| <i>registration</i>               | Configures settings enabling dynamic registration of devices. Use this command to specify the mode of registration and to configure corresponding parameters.       | <a href="#">page 4-513</a> |
| <i>relay-agent</i>                | Enables support for DHCP relay agent information (option 82) feature on this WLAN                                                                                   | <a href="#">page 4-516</a> |
| <i>shutdown</i>                   | Auto shuts down a WLAN                                                                                                                                              | <a href="#">page 4-518</a> |
| <i>ssid</i>                       | Configures a WLAN's SSID                                                                                                                                            | <a href="#">page 4-520</a> |
| <i>t5-client-isolation</i>        | Disallows clients connecting to the WLAN to communicate with one another                                                                                            | <a href="#">page 4-521</a> |
| <i>t5-security</i>                | Configures T5 PowerBroadband security settings                                                                                                                      | <a href="#">page 4-522</a> |
| <i>time-based-access</i>          | Configures time-based client access                                                                                                                                 | <a href="#">page 4-524</a> |
| <i>use</i>                        | Defines WLAN mode configuration settings                                                                                                                            | <a href="#">page 4-525</a> |
| <i>vlan</i>                       | Sets VLAN assignment for a WLAN                                                                                                                                     | <a href="#">page 4-529</a> |
| <i>vlan-pool-member</i>           | Adds a member VLAN to the pool of VLANs for a WLAN                                                                                                                  | <a href="#">page 4-530</a> |
| <i>wep128</i>                     | Configures WEP128 parameters                                                                                                                                        | <a href="#">page 4-532</a> |
| <i>wep64</i>                      | Configures WEP64 parameters                                                                                                                                         | <a href="#">page 4-534</a> |

**Table 4.54** *WLAN-Mode Commands*

| <b>Command</b>         | <b>Description</b>                                                 | <b>Reference</b>  |
|------------------------|--------------------------------------------------------------------|-------------------|
| <i>wing-extensions</i> | Enables support for WiNG specific extensions to 802.11             | <i>page 4-536</i> |
| <i>wireless-client</i> | Configures the transmit power for wireless clients transmission    | <i>page 4-539</i> |
| <i>wpa-wpa2</i>        | Modifies TKIP and CCMP (WPA/WPA2) related parameters               | <i>page 4-542</i> |
| <i>service</i>         | Invokes service commands applicable in the WLAN configuration mode | <i>page 4-545</i> |

### 4.1.97.2.1 accounting

#### ▶ wlan-mode commands

Defines the WLAN's accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to access point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the access point for periodic network and user permission administration.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
accounting [radius|syslog|wait-client-ip]
```

```
accounting [radius|wait-client-ip]
```

```
accounting syslog [host|mac-address-format]
```

```
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

```
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]
```

#### Parameters

- accounting [radius|wait-client-ip]

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accounting radius         | <p>Enables support for WLAN RADIUS accounting messages. This option is disabled by default.</p> <p>When enabled, the WLAN uses an external RADIUS resource for accounting.</p> <p>Use the <i>use &gt; aaa-policy &gt; &lt;AAA-POLICY-NAME&gt;</i> command to associate an appropriate AAA policy with this WLAN. This AAA policy should be existing and should define the accounting, authentication, and authorization parameters.</p> |
| accounting wait-client-ip | Enables waiting for client's IP before commencing the accounting procedure                                                                                                                                                                                                                                                                                                                                                              |

- `accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}`

|                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accounting syslog                                              | Enables support for WLAN syslog accounting messages in standard syslog format (RFC 3164). This option is disabled by default.                                                                                                                                                                                                                                                                                          |
| host <IP/HOSTNAME>                                             | Configures a syslog destination hostname or IP address for accounting records <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the IP address or name of the destination host.</li> </ul>                                                                                                                                                                                                        |
| port <1-65535>                                                 | Optional. Configures the syslog server's UDP port (this port is used to connect to the server) <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify the port from 1 - 65535. Default port is 514.</li> </ul>                                                                                                                                                                                             |
| proxy-mode [none through-controller through-rf-domain-manager] | Optional. Configures the request proxying mode <ul style="list-style-type: none"> <li>• none - Requests are directly sent to the server from the device</li> <li>• through-controller - Proxies requests through the controller (access point, wireless controller, or service platform) configuring the device</li> <li>• through-rf-domain-manager - Proxies requests through the local RF Domain manager</li> </ul> |

- `accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accounting syslog  | Enables support for WLAN syslog accounting messages                                                                                                                                                                                                                                                                                                                                            |
| mac-address-format | Configures the MAC address format used in syslog messages                                                                                                                                                                                                                                                                                                                                      |
| middle-hyphen      | Configures the MAC address format with middle hyphen (AABBCC-DDEEFF)                                                                                                                                                                                                                                                                                                                           |
| no-delim           | Configures the MAC address format without delimiters (AABBCCDDEEFF)                                                                                                                                                                                                                                                                                                                            |
| pair-colon         | Configures the MAC address format with pair-colon delimiters (AA:BB:CC:DD:EE:FF)                                                                                                                                                                                                                                                                                                               |
| pair-hyphen        | Configures the MAC address format with pair-hyphen delimiters (AA-BB-CC-DD-EE-FF). This is the default setting.                                                                                                                                                                                                                                                                                |
| quad-dot           | Configures the MAC address format with quad-dot delimiters (AABB.CCDD.EEFF)                                                                                                                                                                                                                                                                                                                    |
| case [lower upper] | The following keywords are common to all: <ul style="list-style-type: none"> <li>• case - Specifies MAC address case (upper or lower) <ul style="list-style-type: none"> <li>• lower - Specifies MAC address is filled in lower case (for example, aa-bb-cc-dd-ee-ff)</li> <li>• upper - Specifies MAC address is filled in upper case (for example, AA-BB-CC-DD-EE-FF)</li> </ul> </li> </ul> |

**Example**

```
rfs6000-81742D(config-wlan-test)#accounting syslog host 172.16.10.4 port 2 proxy-mode none

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 accounting syslog host 172.16.10.4 port 2
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables sending of accounting message to the RADIUS server, disables syslog accounting, or disables waiting for client's IP before sending accounting messages |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.2 acl

#### ▶ wlan-mode commands

Defines the actions taken based on an ACL rule configuration

Use the `use > ip-access-list <IP-ACCESS-LIST-NAME>` command to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules. For an overview of firewalls, see [FIREWALL-POLICY](#).

WLANs use firewalls like *Access Control Lists* (ACLs) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of *Access Control Entries* (ACEs). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, administrators can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
disassociate}
```

#### Parameters

- `acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|disassociate}`

|                 |                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl exceed-rate | Sets the action taken based on an ACL rule configuration (for example, drop a packet) <ul style="list-style-type: none"> <li>• exceed-rate – Action is taken when the rate exceeds a specified value</li> </ul> |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless-client-denied-traffic<br><0-1000000> | Sets the action to deny traffic to the wireless client when the rate exceeds the specified value <ul style="list-style-type: none"> <li>&lt;0-1000000&gt; - Specify a allowed rate threshold of disallowed traffic in packets/sec.</li> </ul> <p>If enabled, this option allows an associated client, exceeding the thresholds configured for storm traffic, to be either de-authenticated or blacklisted depending on the action selected. This option is disabled by default.</p> |
| blacklist <0-86400>                           | Optional. When enabled, sets the time interval, in seconds, to blacklist a wireless client. <ul style="list-style-type: none"> <li>&lt;0-86400&gt; - Configures the blacklist duration from 0 - 86400 seconds. Offending clients are re-authenticated once the blacklist duration, configured here, has exceeded.</li> </ul>                                                                                                                                                        |
| disassociate                                  | Optional. When enabled, disassociates a wireless client                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Example**

```
rfs6000-81742D(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic
20 disassociate

rfs6000-81742D(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
accounting syslog host 172.16.10.4 port 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the action (de-authenticate or blacklist) to be taken when an associated client exceeds the thresholds configured for storm traffic |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.3 answer-broadcast-probes

▶ *wlan-mode commands*

Allows the WLAN to respond to probe requests that do not specify a SSID. These probes are for broadcast ESS. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
answer-broadcast-probes
```

**Parameters**

None

**Example**

```

rfs6000-81742D(config-wlan-1)#answer-broadcast-probes
rfs6000-81742D(config-wlan-1)#

```

**Related Commands**

|           |                                                                                  |
|-----------|----------------------------------------------------------------------------------|
| <i>no</i> | Does not allow this WLAN to respond to probe requests that do not specify a SSID |
|-----------|----------------------------------------------------------------------------------|

#### 4.1.97.2.4 assoc-response

► *wlan-mode commands*

Configures the deny-threshold and rssi-threshold values. These threshold values are considered when responding to a client's association/authentication request.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]
```

##### Parameters

- `assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]`

|                           |                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| assoc-response            | Configures the association response thresholds                                                                                                                                                                                                                                                                                           |
| deny-threshold <1-12>     | Configures the number of times association/authentication request, from a client, is ignored if the RSSI is less than the configured RSSI threshold. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;1-12&gt; - Specify the deny-threshold from 1 - 12.</li> </ul>                                      |
| rssi-threshold <-100--40> | Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the client's association/authentication request is ignored. This option is disabled by default. <ul style="list-style-type: none"> <li>• rssi-threshold &lt;-100--40&gt; - Specify a value from -100 - -40 dBm.</li> </ul> |

##### Example

```
nx9500-6C8809(config-wlan-test)#assoc-response rssi-threshold -60
nx9500-6C8809(config-wlan-test)#assoc-response deny-threshold 4

nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 assoc-response rssi-threshold -60
 assoc-response deny-threshold 4
 registration user group-name guest expiry-time 2000 agreement-refresh 14400
nx9500-6C8809(config-wlan-test)#
```

##### Related Commands

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <i>no</i> | Removes the configured deny-threshold and rssi-threshold values |
|-----------|-----------------------------------------------------------------|

#### 4.1.97.2.5 association-list

▶ *wlan-mode commands*

Attaches an existing global association list with this WLAN. For more information on global association lists, see

*global-association-list*.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
association-list global <GLOBAL-ASSO-LIST-NAME>
```

#### Parameters

- `association-list global <GLOBAL-ASSO-LIST-NAME>`

|                                                                  |                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>association-list global &lt;GLOBAL-ASSO-LIST-NAME&gt;</pre> | <p>Attaches an existing global association list with this WLAN</p> <ul style="list-style-type: none"> <li>• <code>&lt;GLOBAL-ASSO-LIST-NAME&gt;</code> - Specify the global association list name (should be existing and configured).</li> </ul> |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config-wlan-test)#association-list global my-clients

rfs4000-229D58 (config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 association-list global my-clients
rfs4000-229D58 (config-wlan-test)#
```

#### Related Commands

|           |                                                                  |
|-----------|------------------------------------------------------------------|
| <i>no</i> | Removes the global association list's association with this WLAN |
|-----------|------------------------------------------------------------------|

### 4.1.97.2.6 authentication-type

#### ▶ wlan-mode commands

Sets the WLAN's authentication type

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]
```

#### Parameters

- authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication-type | Configures a WLAN's authentication type<br>The authentication types are: EAP, EAP-MAC, EAP-PSK, Kerberos, MAC, and none.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| eap                 | Configures EAP authentication (802.1X)<br>EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs.<br>The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An access point passes EAP packets from the client to an authentication server on the wired side of the access point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client's identity.<br>If using EAP authentication ensure that a AAA policy is mapped to the WLAN. |
| eap-mac             | Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type).<br>EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| eap-psk             | Configures EAP authentication or pre-shared keys depending on client (This setting is only valid with <i>Temporal Key Integrity Protocol (TKIP)</i> or <i>Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP)</i> encryption types).<br>When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and pass code during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP.<br>If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN.                                                                                                                                                                                                                                                     |

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kerberos | <p>Configures Kerberos authentication (encryption will change to WEP128 if it's not already WEP128 or Keyguard)</p> <p>Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.</p> <p>Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses <i>Network Time Protocol</i> (NTP) for synchronizing the clocks of its <i>Key Distribution Center</i> (KDC) server(s).</p>                       |
| mac      | <p>Configures MAC authentication (RADIUS lookup of MAC address)</p> <p>MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP.</p> <p>MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, Firewall policies and time and date restrictions.</p> <p>MAC authentication can only identify devices, not users.</p> <p>If using mac authentication ensure that an AAA policy is mapped to the WLAN.</p> |
| none     | No authentication is used or the client uses pre-shared keys. This is the default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Example**

```
rfs6000-81742D(config-wlan-test)#authentication-type eap

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                                      |
|-----------|--------------------------------------------------------------------------------------|
| <i>no</i> | Resets the authentication mode used with this WLAN to default (none/pre-shared keys) |
|-----------|--------------------------------------------------------------------------------------|

### 4.1.97.2.7 bridging-mode

► *wlan-mode commands*

Configures how packets are bridged to and from a WLAN

Use this command to define which VLANs are bridged, and how local VLANs are bridged between the wired and wireless sides of the network.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
bridging-mode [local|tunnel]
```

#### Parameters

- `bridging-mode [local|tunnel]`

|               |                                                                                          |
|---------------|------------------------------------------------------------------------------------------|
| bridging-mode | Configures how packets are bridged to and from a WLAN. The options are local and tunnel. |
| local         | Bridges packets between WLAN and local ethernet ports. This is the default mode.         |
| tunnel        | Tunnels packets to other devices (typically a wireless controller or service platform)   |

#### Example

```
rfs6000-81742D(config-wlan-test)#bridging-mode local

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs6000-81742D(config-wlan-test)#
```

### 4.1.97.2.8 broadcast-dhcp

► *wlan-mode commands*

Configures broadcast DHCP packet handling parameters

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
broadcast-dhcp validate-offer
```

**Parameters**

- broadcast-dhcp validate-offer

|                |                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| validate-offer | Enables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air. This option is disabled by default. |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-wlan-test)#broadcast-dhcp validate-offer

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.9 broadcast-ssid

▶ *wlan-mode commands*

Advertises the WLAN SSID in beacons. If a hacker tries to isolate and hack a SSID from a client, the SSID will display since the ESSID is in the beacon. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
broadcast-ssid
```

**Parameters**

None

**Example**

```
rfs6000-81742D(config-wlan-1)#broadcast-ssid
rfs6000-81742D(config-wlan-1)#
```

**Related Commands**

|           |                                                         |
|-----------|---------------------------------------------------------|
| <i>no</i> | Disables the broadcasting of the WLAN's SSID in beacons |
|-----------|---------------------------------------------------------|

### 4.1.97.2.10 captive-portal-enforcement

▶ *wlan-mode commands*

Configures the captive portal enforcement on this WLAN. When enabled, provides successfully authenticated guests temporary and restricted access to the network. If enforcing captive-portal authentication, specify the captive-portal policy to use. For more information, see [use](#).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
captive-portal-enforcement {fall-back}
```

#### Parameters

- captive-portal-enforcement {fall-back}

|                            |                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| captive-portal-enforcement | Enables captive portal enforcement on a WLAN. This option is disabled by default.                                        |
| fall-back                  | Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only) |

#### Example

```
rfs6000-81742D(config-wlan-test)#captive-portal-enforcement fall-back

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
rfs6000-81742D(config-wlan-test)#
```

**4.1.97.2.11 client-access**▶ *wlan-mode commands*

Enables WLAN client access (for normal data operations)

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
client-access
```

**Parameters**

None

**Example**

```
rfs6000-81742D(config-wlan-1)#client-access
rfs6000-81742D(config-wlan-1)#
```

|-----------|-----------------------------|
| <i>no</i> | Disables WLAN client access |
|-----------|-----------------------------|

**4.1.97.2.12 client-client-communication**▶ *wlan-mode commands*

Allows frame switching from one client to another on a WLAN

This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
client-client-communication
```

**Parameters**

None

**Example**

```
rfs6000-81742D(config-wlan-1)#client-client-communication
rfs6000-81742D(config-wlan-1)#
```

### 4.1.97.2.13 client-load-balancing

#### ▶ wlan-mode commands

Enforces client load balancing on a WLAN's access point radios. AP6522, AP6532, AP6562, AP81XX, and AP82XX models can support 256 clients per access point. AP6511 and AP6521 models can support up to 128 clients per access point. When enforced, loads are balanced by ignoring association and probe requests. Probe and association requests are not responded to, forcing a client to associate with another access point radio.

This feature is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
client-load-balancing {allow-single-band-clients|band-discovery-intvl|
capability-ageout-time|max-probe-req|probe-req-intvl}
```

```
client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|band-discovery-
intvl <0-10000>|capability-ageout-time <0-10000>}
```

```
client-load-balancing {max-probe-req|probe-req-intvl} [2.4ghz|5ghz] <0-10000>
```

#### Parameters

- client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}

|                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-load-balancing                                                                                                                   | Configures client load balancing on a WLAN                                                                                                                                                                                                                                                                                                                                                                                                                               |
| allow-single-band-clients [2.4ghz 5ghz]                                                                                                 | Optional. Allows single band clients to associate even during load balancing <ul style="list-style-type: none"> <li>• 2.4ghz - Enables load balancing across 2.4 GHz channels</li> <li>• 5ghz - Enables load balancing across 5.0 GHz channels</li> </ul> This option is enabled by default for 2.4 and 5.0 GHz radios.                                                                                                                                                  |
| band-discovery-intvl <0-10000>                                                                                                          | Optional. Configures the interval to discover a client's band capability before connection <ul style="list-style-type: none"> <li>• &lt;0-10000&gt; - Specify a value from 0 - 10000 seconds. The default is 10 seconds.</li> </ul>                                                                                                                                                                                                                                      |
| capability-ageout-time <0-10000>                                                                                                        | Optional. Configures a client's capability ageout interval. This is the time for which a client's capabilities are retained in the device's internal table. Once this time is exceeded the client's capabilities are aged out. <ul style="list-style-type: none"> <li>• &lt;0-10000&gt; - Specify a value from 0 - 10000 seconds. The default is 3600 seconds.</li> </ul>                                                                                                |
| <ul style="list-style-type: none"> <li>• client-load-balancing {max-probe-req probe-req-intvl} [2.4ghz 5ghz] &lt;0-10000&gt;</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| client-load-balancing                                                                                                                   | Configures WLAN client load balancing                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| max-probe-req [2.4ghz 5ghz] <0-10000>                                                                                                   | Optional. Configures client probe request interval limits for device association <ul style="list-style-type: none"> <li>• 2.4ghz - Configures maximum client probe requests on 2.4 GHz radios</li> <li>• 5ghz - Configures maximum client probe requests on 5.0 GHz radios <ul style="list-style-type: none"> <li>• &lt;0-10000&gt; - Specify a client probe request threshold from 0 - 10000. The default for both 2.4 and 5.0 GHz radios is 60.</li> </ul> </li> </ul> |

acl exceed-rate wireless-client-denied-traffic 20 disassociate
broadcast-dhcp validate-offer
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                |
|-----------|----------------------------------------------------------------|
| <i>no</i> | Disables client load balancing on a WLAN's access point radios |
|-----------|----------------------------------------------------------------|

#### 4.1.97.2.14 controller-assisted-mobility

▶ *wlan-mode commands*

Enables controller or service platform assisted mobility to determine a wireless client's VLAN assignment. When enabled, a controller or service platform's mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
controller-assisted-mobility
```

**Parameters**

None

**Example**

```
rfs4000-229D58 (config-wlan-test) #controller-assisted-mobility

rfs4000-229D58 (config-wlan-test) #show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 controller-assisted-mobility
rfs4000-229D58 (config-wlan-test) #
```

**Related Commands**

|-----------|------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables controller or service platform assisted mobility to determine a wireless client's VLAN assignment |
|-----------|------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.15 data-rates

#### ▶ wlan-mode commands

Specifies the 802.11 rates supported on a WLAN

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
data-rates [2.4GHz|5GHz]
```

```
data-rates 2.4GHz [b-only|bg|bgn|custom|default|g-only|gn]
```

```
data-rates 2.4GHz custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|
basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|
basic-6|basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]
```

```
data-rates 5GHz [a-only|an|custom|default]
```

```
data-rates 5GHz custom [12|18|24|36|48|54|6|9|basic-1|basic-11|basic-12|
basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|
basic-mcs-1s|mcs-1s|mcs2s|mcs3s]
```

#### Parameters

- data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]

|            |                                                                     |
|------------|---------------------------------------------------------------------|
| data-rates | Specifies the 802.11 rates supported when mapped to a 2.4 GHz radio |
| b-only     | Uses rates that support only 11b clients                            |
| bg         | Uses rates that support both 11b and 11g clients                    |
| bgn        | Uses rates that support 11b, 11g and 11n clients                    |
| default    | Uses the default rates configured for a 2.4 GHz radio               |
| g-only     | Uses rates that support operation in 11g only                       |
| gn         | Uses rates that support 11g and 11n clients                         |

- data-rates 5GHz [a-only|an|default]

|            |                                                                     |
|------------|---------------------------------------------------------------------|
| data-rates | Specifies the 802.11 rates supported when mapped to a 5.0 GHz radio |
| a-only     | Uses rates that support operation in 11a only                       |
| an         | Uses rates that support 11a and 11n clients                         |
| default    | Uses default rates configured for a 5.0 GHz                         |

**4.1.97.2.16 description**▶ *wlan-mode commands*

Defines the WLAN description

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
description <LINE>
```

**Parameters**

- description <LINE>

|                           |                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;LINE&gt;</code> | Specify a WLAN description<br>The WLAN's description should help differentiate it from others with similar configurations. The description should not exceed 64 characters. |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-wlan-test)#description TestWLAN

rfs6000-81742D(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 data-rates 2.4GHz gn
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
rfs6000-81742D(config-wlan-test)#
```

| <i>no</i> | Removes a WLAN's configured description |
|-----------|-----------------------------------------|

**4.1.97.2.17 downstream-group-addressed-forwarding**▶ *wlan-mode commands*

Enables forwarding of downstream *broadcast/multicast* (BC/MC) packets to a group on this WLAN. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
downstream-group-addressed-forwarding
```

**Parameters**

None

**Example**

```
rfs4000-229D58 (config-wlan-test) #downstream-group-addressed-forwarding
rfs4000-229D58 (config-wlan-test) #
```

**Related Commands**

|-----------|------------------------------------------------------------------------|
| <i>no</i> | Disables forwarding of downstream BCMC packets to a group on this WLAN |
|-----------|------------------------------------------------------------------------|

#### 4.1.97.2.18 dpi

▶ *wlan-mode commands*

Enables DPI on this WLAN. When enabled, all traffic is subjected to DPI for detection of applications, application categories, custom applications, and metadata extraction.

DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
dpi metadata [http|ssl|tcp-rtt|voice-video]
```

**Parameters**

- dpi metadata [http|ssl|tcp-rtt|voice-video]

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| dpi metadata<br>[http ssl tcp-rtt <br>voice-video] | <p>Enables extraction of the following metadata flows:</p> <ul style="list-style-type: none"> <li>• http – Extracts HTTP flows. When enabled, administrators can track HTTP Websites accessed by both internal and guest clients and visualize HTTP data usage, hits, active time and total clients on the NSight application’s dashboard. This setting is disabled by default.</li> <li>• ssl – Extracts SSL flows. When enabled, administrators can track SSL Websites accessed by both internal and guest clients and visualize SSL data usage, hits, active time and total clients on the NSight application’s dashboard. This setting is disabled by default</li> <li>• tcp-rtt – Extracts <i>Round Trip Time</i> (RTT) information from <i>Transmission Control Protocol</i> (TCP) flows. However, this TCP-RTT metadata is viewable only on the NSight dashboard. Therefore, ensure the NSight server is up and NSight analytics data collection is enabled.</li> <li>• voice-video – Extracts voice and video flows. When enabled, voice and video calls can be tracked by extracting parameters, such as packets transferred and lost, jitter, and application name. Most Enterprise VoIP applications like facetime, skype for business and VoIP terminals can be monitored for call quality and visualized on the NSight dashboard in manner similar to HTTP and SSL. Call quality and metrics can only be determined from calls established unencrypted. This setting is disabled by default.</li> </ul> |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-wlan-test)#dpi metadata http
rfs6000-81742D(config-wlan-test)#dpi metadata ssl
rfs6000-81742D(config-wlan-test)#dpi metadata voice-video

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 dpi metadata voice-video
 dpi metadata http
 dpi metadata ssl
rfs6000-81742D(config-wlan-test)#
```

### 4.1.97.2.19 dynamic-vlan-assignment

▶ *wlan-mode commands*

Enables dynamic VLAN assignment on this WLAN, and adds or removes VLANs for the selected WLAN. Configure this feature to allow an override to the WLAN configuration. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS Access-Accept packet, and this feature is enabled, all client traffic is forward on that VLAN. If disabled, the RADIUS server returns VLAN-ID is ignored and the WLAN's VLAN configuration is used. For more information, see *vlan*. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dynamic-vlan-assignment allowed-vlans <VLAN-ID>
```

#### Parameters

- `dynamic-vlan-assignment allowed-vlans <VLAN-ID>`

|                                          |                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| dynamic-vlan-assignment<br>allowed-vlans | Enables dynamic VLAN assignment and configures a list of VLAN IDs or VLAN alias allowed access to the WLAN                                           |
| <VLAN-ID>                                | Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, \$guest.<br>For information on VLAN aliases, see <i>alias</i> . |

#### Example

```
rfs4000-229D58(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 10-20

rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#
```

#### Related Commands

| <i>no</i> | Disables dynamic VLAN assignment on this WLAN |
|-----------|-----------------------------------------------|

### 4.1.97.2.20 eap-types

#### ▶ wlan-mode commands

Configures client access based on the EAP type used

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] {(aka|all|fast|peap|sim|
tls|ttls)}
```

#### Parameters

- eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] {(aka|all|fast|peap|sim|tls|ttls)}

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| eap-types<br>[allow deny]        | Configures a list of allowed or denied EAP types <ul style="list-style-type: none"> <li>• allow – Configures a list of EAP types allowed for WLAN client authentication</li> <li>• deny – Configures a list of EAP types not allowed for WLAN client authentication</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| [aka all fast peap sim tls ttls] | The following EAP types are common to the 'allow' and 'deny' keywords: <ul style="list-style-type: none"> <li>• aka – Configures EAP <i>Authentication and Key Agreement</i> (AKA) and EAP-AKA' (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses <i>Universal Mobile Telecommunications System</i> (UMTS) and <i>Universal Subscriber Identity Module</i> (USIM) for client authentication and key distribution.</li> <li>• all – Allows or denies usage of all EAP types on the WLAN. This is the default setting.</li> <li>• fast – Configures EAP <i>Flexible Authentication via Secure Tunneling</i> (FAST). EAP-FAST establishes a <i>Transport Layer Security</i> (TLS) tunnel, to verify client credentials, using <i>Protected Access Credentials</i> (PAC).</li> <li>• peap – Configures <i>Protected Extensible Authentication Protocol</i> (PEAP). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP.</li> <li>• sim – Configures EAP <i>Subscriber Identity Module</i> (SIM). EAP-SIM uses <i>Global System for Mobile Communications</i> (GSMC) SIM for client authentication and key distribution.</li> <li>• tls – Configures EAP <i>Transport Layer Security</i> (TLS). EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server.</li> <li>• ttls – Configures <i>Tunneled Transport Layer Security</i> (TTLS). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA-signed certificate.</li> </ul> <p>These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.</p> |

**Example**

```
rfs6000-81742D(config-wlan-test)#eap-types allow fast sim tls

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 eap-types allow fast sim tls
rfs6000-81742D(config-wlan-test) #
```

### 4.1.97.2.21 encryption-type

#### ▶ wlan-mode commands

Sets a WLAN's encryption type

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|wep128-keyguard|wep64]
```

#### Parameters

- encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|wep128-keyguard|wep64]

|                 |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| encryption-type | Configures the WLAN's data encryption parameters                                                                                                                    |
| ccmp            | Configures <i>Advanced Encryption Standard (AES) Counter Mode CBC-MAC Protocol (AES-CCM/CCMP)</i>                                                                   |
| keyguard        | Configures Keyguard-MCM ( <i>Mobile Computing Mode</i> )                                                                                                            |
| none            | No encryption used. This is the default setting.                                                                                                                    |
| tkip-ccmp       | Configures the TKIP and AES-CCM/CCMP encryption modes                                                                                                               |
| wep128          | Configures WEP with 128 bit keys                                                                                                                                    |
| wep128-keyguard | Configures WEP128 as well as Keyguard-MCM encryption modes                                                                                                          |
| wep64           | Configures WEP with 64 bit keys. A WEP64 configuration is insecure when two WLANs are mapped to the same VLAN, and one uses no encryption while the other uses WEP. |

#### Example

```
rfs6000-81742D(config-wlan-test)#encryption-type tkip-ccmp

rfs6000-81742D(config-wlan-test)#show context
wlan test
description TestWLAN

### 4.1.97.2.23 fast-bss-transition

#### ► wlan-mode commands

Enables support for 802.11r *Fast-BSS Transition* (FT) on the selected WLAN. This feature is disabled by default.

802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
fast-bss-transition {over-ds}
```

#### Parameters

- fast-bss-transition {over-ds}

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fast-bss-transition<br>over-ds | Enables 802.11r FT support on this WLAN <ul style="list-style-type: none"> <li>• over-ds - Optional. Enables 802.11r client roaming over the <i>Distribution System</i> (DS). When enabled, all client communication with the target AP is via the current AP. This communication, carried in FT action frames, is first sent by the client to the current AP, then forwarded to the target AP through the controller.</li> </ul> |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-wlan-test)#fast-bss-transition

rfs6000-81742D(config-wlan-test)#show context
wlan test

### 4.1.97.2.24 http-analyze

#### ▶ wlan-mode commands

Enables HTTP URL analysis on the WLAN

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
http-analyze [filter|syslog]
http-analyze filter [images|post|query-string]
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|
through-controller|through-rf-domain-manager]}
```

#### Parameters

- http-analyze filter [images|post|query-string]

|              |                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| filter       | Filters URLs, based on the parameters set, before forwarding them                                                           |
| images       | Filters out URLs referring to images (does not forward URL requesting images)                                               |
| post         | Filters out URLs requesting POST (does not forward POST requests). This option is disabled by default.                      |
| query-string | Removes query strings from URLs before forwarding them (forwards requests and no data). This option is disabled by default. |

- http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

|                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| syslog<br>host <IP/<br>HOSTNAME>                                              | Forwards client and URL information to a syslog server <ul style="list-style-type: none"> <li>• host &lt;IP/HOSTNAME&gt; – Specify the syslog server’s IP address or hostname</li> </ul>                                                                                                                                                                                                                                               |
| port <1-65535>                                                                | Optional. Specifies the UDP port to connect to the syslog server from 1 - 65535                                                                                                                                                                                                                                                                                                                                                        |
| proxy-mode<br>[none <br>through-controller <br>through-rf-domain-<br>manager] | Optional. Specifies if the request is to be proxied through another device <ul style="list-style-type: none"> <li>• none – Requests are sent directly to syslog server from device</li> <li>• through-controller – Proxies requests, to the syslog server, through the controller configuring the device</li> <li>• through-rf-domain-manager – Proxies requests, to the syslog server, through the local RF Domain manager</li> </ul> |

**Example**

```
rfs4000-229D58(config-wlan-test)#http-analyze syslog host 192.168.13.10 port 21
proxy-mode through-controller

rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller
rfs4000-229D58(config-wlan-test)#
```

**Related Commands**

|           |                                        |
|-----------|----------------------------------------|
| <i>no</i> | Disables HTTP URL analysis on the WLAN |

### 4.1.97.2.25 ip

#### ▶ wlan-mode commands

Configures *Internet Protocol* (IP) settings

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ip [arp|dhcp]

ip arp [header-mismatch-validation|trust]

ip dhcp trust
```

#### Parameters

- ip arp [header-mismatch-validation|trust]

|                            |                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------|
| ip arp                     | Configures the IP settings for ARP packets                                                                  |
| header-mismatch-validation | Verifies mismatch of source MAC address in the ARP and Ethernet headers. This option is enabled by default. |
| trust                      | Sets ARP responses as trusted for a WLAN/range. This option is disabled by default.                         |

- ip dhcp trust

|         |                                                                                      |
|---------|--------------------------------------------------------------------------------------|
| ip dhcp | Configures the IP settings for DHCP packets                                          |
| trust   | Sets DHCP responses as trusted for a WLAN/range. This option is disabled by default. |

#### Example

```
rfs6000-81742D(config-wlan-test)#ip dhcp trust

rfs6000-81742D(config-wlan-test)#show context
wlan test
description TestWLAN
ssid test

rfs6000-81742D(config-wlan-test)#
```

#### Related Commands

|           |                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Resets IP ARP or DHCP trust parameters to default. ARP trust is disabled, ARP mismatch verification is enabled, or DHCP trust is disabled. |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.26 ipv6

#### ▶ wlan-mode commands

Sets the DHCPv6 and ICMPv6 *neighbor discovery* (ND) components for this WLAN

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```

ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]

```

#### Parameters

- `ipv6 dhcpv6 trust`

|                                |                                                                                                                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 dhcpv6 trust</code> | Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default. |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `ipv6 nd [header-mismatch-validation|raguard|trust]`

|                                         |                                                                                                                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 nd</code>                    | Sets the IPv6 ND settings for this WLAN                                                                                                                                      |
| <code>header-mismatch-validation</code> | Checks for mismatch of source MAC address in the ICMPv6 ND message and Ethernet header (link layer option). This option is enabled by default.                               |
| <code>raguard</code>                    | Allows redirection of <i>router advertisements</i> (RAs) and ICMPv6 packets originating on this WLAN. This option is disabled by default.                                    |
| <code>trust</code>                      | Enables trust state for ND requests received on this WLAN. When enabled, all ND requests on an IPv6 firewall, on this WLAN, are trusted. This option is disabled by default. |

#### Example

```

rfs6000-81742D(config-wlan-test)#ipv6 dhcpv6 trust
rfs6000-81742D(config-wlan-test)#ipv6 nd trust
rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 ipv6 dhcpv6 trust
 ipv6 nd trust
rfs6000-81742D(config-wlan-test)#

```

#### Related Commands

|                 |                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no</code> | Resets IPv6 ND or DHCPv6 trust parameters to default. ND request trust is disabled, ND header mismatch verification is enabled, ND RA and ICMPv6 redirection is disabled, or DHCPv6 trust is disabled. |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 4.1.97.2.27 kerberos

##### ▶ wlan-mode commands

Configures Kerberos authentication parameters on a WLAN

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses *Network Time Protocol* (NTP) for synchronizing the clocks of its *Key Distribution Center* (KDC) server(s).

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>
```

##### Parameters

- kerberos password [0 <LINE>|2 <LINE>|<LINE>]

|               |                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kerberos      | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server.                                                                                                                                                                                                                             |
| password      | Configures a Kerberos KDC server password. The password should not exceed 127 characters. The password options are: <ul style="list-style-type: none"> <li>• 0 &lt;LINE&gt; - Configures a clear text password</li> <li>• 2 &lt;LINE&gt; - Configures an encrypted password</li> <li>• &lt;LINE&gt; - Specify the password.</li> </ul> |
|               | <ul style="list-style-type: none"> <li>• kerberos realm &lt;REALM&gt;</li> </ul>                                                                                                                                                                                                                                                       |
| kerberos      | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server.                                                                                                                                                                                                                             |
| realm <REALM> | Configures a Kerberos KDC server realm. The REALM should not exceed 127 characters.                                                                                                                                                                                                                                                    |

- `kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}`

|                               |                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kerberos                      | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server.                                                                                                                                  |
| server<br>[primary secondary] | Configures the primary and secondary KDC server parameters <ul style="list-style-type: none"> <li>• primary - Configures the primary KDC server parameters</li> <li>• secondary - Configures the secondary KDC server parameters</li> </ul> |
| host <IP/HOSTNAME>            | Sets the primary or secondary KDC server address <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the IP address or name of the KDC server.</li> </ul>                                                                |
| port <1-65535>                | Optional. Configures the UDP port used to connect to the KDC server <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify the port from 1 - 65535. The default is 88.</li> </ul>                                               |

- `kerberos server timeout <1-60>`

|                |                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kerberos       | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server.                                                                                                                                         |
| timeout <1-60> | Modifies the Kerberos KDC server's timeout parameters <ul style="list-style-type: none"> <li>• &lt;1-60&gt; - Specifies the wait time for a response from the Kerberos KDC server before retrying. Specify a value from 1 - 60 seconds.</li> </ul> |

### Example

```
rfs6000-81742D(config-wlan-test)#kerberos server timeout 12
rfs6000-81742D(config-wlan-test)#kerberos server primary host 172.16.10.2 port 88
rfs6000-81742D(config-wlan-test)#show context

|-----------|--------------------------------------------------------------|
| <i>no</i> | Removes Kerberos authentication related parameters on a WLAN |
|-----------|--------------------------------------------------------------|

### 4.1.97.2.28 mac-authentication

#### ▶ wlan-mode commands

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac-authentication [cached-credentials|enforce-always]
```

