlan2)#ip address dhcp
rfs4000(config-profile-AP6521_UseCase1-if-vlan2)#exit
```

- 3 The VLAN has to be mapped to a physical interface on the access point. Since the only available physical interface on the AP6521 is GE1, this VLAN is mapped to it.

```
rfs4000(config-profile-AP6521_UseCase1)#interface ge 1
rfs4000(config-profile-AP6521_UseCase1-if-ge1)#switchport access vlan 2
rfs4000(config-profile-AP6521_UseCase1-if-ge1)#exit
```

- 4 Before a WLAN can be implemented, it has to be mapped to a radio on the access point. An AP6521 has 2 radios, in this scenario, both radios are utilized.

```
rfs4000(config-profile-AP6521_UseCase1)#interface radio 1
rfs4000(config-profile-AP6521_UseCase1-if-radio1)#wlan 1
rfs4000(config-profile-AP6521_UseCase1-if-radio1)#exit
rfs4000(config-profile-AP6521_UseCase1)#interface radio 2
rfs4000(config-profile-AP6521_UseCase1-if-radio2)#wlan 1
rfs4000(config-profile-AP6521_UseCase1-if-radio2)#exit
rfs4000(config-profile-AP6521_UseCase1)#
```

- 5 Commit the changes made to this profile and exit.

```
rfs4000(config-profile-AP6521_UseCase1)#commit write
rfs4000(config-profile-AP6521_UseCase1)#exit
rfs4000(config)#
```

- 6 Apply this Profile to the discovered AP6521.
- 7 Access the discovered access point using the following command. The discovered device's MAC address is used to access its context.

```
rfs4000 (config) #ap6521 00-A0-F8-00-00-01
rfs4000 (config-device-00-A0-F8-00-00-01) #
```

- 8 Assign the AP profile to this AP6521 access point.

```
rfs4000 (config-device-00-A0-F8-00-00-01) #use profile AP6521_UseCase1
rfs4000 (config-device-00-A0-F8-00-00-01) #commit write
```

- 9 Apply the RF Domain profile to the AP.

- 10 Apply the previously created RF Domain to enable a country code to be assigned to the discovered access point. A discovered access point only works properly if its country code is the country code of its associated wireless controller.

```
rfs4000 (config-device-00-A0-F8-00-00-01) #use rf-domain RFDOMAIN_UseCase1
rfs4000 (config-device-00-A0-F8-00-00-01) #commit write
rfs4000 (config-device-00-A0-F8-00-00-01) #exit
rfs4000 (config) #
```

A.1.3.4.2 Creating an AP7161 Profile

► *Creating an AP Profile*

To create a profile for use with an AP7161:

```
rfs4000 (config) #profile ap7161 AP7161_UseCase1
rfs4000 (config-profile-AP7161_UseCase1) #
```

- 1 Set the access point to be a member of the same VLAN defined in *Creating an AP Profile on page A-5*. In this section, the VLAN was defined as VLAN 2. Configure the access point to be a member of the VLAN 2.

```
rfs4000 (config-profile-AP7161_UseCase1) #interface vlan 2
rfs4000 (config-profile-AP7161_UseCase1-if-vlan2) #
```

- 2 Configure this VLAN to use DHCP, so any device associated using this access point is automatically assigned a unique IP address. Once completed, exit this context.

```
rfs4000 (config-profile-AP7161_UseCase1-if-vlan2) #ip address dhcp
rfs4000 (config-profile-AP7161_UseCase1-if-vlan2) #exit
```

- 3 The configured VLAN has to be mapped to a physical interface on the access point. Map VLAN 2 to the GE1 and GE2 interfaces on the AP7161. To configure the GE1 interface:

```
rfs4000 (config-profile-AP7161_UseCase1) #interface ge 1
rfs4000 (config-profile-AP7161_UseCase1-if-ge1) #switchport access vlan 2
rfs4000 (config-profile-AP7161_UseCase1-if-ge1) #exit
```

- 4 Similarly configure the GE2 interface.

```
rfs4000 (config-profile-AP7161_UseCase1) #interface ge 2
rfs4000 (config-profile-AP7161_UseCase1-if-ge2) #switchport access vlan 2
rfs4000 (config-profile-AP7161_UseCase1-if-ge2) #exit
```

- 5 Before the WLAN can be implemented, it has to be mapped to the physical radio on the access point. An AP7161 has 3 radios (on certain models), two of which can be configured for WLAN support. In this scenario, two radios are used.

```
rfs4000 (config-profile-AP7161_UseCase1) #interface radio 1
rfs4000 (config-profile-AP7161_UseCase1-if-radio1) #wlan 1
rfs4000 (config-profile-AP7161_UseCase1-if-radio1) #exit
rfs4000 (config-profile-AP7161_UseCase1) #interface radio 2
rfs4000 (config-profile-AP7161_UseCase1-if-radio2) #wlan 1
rfs4000 (config-profile-AP7161_UseCase1-if-radio2) #exit
rfs4000 (config-profile-AP7161_UseCase1) #
```

- 6 Commit the changes made to the profile and exit this context.

```
rfs4000(config-profile-AP7161_UseCase1)#commit write
rfs4000(config-profile-AP7161_UseCase1)#exit
rfs4000(config)#
```

7 Apply this Profile to the Discovered AP7161.

8 Access the discovered access point using the following command. The discovered device's MAC address is used to access its context.

```
rfs4000(config)#ap7161 00-23-68-16-C6-C4
rfs4000(config-device-00-23-68-16-C6-C4)#
```

9 Assign the AP profile to this access point.

```
rfs4000(config-device-00-23-68-16-C6-C4)#use profile AP7161_UseCase1
rfs4000(config-device-00-23-68-16-C6-C4)#commit write
```

10 Apply the RF Domain profile to the AP.

11 Apply the previously created RF Domain to enable a country code to be assigned to the discovered access point. A discovered access point only works properly if its country code is the same as its associated wireless controller.

