ABOUT THIS GUIDE

Chapter 1, INTRODUCTION

| | |
|---|------|
| 1.1 CLI Overview | 1-2 |
| 1.2 Getting Context Sensitive Help | 1-7 |
| 1.3 Using the No Command | 1-9 |
| 1.3.1 Basic Conventions | 1-9 |
| 1.4 Using CLI Editing Features and Shortcuts | 1-9 |
| 1.4.1 Moving the Cursor on the Command Line | 1-10 |
| 1.4.2 Completing a Partial Command Name | 1-10 |
| 1.4.3 Command Output Pagination | 1-11 |
| 1.5 Using CLI to Create Profiles and Enable Remote Administration | 1-11 |
| 1.5.1 Creating Profiles | 1-12 |
| 1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface | 1-13 |
| 1.5.3 Enabling Remote Administration | 1-14 |

Chapter 2, USER EXEC MODE COMMANDS

| | |
|--|------|
| 2.1 User Exec Commands | 2-2 |
| 2.1.1 captive-portal-page-upload | 2-4 |
| 2.1.2 change-passwd | 2-8 |
| 2.1.3 clear | 2-9 |
| 2.1.4 clock | 2-20 |
| 2.1.5 cluster | 2-21 |
| 2.1.6 connect | 2-22 |
| 2.1.7 create-cluster | 2-23 |
| 2.1.8 crypto | 2-24 |
| 2.1.9 crypto-cmp-cert-update | 2-33 |
| 2.1.10 database | 2-34 |
| 2.1.11 database-backup | 2-38 |
| 2.1.12 database-restore | 2-40 |
| 2.1.13 device-upgrade | 2-41 |
| 2.1.14 disable | 2-49 |
| 2.1.15 enable | 2-50 |
| 2.1.16 file-sync | 2-51 |
| 2.1.17 join-cluster | 2-54 |
| 2.1.18 l2tpv3 | 2-56 |
| 2.1.19 logging | 2-58 |
| 2.1.20 mint | 2-60 |
| 2.1.21 no | 2-62 |
| 2.1.22 on | 2-64 |
| 2.1.23.opendns | 2-65 |
| 2.1.24 page | 2-67 |
| 2.1.25 ping | 2-68 |
| 2.1.26 ping6 | 2-70 |
| 2.1.27 ssh | 2-71 |
| 2.1.28 telnet | 2-72 |
| 2.1.29 terminal | 2-73 |
| 2.1.30 time-it | 2-74 |
| 2.1.31 traceroute | 2-75 |
| 2.1.32 traceroute6 | 2-76 |

| | |
|------------------------------|------|
| 2.1.33 virtual-machine | 2-77 |
| 2.1.34 watch | 2-83 |
| 2.1.35 exit | 2-84 |

Chapter 3, PRIVILEGED EXEC MODE COMMANDS

| | |
|---|-------|
| 3.1 Privileged Exec Mode Commands | 3-3 |
| 3.1.1 archive | 3-6 |
| 3.1.2 boot | 3-8 |
| 3.1.3 captive-portal-page-upload | 3-9 |
| 3.1.4 cd | 3-13 |
| 3.1.5 change-passwd | 3-14 |
| 3.1.6 clear | 3-15 |
| 3.1.7 clock | 3-28 |
| 3.1.8 cluster | 3-29 |
| 3.1.9 configure | 3-30 |
| 3.1.10 connect | 3-31 |
| 3.1.11 copy | 3-32 |
| 3.1.12 cpe | 3-33 |
| 3.1.13 create-cluster | 3-35 |
| 3.1.14 crypto | 3-37 |
| 3.1.15 crypto-cmp-cert-update | 3-46 |
| 3.1.16 database | 3-47 |
| 3.1.17 database-backup | 3-50 |
| 3.1.18 database-restore | 3-52 |
| 3.1.19 delete | 3-53 |
| 3.1.20 device-upgrade | 3-54 |
| 3.1.21 diff | 3-60 |
| 3.1.22 dir | 3-61 |
| 3.1.23 disable | 3-62 |
| 3.1.24 edit | 3-63 |
| 3.1.25 enable | 3-64 |
| 3.1.26 erase | 3-65 |
| 3.1.27 ex3500 | 3-67 |
| 3.1.28 factory-reset | 3-75 |
| 3.1.29 file-sync | 3-79 |
| 3.1.30 halt | 3-82 |
| 3.1.31 join-cluster | 3-83 |
| 3.1.32 l2tpv3 | 3-85 |
| 3.1.33 logging | 3-87 |
| 3.1.34 mint | 3-89 |
| 3.1.35 mkdir | 3-91 |
| 3.1.36 more | 3-92 |
| 3.1.37 no | 3-93 |
| 3.1.38 on | 3-95 |
| 3.1.39.opendns | 3-96 |
| 3.1.40 page | 3-100 |
| 3.1.41 ping | 3-101 |
| 3.1.42 ping6 | 3-103 |
| 3.1.43 pwd | 3-104 |
| 3.1.44 re-elect | 3-105 |
| 3.1.45 reload | 3-106 |
| 3.1.46 rename | 3-111 |
| 3.1.47 rmdir | 3-112 |

| | |
|------------------------------|-------|
| 3.1.48 self | 3-113 |
| 3.1.49 ssh | 3-114 |
| 3.1.50 t5 | 3-115 |
| 3.1.51 telnet | 3-117 |
| 3.1.52 terminal | 3-118 |
| 3.1.53 time-it | 3-119 |
| 3.1.54 traceroute | 3-120 |
| 3.1.55 traceroute6 | 3-121 |
| 3.1.56 upgrade | 3-122 |
| 3.1.57 upgrade-abort | 3-126 |
| 3.1.58 virtual-machine | 3-127 |
| 3.1.59 watch | 3-133 |
| 3.1.60 exit | 3-134 |
| 3.1.61 raid | 3-135 |

Chapter 4, GLOBAL CONFIGURATION COMMANDS

| | |
|---|-------|
| 4.1 Global Configuration Commands | 4-4 |
| 4.1.1 aaa-policy | 4-9 |
| 4.1.2 alias | 4-11 |
| 4.1.3 aaa-tacacs-policy | 4-20 |
| 4.1.4 ap6521 | 4-22 |
| 4.1.5 ap6522 | 4-23 |
| 4.1.6 ap6532 | 4-24 |
| 4.1.7 ap6562 | 4-25 |
| 4.1.8 ap71xx | 4-26 |
| 4.1.9 ap7502 | 4-27 |
| 4.1.10 ap7522 | 4-28 |
| 4.1.11 ap7532 | 4-29 |
| 4.1.12 ap7562 | 4-30 |
| 4.1.13 ap7602 | 4-31 |
| 4.1.14 ap7612 | 4-32 |
| 4.1.15 ap7622 | 4-33 |
| 4.1.16 ap7632 | 4-34 |
| 4.1.17 ap7662 | 4-35 |
| 4.1.18 ap81xx | 4-36 |
| 4.1.19 ap82xx | 4-37 |
| 4.1.20 ap8432 | 4-38 |
| 4.1.21 ap8533 | 4-39 |
| 4.1.22 application | 4-40 |
| 4.1.23 application-group | 4-48 |
| 4.1.24 application-policy | 4-55 |
| 4.1.25 association-acl-policy | 4-78 |
| 4.1.26 auto-provisioning-policy | 4-79 |
| 4.1.27 bgp | 4-81 |
| 4.1.28 bonjour-gateway-discovery-policy | 4-83 |
| 4.1.29 bonjour-gw-forwarding-policy | 4-90 |
| 4.1.30 bonjour-gw-query-forwarding-policy | 4-92 |
| 4.1.31 captive portal | 4-93 |
| 4.1.32 clear | 4-146 |
| 4.1.33 client-identity | 4-147 |
| 4.1.34 client-identity-group | 4-156 |
| 4.1.35 clone | 4-164 |
| 4.1.36 crypto-cmp-policy | 4-165 |

| | | |
|--------|----------------------------------|-------|
| 4.1.37 | customize | 4-166 |
| 4.1.38 | database-client-policy | 4-177 |
| 4.1.39 | database-policy | 4-184 |
| 4.1.40 | device | 4-192 |
| 4.1.41 | device-categorization | 4-194 |
| 4.1.42 | dhcp-server-policy | 4-200 |
| 4.1.43 | dhcpv6-server-policy | 4-201 |
| 4.1.44 | dns-whitelist | 4-203 |
| 4.1.45 | end | 4-208 |
| 4.1.46 | event-system-policy | 4-209 |

| 16.2.12 | session-resumption | 16-32 |
| 16.2.13 | termination | 16-33 |
| 16.2.14 | use | 16-34 |
| 16.3 | radius-user-pool-policy | 16-35 |
| 16.3.1 | duration | 16-36 |
| 16.3.2 | user | 16-37 |
| 16.3.3 | no | 16-40 |

Chapter 17, RADIO-QOS-POLICY

| | | |
|--------|-----------------------|-------|
| 17.1 | radio-qos-policy | 17-4 |
| 17.1.1 | accelerated-multicast | 17-5 |
| 17.1.2 | admission-control | 17-6 |
| 17.1.3 | no | 17-10 |
| 17.1.4 | smart-aggregation | 17-12 |
| 17.1.5 | service | 17-14 |
| 17.1.6 | wmm | 17-16 |

Chapter 18, ROLE-POLICY

| | | |
|--------|-----------------|-------|
| 18.1 | role-policy | 18-2 |
| 18.1.1 | default-role | 18-3 |
| 18.1.2 | ldap-deadperiod | 18-5 |
| 18.1.3 | ldap-query | 18-6 |
| 18.1.4 | ldap-server | 18-7 |
| 18.1.5 | ldap-timeout | 18-9 |
| 18.1.6 | no | 18-10 |
| 18.1.7 | user-role | 18-11 |

Chapter 19, SMART-RF-POLICY

| | | |
|---------|------------------------|-------|
| 19.1 | smart-rf-policy | 19-3 |
| 19.1.1 | area | 19-4 |
| 19.1.2 | assignable-power | 19-5 |
| 19.1.3 | avoidance-time | 19-6 |
| 19.1.4 | channel-list | 19-8 |
| 19.1.5 | channel-width | 19-9 |
| 19.1.6 | coverage-hole-recovery | 19-11 |
| 19.1.7 | enable | 19-13 |
| 19.1.8 | group-by | 19-14 |
| 19.1.9 | interference-recovery | 19-15 |
| 19.1.10 | neighbor-recovery | 19-17 |
| 19.1.11 | no | 19-19 |
| 19.1.12 | sensitivity | 19-21 |

| | |
|------------------------------------|-------|
| 19.1.13 smart-ocs-monitoring | 19-23 |
|------------------------------------|-------|

Chapter 20, WIPS-POLICY

| | |
|--|-------|
| 20.1 wips-policy | 20-4 |
| 20.1.1 ap-detection | 20-5 |
| 20.1.2 enable | 20-7 |
| 20.1.3 event | 20-8 |
| 20.1.4 history-throttle-duration | 20-12 |
| 20.1.5 interference-event | 20-13 |
| 20.1.6 no | 20-14 |
| 20.1.7 signature | 20-16 |
| 20.1.8 use | 20-33 |

Chapter 21, WLAN-QOS-POLICY

| | |
|------------------------------------|-------|
| 21.1 wlan-qos-policy | 21-2 |
| 21.1.1 accelerated-multicast | 21-3 |
| 21.1.2 classification | 21-5 |
| 21.1.3 multicast-mask | 21-7 |
| 21.1.4 no | 21-8 |
| 21.1.5 qos | 21-9 |
| 21.1.6 rate-limit | 21-10 |
| 21.1.7 svp-prioritization | 21-13 |
| 21.1.8 voice-prioritization | 21-14 |
| 21.1.9 wmm | 21-15 |

Chapter 22, L2TPV3-POLICY

| | |
|---|-------|
| 22.1 l2tpv3-policy-commands | 22-3 |
| 22.1.1 cookie-size | 22-5 |
| 22.1.2 failover-delay | 22-6 |
| 22.1.3 force-l2-path-recovery | 22-7 |

ABOUT THIS GUIDE

This manual supports the following wireless controllers, service platforms, and access points:

- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000
- Access Points – AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8122, AP8132, AP8163, AP8232, AP8432, AP8533

NOTE: In this document AP8122, AP8132, AP8163 are collectively referred to as AP81XX.

CAUTION: To configure a WE access point, exclusively use the WE UI. Do not use the *command line interface* (CLI) along with it. Similarly, when using the CLI to configure the WE access point, do not use the WE UI along with it.

A simplified version of the WiNG operating system *user interface* (UI) is available on the following access point and service platforms models:

- AP6521E, AP6522E, AP6562E, AP7502E, AP7522E, AP7532E, AP7562E, AP7602, AP7612, AP7632, AP7662
- NX5500E, NX7510E, and VX9000E

This new WiNG *Express* (WE) UI, simplifies configuration and monitoring of small access point deployments by limiting monitoring, analytics, and configuration capabilities. The WE UI is designed for single-site access point deployments not exceeding more than 24 access points of the same model.

This section is organized into the following topics:

- *Document Conventions*
- *Notational Conventions*
- *End-User Software License Agreement*

Document Conventions

The following conventions are used in this document to draw your attention to important information:

NOTE: Indicates tips or special requirements.

CAUTION: Indicates conditions that can cause equipment damage or data loss.

WARNING! Indicates a condition or procedure that could result in personal injury or equipment damage.

Switch Note: Indicates caveats unique to a RFS4000, RFS6000, NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, or NX9600 model controller.

Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents
- Bullets (•) indicate:
 - lists of alternatives
 - lists of required steps that are not necessarily sequential
 - action items
- Sequential lists (those describing step-by-step procedures) appear as numbered lists

Understanding Command Syntax

| | |
|-------------------------------|--|
| <code><variable></code> | <p>Variables are described with a short description enclosed within a ‘<’ and a ‘>’ pair.</p> <p>For example, the command,</p> <pre style="margin-left: 40px;">nx9500-6C8809>show interface ge 1</pre> <p>is documented as:</p> <pre style="margin-left: 40px;">show interface ge <1-2></pre> <p>where:</p> <ul style="list-style-type: none"> • show – is the command – displays information • interface – is the keyword – represents the interface type • <1-2> – is the variable – represents the ge interface index value |
|-------------------------------|--|

| | |
|----|--|
| | <p>The pipe symbol. This is used to separate the variables/keywords in a list.</p> <p>For example, the command,</p> <pre>nx9500-6C8809> show</pre> <p>is documented as:</p> <pre>show [adoption bluetooth bonjour boot </pre> <p>where:</p> <ul style="list-style-type: none"> • show – is the command – displays information • [adoption bluetooth bonjour boot] – indicates the different keywords that can be combined with the show command. However, only one of the above option can be used at a time. <pre>show adoption ... show bluetooth ... show bonjour ...</pre> |
| [] | <p>Of the different keywords and variables listed inside a '[' & ']' pair, only one can be used. Each choice in the list is separated with a ' ' (pipe) symbol.</p> <p>For example, the command,</p> <pre>nx9500-6C8809#clear ...</pre> <p>is documented as:</p> <pre>clear [arp-cache bonjour cdp counters crypto event-history firewall gre ip ipv6 l2tpv3- stats lacp license lldp logging mac-address- table mint role rtls spanning-tree traffic- shape vrrp]</pre> <p>where:</p> <ul style="list-style-type: none"> • clear – is the command • [arp-cache cdp bonjour counters crypto event-history firewall gre ip ipv6 l2tpv3-stats lacp license lldp logging mac-address-table mint role rtls spanning-tree traffic-shape vrrp] – indicates that these keywords are available for this command. However, only one can be used at a time. |

| | |
|--------------------------|--|
| <p>{ }</p> | <p>Any command/keyword/variable or a combination of them inside a '{ & }' pair is optional. All optional commands follow the same conventions as listed above. However, they are displayed italicized. For example, the command,</p> <pre>nx9500-6C8809> show adoption</pre> <p>is documented as:</p> <pre>show adoption info {on <DEVICE-NAME>}</pre> <p>here:</p> <ul style="list-style-type: none"> • show adoption info – is the command. This command can also be used as: <pre>show adoption info</pre> <p>The command can also be extended as:</p> <pre>show adoption info {on <DEVICE-NAME>}</pre> <p>here:</p> <ul style="list-style-type: none"> • {on <DEVICE-NAME>} – is the keyword, which is optional. |
| <p>command / keyword</p> | <p>The first word is always a command. Keywords are words that must be entered as is. Commands and keywords are mandatory. For example, the command,</p> <pre>nx9500-6C8809>show wireless</pre> <p>is documented as:</p> <pre>show wireless</pre> <p>where:</p> <ul style="list-style-type: none"> • show – is the command • wireless – is the keyword |
| <p>()</p> | <p>Any command/keyword/variable or a combination of them inside a '(&)' pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands. For example, the command,</p> <pre>crypto pki export request generate-rsa-key test autogen-subject-name ...</pre> <p>is documented as:</p> <pre>nx9500-6C8809#crypto pki export request generate-rsa-key test autogen-subject-name (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)</pre> <p>here:</p> <ul style="list-style-type: none"> • crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME> auto-gen-subject-name – is the command • <RSA-KEYPAIR-NAME> – is the RSA keypair name (in this example, the keypair name is 'test'), and is a variable <ul style="list-style-type: none"> • (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>) – is the set of recursive parameters (separated by commas) that can be used in any order. |

End-User Software License Agreement

This document is an agreement (“Agreement”) between You, the end user, and Extreme Networks, Inc., on behalf of itself and its Affiliates (“Extreme”) that sets forth your rights and obligations with respect to the “Licensed Materials”. BY INSTALLING SOFTWARE AND/OR THE LICENSE KEY FOR THE SOFTWARE (“License Key”) (collectively, “Licensed Software”), IF APPLICABLE, COPYING, OR OTHERWISE USING THE LICENSED SOFTWARE AND/OR ANY OF THE LICENSED MATERIALS UNDER THIS AGREEMENT, YOU ARE AGREEING TO BE BOUND BY THE TERMS OF THIS AGREEMENT, WHICH INCLUDES THE LICENSE(S) AND THE LIMITATION(S) OF WARRANTY AND DISCLAIMER(S)/LIMITATION(S) OF LIABILITY. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, RETURN THE LICENSE KEY (IF APPLICABLE) TO EXTREME OR YOUR DEALER, IF ANY, OR DO NOT USE THE LICENSED SOFTWARE AND/OR LICENSED MATERIALS AND CONTACT EXTREME OR YOUR DEALER WITHIN TEN (10) DAYS FOLLOWING THE DATE OF RECEIPT TO ARRANGE FOR A REFUND. IF YOU HAVE ANY QUESTIONS ABOUT THIS AGREEMENT, CONTACT EXTREME, Attn: LegalTeam@extremenetworks.com.

- 1. DEFINITIONS.** “Affiliates” means any person, partnership, corporation, limited liability company, or other form of enterprise that directly or indirectly through one or more intermediaries, controls, or is controlled by, or is under common control with the party specified. “Server Application” means the software application associated to software authorized for installation (per License Key, if applicable) on one or more of Your servers as further defined in the Ordering Documentation. “Client Application” shall refer to the application to access the Server Application. “Network Device” for purposes of this Agreement shall mean a physical computer device, appliance, appliance component, controller, wireless access point, or virtual appliance as further described within the applicable product documentation, which includes the Order Documentation. “Licensed Materials” means the Licensed Software (including the Server Application and Client Application), Network Device (if applicable), Firmware, media embodying software, and the accompanying documentation. “Concurrent User” shall refer to any of Your individual employees who You provide access to the Server Application at any one time. “Firmware” refers to any software program or code embedded in chips or other media. “Standalone” software is software licensed for use independent of any hardware purchase as identified in the Ordering Documentation. “Licensed Software” collectively refers to the software, including Standalone software, Firmware, Server Application, Client Application or other application licensed with conditional use parameters as defined in the Ordering Documentation. “Ordering Documentation” shall mean the applicable price quotation, corresponding purchase order, relevant invoice, order acknowledgement, and accompanying documentation or specifications for the products and services purchased, acquired or licensed hereunder from Extreme either directly or indirectly.
- 2. TERM.** This Agreement is effective from the date on which You accept the terms and conditions of this Agreement via click-through, commence using the products and services or upon delivery of the License Key if applicable, and shall be effective until terminated. In the case of Licensed Materials offered on a subscription basis, the term of “licensed use” shall be as defined within Your Ordering Documentation.
- 3. GRANT OF LICENSE.** Extreme will grant You a non-transferable, non-sublicensable, non-exclusive license to use the Licensed Materials and the accompanying documentation for Your own business purposes subject to the terms and conditions of this Agreement, applicable licensing restrictions, and any term, user server networking device, field of use, or other restrictions as set forth in Your Ordering Documentation. If the Licensed Materials are being licensed on a subscription and/or capacity basis, the applicable term and/or capacity limit of the license shall be specified in Your Ordering Documentation. You may install and use the Licensed Materials as permitted by the license type purchased as described below in License Types. The license type purchased is specified on the invoice issued to You by Extreme

or Your dealer, if any. YOU MAY NOT USE, COPY, OR MODIFY THE LICENSED MATERIALS, IN WHOLE OR IN PART, EXCEPT AS EXPRESSLY PROVIDED IN THIS AGREEMENT.