#### Parameters

- mac-authentication [cached-credentials|enforce-always]

|                    |                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-authentication | Enables MAC authentication on this WLAN and configures related parameters                                                                                                                                                                                              |
| cached-credentials | Uses cached credentials to skip RADIUS lookups. This option is disabled by default.                                                                                                                                                                                    |
| enforce-always     | Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default. |

#### Example

```
rfs4000-229D58 (config-wlan-test) #mac-authentication cached-credentials
rfs4000-229D58 (config-wlan-test) #
```

### Parameters

- no <PARAMETERS>

|                 |                                                                        |
|-----------------|------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this WLAN's settings based on the parameters passed |
|-----------------|------------------------------------------------------------------------|

### Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

### Example

```

rfs6000-81742D(config-wlan-test)#no ?
 accounting Configure how accounting records are
 created for this wlan
 acl Actions taken based on ACL
 configuration [packet drop being one
 of them]
 answer-broadcast- Do not Include this wlan when
 probes responding to probe requests that do
 not specify an SSID
 assoc-response Association response threshold
 association-list Configure the association list for
 authentication-type the wlan
 broadcast-dhcp Reset the authentication to use on
 broadcast-ssid this wlan to default (none/Pre-shared
 captive-portal- keys)
 enforcement Configure broadcast DHCP packet
 client-access handling
 client-client- Do not advertise the SSID of the WLAN
 communication in beacons
 client-load- Configure how captive-portal is
 balancing enforced on the wlan
 controller-assisted Disallow client access on this wlan
 mobility (no data operations)
 Disallow switching of frames from one
 wireless client to another on this
 wlan
 Disable load-balancing of clients on
 this wlan
 Disable configure assisted mobility

```

```

data-rates Reset data rate configuration to
 default
description Reset the description of the wlan
downstream-group-addressed-forwarding Disable downstream group addressed
 forwarding of packets
dpi Deep-Packet-Inspection (Application
 Assurance)
dynamic-vlan-assignment Dynamic VLAN assignment configuration
eap-types Allow all EAP types on this wlan
encryption-type Reset the encryption to use on this
 wlan to default (none)
enforce-dhcp Drop packets from Wireless Clients
 with static IP address
fast-bss-transition Disable support for 802.11r Fast BSS
 Transition
http-analyze Enable HTTP URL analysis on the wlan
ip Internet Protocol (IP)
ipv6 Internet Protocol version 6 (IPv6)
kerberos Configure kerberos authentication
 parameters
mac-authentication Configure mac-authentication related
 parameters
nsight Nsight Server
opendns OpenDNS related config for this wlan
protected-mgmt-frames Disable support for Protected
 Management Frames (IEEE 802.11w)
proxy-arp-mode Configure handling of ARP requests
 with proxy-arp is enabled
proxy-nd-mode Configure handling of IPv6 ND
 requests with proxy-nd is enabled
qos-map Disable the 802.11u QoS map element
 and frame
radio-resource-measurement Disable support for 802.11k Radio
 Resource Measurement
radius Configure RADIUS related parameters
registration Dynamic registration of device (or)
 user
relay-agent Configure dhcp relay agent info
shutdown Enable the use of this wlan
ssid Configure ssid
t5-client-isolation Do not Isolate traffic among clients
t5-security Configure encryption and
 authentication
time-based-access Reset time-based-access parameters to
 default
use Set setting to use
vlan Map the default vlan (vlan-id 1) to
 the wlan
vlan-pool-member Delete a mapped vlan from this wlan
wep128 Reset WEP128 parameters
wep64 Reset WEP64 parameters
wing-extensions Disable support for WiNG-Specific
 extensions to 802.11
wireless-client Configure wireless-client specific
 parameters
wpa-wpa2 Modify tkip-ccmp (wpa/wpa2) related
 parameters

service Service to monitor to show no-service
 page to user

rfs6000-81742D(config-wlan-test) #

```

The test settings before execution of the no command:

```
rfs6000-81742D(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test
 bridging-mode local
 encryption-type tkip-ccmp
 authentication-type eap
 kerberos server timeout 12
 kerberos server primary host 172.16.10.2
 accounting syslog host 172.16.10.4 port 2
 data-rates 2.4GHz gn
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 captive-portal-enforcement fall-back
 ip dhcp trust
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 enforce-dhcp
 broadcast-dhcp validate-offer
 http-analyze controller
rfs6000-81742D(config-wlan-test)#

rfs6000-81742D(config-wlan-test)#no accounting syslog

rfs6000-81742D(config-wlan-test)#no description

rfs6000-81742D(config-wlan-test)#no authentication-type

rfs6000-81742D(config-wlan-test)#no encryption-type

rfs6000-81742D(config-wlan-test)#no enforce-dhcp

rfs6000-81742D(config-wlan-test)#no kerberos server primary host

rfs6000-81742D(config-wlan-test)#no kerberos server timeout

rfs6000-81742D(config-wlan-test)#no data-rates 2.4GHz

rfs6000-81742D(config-wlan-test)#no ip dhcp trust

rfs6000-81742D(config-wlan-test)#no captive-portal-enforcement
```

The test settings after the execution of the no command:

```
rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
 http-analyze controller
rfs6000-81742D(config-wlan-test)#
```

### 4.1.97.2.30 nsight

#### ▶ *wlan-mode commands*

Enables retention of client-history

A typical NSight-server enabled, guest access environment may be visited by thousands of unique clients on a daily basis. Some of these guest clients are not regular visitors, accessing the network infrequently. However, by default, historical data of all guest clients, irrespective of their network access frequency, is retained by the NSight server for up to 180 days. This results in the database containing thousands if not millions of unique MAC addresses of infrequent guest clients. To address this potential problem it is recommended to disable client-history retention on a guest WLAN, and use the nsight-policy context to configure a separate timer (8 hours by default) specifying the guest client data lifespan in the database.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nsight client-history
```

#### Parameters

- nsight client-history

|                       |                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------|
| nsight client-history | Enables retention of client-history in the database. This option is enabled by default. |
|-----------------------|-----------------------------------------------------------------------------------------|

#### Example

On a WLAN, the client-history option is enabled by default. When enabled, all client history (including guest-clients) is retained in the NSight server database for 180 days.

To disable this option, execute the `no > nsight > client-history` command. When disabled, guest client history is retained only for 8 hours, which is the default setting defined by the NSight policy applied on the access point (through which the guest client accesses the WLAN) or the access point's RF Domain. However, the default historical data retention duration for regular clients and devices (access point and controllers) remains unchanged (180 days) as per the NSight policy settings.

```

nx9500-6C8809(config-wlan-test3)#no nsight client-history
nx9500-6C8809(config-wlan-test3)#show context
wlan test3
 ssid test3
 bridging-mode local
 encryption-type none
 authentication-type none
 no nsight client-history
nx9500-6C8809(config-wlan-test3)#

```

Use the NSight policy context to define separate client-history retention time for regular clients, devices, and guest clients. For more information, see [nsight-policy](#).

#### Related Commands

|-----------|----------------------------------------------------------|
| <i>no</i> | Disables client-history retention in the NSight database |
|-----------|----------------------------------------------------------|

### 4.1.97.2.31 `opendns`

#### ▶ *wlan-mode commands*

Configures the pre-fetched OpenDNS `device_id`. Once configured, all DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. The device ID is a sixteen (16) character hex string representing a 64 bit unsigned integer and is fetched from the OpenDNS site.

This command is part of a series of configurations that are required to integrate WiNG access points, wireless controllers, and service platforms with OpenDNS. When all the parameters have been configured, DNS queries from wireless clients, associating with the WLAN, are redirected to OpenDNS (208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement. For more information on the entire configuration, see *opendns*.

This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
opendns device-id <DEVICE-ID>
```

#### Parameters

- `opendns device-id <DEVICE-ID>`

|                                                  |                                                                                                                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>opendns device-id &lt;DEVICE-ID&gt;</code> | Configures the device ID to embed in DNS queries sent to OpenDNS <ul style="list-style-type: none"> <li>• <code>&lt;DEVICE-ID&gt;</code> - Specify the device ID.</li> </ul> |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

The following command fetches the `device_id` from the OpenDNS site.

```
ap7131-E6D512#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
```

Use this `device_id` in the WLAN configuration context.

```
ap7131-E6D512(config)#wlan opendns
ap7131-E6D512(config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#commit

ap7131-E6D512(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 vlan 1
 bridging-mode local
 encryption-type none
 authentication-type none
 opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#
```

**Related Commands**

|-----------|------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the device ID configured to be embedded in the DNS queries originating from the WiNG devices |
|-----------|------------------------------------------------------------------------------------------------------|

### 4.1.97.2.32 protected-mgmt-frames

#### ► wlan-mode commands

Configures the WLAN's frame protection mode and *security association* (SA) query parameters

802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The 'robust management frames' are *action*, *disassociation*, and *deauthentication* frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. *Protected management frames* (PMF) protocol only applies to robust management frames after establishment of RSNA PTK. Robust management frame protection is achieved by using CCMP for unicast management frames, *broadcast/multicast integrity protocol* (BIP) for broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]]
```

#### Parameters

```
• protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]]
```

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protected-mgmt-frames                                | Enables and configures WLAN's frame protection mode and SA query parameters. Use this command to specify whether management frames are continually or optionally protected. Frame protection mode is disabled by default.                                                                                                                                                                                                                 |
| mandatory                                            | Enforces <i>protected management frames</i> (PMF) on this WLAN (management frames are continually optionally protected)                                                                                                                                                                                                                                                                                                                   |
| optional                                             | Provides PMF only for those clients that support PMF (management frames are optionally protected)                                                                                                                                                                                                                                                                                                                                         |
| sa-query<br>[attempts <1-10> <br>timeout <100-1000>] | Configures the following SA parameters: <ul style="list-style-type: none"> <li>• attempts &lt;1-10&gt; - Configures the number of SA query attempts from 1 - 10. The default is 5.</li> <li>• timeout &lt;100-1000&gt; - Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds.</li> </ul> |

**Example**

```
rfs6000-81742D(config-wlan-test)#protected-mgmt-frames mandatory

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables enforcement of protected management frames on this WLAN. And reverts protected management frames sa-query timeout and attempts to 201 milliseconds and 5 respectively. |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.33 proxy-arp-mode

#### ► wlan-mode commands

Enables proxy ARP mode for handling ARP requests

Proxy ARP is the technique used to answer ARP requests intended for another system. By faking its identity, the access point accepts responsibility for routing packets to the actual destination.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
proxy-arp-mode [dynamic|strict]
```

#### Parameters

- proxy-arp-mode [dynamic|strict]

|                |                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------|
| proxy-arp-mode | Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict.                      |
| dynamic        | Forwards ARP requests to the wireless side (for which a response could not be proxied). This is the default setting. |
| strict         | Does not forward ARP requests to the wireless side                                                                   |

#### Example

```
rfs6000-81742D(config-wlan-test)#proxy-arp-mode strict

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 http-analyze controller
rfs6000-81742D(config-wlan-test)#
```

#### Related Commands

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>no</i> | Reverts the proxy ARP mode to default (dynamic) |
|-----------|-------------------------------------------------|

#### 4.1.97.2.34 proxy-nd-mode

▶ *wlan-mode commands*

Configures the proxy ND mode for this WLAN member clients as either strict or dynamic

ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can be done either dynamically (requiring exchanges of identity and authorization information) or statically when the network topology is defined.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
proxy-nd-mode [dynamic|strict]
```

##### Parameters

- proxy-nd-mode [dynamic|strict]

|                                   |                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| proxy-nd-mode<br>[dynamic strict] | Configures the proxy ND mode for this WLAN member clients. The options are:<br>dynamic and strict <ul style="list-style-type: none"> <li>• dynamic - Forwards ND request to wireless for which a response could not be proxied. This is the default value.</li> <li>• strict - Does not forward ND requests to the wireless side</li> </ul> |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

##### Example

```
rfs6000-81742D(config-wlan-test)#proxy-nd-mode strict

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 wpa-wpa2 server-only-authentication
 proxy-nd-mode strict
 .opendns device-id 44-55-66
rfs6000-81742D(config-wlan-test)#
```

##### Related Commands

|-----------|------------------------------------------------|
| <i>no</i> | Reverts the proxy ND mode to default (dynamic) |
|-----------|------------------------------------------------|

### 4.1.97.2.35 qos-map

▶ *wlan-mode commands*

Enables support for 802.11u QoS map element and frames

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
qos-map
```

**Parameters**

None

**Example**

```
rfs6000-81742D(config-wlan-test)#qos-map

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 qos-map
 wpa-wpa2 server-only-authentication
 proxy-nd-mode strict
 .opendns device-id 44-55-66
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|-----------|---------------------------------------------------------|
| <i>no</i> | Disables support for 802.11u QoS map element and frames |
|-----------|---------------------------------------------------------|

### 4.1.97.2.36 radio-resource-measurement

#### ▶ wlan-mode commands

Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN

802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and under utilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to an under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it's an efficient use of the network's resources. This feature is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```

#### Parameters

```
• radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```

|                             |                                                                                                                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radio-resource-measurement  | Enables support for 802.11k radio resource measurement capabilities                                                                                                                                            |
| channel-report              | Optional. Includes the channel-report element in beacons and probe responses                                                                                                                                   |
| neighbor-report<br>{hybrid} | Optional. Enables responding to neighbor-report requests <ul style="list-style-type: none"> <li>• hybrid - Optional. Uses the hybrid model of smart-rf neighbors and roaming frequency to neighbors</li> </ul> |

#### Example

```
rfs4000-229D58 (config-wlan-test) #radio-resource-measurement

rfs4000-229D58 (config-wlan-test) #show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 radio-resource-measurement
 controller-assisted-mobility
rfs4000-229D58 (config-wlan-test) #
```

### 4.1.97.2.37 radius

#### ► wlan-mode commands

Configures RADIUS related parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]
```

```
radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|
vlan-assignment]
```

#### Parameters

- radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dynamic-authorization        | <p>Enables support for disconnect and change of authorization messages (RFC5176)</p> <p>When enabled, this option extends the RADIUS protocol to support unsolicited messages from the RADIUS server. These messages allow administrators to issue <i>change of authorization</i> (CoA) messages, which affect session authorization, or <i>disconnect messages</i> (DM) that terminate a session immediately. This option is disabled by default.</p>                                                                                                                                                                                                    |
| nas-identifier<br><NAS-ID>   | <p>Configures the <i>network access server</i> (NAS) identifier attribute, a value that identifies the access point or controller where the RADIUS messages originate. The value specified here is included in the RADIUS NAS-Identifier field for WLAN authentication and accounting packets.</p> <ul style="list-style-type: none"> <li>• &lt;NAS-ID&gt; - Specify the NAS identifier attribute (should not exceed 256 characters in length).</li> </ul>                                                                                                                                                                                                |
| nas-port-id<br><NAS-PORT-ID> | <p>Configures the NAS port ID attribute, a value that identifies the port from where the RADIUS messages originate</p> <ul style="list-style-type: none"> <li>• &lt;NAS-PORT-ID&gt; - Specify the NAS port ID attribute (should not exceed 256 characters in length).</li> </ul> <p>The profile database on the RADIUS server consists of user profiles for each connected NAS port. Each profile is matched to a username representing a physical port. When authorizing users, it queries the user profile database using a username representative of the physical NAS port making the connection. Set the numeric port value from 0 - 4294967295.</p> |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan-assignment | <p>Configures the VLAN assignment of a WLAN. RADIUS VLAN assignment is disabled by default.</p> <p>When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the <i>vlan/vlan-pool-member</i> options (in the WLAN config mode) is used.</p> <p>If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration.</p> |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-wlan-test)#radius vlan-assignment

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 --More--
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | <p>Disables support for disconnect and change of authorization messages. Disables the use of VLAN information received in RADIUS server responses, instead uses the VLAN provided in the WLAN configuration. Removes the NAS identifier and NAS port identifiers configured.</p> |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.38 registration

#### ▶ *wlan-mode commands*

Configures settings enabling dynamic registration and validation of devices by their MAC addresses. When configured, this option registers a device's MAC address, and allows direct access to a previously registered device.

This command also configures the external guest registration and validation server details. If using an external server to perform guest registration, authentication and accounting, use this command to configure the external server's IP address/hostname. When configured, access points and controllers forward guest registration requests to the specified registration server. In case of EGuest deployment, this external resource should point to the EGuest registration server.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
registration [device|device-OTP|external|user]

registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {agreement-
refresh <0-144000>|expiry-time <1-43800>}

registration external [follow-aaa|host]

registration external follow-aaa {send-mode [http|https|udp]}

registration external host <IP/HOSTNAME> {proxy-mode|send-mode}

registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
through-rf-domain-manager|through-centralized-controller]|send-mode [https|
https|udp]}
```

#### Parameters

- registration external follow-aaa {send-mode [http|https|udp]}

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| registration | Enables dynamic guest-user registration and validation. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| external     | Specifies that the guest registration is handled by an external resource. Access points/controllers send registration requests to the external registration server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| follow-aaa   | <p>Uses an AAA policy to point to the guest registration, authentication, and accounting server. When used, guest registration is handled by the RADIUS server specified in the AAA policy used in the WLAN context.</p> <p>In case of EGuest deployment, the RADIUS authentication and accounting server configuration in the AAA policy should point to the EGuest server. The use of 'follow-aaa' option is recommended in EGuest replica-set deployments.</p> <p>For more information on enabling the EGuest server, see <i>eguest-server (VX9000 only)</i>.</p> <p>For more information on configuring an EGuest deployment, see <i>configuring ExtremeGuest captive-portal</i>.</p> |

|                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables dynamic user registration and removes associated configurations. Also disables forwarding of user information to an external device. |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.97.2.39 relay-agent

► *wlan-mode commands*

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

#### Parameters

- relay-agent [dhcp-option82|dhcpv6-ldra]

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relay-agent   | Enables support for the following DHCP and DHCPv6 options: option 82 and <i>Lightweight DHCPv6 Relay Agent</i> (LDRA) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server.<br><br>This information provides the following: <ul style="list-style-type: none"> <li>• circuit ID suboption - Provides the SNMP port interface index</li> <li>• remote ID - Provides the controller's MAC address</li> </ul> |
| dhcp-option82 | Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| dhcpv6-ldra   | Enables the DHCPv6 relay agent. The LDRA feature allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                        |

#### Example

```
rfs4000-229D58(config-wlan-test)#relay-agent dhcp-option82

rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 radio-resource-measurement
 relay-agent dhcp-option82
 controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#

rfs6000-81701D(config-wlan-test)#relay-agent dhcpv6-ldra

rfs6000-81701D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 relay-agent dhcpv6-ldra
rfs6000-81701D(config-wlan-test)#
```

|-----------|-----------------------------------------------------------------------------------------------------------|

#### 4.1.97.2.40 shutdown

##### ▶ *wlan-mode commands*

Auto shuts down a WLAN

The auto shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administrated. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN's availability is automated.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
shutdown {on-critical-resource <CR-NAME>|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

##### Parameters

```
• shutdown {on-critical-resource <CR-NAME>|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

|                                   |                                                                                                                                                                                                                                                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shutdown                          | Auto shuts down the WLAN when specified events occur. Disabled by default.                                                                                                                                                                      |
| on-critical-resource<br><CR-NAME> | Optional. Auto shuts down the WLAN when critical resource failure occurs. Disabled by default. <ul style="list-style-type: none"> <li>• &lt;CR-NAME&gt; - Specifies the name of the critical resource being monitored for this WLAN.</li> </ul> |
| on-meshpoint-loss                 | Optional. Auto shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.                                                                                                                                    |
| on-primary-port-link-loss         | Optional. Auto shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.                                                                                                                          |
| on-unadoption                     | Optional. Auto shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.                                                                                                                                               |

##### Usage Guidelines

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.

**Example**

```

rfs6000-81742D(config-wlan-test)#shutdown on-unadoption

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 shutdown on-unadoption
 http-analyze controller
rfs6000-81742D(config-wlan-test)#

```

**Related Commands**

|           |                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables auto shut down WLAN. Use the optional keywords provided to disable auto shut down of the WLAN upon critical resource failure, when meshpoint links fail, when the primary Ethernet port (e1/up1) loses link, or when the WLAN gets unadopted. |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 4.1.97.2.41 ssid

▶ *wlan-mode commands*

Configures a WLAN's SSID

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ssid <SSID>
```

**Parameters**

- ssid <SSID>

|        |                                                                                                                        |
|--------|------------------------------------------------------------------------------------------------------------------------|
| <SSID> | Specify the WLAN's SSID. The WLAN SSID is case sensitive and alphanumeric. Its length should not exceed 32 characters. |
|--------|------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-wlan-test)#ssid testWLAN1

rfs6000-81742D(config-wlan-test)#show context
wlan test
ssid testWLAN1
bridging-mode local
encryption-type none
authentication-type none
protected-mgmt-frames mandatory
radius vlan-assignment
wing-extensions wmm-load-information
client-load-balancing probe-req-intvl 5ghz 5
client-load-balancing band-discovery-intvl 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
proxy-arp-mode strict
broadcast-dhcp validate-offer
shutdown on-unadoption
http-analyze controller
rfs6000-81742D(config-wlan-test)#
```

**Related Commands**

|           |                         |
|-----------|-------------------------|
| <i>no</i> | Removes the WLAN's SSID |
|-----------|-------------------------|

#### 4.1.97.2.42 t5-client-isolation

▶ *wlan-mode commands*

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by a T5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

#### Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
t5-client-isolation
```

#### Parameters

None

#### Example

```

nx9500-6C8809(config-wlan-test)#t5-client-isolation

nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 t5-client-isolation
nx9500-6C8809(config-wlan-test)#

```

#### Related Commands

|           |                                                                       |
|-----------|-----------------------------------------------------------------------|
| <i>no</i> | Allows clients connecting to the WLAN to communicate with one another |
|-----------|-----------------------------------------------------------------------|

### 4.1.97.2.43 t5-security

▶ *wlan-mode commands*

Configures T5 PowerBroadband security settings

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

**Supported in the following platforms:**

- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
t5-security [static-wep|wpa-enterprise|wpa-personal]

t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]

t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]
```

**Parameters**

- t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]

|                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t5-security static-wep                                                                                                                                       | Configures the T5 WLAN security type as static-wep                                                                                                                                                                                                                                                                                                                                                                                                                          |
| encryption-type [wep128 wep64]                                                                                                                               | Applies one of the following encryption algorithms to the T5 support WLAN configuration: WEP64 or WEP128                                                                                                                                                                                                                                                                                                                                                                    |

#### 4.1.97.2.44 time-based-access

##### ► wlan-mode commands

Configures time-based client access to the network resources

Administrators can use this feature to assign fixed days and time of WLAN access for wireless clients

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|
saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

##### Parameters

```
• time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|
saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| day <option>       | Specifies the day or days on which the client can access the WLAN <ul style="list-style-type: none"> <li>• sunday - Allows access on Sundays only</li> <li>• monday - Allows access on Mondays only</li> <li>• tuesday - Allows access on Tuesdays only</li> <li>• wednesday - Allows access on Wednesdays only</li> <li>• thursday - Allows access on Thursdays only</li> <li>• friday - Allows access on Fridays only</li> <li>• saturday - Allows access on Saturdays only</li> <li>• weekends - Allows access on weekends only</li> <li>• weekdays - Allows access on weekdays only</li> <li>• all - Allows access on all days</li> </ul> |
| start <START-TIME> | Optional. Specifies the access start time in hours and minutes (HH:MM)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| end <END-TIME>     | Specifies the access end time in hours and minutes (HH:MM)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

##### Example

```
rfs6000-81742D(config-wlan-test)#time-based-access days weekdays start 10:00 end
16:30

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 time-based-access days weekdays start 10:00 end 16:30
 --More--
rfs6000-81742D(config-wlan-test)#
```

**4.1.97.2.45 use**▶ *wlan-mode commands*

This command associates an existing captive portal with a WLAN.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use [aaa-policy|application-policy|association-acl-policy|bonjour-gw-discovery-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|roaming-assist-policy|url-filter|wlan-qos-policy]
```

```
use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|association-acl-policy <ASSOCIATION-POLICY-NAME>|bonjour-gw-discovery-policy <POLICY-NAME>|captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy <PASSPOINT-POLICY-NAME>|roaming-assist-policy <POLICY-NAME>|url-filter <URL-FILTER-NAME>|wlan-qos-policy <WLAN-QOS-POLICY-NAME>]
```

```
use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>
```

**Parameters**

- use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|association-acl-policy <ASSOCIATION-POLICY-NAME>|bonjour-gw-discovery-policy <POLICY-NAME>|captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy <PASSPOINT-POLICY-NAME>|roaming-assist-policy <POLICY-NAME>|url-filter <URL-FILTER-NAME>|wlan-qos-policy <WLAN-QoS-POLICY-NAME>]

|                                              |                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aaa-policy<br><AAA-POLICY-NAME>              | Uses an existing AAA policy with a WLAN <ul style="list-style-type: none"> <li>• &lt;AAA-POLICY-NAME&gt; - Specify the AAA policy name.</li> </ul>                                                                                                                                                                                                            |
| application-policy<br><POLICY-NAME>          | Uses an existing application policy with a WLAN. An application policy defines actions to perform on a packet when it matches a specified set of pre-defined applications or application categories. For more information, see <i>application-policy</i> . <ul style="list-style-type: none"> <li>• &lt;POLICY-NAME&gt; - Specify the policy name.</li> </ul> |
| association-acl<br><ASSOCIATION-POLICY-NAME> | Uses an existing association ACL policy with a WLAN <ul style="list-style-type: none"> <li>• &lt;ASSOCIATION-POLICY-NAME&gt; - Specify the association ACL policy name.</li> </ul>                                                                                                                                                                            |
| bonjour-gw-discovery-policy<br><POLICY-NAME> | Uses an existing Bonjour GW Discovery policy with a WLAN. When associated, the Bonjour GW Discovery policy defines a list of services clients can discover across subnets.<br>Contd..                                                                                                                                                                         |

### Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of *Access Control Entries* (ACEs). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE's conditions, it is either forwarded, dropped, or marked depending on the action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

### Example

```
rfs6000-81742D(config-wlan-test)#use aaa-policy test

rfs6000-81742D(config-wlan-test)#use association-acl-policy test
rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local

▶ *wlan-mode commands*

Sets the VLAN where traffic from a WLAN is mapped

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

**Parameters**

- vlan [<1-4094>|<VLAN-ALIAS-NAME>]

|                   |                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-4094>          | Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased.<br><br>Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool.                                                                          |
| <VLAN-ALIAS-NAME> | Assigns a VLAN alias to the WLAN. The VLAN alias should be existing and configured.<br><br>A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see <i>alias</i> . |

**Example**

```
rfs6000-81742D(config-wlan-test)#vlan 4

rfs6000-81742D(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 vlan 4
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 time-based-access days weekdays start 10:00 end 16:30
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 use aaa-policy test
 use association-acl-policy test
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 proxy-arp-mode strict

### 4.1.97.2.47 vlan-pool-member

▶ *wlan-mode commands*

Adds a member VLAN to a WLAN's VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

**NOTE:** Configuration of a VLAN pool overrides the 'vlan' configuration.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
vlan-pool-member <WORD> {limit <0-8192>}
```

#### Parameters

- `vlan-pool-member <WORD> {limit <0-8192>}`

|                  |                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan-pool-member | Adds a member VLAN to a WLAN's VLAN pool<br>Since users belonging to separate VLANs can share the same WLAN, it is not necessary to create a new WLAN for every VLAN in the network.                                            |
| <WORD>           | Define the VLANs available to this WLAN. It is either a single index, or a list of VLAN IDs (for example, 1,3,7), or a range (for example, 1-10)                                                                                |
| limit <0-8192>   | Optional. Is ignored if the number of clients are limited and well within the limits of the DHCP pool on the VLAN<br><ul style="list-style-type: none"> <li>• &lt;0-8192&gt; - Specifies the number of users allowed</li> </ul> |

#### Example

```
rfs6000-81742D(config-wlan-test)#vlan-pool-member 1-10 limit 1

rfs6000-81742D(config-wlan-test)#show context
wlan test
ssid testWLAN1
vlan-pool-member 1 limit 1
vlan-pool-member 2 limit 1
vlan-pool-member 3 limit 1
vlan-pool-member 4 limit 1
vlan-pool-member 5 limit 1
vlan-pool-member 6 limit 1
vlan-pool-member 7 limit 1
vlan-pool-member 8 limit 1
vlan-pool-member 9 limit 1
vlan-pool-member 10 limit 1
bridging-mode local
encryption-type none
authentication-type none
protected-mgmt-frames mandatory
radius vlan-assignment
time-based-access days weekdays start 10:00 end 16:30
--More--
rfs6000-81742D(config-wlan-test)#
```

### 4.1.97.2.48 wep128

▶ *wlan-mode commands*

Configures WEP128 parameters

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
wep128 [key|keys-from-passkey|transmit-key]
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep128 keys-from-passkey <WORD>
wep128 transmit-key <1-4>
```

**Parameters**

- wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]

|                                                                                           |                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wep128                                                                                    | Configures WEP128 parameters. The parameters are: key, key-from-passkey, and transmit-key.                                                                                                                                                                                                                                                            |
| key <1-4>                                                                                 | Configures pre-shared hex keys <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Configures a maximum of four key indexes. Select the key index from 1 - 4.</li> </ul>                                                                                                                                                                           |

Resets the WEP64 PSK and transmission keys to factory-default values

### 4.1.97.2.50 wing-extensions

#### ▶ wlan-mode commands

Enables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards that potentially increase client roaming reliability and handshake speed

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
wing-extensions [ap-attributes-information {include-hostname}|
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60>}|
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}|
smart-scan|wing-load-information|wmm-load-information]
```

#### Parameters

```
• wing-extensions [ap-attributes-information {include-hostname}|
coverage-hole-detection {11k-clients|offset <5-20>|offset <5-20>|threshold <-80--60>}|
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}|
smart-scan|wing-load-information|wmm-load-information]
```

### 4.1.97.2.51 wireless-client

#### ▶ wlan-mode commands

Configures the transmit power indicated to clients

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|
max-firewall-sessions|reauthentication|roam-notification|t5-inactivity-timeout|
tx-power|vlan-cache-ageout]
```

```
wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|hold-time
<1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]
```

```
wireless-client roam-notification [after-association|after-data-ready|auto]
```

#### Parameters

- wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|vlan-cache-out <60-86400>]

|                                     |                                                                                                                                                                                                                                                                                                                                                      |

### 4.1.97.2.52 wpa-wpa2

#### ▶ wlan-mode commands

Modifies TKIP-CCMP (WPA/WPA2) related parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
wpa-wpa2 [exclude-wpa2-tkip|handshake|key-rotation|opp-pmk-caching|pmk-caching|
preauthentication|server-only-authentication|psk|tkip-countermeasures|
use-sha256-akm]

wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|
server-only-authentication|use-sha256-akm]

wpa-wpa2 handshake [attempts|init-wait|priority|timeout]
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]]|
timeout <10-5000> {10-5000}]

wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>

wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]

wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

#### Parameters

- wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|use-sha256-akm]

|                            |                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| wpa-wpa2                   | Modifies TKIP-CCMP (WPA/WPA2) related parameters                                                                                                      |
| exclude-wpa2-tkip          | Excludes the <i>Wi-Fi Protected Access II</i> (WPA2) version of TKIP. It supports the WPA version of TKIP only. This option is disabled by default.   |
| opp-pmk-caching            | Uses opportunistic key caching (same <i>Pairwise Master Key</i> (PMK) across APs for fast roaming with EAP.802.1x. This option is enabled by default. |
| pmk-caching                | Uses cached pair-wise master keys (fast roaming with eap/802.1x). This option is enabled by default.                                                  |
| preauthentication          | Uses pre-authentication mode (WPA2 fast roaming)                                                                                                      |
| server-only-authentication | Uses online sign up server-only-authenticated encryption network. This option is disabled by default.                                                 |
| use-sha256-akm             | Uses sha256 authentication key management suite. This option is disabled by default.                                                                  |

- wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]]|timeout <10-5000> {10-5000}]

|                |                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wpa-wpa2       | Modifies TKIP-CCMP (WPA/WPA2) related parameters                                                                                                                                                              |
| handshake      | Configures WPA/WPA2 handshake parameters                                                                                                                                                                      |
| attempts <1-5> | Configures the total number of times a message is transmitted towards a non-responsive client <ul style="list-style-type: none"> <li>• &lt;1-5&gt; - Specify a value from 1 - 5. The default is 2.</li> </ul> |

|                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| init-wait<br><5-1000000>                                                                                       | Configures a minimum wait-time period, in microseconds, before the first handshake message is transmitted from the AP. This option is disabled by default.<br><ul style="list-style-type: none"> <li>• &lt;5-1000000&gt; - Specify a value from 5 - 1000000 microseconds.</li> </ul>                                                                                                                                |
| priority<br>[high normal]                                                                                      | Configures the relative priority of handshake messages compared to other data traffic<br><ul style="list-style-type: none"> <li>• high - Treats handshake messages as high priority packets on a radio. This is the default setting.</li> <li>• normal - Treats handshake messages as normal priority packets on a radio</li> </ul>                                                                                 |

### 4.1.97.2.53 service

#### ▶ wlan-mode commands

Invokes service commands applicable in the WLAN configuration mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
service [allow-ht-only|allow-open-passpoint|client-load-balancing|cred-cache|
eap-mac-mode|eap-mac-multicopy|eap-mac-multikeys|eap-throttle|
enforce-pmkid-validation|key-index|monitor|radio-crypto|reauthentication|
session-timeout|tx-death-on-roam-detection|unresponsive-client|wpa-wpa2|show]

service [allow-ht-only|allow-open-passpoint|cred-cache [clear-on-4way-timeout|
clear-on-disconnect]|eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-
validation|radio-crypto|reauthentication seamless|session-timeout mac|
tx-death-on-roam-detection|show cli]

service eap-mac-mode [mac-always|normal]

service eap-throttle <0-254>

service key-index eap-wep-unicast <1-4>

service monitor [aaa-server|adoption|captive-portal|dhcp|dns]

service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]
service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>

service unresponsive-client [attempts <1-1000>|ps-detect {threshold <1-1000>}|
timeout <1-60>]

service wpa-wpa2 exclude-ccmp
```

#### Parameters

- service [allow-ht-only|allow-open-passpoint|cred-cache [clear-on-4way-timeout|clear-on-disconnect]|eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-crypto|reauthentication seamless|session-timeout mac|tx-death-on-roam-detection|show cli]

|                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow-ht-only                                                 | Only allows clients capable of High Throughput (802.11n) data rates to associate. This option is disabled by default.                                                                                                                                                                                                                                                                                                 |
| allow-open-passpoint                                          | Enables non-WPA2 security for passpoint WLANs. This option is disabled by default.<br>For more information on passpoint policy and configuration, see <a href="#">PASSPOINT POLICY</a> .                                                                                                                                                                                                                              |
| cred-cache<br>[clear-on-4way-timeout <br>clear-on-disconnect] | Clears credential cache based on the parameter passed <ul style="list-style-type: none"> <li>• clear-on-4way-timeout – Clears cached client credentials after the 4way handshake with a client has timed out. This option is enabled by default.</li> <li>• clear-on-disconnect – Clears cached client credentials after the client has disconnected from the network. This option is disabled by default.</li> </ul> |
| eap-mac-multicopy                                             | Enables sending of multiple copies of broadcast and unicast messages. This option is disabled by default.                                                                                                                                                                                                                                                                                                             |

|                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eap-mac-multikeys                                                                                              | Enables configuration of different key indices for MAC authentication. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| enforce-pmkid-validation                                                                                       | Validates the <i>Predictive real-time pairwise master key identifier</i> (PMKID) contained in a client's association request against the one present in the wpa-wpa2 handshake. This option is enabled by default.<br><br>This functionality is based on the <i>Proactive Key Caching</i> (PKC) extension of the 802.11i EEEE standard. Whenever a wireless client successfully authenticates with a AP it receives a <i>pairwise master key</i> (PMK). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP. |
| radio-crypto                                                                                                   | Uses radio hardware for encryption and decryption. This is applicable only for devices using <i>Counter Cipher Mode with Block Chaining Message Authentication Code Protocol</i> (CCMP) encryption mode. This option is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| reauthentication-seamless                                                                                      | Enables seamless EAP client reauthentication without disconnecting client after the session has timed out. This option is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| monitor                        | Enables critical resource monitoring. In a WLAN, service monitoring enables regular monitoring of external AAA servers, captive portal servers, access point adoption, DHCP and DNS servers. When enabled, it allows administrators to notify users of a service's availability and make resource substitutions in case of unavailability of a service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| aaa-server                     | Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource's AAA activity and ensures its adoption and availability. This feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| adoption vlan <1-4094>         | <p>Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default.</p> <ul style="list-style-type: none"> <li>• VLAN &lt;1-4094&gt; – Specify the VLAN on which clients are placed when the connectivity between the AAP and the controller is lost.</li> </ul> <p>Configure a DHCP pool and gateway for the failover VLAN. Ensure the DHCP server is running on the AP. Also ensure that the DHCP pool is configured to have less lease time.</p> <p>When this feature is enabled on a WLAN, it allows adopted APs to monitor their connectivity with the controller. If and when this connectivity is lost, all new clients are placed in the configured adoption failover VLAN. They are served an IP by the DHCP server running on the AP. In this situation if a client tries to access a Web URL, the AP redirects the client to a page stating that the service is down.</p> <p>When the AAP's link to the switch is restored, clients are placed back in the WLAN's configured VLAN, and are served an IP from the corresponding configured DHCP server (external or on the AP/controller).</p> |
| captive-portal external-server | <p>Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.</p> <p>When enabled, this feature enables APs to display, to an externally located captive portal's user, the no-service page when the captive portal's server is not reachable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

- `service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>]`

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 4.1.98 wlan-qos-policy

### ► Global Configuration Commands

Configures a WLAN QoS policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

#### Parameters

- wlan-qos-policy <WLAN-QOS-POLICY-NAME>

|                        |                                                                                |
|------------------------|--------------------------------------------------------------------------------|
| <WLAN-QOS-POLICY-NAME> | Specify the WLAN QoS policy name. If the policy does not exist, it is created. |
|------------------------|--------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#wlan-qos-policy test
rfs6000-81742D(config-wlan-qos-test)#?
WLAN QoS Mode commands:
 accelerated-multicast Configure accelerated multicast streams address asnd
 forwarding QoS classification
 classification Select how traffic on this WLAN must be classified
 (relative prioritization on the radio)
 multicast-mask Egress multicast mask (frames that match bypass the
 PSPqueue. This permits intercom mode operation
 without delay even in the presence of PSP clients)
 no Negate a command or set its defaults
 qos Quality of service
 rate-limit Configure traffic rate-limiting parameters on a
 per-wlan/per-client basis
 svp-prioritization Enable spectralink voice protocol support on this
 wlan
 voice-prioritization Prioritize voice client over other client (for
 non-WMM clients)
 wmm Configure 802.11e/Wireless MultiMedia parameters

## 4.1.99 url-filter

### ► *Global Configuration Commands*

The following table lists the commands that allow you to enter the URL filter configuration mode:

**Table 4.55** *Commands Creating a URL Filter*

| Command                                | Description                                                | Reference         |
|----------------------------------------|------------------------------------------------------------|-------------------|
| <i>url-filter</i>                      | Creates a new URL filter and enters its configuration mode | <i>page 4-552</i> |
| <i>url-filter-config-mode commands</i> | Summarizes the URL filter configuration mode commands      | <i>page 4-555</i> |

### 4.1.99.1 url-filter

#### ► *url-filter*

Creates a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user's request (in the form of a HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user's application (browser/email reader), the network's gateway, at the *Internet service provider's* (ISP) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration, these 12 category-types have been grouped into *five* (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see *web-filter-policy*.

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter's blacklist these three sites are banned. Where as, when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see *url-list*.

**NOTE:** URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see *license*.

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
url-filter <URL-FILTER-NAME>
```

#### Parameters

- url-filter <URL-FILTER-NAME>

|                   |                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <URL-FILTER-NAME> | Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If the filter does not exist, it is created. |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|

**Usage Guidelines**

|    | <b>Category Type</b>     | <b>Category</b>                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 4.1.99.2 url-filter-config-mode commands

#### ► *url-filter*

The following table summarizes URL filter configuration mode commands:

**Table 4.56** *URL-Filter-Config-Mode Commands*

| <b>Command</b>     | <b>Description</b>                                                                                                                                 | <b>Reference</b>  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>blacklist</i>   | Creates a blacklist rule defining a list of banned Websites and URLs                                                                               | <i>page 4-556</i> |
| <i>blockpage</i>   | Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed | <i>page 4-559</i> |
| <i>description</i> | Configures an appropriate description for this URL filter                                                                                          | <i>page 4-561</i> |
| <i>no</i>          | Removes this URL filter's configured parameters                                                                                                    | <i>page 4-562</i> |
| <i>whitelist</i>   | Creates a whitelist rule defining a list of Websites and URLs allowed access by clients.                                                           | <i>page 4-563</i> |

### 4.1.99.2.1 blacklist

#### ► *url-filter-config-mode commands*

Creates a blacklist rule. A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides *five* (5) levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see *url-filter*.