```
rfs4000(config-device-00-23-68-16-C6-C4)#use rf-domain RFDOMAIN_UseCase1
rfs4000(config-device-00-23-68-16-C6-C4)#commit write
rfs4000(config-device-00-23-68-16-C6-C4)#Exit
rfs4000(config)#
```

A.1.3.5 Creating a DHCP Server Policy

► *Using the Command Line Interface to Configure the WLAN*

The DHCP server policy defines the parameters required to run a DHCP server on the wireless controller and assign IP addresses automatically to devices that associate. Configuring DHCP enables the reuse of a limited set of IP addresses.

To create a DHCP server policy:

```
rfs4000-37FABE(config)#dhcp-server-policy DHCP_POLICY_UseCase1
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#
```

The following table displays how IP addresses are used.

Table A.1 *IP Address Usage*

| IP Range | Usage |
|----------------------------------|---|
| 172.16.11.1 till 172.16.11.10 | Reserved for devices that require a static IP address |
| 172.16.11.11 till 172.16.11.200 | Range of IP addresses that can be assigned using the DHCP server. |
| 172.16.11.201 till 172.16.11.254 | Reserved for devices that require a static IP address |

In the table, the IP address range of 172.16.11.11 to 172.16.11.200 is available using the DHCP server. To configure the DHCP server:

```
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#dhcp-pool
DHCP_POOL_USECASE1_01
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-
DHCP_POOL_USECASE1_01)#
```

1 Configure the address range as follows:

```
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-
DHCP_POOL_USECASE1_01)#address range 172.16.11.11 172.16.11.200
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-
DHCP_POOL_USECASE1_01)#
```

- 2 Configure the IP pool used with a network segment. This starts the DHCP server on the specified interface.

```
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-
DHCP_POOL_USECASE1_01)#network 172.16.11.0/24
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-
DHCP_POOL_USECASE1_01)#exit
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#exit
rfs4000-37FABE(config)#commit write
```

Configure the RFS4000 to use the DHCP Policy

- 3 For the DHCP to work properly, the new DHCP Server Policy must be applied to the wireless controller. To apply the DHCP Server Policy to the wireless controller:

```
rfs4000-37FABE(config)#self
rfs4000-37FABE(config-device-03-14-28-57-14-28)#use dhcp-server-policy
DHCP_POLICY_UseCase1
rfs4000-37FABE(config-device-03-14-28-57-14-28)#commit write
rfs4000-37FABE(config-device-03-14-28-57-14-28)#exit
rfs4000-37FABE(config)#
```

A.1.3.6 Completing and Testing the Configuration

► *Using the Command Line Interface to Configure the WLAN*

A wireless client must be configured to associate with the wireless controller managed WLAN. The following information must be defined:

- SSID: WLAN_USECASE_01
- Country: Same as the country configured in *Creating a RF Domain on page A-3*. In this scenario, the country code is set to US.
- Mode: Infrastructure

With the WLAN set to beacon, use the wireless client's discovery client to discover the configured WLAN and associate.

B PUBLICLY AVAILABLE SOFTWARE

B.1 General Information

This document contains information regarding licenses, acknowledgments and required copyright notices for open source packages used in the following products:

Access Points

- AP6521, AP6522, AP6522M, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8122, AP8132, AP8163, AP8232, AP8432 and AP8533.

Wireless Controllers and Service Platforms

B.3 OSS Licenses

B.3.1 Apache License, Version 2.0

Apache License

Version 2.0, January 2004

<http://www.apache.org/licenses>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

You must give any other recipients of the Work or Derivative Works a copy of this License; and

You must cause any modified files to carry prominent notices stating that You changed the files; and

You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

B.3.2 The BSD License

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

Redistributions of source code must retain the above copyright notice, and the entire permission notice in its entirety, including the disclaimer of warranties.

Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission.

Neither the name of the University nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE REGENTS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ALL OF WHICH ARE HEREBY DISCLAIMED. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT,

STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF NOT ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

B.3.3 Creative Commons Attribution-ShareAlike License, version 3.0

Creative Commons

Attribution-ShareAlike 3.0 Unported

CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS LICENSE DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES REGARDING THE INFORMATION PROVIDED, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM ITS USE

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CREATIVE COMMONS PUBLIC LICENSE ("CCPL" OR "LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED

BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HERE, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. TO THE EXTENT THIS LICENSE MAY BE CONSIDERED TO BE A CONTRACT, THE LICENSOR GRANTS YOU THE RIGHTS CONTAINED HERE IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS.

Definitions

1. "Adaptation" means a work based upon the Work, or upon the Work and other pre-existing works, such as a translation, adaptation, derivative work, arrangement of music or other alterations of a literary or artistic work, or phonogram or performance and includes cinematographic adaptations or any other form in which the Work may be recast, transformed, or adapted including in any form recognizably derived from the original, except that a work that constitutes a Collection will not be considered an Adaptation for the purpose of this License. For the avoidance of doubt, where the Work is a musical work, performance or phonogram, the synchronization of the Work in timed-relation with a moving image ("synching") will be considered an Adaptation for the purpose of this License.
2. "Collection" means a collection of literary or artistic works, such as encyclopedias and anthologies, or performances, phonograms or broadcasts, or other works or subject matter other than works listed in Section 1(f) below, which, by reason of the selection and arrangement of their contents, constitute intellectual creations, in which the Work is included in its entirety in unmodified form along with one or more other contributions, each constituting separate and independent works in themselves, which together are assembled into a collective whole. A work that constitutes a Collection will not be considered an Adaptation (as defined below) for the purposes of this License.
3. "Creative Commons Compatible License" means a license that is listed at <http://creativecommons.org/compatiblelicenses> that has been approved by Creative Commons as being essentially equivalent to this License, including, at a minimum, because that license: (i) contains terms that have the same purpose, meaning and effect as the License Elements of this License; and, (ii) explicitly permits the relicensing of adaptations of works made available under that license under this License or a Creative Commons jurisdiction license with the same License Elements as this License.

4. "Distribute" means to make available to the public the original and copies of the Work or Adaptation, as appropriate, through sale or other transfer of ownership.
5. "License Elements" means the following high-level license attributes as selected by Licensor and indicated in the title of this License: Attribution, ShareAlike.
6. "Licensor" means the individual, individuals, entity or entities that offer(s) the Work under the terms of this License.
7. "Original Author" means, in the case of a literary or artistic work, the individual, individuals, entity or entities who created the Work or if no individual or entity can be identified, the publisher; and in addition (i) in the case of a performance the actors, singers, musicians, dancers, and other persons who act, sing, deliver, declaim, play in, interpret or otherwise perform literary or artistic works or expressions of folklore; (ii) in the case of a phonogram the producer being the person or legal entity who first fixes the sounds of a performance or other sounds; and, (iii) in the case of broadcasts, the organization that transmits the broadcast.
8. "Work" means the literary and/or artistic work offered under the terms of this License including without limitation any production in the literary, scientific and artistic domain, whatever may be the mode or form of its expression including digital form, such as a book, pamphlet and other writing; a lecture, address, sermon or other work of the same nature; a dramatic or dramatico-musical work; a choreographic work or entertainment in dumb show; a musical composition with or without words; a cinematographic work to which are assimilated works expressed by a process analogous to cinematography; a work of drawing, painting, architecture, sculpture, engraving or lithography; a photographic work to which are assimilated works expressed by a process analogous to photography; a work of applied art; an illustration, map, plan, sketch or three-dimensional work relative to geography, topography, architecture or science; a performance; a broadcast; a phonogram; a compilation of data to the extent it is protected as a copyrightable work; or a work performed by a variety or circus performer to the extent it is not otherwise considered a literary or artistic work.
9. "You" means an individual or entity exercising rights under this License who has not previously violated the terms of this License with respect to the Work, or who has received express permission from the Licensor to exercise rights under this License despite a previous violation.
10. "Publicly Perform" means to perform public recitations of the Work and to communicate to the public those public recitations, by any means or process, including by wire or wireless means or public digital performances; to make available to the public Works in such a way that members of the public may access these Works from a place and at a place individually chosen by them; to perform the Work to the public by any means or process and the communication to the public of the performances of the Work, including by public digital performance; to broadcast and rebroadcast the Work by any means including signs, sounds or images.
11. "Reproduce" means to make copies of the Work by any means including without limitation by sound or visual recordings and the right of fixation and reproducing fixations of the Work, including storage of a protected performance or phonogram in digital form or other electronic medium.
12. Fair Dealing Rights. Nothing in this License is intended to reduce, limit, or restrict any uses free from copyright or rights arising from limitations or exceptions that are provided for in connection with the copyright protection under copyright law or other applicable laws.

13. License Grant. Subject to the terms and conditions of this License, Licensor hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

- a. to Reproduce the Work, to incorporate the Work into one or more Collections, and to Reproduce the Work as incorporated in the Collections;
- b. to create and Reproduce Adaptations provided that any such Adaptation, including any translation in any medium, takes reasonable steps to clearly label, demarcate or otherwise identify that changes were made to the original Work. For example, a translation could be marked "The original work was translated from English to Spanish," or a modification could indicate "The original work has been modified.";
- c. to Distribute and Publicly Perform the Work including as incorporated in Collections; and,
- d. to Distribute and Publicly Perform Adaptations

For the avoidance of doubt:

1. Non-waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme cannot be waived, the Licensor reserves the exclusive right to collect such royalties for any exercise by You of the rights granted under this License;
2. Waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme can be waived, the Licensor waives the exclusive right to collect such royalties for any exercise by You of the rights granted under this License; and,
3. Voluntary License Schemes. The Licensor waives the right to collect royalties, whether individually or, in the event that the Licensor is a member of a collecting society that administers voluntary licensing schemes, via that society, from any exercise by You of the rights granted under this License.

The above rights may be exercised in all media and formats whether now known or hereafter devised. The above rights include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. Subject to Section 8(f), all rights not expressly granted by Licensor are hereby reserved.

4. Restrictions. The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:
 - a. You may Distribute or Publicly Perform the Work only under the terms of this License. You must include a copy of, or the *Uniform Resource Identifier* (URI) for, this License with every copy of the Work You Distribute or Publicly Perform. You may not offer or impose any terms on the Work that restrict the terms of this License or the ability of the recipient of the Work to exercise the rights granted to that recipient under the terms of the License. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties with every copy of the Work You Distribute or Publicly Perform. When You Distribute or Publicly Perform the Work, You may not impose any effective technological measures on the Work that restrict the ability of a recipient of the Work from You to exercise the rights granted to that recipient under the terms of the License. This Section 4(a) applies to the Work as incorporated in a Collection, but this does not require the Collection apart from the Work itself to be made subject to the terms of this License. If You create a Collection, upon notice from any Licensor You must, to the extent practicable, remove from the Collection any credit as required by Section 4(c), as requested. If You create an Adaptation, upon notice from any Licensor You must, to the extent practicable, remove from the Adaptation any credit as required by Section 4(c), as requested.
 - b. You may Distribute or Publicly Perform an Adaptation only under the terms of: (i) this License; (ii) a later version of this License with the same License Elements as this License; (iii) a Creative Commons jurisdiction

license (either this or a later license version) that contains the same License Elements as this License (e.g., Attribution-ShareAlike 3.0 US)); (iv) a Creative Commons Compatible License. If you license the Adaptation under one of the licenses mentioned in (iv), you must comply with the terms of that license. If you license the Adaptation under the terms of any of the licenses mentioned in (i), (ii) or (iii) (the "Applicable License"), you must comply with the terms of the Applicable License generally and the following provisions: (I) You must include a copy of, or the URI for, the Applicable License with every copy of each Adaptation You Distribute or Publicly Perform; (II) You may not offer or impose any terms on the Adaptation that restrict the terms of the Applicable License or the ability of the recipient of the Adaptation to exercise the rights granted to that recipient under the terms of the Applicable License; (III) You must keep intact all notices that refer to the Applicable License and to the disclaimer of warranties with every copy of the work as included in the Adaptation You Distribute or Publicly Perform; (IV) when You Distribute or Publicly Perform the Adaptation, You may not impose any effective technological measures on the Adaptation that restrict the ability of a recipient of the Adaptation from You to exercise the rights granted to that recipient under the terms of the Applicable License. This Section 4(b) applies to the Adaptation as incorporated in a Collection, but this does not require the Collection apart from the Adaptation itself to be made subject to the terms of the Applicable License.

c. If You Distribute, or Publicly Perform the Work or any Adaptations or Collections, You must, unless a request has been made pursuant to Section 4(a), keep intact all copyright notices for the Work and provide, reasonable to the medium or means You are utilizing: (i) the name of the Original Author (or pseudonym, if applicable) if supplied, and/or if the Original Author and/or Licensor designate another party or parties (e.g., a sponsor institute, publishing entity, journal) for attribution ("Attribution Parties") in Licensor's copyright notice, terms of service or by other reasonable means, the name of such party or parties; (ii) the title of the Work if supplied; (iii) to the extent reasonably practicable, the URI, if any, that Licensor specifies to be associated with the Work, unless such URI does not refer to the copyright notice or licensing information for the Work; and (iv) , consistent with Section 3(b), in the case of an Adaptation, a credit identifying the use of the Work in the Adaptation (e.g., "French translation of the Work by Original Author," or "Screenplay based on original Work by Original Author"). The credit required by this Section 4(c) may be implemented in any reasonable manner; provided, however, that in the case of a Adaptation or Collection, at a minimum such credit will appear, if a credit for all contributing authors of the Adaptation or Collection appears, then as part of these credits and in a manner at least as prominent as the credits for the other contributing authors. For the avoidance of doubt, You may only use the credit required by this Section for the purpose of attribution in the manner set out above and, by exercising Your rights under this License, You may not implicitly or explicitly assert or imply any connection with, sponsorship or endorsement by the Original Author, Licensor and/or Attribution Parties, as appropriate, of You or Your use of the Work, without the separate, express prior written permission of the Original Author, Licensor and/or Attribution Parties.

d. Except as otherwise agreed in writing by the Licensor or as may be otherwise permitted by applicable law, if You Reproduce, Distribute or Publicly Perform the Work either by itself or as part of any Adaptations or Collections, You must not distort, mutilate, modify or take other derogatory action in relation to the Work which would be prejudicial to the Original Author's honor or reputation. Licensor agrees that in those jurisdictions (e.g. Japan), in which any exercise of the right granted in Section 3(b) of this License (the right to make Adaptations) would be deemed to be a distortion, mutilation, modification or other derogatory action prejudicial to the Original Author's honor and reputation, the Licensor will waive or not assert, as appropriate, this Section, to the fullest extent permitted by the applicable national law, to enable You to reasonably exercise Your right under Section 3(b) of this License (right to make Adaptations) but not otherwise.

5. Representations, Warranties and Disclaimer.

UNLESS OTHERWISE MUTUALLY AGREED TO BY THE PARTIES IN WRITING, LICENSOR OFFERS THE WORK AS-IS AND MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND CONCERNING THE WORK, EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR THE ABSENCE OF LATENT OR OTHER DEFECTS, ACCURACY, OR THE PRESENCE OF ABSENCE OF ERRORS, WHETHER OR NOT DISCOVERABLE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO SUCH EXCLUSION MAY NOT APPLY TO YOU.

6. Limitation on Liability. EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL LICENSOR BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK, EVEN IF LICENSOR HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. Termination.

This License and the rights granted hereunder will terminate automatically upon any breach by You of the terms of this License. Individuals or entities who have received Adaptations or Collections from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 5, 6, 7, and 8 will survive any termination of this License.

Subject to the above terms and conditions, the license granted here is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, Licensor reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

8. Miscellaneous.

Each time You Distribute or Publicly Perform the Work or a Collection, the Licensor offers to the recipient a license to the Work on the same terms and conditions as the license granted to You under this License.

Each time You Distribute or Publicly Perform an Adaptation, Licensor offers to the recipient a license to the original Work on the same terms and conditions as the license granted to You under this License.

If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this License, and without further action by the parties to this agreement, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.

This License constitutes the entire agreement between the parties with respect to the Work licensed here. There are no understandings, agreements or representations with respect to the Work not specified here. Licensor shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of the Licensor and You.

The rights granted under, and the subject matter referenced, in this License were drafted utilizing the terminology of the Berne Convention for the Protection of Literary and Artistic Works (as amended on September 28, 1979), the Rome Convention of 1961, the WIPO Copyright Treaty of 1996, the WIPO