4 LICENSE TYPES.

- *Single User, Single Network Device.* Under the terms of this license type, the license granted to You by Extreme authorizes You to use the Licensed Materials as bundled with a single Network Device as identified by a unique serial number for the applicable Term, if and as specified in Your Ordering Documentation, or any replacement for that network device for that same Term, for internal use only. A separate license, under a separate License Agreement, is required for any other network device on which You or another individual, employee or other third party intend to use the Licensed Materials. A separate license under a separate License Agreement is also required if You wish to use a Client license (as described below).
- *Single User, Multiple Network Device.* Under the terms of this license type, the license granted to You by Extreme authorizes You to use the Licensed Materials with a defined amount of Network Devices as defined in the Ordering Documentation.
- *Client.* Under the terms of the Client license, the license granted to You by Extreme will authorize You to install the License Key for the Licensed Materials on your server and allow the specific number of Concurrent Users as ordered by you and is set forth in Your Ordering Documentation. A separate license is required for each additional Concurrent User.
- *Standalone.* Software or other Licensed Materials licensed to You for use independent of any Network Device.
- *Subscription.* Licensed Materials, and inclusive Software, Network Device or related appliance updates and maintenance services, licensed to You for use during a subscription period as defined in Your applicable Ordering Documentation.
- *Capacity.* Under the terms of this license, the license granted to You by Extreme authorizes You to use the Licensed Materials up to the amount of capacity or usage as defined in the Ordering Documentation.

5 AUDIT RIGHTS. You agree that Extreme may audit Your use of the Licensed Materials for compliance with these terms and Your License Type at any time, upon reasonable notice. In the event that such audit reveals any use of the Licensed Materials by You other than in full compliance with the license granted and the terms of this Agreement, Extreme reserves the right to charge You for all reasonable expenses related to such audit in addition to any other liabilities and overages applicable as a result of such non-compliance, including but not limited to additional fees for Concurrent Users, excess capacity or usage over and above those specifically granted to You. From time to time, the Licensed Materials may upload information about the Licensed Materials and the associated usage to Extreme. This is to verify the Licensed Materials are being used in accordance with a valid license and/or entitlement. By using the Licensed Materials, you consent to the transmission of this information.

6 RESTRICTION AGAINST COPYING OR MODIFYING LICENSED MATERIALS. Except as expressly permitted in this Agreement, You may not copy or otherwise reproduce the Licensed Materials. In no event does the limited copying or reproduction permitted under this Agreement include the right to decompile, disassemble, electronically transfer, or reverse engineer the Licensed Materials, including the Licensed Software, or to translate the Licensed Materials into another computer language. The media embodying the Licensed Materials may be copied by You, in whole or in part, into printed or machine readable form, in sufficient numbers only for backup or archival purposes, or to replace a worn or defective copy. However, You agree not to have more than two (2) copies of the Licensed Software in whole or in part, including the original media, in your possession for said purposes without Extreme' prior written consent, and in no event shall You operate more copies of the Licensed Software than the specific licenses granted to You. You may not copy or reproduce the documentation. You agree to maintain appropriate records of the location of the original media and all copies of the Licensed Software, in whole or in part, made by You. Any portion of the Licensed Software included in any such modular work shall be used only on a single computer for internal purposes and shall remain subject to

all the terms and conditions of this Agreement. You agree to include any copyright or other proprietary notice set forth on the label of the media embodying the Licensed Software on any copy of the Licensed Software in any form, in whole or in part, or on any modification of the Licensed Software or any such modular work containing the Licensed Software or any part thereof.

7 TITLE AND PROPRIETARY RIGHTS

- a The Licensed Materials are copyrighted works and are the sole and exclusive property of Extreme, any company or a division thereof which Extreme controls or is controlled by, or which may result from the merger or consolidation with Extreme (its “Affiliates”), and/or their suppliers. This Agreement conveys a limited right to operate the Licensed Materials and shall not be construed to convey title to the Licensed Materials to You. There are no implied rights. You shall not sell, lease, transfer, sublicense, dispose of, or otherwise make available the Licensed Materials or any portion thereof, to any other party.
- b You further acknowledge that in the event of a breach of this Agreement, Extreme shall suffer severe and irreparable damages for which monetary compensation alone will be inadequate. You therefore agree that in the event of a breach of this Agreement, Extreme shall be entitled to monetary damages and its reasonable attorney’s fees and costs in enforcing this Agreement, as well as injunctive relief to restrain such breach, in addition to any other remedies available to Extreme.

8 PROTECTION AND SECURITY. In the performance of this Agreement or in contemplation thereof, You and your employees and agents may have access to private or confidential information owned or controlled by Extreme relating to the Licensed Materials supplied hereunder including, but not limited to, product specifications and schematics, and such information may contain proprietary details and disclosures. All information and data so acquired by You or your employees or agents under this Agreement or in contemplation hereof shall be and shall remain Extreme’ exclusive property, and You shall use all commercially reasonable efforts to keep, and have your employees and agents keep, any and all such information and data confidential, and shall not copy, publish, or disclose it to others, without Extreme’ prior written approval, and shall return such information and data to Extreme at its request. Nothing herein shall limit your use or dissemination of information not actually derived from Extreme or of information which has been or subsequently is made public by Extreme, or a third party having authority to do so.

You agree not to deliver or otherwise make available the Licensed Materials or any part thereof, including without limitation the object or source code (if provided) of the Licensed Software, to any party other than Extreme or its employees, except for purposes specifically related to your use of the Licensed Materials on a single computer as expressly provided in this Agreement, without the prior written consent of Extreme. You acknowledge that the Licensed Materials contain valuable confidential information and trade secrets, and that unauthorized use, copying and/or disclosure thereof are harmful to Extreme or its Affiliates and/or its/their software suppliers.

9 MAINTENANCE AND UPDATES. Except as otherwise defined below, updates and certain maintenance and support services, if any, shall be provided to You pursuant to the terms of an Extreme Service and Maintenance Agreement, if Extreme and You enter into such an agreement. Except as specifically set forth in such agreement, Extreme shall not be under any obligation to provide updates, modifications, or enhancements, or maintenance and support services for the Licensed Materials to You. If you have purchased Licensed Materials on a subscription basis then the applicable service terms for Your Licensed Materials are as provided in Your Ordering Documentation. Extreme will perform the maintenance and updates in a timely and professional manner, during the Term of Your subscription, using qualified and experienced personnel. You will cooperate in good faith with Extreme in the performance of the support services including, but not limited to, providing Extreme with: (a) access to the Extreme Licensed Materials (and related systems); and (b) reasonably requested assistance and

information. Further information about the applicable maintenance and updates terms can be found on Extreme's website at <http://www.extremenetworks.com/company/legal/terms-of-support>

- 10 DEFAULT AND TERMINATION. In the event that You shall fail to keep, observe, or perform any obligation under this Agreement, including a failure to pay any sums due to Extreme, or in the event that you become insolvent or seek protection, voluntarily or involuntarily, under any bankruptcy law, Extreme may, in addition to any other remedies it may have under law, terminate the License and any other agreements between Extreme and You.
- a Immediately after any termination of the Agreement, Your licensed subscription term, or if You have for any reason discontinued use of Licensed Materials, You shall return to Extreme the original and any copies of the Licensed Materials and remove the Licensed Materials, including an Licensed Software, from any modular works made pursuant to Section 3, and certify in writing that through your best efforts and to the best of your knowledge the original and all copies of the terminated or discontinued Licensed Materials have been returned to Extreme.
 - b Sections 1, 7, 8, 10, 11, 12, 13, 14 and 15 shall survive termination of this Agreement for any reason.
- 11 EXPORT REQUIREMENTS. You are advised that the Licensed Materials, including the Licensed Software is of United States origin and subject to United States Export Administration Regulations; diversion contrary to United States law and regulation is prohibited. You agree not to directly or indirectly export, import or transmit the Licensed Materials, including the Licensed Software to any country, end user or for any Use that is prohibited by applicable United States regulation or statute (including but not limited to those countries embargoed from time to time by the United States government); or contrary to the laws or regulations of any other governmental entity that has jurisdiction over such export, import, transmission or Use.
- 12 UNITED STATES GOVERNMENT RESTRICTED RIGHTS. The Licensed Materials (i) were developed solely at private expense; (ii) contain "restricted computer software" submitted with restricted rights in accordance with section 52.227-19 (a) through (d) of the Commercial Computer Software-Restricted Rights Clause and its successors, and (iii) in all respects is proprietary data belonging to Extreme and/or its suppliers. For Department of Defense units, the Licensed Materials are considered commercial computer software in accordance with DFARS section 227.7202-3 and its successors, and use, duplication, or disclosure by the U.S. Government is subject to restrictions set forth herein.
- 13 LIMITED WARRANTY AND LIMITATION OF LIABILITY. Extreme warrants to You that (a) the initially-shipped version of the Licensed Materials will materially conform to the Documentation; and (b) the media on which the Licensed Software is recorded will be free from material defects for a period of ninety (90) days from the date of delivery to You or such other minimum period required under applicable law. Extreme does not warrant that Your use of the Licensed Materials will be error-free or uninterrupted.

NEITHER EXTREME NOR ITS AFFILIATES MAKE ANY OTHER WARRANTY OR REPRESENTATION, EXPRESS OR IMPLIED, WITH RESPECT TO THE LICENSED MATERIALS, WHICH ARE LICENSED "AS IS". THE LIMITED WARRANTY AND REMEDY PROVIDED ABOVE ARE EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES, INCLUDING IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHICH ARE EXPRESSLY DISCLAIMED, AND STATEMENTS OR REPRESENTATIONS MADE BY ANY OTHER PERSON OR FIRM ARE VOID. IN NO EVENT WILL EXTREME OR ANY OTHER PARTY WHO HAS BEEN INVOLVED IN THE CREATION, PRODUCTION OR DELIVERY OF THE LICENSED MATERIALS BE LIABLE FOR SPECIAL, DIRECT, INDIRECT, RELIANCE, INCIDENTAL OR CONSEQUENTIAL DAMAGES, INCLUDING LOSS OF DATA OR PROFITS OR FOR INABILITY TO USE THE LICENSED MATERIALS, TO ANY PARTY EVEN IF EXTREME OR SUCH OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN NO EVENT SHALL

EXTREME OR SUCH OTHER PARTY'S LIABILITY FOR ANY DAMAGES OR LOSS TO YOU OR ANY OTHER PARTY EXCEED THE LICENSE FEE YOU PAID FOR THE LICENSED MATERIALS.

Some states do not allow limitations on how long an implied warranty lasts and some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation and exclusion may not apply to You. This limited warranty gives You specific legal rights, and You may also have other rights which vary from state to state.

- 14 JURISDICTION. The rights and obligations of the parties to this Agreement shall be governed and construed in accordance with the laws and in the State and Federal courts of the State of California, without regard to its rules with respect to choice of law. You waive any objections to the personal jurisdiction and venue of such courts. None of the 1980 United Nations Convention on the Limitation Period in the International Sale of Goods, and the Uniform Computer Information Transactions Act shall apply to this Agreement.
- 15 FREE AND OPEN SOURCE SOFTWARE. Portions of the Software (Open Source Software) provided to you may be subject to a license that permits you to modify these portions and redistribute the modifications (an Open Source License). Your use, modification and redistribution of the Open Source Software are governed by the terms and conditions of the applicable Open Source License. More details regarding the Open Source Software and the applicable Open Source Licenses are available at www.extremenetworks.com/services/SoftwareLicensing.aspx. Some of the Open Source software may be subject to the GNU General Public License v.x (GPL) or the Lesser General Public Library (LGPL), copies of which are provided with the Licensed Materials and are further available for review at www.extremenetworks.com/services/SoftwareLicensing.aspx, or upon request as directed herein. In accordance with the terms of the GPL and LGPL, you may request a copy of the relevant source code. See the Software Licensing web site for additional details. This offer is valid for up to three years from the date of original download of the software.
- 16 GENERAL.
 - a This Agreement is the entire agreement between Extreme and You regarding the Licensed Materials, and all prior agreements, representations, statements, and undertakings, oral or written, are hereby expressly superseded and canceled.
 - b This Agreement may not be changed or amended except in writing signed by both parties hereto.
 - c You represent that You have full right and/or authorization to enter into this Agreement.
 - d This Agreement shall not be assignable by You without the express written consent of Extreme. The rights of Extreme and Your obligations under this Agreement shall inure to the benefit of Extreme' assignees, licensors, and licensees.
 - e Section headings are for convenience only and shall not be considered in the interpretation of this Agreement
 - f The provisions of the Agreement are severable and if any one or more of the provisions hereof are judicially determined to be illegal or otherwise unenforceable, in whole or in part, the remaining provisions of this Agreement shall nevertheless be binding on and enforceable by and between the parties hereto
 - g Extreme's waiver of any right shall not constitute waiver of that right in future. This Agreement constitutes the entire understanding between the parties with respect to the subject matter hereof, and all prior agreements, representations, statements and undertakings, oral or written, are hereby expressly superseded and canceled. No purchase order shall supersede this Agreement.

1 INTRODUCTION

This chapter describes the commands available within a device's *Command Line Interface* (CLI) structure. CLI is available for wireless controllers, access points (APs), and service platforms.

Access the CLI by using:

- A terminal emulation program running on a computer connected to the serial port on the device (access point, wireless controller, and service platform).
- A Telnet session through *Secure Shell* (SSH) over a network.

Configuration for connecting to a Controller using a terminal emulator

If connecting through the serial port, use the following settings to configure your terminal emulator:

| | |
|------------------------|---|
| <i>Bits Per Second</i> | 19200 For AP8533, AP8432, AP7662, AP7632, AP7622, AP7612, AP7602, AP7502, AP7522, AP7532, AP7562, AP6521, AP6522, AP6532, AP6562 model access points set this value to 115200. |
| <i>Data Bits</i> | 8 |
| <i>Parity</i> | None |
| <i>Stop Bit</i> | 1 |
| <i>Flow Control</i> | None |

When a CLI session is established, complete the following (user input is in bold):

```
login as: <username>  
administrator's login password: <password>
```

User Credentials

Use the following credentials when logging into a device for the first time:

| | |
|------------------|-----------------|
| <i>User Name</i> | admin |
| <i>Password</i> | admin123 |

When logging into the CLI for the first time, you are prompted to change the password.

Examples in this reference guide

Examples used in this reference guide are generic to each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation "Supported in the following platforms:" For an example, see below:

Supported in the following platforms:

- Wireless Controller – RFS6000

The above example indicates the command is only available for an RFS6000 model wireless controller.

This chapter is organized into the following sections:

- *CLI Overview*
- *Getting Context Sensitive Help*
- *Using the No Command*
- *Using CLI Editing Features and Shortcuts*
- *Using CLI to Create Profiles and Enable Remote Administration*

1.1 CLI Overview

► INTRODUCTION

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.

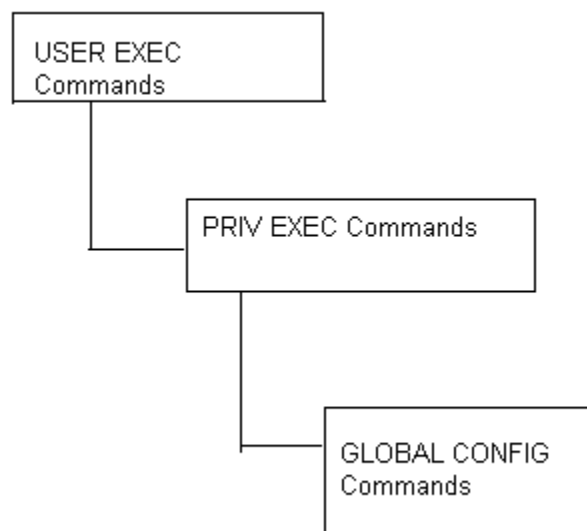

Figure 1-1 *Hierarchy of User Modes*

Command Modes

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is

reserved for tasks that do not change the device's (wireless controller, service platform, or AP) configuration.

```
rfs6000-6DB5D4>
```

The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

```
rfs6000-6DB5D4>enable
rfs6000-6DB5D4#
```

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing 'commit' command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

```
rfs6000-6DB5D4#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs6000-6DB5D4(config)#
```

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

```
rfs6000-6DB5D4(config)#aaa-policy test
rfs6000-6DB5D4(config-aaa-policy-test)#
```

The following table summarizes available CLI commands:

Table 1.1 *Controller CLI Modes and Commands*

| User Exec Mode | Priv Exec Mode | Global Configuration Mode |
|----------------------------|----------------------------|---------------------------|
| captive-portal-page-upload | archive | aaa-policy |
| change-passwd | boot | aaa-tacacs-policy |
| clear | captive-portal-page-upload | alias |
| clock | cd | ap6521 |
| cluster | change-passwd | ap6522 |
| commit | clear | ap6532 |
| connect | clock | ap6562 |
| create-cluster | cluster | ap7161 |
| crypto | commit | ap7502 |
| crypto-cmp-cert-update | configure | ap7522 |
| database | connect | ap7532 |
| database-backup | copy | ap7562 |

Table 1.1 *Controller CLI Modes and Commands*

| User Exec Mode | Priv Exec Mode | Global Configuration Mode |
|--|--|--|
| database-restore | cpe (RFS4000, RFS6000, NX9500, NX9600, VX9000) | ap7602 |

|----------------|----------------|---------------------------|
| | | commit |
| | | do |
| | | end |
| | | exit |
| | | revert |
| | | service |
| | | show |

1.2 Getting Context Sensitive Help

▶ INTRODUCTION

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

| Command | Description |
|---|--|
| (prompt)#help | Displays a brief description of the help system |
| (prompt)#abbreviated-command-entry? | Lists commands in the current mode that begin with a particular character string |
| (prompt)#abbreviated-command-entry[TAB] | Completes a partial command name |
| (prompt)#? | Lists all commands available in the command mode |
| (prompt)#command ? | Lists the available syntax options (arguments and keywords) for the command |
| (prompt)#command keyword ? | Lists the next available syntax option for the command |

NOTE: The system prompt varies depending on the configuration mode.

NOTE: Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

NOTE: The escape character used through out the CLI is "\". To enter a "\" use "\\" instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

```
rfs6000-6DB5D4#service?
service Service Commands
rfs6000-6DB5D4#service
```

Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the "?". This form of help is called command syntax help. It shows the keywords or arguments available based on the command/keyword and argument already entered.

```
rfs6000-6DB5D4#service ?
block-adopter-config-update      Block configuration updates from the
bluetooth                        Bluetooth service commands
clear                             Clear adoption history
cli-tables-skin                  Choose a formatting layout/skin for CLI
                                tabular outputs (EXPERIMENTAL-Applies only
                                to certain commands)
cluster                           Cluster Protocol
copy                              Copy files or directories
delete                            Delete sessions
delete-offline-aps               Delete Access Points that are configured
                                but offline
force-send-config                 Resend configuration to the device
force-update-vm-stats            Force VM statistics to be pushed up to the
                                NOC
load-balancing                    Wireless load-balancing service commands
load-ssh-authorized-keys         Load Ssh authorized keys
locator                           Enable leds flashing on the device
mint                              MiNT protocol
pktcap                           Start packet capture
pm                                Process Monitor
radio                             Radio parameters
radius                            Radius test
request-full-config-from-adopter Request full configuration from the
                                adopter
set                               Set global options
show                              Show running system information
signal                            Send a signal to a process
smart-rf                          Smart-RF Management Commands
snmp                              Snmp
ssm                               Command related to ssm
start-shell                       Provide shell access
syslog                            Syslog service
trace                             Trace a process for system calls and
                                signals
troubleshoot                       Troubleshooting
wireless                          Wireless commands

rfs6000-6DB5D4#
```

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, “configure terminal” can be abbreviated as **config t**. Since the abbreviated command is unique, the controller accepts the abbreviation and executes the command.