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
blacklist [category-type|level|url-list]
```

```
blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
```

```
blacklist level [basic|high|low|medium|medium-high] precedence <1-500>
{description <LINE>}
```

```
blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

#### Parameters

- `blacklist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}`

|                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>blacklist category-type &lt;SELECT- CATEGORY-TYPE&gt;</pre> | <p>Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.</p> <p>Websites have been classified into the following 12 category types:<br/>adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates</p> <p>Contd..</p> |

Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                                                                                                                                                                                                                                                                                                                                                                                       |
| description <LINE>                                                                                                                                                       | Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                      |

**Example**

```
rfs6000-81742D(config-url-filter-test)#blacklist level medium-high precedence 10

rfs6000-81742D(config-url-filter-test)#blacklist category-type adult-content
category alcohol-tobacco precedence 1

rfs6000-81742D(config-url-filter-test)#blacklist category-type security-risk
category botnets precedence 3
```

```
rfs6000-81742D(config-url-filter-test)#show context
url-filter test
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs6000-81742D(config-url-filter-test)#
```

### 4.1.99.2.2 blockpage

#### ► *url-filter-config-mode commands*

Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
blockpage [external|internal|path]

blockpage path [external|internal]
blockpage external url <URL>
blockpage internal [content|footer|header|main-logo|org-name|org-signature|
small-logo|title] <LINE/IMAGE-URL>
```

#### Parameters

- `blockpage path [external|internal]`

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>blockpage path [external internal]</code> | <p>Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal</p> <ul style="list-style-type: none"> <li>• <code>external</code> - Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the <code>blockpage &gt; external &gt; url &lt;URL&gt;</code> command to provide the path to the external Web server hosting the page.</li> <li>• <code>internal</code> - Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the <code>blockpage &gt; internal &gt; &lt;SELECT-PAGE-TYPE&gt; &gt; &lt;LINE/IMAGE-URL&gt;</code> command to define the page configuration.</li> </ul> |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `blockpage external url <URL>`

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>blockpage external url &lt;URL&gt;</code> | <p>Configures the URL of the external Web server hosting the page (displayed to the client when a requested URL is blocked).</p> <ul style="list-style-type: none"> <li>• <code>url &lt;URL&gt;</code> - Specify the URL of the Web server and the blocking page name</li> </ul> <p>Valid URLs should begin with <code>http://</code> or <code>https://</code></p> <p>The URL can contain query strings.</p> <p>Use <code>'&amp;'</code> or <code>'?'</code> character to separate field-value pair.</p> <p>Enter <code>'ctrl-v'</code> followed by <code>'?'</code> to configure query strings</p> |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>`

|                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>blockpage internal [content footer header main-logo org-name org-signature small-logo title] &lt;LINE/IMAGE-URL&gt;</code> | <p>Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title</p> <ul style="list-style-type: none"> <li>• <code>content</code> - Configures the text (message) displayed on the blocking page</li> <li>• <code>footer</code> - Configures the text displayed as the blocking page footer</li> </ul> <p>Contd...</p> |
|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- header - Configures the text displayed as the blocking page header
- org-name - Configures the organization's name displayed on the blocking page
- org-signature - Configures the organization's signature displayed on the blocking page
- title - Configures the title of the blocking page.
- main-logo - Configures the location of the main logo (organization's large logo)
- small-logo - Configures the location of the small logo (organization's small logo)

The following keyword is common to all of the above parameters:

- <LINE/IMAGE-URL> - Specify the location of the logo (main and small) image file. The image is retrieved and displayed from the location configured here. If you are using this option to provide content, such as organization name, footer, header, etc. enter a text string not exceeding 255 characters in length.

### Example

```
rfs6000-81742D(config-url-filter-test)#blockpage internal content "The requested
Web page is blocked and cannot be displayed for viewing"

rfs6000-81742D(config-url-filter-test)#show context
url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be
displayed for viewing"
rfs6000-81742D(config-url-filter-test)#
```

### Related Commands

|           |                                          |
|-----------|------------------------------------------|
| <i>no</i> | Removes the blocking page configurations |
|-----------|------------------------------------------|

### 4.1.99.2.3 description

► *url-filter-config-mode commands*

Configures a description for this URL filter. Provide a description that enables you to identify the purpose of this URL filter.

**Supported in the following platforms:**

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
description <LINE>
```

**Parameters**

- description <LINE>

|                    |                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <LINE> | Enter an appropriate description for this URL filter. The description should identify the URL filter's purpose and should not exceed 80 characters in length. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-url-filter-test)#description Blacklists sites inappropriate
for children and are security risks.

rfs6000-81742D(config-url-filter-test)#show context
url-filter test
 description "Blacklists sites inappropriate for children and are security risks."
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be
displayed for viewing"
rfs6000-81742D(config-url-filter-test)#
```

**Related Commands**

|           |                                       |
|-----------|---------------------------------------|
| <i>no</i> | Removes this URL filter's description |
|-----------|---------------------------------------|

#### 4.1.99.2.4 no

##### ► *url-filter-config-mode commands*

Use the no command to remove this URL filter's configured parameters

##### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
no [blacklist|blockpage|description|whitelist]

no blacklist [category-type|level|url-list]
no blacklist [category-type <SELECT-CATEGORY-TYPE>|level <SELECT-LEVEL>|
url-list <URL-LIST-NAME>] precedence <1-500>

no blockpage [external|internal [content|footer|header|main-logo|org-name|
org-signature|small-logo|title]|path]

no description

no whitelist [category-type|url-list]
no whitelist [category-type <SELECT-CATEGORY-TYPE>|url-list <URL-LIST-NAME>]
precedence <1-500>
```

##### Parameters

- no <PARAMETERS>

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes this URL filter's configured parameters based on the values passed here |
|-----------------|---------------------------------------------------------------------------------|

##### Example

The following example displays the URL filter 'test' settings before the 'no' is executed:

```
rfs6000-81742D(config-url-filter-test)#show context
url-filter test
 description "Blacklists sites inappropriate for children and are security risks."
 blacklist level medium-high precedence 10
 whitelist category-type communication category chat precedence 7
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be
 displayed for viewing"
rfs6000-81742D(config-url-filter-test)#

rfs6000-81742D(config-url-filter-test)#no description

rfs6000-81742D(config-url-filter-test)#no blacklist category-type adult-content
category alcohol-tobacco precedence 1

rfs6000-81742D(config-url-filter-test)#no whitelist category-type communication
category chat precedence 7
```

The following example displays the URL filter 'test' settings after the 'no' is executed:

```
rfs6000-81742D(config-url-filter-test)#show context
url-filter test
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blockpage internal content "The requested Web page is blocked and cannot be
 displayed for viewing"
rfs6000-81742D(config-url-filter-test)#
```

### 4.1.99.2.5 whitelist

#### ► *url-filter-config-mode commands*

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
whitelist [category-type|url-list]

whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

#### Parameters

- `whitelist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}`

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| whitelist<br>category-type<br><SELECT-<br>CATEGORY-TYPE> | <p>Selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.</p> <p>Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates.</p> <p>Select 'all' to whitelist all category-types.</p> <p>Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories:</p> <ul style="list-style-type: none"> <li>• alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.</li> </ul> <p>The system allows all categories (URLs falling within their limits) within the selected category-type.</p> |
| precedence<br><1-500>                                    | Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| description <LINE>                                       | Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 4.1.100 url-list

### ► *Global Configuration Commands*

The following table lists the commands that allow you to enter the URL list configuration mode:

**Table 4.57** *Commands Creating a URL List*

| <b>Command</b>                       | <b>Description</b>                                       | <b>Reference</b>  |
|--------------------------------------|----------------------------------------------------------|-------------------|
| <i>url-list</i>                      | Creates a new URL list and enters its configuration mode | <i>page 4-566</i> |
| <i>url-list-config-mode commands</i> | Summarizes the URL list configuration mode commands      | <i>page 4-567</i> |

### 4.1.100.1 url-list

#### ► *url-list*

Creates a URL list and enters its configuration mode. URL lists are a means of categorizing URLs on the basis of various criteria, such as frequently used, not-permitted, etc. It is used in URL filters to identify whitelisted/blacklisted URLs. Web requests are blocked or approved based on URL filter whitelist/blacklist rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
url-list <URL-LIST-NAME>
```

#### Parameters

- url-list <URL-LIST-NAME>

|                                    |                                                                                                       |
|------------------------------------|-------------------------------------------------------------------------------------------------------|
| <code>&lt;URL-LIST-NAME&gt;</code> | Specify the URL list name. The URL list is created if another list with the same name does not exist. |
|------------------------------------|-------------------------------------------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config)#url-list URLlist1
nx9500-6C8809(config-url-list-URLlist1)#?
URL List Mode commands:
 description Description of the category
 no Negate a command or set its defaults
 url Add a URL entry

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-url-list-URLlist1)#

nx9500-6C8809(config-url-list-URLlist1)#url http://www.example_company.com depth
10

nx9500-6C8809(config-url-list-test)#show context
url-list test
url http://www.example_company.com depth 10
nx9500-6C8809(config-url-list-URLlist1)#

```

## 4.1.100.2 url-list-config-mode commands

### ► *url-list*

The following table summarizes URL list configuration mode commands:

**Table 4.58** *URL-Filter-Config-Mode Commands*

| Command            | Description                                                           | Reference         |
|--------------------|-----------------------------------------------------------------------|-------------------|
| <i>description</i> | Creates a blacklist rule defining a list of banned Web sites and URLs | <i>page 4-568</i> |
| <i>url</i>         | Adds URL entries to this URL list                                     | <i>page 4-569</i> |
| <i>no</i>          | Removes this URL list's settings                                      | <i>page 4-570</i> |

**4.1.100.2.1 description**▶ *url-list-config-mode commands*

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

**Supported in the following platforms:**

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
description <LINE>
```

**Parameters**

- description <LINE>

|                    |                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------|
| description <LINE> | Provide a unique description for this URL list (should not exceed 500 characters in length) |
|--------------------|---------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-url-list-test)#description "This URL list contains social
media URLs"

nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs"
nx9500-6C8809(config-url-list-test)#
```

**Related Commands**

|           |                                     |
|-----------|-------------------------------------|
| <i>no</i> | Removes this URL list's description |
|-----------|-------------------------------------|

#### 4.1.100.2.2 url

##### ► *url-list-config-mode commands*

Adds URL entries to this URL list

##### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
url <WORD> {depth <1-10>}
```

##### Parameters

- url <WORD> {depth <1-10>}

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url <WORD><br>{depth <1-10>} | <p>Adds a URL entry</p> <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the URL to add. <ul style="list-style-type: none"> <li>• depth - Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache. <ul style="list-style-type: none"> <li>• &lt;1-10&gt; - Specify the depth from 1 - 10.</li> </ul> </li> </ul> </li> </ul> |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

##### Example

```

nx9500-6C8809(config-url-list-test)#url http://www.facebook.com

nx9500-6C8809(config-url-list-test)#show context
url-list test
description "This URL list contains social communication URLs"
url https://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#

```

##### Related Commands

|           |                                        |
|-----------|----------------------------------------|
| <i>no</i> | Removes a URL entry from this URL list |
|-----------|----------------------------------------|

**4.1.100.2.3 no**▶ *url-list-config-mode commands*

Removes this URL list's settings

**Supported in the following platforms:**

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [description|url]
no description
no url <WORD>
```

**Parameters**

- no <PARAMETERS>

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| no <PARAMETERS> | Removes this URL's settings based on the parameters passed |
|-----------------|------------------------------------------------------------|

**Example**

The following example displays the URL list 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social communication URLs"
 url https://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#

nx9500-6C8809(config-url-list-test)#no url www.facebook.com
```

The following example displays the URL list 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social communication URLs"
nx9500-6C8809(config-url-list-test)#
```

## 4.1.101 vx9000

### ► Global Configuration Commands

Configures a *Virtual WLAN Controller* (V-WLC) in a *virtual machine* (VM) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.
- VX-DEMO – This is a 60 day trial license. This license also activates VM controller instance, and enables the V-WLC to adopt access points. But, the access point adoption capacity is limited to 16. Having installed this license on a device, the only other license that you can install on it is the VX license. All existing installed licenses will continue to work as before. Since this license has a limited validity period, ensure that the system clock on the license generating tool and the device are in sync. preferably through NTP.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

#### Supported in the following platforms:

- Service Platforms – NX9500, NX9510, NX9600

#### Syntax

```
vx9000 <MAC>
```

#### Parameters

- vx9000 <MAC>

|          |                                                                                                                             |
|----------|-----------------------------------------------------------------------------------------------------------------------------|
| vx <MAC> | Configures a V-WLC and enters its configuration mode<br>The V-WLC configuration is the same as that of a normal controller. |
|----------|-----------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#vx9000 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?
Device Mode commands:
 adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning
 policy when adopted by another
 controller
 adoption Adoption configuration
 adoption-site Set system's adoption site
 adoption-mode Configure the adoption mode for the
 access-points in this RF-Domain
 alias Alias
 application-policy Application Policy configuration
 area Set name of area where the system
 is located
 arp Address Resolution Protocol (ARP)
 auto-learn Auto learning
```

|                           |                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| autogen-uniqueid          | Autogenerate a unique id                                                                                           |
| autoinstall               | Autoinstall settings                                                                                               |
| bluetooth-detection       | Detect Bluetooth devices using the Bluetooth USB module - there will be interference on 2.4 Ghz radio in wlan mode |
| bridge                    | Ethernet bridge                                                                                                    |
| captive-portal            | Captive portal                                                                                                     |
| cdp                       | Cisco Discovery Protocol                                                                                           |
| channel-list              | Configure channel list to be advertised to wireless clients                                                        |
| cluster                   | Cluster configuration                                                                                              |
| configuration-persistence | Enable persistence of configuration across reloads (startup configfile)                                            |
| contact                   | Configure the contact                                                                                              |
| controller                | WLAN controller configuration                                                                                      |
| country-code              | Configure the country of operation                                                                                 |
| critical-resource         | Critical Resource                                                                                                  |
| crypto                    | Encryption related commands                                                                                        |
| database                  | Database command                                                                                                   |
| device-upgrade            | Device firmware upgrade                                                                                            |
| dot1x                     | 802.1X                                                                                                             |
| dpi                       | Enable Deep-Packet-Inspection (Application Assurance)                                                              |
| dscp-mapping              | Configure IP DSCP to 802.1p priority mapping for untagged frames                                                   |
| email-notification        | Email notification configuration                                                                                   |
| enforce-version           | Check the firmware versions of devices before interoperating                                                       |
| environmental-sensor      | Environmental Sensors Configuration                                                                                |
| events                    | System event messages                                                                                              |
| export                    | Export a file                                                                                                      |
| file-sync                 | File sync between controller and adoptees                                                                          |
| floor                     | Set the floor within a area where the system is located                                                            |
| geo-coordinates           | Configure geo coordinates for this device                                                                          |
| gre                       | GRE protocol                                                                                                       |
| hostname                  | Set system's network name                                                                                          |
| http-analyze              | Specify HTTP-Analysis configuration                                                                                |
| interface                 | Select an interface to configure                                                                                   |
| ip                        | Internet Protocol (IP)                                                                                             |
| ipv6                      | Internet Protocol version 6 (IPv6)                                                                                 |
| l2tpv3                    | L2tpv3 protocol                                                                                                    |
| l3e-lite-table            | L3e lite Table                                                                                                     |
| layout-coordinates        | Configure layout coordinates for this device                                                                       |
| led                       | Turn LEDs on/off on the device                                                                                     |
| led-timeout               | Configure the time for the led to turn off after the last radio state change                                       |
| legacy-auto-downgrade     | Enable device firmware to auto downgrade when other legacy devices are detected                                    |
| legacy-auto-update        | Auto upgrade of legacy devices                                                                                     |
| license                   | License management command                                                                                         |
| lldp                      | Link Layer Discovery Protocol                                                                                      |
| load-balancing            | Configure load balancing parameter                                                                                 |
| location                  | Configure the location                                                                                             |
| logging                   | Modify message logging facilities                                                                                  |
| mac-address-table         | MAC Address Table                                                                                                  |
| mac-auth                  | 802.1X                                                                                                             |
| mac-name                  | Configure MAC address to name mappings                                                                             |
| management-server         | Configure management server address                                                                                |
| memory-profile            | Memory profile to be used on the                                                                                   |

|                                    |                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------|
| meshpoint-device                   | device<br>Configure meshpoint device parameters                                     |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                             |
| min-misconfiguration-recovery-time | Check controller connectivity after configuration is received                       |
| mint                               | MiNT protocol                                                                       |
| mirror                             | Mirroring                                                                           |
| misconfiguration-recovery-time     | Check controller connectivity after configuration is received                       |
| mpact-server                       | MPACT server configuration                                                          |
| neighbor-inactivity-timeout        | Configure neighbor inactivity timeout                                               |
| neighbor-info-interval             | Configure neighbor information exchange interval                                    |
| no                                 | Negate a command or set its defaults                                                |
| noc                                | Configure the noc related setting                                                   |
| nsight                             | NSight                                                                              |
| ntp                                | Ntp server WORD                                                                     |
| offline-duration                   | Set duration for which a device remains unadopted before it generates offline event |
| override                           | Override a command                                                                  |
| override-wlan                      | Configure RF Domain level overrides for wlan                                        |
| power-config                       | Configure power mode                                                                |
| preferred-controller-group         | Controller group this system will prefer for adoption                               |
| preferred-tunnel-controller        | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic  |
| radius                             | Configure device-level radius authentication parameters                             |
| raid                               | RAID                                                                                |
| remove-override                    | Remove configuration item override from the device (so profile value takes effect)  |
| rf-domain-manager                  | RF Domain Manager                                                                   |
| router                             | Dynamic routing                                                                     |
| rsa-key                            | Assign a RSA key to a service                                                       |
| sensor-server                      | AirDefense sensor server configuration                                              |
| slot                               | PCI expansion Slot                                                                  |
| spanning-tree                      | Spanning tree                                                                       |
| timezone                           | Configure the timezone                                                              |
| traffic-class-mapping              | Configure IPv6 traffic class to 802.1p priority mapping for untagged frames         |
| trustpoint                         | Assign a trustpoint to a service                                                    |
| tunnel-controller                  | Tunnel Controller group this controller belongs to                                  |
| use                                | Set setting to use                                                                  |
| vrrp                               | VRRP configuration                                                                  |
| vrrp-state-check                   | Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP       |
| wep-shared-key-auth                | Enable support for 802.11 WEP shared key authentication                             |
| clrscr                             | Clears the display screen                                                           |
| commit                             | Commit all changes made in this session                                             |
| do                                 | Run commands from Exec mode                                                         |
| end                                | End current mode and change to EXEC mode                                            |
| exit                               | End current mode and down to                                                        |

# 5 COMMON COMMANDS

This chapter describes the CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes.

The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

## 5.1 Common Commands

### ► COMMON COMMANDS

The following table summarizes commands common to the User Exec, Priv Exec, and Global Config modes:

**Table 5.1** *Commands Common to Controller CLI Modes*

| Command        | Description                                                                                          | Reference        |
|----------------|------------------------------------------------------------------------------------------------------|------------------|
| <i>clrscr</i>  | Clears the display screen                                                                            | <i>page 5-3</i>  |
| <i>commit</i>  | Commits (saves) changes made in the current session                                                  | <i>page 5-4</i>  |
| <i>exit</i>    | Ends and exits the current mode and moves to the PRIV EXEC mode                                      | <i>page 5-5</i>  |
| <i>help</i>    | Displays the interactive help system                                                                 | <i>page 5-6</i>  |
| <i>no</i>      | Negates a command or reverts values to their default settings                                        | <i>page 5-9</i>  |
| <i>revert</i>  | Reverts changes to their last saved configuration                                                    | <i>page 5-12</i> |
| <i>service</i> | Invokes service commands to troubleshoot or debug ( <code>config-if</code> ) instance configurations | <i>page 5-13</i> |
| <i>show</i>    | Displays running system information                                                                  | <i>page 5-58</i> |
| <i>write</i>   | Writes the system's running configuration to memory or to the terminal                               | <i>page 5-60</i> |

**NOTE:** The input parameter <HOSTNAME> cannot include an underscore character. In other words, a device's hostname cannot contain an underscore.

## 5.1.1 clrscr

### ► Common Commands

Clears the screen and refreshes the prompt, irrespective of the mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
clrscr
```

#### Parameters

None

#### Example

The terminal window or screen before the clrscr command is executed:

```
rfs4000-229D58#device-upgrade ?
DEVICE-NAME Name/MAC address of device
all Upgrade all devices
ap650 Upgrade AP650 Device
ap6511 Upgrade AP6511 Device
ap6521 Upgrade AP6521 Device
ap6522 Upgrade AP6522 Device
ap6532 Upgrade AP6532 Device
ap6562 Upgrade AP6562 Device
ap71xx Upgrade AP7161 Device
ap7502 Upgrade AP7502 Device
ap7522 Upgrade AP7522 Device
ap7532 Upgrade AP7532 Device
ap7562 Upgrade AP7562 Device
ap81xx Upgrade AP81XX Device
ap82xx Upgrade AP82XX Device
ap8432 Upgrade AP8432 Device
ap8533 Upgrade AP8533 Device
cancel-upgrade Cancel upgrading the device
load-image Load the device images to controller for device-upgrades
rf-domain Upgrade all devices belonging to an RF Domain
rfs4000 Upgrade RFS4000 Device

rfs4000-229D58#
```

The terminal window or screen after the clrscr command is executed:

```
rfs4000-229D58#
```

## 5.1.2 commit

### ▶ *Common Commands*

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
commit {write}{memory}
```

#### Parameters

- `commit {write}{memory}`

|        |                                                                                         |
|--------|-----------------------------------------------------------------------------------------|
| write  | Optional. Commits changes made in the current session                                   |
| memory | Optional. Writes to memory. This option ensures current changes persist across reboots. |

#### Example

```
nx9500-6C8809#commit write memory
[OK]
nx9500-6C8809#
```

## 5.1.3 exit

### ▶ *Common Commands*

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from (config)# to #. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system prompts you to either do a commit or a revert before terminating the session.

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
exit
```

#### **Parameters**

None

#### **Example**

```
nx9500-6C8809(config)#exit
nx9500-6C8809#
```

## 5.1.4 help

### ► Common Commands

Describes the interactive help system

Use this command to access the advanced help feature. Use “?” anytime at the command prompt to access the help topic.

Two kinds of help are provided:

- Full help is available when ready to enter a command argument
- Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example 'show ve?').

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
help {search}
```

```
help {search <WORD>} {detailed|only-show|skip-no|skip-show}
```

#### Parameters

- help {search <WORD>} {detailed|only-show|skip-no|skip-show}

|               |                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| search <WORD> | Optional. Searches for CLI commands related to a specified target term <ul style="list-style-type: none"> <li>• &lt;WORD&gt; – Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.</li> </ul> |
| detailed      | Optional. Searches and displays help strings in addition to mode and commands                                                                                                                                                                                                                                                                                                                    |
| only-show     | Optional. Displays only “show” commands. Does not display configuration commands                                                                                                                                                                                                                                                                                                                 |
| skip-no       | Optional. Displays only configuration commands. Does not display “no” commands                                                                                                                                                                                                                                                                                                                   |
| skip-show     | Optional. Displays only configuration commands. Does not display “show” commands                                                                                                                                                                                                                                                                                                                 |

## 5.1.5 no

### ► Common Commands

Negates a command or sets its default. Though the `no` command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no <PARAMETERS>
```

#### Parameters

- `no <PARAMETERS>`

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no &lt;PARAMETERS&gt;</code> | The <code>no</code> command is common across all configuration modes and sub modes. It resets or reverts settings based on the mode in which executed. For example, when executed in the AAA policy configuration mode, it allows you to reset or revert a specific AAA policy settings. Similarly, when executed in the global configuration mode, it only resets or reverts settings configured in the global configuration mode. |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

#### Example

Global Config mode: No command options

```
rfs6000-81742D(config)##no ?
aaa-policy Delete a aaa policy
aaa-tacacs-policy Delete a aaa tacacs policy
alias Alias
ap621 Delete an AP621 access point
ap622 Delete an AP622 access point
ap650 Delete an AP650 access point
ap6511 Delete an AP6511 access point
ap6521 Delete an AP6521 access point
ap6522 Delete an AP6522 access point
ap6532 Delete an AP6532 access point
ap6562 Delete an AP6562 access point
ap71xx Delete an AP71XX access point
ap7502 Delete an AP7502 access point
ap7522 Delete an AP7522 access point
ap7532 Delete an AP7532 access point
ap7562 Delete an AP7562 access point
ap81xx Delete an AP81XX access point
ap82xx Delete an AP82XX access point
ap8432 Delete an AP8432 access point
ap8533 Delete an AP8533 access point
application Delete an application
application-group Delete an application-group
application-policy Delete an application policy
association-acl-policy Delete an association-acl policy
auto-provisioning-policy Delete an auto-provisioning policy
bgp BGP Configuration
bonjour-gw-discovery-policy Disable Bonjour Gateway discovery policy
```

|                                    |                                                                       |

| crypto-cmp-policy                  | CMP policy                                                            |
| customize                          | Restore the custom cli commands to default                            |
| device                             | Delete multiple devices                                               |
| device-categorization              | Delete device categorization object                                   |
| dhcp-server-policy                 | DHCP server policy                                                    |
| dhcpv6-server-policy               | DHCPv6 server related configuration                                   |
| dns-whitelist                      | Delete a whitelist object                                             |
| event-system-policy                | Delete a event system policy                                          |
| ex3500                             | Ex3500 device                                                         |
| ex3500-management-policy           | Delete a ex3500 management policy                                     |
| ex3500-qos-class-map-policy        | Delete a ex3500 qos class-map policy                                  |
| ex3500-qos-policy-map              | Delete a ex3500 qos policy-map                                        |
| ex3524                             | Delete an EX3524 wireless controller                                  |
| ex3548                             | Delete an EX3548 wireless controller                                  |
| firewall-policy                    | Configure firewall policy                                             |
| global-association-list            | Delete a global association list                                      |
| igmp-snoop-policy                  | Remove device onboard igmp snoop policy                               |
| inline-password-encryption         | Disable storing encryption key in the startup configuration file      |
| ip                                 | Internet Protocol (IP)                                                |
| ipv6                               | Internet Protocol version 6 (IPv6)                                    |
| ipv6-router-advertisement-policy   | IPv6 Router Advertisement related configuration                       |
| l2tpv3                             | Negate a command or set its defaults                                  |
| mac                                | MAC configuration                                                     |
| management-policy                  | Delete a management policy                                            |
| meshpoint                          | Delete a meshpoint object                                             |
| meshpoint-qos-policy               | Delete a mesh point QoS configuration policy                          |
| nac-list                           | Delete an network access control list                                 |
| nsight-policy                      | Delete a nsight policy                                                |
| passpoint-policy                   | Delete a passpoint configuration policy                               |
| password-encryption                | Disable password encryption in configuration                          |
| profile                            | Delete a profile and all its associated configuration                 |
| radio-qos-policy                   | Delete a radio QoS configuration policy                               |
| radius-group                       | Local radius server group configuration                               |
| radius-server-policy               | Remove device onboard radius policy                                   |
| radius-user-pool-policy            | Configure Radius User Pool                                            |
| rf-domain                          | Delete one or more RF-domains and all their associated configurations |
| rfs4000                            | Delete an RFS4000 wireless controller                                 |
| rfs6000                            | Delete an RFS6000 wireless controller                                 |
| roaming-assist-policy              | Delete a roaming-assist policy                                        |
| role-policy                        | Role based firewall policy                                            |
| route-map                          | Dynamic routing route map Configuration                               |
| routing-policy                     | Policy Based Routing Configuratio                                     |
| rtl-server-policy                  | Delete a rtl server policy                                            |
| schedule-policy                    | Delete a schedule policy                                              |
| sensor-policy                      | Delete a sensor policy                                                |
| smart-rf-policy                    | Delete a smart-rf-policy                                              |
| t5                                 | Delete an T5 DSL switch                                               |
| url-filter                         | Delete a url filter                                                   |
| url-list                           | Delete a URL list                                                     |
| web-filter-policy                  | Delete a web filter policy                                            |
| wips-policy                        | Delete a wips policy                                                  |
| wlan                               | Delete a wlan object                                                  |

```

## 5.1.6 revert

### ▶ *Common Commands*

Reverts changes made, in the current session, to their last saved configuration

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
revert
```

#### **Parameters**

None

#### **Example**

```
nx9500-6C8809>revert
nx9500-6C8809>
```

## 5.1.7 service

### ► Common Commands

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The User Exec mode and Priv Exec mode commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode's CLI tree.