Performances and Phonograms Treaty of 1996 and the Universal Copyright Convention (as revised on July 24, 1971). These rights and subject matter take effect in the relevant jurisdiction in which the License terms are sought to be enforced according to the corresponding provisions of the implementation of those treaty provisions in the applicable national law. If the standard suite of rights granted under applicable copyright law includes additional rights not granted under this License, such additional rights are deemed to be included in the License; this License is not intended to restrict the license of any rights under applicable law.

Creative Commons Notice

Creative Commons is not a party to this License, and makes no warranty whatsoever in connection with the Work. Creative Commons will not be liable to You or any party on any legal theory for any damages whatsoever, including without limitation any general, special, incidental or consequential damages arising in connection to this license. Notwithstanding the foregoing two (2) sentences, if Creative Commons has expressly identified itself as the Licensor hereunder, it shall have all rights and obligations of Licensor.

Except for the limited purpose of indicating to the public that the Work is licensed under the CCPL, Creative Commons does not authorize the use by either party of the trademark "Creative Commons" or any related trademark or logo of Creative Commons without the prior written consent of Creative Commons. Any permitted use will be in compliance with Creative Commons' then-current trademark usage guidelines, as may be published on its website or otherwise made available upon request from time to time. For the avoidance of doubt, this trademark restriction does not form part of the License.

Creative Commons may be contacted at <http://creativecommons.org/>.

B.3.4 DropBear License

Dropbear contains a number of components from different sources, hence there are a few licenses and authors involved. All licenses are fairly non-restrictive.

The majority of code is written by Matt Johnston, under the license below.

Portions of the client-mode work are (c) 2004 Mihnea Stoenescu, under the same license:

B.3.5 GNU General Public License, version 2

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program

proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

B.3.6 GNU GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

The modified work must itself be a software library.

You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted,

regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided

that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only

in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

B.3.7 GNU Lesser General Public License 2.1

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

Creative Commons Legal Code CC0 1.0 Universal CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS DOCUMENT DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES REGARDING THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER.

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

The modified work must itself be a software library.

You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if

you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

B.3.8 CCO 1.0 Universal

Creative Commons Legal Code

CC0 1.0 Universal

CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS DOCUMENT DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES REGARDING THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER.

Statement of Purpose

The laws of most jurisdictions throughout the world automatically confer exclusive Copyright and Related Rights (defined below) upon the creator and subsequent owner(s) (each and all, an "owner") of an original work of authorship and/or a database (each, a "Work").

Certain owners wish to permanently relinquish those rights to a Work for the purpose of contributing to a commons of creative, cultural and scientific works ("Commons") that the public can reliably and without fear of later claims of infringement build upon, modify, incorporate in other works, reuse and redistribute as freely as possible in any form whatsoever and for any purposes, including without limitation commercial purposes. These owners may contribute to the Commons to promote the ideal of a free culture and the further production of creative, cultural and scientific works, or to gain reputation or greater distribution for their Work in part through the use and efforts of others.

For these and/or other purposes and motivations, and without any expectation of additional consideration or compensation, the person associating CCO with a Work (the "Affirmer"), to the extent that he or she is an owner of Copyright and Related Rights in the Work, voluntarily elects to apply CCO to the Work and publicly distribute the Work under its terms, with knowledge of his or her Copyright and Related Rights in the Work and the meaning and intended legal effect of CCO on those rights.

Copyright and Related Rights. A Work made available under CC0 may be protected by copyright and related or neighboring rights ("Copyright and Related Rights"). Copyright and Related Rights include, but are not limited to, the following:

the right to reproduce, adapt, distribute, perform, display, communicate, and translate a Work;

moral rights retained by the original author(s) and/or performer(s);

publicity and privacy rights pertaining to a person's image or likeness depicted in a Work;

rights protecting against unfair competition in regards to a Work, subject to the limitations in paragraph 4(a), below;

rights protecting the extraction, dissemination, use and reuse of data in a Work;

database rights (such as those arising under Directive 96/9/EC of the European Parliament and of the Council of 11 March 1996 on the legal protection of databases, and under any national implementation thereof, including any amended or successor version of such directive); and

other similar, equivalent or corresponding rights throughout the world based on applicable law or treaty, and any national implementations thereof.

Waiver. To the greatest extent permitted by, but not in contravention of, applicable law, Affirmer hereby overtly, fully, permanently, irrevocably and unconditionally waives, abandons, and surrenders all of Affirmer's Copyright and Related Rights and associated claims and causes of action, whether now known or unknown (including existing as well as future claims and causes of action), in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "Waiver"). Affirmer makes the Waiver for the benefit of each member of the public at large and to the detriment of Affirmer's heirs and successors, fully intending that such Waiver shall not be subject to revocation, rescission, cancellation, termination, or any other legal or equitable action to disrupt the quiet enjoyment of the Work by the public as contemplated by Affirmer's express Statement of Purpose.

Public License Fallback. Should any part of the Waiver for any reason be judged legally invalid or ineffective under applicable law, then the Waiver shall be preserved to the maximum extent permitted taking into account Affirmer's express Statement of Purpose. In addition, to the extent the Waiver is so judged Affirmer hereby grants to each affected person a royalty-free, non transferable, non sublicensable, non exclusive, irrevocable and unconditional license to exercise Affirmer's Copyright and Related Rights in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "License"). The License shall be deemed effective as of the date CC0 was applied by Affirmer to the Work. Should any part of the License for any reason be judged legally invalid or ineffective under applicable law, such partial invalidity or ineffectiveness shall not invalidate the remainder of the License, and in such case Affirmer hereby affirms that he or she will not (i) exercise any of his or her remaining Copyright and Related Rights in the Work or (ii) assert any associated claims and causes of action with respect to the Work, in either case contrary to Affirmer's express Statement of Purpose.

Limitations and Disclaimers.

No trademark or patent rights held by Affirmer are waived, abandoned, surrendered, licensed or otherwise affected by this document.

Affirmer offers the Work as-is and makes no representations or warranties of any kind concerning the Work, express, implied, statutory or otherwise, including without limitation warranties of title, merchantability, fitness for a particular purpose, non infringement, or the absence of latent or other defects, accuracy, or the present or absence of errors, whether or not discoverable, all to the greatest extent permissible under applicable law.

Affirmer disclaims responsibility for clearing rights of other persons that may apply to the Work or any use thereof, including without limitation any person's Copyright and Related Rights in the Work. Further, Affirmer disclaims responsibility for obtaining any necessary consents, permissions or other rights required for any use of the Work.

Affirmer understands and acknowledges that Creative Commons is not a party to this document and has no duty or obligation with respect to this CCO or use of the Work.

B.3.9 GNU General Public License, version 3

GNU GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

- a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
- b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".
- c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.
- d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

- a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
- b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
- c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
- d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
- e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
- f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives

whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any

of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE

PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

B.3.10 ISC License

Permission to use, copy, modify, and/or distribute this software for any purpose with or without fee is hereby granted, provided that the above copyright notice and this permission notice appear in all copies.

THE SOFTWARE IS PROVIDED "AS IS" AND THE AUTHOR DISCLAIMS ALL WARRANTIES WITH REGARD TO THIS SOFTWARE INCLUDING ALL IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY SPECIAL, DIRECT, INDIRECT, OR CONSEQUENTIAL DAMAGES OR ANY DAMAGES WHATSOEVER RESULTING FROM LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR OTHER TORTIOUS ACTION, ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.

B.3.11 GNU Lesser General Public License, version 3.0

GNU LESSER GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates the terms and conditions of version 3 of the GNU General Public License, supplemented by the additional permissions listed below.

Additional Definitions.

As used herein, "this License" refers to version 3 of the GNU Lesser General Public License, and the "GNU GPL" refers to version 3 of the GNU General Public License.

"The Library" refers to a covered work governed by this License, other than an Application or a Combined Work as defined below.

An "Application" is any work that makes use of an interface provided by the Library, but which is not otherwise based on the Library. Defining a subclass of a class defined by the Library is deemed a mode of using an interface provided by the Library.

A "Combined Work" is a work produced by combining or linking an Application with the Library. The particular version of the Library with which the Combined Work was made is also called the "Linked Version".

The "Minimal Corresponding Source" for a Combined Work means the Corresponding Source for the Combined Work, excluding any source code for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

The "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

1. Exception to Section 3 of the GNU GPL.

You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.

2. Conveying Modified Versions.

If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:

a) under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or

b) under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

3. Object Code Incorporating Material from Library Header Files.

The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:

a) Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.

b) Accompany the object code with a copy of the GNU GPL and this license document.

4. Combined Works.

You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:

- a) Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.
- b) Accompany the Combined Work with a copy of the GNU GPL and this license document.
- c) For a Combined Work that displays copyright notices during execution, include the copyright notice for the Library among these notices, as well as a reference directing the user to the copies of the GNU GPL and this license document.
- d) Do one of the following:
 - 0) Convey the Minimal Corresponding Source under the terms of this License, and the Corresponding Application Code in a form suitable for, and under terms that permit, the user to recombine or relink the Application with a modified version of the Linked Version to produce a modified Combined Work, in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.
 - 1) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (a) uses at run time a copy of the Library already present on the user's computer system, and (b) will operate properly with a modified version of the Library that is interface-compatible with the Linked Version.
- e) Provide Installation Information, but only if you would otherwise be required to provide such information under section 6 of the GNU GPL, and only to the extent that such information is necessary to install and execute a modified version of the Combined Work produced by recombining or relinking the Application with a modified version of the Linked Version. (If you use option 4d0, the Installation Information must accompany the Minimal Corresponding Source and Corresponding Application Code. If you use option 4d1, you must provide the Installation Information in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.)

5. Combined Libraries.

You may place library facilities that are a work based on the Library side by side in a single library together with other library facilities that are not Applications and are not covered by this License, and convey such a combined library under terms of your choice, if you do both of the following:

- a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities, conveyed under the terms of this License.
- b) Give prominent notice with the combined library that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

6. Revised Versions of the GNU Lesser General Public License.

The Free Software Foundation may publish revised and/or new versions of the GNU Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library as you received it specifies that a certain numbered version of the GNU Lesser General Public License "or any later version" applies to it, you

have the option of following the terms and conditions either of that published version or of any later version published by the Free Software Foundation. If the Library as you received it does not specify a version number of the GNU Lesser General Public License, you may choose any version of the GNU Lesser General Public License ever published by the Free Software Foundation.

If the Library as you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public License shall apply, that proxy's public statement of acceptance of any version is permanent authorization for you to choose that version for the Library.

B.3.12 GNU General Public License 2.0

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, thus in effect making the program proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

- 1 You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

- 2 You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

The modified work must itself be a software library.

You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

If, a facility in the modified Library, refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

- 3 You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer

version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

- 4 You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

- 5 A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

- 6 As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library.

(It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

- 7 You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:
 - Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
 - Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.
- 8 You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
- 9 You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.
- 10 Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.
- 11 If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who

receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

- 12 If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

- 13 The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

- 14 If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

- 15 BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY

TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

B.3.13 GNU Lesser General Public License, version 2.0

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc. 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the

library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

* a) The modified work must itself be a software library.

* b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

* c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

* d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, as the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

* a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

* b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

* c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

* d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

* a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

* b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by

law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

B.3.14 GNU Lesser General Public License, version 2.1

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

B.3.15 GNU LESSER GENERAL PUBLIC LICENSE

ERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

- 1 You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.
You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.
- 2 You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
 - a. The modified work must itself be a software library.
 - b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
 - c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

- 3 You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

- 4 You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

- 5 A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

- 6 As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)
- b. Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.
- c. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.
- d. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.
- e. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

- 7 You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:
 - a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
 - b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.
- 8 You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
- 9 You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.
- 10 Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.
- 11 If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