Enter the help command (available in any command mode) to provide the following description:

```
rfs6000-6DB5D4>help
```

```
When using the CLI, help is provided at the command line when typing '?'. If no
help is available, the help content will be empty. Backup until entering a '?'
shows the help content.
There are two styles of help provided:
1. Full help. Available when entering a command argument (e.g. 'show ?'). This will
```

describe each possible argument.

2. Partial help. Available when an abbreviated argument is entered. This will display which arguments match the input (e.g. 'show ve?').

```
rfs6000-6DB5D4>
```

1.3 Using the No Command

▶ INTRODUCTION

Almost every command has a **no** form. Use **no** to disable a feature or function or return it to its default. Use the command without the **no** keyword to re-enable a disabled feature.

1.3.1 Basic Conventions

Keep the following conventions in mind while working within the CLI structure:

- Use “?” at the end of a command to display the sub-modes (keywords) associated with the command. Type the first few characters of the required sub-mode and press the tab key to auto-fill. Continue using “?” until you reach the last sub-mode.
- Pre-defined CLI commands and keywords are case-insensitive: `cfg` = `Cfg` = `CFG`. However (for clarity), CLI commands and keywords are displayed (in this guide) using mixed case. For example, `apPolicy`, `trapHosts`, `channelInfo`.
- Enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive.

1.4 Using CLI Editing Features and Shortcuts

▶ INTRODUCTION

A variety of shortcuts and edit features are available. The following sections describe these features:

- [Moving the Cursor on the Command Line](#)
- [Completing a Partial Command Name](#)
- [Command Output Pagination](#)

1.4.1 Moving the Cursor on the Command Line

► *Using CLI Editing Features and Shortcuts*

The following table shows the key combinations or sequences to move the command line cursor. Ctrl defines the control key, which must be pressed simultaneously with its associated letter key. Esc means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions.

Table 1.2 *Keystrokes Details*

| Keystrokes | Function Summary | Function Details |
|----------------------------|-------------------|--|
| Left Arrow or Ctrl-B | Back character | Moves the cursor one character to the left When entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt. |
| Right Arrow or Ctrl-F | Forward character | Moves the cursor one character to the right |
| Esc- B | Back word | Moves the cursor back one word |
| Esc- F | Forward word | Moves the cursor forward one word |
| Ctrl-A | Beginning of line | Moves the cursor to the beginning of the command line |
| Ctrl-E | End of line | Moves the cursor to the end of the command line |
| Ctrl-D | | Deletes the current character |
| Ctrl-U | | Deletes text up to cursor |
| Ctrl-K | | Deletes from the cursor to end of the line |
| Ctrl-P | | Obtains the prior command from memory |
| Ctrl-N | | Obtains the next command from memory |
| Esc-C | | Converts the letter at the cursor to uppercase |
| Esc-L | | Converts the letter at the cursor to lowercase |
| Esc-D | | Deletes the remainder of a word |
| Ctrl-W | | Deletes the word up to the cursor |
| Ctrl-Z | | Returns to the root prompt |
| Ctrl-T | | Transposes the character to the left of the cursor with the character located at the cursor |
| Ctrl-L | | Clears the screen |

1.4.2 Completing a Partial Command Name

► *Using CLI Editing Features and Shortcuts*

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a Tab key, press Ctrl-L.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter “conf” within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with **conf**.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

```
rfs6000-6DB5D4#conf[TAB]
rfs6000-6DB5D4#configure
```

When using the command completion feature, the CLI displays the full command name. The command is not executed until the [Return] or [Enter] key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (?) to obtain a list of commands beginning with a particular set of characters. Do not leave a space between the last letter and the question mark (?).

In the following example, all commands, available in the current context, starting with the characters ‘co’ are listed:

```
rfs6000-6DB5D4#co?
commit      Commit all changes made in this session
configure   Enter configuration mode
connect     Open a console connection to a remote device
copy        Copy from one file to another

rfs6000-6DB5D4#
```

NOTE: The characters entered before the question mark are reprinted to the screen to complete the command entry.

1.4.3 Command Output Pagination

► *Using CLI Editing Features and Shortcuts*

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a

```
--More--
```

prompt displays at the bottom of the screen. To resume the output, press the [Enter] key to scroll down one line or press the Spacebar to display the next full screen of output.

1.5 Using CLI to Create Profiles and Enable Remote Administration

► *INTRODUCTION*

The following sections describe the following essential procedures:

- *Creating Profiles*
- *Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface*
- *Enabling Remote Administration*

1.5.1 Creating Profiles

► *Using CLI to Create Profiles and Enable Remote Administration*

Profiles are sort of a 'template' representation of configuration. The system has:

- a default profile for each of the following devices:
 - RFS4000, RFS6000
- a default profile for each of the following service platforms:
 - NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000
- a default profile for each of the following access points:
 - AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533

You can modify a default profile. In the following example, an IP address is assigned to the management port on the default RFS6000 profile.

```
rfs6000-6DB5D4 (config)#profile rfs6000 default-rfs6000
rfs6000-6DB5D4 (config-profile-default-rfs6000)#interface mel
rfs6000-6DB5D4 (config-profile-default-rfs6000-if-mel)#ip address 172.16.10.2/24
rfs6000-6DB5D4 (config-profile-default-rfs6000-if-mel)#commit
rfs6000-6DB5D4 (config-profile-default-rfs6000)#exit
rfs6000-6DB5D4 (config)#
```

The following command displays a default AP7562 profile configuration:

```
rfs6000-6DB5D4 (config-profile-default-ap7562)#
rfs6000-6DB5D4 (config-profile-default-ap7562)#show context
profile ap7562 default-ap7562
  autoinstall configuration
  autoinstall firmware
  crypto ikev1 policy ikev1-default

```

1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface

► Using CLI to Create Profiles and Enable Remote Administration

Logon to the controller in config mode and follow the procedure below:

```
rfs6000-6DB5D4(config-profile-default-rfs6000)#interface vlan 150

rfs6000-6DB5D4(config-profile-default-rfs6000-if-vlan150)#ip address
192.168.150.20/24

rfs6000-6DB5D4(config-profile-default-rfs6000-if-vlan150)#exit

rfs6000-6DB5D4(config-profile-default-rfs6000)#interface ge 3

rfs6000-6DB5D4(config-profile-default-rfs6000-if-ge3)#switchport access vlan 150

1.5.3 Enabling Remote Administration

► *Using CLI to Create Profiles and Enable Remote Administration*

A terminal server may function in remote administration mode if either the terminal services role is not installed on the machine or the client used to invoke the session has enabled the admin controller.

- A terminal emulation program running on a computer connected to the serial port on the controller. The serial port is located on the front of the controller.
- A Telnet session through a Secure Shell (SSH) over a network. The Telnet session may or may not use SSH depending on how the controller is configured. It is recommended you use SSH for remote administration tasks.

This section is organized into the following sub sections:

- *Configuring Telnet for Management Access*
- *Configuring SSH for Management Access*

1.5.3.1 Configuring Telnet for Management Access

► *Enabling Remote Administration*

To enable Telnet for management access, use the serial console to login to the device and perform the following:

- 1 The session, by default, opens in the USER EXEC mode (one of the two access levels of the EXEC mode). Access the PRIV EXEC mode from the USER EXEC mode.

```
rfs6000-6DB5D4>en
rfs6000-6DB5D4#
```

- 2 Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
rfs6000-6DB5D4>en
rfs6000-6DB5D4#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs6000-6DB5D4(config)#
```

- 3 Go to 'default-management-policy' mode.

```
rfs6000-6DB5D4(config)#management-policy ?
MANAGEMENT  Name of the management policy to be configured (will be created
              if it does not exist)
```

```
rfs6000-6DB5D4(config)#management-policy default
rfs6000-6DB5D4(config-management-policy-default)#
```

- 4 Enter Telnet and the port number at the command prompt. Note, the port number is optional. If you do not specify the port, the system, by default, assigns port 23 for Telnet. Commit your changes. Telnet is enabled.

```
rfs6000-6DB5D4(config-management-policy-default)#telnet
rfs6000-6DB5D4(config-management-policy-default)#commit write
rfs6000-6DB5D4(config-management-policy-default)#end
rfs6000-6DB5D4#exit
```

- 5 Connect to the controller through Telnet using its configured IP address. If logging in for the first time, use the following credentials:

| | |
|------------------|----------|
| User Name | admin |
| Password | admin123 |

At the first-time login instance, you will be prompted to change the password. Set a new password.

- 6 On subsequent logins, to change the password, access the default management-policy configuration mode and enter the username, new password, role, and access details.

```
rfs6000-6DB5D4(config-management-policy-default)#user testuser password test@123

1.5.3.2 Configuring SSH for Management Access

► *Enabling Remote Administration*

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access on a device, login through the serial console and perform the following:

- 1 The session, by default, opens in the USER EXEC mode (one of the two access levels of the EXEC mode). Access the PRIV EXEC mode from the USER EXEC mode.

```
rfs6000-6DB5D4>en
rfs6000-6DB5D4#
```

- 2 Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
rfs6000-6DB5D4>en
rfs6000-6DB5D4#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs6000-6DB5D4(config)#
```

- 3 Go to 'default-management-policy' mode.

```
rfs6000-6DB5D4(config)#management-policy ?
MANAGEMENT Name of the management policy to be configured (will be created
if it does not exist)

rfs6000-6DB5D4(config)#management-policy default
rfs6000-6DB5D4(config-management-policy-default)#
```

- 4 Enter SSH at the command prompt.

```
rfs6000-6DB5D4 (config-management-policy-default) #ssh
rfs6000-6DB5D4 (config-management-policy-default) #commit write
rfs6000-6DB5D4 (config-management-policy-default) #end
rfs6000-6DB5D4#exit
```

- 5 Connect to the controller through SSH using its configured IP address. If logging in for the first time, use the following credentials:

| | |
|------------------|----------|
| User Name | admin |
| Password | admin123 |

At the first-time login instance, you will be prompted to change the password. Set a new password.

- 6 On subsequent logins, to change the password, access the default management-policy configuration mode and enter the username, new password, role, and access details.

```
rfs6000-6DB5D4 (config-management-policy-default) #user testuser password test@123

2 USER EXEC MODE COMMANDS

Logging in to the wireless controller places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

```
<DEVICE>>>?
Command commands:
captive-portal-page-upload  Captive portal internal and advanced page upload
change-passwd              Change password
clear                       Clear
clock                       Configure software system clock
cluster                     Cluster commands
commit                      Commit all changes made in this session
connect                     Open a console connection to a remote device
create-cluster              Create a cluster
crypto                      Encryption related commands
crypto-cmp-cert-update      Update the cmp certs
database                    Database
database-backup             Backup database
database-restore            Restore database
debug                       Debugging functions
device-upgrade              Device firmware upgrade
disable                     Turn off privileged mode command
enable                      Turn on privileged mode command
file-sync                   File sync between controller and adoptees
help                        Description of the interactive help system
join-cluster                Join the cluster
l2tpv3                      L2tpv3 protocol
logging                     Modify message logging facilities
mint                        MiNT protocol
no                           Negate a command or set its defaults
on                           On RF-Domain
opendns                     OpenDNS configuration
page                        Toggle paging
ping                        Send ICMP echo messages
ping6                       Send ICMPv6 echo messages
revert                      Revert changes
service                     Service Commands
show                        Show running system information
ssh                          Open an ssh connection
telnet                      Open a telnet connection
terminal                    Set terminal line parameters
time-it                     Check how long a particular command took between
                             request and completion of response
traceroute                  Trace route to destination
traceroute6                 Trace route to destination(IPv6)
virtual-machine              Virtual Machine
watch                       Repeat the specific CLI command at a periodic
                             interval
write                       Write running configuration to memory or
                             terminal

clrscr                       Clears the display screen
exit                        Exit from the CLI

<DEVICE>>>
```

2.1 User Exec Commands

► USER EXEC MODE COMMANDS

The following table summarizes the User Exec Mode commands:

Table 2.1 *User Exec Mode Commands*

| Command | Description | Reference |
|-----------------------------------|--|------------------|
| <i>captive-portal-page-upload</i> | Uploads captive portal advanced pages to adopted access points | <i>page 2-4</i> |
| <i>change-passwd</i> | Changes the password of a logged user | <i>page 2-8</i> |
| <i>clear</i> | Resets the last saved command | <i>page 2-9</i> |
| <i>clock</i> | Configures the system clock | <i>page 2-20</i> |
| <i>cluster</i> | Accesses the cluster context | <i>page 2-21</i> |
| <i>connect</i> | Establishes a console connection to a remote device | <i>page 2-22</i> |
| <i>create-cluster</i> | Creates a new cluster on a specified device | <i>page 2-23</i> |
| <i>crypto</i> | Enables encryption and configures encryption related parameters | <i>page 2-24</i> |
| <i>crypto-cmp-cert-update</i> | Triggers a CMP certificate update on a specified device or devices | <i>page 2-33</i> |
| <i>database</i> | Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight) | <i>page 2-34</i> |
| <i>database-backup</i> | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server | <i>page 2-38</i> |
| <i>database-restore</i> | Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database. | <i>page 2-40</i> |
| <i>device-upgrade</i> | Configures device firmware upgrade settings | <i>page 2-41</i> |
| <i>disable</i> | Turns off (disables) the privileged mode command set | <i>page 2-49</i> |
| <i>enable</i> | Turns on (enables) the privileged mode command set | <i>page 2-50</i> |
| <i>file-sync</i> | Configures parameters enabling syncing of PKCS#12 and wireless-bridge certificate between the staging-controller and adopted access points | <i>page 2-51</i> |
| <i>join-cluster</i> | Adds a device (access point, wireless controller, or service platform) to an existing cluster of devices | <i>page 2-54</i> |
| <i>l2tpv3</i> | Establishes or brings down <i>Layer 2 Tunneling Protocol Version 3</i> (L2TPV3) tunnels | <i>page 2-56</i> |
| <i>logging</i> | Modifies message logging facilities | <i>page 2-58</i> |
| <i>mint</i> | Configures MiNT protocol | <i>page 2-60</i> |
| <i>no</i> | Negates a command or sets its default | <i>page 2-62</i> |
| <i>on</i> | Executes the following commands in the RF Domain context: clscr, do, end, exit, help, service, and show | <i>page 2-64</i> |

Table 2.1 *User Exec Mode Commands*

| Command | Description | Reference |
|------------------------|---|------------------|
| <i>opendns</i> | Connects to the OpenDNS site using OpenDNS registered credentials (username, password) OR OpenDNS API token to fetch the OpenDNS device_id. This command is a part of the process that integrates access points, controllers, and service platforms with OpenDNS. | <i>page 2-65</i> |
| <i>page</i> | Toggles a device's (access point, wireless controller, or service platform) paging function | <i>page 2-67</i> |
| <i>ping</i> | Sends ICMP echo messages to a user-specified location | <i>page 2-68</i> |
| <i>ping6</i> | Sends ICMPv6 echo messages to a user-specified IPv6 address | <i>page 2-70</i> |
| <i>ssh</i> | Opens an SSH connection between two network devices | <i>page 2-71</i> |
| <i>telnet</i> | Opens a Telnet session | <i>page 2-72</i> |
| <i>terminal</i> | Sets the length and width of the terminal window | <i>page 2-73</i> |
| <i>time-it</i> | Verifies the time taken by a particular command between request and response | <i>page 2-74</i> |
| <i>traceroute</i> | Traces the route to its defined destination | <i>page 2-75</i> |
| <i>traceroute6</i> | Traces the route to a specified IPv6 destination | <i>page 2-76</i> |
| <i>virtual-machine</i> | Installs, configures, and monitors the status of virtual machines (VMs) installed on a WING controller | <i>page 2-77</i> |
| <i>watch</i> | Repeats a specific CLI command at a periodic interval | <i>page 2-83</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

NOTE: The input parameter <HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore (_) character.

2.1.1 captive-portal-page-upload

► *User Exec Commands*

Uploads captive portal advanced pages to adopted access points. Use this command to provide access points with specific captive portal configurations, so that they can successfully provision login, welcome, and condition pages to clients attempting to access the wireless network using the captive portal.

NOTE: Ensure that the captive portal pages uploaded are *.tar files.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|
load-file]

captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all]
{upload-time <TIME>}

captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME>|all]
{from-controller} {(upload-time <TIME>)}

captive-portal-page-upload cancel-upload [<MAC/HOSTNAME>|all|on rf-domain
[<DOMAIN-NAME>|all]]

captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>

captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

Parameters

- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all]
{upload-time <TIME>}

| | |
|--|---|
| captive-portal-page-upload <CAPTIVE-PORTAL-NAME> | Uploads advanced pages of the captive-portal identified by the <CAPTIVE-PORTAL-NAME> parameter <ul style="list-style-type: none"> • <CAPTIVE-PORTAL-NAME> - Specify the captive portal's name (should be existing and configured). |
| <MAC/HOSTNAME> | Uploads to a specified AP <ul style="list-style-type: none"> • <MAC/HOSTNAME> - Specify AP's MAC address or hostname. |
| all | Uploads to all APs |

| | |
|---|--|
| upload-time <TIME> | <p>Optional. Schedules an AP upload time</p> <ul style="list-style-type: none"> • <TIME> - Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. <p>The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.</p> <p>To view a list of uploaded captive portal files, execute the <i>show > captive-portal-page-upload > list-files <CAPTIVE-PORTAL-NAME></i> command.</p> |
| <ul style="list-style-type: none"> • captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME> all] {from-controller} {(upload-time <TIME>)} | |
| captive-portal-page-upload <CAPTIVE-PORTAL-NAME> | <p>Uploads advanced pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter</p> <ul style="list-style-type: none"> • <CAPTIVE-PORTAL-NAME> - Specify captive portal name (should be existing and configured). |
| rf-domain [<DOMAIN-NAME> all] | <p>Uploads to all APs within a specified RF Domain or all RF Domains</p> <ul style="list-style-type: none"> • <DOMAIN-NAME> - Uploads to APs within a specified RF Domain. Specify the RF Domain name. • all - Uploads to APs across all RF Domains |
| from-controller | <p>Optional. Uploads captive-portal pages to APs via the controller to which the APs are adopted</p> |
| upload-time <TIME> | <p>Optional. Schedules an AP upload time</p> <ul style="list-style-type: none"> • <TIME> - Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. <p>The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.</p> |
| <ul style="list-style-type: none"> • captive-portal-page-upload cancel-upload [<MAC/HOSTNAME> all on rf-domain [<DOMAIN-NAME> all]] | |
| captive-portal-page-upload cancel-upload | <p>Cancels a scheduled AP upload</p> |
| cancel-upload [<MAC/HOSTNAME> all on rf-domain [<DOMAIN-NAME> all]] | <p>Select one of the following options:</p> <ul style="list-style-type: none"> • <MAC/HOSTNAME> - Cancels scheduled upload to a specified AP. Specify the AP's MAC address or hostname. • all - Cancels all scheduled AP uploads • on rf- domain - Cancels all scheduled uploads to APs within a specified RF Domain or all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> - Cancels scheduled uploads to APs within a specified RF Domain. Specify RF Domain name. • all - Cancels scheduled uploads across all RF Domains |
| <ul style="list-style-type: none"> • captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME> | |
| captive-portal-page-upload delete-file | <p>Deletes a specified captive portal's uploaded captive-portal Web page files</p> |
| <CAPTIVE-PORTAL-NAME> <FILE-NAME> | <p>Identifies the captive-portal and Web pages to delete</p> <ul style="list-style-type: none"> • <CAPTIVE-PORTAL-NAME> - Specify the captive portal name. • <FILE-NAME> - Specify the file name. The specified internal captive portal page is deleted. |

- captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>

| | |
|--------------------------------------|--|
| captive-portal-page-upload load-file | Loads captive-portal advanced pages |
| <CAPTIVE-PORTAL-NAME> <URL> | <p>Specify the captive portal name and location. The captive portal should be existing and configured.</p> <ul style="list-style-type: none"> • <URL> - Specifies location of the captive-portal Web pages. Use one of the following formats to specify the location: <p>IPv4 URLs:</p> <pre>tftp://<hostname IP>[:port]/path/file ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file http://<hostname IP>[:port]/path/file cf:/path/file usb<n>:/path/file</pre> <p>IPv6 URLs:</p> <pre>tftp://<hostname [IPv6]>[:port]/path/file ftp://<user>:<passwd>@<hostname [IPv6]>[:port]/path/file sftp://<user>:<passwd>@<hostname [IPv6]>[:port]/path/file http://<hostname [IPv6]>[:port]/path/file</pre> <p>Note: The captive portal pages are downloaded to the controller from the location specified here. After downloading use the <i>captive-portal-page-upload > <CAPTIVE-PORTAL-NAME> > <DEVICE-OR-DOMAIN-NAME></i> command to upload these pages to APs.</p> |

Example

```
ap6562-B1A214>captive-portal-page-upload load-file captive_portal_test tftp://
89.89.89.17/pages_new_only.tar
ap6562-B1A214>

ap6562-B1A214>show captive-portal-page-upload load-image-status
Download of captive_portal_test advanced page file is complete
ap6562-B1A214>

ap6562-B1A214>captive-portal-page-upload captive_portal_test all
-----

2.1.2 change-passwd

► User Exec Commands

Changes the password of the logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

Parameters

- change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>

| | |
|----------------|--|
| <OLD-PASSWORD> | Optional. Specify the existing password. |
| <NEW-PASSWORD> | Specify the new password. Note: The password can also be changed interactively. To do so, press [Enter] after the command. |

Usage Guidelines

A password must be from 1 - 64 characters in length.