This section consists of the following sub-sections:

- Syntax (*User Exec Mode*)
- Syntax (*Privilege Exec Mode*)
- Syntax (*Privilege Exec Mode: NX9500 and NX9510*)

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax (User Exec Mode)

```

service [block-adopter-config-update|clear|cli-tables-skin|cluster|database|
delete-offline-aps|force-send-config|force-update-vm-stats|guest-registration|
load-balancing|load-ssh-authorized-keys|locator|nsight|radio|radius|

|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| block-adopter-config-update      | Blocks the configuration updates sent from the NOC server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| request-full-config-from-adopter | Configures a request for full configuration updates from the adopter device<br>In an <i>hierarchically managed</i> (HM) network devices are deployed in two levels. The first level consists of the <i>Network Operations Center</i> (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'. |
|                                  | • service clear adoption history {on <DEVICE-NAME>}                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| clear adoption history           | Clears adoption history on this device and its adopted access points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

A route entry consists of IPv6 network (which can also be a host) address, the prefix length for the network (for IPv6 routes this is between 0 - 128), and the next hop's (gateway) IPv6 address. Since a destination can be reached through multiple next hops, you can configure multiple routes to the same destination with multiple next hops.</p> |
| table-id <0-255>                                                                                                               | Optional. **Syntax (Privilege Exec Mode)**

**NOTE:** The “service” command of the Priv Exec Mode is the same as the service command in the User Exec Mode. There are a few modifications that have been documented in this section. For the syntax and parameters of the other commands refer to the *(User Exec Mode)* syntax and *(User Exec Mode)* parameters sections of this chapter.

*service*

```

service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|

### Parameters (Privilege Exec Mode)

#### ► *service*

- `service copy tech-support [<FILE>|<URL>]`

|                   |                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| copy tech-support | Copies extensive system information used for troubleshooting                                                                                                                                                                                                                                                          |
| <FILE>            | Specify the location to copy file using the following format: <ul style="list-style-type: none"> <li>• usbX:/path/file</li> </ul>                                                                                                                                                                                     |
| <URL>             | Specify the location URL to copy file. Both IPv4 and IPv6 address formats are supported. <pre> tftp://&lt;hostname IPv4/IPv6&gt;[:port]/path/file ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IPv4/IPv6&gt;[:port]/path/file sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IPv4/IPv6&gt;[:port]/path/file </pre> |

- `service copy stats-report [global|rf-domain <DOMAIN-NAME>] (<FILE>|<URL>)`

|                                  |                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| copy stats-report                | Copies extensive statistical data useful for troubleshooting                                                                                                                                                                                                                                                          |
| [global rf-domain <DOMAIN-NAME>] | Identifies the RF Domain to copy statistical data <ul style="list-style-type: none"> <li>• global – Copies extensive statistical data of all configured RF Domains</li> <li>• rf-domain &lt;DOMAIN-NAME&gt; – Copies extensive statistical data of a specified RF Domain. Specify the domain name.</li> </ul>         |
| <FILE>                           | Specify the location to copy file using the following format: <ul style="list-style-type: none"> <li>• usbX:/path/file</li> </ul>                                                                                                                                                                                     |
| <URL>                            | Specify the location URL to copy file. Both IPv4 and IPv6 address formats are supported. <pre> tftp://&lt;hostname IPv4/IPv6&gt;[:port]/path/file ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IPv4/IPv6&gt;[:port]/path/file sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IPv4/IPv6&gt;[:port]/path/file </pre> |

- `service clear crash-info {on <DEVICE-NAME>}`

|                  |                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear crash-info | Clears all crash files                                                                                                                                                                                                                              |
| on <DEVICE-NAME> | Optional. Clears crash files on a specified device. These crash files are core, panic, and AP dump. <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

| tcpdump                                                                                                                                                                                                      | Optional. Decodes tcpdump. The tcpdump analyzes network behavior, performance, and infrastructure. It also analyzes applications that generate or receive traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Syntax (Privilege Exec Mode: NX9500 and NX9510)***service*

The following service commands are specific to the NX9500 and NX9510 series service platforms:

```
service copy analytics-support [<FILE>|<URL>]
```

**Parameters (Privilege Exec Mode: NX9500 and NX9510)**

- `service copy analytics-support [<FILE>|<URL>]`

|                        |                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| copy analytics-support | Enables copying of analytics information to a specified. Use one of the following options to specify the file:<br>This information is useful to troubleshoot issues by the Technical Support team. |
| <FILE>                 | Specify the file name and location using one of the following formats:<br>usb1:/path/file<br>usb2:/path/file                                                                                       |

|       |                                                                                                                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <URL> | Specify the location URL to copy file. Both IPv4 and IPv6 formats are supported.<br>tftp://<hostname IPv4/IPv6>[:port]/path/file<br>ftp://<user>:<passwd>@<hostname IPv4/IPv6>[:port]/path/file<br>sftp://<user>:<passwd>@<hostname IPv4/IPv6>[:port]/path/file |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Usage Guidelines

The NX9500 and NX9510 model service platforms (NOC) provide granular and robust analytic reporting for a RFS4000 or RFS6000 device managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of access point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

### Syntax (Global Config Mode)

#### ▶ *service*

```
service [set|show cli]
```

```
service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|virtual-machine-history <10-200>] {on <DEVICE-NAME>}
```

```
service show cli
```

### Parameters (Global Config Mode)

- `service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|virtual-machine-history <10-200>] {on <DEVICE-NAME>}`

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| set                              | Sets the size of history files                                                                                                                                                                                                                                                                                                                                                                                               |
| command-history <10-300>         | Sets the size of the command history file <ul style="list-style-type: none"> <li>• &lt;10-300&gt; - Specify a value from 10 - 300. The default is 200.</li> </ul>                                                                                                                                                                                                                                                            |
| upgrade-history <10-100>         | Sets the size of the upgrade history file <ul style="list-style-type: none"> <li>• &lt;10-100&gt; - Specify a value from 10 - 100. The default is 50.</li> </ul>                                                                                                                                                                                                                                                             |
| reboot-history <10-100>          | Sets the size of the reboot history file <ul style="list-style-type: none"> <li>• &lt;10-100&gt; - Specify a value from 10 - 100. The default is 50.</li> </ul>                                                                                                                                                                                                                                                              |
| virtual-machine-history <10-200> | Sets the size of the virtual-machine history file <ul style="list-style-type: none"> <li>• &lt;10-200&gt; - Specify a value from 10 - 200. The default is 100.</li> </ul> <p>This command is applicable only to the NX9500 and NX9510 series service platforms. Use the <code>no &gt; service &gt; set &gt; virtual-machine-history &gt; {on &lt;DEVICE-NAME&gt;}</code> command to revert the history file size to 100.</p> |
| on <DEVICE-NAME>                 | Optional. Sets the size of history files on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                                                                                                                               |

- service show cli

rfs6000-81742D#service show wireless reference reason-codes
CODE DESCRIPTION
0 Success
1 Unspecified Reason
2 Previous authentication no longer valid
3 Death because sending STA is leaving IBSS or ESS
4 Disassoc due to inactivity
5 Disassoc because AP is unable to handle all currently assoc STA
6 Class 2 frame received from non-authenticated STA
7 Class 3 frame received from nonassociated STA
8 Disassoc because STA is leaving BSS
9 STA requesting association is not authentication with corresponding STA
10 Disassoc because info in the power capability elem is unacceptable
--More--
rfs6000-81742D#

rfs6000-81742D#service show wireless reference status-codes
CODE DESCRIPTION
0 Successful
1 Unspecified failure
2-9 Reserved
10 Cannot support all requested capabilities in the Capability Information field
11 Reassociation denied due to inability to confirm that association exists
12 Association denied due to reason outside the scope of this standard
13 Responding STA does not support the specified authentication algorithm
14 Received an auth frame with authentication transaction seq number out of
expected sequence
15 Authentication rejected because of challenge failure

16-L2P | GEN
 | 0

```

```
ROOT1-ap81xx-71174C#
```

In the preceding example,

- The meshpoint name is mesh\_root
- The device on which the command is executed is ROOT1-ap81xx-71174C
- The vertical ZONE column represents meshpoint modules. For example, 3-ND presents the Neighbor Discovery module.
- The SUBZONE 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.

To enable meshpoint module debugging, specify the module number and the process number separated by a period (.). And then specify the debugging level from 0 - 7.

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C
3.2 7
```

In the preceding command,

- The meshpoint module number provided is 3 (ND)
- The process number provided is 2 (RX - Received signals from neighbors)
- The debugging level provided is 7 (highest level - warning)

```

ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C

 | SUBZONE
 | 0 1 2 3 4 5 6 7

16-L2P | 0

ROOT1-ap81xx-71174C#

```

In the preceding example, level 7 debugging has been enabled only for the ND module's received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
0
```

To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
5
```

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
| SUBZONE
| 0 1 2 3 4 5 6 7

```

The following examples show the purging of users from the guest-registration database:

```

nx7500-112233#service guest-registration delete ?
 all Delete all users
 email Email address
 group Group
 mac MAC address
 mobile Mobile phone number
 name Full name
 offline-for Specify minimum amount of time offline
 otp-incomplete-for Specify minimum amount of time registration with
 one-time-passcode incomplete
 social Social site used to log in
 wlan Wireless LAN

nx7500-112233#

```

Purges users belonging to a specified RADIUS group.

```

nx7500-112233#service guest-registration delete group mac_reg_grp
delete user status: delete users matching a group will take time, please wait
nx7500-112233#

```

Purges users using social-site (Facebook or Google) credentials to login.

```

nx7500-112233#service guest-registration delete social facebook
delete user status: delete users matching a social category will take time,
please wait
nx7500-112233#

```

Purges users inactive for a specified time period.

```

nx7500-112233#service guest-registration delete offline-for days 5
delete user status: Deleting users offline for minimum 5 days. This will take
time, please wait
nx7500-112233#

```

Purges users who have failed to complete registration using the *one-time-passcode* (OTP) within a specified time period.

```

nx7500-112233#service guest-registration delete otp-incomplete-for days 5

```

```
delete user status: Deleting registration with one-time-passcode incomplete for
minimum 5 days. This will take time, please wait
nx7500-112233#
```

The following example displays IP ACLs to WLAN mapping summary on the 'TechPubs' RF Domain:

```
nx9500-6C8809#service show ip-access-list wlan TechPubs status
Reporting Device: ap7131-99BB7C - success
Reporting Device: ap7532-80C2AC - success
Reporting Device: ap7562-84A224 - success
Reporting Device: nx9500-6C8809 - success
Reporting Device: ap8132-74B45C - success
Total reporting devices: 5
nx9500-6C8809#
```

Consider an RF Domain (name guest-domain) with 3 APs adopted to a controller. The CLI output for the `service > show > ip-access-list` command in this set up varies for different scenarios, as shown in the following examples:

Scenario 1: Executing the command on a device (access point).

```
AP01#service show ip-access-list wlan status
Reporting Device: AP01 - fail
WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
Total reporting devices: 1
AP01#
AP01#service show ip-access-list wlan status detail
=====
==
Reporting Device: AP01

--
WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
 use ip-access-list out BC-MC-CONTROL : success

--
WLAN: PartnerNet
 use ip-access-list in default : success
 use ip-access-list out default : success

--
Total reporting devices: 1
AP01#
```

Scenario 2: IP ACL to WLAN mapping is successful for all APs in a specified RF Domain.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - success
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#
```

Scenario 3: IP ACL has failed in dataplane due to unknown reasons.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - fail
WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
```

```
SW01#service show ip-access-list wlan status detail on guest-domain
=====
```

```
==
Reporting Device: AP01

--
```

```

WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
 use ip-access-list out BC-MC-CONTROL : success

--
WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

--

=====
==
Reporting Device: AP02

--
WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

--

=====
==
Reporting Device: AP03

--
WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

--
Total reporting devices: 3
SW01#

```

Scenario 4: AP in RF Domain is unreachable or does not support this functionality.

```

SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - unreachable
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#

SW01#service show ip-access-list wlan status detail on guest-domain

=====
==
Reporting Device: AP01
Timed out waiting for remote device: xpath=wing-stats/device/00-23-68-0B-86-38/
firewall/ip_acl_intf_status/wlan[mac='*']

=====
==
Reporting Device: AP02

--
WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

--

=====
==
Reporting Device: AP03

--
WLAN: PartnerNet

```

```
use ip-access-list in guest_access_inbound : success
use ip-access-list out BC-MC-CONTROL : success

--
Total reporting devices: 3
```

## 5.1.8 show

### ► Common Commands

Displays specified system component settings. There are a number of ways to invoke the show command:

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show <PARAMETERS>
```

### Parameters

- show <PARAMETERS>

|                   |                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show <PARAMETERS> | The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The example below shows the configuration details that can be viewed in the Priv Executable mode. |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Example

```
nx9500-6C8809#show ?
 adoption Adoption related information
 bluetooth Bluetooth Configuration/Statistics commands
 bonjour Bonjour Gateway related commands
 boot Display boot configuration.
 captive-portal Captive portal commands
 captive-portal-page-upload Captive portal internal and advanced page upload
 cdp Cisco Discovery Protocol
 classify-url Query the category of an URL
 clock Display system clock
 cluster Cluster Protocol
 cmp-factory-certs Display the CMP certificate status
 commands Show command lists
 context Information about current context
 critical-resources Critical Resources
 crypto Encryption related commands
 database Database
 debug Debugging functions
 debugging Debugging functions
 device-upgrade Device Upgrade
 dot1x 802.1X
 dpi Deep Packet Inspection
 equest Registration EGuest process
 environmental-sensor Display Environmental Sensor Module status
 event-history Display event history
 event-system-policy Display event system policy
 ex3500 EX3500 device details
 extdev External device (T5, Ex3500..)
 file Display filesystem information
 file-sync File sync between controller and adoptees
 firewall Wireless Firewall
```

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|

| radius                    | RADIUS statistics commands                                                     |
| raid                      | Show RAID status                                                               |
| reload                    | Scheduled reload information                                                   |
| remote-debug              | Show details of remote debug sessions                                          |
| rf-domain-manager         | Show RF Domain Manager selection details                                       |
| role                      | Role based firewall                                                            |
| route-maps                | Display Route Map Statistics                                                   |
| rtls                      | RTLS Statistics                                                                |
| running-config            | Current operating configuration                                                |
| session-changes           | Configuration changes made in this session                                     |
| session-config            | This session configuration                                                     |
| sessions                  | Display sessions                                                               |
| site-config-diff          | Difference between site configuration on the NOC and actual site configuration |
| slot                      | Expansion slots stats                                                          |
| smart-rf                  | Smart-RF Management Commands                                                   |
| spanning-tree             | Display spanning tree information                                              |
| startup-config            | Startup configuration                                                          |
| t5                        | Display T5 inventory information                                               |
| terminal                  | Display terminal configuration parameters                                      |
| timezone                  | The timezone                                                                   |
| traffic-shape             | Display traffic shaping                                                        |
| upgrade-status            | Display last image upgrade status                                              |
| version                   | Display software & hardware version                                            |
| virtual-machine           | Virtual Machine                                                                |
| vrrp                      | VRRP protocol                                                                  |
| web-filter                | Web filter                                                                     |
| what                      | Perform global search                                                          |
| wireless                  | Wireless commands                                                              |
| wwan                      | Display wireless WAN Status                                                    |

nx9500-6C8809#

**NOTE:** For more information on the show command, see *Chapter 6, SHOW COMMANDS*.

## 5.1.9 write

### ▶ Common Commands

Writes the system running configuration to memory or terminal

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
write [memory|terminal]
```

#### Parameters

- write [memory|terminal]

|          |                                               |
|----------|-----------------------------------------------|
| memory   | Writes to the <i>non-volatile</i> (NV) memory |
| terminal | Writes to the terminal                        |

#### Example

```
nx9500-6C8809>write memory
[OK]
nx9500-6C8809>
```

# 6 SHOW COMMANDS

Show commands display configuration settings or statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context's configuration.

This chapter describes the 'show' CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the 'show' commands in the 'GLOBAL CONFIG' mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.

**NOTE:** The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore ( \_ ) character. In other words, the name of a device cannot contain an underscore.

---

## 6.1 show commands

### ► SHOW COMMANDS

The following table summarizes show commands:

**Table 6.1** *Show Commands*

| Command                           | Description                                                                                                           | Reference        |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|------------------|
| <i>show</i>                       | Displays settings for the specified system component                                                                  | <i>page 6-5</i>  |
| <i>adoption</i>                   | Displays information related to adoption                                                                              | <i>page 6-10</i> |
| <i>bluetooth</i>                  | Displays Bluetooth radio statistics for RF Domain member access points                                                | <i>page 6-14</i> |
| <i>boot</i>                       | Displays a device boot configuration                                                                                  | <i>page 6-16</i> |
| <i>bonjour</i>                    | Displays the configured Bonjour services available on local and remote sites                                          | <i>page 6-17</i> |
| <i>captive-portal</i>             | Displays WLAN hotspot functions                                                                                       | <i>page 6-18</i> |
| <i>captive-portal-page-upload</i> | Displays captive portal page related information                                                                      | <i>page 6-20</i> |
| <i>cdp</i>                        | Displays a <i>Cisco Discovery Protocol</i> (CDP) neighbor table                                                       | <i>page 6-22</i> |
| <i>classify-url</i>               | Queries a specified global data center or a pre-configured classification server for the category of a specified URL. | <i>page 6-24</i> |
| <i>clock</i>                      | Displays the software system clock                                                                                    | <i>page 6-25</i> |
| <i>cluster</i>                    | Displays cluster commands                                                                                             | <i>page 6-26</i> |
| <i>cmp-factory-certs</i>          | Displays factory installed CMP certificates                                                                           | <i>page 6-28</i> |
| <i>commands</i>                   | Displays command list                                                                                                 | <i>page 6-29</i> |
| <i>context</i>                    | Displays information about the current context                                                                        | <i>page 6-30</i> |
| <i>critical-resources</i>         | Displays critical resource information                                                                                | <i>page 6-31</i> |
| <i>crypto</i>                     | Displays encryption mode information                                                                                  | <i>page 6-32</i> |
| <i>database</i>                   | Displays database-related statistics and status                                                                       | <i>page 6-35</i> |
| <i>device-upgrade</i>             | Displays device firmware upgradation information for devices adopted by a wireless controller or access point         | <i>page 6-37</i> |
| <i>dot1x</i>                      | Displays dot1x information on interfaces                                                                              | <i>page 6-39</i> |
| <i>dpi</i>                        | Displays statistics for all configured and canned applications                                                        | <i>page 6-41</i> |
| <i>eguest</i>                     | Displays EGuest server status and EGuest registration statistics                                                      | <i>page 6-44</i> |
| <i>environmental-sensor</i>       | Displays environmental sensor's historical data (applicable only to AP8132)                                           | <i>page 6-45</i> |
| <i>event-history</i>              | Displays event history                                                                                                | <i>page 6-48</i> |
| <i>event-system-policy</i>        | Displays event system policy configuration information                                                                | <i>page 6-49</i> |
| <i>ex3500</i>                     | Displays EX3500-related statistical data                                                                              | <i>page 6-50</i> |
| <i>extdev</i>                     | Displays external device (T5 or EX3500) configuration error history                                                   | <i>page 6-53</i> |

**Table 6.1** *Show Commands*

| <b>Command</b>             | <b>Description</b>                                                                                                                                                                                        | <b>Reference</b>  |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>file-sync</i>           | Displays file synchronization settings and status on a controller. The <i>file-sync</i> command syncs trustpoint/wireless-bridge certificate between the staging-controller and its adopted access points | <i>page 6-54</i>  |
| <i>firewall</i>            | Displays wireless firewall information                                                                                                                                                                    | <i>page 6-56</i>  |
| <i>global</i>              | Displays global information for network devices based on the parameters passed                                                                                                                            | <i>page 6-60</i>  |
| <i>gre</i>                 | Displays GRE tunnel related information                                                                                                                                                                   | <i>page 6-62</i>  |
| <i>guest-registration</i>  | Displays guest registration statistics based on the option and time entered                                                                                                                               | <i>page 6-63</i>  |
| <i>interface</i>           | Displays interface status                                                                                                                                                                                 | <i>page 6-71</i>  |
| <i>ip</i>                  | Displays IP related information                                                                                                                                                                           | <i>page 6-75</i>  |
| <i>ip-access-list</i>      | Displays IP access list statistics                                                                                                                                                                        | <i>page 6-82</i>  |
| <i>ipv6</i>                | Displays IPv6 related information                                                                                                                                                                         | <i>page 6-84</i>  |
| <i>ipv6-access-list</i>    | Displays IPv6 access list statistics                                                                                                                                                                      | <i>page 6-88</i>  |
| <i>l2tpv3</i>              | Displays <i>Layer 2 Tunnel Protocol Version 3</i> (L2TPV3) information                                                                                                                                    | <i>page 6-89</i>  |
| <i>lACP</i>                | Displays <i>Link Aggregation Control Protocol</i> (LACP) related information                                                                                                                              | <i>page 6-92</i>  |
| <i>ldap-agent</i>          | Displays an LDAP agent's join status (join status to a LDAP server domain)                                                                                                                                | <i>page 6-95</i>  |
| <i>licenses</i>            | Displays installed licenses and usage information                                                                                                                                                         | <i>page 6-96</i>  |
| <i>lldp</i>                | Displays <i>Link Layer Discovery Protocol</i> (LLDP) information                                                                                                                                          | <i>page 6-99</i>  |
| <i>logging</i>             | Displays logging information                                                                                                                                                                              | <i>page 6-100</i> |
| <i>mac-access-list</i>     | Displays MAC access list statistics                                                                                                                                                                       | <i>page 6-101</i> |
| <i>mac-address-table</i>   | Displays MAC address table entries                                                                                                                                                                        | <i>page 6-102</i> |
| <i>mac-auth</i>            | Displays details of wired ports that have MAC address-based authentication enabled                                                                                                                        | <i>page 6-103</i> |
| <i>mac-auth-clients</i>    | Displays MAC-authenticated clients based on the parameters passed                                                                                                                                         | <i>page 6-105</i> |
| <i>mint</i>                | Displays MiNT protocol configuration commands                                                                                                                                                             | <i>page 6-107</i> |
| <i>nsight</i>              | Displays NSight module related statistics and also displays the database server status (reachable or not)                                                                                                 | <i>page 6-111</i> |
| <i>ntp</i>                 | Displays <i>Network Time Protocol</i> (NTP) information                                                                                                                                                   | <i>page 6-112</i> |
| <i>password-encryption</i> | Displays password encryption status                                                                                                                                                                       | <i>page 6-114</i> |
| <i>pppoe-client</i>        | Displays <i>Point to Point Protocol over Ethernet</i> (PPPoE) client information                                                                                                                          | <i>page 6-115</i> |
| <i>privilege</i>           | Displays current privilege level information                                                                                                                                                              | <i>page 6-116</i> |
| <i>radius</i>              | Displays the amount of access time consumed and the access time remaining for all guest users configured on a RADIUS server                                                                               | <i>page 6-117</i> |
| <i>reload</i>              | Displays scheduled reload information                                                                                                                                                                     | <i>page 6-119</i> |

**Table 6.1** *Show Commands*

| <b>Command</b>           | <b>Description</b>                                                                                                                                                                                          | <b>Reference</b>  |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>rf-domain-manager</i> | Displays RF Domain manager selection details                                                                                                                                                                | <i>page 6-120</i> |
| <i>role</i>              | Displays role-based firewall information                                                                                                                                                                    | <i>page 6-121</i> |
| <i>route-maps</i>        | Display route map statistics                                                                                                                                                                                | <i>page 6-122</i> |
| <i>rtls</i>              | Displays <i>Real Time Location Service</i> (RTLS) statistics of access points                                                                                                                               | <i>page 6-123</i> |
| <i>running-config</i>    | Displays configuration file contents                                                                                                                                                                        | <i>page 6-125</i> |
| <i>session-changes</i>   | Displays configuration changes made in this session                                                                                                                                                         | <i>page 6-132</i> |
| <i>session-config</i>    | Displays a list of currently active open sessions on the device                                                                                                                                             | <i>page 6-133</i> |
| <i>sessions</i>          | Displays CLI sessions                                                                                                                                                                                       | <i>page 6-134</i> |
| <i>site-config-diff</i>  | Displays the difference between site configuration available on NOC and the actual site configuration                                                                                                       | <i>page 6-135</i> |
| <i>smart-rf</i>          | Displays Smart RF management commands                                                                                                                                                                       | <i>page 6-136</i> |
| <i>spanning-tree</i>     | Displays spanning tree information                                                                                                                                                                          | <i>page 6-140</i> |
| <i>startup-config</i>    | Displays complete startup configuration script on the console                                                                                                                                               | <i>page 6-142</i> |
| <i>t5</i>                | Displays adopted T5 controller details. This command is applicable only on the RFS4000, RFS6000, NX9500, NX9510, and VX9000.                                                                                | <i>page 6-143</i> |
| <i>terminal</i>          | Displays terminal configuration parameters                                                                                                                                                                  | <i>page 6-151</i> |
| <i>timezone</i>          | Displays timezone information for the system and managed devices                                                                                                                                            | <i>page 6-152</i> |
| <i>traffic-shape</i>     | Displays traffic-shaping related configuration details and statistics                                                                                                                                       | <i>page 6-153</i> |
| <i>upgrade-status</i>    | Displays image upgrade status                                                                                                                                                                               | <i>page 6-155</i> |
| <i>version</i>           | Displays a device's software and hardware version                                                                                                                                                           | <i>page 6-156</i> |
| <i>vrrp</i>              | Displays <i>Virtual Router Redundancy Protocol</i> (VRRP) protocol details                                                                                                                                  | <i>page 6-157</i> |
| <i>web-filter</i>        | Displays pre-configured, in-built Web filter options available. These options are: category (URL category), category-types, filter-level, etc. This command also displays Web filter statistics and status. | <i>page 6-159</i> |
| <i>what</i>              | Displays details of a specified search phrase                                                                                                                                                               | <i>page 6-161</i> |
| <i>wireless</i>          | Displays wireless configuration parameters                                                                                                                                                                  | <i>page 6-162</i> |
| <i>wwan</i>              | Displays the wireless WAN status                                                                                                                                                                            | <i>page 6-185</i> |
| <i>virtual-machine</i>   | Displays the <i>virtual-machine</i> (VM) configuration, logs, and statistics                                                                                                                                | <i>page 6-186</i> |
| <i>raid</i>              | Displays <i>Redundant Array of Independent Disks</i> (RAID) related information, such as array status, consistency check status, and RAID log.                                                              | <i>page 6-189</i> |

## 6.1.1 show

### ► *show commands*

The show command displays following information:

- A device's current configuration
- A device's start-up configuration
- A device's current context configuration, such as profiles and policies

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show <PARAMETERS>
```

#### Parameters

- show <PARAMETERS>

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show <PARAMETERS> | The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes. |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

The following examples list the *show* commands in the User Exec, Priv Exec, and Global Config modes:

GLOBAL CONFIG Mode

```
<DEVICE>(config)#show ?
 adoption Adoption related information
 bluetooth Bluetooth Configuration/Statistics commands
 bonjour Bonjour Gateway related commands
 boot Display boot configuration.
 captive-portal Captive portal commands
 captive-portal-page-upload Captive portal internal and advanced page upload
 cdp Cisco Discovery Protocol
 classify-url Query the category of an URL
 clock Display system clock
 cluster Cluster Protocol
 cmp-factory-certs Display the CMP certificate status
 commands Show command lists
 context Information about current context
 critical-resources Critical Resources
 crypto Encryption related commands
 database Database
 debug Debugging functions
 debugging Debugging functions
 device-upgrade Device Upgrade
 dot1x 802.1X
 dpi Deep Packet Inspection
 eguest ExtremeGuest
 environmental-sensor Display Environmental Sensor Module status
 event-history Display event history
```

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|
| event-system-policy       | Display event system policy                                                    |
| ex3500                    | EX3500 device details                                                          |
| extdev                    | External device (T5, Ex3500..)                                                 |
| file                      | Display filesystem information                                                 |
| file-sync                 | File sync between controller and adoptees                                      |
| firewall                  | Wireless Firewall                                                              |
| global                    | Global-level information                                                       |

## 6.1.2 adoption

### ► *show commands*

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

In an *hierarchically managed* (HM) network devices are deployed in two levels. The first level consists of the *Network Operations Center* (NOC) controllers. The second level consists of the site controllers. that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers.

Use this command to confirm if a device is an adoptee or an adopter. This command also allows you to determine the devices adopted by an adopter device.

**NOTE:** A NOC controller's capacity is equal to or higher than a site controller's capacity. The following devices can be deployed at NOC and sites:

- NOC controller – RFS6000, NX65XX, NX9500, NX9510, or NX9600.
- Site controller – RFS6000 or RFS4000.

#### Supported in the following platforms:

- Access Points – AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show adoption [config-errors|controllers|history|info|log|offline|pending|status|
timeline]

show adoption offline

show adoption config-errors <DEVICE-NAME>

show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}

show adoption [controllers {include-ipv6}|history|info|pending|status {summary}|
timeline] {on <DEVICE-NAME>}
```

#### Parameters

- show adoption offline

|          |                                                                                |
|----------|--------------------------------------------------------------------------------|
| adoption | Displays adoption related information. It also displays configuration errors.  |
| offline  | Displays non-adopted status of the logged device and its adopted access points |

- show adoption config-errors <DEVICE-NAME>

|                                |                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adoption                       | Displays adoption related information. It also displays configuration errors.                                                                                                                                |
| config-errors<br><DEVICE-NAME> | Displays configuration errors for a specified adopted device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

- show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}

|          |                                                                               |
|----------|-------------------------------------------------------------------------------|
| adoption | Displays adoption related information. It also displays configuration errors. |
|----------|-------------------------------------------------------------------------------|

## Usage Guidelines

In a device's Global Config mode, use the `customize > show-adoption-status` command to customize the `show > adoption > status` command output. The following columns can be added to the output:

```

nx9500-6C8809(config)#customize show-adoption-status ?
 adopted-by Device name to which the AP is adopted
 ap-name Host-name of the adopted AP
 cdp-lldp-info Cdp/lldp info of the Adopted AP
 config-status Configuration status of the adopted AP
 last-adoption Last known adoption time
 msgs Messages status
 uptime Uptime of the adopted AP
 version Current version of the adopted AP

nx9500-6C8809(config)#

```

For more information on the `customize` command, see [customize](#).

## Example

The following example displays details of the:

- device to which the logged device (rfs6000-81742D) is adopted, and
- devices adopted (ap7532-A2A4B0, ap7532-80C2AC, ap7562-84A224, etc.) by the logged device.

```

rfs6000-81742D(config)#show adoption status
Adopted by:

## 6.1.3 bluetooth

### ► *show commands*

Displays Bluetooth radio statistics for RF Domain member access points

AP8432 and AP8533 model access points utilize a built-in Bluetooth chip for specific Bluetooth functional behaviors in a WiNG managed network. AP8432 and AP8533 models support both Bluetooth classic and *Bluetooth low energy* (BLE) technology. These platforms use their Bluetooth classic enabled radio to sense other Bluetooth enabled devices and report device data (MAC address, RSSI and device calls) to an ADSP server for intrusion detection. If the device presence varies in an unexpected manner, ADSP can raise an alarm.

**NOTE:** AP8132 model access points support an external USB Bluetooth radio providing ADSP Bluetooth classic sensing functionality only, not the BLE beaconing functionality available for AP8432 and AP8533 model access points described in this section.

AP8432 and AP8533 model access points support Bluetooth beaconing to emit either iBeacon or Eddystone-URL beacons. The access point's Bluetooth radio sends non-connectable, undirected *low-energy* (LE) advertisement packets periodically. These advertisement packets are short and sent on Bluetooth advertising channels that conform to already-established iBeacon and Eddystone-URL standards.

#### Supported in the following platforms:

- Access Points — AP8432, AP8533

#### Syntax

```
show bluetooth radio {detail|on}
```

```
show bluetooth radio {detail {<DEVICE-NAME> <1-1>|filter bluetooth-radio-mac <BT-RADIO-MAC>}} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

#### Parameters

- `show bluetooth radio {detail {<DEVICE-NAME> <1-1>|filter bluetooth-radio-mac <BT-RADIO-MAC>}} {(on <DEVICE-OR-DOMAIN-NAME>)}`

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

nx9500-6C8809(config)#

```

## 6.1.4 boot

### ► *show commands*

Displays a device's boot configuration. Use this command to view the primary and secondary image details, such as Build Date, Install Date, and Version. This command also displays the current boot and next boot information.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show boot {on <DEVICE-NAME>}
```

#### Parameters

- show boot {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| boot             | Displays primary and secondary image boot configuration details (build date, install date, version, and the image used to boot the current session)                                                                                                                                                                       |
| on <DEVICE-NAME> | Optional. Displays a specified device's boot configuration <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> <p><b>Note:</b> Use the <i>on &lt;DEVICE-NAME&gt;</i> option to view a remote device's boot configuration.</p> |

#### Example

```
nx9500-6C8809#show boot
```

```

## 6.1.5 Bonjour

### ► *show commands*

Displays the configured Bonjour services available on local and remote sites

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show bonjour services {on <DEVICE-NAME>}
```

#### Parameters

- `show bonjour services {on <DEVICE-NAME>}`

|                  |                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bonjour services | Displays the configured Bonjour services available on local and remote sites                                                                                                                                        |
| on <DEVICE-NAME> | Optional. Displays Bonjour services available on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
rfs6000-81742D#show bonjour services on ap7131-11E6C4

## 6.1.6 captive-portal

### ► show commands

Displays WLAN captive portal information. Use this command to view a configured captive portal's client information.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|
statistics} {(filter [captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]|
ip [<IPv4>|not <IPv4>]|ipv6 [<IPv6>|not <IPv6>]|state [pending|success|not
[pending|success]|vlan [<VLAN-ID>|not <VLAN-ID>]|wlan [<WLAN-NAME>|not <WLAN-
NAME>]])}
```

#### Parameters

- show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics} {(filter [captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]|ip [<IPv4>|not <IPv4>]|ipv6 [<IPv6>|not <IPv6>]|state [pending|success|not [pending|success]|vlan [<VLAN-ID>|not <VLAN-ID>]|wlan [<WLAN-NAME>|not <WLAN-NAME>]])}

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| captive-portal sessions                                | Displays active captive portal client session details                                                                                                                                                                                                                                                                                                                                                                                                  |
| include-ipv6                                           | Optional. Includes IPv6 address (if known) of captive portal clients<br>By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.                                                                                                                                                                                                                                                |
| statistics                                             | Optional. Displays statistical information regarding client sessions                                                                                                                                                                                                                                                                                                                                                                                   |
| on <DEVICE-OR-DOMAIN-NAME>                             | Optional. Displays active captive portal session details on a specified device or RF Domain. <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul>                                                                                                                                                                                      |
| filter                                                 | This parameter is recursive and can be used with any of the above parameters to define additional filters.<br><br>Optional. Defines additional filters. Use one of the following options: captive-portal, ip, ipv6, state, vlan, or wlan.                                                                                                                                                                                                              |
| captive-portal [<CAPTIVE-PORTAL> not <CAPTIVE-PORTAL>] | Optional. Displays captive portal client and client session information, based on the captive portal name passed <ul style="list-style-type: none"> <li>• &lt;CAPTIVE-PORTAL&gt; - Specify the captive portal name. Displays client details for the specified captive portal.</li> <li>• not &lt;CAPTIVE-PORTAL&gt; - Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.</li> </ul> |

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip [<IPv4> not <IPv4>]                        | <p>Optional. Displays captive portal client/client sessions information, based on the IPv4 address passed</p> <ul style="list-style-type: none"> <li>• &lt;IPv4&gt; - Specify the client's IPv4 address. Displays information of the client identified by the &lt;IPv4&gt; parameter</li> <li>• not &lt;IPv4&gt; - Inverts the match selection. ## 6.1.7 captive-portal-page-upload

### ► *show commands*

Displays captive portal page information, such as upload history, upload status, and page file download status

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show captive-portal-page-upload [history|list-files|load-image-status|status]
show captive-portal-page-upload load-image-status

show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}

show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}

show captive-portal-page-upload list-files <CAPTIVE-PORTAL-NAME>
```

#### Parameters

- `show captive-portal-page-upload load-image-status`

|                   |                                                                                 |
|-------------------|---------------------------------------------------------------------------------|
| load-image-status | Displays captive portal advanced page file download status on the logged device |
|-------------------|---------------------------------------------------------------------------------|

- `show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}`

|                                  |                                                                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| history<br>{on <RF-DOMAIN-NAME>} | Displays captive portal page upload history <ul style="list-style-type: none"> <li>• on &lt;RF-DOMAIN-NAME&gt; - Optional. Displays captive portal page upload history within a specified RF Domain. Specify the RF Domain name.</li> </ul> |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}`

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status<br>{on <RF-DOMAIN-NAME> <br>on <RF-DOMAIN-MANAGER>} | Displays captive portal page upload status <ul style="list-style-type: none"> <li>• on &lt;RF-DOMAIN-NAME&gt; - Optional. Displays captive portal page upload status within a specified RF Domain. Specify the RF Domain name.</li> <li>• on &lt;RF-DOMAIN-MANAGER&gt; - Optional. Displays captive portal page upload status for a specified RF Domain Manager. Specify the RF Domain Manager name.</li> </ul> |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `show captive-portal-page-upload list-files <CAPTIVE-PORTAL-NAME>`

|                                     |                                                                                                                                                                                                                                                     |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| list-files<br><CAPTIVE-PORTAL-NAME> | Displays a list of all captive portal Web page files, of a specified captive portal, uploaded (internal and advanced page files) <ul style="list-style-type: none"> <li>• &lt;CAPTIVE-PORTAL-NAME&gt; - Specify the captive portal name.</li> </ul> |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.1.8 cdp

### ► *show commands*

Displays the *Cisco Discovery Protocol* (CDP) neighbor table

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

#### Parameters

```
• show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

|                              |                                                                                                                                                                                                                                                                                                                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cdp [neighbors report]       | Displays CDP neighbors table or aggregated CDP neighbors table                                                                                                                                                                                                                                                               |
| detail<br>{on <DEVICE-NAME>} | Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays table details on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
| on <DEVICE-NAME>             | Optional. Displays table details on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                                       |

#### Example

The following example shows detailed CDP neighbors table:

```
nx9500-6C8809#show cdp neighbors detail

Device ID: ap8132-74B45C
Entry address(es):
 IP Address: 192.168.13.26
Platform: AP-8132-66040-WR, Capabilities: Router Switch
Interface: ge1, Port ID (outgoing port): ge1
Hold Time: 165 sec

advertisement version: 2
Native VLAN: 1
Duplex: full
Version :
5.8.6.0-008B

Device ID: ap7532-80C2AC
Entry address(es):
 IP Address: 192.168.13.28
Platform: AP-7532-67040-WR, Capabilities: Router Switch
Interface: ge1, Port ID (outgoing port): ge1
Hold Time: 169 sec

--More--
nx9500-6C8809#
```

The following example shows a non-detailed CDP neighbors table:

```
rfs6000-81742D#show cdp neighbors

 Device ID Platform Local Interface Port ID Duplex

nx9500-6C8809 NX-9500-100R0-WR ge2 ge1 full
rfs6000-81742D RFS-6010-1000-WR ge2 ge1 full
rfs4000-880DA7 RFS-4011-11110-US ge2 ge1 full
ap6521-42936C AP-6521E-60020-WR ge2 ge1 full

rfs6000-81742D#
```

## 6.1.9 classify-url

### ► *show commands*

Displays a specified URL's category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

#### Parameters

- show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]

|                              |                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| classify-url                 | Queries the category of a specified URL                                                                                                                      |
| <URL-TO-QUERY>               | Specify the URL to query. The query is sent to the configured classification server.                                                                         |
| datacenter<br><URL-TO-QUERY> | The query is sent to a global classification datacenter <ul style="list-style-type: none"> <li>• &lt;URL-TO-QUERY&gt; - Specify the URL to query.</li> </ul> |

#### Example

```
nx9500-6C8809#show classify-url www.google.com
Categories: search-engines-portals,
Custom Categories:
nx9500-6C8809#

nx9500-6C8809#show classify-url www.ndtv.com
Categories: news,
Custom Categories: list1,
nx9500-6C8809#
```