- 12 If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
- 13 The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.
- Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.
- 14 If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

- 15 BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

B.3.16 MIT License

Permission is hereby granted, without written agreement and without license or royalty fees, to use, copy, modify, and distribute this software and its documentation for any purpose, provided that the above copyright notice and the following two paragraphs appear in all copies of this software.

IN NO EVENT SHALL THE COPYRIGHT HOLDER BE LIABLE TO ANY PARTY FOR DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OF THIS SOFTWARE AND ITS DOCUMENTATION, EVEN IF THE COPYRIGHT HOLDER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

THE COPYRIGHT HOLDER SPECIFICALLY DISCLAIMS ANY WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE SOFTWARE PROVIDED HEREUNDER IS ON AN "AS IS" BASIS, AND THE COPYRIGHT HOLDER HAS NO OBLIGATION TO PROVIDE MAINTENANCE, SUPPORT, UPDATES, ENHANCEMENTS, OR MODIFICATIONS.

B.3.17 Mozilla Public License, version 2

Version 2.0

1. Definitions

- 1.1. Contributor means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software.
- 1.2. Contributor Version means the combination of the Contributions of others (if any) used by a Contributor and that particular Contribution.
- 1.3. Contribution means Covered Software of a particular Contributor.
- 1.4. Covered Software means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof.
- 1.5. Incompatible With Secondary Licenses means
 1. that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or
 2. that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License.
- 1.6. Executable Form means any form of the work other than Source Code Form.
- 1.7. Larger Work means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software.
- 1.8. License means this document.
- 1.9. Licensable means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License.
- 1.10. Modifications means any of the following:
 1. any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or
 2. any new file in Source Code Form that contains any Covered Software.
- 1.11. Patent Claims of a Contributor means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version.
- 1.12. Secondary License means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses.
- 1.13. Source Code Form means the form of the work preferred for making modifications.
- 1.14. You (orYour) means an individual or a legal entity exercising rights under this License. For legal entities, You includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, control means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants and Conditions

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

1. under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and
2. under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer either its Contributions or its Contributor Version.

2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the Contributor first distributes such Contribution.

2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no patent license is granted by a Contributor:

1. for any code that a Contributor has removed from Covered Software; or
2. for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the combination of its Contributions with other software (except as part of its Contributor Version); or
3. under Patent Claims infringed by Covered Software in the absence of its Contributions.

This License does not grant any rights in the trademarks, service marks, or logos of any Contributor (except as may be necessary to comply with the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

3. Responsibilities

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter or restrict the recipients' rights in the Source Code Form.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

1. such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must inform recipients of the Executable Form how they can obtain a copy of such Source Code Form by reasonable means in a timely manner, at a charge no more than the cost of distribution to the recipient; and
2. You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided that the license for the Executable Form does not attempt to limit or alter the recipients'™ rights in the Source Code Form under this License.

3.3. Distribution of a Larger Work

You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s).

3.4. Notices

You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices to the extent required to remedy known factual inaccuracies.

3.5. Application of Additional Terms

You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that any such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for any liability incurred by such Contributor as a result of warranty, support, indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

4. Inability to Comply Due to Statute or Regulation

If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Termination

5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance. Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice.

5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination.

6. Disclaimer of Warranty

Covered Software is provided under this License on an "as is" basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the Covered Software is free of defects, merchantable, fit for a particular purpose or non-infringing. The entire risk as to the quality and performance of the Covered Software is with You. Should any Covered Software prove defective in any respect, You (not any Contributor) assume the cost of any necessary servicing, repair, or correction. This disclaimer of warranty constitutes an essential part of this License. No use of any Covered Software is authorized under this License except under this disclaimer.

7. Limitation of Liability

Under no circumstances and under no legal theory, whether tort (including negligence), contract, or otherwise, shall any Contributor, or anyone who distributes Covered Software as permitted above, be liable to You for any direct, indirect, special, incidental, or consequential damages of any character including, without limitation, damages for lost profits, loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses, even if such party shall have been informed of the possibility of such damages. This limitation of liability shall not apply to liability for death or personal injury resulting from such party's negligence to the extent applicable law prohibits such limitation. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so this exclusion and limitation may not apply to You.

8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-of-law provisions. Nothing in this Section shall prevent a party's ability to bring cross-claims or counter-claims.

9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License against a Contributor.

10. Versions of the License

10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the right to modify or publish new versions of this License. Each version will be given a distinguishing version number.

10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version of the License under which You originally received the Covered Software, or under the terms of any subsequent version published by the license steward.

10.3. Modified Versions

If you create software not governed by this License, and you want to create a new license for such software, you may create and use a modified version of this License if you rename the license and remove any references to the name of the license steward (except to note that such modified license differs from this License).

10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses

If You choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of the License, the notice described in Exhibit B of this License must be attached.

Exhibit A - Source Code Form License Notice

This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed with this file, You can obtain one at <http://mozilla.org/MPL/2.0/>. You may add additional accurate notices of copyright ownership.

Exhibit B - Incompatible With Secondary Licenses Notice

This Source Code Form is Incompatible With Secondary Licenses, as defined by the Mozilla Public License, v. 2.0.

B.3.18 The Open LDAP Public License

The OpenLDAP Public License

Version 2.8, 17 August 2003

Redistribution and use of this software and associated documentation ("Software"), with or without modification, are permitted provided that the following conditions are met:

1. Redistributions in source form must retain copyright statements and notices,
2. Redistributions in binary form must reproduce applicable copyright statements and notices, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution, and
3. Redistributions must contain a verbatim copy of this document.

The OpenLDAP Foundation may revise this license from time to time. Each revision is distinguished by a version number. You may use this Software under terms of this license revision or under the terms of any subsequent revision of the license.

THIS SOFTWARE IS PROVIDED BY THE OPENLDAP FOUNDATION AND ITS CONTRIBUTORS ``AS IS'' AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OPENLDAP FOUNDATION, ITS CONTRIBUTORS, OR THE AUTHOR(S) OR OWNER(S) OF THE SOFTWARE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The names of the authors and copyright holders must not be used in advertising or otherwise to promote the sale, use or other dealing in this Software without specific, written prior permission. Title to copyright in this Software shall at all times remain with copyright holders.

B.3.19 OpenSSL License

OpenSSL License