Example

```
rfs6000-81742D>change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs6000-81742D#write memory
OK
rfs6000-81742D>
```

2.1.3 clear

► User Exec Commands

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode where the clear command is executed.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

NOTE: When using the *clear* command, refer to the interface details provided in *interface*.

Syntax

```
clear [arp-cache|bonjour|cdp|counters|crypto|eguest|event-history|gre|ip|
ipv6|lacp|lldp|mac-address-table|mint|role|rtls|spanning-tree|traffic-shape|
vrrp]

clear arp-cache {on <DEVICE-NAME>}

clear bonjour cache {on <DEVICE-NAME>}

clear [cdp|lldp] neighbors {on <DEVICE-NAME>}

clear counters [ap|radio|wireless-client]

clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client
{<MAC>}] {(on <DEVICE-OR-DOMAIN-NAME>)}

clear crypto [ike|ipsec] sa
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}

clear eguest registration statistics

clear event-history

clear gre stats {on <DEVICE-NAME>}

clear ip [bgp|dhcp|ospf]

clear ip bgp [<IP>|all|external|process]
clear ip bgp [<IP>|all|external] {in|on|out|soft}
clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [<IP>|all|external] {out} {(on <DEVICE-NAME>)}
clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}

clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}

clear ipv6 neighbor-cache {on <DEVICE-NAME>}

clear lacp [<1-4> counters|counters]
```

```
clear mac-address-table {address|interface|mac-auth-state|vlan} {on <DEVICE-NAME>}

clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}

clear mac-address-table {interface [<IN-NAME>|ge <1-2>|port-channel <1-2>|vmif <1-8>]} {on <DEVICE-NAME>}

clear mac-address-table mac-auth-state address <MAC> vlan <1-4094> {on <DEVICE-NAME>}

clear mint mlcp history {on <DEVICE-NAME>}

clear role ldap-stats {on <DEVICE-NAME>}

clear rtls [aeroscout|ekahau]

clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}|on <DEVICE-OR-DOMAIN-NAME>}

clear spanning-tree detected-protocols {interface|on}

clear spanning-tree detected-protocols {on <DEVICE-NAME>}

clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1]} {on <DEVICE-NAME>}

clear traffic-shape statistics class <1-4> {(on <DEVICE-NAME>)}

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}
```

Parameters

- clear arp-cache {on <DEVICE-NAME>}

| | |
|------------------|--|
| arp-cache | Clears <i>Address Resolution Protocol</i> (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses. |
| on <DEVICE-NAME> | Optional. Clears ARP cache entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- clear bonjour cache {on <DEVICE-NAME>}

| | |
|------------------|--|
| bonjour cache | Clears all Bonjour cached statistics. Once cleared the system has to re-discover available Bonjour services. |
| on <DEVICE-NAME> | Optional. Clears all Bonjour cached statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- clear [cdp|lldp] neighbors {on <DEVICE-NAME>}

| | |
|------------------|---|
| cdp | Clears <i>Cisco Discovery Protocol</i> (CDP) table entries |
| lldp | Clears <i>Link Layer Discovery Protocol</i> (LLDP) table entries |
| neighbors | Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step |
| on <DEVICE-NAME> | Optional. Clears CDP or LLDP neighbor table entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

```
• clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}] {on <DEVICE-OR-DOMAIN-NAME>}
```

| | |
|--|---|
| counters | Clears counters based on the parameters passed. The options are: AP, radio, and wireless clients. |
| ap <MAC> | Clears counters for all APs or a specified AP <ul style="list-style-type: none"> • <MAC> - Optional. Specify the AP's MAC address. Note: If no MAC address is specified, all AP counters are cleared. |
| radio <MAC/DEVICE-NAME> <1-X> | Clears radio interface counters on a specified device or on all devices <ul style="list-style-type: none"> • <MAC/DEVICE-NAME> - Optional. Specify the device's hostname or MAC address. Optionally, append the radio interface number (to the radio ID) using one of the following formats: AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX (where RX is the interface number). • <1-X> - Optional. Identifies the radio interface by its index. Specify the radio interface index, if not specified as part of the radio ID. Note, the number of radio interfaces available varies with the access point type. If no device name or MAC address is specified, all radio interface counters are cleared. |
| wireless-client <MAC> | Clears counters for all wireless clients or a specified wireless client <ul style="list-style-type: none"> • <MAC> - Optional. Specify the wireless client's MAC address. If no MAC address is specified, all wireless client counters are cleared. |
| on <DEVICE-OR-DOMAIN-NAME> | The following option is common to all of the above keywords: <ul style="list-style-type: none"> • on <DEVICE-OR-DOMAIN-NAME> - Optional. Clears AP, radio, or wireless client counters on a specified device or RF Domain • <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain. |
| <pre>• clear crypto ike sa [<IP> all] {on <DEVICE-NAME>}</pre> | |
| crypto | Clears encryption module's cached statistics |
| ike sa [<IP> all] | Clears <i>Internet Key Exchange</i> (IKE) <i>security associations</i> (SAs) <ul style="list-style-type: none"> • <IP> - Clears IKE SA entries for the peer identified by the <IP> keyword • all - Clears IKE SA entries for all peers |
| on <DEVICE-NAME> | Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• clear crypto ipsec sa {on <DEVICE-NAME>}</pre> | |
| crypto | Clears encryption module's cached statistics |
| ipsec sa on <DEVICE-NAME> | Clears <i>Internet Protocol Security</i> (IPSec) database SAs <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears IPSec SA entries on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

| | |
|---|--|
| <ul style="list-style-type: none"> • <code>clear eguest registration statistics</code> | |
| eguest registration statistics | <p>Clears EGuest registration server counters. When cleared EGuest registration details are deleted, and the <code>show > eguest > registration > statistics</code> command output is null.</p> <p>This command is applicable only on the NX9500, NX9600, and VX9000 model service platforms.</p> |
| <ul style="list-style-type: none"> • <code>clear gre stats {on <DEVICE-NAME>}</code> | |
| gre stats | Clears GRE tunnel statistics |
| on <DEVICE-NAME> | <p>Optional. Clears GRE tunnel statistics on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>clear event-history</code> | |
| event-history | Clears event history cache entries |
| <ul style="list-style-type: none"> • <code>clear ip bgp [<IP> all external] {in prefix-filter} {on <DEVICE-NAME>}</code> | |
| ip bgp [<IP> all external] | <p>Clears on-going BGP sessions based on the option selected</p> <ul style="list-style-type: none"> • <IP> - Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all - Clears all BGP peer sessions • external - Clears <i>external BGP</i> (eBGP) peer sessions <p>This command is applicable only to the RFS4000, RFS6000, NX9500, NX9600, and VX9000 platforms.</p> <p>Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The <code>clear > ip > bgp</code> command clears BGP sessions. To reduce lose of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.</p> |
| in prefix-filter | <p>Optional. Clears inbound route updates</p> <ul style="list-style-type: none"> • prefix-filter - Optional. Clears the existing <i>Outbound Route Filtering</i> (ORF) prefix-list |
| on <DEVICE-NAME> | <p>Optional. Clears route updates on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP or service platform. |
| <ul style="list-style-type: none"> • <code>clear ip bgp [<IP> all external] {out} {(on <DEVICE-NAME>)}</code> | |
| ip bgp [<IP> all external] | <p>Clears on-going BGP sessions based on the option selected</p> <ul style="list-style-type: none"> • <IP> - Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all - Clears all BGP peer sessions • external - Clears eBGP peer sessions <p>This command is applicable only to the RFS4000, RFS6000, NX9500, NX9600, and VX9000 platforms.</p> <p>Contd..</p> |

| | |
|--|---|
| | Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The <code>clear > ip > bgp</code> command clears BGP sessions. To reduce loss of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage. |
| out | Optional. Clears outbound route updates. Optionally specify the device on which to execute this command. |
| on <DEVICE-NAME> | The following keyword is recursive and optional. <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Clears BGP sessions on a specified device <DEVICE-NAME> - Specify the name of the AP or service platform. |
| <pre>• clear ip bgp [<IP> all external] {soft {in out}} {on <DEVICE-NAME>}</pre> | |
| ip bgp [<IP> all external] | Clears on-going BGP sessions based on the option selected <ul style="list-style-type: none"> <IP> - Clears the BGP peer session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. all - Clears all BGP peer sessions external - Clears eBGP peer sessions This command is applicable only to the RFS4000, RFS6000, NX9500, NX9600, and VX9000 platforms. |
| soft {in out} | Optional. Initiates soft-reconfiguration of route updates for the specified IP address <ul style="list-style-type: none"> in - Optional. Enables soft reconfiguration of inbound route updates out - Optional. Enables soft reconfiguration of outbound route updates Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The <code>clear > ip > bgp</code> command clears BGP sessions. To reduce loss of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage. |
| on <DEVICE-NAME> | Optional. Initiates soft reconfiguration inbound/outbound route updates on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP or service platform. |
| <pre>• clear ip bgp process {on <DEVICE-NAME>}</pre> | |
| ip bgp process | Clears all BGP processes running This command is applicable only to the RFS4000, RFS6000, NX9500, NX9600, and VX9000 platforms. |
| on <DEVICE-NAME> | Optional. Clears all BGP processes on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP or service platform. |
| <pre>• clear ip dhcp bindings [<IP> all] {on <DEVICE-NAME>}</pre> | |
| ip | Clears a <i>Dynamic Host Configuration Protocol</i> (DHCP) server's IP address binding entries |
| dhcp bindings | Clears DHCP connections and server bindings |
| <IP> | Clears specific address binding entries. Specify the IP address to clear binding entries. |

| | |
|---|---|
| all | Clears all address binding entries |
| on <DEVICE-NAME> | Optional. Clears a specified address binding or all address bindings on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>clear ip ospf process {on <DEVICE-NAME>}</code> | |
| ip ospf process | Clears already enabled <i>Open Shortest Path First</i> (OSPF) process and restarts the process |
| on <DEVICE-NAME> | Optional. Clears OSPF process on a specified device OSPF is a link-state <i>interior gateway protocol</i> (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets. <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>clear ipv6 neighbor-cache {on <DEVICE-NAME>}</code> | |
| clear ipv6 neighbor-cache | Clears IPv6 neighbor cache entries |
| on <DEVICE-NAME> | Optional. Clears IPv6 neighbor cache entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>clear lacp [<1-4> counters counters]</code> | |
| clear lacp [<1-4> counters counters] | Clears <i>Link Aggregation Control Protocol</i> (LACP) counters for a specified port-channel group or all port-channel groups configured <ul style="list-style-type: none"> • <1-4> counters - Clears LACP counters for a specified port-channel. Specify the port-channel index number from 1 - 4. Note, LACP is supported only on the NX5500, NX7500, and NX9500 model service platforms. However, the NX9500 series service platforms support only two (2) port-channels, and the other model service platforms support four (4) port-channels. • counters - Clears LACP counters for all configured port-channels on the device |
| <ul style="list-style-type: none"> • <code>clear mac-address-table {address <MAC> vlan <1-4094>} {on <DEVICE-NAME>}</code> | |
| mac-address-table | Clears MAC address forwarding table data based on the parameters passed Use this command to clear the following: all or specified MAC addresses from the system, all MAC addresses on a specified interface, all MAC addresses on a specified VLAN, or the authentication state of a MAC address. |
| address <MAC> | Optional. Clears a specified MAC address from the MAC address table. <ul style="list-style-type: none"> • <MAC> - Specify the MAC address in one of the following formats: AA-BB-CC-DD-EE-FF or AA:BB:CC:DD:EE:FF or AABB.CCDD.EEFF If executed without specifying any MAC address(es), all MAC addresses from the MAC address table will be removed. |

| | |
|---|--|
| vlan <1-4094> | Optional. Clears all MAC addresses for a specified VLAN <ul style="list-style-type: none"> • <1-4094> – Specify the VLAN ID from 1 - 4094. |
| on <DEVICE-NAME> | Optional. Clears a single MAC entry or all MAC entries, for the specified VLAN on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| <pre>• clear mac-address-table {interface [<IF-NAME> ge <1-X> port-channel <1-X>]} {on <DEVICE-NAME>}</pre> | |
| mac-address-table | Clears MAC address forwarding table data based on the parameters passed Use this command to clear the following: all or specified MAC addresses from the system, all MAC addresses on a specified interface, all MAC addresses on a specified VLAN, or the authentication state of a MAC address. |
| interface | Clears all MAC addresses for the selected interface. Use the options available to specify the interface. |
| <IF-NAME> | Clears MAC address forwarding table for the specified layer 2 interface (Ethernet port) <ul style="list-style-type: none"> • <IF-NAME> – Specify the layer 2 interface name. |
| ge <1-X> | Clears MAC address forwarding table for the specified GigabitEthernet interface <ul style="list-style-type: none"> • <1-X> – Specify the GigabitEthernet interface index from 1 - X. <p>The number of GE interfaces supported varies for different device types.</p> |
| port-channel <1-X> | Clears MAC address forwarding table for the specified port-channel interface <ul style="list-style-type: none"> • <1-X> – Specify the port-channel interface index from 1 - X. <p>The number of port-channel interfaces supported varies for different device types.</p> |
| on <DEVICE-NAME> | Optional. Clears the MAC address forwarding table, for the selected interface, on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| <pre>• clear mac-address-table mac-auth-state address <MAC> vlan <1-4904> {on <DEVICE-NAME>}</pre> | |
| mac-address-table mac-auth-state address <MAC> vlan <1-4904> | Clears MAC addresses learned from a particular VLAN when WLAN MAC authentication and captive-portal fall back is enabled Access points/controllers provide WLAN access to clients whose MAC address has been learned and stored in their MAC address tables. Use this command to clear a specified MAC address on the MAC address table. Once cleared the client has to re-authenticate, and is provided access only on successful authentication. <ul style="list-style-type: none"> • <MAC> – Specify the MAC address to clear. <ul style="list-style-type: none"> • vlan <1-4904> – Specify the VLAN interface from 1 - 4094. In the AP/controller's MAC address table, the specified MAC address is cleared on the specified VLAN interface. |
| on <DEVICE-NAME> | Optional. Clears the specified MAC address on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. <p>If a device is not specified, the system clears the MAC address on all devices.</p> |

- `clear mint mlcp history {on <DEVICE-NAME>}`

| | |
|------------------|--|
| mint | Clears MiNT related information |
| mlcp history | Clears <i>MiNT Link Creation Protocol</i> (MLCP) client history |
| on <DEVICE-NAME> | Optional. Clears MLCP client history on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear role ldap-stats {on <DEVICE-NAME>}`

| | |
|------------------|---|
| role ldap-stats | Clears <i>Lightweight Directory Access Protocol</i> (LDAP) server statistics |
| on <DEVICE-NAME> | Optional. Clears LDAP server statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>} | on <DEVICE-OR-DOMAIN-NAME>}`

| | |
|----------------------------|--|
| rtls | Clears <i>Real Time Location Service</i> (RTLS) statistics |
| aeroscout | Clears RTLS Aeroscout statistics |
| ekahau | Clears RTLS Ekahau statistics |
| <MAC/DEVICE-NAME> | This keyword is common to the 'aeroscout' and 'ekahau' parameters. <ul style="list-style-type: none"> • <MAC/DEVICE-NAME> - Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP's MAC address or hostname. |
| on <DEVICE-OR-DOMAIN-NAME> | This keyword is common to the 'aeroscout', 'ekahau', and <MAC/DEVICE-NAME> parameters. <ul style="list-style-type: none"> • on <DEVICE-OR-DOMAIN-NAME> - Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain. |

- `clear spanning-tree detected-protocols {on <DEVICE-NAME>}`

| | |
|--------------------|--|
| spanning-tree | Clears spanning tree entries on an interface, and restarts protocol migration |
| detected-protocols | Restarts protocol migration |
| on <DEVICE-NAME> | Optional. Clears spanning tree entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wan1]} {on <DEVICE-NAME>}`

| | |
|--------------------|--|
| spanning-tree | Clears spanning tree entries on an interface and restarts protocol migration |
| detected-protocols | Restarts protocol migration |

| | |
|--|---|
| <pre>interface [<INTERFACE-NAME>] ge <1-X> me1 port-channel <1-X> ppoe1 up1 vlan <1-4094> wwan1]</pre> | <p>Optional. Clears spanning tree entries on different interfaces</p> <ul style="list-style-type: none"> • <INTERFACE-NAME> - Clears detected spanning tree entries on a specified interface. Specify the interface name. • ge <1-X> - Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X. • me1 - Clears FastEthernet interface spanning tree entries • port-channel <1-X> - Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X. <p>The number of port-channel interfaces supported varies for different device types.</p> <ul style="list-style-type: none"> • pppoe1 - Clears detected spanning tree entries for <i>Point-to-Point Protocol over Ethernet</i> (PPPoE) interface • up1 - Clears detected spanning tree entries for the WAN Ethernet interface • vlan <1-4094> - Clears detected spanning tree entries for the selected VLAN interface. Select a <i>Switch Virtual Interface</i> (SVI) VLAN ID from 1- 4094. • wwan1 - Clears detected spanning tree entries for wireless WAN interface. |
| <pre>on <DEVICE-NAME></pre> | <p>Optional. Clears spanning tree entries on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <p>• clear traffic-shape statistics class <1-4> { (on <DEVICE-NAME>) }</p> | |
| <pre>traffic-shape statistics</pre> | <p>Clears traffic shaping statistics</p> |
| <pre>class <1-4></pre> | <p>Clears traffic shaping statistics for a specific traffic class</p> <ul style="list-style-type: none"> • <1-4> - Specify the traffic class from 1 - 4. <p>Note: If the traffic class is not specified, the system clears all traffic shaping statistics.</p> |
| <pre>on <DEVICE-NAME></pre> | <p>Optional. Clears traffic shaping statistics for the specified traffic class on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the access point, wireless controller, or service platform. <p>Note: For more information on configuring traffic-shape, see traffic-shape.</p> |
| <p>• clear vrrp [error-stats stats] {on <DEVICE-NAME>}</p> | |
| <pre>vrrp</pre> | <p>Clears a device's <i>Virtual Router Redundancy Protocol</i> (VRRP) statistics</p> <p>VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.</p> |
| <pre>error-stats</pre> | <p>Clears global error statistics</p> |
| <pre>stats</pre> | <p>Clears VRRP related statistics</p> |
| <pre>on <DEVICE-NAME></pre> | <p>The following keywords are common to the 'error-stats' and 'stats' parameters:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears VRRP statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Example

```

rfs4000-229D58>clear event-history

2.1.4 clock

► User Exec Commands

Sets a device's system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device's clock is set without resetting the time zone, the time is displayed relative to the *Universal Time Coordinated* (UTC) – Greenwich Time. To display time in the local time zone format, in the device's configuration mode, use the `timezone` command. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see [timezone](#).

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

Parameters

- `clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}`

| | |
|---------------------|---|
| clock set | Sets a device's software system clock |
| <HH:MM:SS> | Sets the current time (in military format hours, minutes, and seconds) Note: By default, the WiNG software displays time in the 24-hour clock format. This setting cannot be changed. |
| <1-31> | Sets the numerical day of the month |
| <MONTH> | Sets the month of the year (Jan to Dec) |
| <1993-2035> | Sets a valid four digit year from 1993 - 2035 |
| on <DEVICE-NAME> | Optional. Sets the clock on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Example

The following commands set the time zone and clock for the logged device:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#timezone America/Los_Angeles
nx9500-6C8809>clock set 11:24:30 21 Jan 2017
nx9500-6C8809>show clock
2017-01-21 12:14:14 PDT
nx9500-6C8809>
```