## 6.1.10 clock

### ► *show commands*

Displays a selected system's clock

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show clock {on <DEVICE-NAME>}
```

#### Parameters

- show clock {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clock            | Displays a system's clock                                                                                                                                                                                        |
| on <DEVICE-NAME> | Optional. Displays system clock on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

#### Example

```
rfs6000-81742D#show clock
2017-04-06 15:50:42 IST
rfs6000-81742D#
```

```
rfs6000-380649(config)#show cluster status

Cluster Runtime Information
Protocol version : 1
Cluster operational state : active
AP license : 1
AAP license : 0
AP count : 0
AAP count : 1
Max AP adoption capacity : 256
Number of connected member(s) : 1
rfs6000-380649(config)#
```

## 6.1.12 cmp-factory-certs

### ► *show commands*

Displays factory installed CMP certificates

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show cmp-factory-certs {all}
```

#### Parameters

- `show cmp-factory-certs {all}`

|                            |                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| cmp-factory-certs<br>{all} | Displays factory installed CMP certificates on the logged device. Optionally use the 'all' keyword to view certificate details. |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
```

## 6.1.13 commands

### ► *show commands*

Displays commands available for the current mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show commands
```

#### Parameters

None

#### Example

```
rfs4000-880DA7(config)#show commands
help
help search WORD (|detailed|only-show|skip-show|skip-no)
show commands
show adoption log adoptee(|on DEVICE-NAME)
show adoption log adopter (|mac AA-BB-CC-DD-EE-FF) (|on DEVICE-NAME)
show adoption info (|on DEVICE-NAME)
show adoption status (|on DEVICE-NAME)
show adoption status summary (|on DEVICE-NAME)
show adoption config-errors DEVICE-NAME
show adoption offline
show adoption pending (|on DEVICE-NAME)
show adoption history (|on DEVICE-NAME)
show adoption timeline (|on DEVICE-NAME)
show adoption controllers (|on DEVICE-NAME)
show adoption controllers include-ipv6(|on DEVICE-NAME)
show debugging (|on DEVICE-OR-DOMAIN-NAME)
show debugging cfgd(|on DEVICE-NAME)
show debugging fib(|on DEVICE-NAME)
show debugging adoption (|on DEVICE-OR-DOMAIN-NAME)
show debugging wireless (|on DEVICE-OR-DOMAIN-NAME)
show debugging snmp (|on DEVICE-NAME)
show debugging ssm (|on DEVICE-NAME)
show debugging voice (|on DEVICE-OR-DOMAIN-NAME)
--More--
rfs4000-880DA7(config)#
```

## 6.1.14 context

### ► *show commands*

Displays the current context details

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, NX7500, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show context {include-factory|session-config {include-factory}}
```

#### Parameters

- `show context {include-factory|session-config {include-factory}}`

|                                     |                                                                                                                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include-factory                     | Optional. Includes factory defaults                                                                                                                                            |
| session-config<br>{include-factory} | Optional. Displays running system information in the current context <ul style="list-style-type: none"> <li>• include-factory - Optional. Includes factory defaults</li> </ul> |

#### Example

```
rfs4000-880DA7(config)#show context
!
! Configuration of RFS4000 version 5.9.1.0-015D
!
!
version 2.5
!
!
client-identity-group default
 load default-fingerprints
!
ip snmp-access-list default
 permit any
!
firewall-policy default
 no ip dos tcp-sequence-past-window
!
!
mint-policy global-default
!
radio-qos-policy default
!
auto-provisioning-policy 4K
!
--More--
rfs4000-880DA7(config)#
```

## 6.1.15 critical-resources

### ► *show commands*

Displays critical resource information. Critical resources are resources vital to the network.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show critical-resources {on <DEVICE-NAME>}
```

#### Parameters

- `show critical-resources {on <DEVICE-NAME>}`

|                    |                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| critical-resources | Displays critical resources information                                                                                                                                                                                |
| on <DEVICE-NAME>   | Optional. Displays critical resource information on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
rfs4000-229D58 (config)#show critical-resources

CRITICAL RESOURCE IP VLAN PING-MODE STATE

172.168.1.103 1 arp-icmp up

rfs4000-229D58 (config)#
```

## 6.1.16 crypto

### ► *show commands*

Displays encryption mode information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show crypto [cmp|ike|ipsec|key|pki]
show crypto cmp request status
show crypto ike sa {detail|on|peer|version}
show crypto ike sa {detail|peer <IP>} {on <DEVICE-NAME>}
show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
show crypto ipsec sa {detail|on|peer}
show crypto ipsec sa {detail} {on <DEVICE-NAME>}
show crypto ipsec sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}
show crypto key rsa {on|public-key-detail}
show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all|on}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}
```

#### Parameters

- show crypto cmp request status

|                           |                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto cmp request status | Displays current status of in-progress <i>certificate management protocol</i> (CMP) requests<br>For more information, see <a href="#">CRYPTO-CMP-POLICY</a> .                                              |
|                           | • show crypto ike sa {detail peer <IP>} {on <DEVICE-NAME>}                                                                                                                                                 |
| crypto ike sa             | Displays <i>Internet Key Exchange</i> (IKE) <i>security association</i> (SA) statistics                                                                                                                    |
| detail                    | Displays detailed IKE SA statistics                                                                                                                                                                        |
| peer <IP>                 | Optional. Displays IKE SA statistics for a specified peer <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the peer's IP address in the A.B.C.D format</li> </ul>                             |
| on <DEVICE-NAME>          | Optional. Displays IKE SA statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

- `show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}`

|                  |                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto ike sa    | Displays IKE SA details                                                                                                                                                                                                                                                                                                                                            |
| version [1 2]    | Optional. Displays IKE SA version statistics <ul style="list-style-type: none"> <li>• 1 - Displays IKEv1 statistics</li> <li>• 2 - Displays IKEv2 statistics</li> </ul>                                                                                                                                                                                            |
| peer <IP>        | Optional. Displays IKE SA version statistics for a specified peer <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the peer's IP address in the A.B.C.D format</li> </ul>                                                                                                                                                                             |
| on <DEVICE-NAME> | The following keyword is recursive and common to the 'peer ip' parameter: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays IKE SA statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> |

- `show crypto ipsec sa {detail} {on <DEVICE-NAME>}`

|                  |                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto ipsec sa  | Displays <i>Internet Protocol Security</i> (IPSec) SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session                                        |
| detail           | Optional. Displays detailed IPSec SA statistics                                                                                                                                                    |
| on <DEVICE-NAME> | Optional. Displays IPSec SAs on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

- `show crypto sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}`

|                  |                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto ipsec sa  | Displays IPSec SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session                                                                                                                                                                                              |
| peer <IP> detail | Optional. Displays IPSec SA statistics for a specified peer <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the peer's IP address in the A.B.C.D format.</li> <li>• detail - Displays detailed IPSec SA statistics for the specified peer</li> </ul>                                                   |
| on <DEVICE-NAME> | The following keyword is recursive: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays IPSec SAs on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> |

- `show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}`

|                   |                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto key rsa    | Displays RSA public keys                                                                                                                                                                                                                                                                                              |
| public-key-detail | Optional. Displays public key in the <i>Privacy-Enhanced Mail</i> (PEM) format                                                                                                                                                                                                                                        |
| on <DEVICE-NAME>  | The following keyword is recursive: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays public key on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> |

- `show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}`

|                   |                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------|
| crypto pki        | Displays PKI related information                                                                        |
| trustpoints       | Displays WLAN trustpoints<br>This command displays all trustpoints including CMP-generated trustpoints. |
| <TRUSTPOINT-NAME> | Optional. Displays a specified trustpoint details. Specify the trustpoint name.                         |

|                  |                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all              | Optional. Displays details of all trustpoints                                                                                                                                                                                                                                                                                                |
| on <DEVICE-NAME> | The following keyword is recursive and common to the 'trustpoint-name' and 'all' parameters: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays trustpoints configured on a specified device</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

## 6.1.17 database

### ► *show commands*

Displays database-related statistics and status

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, VX9000

#### Syntax

```
show database [backup-status|keyfile|restore-status|statistics|status|users] {on
<DEVICE-NAME>}
```

#### Parameters

- show database [backup-status|keyfile|restore-status|statistics|status|users] {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database         | Displays all configured database-related statistics and status                                                                                                                                                        |
| backup-status    | Displays the last database backup status                                                                                                                                                                              |
| keyfile          | Displays the keyfiles generated on the database host to enable authenticated database access                                                                                                                          |
| back-restore     | Displays the last database restore status                                                                                                                                                                             |
| statistics       | Displays database-related statistics, such as name of the database (NSight or captive portal), data size, storage size, free disk space available, etc.                                                               |
| status           | Displays database status, such as online time.                                                                                                                                                                        |
| users            | Displays database users created. These are the users that can access the databases.                                                                                                                                   |
| on <DEVICE-NAME> | Optional. Displays database-related information on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

## 6.1.18 device-upgrade

### ► show commands

Displays device firmware upgradation information for devices adopted by a wireless controller or access point

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show device-upgrade [history|load-image-status|status|versions]
```

```
show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-DOMAIN-NAME>}]
```

```
show device-upgrade status {on [<DOMAIN-NAME>|rf-domain-manager]|summary {on <DOMAIN-NAME>}}
```

#### Parameters

- show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-DOMAIN-NAME>}]

|                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device-upgrade                                                                                                                                               | Displays device upgrade information based on the parameters passed                                                                                                                                                                                                                                                                                                                                                                                          |
| history {on <DOMAIN-NAME>}                                                                                                                                   | Displays device upgrade history <ul style="list-style-type: none"> <li>• on &lt;DOMAIN-NAME&gt; - Optional. Displays upgrade history for all devices within a specified RF Domain. Specify the RF Domain name.</li> </ul>                                                                                                                                                                                                                                   |
| load-image-status                                                                                                                                            | Displays firmware image loading status. The output displays the <DEVICE> image loading status in percentage.<br>For example:<br><pre>#show device-upgrade load-image-status Download of ap81xx firmware file is 47 percent complete</pre>                                                                                                                                                                                                                   |
| versions {on <DEVICE-OR-DOMAIN-NAME>}                                                                                                                        | Displays firmware image versions <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Optional. Displays firmware image versions loaded on specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain. <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the AP, wireless controller, service platform, or RF Domain name.</li> </ul> </li> </ul> |

## 6.1.19 dot1x

### ► *show commands*

Displays dot1x information on interfaces

Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a dot1X-enabled device automatically connects and authenticates without needing to manually login.

However, dot1x-enabled devices can be configured either as:

- supplicants only – Devices seeking network access
- authenticators only – Devices authenticating the supplicants, or
- supplicants as well authenticators

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

---

**NOTE:** Dot.1x supplicant configuration is supported on the following platforms:

- Access Points – AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers – RFS4000
- Service Platforms – NX5500, NX7500

---

**NOTE:** Dot.1x authenticator configuration is supported on the following platforms:

- Access Points – AP6521, AP6522, AP6562, AP7161, AP7502, AP81XX
  - Wireless Controllers – RFS4000, RFS6000
  - Service Platforms – NX5500, NX7500
- 

#### Syntax

```
show dot1x {all|interface|on}
```

```
show dot1x {all {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

```
show dot1x {interface [<INTERFACE-NAME>|ge <1-4>|port-channel <1-2>]} {on <DEVICE-NAME>}
```

#### Parameters

- show dot1x {all {on <DEVICE-NAME>}|on <DEVICE-NAME>}

|                                 |                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x all<br>{on <DEVICE-NAME>} | Optional. Displays dot1x information for all interfaces <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Displays dot1x information for all interfaces on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                             |                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x<br>{on <DEVICE-NAME>} | Optional. Displays dot1x information for interfaces on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of AP, wireless controller, or service platform.</li> </ul> <pre>• show dot1x {interface [&lt;INTERFACE-NAME&gt; ge &lt;1-4&gt; port-channel &lt;1-2&gt;]} {on &lt;DEVICE-NAME&gt;}</pre>            |
| dot1x interface             | Optional. Displays dot1x information for a specified interface or interface type                                                                                                                                                                                                                                                                             |
| <INTERFACE-NAME>            | Displays dot1x information for the layer 2 (Ethernet port) interface specified by the <INTERFACE-NAME> parameter                                                                                                                                                                                                                                             |
| ge <1-4>                    | Displays dot1x for a specified GigabitEthernet interface <ul style="list-style-type: none"> <li>&lt;1-4&gt; - Select the interface index from 1 - 4.</li> </ul>                                                                                                                                                                                              |
| port-channel <1-2>          | Displays dot1x for a specified port channel interface <ul style="list-style-type: none"> <li>&lt;1-2&gt; - Select the interface index from 1 - 2.</li> </ul>                                                                                                                                                                                                 |
| on <DEVICE-NAME>            | The following keywords are common to all of the above parameters: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays dot1x interface information on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of AP, wireless controller, or service platform.</li> </ul> </li> </ul> |

**Example**

```
rfs6000-81742D#show dot1x all
802.1X information

```

## 6.1.20 dpi

### ► *show commands*

Displays *Deep Packet Inspection* (DPI) statistics for all configured and canned applications. DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When DPI is enabled, packets of all flows are subjected to DPI to get accurate results. DPI identifies applications (such as, Netflix, Twitter, Facebook, etc.) and also extracts metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

**NOTE:** The `show > dpi` command returns results only if executed on a device that supports DPI and has DPI logging enabled. DPI logging can be enabled either on the device or on the profile applied to the device. For more information, see [dpi](#).

### Supported in the following platforms:

- Access Points — AP7522, AP7532, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show dpi [app|app-category|application|application-policy|per-category]
```

```
show dpi app wireless-clients stats <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

```
show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}
```

```
show dpi application-policy stats <APPLICATION-POLICY-NAME> {on <DEVICE-OR-DOMAIN-NAME>}
```

```
show dpi application brief
```

```
show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}
```

### Parameters

- `show dpi app wireless-clients stats <MAC> {<DEVICE-OR-DOMAIN-NAME>}`

|                                                 |                                                                                                                                                                                                                                                                           |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>dpi app wireless-clients &lt;MAC&gt;</pre> | <p>Displays application-related statistics for all or a specified wireless clients</p> <ul style="list-style-type: none"> <li>• <code>&lt;MAC&gt;</code> – Displays statistics for a specified wireless client. Specify the client's MAC address.</li> </ul>              |
| <pre>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</pre>     | <p>Optional. Displays statistical data on a specified device or RF Domain</p> <ul style="list-style-type: none"> <li>• <code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code> – Specify the name of the access point, wireless controller, service platform, or RF Domain.</li> </ul> |

- `show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}`

|                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.1.21 eguest

▶ *show commands*

Displays EGuest server status and EGuest registration statistics

### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

### Syntax

```
eguest [registration statistics|status]
```

### Parameters

- eguest [registration statistics|status]

|                         |                                               |
|-------------------------|-----------------------------------------------|
| registration statistics | Displays the EGuest registration statistics   |
| status                  | Displays the current status of EGuest servers |

### Example

```
vx-eguest-primary#show eguest status

pid process

2521 gmd
2529 regserver
2539 acct_server
2569 guest_manager
2636 acct_server
2642 acct_server
2643 acct_server
2649 acct_server
2655 acct_server
2708 acct_server-helper
2770 guest_manager
2776 guest_manager
2777 guest_manager
2783 guest_manager
3628 gmd
3630 gmd
3631 gmd
3632 gmd
3633 gmd
3634 gmd
5729 radiusd

## 6.1.22 environmental-sensor

### ► *show commands*

Displays environmental sensor's recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

**NOTE:** The environmental sensor is supported only on an AP8132. When executed on any controller (other than an AP8132), the *show > environmental-sensor > <parameters>* command displays environmental-sensor details for adopted AP8132s (if any).

#### Supported in the following platforms:

- Access Points — AP8132

#### Syntax

```
show environmental-sensor [history|humidity|light|motion|summary|temperature|version]
```

```
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
```

```
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

#### Parameters

- *show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}*

|                              |                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environmental-sensor history | Displays environmental sensor history once in every hour, 20 minutes, or 24 hours<br>History includes the humidity, light, motion, and temperature data recorded by the sensor at specified time interval. |
| 1-hour                       | Optional. Displays environmental sensor history once in every 1 (one) hour                                                                                                                                 |
| 20-minute                    | Optional. Displays environmental sensor history once in every 20 minutes                                                                                                                                   |
| 24-hour                      | Optional. Displays environmental sensor history once in every 24 hours                                                                                                                                     |

- *show environmental-sensor [humidity|light|motion|summary|temperature|version]*

|                      |                                                                                                                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environmental-sensor | Displays environmental sensor's recorded data, based on the parameters passed. The system displays the specified recorded data.<br>The environmental sensor records data at the following intervals: 20 minutes, 1 hour, and 24 hours. |
| humidity             | Displays the minimum, average, and maximum humidity recorded                                                                                                                                                                           |
| light                | Displays the minimum, average, and maximum light recorded                                                                                                                                                                              |
| motion               | Displays the minimum, average, and maximum motion recorded                                                                                                                                                                             |
| temperature          | Displays the minimum, average, and maximum temperature recorded                                                                                                                                                                        |
| version              | Displays the hardware and firmware versions                                                                                                                                                                                            |
| summary              | Displays a summary of the data recorded at following intervals:                                                                                                                                                                        |

**Example**

```
ap8132-711728#show environmental-sensor summary

## 6.1.23 event-history

### ► show commands

Displays event history report

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

- show event-history {on <DEVICE-OR-DOMAIN-NAME>}

|                            |                                                                                                                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event-history              | Displays event history report                                                                                                                                                                                                         |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays event history report on a device or RF Domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

#### Example

```
nx9500-6C8809#show event-history

## 6.1.24 event-system-policy

### ► *show commands*

Displays detailed event system policy configuration

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>
```

#### Parameters

- `show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>`

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| event-system-policy        | Displays event system policy configuration             |
| config                     | Displays configuration for a specified policy          |
| detail                     | Displays detailed configuration for a specified policy |
| <EVENT-SYSTEM-POLICY-NAME> | Specify the event system policy name.                  |

#### Example

```
rfs6000-81742D(config)#show event-system-policy config testpolicy

MODULE EVENT SYSLOG SNMP FORWARD EMAIL

aaa radius-discon-msg on on on default

rfs6000-81742D(config)#
```

## 6.1.25 ex3500

### ► show commands

Displays EX3500-related statistical data

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
show ex3500 [dir|interfaces|system|upgrade|version|whichboot]
```

```
show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
```

```
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
```

```
show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}
```

#### Parameters

- show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}

|                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 dir                                                                                                                                                                                                                           | Displays EX3500 directory information based on the option selected. ## 6.1.26 extdev

### ► *show commands*

Displays external device (T5 or EX3500) configuration error history

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX9500, NX9510

#### Syntax

```
show extdev error history {on <T5/EX3500-DEVICE-NAME>}
```

#### Parameters

- `show extdev error history {on <T5/EX3500-DEVICE-NAME>}`

|                            |                                                                                                                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extdev error history       | Displays external device error history. This command is applicable only to the external devices T5, and EX3500 series switches. Use this command to view configuration error history for all or a specified external device adopted and managed by a WiNG NX9500 series service platform. |
| on <T5/EX3500-DEVICE-NAME> | Optional. Displays configuration error history on a specified T5 or EX3500 device <ul style="list-style-type: none"> <li>• &lt;T5/EX3500-DEVICE-NAME&gt; - Specify the name of the device.</li> </ul>                                                                                     |

#### Example

```
nx9500-6C8809#show extdev error history on t5-ED5EAC
%% No History for this device
nx9500-6C8809#
```

## 6.1.27 file-sync

### ► *show commands*

Displays file synchronization settings and status on a controller

The *file-sync* command syncs *wireless-bridge certificate* and *trustpoint* between the staging-controller and its adopted access points. The *show > file-sync* command displays information related to this process.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
show file-sync [configuration|history|load-file-status|status] {on <DEVICE-OR-
DOMAIN-NAME>}
```

#### Parameters

- *show file-sync* [configuration|history|load-file-status|status] {on <DEVICE-OR-  
DOMAIN-NAME>}

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file-sync        | Displays the following file-synchronization (trustpoint and wireless-bridge certificate) related information: configuration, history, load-file-status, and status                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| configuration    | <p>Displays the following file-synchronization configuration details:</p> <ul style="list-style-type: none"> <li>• automatic file-syncing enabled or disabled. The default setting is disabled.</li> </ul> <p>The X.509 certificate needs synchronization only if the access point's radio2 is configured to use EAP-TLS authentication. In which case PKCS#12 certificate needs to be pushed on AP adoption. To enable automatic file syncing, in the controller's device/profile configuration mode, execute the <i>file-sync &gt; auto</i> command. For more information, see <i>file-sync</i>.</p> <ul style="list-style-type: none"> <li>• Number of access points to which the certificate can be simultaneously uploaded. The default is 10.</li> </ul> <p>To modify the number of simultaneous uploads, in the controller's device/profile configuration mode, execute the <i>file-sync &gt; count &lt;1-20&gt;</i> command. For more information, see <i>file-sync</i>.</p> |
| history          | Displays file synchronization history. Use this option to view statistical data relating to wireless-bridge certificate synchronization between staging controller and its access points. When executed, a list of all certificate transfers made to the APs is displayed, with the latest transfer listed at the top.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| load-file-status | <p>Displays the status of the file upload to the controller. Use this command to view the status of a in-progress certificate upload,</p> <p>For more information on initiating a PKCS#12 certificate upload, see <i>file-sync</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| status           | Displays status of the file synchronization between the controller and its adopted access point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                |

```

## 6.1.28 firewall

### ► *show commands*

Displays wireless firewall information, such as *Dynamic Host Configuration Protocol* (DHCP) snoop table entries, denial of service statistics, active session summaries, etc.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show firewall [dhcp|flows|neighbors]

show firewall dhcp snoop-table {on <DEVICE-NAME>}

show firewall flows {filter|management|on|stats|wireless-client}

show firewall flows {filter} {(dir|dst port <1-65535>|ether|flow-type|icmp|
icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)}

show firewall flows {management {on <DEVICE-NAME>}|stats {on <DEVICE-NAME>}|
wireless-client <MAC>|on <DEVICE-NAME>}

show firewall neighbors snoop-table {on <DEVICE-NAME>}
```

#### Parameters

- show firewall dhcp snoop-table {on <DEVICE-NAME>}

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| firewall dhcp snoop-table                                         | <p>Displays DHCP snoop table entries</p> <ul style="list-style-type: none"> <li>• snoop-table - Displays DHCP snoop table entries</li> </ul> <p>DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server. Snoop table entries contain MAC address, IP address, lease time, binding type, and interface information of non-trusted interfaces.</p> |
| on <DEVICE-NAME>                                                  | <p>The following keyword is common to the 'DHCP snoop table' and 'DoS stats' parameters:</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays snoop table entries, or DoS stats on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>             |
| firewall flows                                                    | <p>Notifies a session has been established</p>                                                                                                                                                                                                                                                                                                                          |
| filter                                                            | <p>Optional. Defines additional firewall flow filter parameters</p>                                                                                                                                                                                                                                                                                                     |
| dir [wired-wired wired-wireless wireless-wired wireless-wireless] | <p>Optional. Matches the packet flow direction</p> <ul style="list-style-type: none"> <li>• wired-wired - Wired to wired flows</li> <li>• wired-wireless - Wired to wireless flows</li> <li>• wireless-wired - Wireless to wired flows</li> <li>• wireless-wireless - Wireless to wireless flows</li> </ul>                                                             |

## 6.1.29 global

### ► *show commands*

Displays global information for network devices based on the parameters passed

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show global [device-list|domain]

show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}

show global domain managers
```

#### Parameters

- `show global device-list {filter {offline|online}}`

|                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| global device-list                                                                                                                                        | Displays global information for all network devices. Use the following keywords to specify additional filters: offline, online, and rf-domain.                                                                                                                                                                                                                                                                                                                                                                            |
| filter {offline online}                                                                                                                                   | Optional. Specifies additional filters <ul style="list-style-type: none"> <li>• offline - Optional. Displays global information for offline devices only</li> <li>• online - Optional. ## 6.1.30 gre

### ► *show commands*

Displays layer 2 *Generic Routing Encapsulation* (GRE) tunnel traffic flow information

GRE is one of the available tunneling mechanisms which uses IP as the transport protocol and can be used for carrying many different passenger protocols. The tunnels behave as virtual point-to-point links that have two endpoints identified by the tunnel source and tunnel destination addresses at each endpoint.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show gre info {detail} {(on <DEVICE-NAME>)}
```

#### Parameters

- show gre info {detail} {(on <DEVICE-NAME>)}

|                  |                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gre info         | Displays GRE tunnel information                                                                                                                                                                                                                                                                                                                                 |
| detail           | Optional. Displays GRE tunnel information in detail, such as tunnel state, tunnel's remote-end peer device's IP address, session ID of an operational tunnel, total number of packets received and transmitted through the tunnel, and the number of dropped packets during tunneled exchanges between access point and a peer at the remote end of the tunnel. |
| on <DEVICE-NAME> | Optional. Executes the command on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the access point, controller, or service platform.</li> </ul>                                                                                                                                                           |

#### Example

```
rfs6000-81742D#show gre info
Gre Tunnel info:
 Tunnel info not found
rfs6000-81742D#
```

## 6.1.31 guest-registration

### ► show commands

Displays information on the performance of clients using guest access permissions to obtain network resources within the WiNG network. The reporting timeline can be adjusted as needed, as can the RF Domain(s) and WLAN(s) used to filter and report guest client statistics.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
show guest-registration [age-range|backup-snapshots|browsers|client|devices|
gender|loyalty-app-status|notification-status|os|social|user-trends|visitors]
{on <DEVICE-NAME>}

show guest-registration backup-snapshots

show guest-registration [age-range|browsers|devices|gender|os|user-trends|
visitors] time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(rfdomain
<DOMAIN-NAME>|wlan <WLAN-NAME>)}

show guest-registration client [email|mac|member|mobile|name|time]

show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|member <MEMBER-
ID>|mobile <MOBILE-NUMBER>|name <NAME>]

show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|
30-Secs|5-Mins] {(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}

show guest-registration loyalty-app-status time [1-Day|1-Month|1-Week|2-Hours|
30-Mins|5-Hours|all] {rfdomain <RF-DOMAIN-NAME>|wlan <WLAN-NAME>}

show guest-registration notification-status

show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|
5-Hours|all] {(facebook|rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>|google)}
```

#### Parameters

- show guest-registration backup-snapshots

|                    |                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| guest-registration | Displays guest registration statistics based on the parameters passed                                                                                                                                                                                                                                                                                                        |
| backup-snapshots   | Displays a list of periodically backed up snapshots of the database. By default, the system maintains a snapshot of the database on a daily basis.<br><b>Note:</b> Use the <code>service &gt; guest-registration &gt; backup [delete/restore]</code> command to delete these snapshots and to restore deleted snapshots. For more information, see <a href="#">service</a> . |

- show guest-registration [age-range|browsers|devices|gender|os|user-trends|visitors] time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}

|                    |                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| guest-registration | Displays guest registration statistics based on the parameters and time entered. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view guest registration statistics for a specified RF Domain and/or WLAN. |
| age-range          | Displays the age ranges of logged guest users for a selected time period                                                                                                                                            |
| browsers           | Displays the browsers used by guest users logged in within a selected time period                                                                                                                                   |
| devices            | Displays the device types used by guest users logged in within a selected time period                                                                                                                               |

|                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gender                                                                                                                                                                                                   | Displays the gender of guest users logged in within a selected time period                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 6.1.32 interface

### ► show commands

Displays configured system interfaces and their status

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show interface {<INTERFACE-NAME>|brief|counters|ge|me1|port-channel|pppoe1|
switchport|vlan|wwan1}
```

```
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|
pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
```

#### Parameters

- show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}

|                    |                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface          | Optional. Displays system interface status based on the parameters passed                                                                                                                                                                                                                                                                                              |
| <INTERFACE-NAME>   | Optional. Displays status of the interface specified by the <INTERFACE-NAME> parameter. Specify the interface name.                                                                                                                                                                                                                                                    |
| brief              | Optional. Displays a brief summary of the interface status and configuration                                                                                                                                                                                                                                                                                           |
| counters           | Optional. Displays interface Tx or Rx counters                                                                                                                                                                                                                                                                                                                         |
| ge <1-4>           | Optional. Displays Gigabit Ethernet interface status and configuration <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Select the Gigabit Ethernet interface index from 1 - 4.</li> </ul>                                                                                                                                                                       |
| me1                | Optional. Displays Fast Ethernet interface status and configuration                                                                                                                                                                                                                                                                                                    |
| port-channel <1-2> | Optional. Displays port channel interface status and configuration <ul style="list-style-type: none"> <li>• &lt;1-2&gt; - Specify the port channel index from 1 - 2.</li> </ul>                                                                                                                                                                                        |
| pppoe1             | Optional. Displays PPP over Ethernet interface status and configuration                                                                                                                                                                                                                                                                                                |
| switchport         | Optional. Displays layer 2 interface status                                                                                                                                                                                                                                                                                                                            |
| vlan <1-4094>      | Optional. Displays VLAN interface status and configuration <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the <i>Switch Virtual Interface</i> (SVI) VLAN ID from 1 - 4094.</li> </ul>                                                                                                                                                               |
| wwan1              | Optional. Displays Wireless WAN interface status, configuration, and counters                                                                                                                                                                                                                                                                                          |
| on <DEVICE-NAME>   | The following keywords are common to all of the above interfaces: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays interface related information on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> |

**Example**

Following interfaces are available on a RFS6000 controller:

```
rfs6000-81742D(config)#show interface ?

WORD Interface name
brief Brief summary of interface status and configuration
counters Interface tx/rx counters
ge GigabitEthernet interface
me1 FastEthernet interface
on On AP/Controller
port-channel Port-Channel interface
pppoe1 PPP Over Ethernet interface
switchport Status of Layer2 interfaces
up1 WAN Ethernet interface
vlan Switch VLAN interface
wwan1 Wireless WAN interface

## 6.1.33 ip

### ► show commands

Displays IP related information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show ip [arp|bgp|ddns|default-gateways|dhcp|dhcp-vendor-options|domain-name|
extcommunity-list|igmp|interface|name-server|nat|ospf|route|routing]

show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}

show ip bgp {<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|paths|
prefix-list|regexp|route-map|state|summary}

show ip ddns bindings {on <DEVICE-NAME>}

show ip dhcp [binding|networks|status]
show ip dhcp binding {manual} {(on <DEVICE-NAME>)}
show ip dhcp [networks|status] {on <DEVICE-NAME>}

show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing]
{on <DEVICE-NAME>}

show ip extcommunity-list [<1-500>|<NAME>]

show ip igmp snooping [mrouter|querier|vlan]
show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}
show ip igmp snooping vlan <1-4095> {<IP>} {(on <DEVICE-NAME>)}

show ip interface {<INTERFACE-NAME>|brief|on}
show ip interface {<INTERFACE-NAME>|brief} {(on <DEVICE-NAME>)}

show ip nat translations verbose {on <DEVICE-NAME>}

show ip route {<INTERFACE-NAME>|ge|me1|on|port-channel|pppoe1|vlan|wan1}
show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|
pppoe1|wan1} {(on <DEVICE-NAME>)}

show ip ospf {border-router|interface|neighbor|on|route|state}
show ip ospf {border-router|neighbor|route|on|state} {on <DEVICE-NAME>}
show ip ospf {interface} {vlan|on}
show ip ospf {interface} {vlan <1-4094>} {(on <DEVICE-NAME>)}

```

**NOTE:** The show ip ospf command is also available under the 'profile' and 'device' modes.

#### Parameters

- show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}

|             |                                                                            |
|-------------|----------------------------------------------------------------------------|
| ip arp      | Displays <i>Address Resolution Protocol</i> (ARP) mappings                 |
| <VLAN-NAME> | Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name. |

|                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip route           | Displays route table details. The route tables use flags to distinguish between routes. The different flags are: <ul style="list-style-type: none"> <li>• C - Connected</li> <li>• G - Gateway</li> <li>• O - OSPF route</li> <li>• S - Static route</li> </ul> <b>Note:</b> Flags 'S' and 'O' identify static learned routes and dynamic learned routes respectively. |
| <INTERFACE-NAME>   | Optional. Displays route table details for a specified interface. Specify the interface name                                                                                                                                                                                                                                                                           |
| ge <1-4>           | Optional. Displays GigabitEthernet interface route table details <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Specify the GigabitEthernet interface index from 1 - 4.</li> </ul>                                                                                                                                                                             |
| me1                | Optional. Displays FastEthernet interface route table details                                                                                                                                                                                                                                                                                                          |
| port-channel <1-2> | Optional. Displays port channel interface route table details. Specify the port channel index from 1 - 2.                                                                                                                                                                                                                                                              |
| vlan <1-4094>      | Optional. Displays VLAN interface route table details. Select the VLAN interface ID from 1 - 4094.                                                                                                                                                                                                                                                                     |
| pppoe1             | Optional. Displays <i>Point-to-point Protocol over Ethernet</i> (PPPoE) interface route table details                                                                                                                                                                                                                                                                  |
| wwan1              | Optional. Displays Wireless WAN route table details                                                                                                                                                                                                                                                                                                                    |
| on <DEVICE-NAME>   | The following keywords are recursive and common to all of the above parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Displays route table details, based on the parameters passed, on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                |

```
• show ip ospf {border-router|interface|neighbor|route|on|state} {on <DEVICE-NAME>}
```

|                                                  |                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip ospf                                          | Displays overall OSPF information                                                                                                                                                                                                                                                                                                                |
| border-router                                    | Optional. Displays details of all the border routers connected                                                                                                                                                                                                                                                                                   |
| interface {on  vlan <1-4094>} {on <DEVICE-NAME>} | Optional. Displays details of all the interfaces with OSPF enabled <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays specified device details</li> <li>• vlan &lt;1-4094&gt; - Displays VLAN interface details</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP or wireless controller.</li> </ul> |
| neighbor                                         | Optional. Displays an OSPF neighbors list                                                                                                                                                                                                                                                                                                        |
| route                                            | Optional. Displays OFPS routes information                                                                                                                                                                                                                                                                                                       |
| on <DEVICE-NAME>                                 | Optional. Displays overall OSPF information on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                                                |
| state                                            | Optional. Displays an OSPF process state                                                                                                                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| on <DEVICE-NAME> | <p>The following keywords are recursive and common to all of the above parameters:</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays overall OSPF information, based on the parameters passed, on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config)#show ip arp
```

| IP            | MAC               | INTERFACE | TYPE    |
|---------------|-------------------|-----------|---------|
| 192.168.13.10 | 00-02-B3-28-D1-55 | vlan1     | dynamic |
| 192.168.13.13 | B4-C7-99-6C-88-09 | vlan1     | dynamic |

```

## 6.1.34 ip-access-list

► *show commands*

Displays IP access list statistics

**NOTE:** This command is not available in the USER EXEC Mode.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}
{ (on <DEVICE-NAME>)}
```

### Parameters

- show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>} { (on <DEVICE-NAME>)}

|                                 |                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip-access-list stats            | Displays IP access list statistics                                                                                                                                                                                                                                                                                                                                             |
| <IP-ACCESS-LIST-NAME>           | Optional. Displays statistics for a specified IP access list. Specify the IP access list name.                                                                                                                                                                                                                                                                                 |
| detail<br><IP-ACCESS-LIST-NAME> | Optional. Displays detailed statistics for a specified IP access list. Specify the IP access list name.                                                                                                                                                                                                                                                                        |
| on <DEVICE-NAME>                | The following keyword is recursive and common to the 'IP-ACCESS-LIST-NAME' and 'detail' parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays all or a specified IP access list statistics on a specified device.</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

### Example

```
rfs6000-81742D(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
 permit tcp any any eq ftp rule-precedence 1 Hitcount: 0
 permit tcp any any eq www rule-precedence 2 Hitcount: 4
 permit tcp any any eq ssh rule-precedence 3 Hitcount: 448
 permit tcp any any eq https rule-precedence 4 Hitcount: 0
 permit udp any any eq snmp rule-precedence 5 Hitcount: 0
 permit tcp any any eq telnet rule-precedence 6 Hitcount: 4
rfs6000-81742D(config)#
```

The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```
rfs4000-229D58(config)#ip access-list auto-tunnel-acl
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
permit ip host 200.200.200.99 any rule-precedence 3
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#
```

The following example displays the statistics for the 'auto-tunnel-acl' ACL:

```
rfs4000-229D58#show ip-access-list stats
IP Access-list: auto-tunnel-acl
 permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2 Hitcount: 0
 permit ip host 200.200.200.99 any rule-precedence 3 Hitcount: 0

rfs4000-229D58#

nx9500-6C8809#show ip-access-list stats scaleacl | i 125
 permit ip host 125.1.1.1 any rule-precedence 125 Hitcount: 893 Hardware
Hitcount: 3120
 permit ip host 125.2.1.1 any rule-precedence 346 Hitcount: 0 Hardware
Hitcount: 0
nx9500-6C8809#
```

## 6.1.35 ipv6

### ► show commands

Displays IPv6 related information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show ipv6 [default-gateways|delegated-prefix|dhcp|hop-limit|interface|mld|name-server|neighbors|route]

show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}

show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}

show ipv6 interface {<IF-NAME>|brief} {(on <DEVICE-NAME>)}

show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>]
{on <DEVICE-NAME>}

show ipv6 neighbors <VLAN-NAME> {(on <DEVICE-NAME>)}

show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|t1e1 <1-4> <1-1>|up|vlan <1-4095>|wwan1|xge} {(on <DEVICE-NAME>)}
```

#### Parameters

- show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}

|                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                              |

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route              | Displays IPv6 route table                                                                                                                                                                                                                                                                                                                 |
| <IF-NAME>          | Optional. Displays IPv6 route table for the interface identified by the <IF-NAME> keyword                                                                                                                                                                                                                                                 |
| ge <1-X>           | Optional. Displays IPv6 route table for the selected GigabitEthernet interface                                                                                                                                                                                                                                                            |
| me1                | Optional. Displays IPv6 route table for the FastEthernet interface                                                                                                                                                                                                                                                                        |
| port-channel <1-2> | Optional. Displays IPv6 route table for the selected port-channel interface                                                                                                                                                                                                                                                               |
| pppoe1             | Optional. Displays IPv6 route table for the PPP over Ethernet interface                                                                                                                                                                                                                                                                   |
| vlan <1-4095>      | Optional. Displays IPv6 route table for the selected VLAN interface                                                                                                                                                                                                                                                                       |
| up                 | Optional. Displays IPv6 route table for the WAN Ethernet interface                                                                                                                                                                                                                                                                        |
| wwan1              | Optional. Displays IPv6 route table for the wireless WAN interface                                                                                                                                                                                                                                                                        |
| xge <1-4>          | Optional. Displays IPv6 route table for the selected TenGigabitEthernet interface<br>Applicable only for the NX9500 and NX9510 service platforms.                                                                                                                                                                                         |
| on <DEVICE-NAME>   | This parameter is common to all of the above keywords. <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays the specified information on a device (access point, wireless controller, or service platform)</li> </ul> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

**Example**

```
rfs6000-81742D(config)#show ipv6 dhcp client received-options

## 6.1.36 ipv6-access-list

► *show commands*

Displays IPv6 access list statistics

**NOTE:** This command is not available in the USER EXEC Mode.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}
```

### Parameters

- `show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}`

|                         |                                                                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6-access-list stats  | Displays IPv6 access list statistics                                                                                                                                                                                                    |
| <IPv6-ACCESS-LIST-NAME> | Optional. Displays statistics for a specified IPv6 access list. Specify the IPv6 access list name.<br>If IPv6 ACL name is not provided, the system displays statistics for all ACLs configured and applied.                             |
| on <DEVICE-NAME>        | Optional. Displays all or a specified IPv6 access list statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

### Example

```

rfs6000-81742D#show ipv6-access-list stats
IPV6 Access-list: test
 deny ipv6 any any rule-precedence 20 Hitcount: 4
rfs6000-81742D#

```

## 6.1.37 l2tpv3

### ► show commands

Displays a *Layer 2 Tunnel Protocol Version 3 (L2TPV3)* session information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**NOTE:** This command is not available in the USER EXEC mode.