Copyright (c) 1998-2000 The OpenSSL Project. All rights reserved. Redistribution and use in source and binary forms with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgment: This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit. (<http://www.openssl.org>)
4. The names "OpenSSL Toolkit" and "OpenSSL Project" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact openssl-core@openssl.org
5. Products derived from this software may not be called "OpenSSL" nor may "OpenSSL" appear in their names without prior written permission of the OpenSSL Project.
6. Redistributions of any form whatsoever must retain the following acknowledgment: "This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org>)"

THIS SOFTWARE IS PROVIDED BY THE OpenSSL PROJECT ``AS IS'' AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OpenSSL PROJECT OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE. This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

B.3.20 WU-FTPD Software License

WU-FTPD SOFTWARE LICENSE

Use, modification, or redistribution (including distribution of any modified or derived work) in any form, or on any medium, is permitted only if all the following conditions are met:

1. Redistributions qualify as "freeware" or "Open Source Software" under the following terms:
 - a. Redistributions are made at no charge beyond the reasonable cost of materials and delivery. Where redistribution of this software is as part of a larger package or combined work, this restriction applies only to the costs of materials and delivery of this software, not to any other costs associated with the larger package or combined work.
 - b. Redistributions are accompanied by a copy of the Source Code or by an irrevocable offer to provide a copy of the Source Code for up to three years at the cost of materials and delivery. Such redistributions must allow further use, modification, and redistribution of the Source Code under substantially the same terms as this license. For the purposes of redistribution "Source Code" means all files included in the original distribution, including all modifications or additions, on a medium and in a form allowing fully working executable programs to be produced.
2. Redistributions of Source Code must retain the copyright notices as they appear in each Source Code file and the COPYRIGHT file, these license terms, and the disclaimer/limitation of liability set forth as paragraph 6 below.
3. Redistributions in binary form must reproduce the Copyright Notice, these license terms, and the disclaimer/limitation of liability set forth as paragraph 6 below, in the documentation and/or other materials provided with the distribution. For the purposes of binary distribution the "Copyright Notice" refers to the following language:

Copyright (c) 1999,2000,2001 WU-FTPD Development Group.

B.3.22 Python License, Version 2 (Python-2.0)

PYTHON SOFTWARE FOUNDATION LICENSE VERSION 2

This LICENSE AGREEMENT is between the Python Software Foundation ("PSF"), and the Individual or Organization ("Licensee") accessing and otherwise using this software ("Python") in source or binary form and its associated documentation.

Subject to the terms and conditions of this License Agreement, PSF hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python alone or in any derivative version, provided, however, that PSF's License Agreement and PSF's notice of copyright, i.e., "Copyright (c) 2001, 2002, 2003, 2004, 2005, 2006 Python Software Foundation; All Rights Reserved" are retained in Python alone or in any derivative version prepared by Licensee.

In the event Licensee prepares a derivative work that is based on or incorporates Python or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python.

PSF is making Python available to Licensee on an "AS IS" basis. PSF MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, PSF MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

PSF SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

This License Agreement will automatically terminate upon a material breach of its terms and conditions.

Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between PSF and Licensee. This License Agreement does not grant permission to use PSF trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

By copying, installing or otherwise using Python, Licensee agrees to be bound by the terms and conditions of this License Agreement.

B.3.23 BEOPEN.COM LICENSE AGREEMENT FOR PYTHON 2.0

BEOPEN PYTHON OPEN SOURCE LICENSE AGREEMENT VERSION 1

This LICENSE AGREEMENT is between BeOpen.com ("BeOpen"), having an office at 160 Saratoga Avenue, Santa Clara, CA 95051, and the Individual or Organization ("Licensee") accessing and otherwise using this software in source or binary form and its associated documentation ("the Software").

Subject to the terms and conditions of this BeOpen Python License Agreement, BeOpen hereby grants Licensee a non-exclusive,royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use the Software alone or in any derivative version, provided, however, that the BeOpen Python License is retained in the Software, alone or in any derivative version prepared by Licensee.

BeOpen is making the Software available to Licensee on an "AS IS" basis. BEOPEN MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, BEOPEN MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF THE SOFTWARE WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

BEOPEN SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF THE SOFTWARE FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF USING, MODIFYING OR DISTRIBUTING THE SOFTWARE, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

This License Agreement will automatically terminate upon a material breach of its terms and conditions.

This License Agreement shall be governed by and interpreted in all respects by the law of the State of California, excluding conflict of law provisions. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between BeOpen and Licensee. This License Agreement does not grant permission to use BeOpen trademarks or trade names in a trademark sense to endorse or promote products or services of Licensee, or any third party. As an exception, the "BeOpen Python" logos available at <http://www.pythonlabs.com/logos.html> may be used according to the permissions granted on that web page.

By copying, installing or otherwise using the software, Licensee agrees to be bound by the terms and conditions of this License Agreement.

B.3.24 CNRI OPEN SOURCE LICENSE AGREEMENT (for Python 1.6b1)

 IMPORTANT: PLEASE READ THE FOLLOWING AGREEMENT CAREFULLY.

BY CLICKING ON "ACCEPT" WHERE INDICATED BELOW, OR BY COPYING, INSTALLING OR OTHERWISE USING PYTHON 1.6, beta 1 SOFTWARE, YOU ARE DEEMED TO HAVE AGREED TO THE TERMS AND CONDITIONS OF THIS LICENSE AGREEMENT.

This LICENSE AGREEMENT is between the Corporation for National Research Initiatives, having an office at 1895 Preston White Drive, Reston, VA 20191 ("CNRI"), and the Individual or Organization ("Licensee") accessing and otherwise using Python 1.6, beta 1 software in source or binary form and its associated documentation,as released at the www.python.org Internet site on August 4, 2000 ("Python 1.6b1").

Subject to the terms and conditions of this License Agreement, CNRI hereby grants Licensee a non-exclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python 1.6b1 alone or in any derivative version, provided, however, that CNRI's License Agreement is retained in Python 1.6b1, alone or in any derivative version prepared by Licensee.

Alternately, in lieu of CNRI's License Agreement, Licensee may substitute the following text (omitting the quotes): "Python 1.6, beta 1, is made available subject to the terms and conditions in CNRI's License Agreement. This Agreement may be located on the Internet using the following unique, persistent identifier (known as a handle): 1895.22/1011. This Agreement may also be obtained from a proxy server on the Internet using the URL: <http://hdl.handle.net/1895.22/1011>".

In the event Licensee prepares a derivative work that is based on or incorporates Python 1.6b1 or any part thereof, and wants to make the derivative work available to the public as provided herein, then Licensee hereby agrees to indicate in any such work the nature of the modifications made to Python 1.6b1.

CNRI is making Python 1.6b1 available to Licensee on an "AS IS" basis. CNRI MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, CNRI MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON 1.6b1 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

CNRI SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF THE SOFTWARE FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF USING, MODIFYING OR DISTRIBUTING PYTHON 1.6b1, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

This License Agreement will automatically terminate upon a material breach of its terms and conditions.

This License Agreement shall be governed by and interpreted in all respects by the law of the State of Virginia, excluding conflict of law provisions. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between CNRI and Licensee. This License Agreement does not grant permission to use CNRI trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

By clicking on the "ACCEPT" button where indicated, or by copying, installing or otherwise using Python 1.6b1, Licensee agrees to be bound by the terms and conditions of this License Agreement.

ACCEPT

B.3.25 CWI LICENSE AGREEMENT FOR PYTHON 0.9.0 THROUGH 1.2

 Copyright (c) 1991 - 1995, Stichting Mathematisch Centrum Amsterdam, The Netherlands. All rights reserved.

Permission to use, copy, modify, and distribute this software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation, and that the name of Stichting Mathematisch Centrum or CWI not be used in advertising or publicity pertaining to distribution of the software without specific, written prior permission.