Note, if the clock is set without resetting the time zone, the time displays as UTC time, as shown in the following example:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#no timezone
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#commit
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show clock
2017-01-21 19:15:55 UTC
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

2.1.5 cluster

► *User Exec Commands*

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cluster start-election
```

Parameters

- cluster start-election

| | |
|----------------|--------------------------------------|
| start-election | Starts a new cluster master election |
|----------------|--------------------------------------|

Example

```
nx9500-6C8809>cluster start-election
nx9500-6C8809>
```

Related Commands

| | |
|-----------------------|--|
| <i>create-cluster</i> | Creates a new cluster on the specified device |
| <i>join-cluster</i> | Adds a wireless controller or service platform, as a member, to an existing cluster of controllers |

2.1.6 connect

► User Exec Commands

Begins a console connection to a remote device using the remote device's MiNT ID or name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

Parameters

- connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

| | |
|----------------------|---|
| mint-id <MINT-ID> | Connects to the remote system using its MiNT ID <ul style="list-style-type: none"> • <MINT-ID> - Specify the remote device's MiNT ID. |
| <REMOTE-DEVICE-NAME> | Connects to the remote system using its name <ul style="list-style-type: none"> • <REMOTE-DEVICE-NAME> - Specify the remote device's name. |

Example

```
rfs6000-81742D>show mint lsp-db
9 LSPs in LSP-db of 19.6D.B5.D4:
LSP 19.6C.88.09 at level 1, hostname nx9500-6C8809", 8 adjacencies, seqnum 1294555

2.1.7 create-cluster

► User Exec Commands

Creates a new device cluster with the specified name and assigns it an IP address and routing level

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

Parameters

- `create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}`

| | |
|--|---|
| <code>create-cluster</code> | Creates a cluster |
| <code>name <CLUSTER-NAME></code> | Configures the cluster name <ul style="list-style-type: none"> • <code><CLUSTER-NAME></code> – Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters. |
| <code>ip <IP></code> | Specifies the device's IP address used for cluster creation <ul style="list-style-type: none"> • <code><IP></code> – Specify the device's IP address in the A.B.C.D format. |
| <code>level [1 2]</code> | Optional. Configures the cluster's routing level <ul style="list-style-type: none"> • 1 – Configures level 1 (local) routing • 2 – Configures level 2 (inter-site) routing |

Example

```
rfs6000-81742D>create-cluster name TechPubs ip 192.168.13.23 level 1
... creating cluster
... committing the changes
... saving the changes
Please Wait .
[OK]
rfs6000-81742D>

rfs6000-81742D>show context session-config include-factory | include cluster name
TechPubs
  cluster name TechPubs
rfs6000-81742D>
```

Related Commands

| | |
|---------------------------|--|
| <code>cluster</code> | Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member. |
| <code>join-cluster</code> | Adds a device, as a member, to an existing cluster of devices |

2.1.8 crypto

► User Exec Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name, etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate *Certificate Signing Request* (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
  {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase
  <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
  {background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase
  <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
crypto pki [authenticate|export|generate|import|zeroize]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}
  {(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]
crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
  [autogen-subject-name|subject-name]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
  autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,
  ip-address <IP>)
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|
  use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE>
  <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,
  fqdn <FQDN>,ip-address <IP>)
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
  {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-
address <IP>, on <DEVICE-NAME>)}

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address
<IP>, on <DEVICE-NAME>)}

crypto pki import [certificate|crl|trustpoint]

crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background} {(on <DEVICE-NAME>)}

crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

Parameters

- crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

| | |
|--|--|
| key | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
| export rsa <RSA-KEYPAIR-NAME> | Exports an existing RSA Keypair to a specified destination <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. |
| <EXPORT-TO-URL> | Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported. After specifying the destination address (where the RSA Keypair is exported), configure one of the following parameters: background or passphrase. |
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts RSA Keypair before exporting <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify a passphrase to encrypt the RSA Keypair. • background - Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to all of the above parameters: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs export operation on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

| | |
|-----|--|
| key | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
|-----|--|

| | |
|--|---|
| generate rsa <RSA-KEYPAIR-NAME> [2048 4096] | <p>Generates a new RSA Keypair</p> <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. • [2048 4096] - Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits. <p>After specifying the key size, optionally specify the device (access point or controller) to generate the key on.</p> |
| on <DEVICE-NAME> | <p>Optional. Generates the new RSA Keypair on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <p>• <code>crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background} passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}</code></p> | |
| key | <p>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</p> |
| import rsa <RSA-KEYPAIR-NAME> | <p>Imports a RSA Keypair from a specified source</p> <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. |
| <IMPORT-FROM-URL> | <p>Specify the RSA Keypair source address. Both IPv4 and IPv6 address formats are supported.</p> <p>After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase.</p> |
| background | <p>Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.</p> |
| passphrase <KEY-PASSPHRASE> background | <p>Optional. Decrypts the RSA Keypair after importing</p> <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify the passphrase to decrypt the RSA Keypair. • background - Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point, controller, or service platform) to perform the import on. |
| on <DEVICE-NAME> | <p>The following parameter is recursive and common to the 'background' and 'passphrase' keywords:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs import operation on a specific device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <p>• <code>crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}</code></p> | |
| key | <p>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</p> |
| zeroize rsa <RSA-KEYPAIR-NAME> | <p>Deletes a specified RSA Keypair</p> <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. <p>Note: All device certificates associated with this key will also be deleted.</p> |
| force | <p>Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion.</p> |

| | |
|---|--|
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Deletes all certificates associated with the RSA Keypair on a specified device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto pki authenticate <TRUSTPOINT-NAME> <URL> {background} {(on <DEVICE-NAME>)}</pre> | |
| pki | Enables <i>Private Key Infrastructure</i> (PKI) management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated <i>Certificate Authority</i> (CA) certificates. |
| authenticate <TRUSTPOINT-NAME> | Authenticates a trustpoint and imports the corresponding CA certificate <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name. |
| <URL> | Specify CA's location. Both IPv4 and IPv6 address formats are supported. <p>Note: The CA certificate is imported from the specified location.</p> |
| background | Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point, controller, or service platform) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs authentication on a specified device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto pki export request [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)</pre> | |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| export request | Exports CSR to the CA for digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key. |
| [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair or uses an existing RSA Keypair <ul style="list-style-type: none"> generate-rsa-key - Generates a new RSA Keypair for digital authentication use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| autogen-subject-name | Auto generates subject name from configuration parameters. The subject name identifies the certificate. |
| <EXPORT-TO-URL> | Specify the CA's location. Both IPv4 and IPv6 address formats are supported. <p>Note: The CSR is exported to the specified location.</p> |
| email <SEND-TO-EMAIL> | Exports CSR to a specified e-mail address <ul style="list-style-type: none"> <SEND-TO-EMAIL> - Specify the CA's e-mail address. |
| fqdn <FQDN> | Exports CSR to a specified <i>Fully Qualified Domain Name</i> (FQDN) <ul style="list-style-type: none"> <FQDN> - Specify the CA's FQDN. |
| ip-address <IP> | Exports CSR to a specified device or system <ul style="list-style-type: none"> <IP> - Specify the CA's IP address. |

```

• crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-
key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE>
<CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,
fqdn <FQDN>,ip-address <IP>)

```

| | |
|---|--|
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| export request | Exports CSR to the CA for a digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key. |
| [generate-rsa-key short [generate-rsa-key use-rsa-key] use-rsa-key] <RSA-KEYPAIR-NAME> | <p>Generates a new RSA Keypair or uses an existing RSA Keypair</p> <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication • short [generate-rsa-key use-rsa-key] - Generates and exports a shorter version of the CSR <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it. • use-rsa-key - Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name. • use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| subject-name <COMMON-NAME> | <p>Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate</p> <ul style="list-style-type: none"> • <COMMON-NAME> - Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length). |
| <COUNTRY> | Sets the deployment country code (2 character ISO code) |
| <STATE> | Sets the state name (2 to 64 characters in length) |
| <CITY> | Sets the city name (2 to 64 characters in length) |
| <ORGANIZATION> | Sets the organization name (2 to 64 characters in length) |
| <ORGANIZATION-UNIT> | Sets the organization unit (2 to 64 characters in length) |
| <EXPORT-TO-URL> | Specify the CA's location. Both IPv4 and IPv6 address formats are supported. The CSR is exported to the specified location. |
| email <SEND-TO-EMAIL> | Exports CSR to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> - Specify the CA's e-mail address. |
| fqdn <FQDN> | Exports CSR to a specified FQDN <ul style="list-style-type: none"> • <FQDN> - Specify the CA's FQDN. |
| ip-address <IP> | Exports CSR to a specified device or system <ul style="list-style-type: none"> • <IP> - Specify the CA's IP address. |
| <pre> • crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background} passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)} </pre> | |
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |

| | |
|---|---|
| export trustpoint <TRUSTPOINT-NAME> | Exports a trustpoint along with CA certificate, <i>Certificate Revocation List</i> (CRL), server certificate, and private key <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| <EXPORT-TO-URL> | Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here. |
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on |
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts the key with a passphrase before exporting <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify the passphrase to encrypt the trustpoint. <ul style="list-style-type: none"> • background - Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to the 'background' and 'passphrase' keywords: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs export operation on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,fqdn <FQDN>, ip-address <IP>,on <DEVICE-NAME>)}</code> | |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates. |
| generate | Generates a certificate and a trustpoint |
| self-signed <TRUSTPOINT-NAME> | Generates a self-signed certificate and a trustpoint <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify a name for the certificate and its trustpoint. |
| [generate-rsa-key] use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair, or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication • use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| autogen-subject-name | Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate. |
| email <SEND-TO-EMAIL> | Optional. Exports the self-signed certificate to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> - Specify the e-mail address. |
| fqdn <FQDN> | Optional. Exports the self-signed certificate to a specified FQDN <ul style="list-style-type: none"> • <FQDN> - Specify the FQDN. |
| ip-address <IP> | Optional. Exports the self-signed certificate to a specified device or system <ul style="list-style-type: none"> • <IP> - Specify the device's IP address. |
| on <DEVICE-NAME> | Optional. Exports the self-signed certificate on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> { (email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>, on <DEVICE-NAME>) }`

| | |
|---|---|
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates. |
| generate self-signed <TRUSTPOINT-NAME> | Generates a self-signed certificate and a trustpoint <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify a name for the certificate and its trustpoint. |
| [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair, or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication • use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| subject-name <COMMON-NAME> | Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate <ul style="list-style-type: none"> • <COMMON-NAME> - Specify the common name used with this certificate. The name should enable you to identify the certificate easily and should not exceed 2 to 64 characters in length. |
| <COUNTRY> | Sets the deployment country code (2 character ISO code) |
| <STATE> | Sets the state name (2 to 64 characters in length) |
| <CITY> | Sets the city name (2 to 64 characters in length) |
| <ORGANIZATION> | Sets the organization name (2 to 64 characters in length) |
| <ORGANIZATION-UNIT> | Sets the organization unit (2 to 64 characters in length) |
| email <SEND-TO-EMAIL> | Optional. Exports the self-signed certificate to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> - Specify the e-mail address. |
| fqdn <FQDN> | Optional. Exports the self-signed certificate to a specified FQDN <ul style="list-style-type: none"> • <FQDN> - Specify the FQDN. |
| ip-address <IP> | Optional. Exports the self-signed certificate to a specified device or system <ul style="list-style-type: none"> • <IP> - Specify the device's IP address. |

- `crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} { (on <DEVICE-NAME>) }`

| | |
|-------------------------------------|---|
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, <i>Certificate Revocation List</i> (CRL), or a trustpoint to the selected device |
| [certificate crl] <TRUSTPOINT-NAME> | Imports a signed server certificate or CRL <ul style="list-style-type: none"> • certificate - Imports signed server certificate • crl - Imports CRL <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported. The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here. |

| | |
|---|--|
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs import operation on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)} }</pre> | |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, CRL, or a trustpoint to the selected device |
| trustpoint <TRUSTPOINT-NAME> | Imports a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported. |
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Decrypts trustpoint with a passphrase after importing <ul style="list-style-type: none"> <KEY-PASSPHRASE> - Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on. <ul style="list-style-type: none"> background - Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs import operation on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)} }</pre> | |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| zeroize trustpoint <TRUSTPOINT-NAME> | Deletes a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| del-key | Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Deletes the trustpoint on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:
 tftp://<hostname|IP>[:port]/path/file
 ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
 sftp://<user>@<hostname|IP>[:port]/path/file
 http://<hostname|IP>[:port]/path/file
 cf:/path/file
 usb<n>:/path/file
- IPv6 URLs:
 tftp://<hostname|[IPv6]>[:port]/path/file
 ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
 sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
 http://<hostname|[IPv6]>[:port]/path/file

Example

```
rfs6000-81742D>crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs6000-81742D>

rfs6000-81742D>crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs6000-81742D>

rfs6000-81742DE>crypto pki generate self-signed word generate-rsa-key word
autogen-subject-name fqdn word
Successfully generated self-signed certificate
rfs6000-81742D>

rfs6000-81742D>crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-
trustpoint
rfs6000-81742D>

rfs6000-81742D>crypto pki authenticate word url background
Import of CA certificate started in background
rfs6000-81742D>

rfs6000-81742D>crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs6000-81742D>
```

Related Commands

| <i>no</i> | Removes server certificates, trustpoints and their associated certificates |
|-----------|--|

2.1.9 crypto-cmp-cert-update

► User Exec Commands

Triggers a *Certificate Management Protocol* (CMP) certificate update on a specified device or devices

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

Parameters

- `crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}`

| | |
|--|--|
| <pre>crypto-cmp-cert- update <TRUSTPOINT- NAME> on <DEVICE-NAME></pre> | <p>Triggers a CMP certificate update on a specified device or devices</p> <ul style="list-style-type: none"> • <code><TRUSTPOINT-NAME></code> - Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the <code>crypto-cmp-policy</code> context mode to configure the trustpoint. • <code>on <DEVICE-NAME></code> - Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list. <ul style="list-style-type: none"> • <code><DEVICE-NAME></code> - Specify the name of the AP, wireless controller, or service platform. |
|--|--|

Example

```
rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
```

2.1.10 database

► User Exec Commands

Enables automatic repairing (vacuuming) and dropping of captive-portal and NSight databases

If enforcing authenticated access to the *database*, use this command to generate the keyfile. Every keyfile has a set of associated users having a username and password. Access to the database is allowed only if the user credentials entered during database login are valid. For more information on enabling database authentication, see *Enabling Database Authentication*.

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
database [drop|keyfile|repair]

database drop [all|captive-portal|nsight]

database repair {on <DEVICE-NAME>}

database keyfile [export|generate|import|zerzoise]
database keyfile generate
database keyfile [export|import] <URL>
database keyfile zerzoise
```

Parameters

- database drop [all|captive-portal|nsight]

| | |
|--|--|
| database drop [all captive-portal nsight] | Drops (deletes) all or a specified database. Execute the command on the database. <ul style="list-style-type: none"> • all – Drops all databases, captive portal and NSight • captive-portal – Drops the captive-portal database • nsight – Drops the NSight database |
|--|--|

- database repair {on <DEVICE-NAME>}

| | |
|-------------------------------------|---|
| database repair on <DEVICE-NAME> | Enables automatic repairing of all databases. Repairing (vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements. Execute the command on the database host. <ul style="list-style-type: none"> • on <DEVICE-NAME> – Optional. Specifies the name of the database host. When specified, databases on the specified host are periodically checked to identify and remove obsolete data documents. <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the access point, wireless controller, or service platform. <p>Note: If no device is specified, the system repairs all databases.</p> |
|-------------------------------------|---|

• database keyfile generate

| | |
|---|---|
| database keyfile [generate zerzoise] | <p>Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to generate database keyfiles. After generating the keyfile, create the username and password combination required to access the database. For information on creating database users see, <i>service</i>. For information on enabling database authentication, see <i>Enabling Database Authentication</i>.</p> <ul style="list-style-type: none"> • generate - Generates the keyfile. In case of a replica-set deployment, execute the command on the primary database host. Once generated, export the keyfile to a specified location from where it is imported on to the replica-set hosts. |
|---|---|

• database keyfile [export|import] <URL>

| | |
|--|---|
| database keyfile [export import] <URL> | <p>Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to exchange keyfiles between replica set members.</p> <ul style="list-style-type: none"> • export - Exports the keyfile to a specified location on an FTP/SFTP/TFTP server. Execute the command on the database host on which the keyfile has been generated. • import - Imports the keyfile from a specified location. Execute the command on the replica set members. <p>The following parameter is common to both of the above keywords:</p> <ul style="list-style-type: none"> • <URL> - Specify the location to/from where the keyfile is to be exported/imported. Use one of the following options to specify the keyfile location: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file tftp://<hostname IP>[:port]/path/file |
|--|---|

• database keyfile zerzoise

| | |
|------------------------------|---|
| database keyfile zerzoise | <p>Enables database keyfile management. Use this command to delete keyfiles</p> <ul style="list-style-type: none"> • zerzoise - Deletes an existing keyfile. |
|------------------------------|---|

Example

```

nx9500-6C8809>database repair on nx9500-6C8809
nx9500-6C8809>

nx9500-6C8809>database keyfile generate
Database keyfile successfully generated
nx9500-6C8809>

nx9500-6C8809>database keyfile zeroize
Database keyfile successfully removed
nx9500-6C8809>

vx9000-1A1809>database keyfile generate
Database keyfile successfully generated
vx9000-1A1809>

vx9000-1A1809>database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
vx9000-1A1809>

```

```
vx9000-D031F2>database keyfile import ftp://1.1.1.111/db-key
Database keyfile successfully imported
vx9000-D031F2>
```

Example Enabling Database Authentication

Follow the steps below to enable database authentication.

- 1 On the primary database host,

- a Generate the database keyfile.

```
Primary-DB-HOST>database keyfile generate
Database keyfile successfully generated
Primary-DB-HOST>
```

- b Use the `show > database > keyfile` command to view the generated keyfile.

- c Export the keyfile to an external location. This is required only in case of database replica-set deployment.

```
Primary-DB-HOST>database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
Primary-DB-HOST>
```

- d Create the users that are allowed access to the database.

```
Primary-DB-HOST#service database authentication create-user username techpubs
password techPubs@123
Database user [techpubs] created.
Primary-DB-HOST#
```

- e View the database user account created.

```
Primary-DB-HOST#show database users
-----
                DATABASE USER
-----
techpubs
-----
Primary-DB-HOST#
```

- 2 On the replica set host, import the keyfile from the location specified in Step 1 c.

```
Secondary-DB-HOST#database keyfile import ftp://1.1.1.111/db-key
```

- 3 In the database-policy context, --- (used on the NSight/EGuest database hosts)

- a Enable authentication.

```
Primary-DB-HOST (config-database-policy-techpubs)#authentication
```

- b Configure the user accounts created in Step 1 d.