#### Syntax

```
l2tpv3 {on|tunnel|tunnel-summary}

l2tpv3 {on <DEVICE-NAME>}

l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>} {(on <DEVICE-NAME>)}

l2tpv3 {tunnel-summary} {down|on|up}
l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}
```

#### Parameters

- l2tpv3 {on <DEVICE-NAME>}

|                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l2tpv3<br>{on <DEVICE-NAME>}                                                                                                                                    | Displays a L2TPv3 tunnel and session details or summary <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays L2TPv3 information on a specified access point or wireless controller <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of AP, wireless controller, or service platform.</li> </ul> </li> </ul>                                                               |
| <ul style="list-style-type: none"> <li>• l2tpv3 {tunnel &lt;L2TPV3-TUNNEL-NAME&gt;} {session &lt;L2TPV3-SESSION-NAME&gt;} {(on &lt;DEVICE-NAME&gt;)}</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 6.1.38 lacp

► *show commands*

Displays *Link Aggregation Control Protocol* (LACP) related information

**NOTE:** For more information on enabling dynamic LACP, see *lacp*, *lacp-channel-group*, and *lacp*.

### Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show lacp [<1-4>|counters|details|sys-id]
```

```
show lacp <1-4> ([counters|details])
```

```
show lacp sys-id
```

### Parameters

- `show lacp <1-4> ([counters|details])`

|                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show lacp <1-4>                                                                   | Shows the LACP related information for a specified port-channel or all port-channels using LACP <ul style="list-style-type: none"> <li>• &lt;1-4&gt; – Select the port-channel index number from 1 - 4. Note, LACP is supported only on the NX5500, NX7500, and NX9500 model service platforms. However, the NX9500 series service platforms support only two (2) port-channels. Where as the other model service platforms support four (4) port-channels.</li> </ul> <p>If the port-channel index number is not specified, the system displays LACP counters and details for all port-channels configured on the device.</p> |

## 6.1.39 ldap-agent

### ► show commands

Displays an LDAP agent's join status (join status to a LDAP server domain)

Use this command When LDAP is specified the external resource (as opposed to local RADIUS resources) to validate PEAP-MS-CHAP v2 authentication requests, user credentials, and password information needs to be made available locally to successfully connect to the external LDAP server. Up to two LDAP Agents (primary and secondary external resources) can be defined as external resources for PEAP-MS-CHAP v2 authentication requests.

**NOTE:** This command is not available in the USER EXEC Mode.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show ldap-agent join-status {on <DEVICE-NAME>}
```

### Parameters

- show ldap-agent join-status {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ldap-agent       | Displays LDAP agent related configuration                                                                                                                                                                                                                                                 |
| join-status      | Displays if the LDAP agent has successfully joined a LDAP server's domain                                                                                                                                                                                                                 |
| on <DEVICE-NAME> | Optional. Displays if the LDAP agent has successfully joined a specified LDAP server's domain. <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the device running the LDAP server (access point, wireless controller, or service platform).</li> </ul> |

### Example

```
rfs6000-81701D#show ldap-agent join-status
Primary LDAP Server's agent join-status : Joined domain TEST.

Secondary LDAP Server's agent join-status : Not Configured
rfs6000-81701D#
```

## 6.1.40 licenses

### ► *show commands*

Displays installed licenses and usage information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show licenses {borrowed|lent}
```

#### Parameters

- `show licenses {borrowed|lent}`

|                             |                                                                                                                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| licenses<br>{borrowed lent} | <p>Displays installed licenses and usage information</p> <ul style="list-style-type: none"> <li>• borrowed – Optional. Displays information on licenses borrowed</li> <li>• lent – Optional. Displays information on licenses lent</li> </ul> |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Usage Guidelines

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, access points and adaptive access points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:

- AP/AAP license packs installed on the NOC controller only.  
The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.
- AP/AAP license packs installed on the NOC and site controllers.  
The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NOC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.
- AP/AAP license packs installed on one controller within a cluster.  
The site controller shares its installed and borrowed licenses with other cluster controllers.

**Example**

```
rfs4000-229D58#show licenses
Serial Number : 9184521800027

Device Licenses:
 AP-LICENSE
 String : DEFAULT-6AP-LICENSE
 Value : 6
 Borrowed : 0
 Total : 6
 Used : 0
 AAP-LICENSE
 String :
 Value : 0
 Borrowed : 0
 Total : 0
 Used : 0
 ADVANCED-SECURITY
 String : DEFAULT-ADV-SEC-LICENSE
rfs4000-229D58#
```

The following example shows the show > licenses command output on a NOC controller:

```
nx9500-6C8809#show licenses
Serial Number : B4C7996C8809

Device Licenses:
 AP-LICENSE
 String :
 Value : 0
 Lent : 0
 Total : 0
 Used : 0
 AAP-LICENSE
 String :
 Value : 10250
 Lent : 0
 Total : 10250
 Used : 7
 HOTSPOT-ANALYTICS
 String :
 Value : 66069c24b3bb1259eb36826cab3cc83999dd408f0ff891e74b62b2d3594f0b3dde7967f30e49e497
66069c24b3bb1259b34ff016c723a9e299dd408f0ff891e7c5f7e279a382648397d6b3e975e356a1
 Value : 10250
 Lent : 0
 Total : 10250
 Used : 7

Total Licenses Including Licenses in Adopted Controllers:
 AP-LICENSE
 Value : 14
 Used : 1
 AAP-LICENSE
 Value : 10250
 Used : 7
nx9500-6C8809#
```

In the following example, the 'VALIDITY(HRS)' column specifies the validity period, in days and hours, of a lent license. On a NOC controller, a 'VALIDITY(HRS)' value of 'current' implies that the site controller is currently adopted. Whereas, a numerical 'VALIDITY(HRS)' value indicates the days and hours the lent license is valid for a site controller that is not reachable.

```
nx9500-6C8809#show licenses lent

MAC HOST-NAME TYPE LENT BORROWER-MAC BORROWER-
HOST-NAME VALIDITY

B4-C7-99-6C-88-09 nx9500-6C8809 AAP 5 00-15-70-81-74-2D rfs6000-
81742D current
B4-C7-99-6C-88-09 nx9500-6C8809 AAP 9 B4-C7-99-6D-CD-4B rfs7000-
6DCD4B 97 days, 21 hours

nx9500-6C8809#
```

```
rfs4000-881E4B#show licenses borrowed

MAC HOST-NAME TYPE BORROWED VALIDITY

00-15-70-37-FD-89 rfs7000-37FD89 AAP 2 99 days, 23 hours
00-15-70-81-70-1D rfs6000-81701D AP 1 99 days, 23 hours

rfs4000-881E4B#
```

The following examples show the 'show > licenses' output on the devices participating in the process:

```
nx9500-6C8809>show licenses lent

MAC HOST-NAME TYPE LENT BORROWER-MAC BORROWER-
HOST-NAME VALIDITY

B4-C7-99-6C-88-09 nx9500-6C8809 AAP 1 00-15-70-81-74-2D rfs6000-

rfs6000-81742D(config)#
```

## 6.1.41 lldp

### ► show commands

Displays *Link Layer Discovery Protocol* (LLDP) information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show lldp [neighbors|report]
show lldp neighbors {on <DEVICE-NAME>}
show lldp report {detail|on}
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

#### Parameters

- show lldp neighbors {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lldp             | Displays an LLDP neighbors table or aggregated LLDP neighbors table                                                                                                                                              |
| neighbors        | Displays an LLDP neighbors table                                                                                                                                                                                 |
| on <DEVICE-NAME> | Optional. Displays an LLDP neighbors table on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

- show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}

|                            |                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lldp                       | Displays an LLDP neighbors table or aggregated LLDP neighbors table                                                                                                                                                                                                                                                                                                               |
| report detail              | Displays an aggregated LLDP neighbors table <ul style="list-style-type: none"> <li>• detail - Optional. Displays detailed aggregated LLDP neighbors table</li> </ul> <p><b>Note:</b> If the 'on' keyword is used without the 'detail' keyword, the system displays LLDP neighbors table summary on the specified device or RF Domain.</p>                                         |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to the 'report detail' parameter: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Displays an aggregated LLDP neighbors table on a specified device or RF Domain</li> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

#### Example

```
nx9500-6C8809#show lldp neighbors

Chassis ID: 00-18-71-D0-0B-00
System Name: TechPubs-ProCurve-Switch
Platform: ProCurve J8697A Switch 5406z1, revision K.12.1X, ROM K.11.03 (/sw/code/build/btm(sw_esp1))
Capabilities: Bridge Router
Enabled Capabilities: Bridge
Local Interface: gel, Port ID(Port Description) (outgoing port): 5(A5)
TTL: 113 sec
Management Addresses: 192.168.13.40
nx9500-6C8809#
```

## 6.1.42 logging

### ► *show commands*

Displays the network's activity log

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show logging {on <DEVICE-NAME>}
```

#### Parameters

- show logging {on <DEVICE-NAME>}

|                               |                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging<br>{on <DEVICE-NAME>} | <p>Displays logging information on a specified device</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Executes the command on a specified device.</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809#show logging
```

```
Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: disabled
Buffered logging: level warnings
Syslog logging: level warnings

## 6.1.43 mac-access-list

► *show commands*

Displays MAC access list statistics

**NOTE:** This command is not present in USER EXEC mode.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>|on}
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>) }
```

### Parameters

- `show mac-access-list stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>) }`

|                       |                                                                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-access-list stats | Displays MAC access list statistics                                                                                                                                                                                                    |
| <MAC-ACCESS-LIST>     | Optional. Displays statistics for a specified MAC access list. Specify the MAC access list name.<br><b>Note:</b> The system displays all configured ACL statistics if no ACL name is specified.                                        |
| on <DEVICE-NAME>      | Optional. Displays all or a specified MAC access list statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

### Example

```
nx9500-6C8809#show mac-access-list stats scalemacacl | i 311
 permit D0-67-E5-3F-C0-00 FF-FF-FF-FF-F0-00 host 00-1E-EC-F2-0A-76 rule-
precedence 311 Hitcount: 0 Hardware Hitcount: 0
nx9500-6C8809#
```

## 6.1.44 mac-address-table

### ► *show commands*

Displays MAC address table entries

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show mac-address-table {on <DEVICE-NAME>}
```

#### Parameters

- `show mac-address-table {on <DEVICE-NAME>}`

|                   |                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-address-table | Displays MAC address table entries                                                                                                                                                                                 |
| on <DEVICE-NAME>  | Optional. Displays MAC address table entries on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
rfs6000-81742D(config)#show mac-address-table
```

```

## 6.1.45 mac-auth

### ► show commands

Displays details of wired ports that have MAC address authentication enabled

Use this command to view MAC authentication configuration and authentication state. The command displays the current authentication state of the wired host, the authorization state of the Ge1 port, and the wired hosts' MAC address. The port status displays as *Authorized* if the wired host has successfully authenticated and *Not Authorized* if the wired host has not authenticated or has failed MAC authentication.

For more information on enabling MAC address authentication on a wired port, see [mac-auth](#).

#### Supported in the following platforms:

- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
show mac-auth {all|interface|on}
```

```
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|xge <1-4>]} { (on <DEVICE-NAME>)}
```

#### Parameters

- show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|xge <1-4>]} { (on <DEVICE-NAME>)}

|                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-auth                                                                                  | Displays MAC authentication related information for all interfaces or all interfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| all                                                                                       | Optional. Displays MAC authentication related information for all interfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| interface<br>[<INTERFACE-NAME> ge <1-5> port-channel <1-3> t1e1 <1-4> up <1-2> xge <1-4>] | Optional. Displays MAC authentication related information for a specified interface. Specify the interface using one of the following options: <ul style="list-style-type: none"> <li>• &lt;INTERFACE-NAME&gt; - Selects the interface identified by the &lt;INTERFACE-NAME&gt; keyword</li> <li>• ge &lt;1-5&gt; - Selects the GigabitEthernet interface identified by the index number</li> <li>• port-channel &lt;1-3&gt; - Selects the port channel interface identified by the index number</li> <li>• t1e1 &lt;1-4&gt; - Selects the layer 2 interface (Ethernet port)</li> <li>• up &lt;1-2&gt; - Selects the WAN Ethernet interface identified by the index number</li> <li>• xge &lt;1-4&gt; - Selects the TenGigabitEthernet interface identified by the index number</li> </ul> |
| on <DEVICE-NAME>                                                                          | The following keywords are common to the 'all' and 'interface' parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. ## 6.1.46 mac-auth-clients

### ► show commands

Displays MAC authenticated clients

#### Supported in the following platforms:

- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
show mac-auth-clients [all|interface]
```

```
show mac-auth-clients all {on <DEVICE-NAME>}
```

```
show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|xge <1-4>}
```

#### Parameters

- show mac-auth-clients all {on <DEVICE-NAME>}

|                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Example**

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show mac-auth-clients interface ge
1

MAC STATE INTERFACE

Total number of MACs displayed: 0
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

## 6.1.47 mint

### ► show commands

Displays MiNT protocol related statistics

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show mint [config|dis|id|info|known-adopters|links|lsp|lsp-db|mlcp|neighbors|
route|stats|tunnel-controller|tunneled-vlans]

show mint [config|id|info|known-adopters|route|stats|tunneled-vlans] {on <DEVICE-
NAME>}

show mint [dis|links|neighbors|tunnel-controller] {details} {(on <DEVICE-NAME>)}

show mint lsp

show mint lsp-db {details <MINT-ADDRESS>} {(on <DEVICE-NAME>)}

show mint mlcp {history} {(on <DEVICE-NAME>)}
```

#### Parameters

- show mint [config|id|info|known-adopters|route|stats|tunneled-vlans] {on <DEVICE-NAME>}

## 6.1.48 nsight

► *show commands*

Displays NSight related information and also displays the database server status (reachable or not)

### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

### Syntax

```
show nsight status
```

### Parameters

- show nsight status

|        |                                                                                                                                                                                                                                                                                                                                                                           |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight | <p>Displays the NSight module related status, such as:</p> <ul style="list-style-type: none"> <li>• NSight is enabled or not on the device</li> <li>• NSight report and aggregation daemon is running or not</li> <li>• NSight alarm daemon is running or not</li> <li>• NSight server daemon is running or not</li> <li>• Database server is reachable or not</li> </ul> |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Example

```
nx9500-6C8809(config)#show nsight status
Nsight is enabled
Nsight report and aggregation daemon is running
Nsight alarm daemon is running
Nsight server daemon is running
Database server is local
Database server is reachable
nx9500-6C8809(config)#
```

## 6.1.49 ntp

### ► show commands

Displays *Network Time Protocol* (NTP) information. NTP enables clock synchronization within a network.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show ntp [associations|status]
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]
```

#### Parameters

- show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ntp associations<br>{detail on}  | <p>Displays existing NTP associations. The interaction between the controller or service platform and a SNTP server constitutes an association. SNTP associations are of two kinds:</p> <ul style="list-style-type: none"> <li>- peer associations - where a controller or service platform synchronizes to another system or allows another system to synchronize to it, or</li> <li>- server associations - where only the controller or service platform synchronizes to the SNTP resource, not the other way around.</li> </ul> <ul style="list-style-type: none"> <li>• detail - Optional. Displays detailed NTP associations <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays NTP associations on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> </li> </ul> <p><b>Note:</b> If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.</p> |
| ntp status<br>{on <DEVICE-NAME>} | <p>Displays the performance (status) information relative to the NTP association status. Use this command to view the access point, controller, or service platform's current NTP resource.</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays NTP association status on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Example**

```

nx9500-6C8809#show ntp associations

STATUS NTP SERVER IP ADDR REF CLOCK IP ADDR STRATUM WHEN POLL REACH
DELAY OFFSET DISPERSION

~ 12.12.12.12 INIT 16 - 1024 0 0.0
0.0 15937.5
~ 11.11.11.11 INIT 16 - 1024 0 0.0
0.0 15937.5

STATUS Notation: * master (syncd), # master (unsyncd), + selected, - candidate,
~ configured
nx9500-6C8809#

nx9500-6C8809#show ntp status

ITEM VALUE

Leap Clock is unsynchronized
Stratum 16
Reference INIT
Frequency 0.0000 Hz
Precision 2^-20
Reference time 00000000.00000000 (Feb 07 11:58:16 UTC 2036)
Clock Offset 0.000 msec
Root delay 0.000 msec
Root Dispersion 0.000 msec

nx9500-6C8809#

```

## 6.1.50 password-encryption

### ► *show commands*

Displays password encryption status (enabled/disabled)

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show password-encryption status
```

#### Parameters

- show password-encryption status

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| password-encryption status | Displays password encryption status (enabled/disabled) |
|----------------------------|--------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#show password-encryption status
Password encryption is enabled
rfs6000-81742D(config)#
```

## 6.1.51 pppoe-client

### ► show commands

Displays *Point-to-Point Protocol over Ethernet* (PPPoE) client information

Use this command to view PPPoE statistics derived from access to high-speed data and broadband networks. PPPoE uses standard encryption, authentication, and compression methods as specified by the PPPoE protocol. PPPoE enables point-to-points connection to an ISP over existing Ethernet interface.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

#### Parameters

- show pppoe-client [configuration|status] {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pppoe-client     | Displays PPPoE client information (configuration and status)                                                                                                                                                                                                                                                                                             |
| configuration    | Displays detailed PPPoE client configuration                                                                                                                                                                                                                                                                                                             |
| status           | Displays detailed PPPoE client status                                                                                                                                                                                                                                                                                                                    |
| on <DEVICE-NAME> | The following keywords are common to 'configuration' and 'status' parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays detailed PPPoE client status or configuration on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
nx9500-6C8809#show pppoe-client configuration
 PPPoE Client Configuration:
+-----+
| Mode : Disabled
| Service Name :
| Auth Type : pap
| Username :
| Password : fJx50+5duPjaOaPuXmtLDQAAAAAmvgEXcQ1+eUK4ByHK4aRi
| Idle Time : 600
| Keepalive : Disabled
| Local n/w : vlan1
| Static IP : __wing_internal_not_set__
| MTU : 1492
+-----+

nx9500-6C8809#
```

## 6.1.52 privilege

### ▶ *show commands*

Displays a device's existing privilege level

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
show privilege
```

#### **Parameters**

None

#### **Example**

```
rfs6000-81742D(config)#show privilege
Current user privilege: superuser
rfs6000-81742D(config)#
```

## 6.1.53 radius

### ► *show commands*

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server

Every captive portal guest user can access the captive portal for a specified duration. This results in following three scenarios:

- Scenario 1: Access duration not specified (in this case the default of 1440 minutes is applied)
- Scenario 2: Access duration is specified and is greater than 0
- Scenario 3: Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged.

But the access time remaining varies. It is calculated as follows:

- Scenarios 1 & 2 - It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- Scenario 3 - It is the time until user account expiration

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show radius [guest-users|server]

show radius guest-users {brief|<GUEST-USER-NAME>}

show radius server
```

#### Parameters

- `show radius guest-users {brief|<GUEST-USER-NAME>}`

|                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>radius guest-users {brief &lt;GUEST- USER-NAME&gt;}</pre> | <p>Displays RADIUS server's guest user's access details: total time for which the user has logged in, and the amount of access time remaining.</p> <ul style="list-style-type: none"> <li>• <code>brief</code> - Displays the total number of guest users provided RADIUS access</li> <li>• <code>&lt;GUEST-USER-NAME&gt;</code> - Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once.</li> </ul> <p>Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, configured and current bandwidths (for both downlink and uplink), time configured, and time remaining.</p> <p>Contd..</p> |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <p>If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as 'unlimited'. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user's account).</p> <p><b>Note:</b> For more information on configuring bandwidth-based and time-based vouchers, see <a href="#">user</a>.</p> |
|                    | <ul style="list-style-type: none"> <li>• show radius server</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| show radius server | Displays RADIUS server related statistical data                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Example**

```
rfs4000-229D58#show radius guest-users
 TIME (min:sec)
 USED REMAINING GUEST USER
 0:00 9:00 time9
 0:00 5:00 time5
 0:00 15:00 time15
 0:00 305416:35 notime
 2:31 7:29 time10
rfs4000-229D58#
```

The following example shows a RADIUS user pool with guest users having bandwidth-based, time-based, bandwidth and time based, and no bandwidth or time based vouchers:

```
rfs4000-229D58(config-captive-portal-wdws)#show context
radius-user-pool-policy wdws
 user time and data password 0 both group wdws guest expiry-time 12:00 expiry-
 date 12/31/2015 access-duration 8000 data-limit 500 committed-downlink 3000
 committed-uplink 2000 reduced-downlink 1000 reduce4
 user neither password 0 nine group wdws guest expiry-time 12:00 expiry-date
 12/31/2015
 user data only password 0 data group wdws guest expiry-time 12:00 expiry-date
 12/31/2015 data-limit 125 committed-downlink 1000 committed-uplink 800
 reduced-downlink 500 reduced-uplink 400
rfs4000-229D58(config-captive-portal-wdws)#
```

The following example shows the captive portal access details for the above mentioned RADIUS user pool users:

```
rfs4000-229D58(config-captive-portal-wdws)#show radius guest-users

 Current time: 17:15:07
rfs4000-229D58(config-captive-portal-wdws)#
```

## 6.1.54 reload

► *show commands*

Displays scheduled reload information for a specific device

**NOTE:** This command is not present in the USER EXEC mode.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

### Parameters

- show reload {on <DEVICE-OR-DOMAIN-NAME>}

|                                        |                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reload<br>{on <DEVICE-OR-DOMAIN-NAME>} | <p>Displays scheduled reload information for a specified device</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Optional. Displays configuration on a specified device</li> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Example

```
rfs6000-81742D(config)#show reload
No reload is scheduled.
rfs6000-81742D(config)#
```

## 6.1.55 rf-domain-manager

### ► *show commands*

Displays RF Domain manager selection details

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

- show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}

|                            |                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rf-domain-manager          | Displays RF Domain manager selection details                                                                                                                                                                                                                |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays RF Domain manager selection details on a specified device or domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

#### Example

```
nx9500-6C8809#show rf-domain-manager
RF Domain TechPubs
RF Domain Manager:
 ID: 19.6C.88.09
Controller Managed
Device under query:
 Priority: 220
 Has IP MiNT links
 Has wired MiNT links
nx9500-6C8809#
```

## 6.1.56 role

### ► *show commands*

Displays role based firewall information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}
```

#### Parameters

- show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

|                       |                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| role ldap-stats       | Displays LDAP server status and statistics                                                                                                                                                                                                                                                                                                                  |
| role wireless-clients | Displays clients associated with roles                                                                                                                                                                                                                                                                                                                      |
| on <DEVICE-NAME>      | <p>The following parameters are common to the 'ldap-stats' and 'wireless-clients' keywords:</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays clients associated with roles on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, and service platform.</li> </ul> |

#### Example

```
nx9500-6C8809(config)#show role wireless-clients
No ROLE statistics found.
nx9500-6C8809(config)#
```

## 6.1.57 route-maps

### ► *show commands*

Displays route map statistics for defined device routes

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show route-maps {on <DEVICE-NAME>}
```

#### Parameters

- `show route-maps {on <DEVICE-NAME>}`

|                  |                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-maps       | Displays configured route map statistics for all defined routes<br>For more information on route maps, see <a href="#">route-map</a> .                                                                        |
| on <DEVICE-NAME> | Optional. Displays route map statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
nx9500-6C8809(config)#show route-maps
nx9500-6C8809(config)#
```

## 6.1.58 rtls

### ► show commands

Displays *Real Time Location Service* (RTLS) statistics for access points contributing locationing information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show rtls [aeroscout|ekahau|omnitrail] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

#### Parameters

```
• show rtls [aeroscout|ekahau|omnitrail] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rtls                       | Displays access point RTLS statistics                                                                                                                                                                                                                                                                                                                                                       |
| aeroscout                  | Displays access point Aeroscout statistics                                                                                                                                                                                                                                                                                                                                                  |
| ekahau                     | Displays access point Ekahau statistics                                                                                                                                                                                                                                                                                                                                                     |
| omnitrail                  | Displays access point Omnitrail statistics                                                                                                                                                                                                                                                                                                                                                  |
| <MAC/HOSTNAME>             | Optional. Displays Aeroscout or Ekahau statistics for a specified access point. Specify the MAC address or hostname of the access point.                                                                                                                                                                                                                                                    |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to 'Aeroscout' and 'Ekahau' parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain.</li> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

#### Example

```
rfs4000-229D58(config)#show rtls aeroscout

Aeroscout Engine IP: 0.0.0.0 Port: 0
Send Count : 0
Recv Count : 0
Tag Reports : 0
Nacks : 0
Acks : 0
Lbs : 0
AP Status : 0
AP Notif : 0
Send Err : 0
Errmsg Count : 0

Total number of APs displayed: 1
rfs4000-229D58(config)#
```

```
ap8533-84A224##show rtls omnitrail
Engine IP: 157.235.90.41
Control Port: 8890
Otls 2.4 GHz Engine status: CONNECTED
Otls 5 GHz Engine status: CONNECTED
Data Port configured for forwarding 2.4GHz Radio detected beacons: 8888
Data Port configured for forwarding 5GHz Radio detected beacons:8889
Heart beats sent for 2.4GHz Port : 1
Heart beats sent for 5GHz Port : 0
Beacon tags received on 2.4GHz Radio and forwarded: 6883
Beacon tags received on 5GHz Radio and forwarded: 0
Beacon tags received on Sensor Radio (2.4GHz Band) and forwarded: 5187
Beacon tags received on Sensor Radio (5Ghz Band) and forwarded: 0
Total number of APs displayed: 1
ap8533-84A224#
```

## 6.1.59 running-config

### ► *show commands*

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show running-config {aaa-policy|application|application-group|

## 6.1.60 session-changes

### ► *show commands*

Displays configuration changes made in the current session

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
show session-changes
```

#### **Parameters**

None

#### **Example**

```
rfs6000-81742D(config)#show session-changes
No changes in this session
rfs6000-81742D(config)#
```

## 6.1.61 session-config

### ► *show commands*

Lists active open sessions on a device

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show session-config {exclude-devices|include-factory}
```

#### Parameters

- `show session-config {exclude-devices|include-factory}`

|                                                              |                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>session-config {exclude-devices  include-factory}</pre> | <p>Displays current session configuration</p> <ul style="list-style-type: none"> <li>• <code>exclude-devices</code> - Optional. Excludes device configuration details from the output</li> <li>• <code>include-factory</code> - Optional. Includes factory defaults</li> </ul> |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.1.62 sessions

### ► *show commands*

Displays CLI sessions initiated on a device

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show sessions all {on <DEVICE-NAME>}
```

#### Parameters

- `show sessions all {on <DEVICE-NAME>}`

|                  |                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sessions         | Displays CLI sessions initiated on a device                                                                                                                                                                                                                             |
| all              | Displays all sessions including internal                                                                                                                                                                                                                                |
| on <DEVICE-NAME> | Optional. This is a recurring keyword and is common to the 'all' parameter. Displays CLI sessions on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
nx9500-6C8809#show sessions
INDEX COOKIE NAME START TIME FROM ROLE
1 2 snmp 2017-06-02 14:31:23 127.0.0.1 superuser
2 3 snmp2 2017-06-02 14:31:23 127.0.0.1 superuser
3 18 admin 2017-06-06 10:38:36 192.168.13.17 superuser

nx9500-6C8809#
```

## 6.1.63 site-config-diff

### ► *show commands*

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show site-config-diff <SITE-NAME>
```

#### Parameters

- `show site-config-diff <SITE-NAME>`

|                                 |                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------|
| site-config-diff<br><SITE-NAME> | Displays the configuration difference for the specified site<br>• <SITE-NAME> - Specify the site name. |
|---------------------------------|--------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C874D#show site-config-diff 5C-0E-8B-18-06-F4
---- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs6000 5C-0E-8B-18-06-F4
interface pppoe1
 no shutdown
nx9500-6C874D#
```

## 6.1.64 smart-rf

### ► *show commands*

Displays *Self-Monitoring At Run Time* (Smart RF) statistical history to assess adjustments made to device configurations to compensate for detected coverage holes or device failures

When invoked by an administrator, Smart RF instructs access point radios to change to a specific channel and begin beaconing using the maximum available transmit power. Within a well-planned deployment, any RF Domain member access point radio should be reachable by at least one other radio. Smart RF records signals received from its neighbors as well as signals from external, un-managed radios. AP-to-AP distance is recorded in terms of signal attenuation. The information from external radios is used during channel assignment to minimize interference.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show smart-rf [ap|channel-distribution|history|history-timeline|interfering-ap|
interfering-neighbors|radio]

show smart-rf ap {<MAC>|<DEVICE-NAME>} [activity|energy|neighbors|on <DOMAIN-NAME>]

show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}

show smart-rf ap (activity|energy|neighbors) [<MAC>|<DEVICE-NAME>] {(on <DOMAIN-
NAME>)}

show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}

show smart-rf radio {<MAC>|activity|all-11an|all-11bgn|channel|energy|neighbors|
on <DOMAIN-NAME>}

show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}

show smart-rf radio {activity|neighbors} {<MAC>|all-11an|all-11bgn} {on <DOMAIN-
NAME>}

show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>}|on <DOMAIN-NAME>}

show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>}|on <DOMAIN-NAME>}
threshold <50-100>}
```

#### Parameters

- show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}

|                  |                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smart-rf         | Displays Smart RF related information                                                                                                                               |
| ap               | Displays access point related Smart RF information                                                                                                                  |
| <MAC>            | Optional. Uses MAC addresses to identify access points. Displays all access points, if no MAC address is specified.                                                 |
| <DEVICE-NAME>    | Optional. Uses an administrator defined name to identify an access point                                                                                            |
| on <DOMAIN-NAME> | Optional. Displays access point details on a specified RF Domain <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; – Specify the domain name.</li> </ul> |

- `show smart-rf ap (activity|energy|neighbors) [<MAC>|<DEVICE-NAME>] { (on <DOMAIN-NAME> ) }`

|                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| channel-distribution                                                                                                                                    | Displays Smart RF channel distribution information. This provides an overview of how RF Domain member devices are utilizing different channels to optimally support connect devices and avoid congestion and interference with neighboring devices. Assess whether the channel spectrum is being effectively utilized and whether channel changes are warranted to improve RF Domain member device performance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| threshold <50-100>                                                                                                                   | Optional. Specifies the maximum attenuation threshold of interfering neighbors. <ul style="list-style-type: none"> <li>• &lt;50-100&gt; - Specify a value from 50 -100 dB.</li> </ul> Attenuation is a measure of the reduction of signal strength during transmission. Attenuation is the opposite of amplification, and is normal when a signal is sent from one point to another. If the signal attenuates too much, it becomes unintelligible. Attenuation is measured in decibels. |
| on <DOMAIN-NAME>                                                                                                                     | Optional. Displays radio activity of all radios within a specified RF Domain <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; - Specify the RF Domain name.</li> </ul>                                                                                                                                                                                                                                                                                                      |

**Example**

```
rfs6000-81742D(config)#show smart-rf calibration-status
No calibration currently in progress
rfs6000-81742D(config)#

rfs6000-81742D(config)#show smart-rf history

 TIME EVENT DESCRIPTION

Total number of history entries displayed: 0
rfs6000-81742D(config)#
```

## 6.1.65 spanning-tree

### ► show commands

Displays spanning tree utilization information

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show spanning-tree mst {configuration|detail|instance|on <DEVICE-NAME>}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface|on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|port-
channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} {(on
<DEVICE-NAME>) }
```

#### Parameters

- show spanning-tree mst {configuration} {(on <DEVICE-NAME>) }

## 6.1.66 startup-config

### ► *show commands*

Displays complete startup configuration script

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show startup-config {include-factory}
```

#### Parameters

- show startup-config {include-factory}

|                 |                                                                                                           |

## 6.1.67 t5

### ► *show commands*

Displays adopted T5 controller statistics

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7510, NX7520, NX9500, NX9510, NX9600, VX9000

**NOTE:** This command is applicable only on WiNG controllers with adopted and managed T5 controllers.

#### Syntax

```
show t5 [boot|clock|cpe|interface|mac|system|temperature|uptime|version|
wireless] {on <T5-DEVICE-NAME>}

show t5 [boot|clock|system|temperature|uptime|version] {on <T5-DEVICE-NAME>}

show t5 cpe [address|boot|ether port status|led|reset|system|uptime|version] {on
<T5-DEVICE-NAME>}

show t5 interface [dsl|fe|ge|radio]

show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization] {on
<T5-DEVICE-NAME>}

show t5 interface dsl custom [avg|dses|dsses|peak|uses|usses] {on <T5-DEVICE-
NAME>}

show t5 interface radio [stats|status|wlam-map] {on <T5-DEVICE-NAME>}

show t5 mac table [filter name [dsl<1-24>|ge <1-2>|vlan <1-4094>|wlan <1-24>] {on
<T5-DEVICE-NAME>}]

show t5 wireless [client|wlan]

show t5 wireless client {filter name [association-status|authentication-
status|bss|mac-address|retry-percentage|rssi-value]} {on <T5-DEVICE-NAME>}

show t5 wireless wlan counters [qos|rate|size] {on <T5-DEVICE-NAME>}
```