```
Primary-DB-HOST (config-database-policy-techpubs)#authentication username
techpubs password S540QFz9LzSOdX1ZJEqDgAAAy3b7GtyO4Z/Ih2ruxnOYnr
Primary-DB-HOST (config-database-policy-techpubs)#show context
database-policy techpubs
authentication
authentication username techpubs password 2
S540QFz9LzSOdX1ZJEqDgAAAy3b7GtyO4Z/Ih2ruxnOYnr
replica-set member nx7500-A02B91 arbiter
replica-set member vx9000-1A1809 priority 1
```

```

    replica-set member vx9000-D031F2 priority 20
    Primary-DB-HOST (config-database-policy-techpubs) #

```

- 4 In the database-client policy context --- (used on the NSight/EGuest server host),
 Note, this configuration is required only if the NSight/EGuest server and database are hosted on separate hosts.

- a Configure the user credentials created in Step 1 d.

```

    NOC-Controller (config-database-client-policy-techpubs) #authentication username
techpubs password S540QFZz9LzSOdX1ZJEqDgAAAY3b7GtyO4Z/Ih2ruxnOYnr

```

- b View the configuration.

```

    NOC-Controller (config-database-client-policy-techpubs) #show context
    database-client-policy techpubs
authentication username techpubs password 2
S540QFZz9LzSOdX1ZJEqDgAAAY3b7GtyO4Z/Ih2ruxnOYnr
    NOC-Controller (config-database-client-policy-techpubs) #

```

Related Commands

| | |
|-------------------------------|--|
| <i>database-backup</i> | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server |
| <i>database-restore</i> | Restores a previously exported database [captive-portal and/or NSight] |
| <i>database-policy</i> | Documents database-policy configuration commands. Use this option to enable the database. |
| <i>database-client-policy</i> | Documents database-client-policy configuration commands. Use this option to configure the database host details (IP address or hostname). If enforcing database authentication, use it to configure the users having database access. Once configured, use the policy in the NSight/EGuest server’s device config context. |
| <i>service</i> | Documents the database user account configuration details |

2.1.11 database-backup

► *User Exec Commands*

Backs up captive-portal and/or NSight database to a specified location and file on an FTP, SFTP, or TFTP server. Execute this command on the database host.

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
database-backup database [captive-portal|nsight|nsight-placement-info] <URL>
```

```
database-backup database [captive-portal|nsight] <URL>
```

```
database-backup database nsight-placement-info <URL>
```

Parameters

- database-backup database [captive-portal|nsight] <URL>

| | |
|--|--|
| database-backup database [captive-portal nsight] | Backs up captive portal and/or NSight database to a specified location. Select the database to backup: <ul style="list-style-type: none"> • captive-portal - Backs up captive portal database • nsight - Backs up NSight database After specifying the database type, configure the destination location. |
| <URL> | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz |
| | <ul style="list-style-type: none"> • database-backup database nsight-placement-info <URL> |
| database-backup database nsight-placement- info <URL> | Backs up the NSight access point placement related details to a specified location <ul style="list-style-type: none"> • <URL> - Specify the URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz tftp://<hostname IP>[:port]/path/file.tar.gz |

Example

```

Related Commands

| | |
|-------------------------|--|
| <i>database</i> | Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and/or NSight) |
| <i>database-restore</i> | Restores a previously exported (backed up) database (captive-portal and/or NSight)] |

2.1.12 database-restore

► User Exec Commands

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
database-restore database [captive-portal|nsight] <URL>
```

Parameters

- `database-restore database [captive-portal|nsight] <URL>`

| | |
|---|---|
| database-restore database [captive-portal nsight] | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type: <ul style="list-style-type: none"> • captive-portal - Restores captive portal database • nsight - Restores NSight database After specifying the database type, configure the destination location and file name from where the files are restored. |
| <URL> | Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz tftp://<hostname IP>[:port]/path/file.tar.gz |

Example

```
nx9500-6C8809>database-restore database nsight ftp://  
anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

Related Commands

|------------------------|--|
| <i>database</i> | Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and NSight) |
| <i>database-backup</i> | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server |

2.1.13 device-upgrade

► User Exec Commands

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms).

In an *hierarchically managed* (HM) network, this command enables centralized device upgradation across the network. The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

NOTE: Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.

Use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain.

NOTE: If the *persist-images* option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the 'persist-images' option), see *device-upgrade*.

NOTE: A NOC controller's capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – NX95XX (NX9500 and NX9510), NX9600, VX9000
- Site controller – RFS4000, RFS6000, NX5500, or NX95XX

NOTE: Standalone devices have to be manually upgraded.

Supported in the following platforms:

- Access Points – AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
device-upgrade [<MAC/HOSTNAME>|all|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|

2.1.14 disable

▶ *User Exec Commands*

This command can be executed in the Priv Exec Mode only. When executed, the command turns off (disables) the privileged mode command set and returns to the User Executable Mode. The prompt changes from `rfs6000-81742D#` to `rfs6000-81742D>`.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
disable
```

Parameters

None

Example

```
rfs6000-81742D#disable  
rfs6000-81742D>
```

2.1.15 enable

▶ *User Exec Commands*

Turns on (enables) the privileged mode command set. The prompt changes from *rfs6000-81742D>* to *rfs6000-81742D#*. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
enable
```

Parameters

None

Example

```
rfs6000-81742D>enable  
rfs6000-81742D#
```

2.1.16 file-sync

► User Exec Commands

Syncs trustpoint and/or EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adopted access points.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point is configured to use EAP-TLS authentication.
- Execute the command on the controller adopting the access points.
- Ensure that the X.509 certificate file is installed on the controller.

Syncing of trustpoint/wireless-bridge certificate can be automated. To automate file syncing, in the controller’s device/profile configuration mode, execute the following command: `file-sync [auto/count <1-20>]`. For more information, see [file-sync](#).

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
file-sync [cancel|load-file|trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain
[<DOMAIN-NAME>|all]]
file-sync load-file [trustpoint|wireless-bridge]]
file-sync load-file [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] <URL>
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|
rf-domain [<DOMAIN-NAME>|all] {from-controller}] {reset-radio|upload-time <TIME>}
```

Parameters

- file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]

| | |
|---|---|
| <pre>file-sync cancel [trustpoint wireless-bridge] [<DEVICE-NAME> all rf-domain [<DOMAIN-NAME> all]]</pre> | <p>Cancels scheduled file synchronization</p> <ul style="list-style-type: none"> • trustpoint - Cancels scheduled trustpoint synchronization on a specified AP, all APs, or APs within a specified RF Domain • wireless-bridge - Cancels scheduled wireless-bridge certificate synchronization on a specified AP, all APs, or APs within a specified RF Domain <ul style="list-style-type: none"> • <DEVICE-NAME> - Cancels scheduled trustpoint/certificate synchronization on a specified AP. Specify the AP’s hostname or MAC address. • all - Cancels scheduled trustpoint/certificate synchronization on all APs <p>Contd..</p> |
|---|---|

| | |
|---|---|
| | <ul style="list-style-type: none"> • rf-domain [<DOMAIN-NAME> all] - Cancels scheduled trustpoint/certificate synchronization on all APs in a specified RF Domain or in all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> - Cancels scheduled trustpoint/certificate synchronization on all APs within a specified RF Domain. Specify the RF Domain's name. • all - Cancels scheduled trustpoint/certificate synchronization on all RF Domains |
| <ul style="list-style-type: none"> • file-sync load-file [trustpoint wireless-bridge] <URL> | |
| <pre>file-sync load-file [trustpoint wireless-bridge] <URL></pre> | <p>Loads the following files on to the staging controller:</p> <ul style="list-style-type: none"> • trustpoint - Loads the trustpoint, including CA certificate, server certificate and private key • wireless-bridge - Loads the wireless-bridge certificate to the staging controller <p>Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.</p> <ul style="list-style-type: none"> • <URL> - Provide the trustpoint/certificate location using one of the following formats: tftp://<hostname IP>[:port]/path/file ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file http://<hostname IP>[:port]/path/file cf:/path/file usb<n>:/path/file <p>Note: Both IPv4 and IPv6 address types are supported.</p> |
| <ul style="list-style-type: none"> • file-sync [trustpoint <TRUSTPOINT-NAME> wireless-bridge] [<DEVICE-NAME> all rf-domain [<DOMAIN-NAME> all] {from-controller}] {reset-radio upload-time <TIME>} | |
| <pre>file-sync trustpoint <TRUSTPOINT- NAME> [<DEVICE-NAME> all rf-domain [<DOMAIN-NAME> all] from-controller]</pre> | <p>Configures file-syncing parameters</p> <ul style="list-style-type: none"> • trustpoint <TRUSTPOINT-NAME> - Syncs a specified trustpoint between controller and its adopted APs <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name. • wireless-bridge - Syncs wireless-bridge certificate between controller and its adopted APs <p>After specifying the file that is to be synced, configure following file-sync parameters:</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Syncs trustpoint/certificate with a specified AP. Specify the AP's hostname or MAC address. • all - Syncs trustpoint/certificate with all APs • rf-domain [<DOMAIN-NAME> all] - Syncs trustpoint/certificate with all APs in a specified RF Domain or in all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> - Select to sync with APs within a specified RF Domain. Specify the RF Domain's name. • all - Select to sync with APs across all RF Domains <ul style="list-style-type: none"> • from-controller - Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager <p>After specifying the access points, specify the following options: reset-radio and upload-time.</p> |

| | |
|--------------------|---|
| reset-radio | This keyword is recursive and applicable to all of the above parameters. Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the 'bridge EAP username' and 'bridge EAP password'. |
| upload-time <TIME> | This keyword is recursive and applicable to all of the above parameters. <ul style="list-style-type: none"> upload-time - Optional. Schedules certificate upload at a specified time <ul style="list-style-type: none"> <TIME> - Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed. |

Example

```
rfs6000-81742D>file-sync wireless-bridge ap7131-11E6C4 upload-time 06/01/2017-12:30
```

```
-----
                CONTROLLER                STATUS                MESSAGE
-----
      B4-C7-99-6D-CD-4B                Success                Queued 1 APs to upload
-----
rfs6000-81742D>
```

The following command uploads certificate to all access points:

```
rfs6000-81742D>file-sync wireless-bridge all upload-time 06/01/2017-23:42
```

2.1.17 join-cluster

► User Exec Commands

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster. Note, a cluster can be only formed of devices of the same model type.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode
[active|standby]}
```

Parameters

- join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}

| | |
|-----------------------|---|
| join-cluster | Adds an access point, wireless controller, or service platform to an existing cluster |
| <IP> | Specify the cluster member's IP address. |
| user <USERNAME> | Specify a user account with super user privileges on the new cluster member |
| password <WORD> | Specify password for the account specified in the user parameter |
| level [1 2] | Optional. Configures the routing level <ul style="list-style-type: none"> • 1 - Configures level 1 routing • 2 - Configures level 2 routing |
| mode [active standby] | Optional. Configures the cluster mode <ul style="list-style-type: none"> • active - Configures this cluster as active • standby - Configures this cluster to be on standby mode |

Usage Guidelines

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

Example

```
rfs4000-880DA7>join-cluster 192.168.13.15 user admin password superuser level 1
mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs4000-880DA7>
```

```

rfs4000-880DA7>show context
!
! Configuration of RFS4000 version 5.9.1.0-012D

 cluster mode standby
 cluster member ip 192.168.13.15
 logging on
 logging console warnings
 logging buffered warnings
!
!
end
rfs4000-880DA7>

```

Related Commands

| | |
|-----------------------|---|
| <i>cluster</i> | Initiates cluster context. The cluster context enables centralized management and configuration of all cluster members from any one member. |
| <i>create-cluster</i> | Creates a new cluster on a specified device |

2.1.18 l2tpv3

► User Exec Commands

Establishes and/or brings down a *Layer 2 Tunnel Protocol Version 3* (L2TPV3) tunnel

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
l2tpv3 tunnel [<TUNNEL-NAME>|all]
l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}

l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

Parameters

- l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}

| | |
|---|---|
| l2tpv3 tunnel | Establishes or brings down L2TPv3 tunnels |
| <TUNNEL-NAME> [down up] | Specifies the tunnel name to establish or bring down <ul style="list-style-type: none"> • down – Brings down the specified tunnel • up – Establishes the specified tunnel |
| on <DEVICE-NAME> | Optional. Establishes or brings down a tunnel on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down up] {on <DEVICE-NAME>} | |
| l2tpv3 tunnel | Establishes or brings down L2TPv3 tunnels |
| <TUNNEL-NAME> [session <SESSION-NAME>] [down up] | Establishes or brings down a specified session inside an L2TPv3 tunnel <ul style="list-style-type: none"> • <TUNNEL-NAME> – Specify the tunnel name. • session <SESSION-NAME> – Identifies a specific session <ul style="list-style-type: none"> • <SESSION-NAME> – Specify the session name. <ul style="list-style-type: none"> • down – Brings down the session identified by the <SESSION-NAME> keyword • up – Establishes the session identified by the <SESSION-NAME> keyword |
| on <DEVICE-NAME> | Optional. Establishes or brings down a tunnel session on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • l2tpv3 tunnel all [down up] {on <DEVICE-NAME>} | |
| l2tpv3 tunnel | Establishes or brings down L2TPv3 tunnels |
| all [down up] | Establishes or brings down all L2TPv3 tunnels <ul style="list-style-type: none"> • down – Brings down all tunnels • up – Establishes all tunnels |

| | |
|---------------------|---|
| on <DEVICE-NAME> | Optional. Establishes or brings down all tunnels on a specified device <ul style="list-style-type: none">• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
|---------------------|---|

Example

```
rfs6000-81742D>l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs6000-81742D
```

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see [Chapter 22, L2TPV3-POLICY](#).

2.1.19 logging

► User Exec Commands

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|
informational|notifications|warnings}
```

Parameters

```
• logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|
informational|notifications|warnings}
```

| | |
|---------|--|
| monitor | <p>Sets the terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system uses default settings, if no logging severity level is specified.</p> <ul style="list-style-type: none"> • <0-7> - Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows: • alerts - Optional. Immediate action needed (severity=1) • critical - Optional. Critical conditions (severity=2) • debugging - Optional. Debugging messages (severity=7) • emergencies - Optional. System is unusable (severity=0) • errors - Optional. Error conditions (severity=3) • informational - Optional. Informational messages (severity=6) • notifications - Optional. Normal but significant conditions (severity=5) • warnings - Optional. Warning conditions (severity=4) <p>Note: Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device's configuration mode, execute the <i>logging > on</i> command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.</p> |
|---------|--|

Example

```
rfs6000-81742D(config-device-00-15-70-81-74-2D)##logging on
rfs6000-81742D>logging monitor debugging
rfs6000-81742D>show logging

Logging module: enabled
  Aggregation time: disabled
  Console logging: level warnings
  Monitor logging: level debugging
  Buffered logging: level warnings
  Syslog logging: level warnings
    Facility: local7

Related Commands

| | |
|-----------|--------------------------------------|
| <i>no</i> | Resets terminal lines logging levels |
|-----------|--------------------------------------|

2.1.20 mint

► User Exec Commands

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mint [ping|traceroute]
```

```
mint ping <MINT-ID> {(count <1-10000>|size <1-64000>|timeout <1-10>)}
```

```
mint traceroute <MINT-ID> {(destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>)}
```

Parameters

- `mint ping <MINT-ID> {(count <1-10000>|size <1-64000>|timeout <1-10>)}`

| | |
|--|--|
| ping <MINT-ID> | Sends a MiNT echo message to a specified destination <ul style="list-style-type: none"> • <MINT-ID> - Specify the destination device's MiNT ID. |
| count <1-10000> | Optional. Sets the pings to the MiNT destination <ul style="list-style-type: none"> • <1- 10000> - Specify a value from 1 - 10000. The default is 3. |
| size <1-64000> | Optional. Sets the MiNT payload size in bytes <ul style="list-style-type: none"> • <1-64000> - Specify a value from 1 - 640000 bytes. The default is 64 bytes. |
| timeout <1-10> | Optional. Sets a response time in seconds <ul style="list-style-type: none"> • <1-10> - Specify a value from 1 sec - 10 sec. The default is 1 second. |
| <ul style="list-style-type: none"> • <code>mint traceroute <MINT-ID> {(destination-port <1-65535> max-hops <1-255> source-port <1-65535> timeout <1-255>)}</code> | |
| traceroute <MINT-ID> | Prints the route packets trace to a device <ul style="list-style-type: none"> • <MINT-ID> - Specify the destination device's MiNT ID. |
| destination-port <1-65535> | Optional. Sets the <i>Equal-cost Multi-path</i> (ECMP) routing destination port <ul style="list-style-type: none"> • <1- 65535> - Specify a value from 1 - 65535. The default port is 45. |
| max-hops <1-255> | Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction <ul style="list-style-type: none"> • <1- 255> - Specify a value from 1 - 255. The default is 30. |
| source-port <1-65535> | Optional. Sets the ECMP source port <ul style="list-style-type: none"> • <1- 65535> - Specify a value from 1 - 65535. The default port is 45. |
| timeout <1-255> | Optional. Sets the minimum response time period in seconds <ul style="list-style-type: none"> • <1- 255> - Specify a value from 1 sec - 255 sec. The default is 30 seconds. |

Example

```
rfs6000-81742D>mint ping 19.6C.88.09
MiNT ping 19.6C.88.09 with 64 bytes of data.
  Response from 19.6C.88.09: id=1 time=0.219 ms
  Response from 19.6C.88.09: id=2 time=0.145 ms
  Response from 19.6C.88.09: id=3 time=0.127 ms

--- 19.6C.88.09 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.127/0.164/0.219 ms
rfs6000-81742D>
```

2.1.21 no

► User Exec Commands

Use the `no` command to revert a command or to set parameters to their default. This command turns off an enabled feature or reverts settings to default.

NOTE: The “no” command sub-set of commands changes with the context in which it is executed.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [adoption|captive-portal|crypto|debug|logging|page|service|terminal|
virtual-machine|wireless]
```

```
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
```

NOTE: The `no > adoption` command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

```
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>]
{on <DEVICE-OR-DOMAIN-NAME>}
```

```
no crypto pki [server|trustpoint]
```

```
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}}|
on <DEVICE-NAME>}
```

```
no logging monitor
```

```
no page
```

```
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
```

```
no service snmp sysoid wing5
```

```
no service block-adopter-config-update
```

```
no service ssm trace pattern {<WORD>} {on <DEVICE-NAME>}
```

```
no service wireless [trace pattern {<WORD>} {on <DEVICE-NAME>}|unsanctioned ap air-
terminate <BSSID> {on <DOMAIN-NAME>}]
```

```
no service locator {on <DEVICE-NAME>}
```

```
no terminal [length|width]
```

```
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
```

```
no wireless client [all|<MAC>]
```

```

no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}

```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |
|-----------------|---|

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

```

rfs4000-880DA7>no adoption
rfs4000-880DA7>no page

```

2.1.22 on

► User Exec Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

Parameters

- on rf-domain [<RF-DOMAIN-NAME>|all]

| | |
|---|--|
| <pre>on rf-domain [<RF-DOMAIN- NAME> all]</pre> | <p>Enters the RF Domain context based on the parameter specified</p> <ul style="list-style-type: none"> • <RF-DOMAIN-NAME> - Specify the RF Domain name. Enters the specified RF Domain context. • all - Specifies all RF Domains. |
|---|--|

Example

```
nx9500-6C8809>on rf-domain TechPubs
nx9500-6C8809(TechPubs)>?
on RF-Domain Mode commands:

  clrscr  Clears the display screen
  do      Run commands from Exec mode
  end     End current mode and change to EXEC mode
  exit    End current mode and down to previous mode
  help    Description of the interactive help system
  service Service Commands
  show    Show running system information

nx9500-6C8809(TechPubs)>

nx9500-6C8809(rf-domain-all)>?
on RF-Domain Mode commands:

  clrscr  Clears the display screen
  do      Run commands from Exec mode
  end     End current mode and change to EXEC mode
  exit    End current mode and down to previous mode
  help    Description of the interactive help system
  service Service Commands
  show    Show running system information

nx9500-6C8809(rf-domain-all)>
```

2.1.23 `opendns`

► *User Exec Commands*

Fetches the OpenDNS `device_id` from the OpenDNS site. Use this command to fetch the OpenDNS `device_id`. Once fetched, apply the `device_id` to WLANs that are to be OpenDNS enabled.

OpenDNS is a free DNS service that enables swift Web navigation without frequent outages. It is a reliable DNS service that provides the following services: DNS query resolution, Web-filtering, protection against virus and malware attacks, performance enhancement, etc.

This command is part of a set of configurations that are required to integrate WiNG devices with OpenDNS. When integrated, DNS queries going out of the WiNG device (access point, controller, or service platform) are re-directed to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers that act as proxy DNS servers.

For more information on integrating WiNG devices with OpenDNS site, see *Enabling OpenDNS Support*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
opendns [APIToken|username]
```

```
opendns APIToken <OPENDNS-APITOKEN>
```

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

Note, as per the current implementation both of the above commands can be used to fetch the `device_id` from the OpenDNS site.