#### Parameters

- `show t5 [boot|clock|system|temperature|uptime|version] {on <T5-DEVICE-NAME>}`

|             |                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|
| t5          | Displays adopted T5 controller statistics                                                                                              |
| boot        | Displays the T5 device's boot details. Use this option to view the primary and secondary image files available to use for booting up.  |
| clock       | Displays the T5 controller's system time, as reported from the controller itself or its remote NTP time resource                       |
| system      | Displays T5 controller's system information, which includes the T5 controller's hostname, MAC address, RF Domain, system clock, uptime |
| temperature | Displays T5 controller's current temperature                                                                                           |
| uptime      | Displays the T5 controller's uptime (the time it has been actively deployed and operational)                                           |

|                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| dsl                                                                                                      | <p>Selects A T5 controller's DSL interface.</p> <p>A T5 controller uses the operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <p>radio<br/>[stats status wlan-map]</p>                                             | <p>Displays following radio interface related information:</p> <ul style="list-style-type: none"> <li>• stats – Displays T5 radio interface statistics. A T5 controller uses the operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the operating system. Use this option to view the following: <ul style="list-style-type: none"> <li>• name – The administrator assigned name of each listed CPE radio as its unique identifier</li> <li>• Rx (Kbps) – The listed CPE radio’s receive data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.</li> <li>• Rx Octets – The number of octets (bytes) received with no errors by the listed T5 controller managed CPE radio.</li> <li>• Rx Packets – The number of data packets received for the listed T5 managed CPE radio since this screen was last refreshed.</li> <li>• Tx (Kbps) – The listed CPE radio’s transmit data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.</li> <li>• Tx Octets – Displays the number of octets (bytes) transmitted with no errors by the listed T5 controller managed CPE radio.</li> <li>• Tx Packets – The number of data packets transmitted from the listed T5 managed CPE radio since this screen was last refreshed.</li> </ul> </li> </ul> <p>Contd..</p> |

### Example

The following examples are for show commands executed on the 't5-ED7C6C' controller adopted by the 'nx9500-6C8809' wireless controller:

```
nx9500-6C8809(config)#show t5 boot on t5-ED7C6C
Primary Version: 5.4.2.0-010R
Secondary Version: 5.4.2.0-006B
Next Boot: Primary
Upgrade Status: none
Upgrade Progress %: 0
nx9500-6C8809(config)#

nx9500-6C8809(config)#show t5 version on t5-ED7C6C
Bootloader Version: 5.4.2.0-010R
Application Version: 5.4.2.0-010R
nx9500-6C8809(config)#
```

```

nx9500-6C8809(config)#show t5 system on t5-ED7C6C
Serial Number 14213522400004
SKU TS-0524-WR
Hardware Rev 5
Mac Address B4-C7-99-ED-7C-6C

## 6.1.68 terminal

### ► *show commands*

Displays terminal configuration parameters

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
show terminal
```

#### **Parameters**

None

#### **Example**

```
rfs6000-81742D(config)#show terminal
Terminal Type: xterm
Length: 24 Width: 200
rfs6000-81742D(config)#
```

## 6.1.69 timezone

### ▶ *show commands*

Displays a device's timezone

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
show timezone
```

#### **Parameters**

None

#### **Example**

```
rfs6000-81742D(config)#show timezone
Timezone is America/Los_Angeles
rfs6000-81742D(config)#
```

## 6.1.70 traffic-shape

### ► show commands

Displays traffic-shaping related configuration details and statistics

Traffic shaping regulates network data transfers to ensure a specific performance level. Traffic shaping delays the flow of packets defined as less important than prioritized traffic streams. Traffic shaping enables traffic control out an interface to match its flow to the speed of a remote target's interface and ensure traffic conforms applied policies. Traffic can be shaped to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Apply traffic shaping to specific applications to apply application categories. When application and ACL rules are conflicting, ACL rules take precedence for the traffic shaping class. Using traffic shaping, an application takes precedence over an application category.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530

#### Syntax

```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

#### Parameters

```
• show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

|                        |                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traffic-shape          | Displays traffic-shaping related configuration details and statistics                                                                                                                                                                                                                                                                                     |
| priority-map           | Displays the traffic shaper queue priority. There are 8 queues (0 - 7), and traffic is queued in each based on incoming packets 802.1p markings.                                                                                                                                                                                                          |
| statistics class <1-4> | Displays traffic-shaping related statistics for all traffic shaper classes or for a selected class <ul style="list-style-type: none"> <li>• class &lt;1-4&gt; - Optional. Specify the traffic class from 1 - 4. The system displays traffic shaping statistics for the selected class. If not selected, the system statistics for all classes.</li> </ul> |
| status                 | Displays the controller or service platform's traffic shaping status (whether running or not)                                                                                                                                                                                                                                                             |
| on <DEVICE-NAME>       | Optional. Displays traffic-shaping related configuration details and statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                     |

## 6.1.71 upgrade-status

► *show commands*

Displays the last image upgrade status

**NOTE:** This command is not available in the USER EXEC Mode.

### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
show upgrade-status {detail|on}
show upgrade-status {detail} {(on <DEVICE-NAME>) }
```

### Parameters

- show upgrade-status {detail} {(on <DEVICE-NAME>) }

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| upgrade-status   | Displays last image upgrade status and log                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| detail           | Optional. Displays last image upgrade status in detail                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| on <DEVICE-NAME> | <p>The following keyword is recursive and common to the 'detail' parameter:</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays last image upgrade status on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> <p><b>Note:</b> If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of upgrade status and log on the specified device.</p> |

## 6.1.72 version

### ► *show commands*

Displays a device's software and hardware version

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show version {on <DEVICE-NAME>}
```

#### Parameters

- `show version {on <DEVICE-NAME>}`

|                                              |                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>version {on &lt;DEVICE- NAME&gt;}</pre> | <p>Displays software and hardware versions on all devices or a specified device</p> <ul style="list-style-type: none"> <li>• <code>on &lt;DEVICE-NAME&gt;</code> - Optional. Displays software and hardware versions on a specified device</li> <li>• <code>&lt;DEVICE-NAME&gt;</code> - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809#show version
NX9500 version 5.9.0.0-029R
Copyright (c) 2004-2017 Extreme Networks, Inc. All rights reserved.
Booted from primary

nx9500-6C8809 uptime is 3 days, 20 hours 49 minutes
CPU is Intel(R) Xeon(R) CPU E5645 @ 2.40GHz, No. of CPUs 24
Base ethernet MAC address is B4-C7-99-6C-88-09

## 6.1.73 vrrp

### ► *show commands*

Displays the following *Virtual Router Redundancy Protocol* (VRRP) related statistics: configuration error, router redundancy information in brief and detail. VRRP configuration errors include mismatch of authentication credentials, invalid packet checksums, invalid packet types, invalid virtual route IDs, TTL errors, packet length errors and invalid (non matching) VRRP versions.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7622, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show vrrp [brief|details|error-stats|stats]
show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}
show vrrp error-stats {on <DEVICE-NAME>}
```

#### Parameters

- `show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}`

|                  |                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrrp             | Displays VRRP related statistics in brief or in detail depending on the option selected                                                                                                                                                                                                                                                                                        |
| brief            | Displays virtual router information in brief                                                                                                                                                                                                                                                                                                                                   |
| details          | Displays virtual router information in detail                                                                                                                                                                                                                                                                                                                                  |
| stats            | Displays virtual router statistics                                                                                                                                                                                                                                                                                                                                             |
| <1-255>          | The following keyword is common to all of the above parameters: <ul style="list-style-type: none"> <li>• &lt;1-255&gt; – Optional. Displays information for a specified Virtual Router. Specify the router's ID from 1 - 255.</li> </ul>                                                                                                                                       |
| on <DEVICE-NAME> | The following keyword is recursive and common to the ' <1-255>' parameter: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Displays specified router information on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> </li> </ul> |

- `show vrrp error-stats {on <DEVICE-NAME>}`

|                                |                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrrp                           | Displays VRRP related statistics in brief or in detail depending on the option selected                                                                                                                                                                                                                                         |
| error-stats {on <DEVICE-NAME>} | Displays global error statistics <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Checksum error: 0
Invalid virtual router id: 0
Authentication mismatch: 0
Invalid packet type: 0
rfs6000-81742D(config)#
```

```
rfs6000-81742D(config)#show vrrp details
VRRP Group 1:
 version 2
 interface none
 configured priority 1
 advertisement interval 1 sec
 preempt enable, preempt-delay 0
 virtual mac address 00-00-5E-00-01-01
 sync group disable
rfs6000-81742D(config)#
```

## 6.1.74 web-filter

### ► show commands

Displays Web filtering related information

Use this command to view information on Web requests for content and whether the requests were blocked or approved based on URL filter settings defined for the selected controller or service platform. A URL filter is comprised of several filter rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7161, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show web-filter [category|category-type|config|filter-level [basic|high|low|
medium|medium-high]]|statistics {on <DEVICE-NAME>}|status]
```

#### Parameters

```
• show web-filter [category|category-type|config|filter-level [basic|high|low|
medium|medium-high]]|statistics {on <DEVICE-NAME>}|status]
```

| web-filter                                       | Displays an existing and configured Web filter details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| category                                         | Displays Web filter categories. A category is a pre-defined URL list available in the WiNG software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| category-type                                    | Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in to which commonly accessed URLs have been classified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| config                                           | Displays all existing Web filters and their configuration details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| filter-level [basic high low medium medium-high] | Displays category types for the selected filter-level. Each filter level is pre-configured to use a set of category types. You cannot change the categories in the category types used for these pre-configured filter-level setting. Nor can you add, modify, or remove the category types mapped to a filter-level setting. The options are: <ul style="list-style-type: none"> <li>• basic – Displays all category types configured for the basic filter-level</li> <li>• high – Displays all category types configured for the high filter-level</li> <li>• low – Displays all category types configured for the low filter-level</li> <li>• medium – Displays all category types configured for the medium filter-level</li> <li>• medium-high – Displays all category types configured for the medium-high filter-level</li> </ul> |
| statistics {on <DEVICE-NAME>}                    | Displays Web filter statistics on a specified device <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Specifies the device name <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, controller, or service platform.</li> </ul> </li> </ul> <p><b>Note:</b> Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                           |

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>status {on &lt;DEVICE-NAME&gt;}</pre> | <p>Displays Web filter status on a specified device</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Specifies the device name</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, controller, or service platform.</li> </ul> <p><b>Note:</b> Web filtering is a licensed feature, and only when enforced can the system display Web filtering status.</p> |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config)#show web-filter category
advertisement-popups
 Sites that provide advertising graphics or other ad content
 files such as banners and pop-ups.
alcohol-tobacco
 Sites that promote or sell alcohol- or tobacco-related
 products or services.
anonymizers
 Sites and proxies that act as an intermediary for surfing to
 other websites in an anonymous fashion, whether to
 circumvent web filtering or for other reasons.
arts
 Sites with artistic content or relating to artistic
 institutions such as theaters, museums, galleries, dance
 companies, photography, and digital graphic resources.
botnets
 Sites that use bots (zombies) including command-and-control
 sites.
--More--
nx9500-6C8809(config)#

nx9500-6C8809(config)#show web-filter config
URL filters configured for this device are:
 WebFilter_ShoppingSites
 Blacklisted categories:
 shopping,
 Whitelisted categories:
 <AllowedShopping>,
nx9500-6C8809(config)#
```

## 6.1.75 what

### ► *show commands*

Displays details of a specified search phrase (performs global search)

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

- show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}

|                            |                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| contain <WORD>             | Searches on all the items that contain a specified word <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify a word to search (for example, MAC address, hostname, etc.).</li> </ul>                                          |
| is <WORD>                  | Searches on an exact match <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify a word to search (for example, MAC address, hostname, etc.).</li> </ul>                                                                       |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Performs global search on a specified device or RF Domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

#### Example

```
rfs4000-229D58#show what contain default

NO. CATEGORY MATCHED OTHER KEY INFO (1)
OTHER KEY INFO (2) NAME/VALUE OTHER KEY INFO (3) NAME/VALUE NAME/
VALUE NAME/VALUE

## Parameters

- `show wireless ap {configured}`

|            |                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------|
| wireless   | Displays wireless configuration parameters                                                                       |
| ap         | Displays managed access point information                                                                        |
| configured | Optional. Displays configured AP information, such as name, MAC address, profile, RF Domain, and adoption status |

- `show wireless ap {detail} {<MAC/HOST-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}`

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless                   | Displays wireless configuration parameters                                                                                                                                                                                                                                                                                                                                                                              |
| ap                         | Displays managed access point information                                                                                                                                                                                                                                                                                                                                                                               |
| detail<br><MAC/HOST-NAME>  | Optional. Displays detailed information for all APs or a specified AP <ul style="list-style-type: none"> <li>• &lt;MAC/HOST-NAME&gt; - Optional. Displays information for a specified AP. Specify the AP's MAC address.</li> </ul>                                                                                                                                                                                      |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to the 'detail <MAC/HOST-NAME>' parameter: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Optional. Displays information on a specified device or RF Domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> </li> </ul> |

- `show wireless ap {load-balancing} {client-capability|events|neighbors} {(on <DEVICE-NAME>)}`

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless                                                   | Displays wireless configuration parameters                                                                                                                                                                                                                                                                                                                                                                                                         |

- `show wireless bridge {config}`

|               |                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless      | Displays wireless configuration statistics                                                                                                                                                                        |
| bridge config | Optional. Displays all client bridges in configuration<br>The output displays the configured client-bridges' hostname, MAC address, profile, RF Domain, SSID, band, encryption, authentication, and EAP username. |

- `show wireless bridge {hosts} {on <DEVICE-OR-DOMAIN-NAME>}`

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless     | Displays wireless configuration statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| bridge hosts | Optional. Displays the client bridge host information<br>The output displays the configured client-bridges' host's MAC Address, bridge MAC address, IPv4 address, bridging status, and activity<br><b>Note:</b> The HOST MAC column displays real MAC addresses of wired hosts, while the BRIDGE MAC column displays the translated MAC addresses. The BRIDGE MAC column is based on the radio 2 base MAC address and increments by 1 for each wired host connected to the client bridges Ge1 port. |

| links                                                                                                                                       | Displays MiNT-mesh links related information. MiNT Links are automatically created between controllers and access points during adoption using MLCP ( <i>MiNT Link Creation Protocol</i> ). They can also be manually created between a controller and access point (or) between access points. MiNT links are manually created between controllers while configuring a cluster.<br><br>Level 2 (or) remote MiNT links are controller aware links, and requires IP network for communication. This level 2 MiNT links at access points are intended for remote adaptive AP deployment and management from NOC. With Level2 MiNT links, access points are only aware of the controllers and not about other access points. Level 2 MiNT links also provide partitioning, between access points deployed at various remote sites. |

### Usage Guidelines

The customize command enables you to customize the `show > wireless` command output.

|                                                   |                                                                 |
|---------------------------------------------------|-----------------------------------------------------------------|
| <code>rfs6000-81742D(config)#customize ?</code>   |                                                                 |
| <code>  cdp-lldp-info-column-width</code>         | Customize cdp-lldp-info column width                            |
| <code>  hostname-column-width</code>              | Customize hostname column width                                 |
| <code>  show-adoption-offline</code>              | Customize the output of (show adoption offline) command         |
| <code>  show-adoption-status</code>               | Customize the output of (show adoption status) command          |
| <code>  show-wireless-bridge</code>               | Customize the output of (show wireless bridge) command          |
| <code>  show-wireless-bridge-hosts</code>         | Customize the output of (show wireless bridge hosts) command    |
| <code>  show-wireless-bridge-stats</code>         | Customize the output of (show wireless bridge stats) command    |
| <code>  show-wireless-bridge-stats-rf</code>      | Customize the output of (show wireless bridge stats rf) command |
| <code>  show-wireless-bridge-stats-traffic</code> | Customize the output of (show wireless bridge stats) command    |
| <code>  show-wireless-client</code>               | Customize the output of (show wireless client) command          |
| <code>  show-wireless-client-stats</code>         | Customize the output of (show wireless client stats) command    |
| <code>  show-wireless-client-stats-rf</code>      | Customize the output of (show                                   |

|                                                            |                                                                                                |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <code>show-wireless-legacy-mesh-client-stats</code>        | wireless client stats rf)<br>Customize the output of (show wireless mint client stats) command |
| <code>show-wireless-meshpoint</code>                       | Customize the output of (show wireless meshpoint) command                                      |
| <code>show-wireless-meshpoint-accelerated-multicast</code> | Customize the output of (show wireless meshpoint accelerated-multicast) command                |
| <code>show-wireless-meshpoint-neighbor-stats</code>        | Customize the output of (show wireless meshpoint neighbor stats) command                       |
| <code>show-wireless-meshpoint-neighbor-stats-rf</code>     | Customize the output of (show wireless meshpoint neighbor stats rf) command                    |
| <code>show-wireless-mint-client</code>                     | Customize the output of (show wireless mint client) command                                    |
| <code>show-wireless-mint-client-stats</code>               | Customize the output of (show wireless mint client stats) command                              |
| <code>show-wireless-mint-client-stats-rf</code>            | Customize the output of (show wireless mint client stats rf) command                           |
| <code>show-wireless-mint-portal</code>                     | Customize the output of (show wireless mint portal) command                                    |
| <code>show-wireless-mint-portal-stats</code>               | Customize the output of (show wireless mint portal stats) command                              |
| <code>show-wireless-mint-portal-stats-rf</code>            | Customize the output of (show wireless mint portal stats rf) command                           |
| <code>show-wireless-radio</code>                           | Customize the output of (show wireless radio) command                                          |
| <code>show-wireless-radio-stats</code>                     | Customize the output of (show wireless radio stats) command                                    |
| <code>show-wireless-radio-stats-rf</code>                  | Customize the output of (show wireless radio stats rf) command                                 |

```
rfs6000-81742D(config)#
```

The default setting for the `show > wireless > client` command is as follows:

```
rfs6000-81742D(config)#show wireless client
```

```

MAC IPv4 VENDOR RADIO-ID WLAN VLAN
STATE

```

```
Total number of wireless clients displayed: 0
```

```
rfs6000-81742D(config)#
```

The above output can be customized, using the `customize > show-wireless-client` command, as follows:

```
rfs6000-81742D(config)#customize show-wireless-client mac ip vendor wlan radio-id
state wlan location radio-alias radio-type
rfs6000-81742D(config)#commit
```

```
rfs6000-81742D(config)#show wireless client
```

```

--
MAC IP VENDOR VLAN RADIO-ID STATE WLAN
AP-LOCATION RADIO RADIO RADIO-TYPE

--
```

```

--
Total number of wireless clients displayed: 0
rfs6000-81742D(config)#

```

**Example**

```

nx9500-6C8809(config)#show wireless wlan config

```

```

NAME ENABLE SSID ENCRYPTION AUTHENTICATION VLAN BRIDGING MODE

test Y test wep64 none 1 local

```

```

nx9500-6C8809(config)#

```

```

nx9500-6C8809(config)#show wireless wips client-blacklist
No wireless clients blacklisted
nx9500-6C8809(config)#

```

```

rfs6000-81742D#show wireless regulatory channel-info 36
Center frequency for channel 36 is 5180MHZ
rfs6000-81742D#

```

```

nx9500-6C8809(config)#show wireless regulatory country-code

```

```

ISO CODE NAME

gt Guatemala
co Colombia
cn China
cm Cameroon
cl Chile

```

```

--More--

```

```

nx9500-6C8809(config)#

```

```

nx9500-6C8809(config)#show wireless regulatory device-type ap7502 us

```

```

nx9500-6C8809#show wireless ap load-balancing on rfs6000-81742D
```

```
Column Name Reference:
Ap-Ld : Load of the AP as reported by it.
Avg-Ld : Average AP load in the AP's neighborhood.
2.4g-Ld : 2.4GHz band load in the AP's neighborhood.
5g-Ld : 5GHz band load in the AP's neighborhood.
Ap-2.4g-Ch-Ld : Load in the AP's 2.4GHz channel in its neighborhood.
Avg-2.4g-Ch-Ld : Average load of a 2.4GHz channel in AP's neighborhood.
Ap-5g-Ch-Ld : Load in the AP's 5GHz channel in its neighborhood.
Avg-5g-Ch-Ld : Average load of a 5GHz channel in AP's neighborhood.
Allow-2.4g-Req : AP responds to client requests on 2.4ghz radio
Allow-5g-Req : AP responds to client requests on 5ghz radio
```

## 6.1.77 wwan

### ► show commands

Displays wireless WAN status

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

```
• show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                  |

## 6.1.78 virtual-machine

### ► show commands

Displays the *virtual-machine* (VM) configuration, logs, and statistics

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
show virtual-machine [configuration|debugging|export|statistics]

show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|
team-vowlan} {(on <DEVICE-NAME>)}

show virtual-machine debugging {level|on}
show virtual-machine debugging {level [debug|error|info|warning]} {on <DEVICE-
NAME>}

show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}

show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt}
```

#### Parameters

- show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| export                                                                                                 | Displays VM configuration export related information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <VM-NAME>                                                                                              | Displays VM configuration export related information for the virtual machine identified by the <VM-NAME> keyword. Specify the VM name. <p>The NX9500 and NX9510 series service platforms will display ADSP and TEAM-CMT VM configuration export information</p>                                                                                                                                                                                                                                                                                                          |
| on <DEVICE-NAME>                                                                                       | Optional. Specifies the name of the device on which the command is executed <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the service platform.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                          |

**Example**

```
nx9500-6C874D#show virtual-machine statistics
```

| NAME     | STATE  | VCPUS | MEM (MB) | BRIDGE-IF | IP |
|----------|--------|-------|----------|-----------|----|
| WiNG     | -      | -     | 18432    | -         | -  |
| adsp     | Halted | -     | -        | unknown   | -  |
| team-cmt | Halted | -     | -        | unknown   | -  |

```
nx9500-6C874D#
```

```
nx9500-6C874D#show virtual-machine configuration
```

| NAME     | AUTOSTART | MEMORY (MB) | VCPUS |
|----------|-----------|-------------|-------|
| WiNG     | -         | 18432       | -     |
| adsp     | ignore    | 12000       | 12    |
| team-cmt | ignore    | 1024        | 1     |

```
nx9500-6C874D#
```

```
nx9500-6C874D>show virtual-machine statistics adsp
```

```
VM name: adsp
Base Version : unknown
Install Status : not_installed
nx9500-6C874D>
```

## 6.1.79 raid

### ► *show commands*

Displays *Redundant Array of Independent Disks* (RAID) related information, such as array status, consistency check status, and RAID log.

Use this command to assess the RAID array's drive utilization and whether the drives are currently online. Since there is only one RAID array controller reporting status to the service platform, it is important to know if other drive s house hot spare drives as additional resources should one of the dedicated drives fail. This command also displays whether a physical within the RAID array has a drive installed, and whether the drive is currently online.

#### Supported in the following platforms:

- Service Platforms — NX9500

#### Syntax

```
show raid {on <DEVICE-NAME>}
```

#### Parameters

- show raid {on <DEVICE-NAME>}

|                  |                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| raid             | Displays the RAID array status and statistics                                                                                                                                                                       |
| on <DEVICE-NAME> | Optional. Displays RAID status and statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```
nx9500-6C874D(config)#show raid
Logical drive info:
 Size 930 GB, State optimal
 Alarm enabled
 Last check: Sat Aug 10 02:56:54 2013
 Last check result: ending
Physical drive info:

Drive 0: online
Drive 1: online
Drive 2: not-installed
Drive 3: not-installed
Drive 4: not-installed
nx9500-6C874D(config)#
```

# 7 PROFILES

Profiles enable administrators to assign a common set of configuration parameters, policies, and WLANs to service platforms, controllers, and access points across a large, multi segment, site. The configuration parameters within a profile are based on the hardware model the profile was created to support.

The service platforms, wireless controllers, and access points support both default and user-defined profiles. Each default and user-defined profile contains policies and configurations that are applied to devices assigned to the profile. Changes made to these configurations are automatically inherited by the devices. The central benefit of a profile is its ability to update devices collectively without having to modify individual device configurations.

Default profiles are system maintained and are automatically applied to service platforms and wireless controllers. The default AP profile is automatically applied to a AP (discovered by a wireless controller or service platform), unless an AP auto-provisioning policy is defined specifically to assign APs to a user-defined profile. After adoption, changes made to a profile's parameters are reflected across all devices using the profile. Default profiles are ideal for single site deployments where service platforms, wireless controllers, and access points share a common configuration.

User-defined profiles, on the other hand, are manually created for each supported service platform, wireless controller, and access point model. User-defined profiles are recommended for larger deployments using centralized controllers and service platforms when groups of devices on different floors, buildings or sites share a common configuration. These user-defined profiles can be manually, or automatically assigned to through an auto provisioning policy. An auto provisioning policy provides the means to assign profiles to access points based on model, serial number, VLAN ID, DHCP options, IP address (subnet) and MAC address. For more information, see [AUTO-PROVISIONING-POLICY](#).

Each default and user-defined profile contains policies and configuration parameters.

A user defined profile can be created for each of the following device type:

- AP6521 – Adds an AP6521 access point profile
- AP6522 – Adds an AP6522 access point profile
- AP6532 – Adds an AP6532 access point profile
- AP6562 – Adds an AP6562 access point profile
- AP7161 – Adds an AP7161 access point profile
- AP7502 – Adds an AP7502 access point profile
- AP7522 – Adds an AP7522 access point profile
- AP7532 – Adds an AP7532 access point profile
- AP7562 – Adds an AP7562 access point profile
- AP7602 – Adds an AP7602 access point profile
- AP7612 – Adds an AP7612 access point profile
- AP7622 – Adds an AP7622 access point profile
- AP7632 – Adds an AP7632 access point profile
- AP7662 – Adds an AP7662 access point profile
- AP81XX – Adds an AP81XX access point profile supporting the AP8132 and AP8163 models
- AP8232 – Adds an AP8232 access point profile
- AP8432 – Adds an AP8432 access point profile

- AP8533 – Adds an AP8533 access point profile
- EX3524 – Adds an EX3524 wireless controller profile
- EX3548 – Adds an EX3548 wireless controller profile
- RFS4000 – Adds an RFS4000 wireless controller profile
- RFS6000 – Adds an RFS6000 wireless controller profile
- NX5500 – Adds an NX5500 wireless controller profile
- NX7500 – Adds an NX75XX series service platform profile supporting the NX7510, NX7520, and NX7530 models
- NX9000 – Adds an NX95XX series service platform profile supporting the NX9500 and NX9510 models
- NX9600 – Adds an NX96XX series service platform profile supporting the NX9600 and NX9610 models. Supported only on an NX96XX model device.
- VX9000 – Adds a VX9000 wireless controller profile
- T5 – Adds a T5 controller profile

**NOTE:** A T5 profile can be created only on the following platforms: RFS4000, RFS6000, NX9500, NX9510, and NX9600.

Although profiles assign a common set of configuration parameters across devices, individual devices can still be assigned unique configuration parameters that follow the flat configuration model. As individual device updates are made, these devices no longer share the profile based configuration they originally supported. Therefore, changes made to a profile are not automatically inherited by devices who have had their configuration customized. These devices require careful administration, as they cannot be tracked as profile members. Their customized configurations overwrite their profile configurations until the profile is re-applied.

**NOTE:** The commands present under ‘Profiles’ are also available under the ‘Device mode’. The additional commands specific to the ‘Device mode’ are listed separately.

This chapter is organized into the following topics:

- *Profile Config Commands*
- *Device Config Commands*
- *T5 Profile Config Commands*
- *EX3524 & EX3548 Profile/Device Config Commands*

To view the list of device profiles supported, use the following command:

```
<DEVICE>(config)#profile ?
anyap Any access point profile
ap650 AP650 access point profile
ap6511 AP6511 access point profile
ap6521 AP6521 access point profile
ap6522 AP6522 access point profile
ap6532 AP6532 access point profile
ap6562 AP6562 access point profile
ap71xx AP7161 access point profile
ap7502 AP7502 access point profile
ap7522 AP7522 access point profile
ap7532 AP7532 access point profile
ap7562 AP7562 access point profile
```

```

ap81xx AP81XX access point profile
ap82xx AP8232 access point profile
ap8432 AP8432 access point profile
ap8533 AP8533 access point profile
containing Specify profiles that contain a sub-string in the profile name
ex3524 EX3524 wireless controller profile
ex3548 EX3548 wireless controller profile
filter Specify addition selection filter
nx5500 NX5500 wireless controller profile
nx75xx NX75XX wireless controller profile
nx9000 NX9000 wireless controller profile
nx9600 NX9600 wireless controller profile
rfs4000 RFS4000 wireless controller profile
rfs6000 RFS6000 wireless controller profile
rfs7000 RFS7000 wireless controller profile
t5 T5 wireless controller profile
vx9000 VX9000 wireless controller profile

<DEVICE>(config)#

rfs6000-37FABE(config)#profile rfs6000 default-rfs6000
rfs6000-37FABE(config-profile-default-rfs6000)#

rfs6000-37FABE(config)#profile ap71xx default-ap71xx
rfs6000-37FABE(config-profile-default-ap71xx)#

<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#

<DEVICE>(config-profile-<PROFILE-NAME>)#?
Profile Mode commands:
adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning
 policy when adopted by another
 controller
adoption Adoption configuration
adoption-mode Configure the adoption mode for the
 access-points in this RF-Domain
alias Alias
application-policy Application Poicy configuration
area Set name of area where the system
 is located
arp Address Resolution Protocol (ARP)
auto-learn Auto learning
autogen-uniqueid Autogenerate a unique id
autoinstall Autoinstall settings
bridge Ethernet bridge
captive-portal Captive portal
cdp Cisco Discovery Protocol
cluster Cluster configuration
configuration-persistence Enable persistence of configuration
 across reloads (startup config
 file)
controller WLAN controller configuration
critical-resource Critical Resource
crypto Encryption related commands
database Database command
device-onboard Device-onboarding configuration
device-upgrade Device firmware upgrade
diag Diagnosis of packets
dot1x 802.1X
dpi Enable Deep-Packet-Inspection
 (Application Assurance)
dscp-mapping Configure IP DSCP to 802.1p
 priority mapping for untagged
 frames
equest-server Enable ExtremeGuest Server
 functionality
email-notification Email notification configuration

| ip                                 | Internet Protocol (IP)                                                              |
| ipv6                               | Internet Protocol version 6 (IPv6)                                                  |
| l2tpv3                             | L2tpv3 protocol                                                                     |
| l3e-lite-table                     | L3e lite Table                                                                      |
| led                                | Turn LEDs on/off on the device                                                      |
| led-timeout                        | Configure the time for the led to turn off after the last radio state change        |
| legacy-auto-downgrade              | Enable device firmware to auto downgrade when other legacy devices are detected     |
| legacy-auto-update                 | Auto upgrade of legacy devices                                                      |
| lldp                               | Link Layer Discovery Protocol                                                       |
| load-balancing                     | Configure load balancing parameter                                                  |
| logging                            | Modify message logging facilities                                                   |
| mac-address-table                  | MAC Address Table                                                                   |
| mac-auth                           | 802.1X                                                                              |
| management-server                  | Configure management server address                                                 |
| memory-profile                     | Memory profile to be used on the device                                             |
| meshpoint-device                   | Configure meshpoint device parameters                                               |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                             |
| min-misconfiguration-recovery-time | Time interval to check controller connectivity after configuration is received      |
| mint                               | MiNT protocol                                                                       |
| misconfiguration-recovery-time     | Check controller connectivity after configuration is received                       |
| neighbor-inactivity-timeout        | Configure neighbor inactivity timeout                                               |
| neighbor-info-interval             | Configure neighbor information exchange interval                                    |
| no                                 | Negate a command or set its defaults                                                |
| noc                                | Configure the noc related setting                                                   |
| nsight                             | NSight                                                                              |
| ntp                                | Ntp server WORD                                                                     |
| offline-duration                   | Set duration for which a device remains unadopted before it generates offline event |
| otls                               | Omnitrail Location Server                                                           |
| power-config                       | Configure power mode                                                                |
| preferred-controller-group         | Controller group this system will prefer for adoption                               |
| preferred-tunnel-controller        | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic  |
| radius                             | Configure device-level radius authentication parameters                             |
| raid                               | RAID                                                                                |
| remote-debug                       | Configure remote debug parameters                                                   |
| remove-override                    | Remove configuration item override from the device (so profile value takes effect)  |

```

rf-domain-manager RF Domain Manager
router Dynamic routing
slot PCI expansion Slot
spanning-tree Spanning tree
traffic-class-mapping Configure IPv6 traffic class to
 802.1p priority mapping for
 untagged frames

traffic-shape Traffic shaping
trustpoint Assign a trustpoint to a service
tunnel-controller Tunnel Controller group this
 controller belongs to

use Set setting to use
vrrp VRRP configuration
vrrp-state-check Publish interface via OSPF/BGP only
 if the interface VRRP state is not
 BACKUP

wep-shared-key-auth Enable support for 802.11 WEP
 shared key authentication

zone Configure Zone name

## 7.1 Profile Config Commands

► *PROFILES*

The following table summarizes profile configuration mode commands:

| Command                                        | Description                                                                                                                                                                                                             | Reference         |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>adopter-auto-provisioning-policy-lookup</i> | Enables the use of a centralized auto provisioning policy on this profile                                                                                                                                               | <i>page 7-11</i>  |
| <i>adoption</i>                                | Configures a minimum and maximum delay time in the initiation of the device adoption process                                                                                                                            | <i>page 7-13</i>  |
| <i>alias</i>                                   | Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed -string, etc. at the profile level                                                                    | <i>page 7-15</i>  |
| <i>application-policy</i>                      | Associates a RADIUS server provided application policy with this profile. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane. | <i>page 7-22</i>  |
| <i>area</i>                                    | Sets the system's area of location (the area name)                                                                                                                                                                      | <i>page 7-24</i>  |
| <i>arp</i>                                     | Configures static address resolution protocol                                                                                                                                                                           | <i>page 7-25</i>  |
| <i>auto-learn</i>                              | Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device's host name via DHCP options.          | <i>page 7-27</i>  |
| <i>autogen-uniqueid</i>                        | Auto-generates a unique local ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.                                              | <i>page 7-28</i>  |
| <i>autoinstall</i>                             | Configures the automatic install feature                                                                                                                                                                                | <i>page 7-30</i>  |
| <i>bridge</i>                                  | Configures bridge specific parameters                                                                                                                                                                                   | <i>page 7-31</i>  |
| <i>captive-portal</i>                          | Configures captive portal advanced Web page upload on a device profile                                                                                                                                                  | <i>page 7-62</i>  |
| <i>cdp</i>                                     | Enables <i>Cisco Discovery Protocol</i> (CDP) on a device                                                                                                                                                               | <i>page 7-63</i>  |
| <i>cluster</i>                                 | Configures a cluster name                                                                                                                                                                                               | <i>page 7-64</i>  |
| <i>configuration-persistence</i>               | Enables persistence of configuration across reloads                                                                                                                                                                     | <i>page 7-67</i>  |
| <i>controller</i>                              | Configures a wireless controller or service platform                                                                                                                                                                    | <i>page 7-68</i>  |
| <i>critical-resource</i>                       | Monitors resources that are critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses.             | <i>page 7-72</i>  |
| <i>crypto</i>                                  | Configures data encryption related protocols and settings                                                                                                                                                               | <i>page 7-80</i>  |
| <i>database</i>                                | Backs up captive-portal and/or NSight database to a specified location and file and configures a low-disk-space threshold value                                                                                         | <i>page 7-143</i> |
| <i>device-onboard</i>                          | Configures the logo image file name and title displayed on the EGuest device-onboarding portal. This is the portal a vendor-admin user uses to onboard devices.                                                         | <i>page 7-144</i> |
| <i>device-upgrade</i>                          | Configures device firmware upgrade settings on this profile                                                                                                                                                             | <i>page 7-145</i> |
| <i>diag</i>                                    | Enables looped packet logging                                                                                                                                                                                           | <i>page 7-147</i> |

| Command                               | Description                                                                                                                                      | Reference                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>dot1x</i>                          | Configures 802.1x standard authentication controls                                                                                               | <a href="#">page 7-148</a> |
| <i>dpi</i>                            | Enables <i>Deep Packet Inspection</i> (DPI) on this profile                                                                                      | <a href="#">page 7-150</a> |
| <i>dscp-mapping</i>                   | Configures an IP DSCP to 802.1p priority mapping for untagged frames                                                                             | <a href="#">page 7-153</a> |
| <i>eguest-server</i><br>(VX9000 only) | Enables the EGuest daemon when executed without the 'host' option                                                                                | <a href="#">page 7-154</a> |
| <i>eguest-server</i><br>(NOC Only)    | Points to the EGuest server, when executed along with the 'host' option                                                                          | <a href="#">page 7-155</a> |
| <i>email-notification</i>             | Configures e-mail notification settings                                                                                                          | <a href="#">page 7-156</a> |
| <i>enforce-version</i>                | Enables checking of a device's firmware version before attempting adoption or clustering                                                         | <a href="#">page 7-158</a> |
| <i>environmental-sensor</i>           | Configures the environmental sensor settings on this profile (applicable to AP8132 model access point only)                                      | <a href="#">page 7-159</a> |
| <i>events</i>                         | Enables system event logging and message generation. This command also configures event message forwarding settings.                             | <a href="#">page 7-161</a> |
| <i>export</i>                         | Enables export of startup.log file after every boot                                                                                              | <a href="#">page 7-162</a> |
| <i>file-sync</i>                      | Configures parameters enabling synching of trustpoint and/or wireless-bridge certificate between the staging-controller and adopted access point | <a href="#">page 7-163</a> |
| <i>floor</i>                          | Sets the floor name where the system is located                                                                                                  | <a href="#">page 7-164</a> |
| <i>gre</i>                            | Enables <i>Generic Routing Encapsulation</i> (GRE) tunneling on this profile                                                                     | <a href="#">page 7-165</a> |
| <i>http-analyze</i>                   | Configures HTTP analysis settings                                                                                                                | <a href="#">page 7-177</a> |
| <i>interface</i>                      | Configures an interface (VLAN, radio, GE, etc.)                                                                                                  | <a href="#">page 7-180</a> |
| <i>ip</i>                             | Configures IPv4 components                                                                                                                       | <a href="#">page 7-348</a> |
| <i>ipv6</i>                           | Configures IPv6 components                                                                                                                       | <a href="#">page 7-358</a> |
| <i>l2tpv3</i>                         | Defines the <i>Layer 2 Tunnel Protocol</i> (L2TP) protocol for tunneling layer 2 payloads using <i>Virtual Private Networks</i> (VPNs)           | <a href="#">page 7-362</a> |
| <i>l3e-lite-table</i>                 | Configures L3e Lite Table with this profile                                                                                                      | <a href="#">page 7-364</a> |
| <i>led</i>                            | Turns device LEDs on or off                                                                                                                      | <a href="#">page 7-365</a> |
| <i>led-timeout</i>                    | Configures LED-timeout timer. This command is specific to the NX95XX series service platforms.                                                   | <a href="#">page 7-366</a> |
| <i>legacy-auto-downgrade</i>          | Auto downgrades a legacy device firmware                                                                                                         | <a href="#">page 7-368</a> |
| <i>legacy-auto-update</i>             | Auto upgrades a legacy device firmware                                                                                                           | <a href="#">page 7-369</a> |
| <i>lldp</i>                           | Configures <i>Link Layer Discovery Protocol</i> (LLDP)                                                                                           | <a href="#">page 7-370</a> |
| <i>load-balancing</i>                 | Configures load balancing parameters                                                                                                             | <a href="#">page 7-372</a> |
| <i>logging</i>                        | Modifies message logging settings                                                                                                                | <a href="#">page 7-377</a> |
| <i>mac-address-table</i>              | Configures the MAC address table                                                                                                                 | <a href="#">page 7-379</a> |
| <i>mac-auth</i>                       | Enables 802.1x user authentication protocol on this profile                                                                                      | <a href="#">page 7-381</a> |

| <b>Command</b>                            | <b>Description</b>                                                                                                                                                                   | <b>Reference</b>           |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>management-server</i>                  | Configures a management server with this profile                                                                                                                                     | <a href="#">page 7-384</a> |
| <i>memory-profile</i>                     | Configures the memory profile used on the device                                                                                                                                     | <a href="#">page 7-385</a> |
| <i>meshpoint-device</i>                   | Configures a meshpoint device parameters                                                                                                                                             | <a href="#">page 7-386</a> |
| <i>meshpoint-monitor-interval</i>         | Configures meshpoint monitoring interval                                                                                                                                             | <a href="#">page 7-388</a> |
| <i>min-misconfiguration-recovery-time</i> | Configures the minimum device connectivity verification time                                                                                                                         | <a href="#">page 7-389</a> |
| <i>mint</i>                               | Configures MiNT protocol settings                                                                                                                                                    | <a href="#">page 7-390</a> |
| <i>misconfiguration-recovery-time</i>     | Verifies device connectivity after a configuration is received                                                                                                                       | <a href="#">page 7-397</a> |
| <i>neighbor-inactivity-timeout</i>        | Configures neighbor inactivity timeout                                                                                                                                               | <a href="#">page 7-398</a> |
| <i>neighbor-info-interval</i>             | Configures neighbor information exchange interval                                                                                                                                    | <a href="#">page 7-399</a> |
| <i>no</i>                                 | Removes or reverts settings to their default. The no command, when used in the profile configuration mode, removes the selected profile's settings or reverts them to their default. | <a href="#">page 7-400</a> |
| <i>noc</i>                                | Configures NOC settings                                                                                                                                                              | <a href="#">page 7-402</a> |
| <i>nsight</i>                             | Configures NSight database related parameters                                                                                                                                        | <a href="#">page 7-403</a> |
| <i>ntp</i>                                | Configures NTP server settings                                                                                                                                                       | <a href="#">page 7-408</a> |
| <i>otls</i>                               | Configures support for detection and forwarding of OmniTrail beacon tags                                                                                                             | <a href="#">page 7-411</a> |
| <i>offline-duration</i>                   | Sets the duration, in minutes, for which a device remains un-adopted before it generates offline event                                                                               | <a href="#">page 7-414</a> |
| <i>power-config</i>                       | Configures the power mode                                                                                                                                                            | <a href="#">page 7-415</a> |
| <i>preferred-controller-group</i>         | Specifies the wireless controller or service platform group preferred for adoption                                                                                                   | <a href="#">page 7-417</a> |
| <i>preferred-tunnel-controller</i>        | Configures the tunnel wireless controller or service platform preferred by the system to tunnel extended VLAN traffic                                                                | <a href="#">page 7-418</a> |
| <i>radius</i>                             | Configures device-level RADIUS authentication parameters                                                                                                                             | <a href="#">page 7-419</a> |
| <i>raid</i>                               | Enables alarm on the array. This command is supported only on the NX9500 and NX9510 series service platform profile/device config modes.                                             | <a href="#">page 7-493</a> |
| <i>rf-domain-manager</i>                  | Enables devices using this profile to be elected as RF Domain manager. Also sets the priority value for devices using this profile in the RF Domain manager election process.        | <a href="#">page 7-420</a> |
| <i>router</i>                             | Configures dynamic router protocol settings                                                                                                                                          | <a href="#">page 7-421</a> |
| <i>spanning-tree</i>                      | Configures spanning tree related settings                                                                                                                                            | <a href="#">page 7-423</a> |
| <i>traffic-class-mapping</i>              | Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority                                                                                               | <a href="#">page 7-426</a> |

| Command                                 | Description                                                                                                                                                                                | Reference         |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>traffic-shape</i>                    | Enables traffic shaping and configures traffic shaping parameters                                                                                                                          | <i>page 7-428</i> |
| <i>trustpoint (profile-config-mode)</i> | Configures the trustpoint assigned for validating a CMP auth Operator                                                                                                                      | <i>page 7-434</i> |
| <i>tunnel-controller</i>                | Configures the name of tunneled WLAN (extended VLAN) wireless controller or service platform                                                                                               | <i>page 7-436</i> |
| <i>use</i>                              | Uses pre configured policies with this profile                                                                                                                                             | <i>page 7-437</i> |
| <i>vrrp</i>                             | Configures <i>Virtual Router Redundancy Protocol</i> (VRRP) group settings                                                                                                                 | <i>page 7-443</i> |
| <i>vrrp-state-check</i>                 | Publishes interface via OSPF or BGP based on VRRP status                                                                                                                                   | <i>page 7-447</i> |
| <i>virtual-controller</i>               | Enables an access point as a <i>virtual-controller</i> (VC) or <i>dynamic virtual controller</i> (DVC). Note, DVC is supported only on the AP7522, AP7532, and AP7562 model access points. | <i>page 7-448</i> |
| <i>wep-shared-key-auth</i>              | Enables support for 802.11 WEP shared key authentication                                                                                                                                   | <i>page 7-450</i> |
| <i>service</i>                          | Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode.                                               | <i>page 7-451</i> |
| <i>zone</i>                             | Configures the zone for devices using this profile. The zone can also be configured on the device's self context.                                                                          | <i>page 7-456</i> |

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

## 7.1.1 adopter-auto-provisioning-policy-lookup

### ► Profile Config Commands

Enables the use of a centralized auto provisioning policy on this profile. When enabled, the auto-provisioning policy applied on the NOC gets precedence over the one applied at the site controller level. Optionally, use the 'evaluate-always' option to set flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted. The device's previous adoption status is not taken into consideration.

This command is also applicable in the device configuration context.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
adopter-auto-provisioning-policy-lookup {evaluate-always}
```

#### Parameters

- adopter-auto-provisioning-policy-lookup {evaluate-always}

|                                                                      |                                                                                                                                                                                                                                                                                            |

## 7.1.2 adoption

### ► Profile Config Commands

Configures a minimum and maximum delay time in the initiation of the device adoption process. When configured, devices do not attempt adoption immediately on coming up. The process is initiated after the lapse of a specified period of time (configured using this command as the *start-delay minimum* time).

Once configured and applied, this setting is applicable on all devices using this profile. This option is also available in the device-configuration mode.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
adoption start-delay min <0-30> max <0-30>
```

#### Parameters

- adoption start-delay min <0-30> max <0-30>

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### 7.1.3 alias

► *Profile Config Commands*

Configures network, VLAN, and service aliases. The aliases defined on this profile applies to all devices using this profile. Aliases can be also defined at the device level.

**NOTE:** You can apply overrides to aliases at the device level. Overrides applied at the device level take precedence. For more information on aliases, see *alias*.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>

alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to
<ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|network
<NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www)}

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|
www)}

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

**Parameters**

- alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

|                                                           |                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>address-range<br/>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</p> | <p>Creates a new address-range alias for this profile. Or associates an existing address-range alias with this profile. An address-range alias maps a name to a range of IP addresses. Use this option to create unique address-range aliases for different deployment scenarios.</p> <p>Contd..</p> |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                        | <p>For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.20 through 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.</p> <ul style="list-style-type: none"> <li>• &lt;ADDRESS-RANGE-ALIAS-NAME&gt; – Specify the address range alias name.</li> </ul> <p><b>Note:</b> Alias name should begin with '\$'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |

For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.</p> |

**Example**

The following example shows the global aliases configured. Note the network-service alias '\$kerberos' settings.

```

nx9500-6C8809(config)#show running-config | include alias
alias network-group $NetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
alias network-group $NetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network $NetworkAlias 192.168.13.0/24
alias host $HostAlias 192.168.13.10
alias address-range $AddRanAlias 192.168.13.10 to 192.168.13.13
alias network-service $kerberos proto tcp 23 22 proto udp 25
alias vlan $VlanAlias 1
alias string $AREA Ecospace
alias string $IN-Blr-EcoSpace-Floor-4 IBEF4

## 7.1.4 application-policy

### ► Profile Config Commands

Associates a RADIUS server provided application policy with this profile. This command is also applicable to the device configuration mode. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.

An application policy defines the actions executed on recognized HTTP (Facebook), enterprise (Webex) and peer-to-peer (gaming) applications or application-categories. The following are the actions that can be applied in an application policy:

- Allow - Allows packets for a specific application and its defined category type (for e.g., social networking)
- Deny - Denies (restricts) packets to a specific application and its defined category type
- Mark - Marks recognized packets with DSCP/8021p value
- Rate-limit - Rate limits packets from specific application type

For more information on configuring an application policy, see [application-policy](#).

#### Supported in the following platforms:

- Access Points — AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8432, AP8533
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
application-policy radius <APP-POLICY-NAME>
```

#### Parameters

- application-policy radius <APP-POLICY-NAME>

|                                                   |                                                                                                                                                                            |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| application-policy<br>radius<br><APP-POLICY-NAME> | Associates a RADIUS server provided application policy with this profile<br>• <APP-POLICY-NAME> - Specify the application policy name (should be existing and configured). |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#show context include-factory | include application-policy
application-policy Bing
 no use application-policy
 no use application-policy
 no use application-policy
 no use application-policy
 no use application-policy
 no use application-policy
 no use application-policy
 no use application-policy
 no use application-policy

## 7.1.5 area

### ► Profile Config Commands

Sets the system's area of location (the physical area of deployment)

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
area <WORD>
```

#### Parameters

- area <WORD>

|             |                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| area <WORD> | Sets the system's area of location <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the area name (should not exceed 64 characters).</li> </ul> |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-37FABE(config-profile-default-rfs6000)#area Ecospace

rfs6000-37FABE(config-profile-default-rfs6000)#show context
profile rfs6000 default-rfs6000

|-----------|---------------------------------|
| <i>no</i> | Resets the configured area name |
|-----------|---------------------------------|

## 7.1.6 arp

### ► Profile Config Commands

Adds a static *Address Resolution Protocol* (ARP) IP address in the ARP cache

The ARP protocol maps an IP address to a hardware MAC address recognized on the network. ARP provides protocol rules for making this correlation and providing address conversion in both directions.

When an incoming packet destined for a host arrives, ARP finds a physical host or MAC address that matches the IP address. ARP looks in its ARP cache and, if it finds the address, provides it so the packet can be converted to the right packet length, formatted, and sent to its destination. If no entry is found for the IP address, ARP broadcasts a request packet in a special format on the LAN to locate a device that recognizes the IP address. A device that recognizes the IP address as its own returns a reply indicating it. ARP updates the ARP cache for future reference and then sends the packet to the MAC address that replied.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
arp [<IP>|timeout]
```

```
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1>] {dhcp-server|router}
```

```
arp timeout <15-86400>
```

#### Parameters

- arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1>] {dhcp-server|router}

|                      |                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arp <IP>             | Adds a static ARP IPv4 address in the ARP cache <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the static IP address.</li> </ul>                                                                                                    |
| <MAC>                | Specify the MAC address associated with the IP and the <i>Switch Virtual Interface</i> (SVI).                                                                                                                                                      |
| arpa                 | Sets ARP encapsulation type to ARPA                                                                                                                                                                                                                |
| <L3-INTERFACE-NAME>  | Configures static ARP entry for a specified router interface <ul style="list-style-type: none"> <li>• &lt;L3-INTERFACE-NAME&gt; - Specify the router interface name.</li> </ul>                                                                    |
| pppoe1               | Configures static ARP entry for PPP over Ethernet interface                                                                                                                                                                                        |
| vlan <1-4094>        | Configures static ARP entry for a VLAN interface <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify a SVI VLAN ID from 1 - 4094.</li> </ul>                                                                                         |
| wwan1                | Configures static ARP entry for Wireless WAN interface                                                                                                                                                                                             |
| {dhcp-server router} | The following keywords are common to all off the above interface types: <ul style="list-style-type: none"> <li>• dhcp-server - Optional. Sets ARP entries for a DHCP server</li> <li>• router - Optional. Sets ARP entries for a router</li> </ul> |

- arp timeout <15-86400>

|                           |                                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arp timeout<br><15-86400> | Sets ARP entry timeout <ul style="list-style-type: none"> <li>• &lt;TIME&gt; - Sets the ARP entry timeout in seconds. Specify a value from 15 - 86400 seconds. The default is 3600 seconds.</li> </ul> |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000)#arp timeout 2000

## 7.1.7 auto-learn

### ► Profile Config Commands

Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device’s host name via DHCP options.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
auto-learn [host-name-via-dhcp <WORD>|staging-config]
```

#### Parameters

- auto-learn [host-name-via-dhcp <WORD>|staging-config]

|                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>auto-learn [host-name-via-dhcp &lt;WORD&gt;  staging-config]</pre> | <p>Enables auto-learning of:</p> <ul style="list-style-type: none"> <li>• host-name-via-dhcp – A device’s host name via DHCP option. <ul style="list-style-type: none"> <li>• &lt;WORD&gt; – Provide the optional template with substitution token. For example, 'outdoor-<i>\$DHCP</i>[1:3]-ap', where the <i>\$DHCP token</i> references DHCP Option value received by the adopting device. The <i>\$DHCP token</i> should be present. This option is disabled by default.</li> <li>• staging-config – The network configuration of devices requesting adoption. This option is enabled by default. For dependent access points that are pre-staged prior to deployment, it is recommended that the auto-learn-staging-config parameter remains enabled so that hostnames, VLAN and IP addressing configuration can be maintained upon initial adoption. However, if dependent access points are to be centrally managed and configured, it is recommended that the auto-learn-staging-config parameter be disabled.</li> </ul> </li> </ul> |
|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-profile-test)#auto-learn staging-config

nx9500-6C8809(config-profile-test)#show context include-factory | include auto-learn
 auto-learn staging-config
 no auto-learn host-name-via-dhcp
nx9500-6C8809(config-profile-test)#
```

|-----------|----------------------------------------------------------------------------------|
| <i>no</i> | Disables automatic recognition of devices’ hostname and devices pending adoption |
|-----------|----------------------------------------------------------------------------------|

## 7.1.8 autogen-uniqueid

### ► Profile Config Commands

Auto-generates a unique ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device. A device's unique ID is a combination of a user-defined string (prefix, suffix, or both) and a substitution token. The WiNG implementation provides two built-in substitution tokens: \$SN and \$MiNT-ID that represent the device's serial number and MiNT-ID respectively. The value referenced by these substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for the device.

The general format of this command is: <PREFIX><SUBSTITUTION-TOKEN><SUFFIX>. You can provide both (prefix and suffix) or just a prefix or suffix.

For example, given the following set of inputs:

- user-defined prefix – TestAP6522
- substitution token – \$SN

The unique ID is generated using TestAP6522\$SN, where \$SN is replaced with the device's serial number.

When executed on an AP6522 (having serial number B4C7996C8809), the autogen-uniqueid TestAP6522\$SN command generates the unique ID: TestAP6522B4C7996C8809. When configured on an AP6522 profile, all AP6522s using the profile auto-generate a unique ID in which the device's serial number is preceded by the string 'TestAP6522'.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
autogen-uniqueid <WORD>
```

#### Parameters

- autogen-uniqueid <WORD>

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 7.1.9 autoinstall

### ► Profile Config Commands

Automatically installs firmware image and startup configuration parameters on to the selected device.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
autoinstall [configuration|firmware|start-interval <WORD>]
```

#### Parameters

- autoinstall [configuration|firmware|start-interval <WORD>]

|                          |                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| configuration            | Autoinstalls startup configuration. Setup parameters are automatically configured on devices using this profile. This option is disabled by default.                                                                                                                                                                                                                                           |
| firmware                 | Autoinstalls firmware image. Firmware images are automatically installed on devices using this profile. This option is disabled by default.                                                                                                                                                                                                                                                    |
| start-interval<br><WORD> | Configures the interval between system boot and start of autoinstall process (this is the time, from system boot, after which autoinstall should start) <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the interval in minutes. The default is 10 minutes.</li> </ul> <p><b>Note:</b> Zero (0) implies firmware or startup configuration installation can start any time.</p> |

#### Example

```

## 7.1.10 bridge

### ► Profile Config Commands

The following table summarizes Ethernet bridge configuration commands:

| Command                          | Description                                        | Reference        |
|----------------------------------|----------------------------------------------------|------------------|
| <i>bridge</i>                    | Enables Ethernet bridge configuration context      | <i>page 7-32</i> |
| <i>bridge-vlan-mode commands</i> | Summarizes bridge VLAN configuration mode commands | <i>page 7-35</i> |

### 7.1.10.1 bridge

#### ► bridge

Configures VLAN Ethernet bridging parameters. Use this command to configure a Bridge NAT or Bridge VLAN settings

Configuring bridge *Network Address Translation* (NAT) parameters, allows management of Internet traffic originating at a remote site. In addition to traditional NAT functionality, bridge NAT provides a means of configuring NAT for bridged traffic through an access point. NAT rules are applied to bridged traffic through the access point, and matching packets are NATed to the WAN link instead of being bridged on their way to the router. Using bridge NAT, a tunneled VLAN (extended VLAN) is created between the NOC and a remote location. When a remote client needs to access the Internet, Internet traffic is routed to the NOC, and from there routed to the Internet. This increases the access time for the end user on the client. To resolve latency issues, bridge NAT identifies and segregates traffic heading towards the NOC and outwards towards the Internet. Traffic towards the NOC is allowed over the secure tunnel. Traffic towards the Internet is switched to a local WLAN link with access to the Internet.

A *Virtual LAN* (VLAN) is a separately administrated virtual network within the same physical managed network. VLANs are broadcast domains defined within wireless controllers or service platforms to allow control of broadcast, multicast, unicast, and unknown unicast within a layer 2 device. For example, say several computers are used in conference room X and some in conference Y. The systems in conference room X can communicate with one another, but not with the systems in conference room Y. The VLAN enables the systems in conference rooms X and Y to communicate with one another even though they are on separate physical subnets. The systems in conference rooms X and Y are managed by the same single wireless controller or service platform, but ignore the systems that are not using the same VLAN ID. Administrators often need to route traffic between different VLANs. Bridging VLANs are only for non-routable traffic, like tagged VLAN frames destined to some other device, which will untag it. When a data frame is received on a port, the VLAN bridge determines the associated VLAN based on the port of reception. Using forwarding database information, the bridge VLAN forwards the data frame on the appropriate port(s). VLANs are useful to set separate networks to isolate some computers from others, without actually having to have separate cabling and Ethernet switches. Controllers can do this on their own, without need for the computer or other gear to know itself what VLAN it is on (this is called port-based VLAN, since it is assigned by port of the switch). Another common use is to put specialized devices like VoIP Phones on a separate network for easier configuration, administration, security, or quality of service.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Switch Note:** For more information on the interface types and the devices supporting them, see [interface](#).

**Syntax**

```
bridge [nat|vlan]
```

```
bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface
[<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|
overload|pool <NAT-POOL-NAME>)]
```

```
bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

**Parameters**

- bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|pool <NAT-POOL-NAME>)]

|                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nat                                                                       | Configures bridge NAT parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| source                                                                    | Configures NAT source addresses                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| list<br><IP-ACCESS-LIST-NAME><br>precedence <1-500>                       | Associates an <i>access control list</i> (ACL) with this bridge NAT policy. The ACL specifies the IP address permit/deny rules applicable to this bridge NAT policy. <ul style="list-style-type: none"> <li>• &lt;IP-ACCESS-LIST-NAME&gt; - Specify access list name.</li> <li>• precedence &lt;1-500&gt; - Specifies a precedence value for this bridge NAT policy.</li> </ul>                                                                                                                                                                                                                       |
| interface<br>[<LAYER3-INTERFACE-NAME> <br>pppoe1 vlan <1-4094> <br>wwan1] | Selects one of the following as the primary interface (between the source and destination points): <ul style="list-style-type: none"> <li>• &lt;LAYER3-INTERFACE-NAME&gt; - A router interface. Specify interface name.</li> <li>• pppoe1 - A PPP over Ethernet interface.</li> <li>• vlan &lt;1-4094&gt; - A VLAN interface. Specify the VLAN interface index from 1 - 4094.</li> <li>• wwan1 - A Wireless WAN interface.</li> </ul>                                                                                                                                                                 |
| [(address interface <br>overload pool<br><NAT-POOL-NAME>)]                | The following keywords are recursive and common to all interface types: <ul style="list-style-type: none"> <li>• address - Configures the interface IP address used for NAT</li> <li>• interface - Configures the failover interface (default setting)</li> <li>• overload - Enables use of one global address for multiple local addresses (terminates command)</li> <li>• pool &lt;NAT-POOLNAME&gt; - Configures the NAT pool used with this bridge NAT policy. Specify the NAT pool name. For more information on configuring a NAT pool, see <a href="#">nat-pool-config-instance</a>.</li> </ul> |

- bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]

|                        |                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan <1-4094>          | Configures the numerical identifier for the Bridge VLAN when it was initially created. <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify a VLAN index from 1 - 4094.</li> </ul>    |
| vlan <VLAN-ALIAS-NAME> | Configures the VLAN alias (should be existing and configured) identifying the bridge VLAN <ul style="list-style-type: none"> <li>• &lt;VLAN-ALIAS-NAME&gt; - Specify a VLAN alias name.</li> </ul> |

**Usage Guidelines**

Creating customized filter schemes for bridged networks limits the amount of unnecessary traffic processed and distributed by the bridging equipment.

If a bridge does not hear *Bridge Protocol Data Units* (BPDUs) from the root bridge within the specified interval, defined in the max-age (seconds) parameter, assume the network has changed and recomputed the spanning-tree topology.

**Example**

```

rfs6000-37FABE(config-profile-default-rfs6000)#bridge vlan 1
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#?
Bridge VLAN Mode commands:
 Bridge VLAN Mode commands:
 bridging-mode Configure how packets on this
 VLAN are bridged
 captive-portal Captive Portal
 captive-portal-enforcement Enable captive-portal enforcement
 on this extended VLAN
 description Vlan description
 edge-vlan Enable edge-VLAN mode
 firewall Enable vlan firewall(IPv4)
 http-analyze Forward URL and Data to
 controller
 ip Internet Protocol (IP)
 ipv6 Internet Protocol version 6
 (IPv6)
 l2-tunnel-broadcast-optimization Enable broadcast optimization
 l2-tunnel-forward-additional-packet-types Forward additional packet types
 not normally forwarded by l2
 broadcast optimization
 mac-auth Enable mac-auth for this bridge
 vlan
 no Negate a command or set its
 defaults
 stateful-packet-inspection-l2 Enable stateful packet inspection
 in layer2 firewall
 tunnel Vlan tunneling settings
 tunnel-over-level2 Tunnel extended VLAN traffic over
 level 2 MiNT links
 use Set setting to use

## 7.1.10.2 bridge-vlan-mode commands

### ► *bridge*

The following table summarizes bridge VLAN configuration mode commands:

| Command                                          | Description                                                                                                                                                                                       | Reference                 |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <i>bridging-mode</i>                             | Configures how packets on this VLAN are bridged                                                                                                                                                   | <a href="#">page 7-36</a> |
| <i>captive-portal</i>                            | Enables IP packet snooping on wired captive portals, and also configures the subnet to snoop                                                                                                      | <a href="#">page 7-38</a> |
| <i>captive-portal-enforcement</i>                | Enables auto-enforcement of captive portal rules on this extended VLAN interface                                                                                                                  | <a href="#">page 7-39</a> |
| <i>description</i>                               | Configures VLAN bridge description                                                                                                                                                                | <a href="#">page 7-40</a> |
| <i>edge-vlan</i>                                 | Enables edge VLAN mode                                                                                                                                                                            | <a href="#">page 7-41</a> |
| <i>firewall</i>                                  | Enables firewall on this bridge VLAN interface                                                                                                                                                    | <a href="#">page 7-42</a> |
| <i>http-analyze</i>                              | Enables the analysis of URLs and data traffic on this Bridge VLAN                                                                                                                                 | <a href="#">page 7-43</a> |
| <i>ip</i>                                        | Configures IP components                                                                                                                                                                          | <a href="#">page 7-44</a> |
| <i>ipv6</i>                                      | Configures IPv6 components                                                                                                                                                                        | <a href="#">page 7-47</a> |
| <i>l2-tunnel-broadcast-optimization</i>          | Enables broadcast optimization                                                                                                                                                                    | <a href="#">page 7-50</a> |
| <i>l2-tunnel-forward-additional-packet-types</i> | Enables forwarding of <i>Wireless Network Management Protocol</i> (WNMP) packets across L2 tunnels. These WNMP packets are normally not forwarded if L2 tunnel broadcast optimization is enabled. | <a href="#">page 7-53</a> |
| <i>mac-auth</i>                                  | Enables MAC authentication for Extended VLAN and Tunneled traffic                                                                                                                                 | <a href="#">page 7-51</a> |
| <i>no</i>                                        | Negates a command or reverts settings to their default                                                                                                                                            | <a href="#">page 7-54</a> |
| <i>stateful-packet-inspection-l2</i>             | Enables stateful packet inspection in the layer 2 fire wall                                                                                                                                       | <a href="#">page 7-56</a> |
| <i>tunnel</i>                                    | Enables tunneling of unicast messages to unknown MAC destinations, on the selected VLAN bridge                                                                                                    | <a href="#">page 7-57</a> |
| <i>tunnel-over-level2</i>                        | Enables extended VLAN traffic over level 2 MiNT links                                                                                                                                             | <a href="#">page 7-59</a> |
| <i>use</i>                                       | Associates a captive-portal, access control list (IP, IPv6, or MAC), and a URL filter with this bridge VLAN                                                                                       | <a href="#">page 7-60</a> |

### 7.1.10.2.1 bridging-mode

▶ *bridge-vlan-mode commands*

Configures how packets are bridged on the selected VLAN

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

**Parameters**

- bridging-mode [auto|isolated-tunnel|local|tunnel]

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bridging-mode   | Configures the VLAN bridging mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| auto            | Automatically selects the bridging mode to match the WLAN, VLAN and bridging mode configurations. When selected, the controller or access point determines the best bridging mode for the VLAN. (default setting)                                                                                                                                                                                                                                                                                                                                                      |
| isolated-tunnel | Bridges packets between local Ethernet ports and local radios, and passes tunneled packets through without de-tunneling<br>Select this option for a dedicated tunnel for bridging VLAN traffic.                                                                                                                                                                                                                                                                                                                                                                        |
| local           | Bridges packets normally between local Ethernet ports and local radios (if any)<br>Local mode is typically configured in remote branch offices where traffic on remote private LAN segments need to be bridged locally. Local mode implies that traffic, wired and wireless, is to be bridged locally.                                                                                                                                                                                                                                                                 |
| tunnel          | Bridges packets between local Ethernet ports, local radios, and tunnels to other APs, wireless controllers, or service platforms<br>Select this option to use a shared tunnel for bridging VLAN traffic.<br>In tunnel mode, the traffic at the AP is always forwarded through the best path. The APs decide the best path to reach the destination and forward packets accordingly. Setting the VLAN to tunnel mode ensures packets are bridged between local Ethernet ports, any local radios, and tunnels to other APs, wireless controllers, and service platforms. |

**Usage Guidelines**

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#bridging-mode
isolated-tunnel

rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#show context
bridge vlan 1
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#
```

**Related Commands**

|           |                              |
|-----------|------------------------------|
| <i>no</i> | Resets bridging mode to auto |
|-----------|------------------------------|

### 7.1.10.2.2 captive-portal

► *bridge-vlan-mode commands*

Enables IP (IPv4 and IPv6) packet snooping on wired captive portals, and also configures the subnet to snoop. When enabled, IP packets received from wired captive portal clients, on the specified subnet, are snooped to learn IP to MAC mapping.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}
```

**Parameters**

```
• captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}
```

|                                                     |                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| captive-portal<br>[ipv4-snooping <br>ipv6-snooping] | Enables snooping of IPv4 or IPv6 packets (based on the option selected) for wired captive portal clients                                                                                                                                                                                                                                   |
| subnet <IPv4/M <br>IPv6/M>                          | Enables IPv4 or IPv6 packet snooping on a specified subnet <ul style="list-style-type: none"> <li>• &lt;IPv4/M IPv6/M&gt; - Specify the subnet address in the A.B.C.D/M or X::X:X/M format to identify an IPv4 or IPv6 subnet respectively. When specified, this is the IPv4/IPv6 subnet on which IP packets are to be snooped.</li> </ul> |
| excluded-address<br><IPv4 IPv6>                     | Optional. Configures the IPv4 or IPv6 address excluded from snooping within the specified IPv4 IPv6 subnet. <ul style="list-style-type: none"> <li>• &lt;IPv4 IPv6&gt; - Specify the IPv4 or IPv6 address. Use this parameter to configure the gateway's address.</li> </ul>                                                               |

**Example**

```
nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#captive-portal ip-snooping
subnet 192.168.13.0/24 excluded-address 192.168.13.7

nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#show context
bridge vlan 4
 captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
 ip igmp snooping
 ip igmp snooping querier
 ipv6 mld snooping
 ipv6 mld snooping querier
nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#
```

|-----------|------------------------------------------------------|
| <i>no</i> | Disables IP packet snooping on wired captive portals |
|-----------|------------------------------------------------------|

### 7.1.10.2.3 captive-portal-enforcement

▶ *bridge-vlan-mode commands*

Enables auto-enforcement of captive portal rules on this extended VLAN interface. This option is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
captive-portal-enforcement {fall-back}
```

**Parameters**

- captive-portal-enforcement {fallback}

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| captive-portal-enforcement | Enables auto-enforcement of captive portal access permission rules to data transmitted over this extended VLAN interface. When enforced, wired network users can pass traffic through the captive portal without being redirected to an authentication page. Authentication instead takes place when the RADIUS server is queried against the wired user's MAC address. If the MAC address is in the RADIUS server's user database, the user is allowed access.<br><br>A captive portal is an access policy for providing temporary and restrictive access using a standard Web browser. Captive portals capture and re-direct a wired/wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access the network. |
| fall-back                  | Optional. If enabling source MAC authentication for Extended VLAN and tunneled traffic on this bridge VLAN, use this option to enforce captive-portal authentication as the fall-back mode of authentication in case MAC authentication fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Example**

```
nx9500-6C8809(config-profile testAP7602-bridge-vlan-20)#show context
bridge vlan 20
 captive-portal-enforcement
 ip igmp snooping
 ip igmp snooping querier
 ipv6 mld snooping
 ipv6 mld snooping querier
nx9500-6C8809(config-profile testAP7602-bridge-vlan-20)#
```

### 7.1.10.2.4 description

► *bridge-vlan-mode commands*

Configures this extended VLAN's description

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7632, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
description <WORD>
```

**Parameters**

- description <WORD>

|                    |                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <WORD> | Configures a description for this VLAN bridge <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Enter a description. The description should be unique to the VLAN's specific configuration to help differentiate it from other VLANs with similar configurations.</li> </ul> |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#description "This is
a description for the bridged VLAN"

rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#show context
bridge vlan 1
description "This is a description for the bridged VLAN"
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#
```

**Related Commands**

|           |                            |
|-----------|----------------------------|
| <i>no</i> | Removes VLAN's description |
|-----------|----------------------------|

### 7.1.10.2.5 edge-vlan

▶ *bridge-vlan-mode commands*

Enables the edge VLAN mode. In the edge VLAN mode, a protected port does not forward traffic to another protected port on the same wireless controller or service platform. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
edge-vlan
```

**Parameters**

None

**Example**

```
rfs6000-37FABE (config-profile-default-rfs6000-bridge-vlan-1)#edge-vlan
rfs6000-37FABE (config-profile-default-rfs6000-bridge-vlan-1)#
```

**Related Commands**

|           |                             |
|-----------|-----------------------------|
| <i>no</i> | Disables the edge VLAN mode |
|-----------|-----------------------------|

### 7.1.10.2.6 firewall

▶ *bridge-vlan-mode commands*

Enables IPv4 firewall on this bridge VLAN interface. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
firewall
```

**Parameters**

None

**Example**

```
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#firewall
rfs6000-37FABE(config-profile-default-rfs6000-bridge-vlan-1)#
```

**Related Commands**

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>no</i> | Disables firewall on this bridge VLAN interface |
|-----------|-------------------------------------------------|

### 7.1.10.2.7 http-analyze

▶ *bridge-vlan-mode commands*

Enables the analysis of URLs and data traffic on this Bridge VLAN. When enabled, URLs and data are forwarded to the controller running the HTTP analytics engine.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
http-analyze {filter [images|post|query-string]}
```

**Parameters**

- http-analyze {filter [images|post|query-string]}

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>http-analyze filter [images post  query-string]</pre> | <p>Enables URL and HTTP data analysis. Optionally use the filter keyword to filter out specific URLs</p> <ul style="list-style-type: none"> <li>• filter - Optional. Filters out specific URLs <ul style="list-style-type: none"> <li>• images - Filters out URLs referring to images</li> <li>• post - Filters out URLs referring to POSTs</li> <li>• query-string - Filters out query strings received from URLs</li> </ul> </li> </ul> |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-device 00-23-68-22-9D-58-bridge-vlan-4) #http-analyze filter
images

rfs4000-229D58 (config-device 00-23-68-22-9D-58-bridge-vlan-4) #show context
bridge vlan 4
 http-analyze filter images
rfs4000-229D58 (config-device 00-23-68-22-9D-58-bridge-vlan-4) #
```

**Related Commands**

|               |                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------|
| <pre>no</pre> | <p>Disables forwarding of URLs and data to the controller running the HTTP analytics engine</p> |
|---------------|-------------------------------------------------------------------------------------------------|

### 7.1.10.2.8 ip

► *bridge-vlan-mode commands*

Configures VLAN bridge IP components

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
ip [arp|dhcp|igmp]

ip [arp|dhcp] trust

ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count|
mrouter|querier}

ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count
<1-7>}

ip igmp snooping {mrouter [interface|learn]}
ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}

ip igmp snooping {querier} {address|max-response-time|timer|version}
ip igmp snooping {querier} {address <IP>|max-response-time <1-25>|timer expiry
<60-300>|version <1-3>}
```

**Parameters**

- ip [arp|dhcp] trust

|                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