Parameters

- `opendns APIToken <OPENDNS-APITOKEN>`

| | |
|--|--|
| <code>opendns</code> | Fetches the <code>device_id</code> from the OpenDNS site using the OpenDNS API token |
| <code>APIToken <OPENDNS-APITOKEN></code> | Configures the OpenDNS APIToken. This is the token provided you by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"> • <code><OPENDNS-APITOKEN></code> - Provide the OpenDNS API token (should be a valid token). For every valid OpenDNS API token provided a <code>device_id</code> is returned. Apply this <code>device_id</code> to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the <code>device_id</code> in the WLAN context, see <i>opendns</i> . |
| <ul style="list-style-type: none"> • <code>opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL></code> | |
| <code>opendns</code> | Fetches the <code>device_id</code> from the OpenDNS site using the OpenDNS credentials |
| <code>username <USERNAME></code> | Configures the OpenDNS user name. This is your OpenDNS email ID provided by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"> • <code><USERNAME></code> - Provide the OpenDNS user name (should be a valid OpenDNS username). |

| | |
|----------------------------|---|
| password <OPENDNS-PSWD> | Configures the password associated with the user name specified in the previous step <ul style="list-style-type: none"> <OPENDNS-PSWD> - Provide the OpenDNS password (should be a valid OpenDNS password). |
| label <LABEL> | Configures the network label. This is the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal. <ul style="list-style-type: none"> <LABEL> - Specify your network label. <p>For every set of user name, password, and label passed only one unique device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see opendns.</p> |

Usage Guidelines

Use your OpenDNS credentials to logon to the [opendns.org](#) site and use the *labels*, *edit settings*, and *customize content filtering* options to configure Web filtering settings.

Example

```
ap7161-E6D512>opendns username bob@examplecompany.com password opendns label
company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7161-E6D512>

nx9600-7F3C7F>opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073 device_id
= 001480fe36dcb245
nx9600-7F3C7F>
```

2.1.24 page

► *User Exec Commands*

Toggles a device's paging function. When executed, this command enables the display of CLI command outputs page by page, instead of running the entire output at once.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
page
```

Parameters

None

Example

```

rfs4000-880DA7>page
rfs4000-880DA7>

```

Related Commands

| | |
|-----------|------------------------|
| <i>no</i> | Disables device paging |
|-----------|------------------------|

2.1.25 ping

► User Exec Commands

Sends *Internet Controller Message Protocol* (ICMP) echo messages to a user-specified location

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

Parameters

```
• ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

| | |
|--|--|
| <IP/HOSTNAME> | Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname. |
| count <1-10000> | Optional. Sets the pings to the specified destination <ul style="list-style-type: none"> • <1-10000> - Specify a value from 1 - 10000. The default is 5. |
| dont-fragment {count size} | Optional. Sets the don't fragment bit in the ping packet. Packets with the dont-fragment bit specified are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified <i>maximum transmission unit</i> (MTU) value, an error message is sent from the device trying to fragment it. <ul style="list-style-type: none"> • count <1-10000> - Optional. Sets the pings to the specified destination from 1 - 10000. The default is 5. • size <1-64000> - Optional. Sets the ping payload size from 1 - 64000 bytes. The default is 100 bytes. |
| size <1-64000> | Optional. Sets the ping payload size in bytes <ul style="list-style-type: none"> • <1-64000> - Specify the ping payload size from 1 - 64000. The default is 100 bytes. |
| source [<IP> pppoe vlan <1-4094> wwan] | Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination. <ul style="list-style-type: none"> • <IP> - Specifies the source IP address • pppoe - Selects the PPP over Ethernet interface • vlan <1-4094> - Selects the VLAN interface from 1 - 4094 • wwan - Selects the wireless WAN interface |

Example

```
rfs6000-81742D>ping 192.168.13.13 count 4
PING 192.168.13.13 (192.168.13.13) 100(128) bytes of data.
108 bytes from 192.168.13.13: icmp_seq=1 ttl=64 time=0.291 ms
108 bytes from 192.168.13.13: icmp_seq=2 ttl=64 time=0.243 ms
108 bytes from 192.168.13.13: icmp_seq=3 ttl=64 time=0.239 ms
108 bytes from 192.168.13.13: icmp_seq=4 ttl=64 time=0.232 ms

--- 192.168.13.13 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3000ms
rtt min/avg/max/mdev = 0.232/0.251/0.291/0.025 ms
rfs6000-81742D>

rfs6000-81742D>ping 10.233.89.182 source vlan 1
PING 10.233.89.182 (10.233.89.182) from 192.168.13.24 vlan1: 100(128) bytes of
data.
From 192.168.13.2 icmp_seq=1 Packet filtered
From 192.168.13.2 icmp_seq=2 Packet filtered
From 192.168.13.2 icmp_seq=3 Packet filtered
From 192.168.13.2 icmp_seq=4 Packet filtered
From 192.168.13.2 icmp_seq=5 Packet filtered

--- 10.233.89.182 ping statistics ---
5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 3997ms

rfs6000-81742D>>
```

2.1.26 ping6

► *User Exec Commands*

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

Parameters

```
• ping <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

| | |
|-----------------|--|
| <IPv6/HOSTNAME> | Specify the destination IPv6 address or hostname. |
| <INTF-NAME> | Specify the interface name for link local/broadcast address |
| count <1-10000> | Optional. Sets the pings to the specified IPv6 destination <ul style="list-style-type: none"> • <1-10000> - Specify a value from 1 - 10000. The default is 5. |
| size <1-64000> | Optional. Sets the IPv6 ping payload size in bytes <ul style="list-style-type: none"> • <1-64000> - Specify the ping payload size from 1 - 64000. The default is 100 bytes. |

Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the *ipv6 > address <IPv6-ADDRESS> command*. After configuring the IPv6 address, use the *ipv6 > enable* command to enable IPv6. For more information, see *ipv6*.

Example

```
rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief
-----
INTERFACE  IPV6 MODE  IPV6-ADDRESS/MASK                TYPE          STATUS  PROTOCOL
-----

rfs4000-229D58>
```

2.1.27 ssh

► User Exec Commands

Opens a *Secure Shell* (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

Parameters

```
• ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

| | |
|-------------------------------|--|
| <IP/HOSTNAME> | Specify the remote system's IP address or hostname. |
| <USERNAME> | Specify the name of the user requesting SSH connection with the remote system. |
| <INF-NAME/ LINK-LOCAL-ADD> | Optional. Specify the interface's name or link local address. |

Example

```
nx9500-6C8809>ssh 192.168.13.24 admin
admin@192.168.13.24's password:
rfs6000-81742D>
```

2.1.28 telnet

► User Exec Commands

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

Parameters

- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

| | |
|---------------|--|
| <IP/HOSTNAME> | Configures the destination remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system. <ul style="list-style-type: none"> • <IP/HOSTNAME> - Specify the remote system's IPv4 or IPv6 address or hostname. |
| <TCP-PORT> | Optional. Specify the <i>Transmission Control Protocol</i> (TCP) port number. |
| <INTF-NAME> | Optional. Specify the interface name for the link local address. |

Example

```
nx9500-6C8809#telnet 192.168.13.10

Entering character mode
Escape character is '^]'.

2.1.29 terminal

► User Exec Commands

Sets the length and width of the CLI display window on a terminal

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
terminal [length|width] <0-512>
```

Parameters

- terminal [length|width] <0-512>

| | |
|----------------|--|
| length <0-512> | Sets the number of lines displayed on the terminal window <ul style="list-style-type: none"> • <0-512> - Specify a value from 0 - 512. |
| width <0-512> | Sets the width (the number of characters displayed in one line) of the terminal window <ul style="list-style-type: none"> • <0-512> - Specify a value from 0 - 512. |

Example

```
rfs6000-81742D>terminal length 150
rfs6000-81742D>terminal width 215

rfs6000-81742D>show terminal
Terminal Type: xterm
Length: 150      Width: 215
rfs6000-81742D>
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the width or length of the terminal window |
|-----------|---|

2.1.30 time-it

► *User Exec Commands*

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
time-it <COMMAND>
```

Parameters

- time-it <COMMAND>

| | |
|-------------------|--|
| time-it <COMMAND> | Verifies the time taken by a particular command to execute and provide a result |
| | <ul style="list-style-type: none"> • <COMMAND> - Specify the command. |

Example

```
rfs6000-81742D>time-it enable
That took 0.00 seconds..
rfs6000-81742D#
```

2.1.31 traceroute

► User Exec Commands

Traces the route to a defined destination

Use '--help' or '-h' to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
traceroute <LINE>
```

Parameters

- traceroute <LINE>

| | |
|-------------------|--|
| traceroute <LINE> | Traces the route to a destination IP address or hostname |
| | • <LINE> - Specify the destination IPv6 address or hostname. |

Example

```
rfs6000-81742D>traceroute --help
BusyBox v1.14.4 () multi-call binary

Usage: traceroute [-Fildnrv] [-f 1st_ttl] [-m max_ttl] [-p port#] [-q nqueries]
[-s src_addr] [-t tos] [-w wait] [-g gateway] [-i iface]
[-z pausesecs] HOST [data size]Options:
-F          Set the don't fragment bit
-I          Use ICMP ECHO instead of UDP datagrams
-l          Display the ttl value of the returned packet
-d          Set SO_DEBUG options to socket
-n          Print hop addresses numerically rather than symbolically
-r          Bypass the normal routing tables and send directly to a host
-v          Verbose
-m max_ttl  Max time-to-live (max number of hops)
-p port#    Base UDP port number used in probes
            (default is 33434)
-q nqueries Number of probes per 'ttl' (default 3)
-s src_addr IP address to use as the source address
-t tos      Type-of-service in probe packets (default 0)
-w wait     Time in seconds to wait for a response
            (default 3 sec)
-g          Loose source route gateway (8 max)

rfs6000-81742D>
rfs6000-81742D>traceroute 192.168.13.13
traceroute to 192.168.13.13 (192.168.13.13), 30 hops max, 38 byte packets
 1 192.168.13.13 (192.168.13.13) 1.150 ms 0.261 ms 0.214 ms
rfs6000-81742D>
```

2.1.32 traceroute6

► User Exec Commands

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
traceroute6 <LINE>
```

Parameters

- traceroute6 <LINE>

| | |
|--------------------|--|
| traceroute6 <LINE> | Traces the route to a destination IPv6 address or hostname |
| | • <LINE> - Specify the destination IPv6 address or hostname. |

Example

```
rfs6000-81742D>traceroute6 2001:10:10:10:10:10:10:1
traceroute to 2001:10:10:10:10:10:10:1 (2001:10:10:10:10:10:1) from
2001:10:10:10:10:10:10:2, 30 hops max, 16 byte packets
 1 2001:10:10:10:10:10:10:1 (2001:10:10:10:10:10:1) 6.054 ms 0.448 ms 0.555
ms
rfs6000-81742D>
```

2.1.33 virtual-machine

► User Exec Commands

Installs, configures, and monitors the status of virtual machines (VMs) installed on a WiNG controller

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
virtual-machine [assign-usb-ports|export|install|restart|set|start|stop|
uninstall]

virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

virtual-machine install [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}

virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan]

virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]

virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|
vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-
INDEX>| vnc [disable|enable]] [<VM-NAME>|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}
```

The following virtual-machine commands are supported only on the VX9000 platform:

```
virtual-machine volume-group [add-drive|replace-drive|resize-drive|resize-volume-
group]

virtual-machine volume-group [add-drive|replace-drive] <BLOCK-DEVICE-LABEL>

virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABLE> <NEW-BLOCK-
DEVICE-LABEL>

virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>
```

Parameters

- virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

| | |
|------------------------------|---|
| assign-usb-ports team-vowlan | <p>Assigns USB ports to TEAM-VoWLAN on a specified device</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Specify the device name. <p>Note: Use the no > virtual-machine > assign-usb-ports to reassign the port to WiNG.</p> <p>Note: TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.</p> |
|------------------------------|---|

- virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

| | |
|------------------------|--|
| virtual-machine export | <p>Exports an existing VM image and settings. Use this command to export the VM to another <NX54XX> or <NX65XX> device in the same domain.</p> <ul style="list-style-type: none"> • <VM-NAME> - Specify the VM name. <ul style="list-style-type: none"> • <FILE> - Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location. • <URL> - Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path: <p>Contd..</p> |
|------------------------|--|

| | |
|--------------------------------|---|
| | <pre>tftp://<hostname IP>[:port]/path/file ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file http://<hostname IP>[:port]/path/file</pre> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. <p>Note: The VM should be in a stop state during the export process. Note: If the destination is a device, the image is copied to a predefined location (VM archive).</p> |
| | <pre>• virtual-machine install [<VM-NAME> adsp team-centro team-rls team-vowlan] {on <DEVICE-NAME>}</pre> |
| <p>virtual-machine install</p> | <p>Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:</p> <ul style="list-style-type: none"> • <VM-NAME> - Installs a VM having name specified by <VM-NAME> keyword. • adsp - Installs ADSP • team-centro - Installs the VM TEAM-Centro image • team-rls - Installs the VM TEAM-RLS image • team-vowlan - Installs the VM TEAM-VoWLAN image <p>Specify the device on which to install the VM.</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
| | <pre>• virtual-machine set [autostart [ignore start] memory <512-8192> vcpus <1-4> vif-count <0-2> vif-mac <VIF-INDEX> <MAC-INDEX> vif-to-vmif <VIF-INDEX> <VMIF- INDEX> vnc [disable enable]] [<VM-NAME> team-urc team-rls team-vowlan] {on <DEVICE-NAME>}</pre> |
| <p>virtual-machine set</p> | <p>Configures the VM settings</p> <ul style="list-style-type: none"> • autostart - Specifies whether to autostart the VM on system reboot <ul style="list-style-type: none"> • ignore - Enables autostart on each system reboot • start - Disables autostart • memory - Defines the VM memory size <ul style="list-style-type: none"> • <512-8192> - Specify the VM memory from 512 - 8192 MB. The default is 1024 MB. • vcpus - Specifies the number of VCPUS for this VM <ul style="list-style-type: none"> • <1-4> - Specify the number of VCPUS from 1- 4. • vif-count - Configures or resets the VM's VIFs <ul style="list-style-type: none"> • <0-2> - Specify the VIF number from 0 - 2. • vif-mac - Configures the MAC address of the selected virtual network interface <ul style="list-style-type: none"> • <1-2> - Select the VIF <ul style="list-style-type: none"> • <1-8> - Specify the MAC index for the selected VIF <ul style="list-style-type: none"> • <MAC> - Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format. <p>Contd..</p> |

| | |
|------------------------------|---|
| | <p>Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the 'set' keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard I2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM's interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.</p> <ul style="list-style-type: none"> vif-to-vmif - Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. <p>WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the twelve ports for <NX9500> on the dataplane bridge. This mapping determines the destination for service platform routing.</p> <p>By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.</p> <ul style="list-style-type: none"> vnc - Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client. <ul style="list-style-type: none"> disable - Disables VNC port enable - Enables VNC port <p>After configuring the VM settings, identify the VM to apply the settings.</p> <ul style="list-style-type: none"> <VM-NAME> - Applies these settings to the VM identified by the <VM-NAME> keyword. Specify the VM name. adsp - Applies these settings to the ADSP VM team-urc - Applies these settings to the VM TEAM-URC team-rls - Applies these settings to the VM TEAM-RLS team-vowlan - Applies these settings to the VM TEAM-VoWLAN |
| | <pre>• virtual-machine start [<VM-NAME> adsp team-urc team-rls team-vowlan] {on <DEVICE-NAME>}</pre> |
| <p>virtual-machine start</p> | <p>Starts the VM, based on the parameters passed. Select one of the following options:</p> <ul style="list-style-type: none"> <VM-NAME> - Starts the VM identified by the <VM-NAME> keyword. Specify the VM name. adsp - Starts the ADSP VM team-urc - Starts the VM TEAM-URC team-rls - Starts the VM TEAM-RLS team-vowlan - Starts the VM TEAM-VoWLAN <p>The following keywords are common to all of the above parameters:</p> <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. |

```
• virtual-machine stop [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
  {on <DEVICE-NAME>}
```

| | |
|------------------------------|---|
| virtual-machine stop hard | <p>Stops the VM, based on the parameters passed. Select one of the following options:</p> <ul style="list-style-type: none"> • <VM-NAME> - Stops the VM identified by the <VM-NAME> keyword. Specify the VM name. • ADSP - Stops the ADSP VM • team-urc - Stops the VM TEAM-URC • team-rls - Stops the VM TEAM-RLS • team-vowlan - Stops the VM TEAM-VoWLAN <p>The following keywords are common to all of the above parameters:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. <p>Note: The option 'hard' forces the selected VM to shutdown.</p> |
|------------------------------|---|

```
• virtual-machine uninstall [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
  {on <DEVICE-NAME>}
```

| | |
|------------------------------|---|
| virtual-machine uninstall | <p>Uninstalls the specified VM</p> <ul style="list-style-type: none"> • <VM-NAME> - Uninstalls the VM identified by the <VM-NAME> keyword. Specify the VM name. • ADSP - Uninstalls the ADSP VM • team-urc - Uninstalls the VM TEAM-URC • team-rls - Uninstalls the VM TEAM-RLS • team-vowlan - Uninstalls the VM TEAM-VoWLAN <p>The following keywords are common to all of the above parameters:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. <p>Note: This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.</p> |
|------------------------------|---|

```
• virtual-machine volume-group [add-drive|resize-drive] <BLOCK-DEVICE-LABEL>
```

| | |
|---|--|
| virtual-machine volume-group [add- drive resize-drive] <BLOCK-DEVICE- LABEL>] | <p>Enables provisioning of logical volume-groups on the VX9000 platform. Logical volume-groups are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives. However, volume-groups can be provisioned only on new VX9000 installation and cannot be added to existing VX9000 installation.</p> <p>Note: The logical volume-group is supported only on a VX9000 running the WiNG 5.9.1 image.</p> <ul style="list-style-type: none"> • add-drive - Adds a new block-device to the VM. Note, currently a maximum of 3 (three) block devices can be added. To add a new drive, first halt the VM, In the Hypervisor, add a new storage disk to the VM and restart the VM. Once the VM comes up, use this command to add the new drive. To identify the new drive execute the <i>show > virtual-machine > volume-group > status</i> command. |
|---|--|

| | |
|--|---|
| | <ul style="list-style-type: none"> • <code>resize-drive</code> - Resizes a drive in the VM's volume group. To increase the size of a drive in the volume-group, first halt the VM. In the Hypervisor, increase the size of the existing secondary storage drive and restart the VM. Once the VM comes up, use this command to resize the drive. To identify the drive with the additional free space, execute the <code>show > virtual-machine > volume-group > status</code> command. <p>The following keyword is common to all of the above parameters:</p> <ul style="list-style-type: none"> • <code><BLOCK-DEVICE-LABEL></code> -Specify the block-device label to be added or resized depending on the action being performed. |
| <ul style="list-style-type: none"> • <code>virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABEL> <NEW-BLOCK-DEVICE-LABEL>]</code> | |
| <pre>virtual-machine volume-group replace- drive <BLOCK-DEVICE- LABEL> <NEW-BLOCK- DEVICE-LABEL>]</pre> | <p>Enables provisioning of VMs as logical volume-groups on the VX9000 platform. Logical volume-group VMs are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives.</p> <ul style="list-style-type: none"> • <code>replace-drive</code> - Replaces an existing block-device with a new block-device in a volume-group. To replace a drive in the volume-group, first halt the VM. In the Hypervisor, add the new drive and restart the VM. Once the VM comes up, use this command to replace an existing drive with the new drive. To identify the drive with the additional free space, execute the <code>show > virtual-machine > volume-group > status</code> command • <code><BLOCK-DEVICE-LABEL></code> -Specify the block-device label to be replaced. • <code><BLOCK-DEVICE-LABEL></code> - Specify the replacement block-device label. |
| <ul style="list-style-type: none"> • <code>virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>]</code> | |
| <pre>virtual-machine volume-group resize- volume-group <BLOCK- DEVICE-LABEL>]</pre> | <p>Enables provisioning of VMs as logical volume-groups on the VX9000 platform. Logical volume-group VMs are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives</p> <ul style="list-style-type: none"> • <code>resize-volume-group</code> - Adds drive space to an existing block-device in the volume-group • <code><BLOCK-DEVICE-LABEL></code> -Specify the block-device label to which additional drive space is to be provided |

Example

The following examples show the VM installation process:

Insatllation media: USB

```
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media
usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

Installation media: pre-installed disk image

```
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/
win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on
<DEVICE-NAME>
```

In the preceding example, the command is executed on the device identified by the `<DEVICE-NAME>` keyword. In such a scenario, the `disk-size` is ignored if specified. The VM has the install media as first boot device.

Installation media: VM archive

```
<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-
NAME> vcpus 3
```

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

Exporting an installed VM:

```
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

```
<exsw6>>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
<exsw6>>
```

```
vx9000-DE6F97>virtual-machine add-drive sdb
```

```
vx9000-DE6F97>show virtual-machine volume-group status
```

```
-----
Logical Volume: lv1
-----

```

2.1.34 watch

► User Exec Commands

Repeats the specified CLI command at periodic intervals

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
watch <1-3600> <LINE>
```

Parameters

- watch <1-3600> <LINE>

| | |
|----------|---|
| watch | Repeats a CLI command at a specified interval (in seconds) |
| <1-3600> | Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command. |
| <LINE> | Specify the CLI command. |

Example

```
rfs6000-81742D>watch 40 ping 192.168.13.13

rfs6000-81742D>
```

2.1.35 exit

► *User Exec Commands*

Ends the current CLI session and closes the session window

For more information, see *exit*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
exit
```

Parameters

None

Example

```
rfs6000-81742D>exit
```

3 PRIVILEGED EXEC MODE COMMANDS

Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

NOTE: To password-protect the Privilege mode, in the Management Policy, configure the `privilege-mode-password`. For more information, see [privilege-mode-password](#).

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

```
<DEVICE>>enable
<DEVICE>#
```

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

```
<DEVICE>#?
Privileged command commands:
archive          Manage archive files
boot             Boot commands
captive-portal-page-upload Captive portal internal and advanced page upload
cd               Change current directory
change-passwd   Change password
clear           Clear
clock           Configure software system clock
cluster         Cluster commands
commit          Commit all changes made in this session
configure       Enter configuration mode
connect         Open a console connection to a remote device
copy            Copy contents of one dir to another
cpe             T5 CPE configuration
create-cluster  Create a cluster
crypto          Encryption related commands
crypto-cmp-cert-update Update the cmp certs
database        Database
database-backup Backup database
database-restore Restore database
debug           Debugging functions
delete          Deletes specified file from the system
device-upgrade Device firmware upgrade
diff            Display differences between two files
dir             List files on a filesystem
disable         Turn off privileged mode command
edit            Edit a text file
enable          Turn on privileged mode command
erase           Erase a filesystem
ex3500          EX3500 commands
factory-reset   Delete startup configuration on device(s),
                reload the device(s) and remove configuration
                entry from the controller
file-sync       File sync between controller and adoptees
format          Format file system
```

| | |
|-----------------|---|
| halt | Halt the system |
| help | Description of the interactive help system |
| join-cluster | Join the cluster |
| l2tpv3 | L2tpv3 protocol |
| logging | Modify message logging facilities |
| mint | MiNT protocol |
| mkdir | Create a directory |
| more | Display the contents of a file |
| no | Negate a command or set its defaults |
| on | On RF-Domain |
| opendns | Opendns username/password configuration |
| page | Toggle paging |
| ping | Send ICMP echo messages |
| ping6 | Send ICMPv6 echo messages |
| pwd | Display current directory |
| raid | RAID operations |
| re-elect | Perform re-election |
| reload | Halt and perform a warm reboot |
| remote-debug | Troubleshoot remote system(s) |
| rename | Rename a file |
| revert | Revert changes |
| rmdir | Delete a directory |
| self | Config context of the device currently logged into |
| service | Service Commands |
| show | Show running system information |
| ssh | Open an ssh connection |
| t5 | T5 commands |
| telnet | Open a telnet connection |
| terminal | Set terminal line parameters |
| time-it | Check how long a particular command took between request and completion of response |
| traceroute | Trace route to destination |
| traceroute6 | Trace route to destination (IPv6) |
| upgrade | Upgrade software image |
| upgrade-abort | Abort an ongoing upgrade |
| virtual-machine | Virtual Machine |
| watch | Repeat the specific CLI command at a periodic interval |
| write | Write running configuration to memory or terminal |
| clrscr | Clears the display screen |
| exit | Exit from the CLI |

<DEVICE>#

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.

3.1 Privileged Exec Mode Commands

► PRIVILEGED EXEC MODE COMMANDS

The following table summarizes the PRIV EXEC Mode commands:

Table 3.1 *Privileged Exec Commands*

| Command | Description | Reference |
|-----------------------------------|--|---------------------------|
| <i>archive</i> | Manages file archive operations | page 3-6 |
| <i>boot</i> | Specifies the boot partition (primary or secondary). The device uses the image stored in the specified partition to boot. | page 3-8 |
| <i>captive-portal-page-upload</i> | Uploads captive portal advanced pages to adopted access points | page 3-9 |
| <i>cd</i> | Changes the current directory | page 3-13 |
| <i>change-passwd</i> | Changes the password of a logged user | page 3-14 |
| <i>clear</i> | Clears parameters, cache entries, table entries, and other similar entries | page 3-15 |
| <i>clock</i> | Configures the system clock | page 3-28 |
| <i>cluster</i> | Initiates a cluster context | page 3-29 |
| <i>configure</i> | Enters the global configuration mode | page 3-30 |
| <i>connect</i> | Begins a console connection to a remote device | page 3-31 |
| <i>copy</i> | Copies a file from any location to the wireless controller, service platform, or access point | page 3-32 |
| <i>cpe</i> | Enables adopted T5 <i>Customer Premises Equipment</i> (CPE) device(s) management. Use this command to perform the following operations on the CPEs: boot, reload, upgrade. This command is specific to the RFS4000, RFS6000, and NX9500 devices. | page 3-33 |
| <i>create-cluster</i> | Creates a new cluster on a specified device | page 3-35 |
| <i>crypto</i> | Enables encryption | page 3-37 |
| <i>crypto-cmp-cert-update</i> | Triggers a CMP certificate update on a specified device or devices | page 3-46 |
| <i>database</i> | Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight) | page 3-47 |
| <i>database-backup</i> | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server | page 3-50 |
| <i>database-restore</i> | Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database. | page 3-52 |
| <i>delete</i> | Deletes a specified file from the system | page 3-53 |
| <i>device-upgrade</i> | Configures device firmware upgrade parameters | page 3-54 |
| <i>diff</i> | Displays the differences between two files | page 3-60 |
| <i>dir</i> | Displays the list of files on a file system | page 3-61 |
| <i>disable</i> | Disables the privileged mode command set | page 3-62 |
| <i>edit</i> | Enables ext file editing | page 3-63 |

Table 3.1 *Privileged Exec Commands*

| Command | Description | Reference |
|----------------------|---|----------------------------|
| <i>enable</i> | Turns on (enables) the privileged mode commands set | page 3-64 |
| <i>erase</i> | Erases a file system | page 3-65 |
| <i>ex3500</i> | Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP related configurations. | page 3-67 |
| <i>factory-reset</i> | Erases startup configuration on a specified device or all devices within a specified RF Domain | page 3-75 |
| <i>file-sync</i> | Configures parameters enabling syncing of PKCS#12 and wireless-bridge certificate between the staging-controller and adopted access points | page 3-79 |
| <i>halt</i> | Halts a device (access point, wireless controller, or service platform) | page 3-82 |
| <i>join-cluster</i> | Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices | page 3-83 |
| <i>l2tpv3</i> | Establishes or brings down <i>Layer 2 Tunneling Protocol Version 3</i> (L2TPV3) tunnels | page 3-85 |
| <i>logging</i> | Modifies message logging parameters | page 3-87 |
| <i>mint</i> | Configures MiNT protocols | page 3-89 |
| <i>mkdir</i> | Creates a new directory in the file system | page 3-91 |
| <i>more</i> | Displays the contents of a file | page 3-92 |
| <i>no</i> | Reverts a command or sets values to their default | page 3-93 |
| <i>on</i> | Executes the following commands in the RF Domain context: clscr, do, end, exit, help, service, show | page 3-95 |
| <i>opendns</i> | Connects to the OpenDNS site using OpenDNS registered credentials (username, password) OR OpenDNS API token to fetch the OpenDNS device_id. This command is a part of the process integrating access points, controllers, and service platforms with OpenDNS. | page 3-96 |
| <i>page</i> | Toggles a device's (access point, wireless controller, or service platform) paging function | page 3-100 |
| <i>ping</i> | Sends ICMP echo messages to a user-specified location | page 3-101 |
| <i>ping6</i> | Sends ICMPv6 echo messages to a user-specified location | page 3-103 |
| <i>pwd</i> | Displays the current directory | page 3-104 |
| <i>re-elect</i> | Re-elects the tunnel controller (wireless controller, service platform, or access point) | page 3-105 |
| <i>reload</i> | Halts a device (wireless controller, service platform, or access point) and performs a warm reboot | page 3-106 |
| <i>rename</i> | Renames a file in the existing file system | page 3-111 |
| <i>rmdir</i> | Deletes an existing file from the file system | page 3-112 |
| <i>self</i> | Displays the configuration context of the device | page 3-113 |
| <i>ssh</i> | Connects to another device using a secure shell | page 3-114 |
| <i>t5</i> | Executes the following operations on a T5 device: copy, rename, delete, and write. This command is specific to the RFS4000, RFS6000, NX9500 devices. | page 3-115 |

Table 3.1 *Privileged Exec Commands*

| Command | Description | Reference |
|------------------------|--|-------------------|
| <i>telnet</i> | Opens a Telnet session | <i>page 3-117</i> |
| <i>terminal</i> | Sets the length and width of the terminal window | <i>page 3-118</i> |
| <i>time-it</i> | Verifies the time taken by a particular command between request and response | <i>page 3-119</i> |
| <i>traceroute</i> | Traces the route to a defined destination | <i>page 3-120</i> |
| <i>traceroute6</i> | Sends ICMPv6 echo messages to a user-specified location | <i>page 3-121</i> |
| <i>upgrade</i> | Upgrades the logged device's software image | <i>page 3-122</i> |
| <i>upgrade-abort</i> | Aborts an ongoing software image upgrade | <i>page 3-126</i> |
| <i>virtual-machine</i> | Installs, configures, and monitors the status of virtual machines (VMs) installed on a WiNG controller | <i>page 3-127</i> |
| <i>watch</i> | Repeats a specified CLI command at a periodic interval | <i>page 3-133</i> |
| <i>raid</i> | Enables RAID management This command is specific to the NX7530, NX9500, and NX9510 service platforms. | <i>page 3-135</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

NOTE: The input parameter <HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore (_) character.

3.1.1 archive

► *Privileged Exec Mode Commands*

Manages file archive operations

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
archive tar /table [<FILE>|<URL>]
archive tar /create [<FILE>|<URL>] <FILE>
archive tar /xtract [<FILE>|<URL>] <DIR>
```

Parameters

- archive tar /table [<FILE>|<URL>]

| | |
|--------|--|
| tar | Manipulates (creates, lists, or extracts) a tar file |
| /table | Lists the files in a tar file |
| <FILE> | Defines a tar filename |
| <URL> | Sets the tar file URL |

- archive tar /create [<FILE>|<URL>] <FILE>

| | |
|---------|---|
| tar | Manipulates (creates, lists or extracts) a tar file |
| /create | Creates a tar file |
| <FILE> | Defines tar filename |
| <URL> | Sets the tar file URL |

- archive tar /xtract [<FILE>|<URL>] <DIR>

| | |
|---------|---|
| tar | Manipulates (creates, lists or extracts) a tar file |
| /xtract | Extracts content from a tar file |
| <FILE> | Defines tar filename |
| <URL> | Sets the tar file URL |
| <DIR> | Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted. |

Example

Following examples show how to zip the folder flash:/log/?

```
nx9500-6C8809#dir flash:/
Directory of flash:/

```

3.1.2 boot

► Privileged Exec Mode Commands

Specifies the image used after reboot

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
boot system [primary|secondary] {on <DEVICE-NAME>}
```

Parameters

- boot system [primary|secondary] {on <DEVICE-NAME>}

| | |
|-------------------------------|---|
| system [primary secondary] | Specifies the image used after a device reboot <ul style="list-style-type: none"> • primary - Uses the primary image after reboot • secondary - Uses the secondary image after reboot |
| on <DEVICE-NAME> | Optional. Specifies the primary or secondary image location on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Example

```
nx9500-6C8809#show boot
```

| IMAGE | BUILD DATE | INSTALL DATE | VERSION |
|-----------|---------------------|---------------------|--------------|
| Primary | 03/26/2017 01:48:56 | 03/30/2017 15:02:18 | 5.9.0.0-012D |
| Secondary | 03/17/2017 13:13:38 | 03/22/2017 13:36:50 | 5.9.0.0-010D |

```
Current Boot      : Primary
Next Boot        : Primary
Software Fallback : Enabled
VM support       : Not present
nx9500-6C8809#
```

```
nx9500-6C8809#boot system secondary
Updated system boot partition
nx9500-6C8809#
```

```
nx9500-6C8809#show boot
```

| IMAGE | BUILD DATE | INSTALL DATE | VERSION |
|-----------|---------------------|---------------------|--------------|
| Primary | 03/26/2017 01:48:56 | 03/30/2017 15:02:18 | 5.9.0.0-012D |
| Secondary | 03/17/2017 13:13:38 | 03/22/2017 13:36:50 | 5.9.0.0-010D |

```
Current Boot      : Primary
Next Boot        : Secondary
Software Fallback : Enabled
VM support       : Not present
nx9500-6C8809#
```

3.1.3 captive-portal-page-upload

► *Privileged Exec Mode Commands*

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

NOTE: Ensure that the captive portal pages to be uploaded are *.tar files.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|
load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all]
{upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME>|all]
{from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME>|all|on rf-domain
{<DOMAIN-NAME>|all}]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

Parameters

- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all] {upload-time <TIME>}

| | |
|---|--|
| captive-portal-page-upload <CAPTIVE-PORTAL-NAME> | Uploads advanced pages specified by the <CAPTIVE-PORTAL-NAME> parameter <ul style="list-style-type: none"> • <CAPTIVE-PORTAL-NAME> - Specify captive portal name (should be existing and configured). |
| <MAC/HOSTNAME> | Uploads to a specified AP <ul style="list-style-type: none"> • <MAC/HOSTNAME> - Specify the AP's MAC address or hostname. |
| all | Uploads to all APs |

| | |
|--|---|
| upload-time <TIME> | <p>Optional. Schedules an upload time</p> <ul style="list-style-type: none"> <TIME> - Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. <p>The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.</p> <p>To view a list of uploaded captive portal files, execute the <i>show > captive-portal-page-upload > list-files <CAPTIVE-PORTAL-NAME></i> command.</p> |
| <ul style="list-style-type: none"> <i>captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME> all] {from-controller} {(upload-time <TIME>)}</i> | |
| captive-portal-page-upload <CAPTIVE-PORTAL-NAME> | <p>Uploads advanced pages specified by the <CAPTIVE-PORTAL-NAME> parameter</p> <ul style="list-style-type: none"> <CAPTIVE-PORTAL-NAME> - Specify captive portal name (should be existing and configured). |
| rf-domain [<DOMAIN-NAME> all] | <p>Uploads to all APs within a specified RF Domain or all RF Domains</p> <ul style="list-style-type: none"> <DOMAIN-NAME> - Uploads to APs within a specified RF Domain. Specify the RF Domain name. all - Uploads to APs across all RF Domains |
| from-controller | Optional. Uploads to APs from the adopted device |
| upload-time <TIME> | <p>Optional. Schedules an AP upload</p> <ul style="list-style-type: none"> <TIME> - Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. <p>The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.</p> |
| <ul style="list-style-type: none"> <i>captive-portal-page-upload cancel-upload [<MAC/HOSTNAME> all on rf-domain [<DOMAIN-NAME> all]]</i> | |
| captive-portal-page-upload cancel-upload | Cancels a scheduled AP upload |
| cancel-upload [<MAC/HOSTNAME> all on rf-domain [<DOMAIN-NAME> all]] | <p>Select one of the following options:</p> <ul style="list-style-type: none"> <MAC/HOSTNAME> - Cancels a scheduled upload to a specified AP. Specify the AP MAC address or hostname. all - Cancels all scheduled AP uploads on rf-domain - Cancels all scheduled uploads within a specified RF Domain or all RF Domains <ul style="list-style-type: none"> <DOMAIN-NAME> - Cancels scheduled uploads within a specified RF Domain. 3.1.4 cd

► *Privileged Exec Mode Commands*

Changes the current directory

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cd {<DIR>}
```

Parameters

- cd {<DIR>}

| | |
|-------|---|
| <DIR> | Optional. Changes the current directory to the directory identified by the <DIR> keyword. If a directory name is not provided, the system displays the current directory. |
|-------|---|

Example

```
rfs6000-81742D#cd flash:/log/
rfs6000-81742D#pwd
flash:/log/
rfs6000-81742D#
```

3.1.5 change-passwd

► *Privileged Exec Mode Commands*

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
change-passwd <OLD-PASSWORD> <NEW-PASSWORD>
```

Parameters

- change-passwd <OLD-PASSWORD> <NEW-PASSWORD>

| | |
|----------------|--|
| <OLD-PASSWORD> | Specify the password to be changed. |
| <NEW-PASSWORD> | Specify the new password. Note: The password can also be changed interactively. To do so, press [Enter] after the command. |

Usage Guidelines

A password must be from 1 - 64 characters in length.

Example

```
rfs6000-81742D#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs6000-81742D#write memory
OK
rfs6000-81742D#
```

3.1.6 clear

► *Privileged Exec Mode Commands*

Clears parameters, cache entries, table entries, and other entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where the clear command is executed.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

NOTE: When using the *clear* command, refer to the interface details provided in *interface*.

Syntax

```
clear [arp-cache|bonjour|cdp|counters|crypto|eguest|event-history|firewall|gre|
ip|ipv6|l2tpv3-stats|lacp|license|lldp|logging|mac-address-table|mint|role|rtls|

clear traffic-shape statistics {class <1-4>} {(on <DEVICE-NAME>)}

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

```

The following clear command is specific to the NX95XX series service platforms:

```
clear logging analytics {on <DEVICE-NAME>}
```

Parameters

- `clear arp-cache {on <DEVICE-NAME>}`

| | |
|------------------|--|
| arp-cache | Clears <i>Address Resolution Protocol</i> (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses. |
| on <DEVICE-NAME> | Optional. Clears ARP cache entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear bonjour cache {on <DEVICE-NAME>}`

| | |
|------------------|--|
| bonjour cache | Clears all Bonjour cached statistics. Once cleared, the system has to re-discover available Bonjour services. |
| on <DEVICE-NAME> | Optional. Clears all Bonjour cached statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear [cdp|lldp] neighbors {on <DEVICE-NAME>}`

| | |
|------------------|---|
| cdp | Clears <i>Cisco Discovery Protocol</i> (CDP) table entries |
| lldp | Clears <i>Link Layer Discovery Protocol</i> (LLDP) neighbor table entries |
| neighbors | Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step |
| on <DEVICE-NAME> | Optional. Clears CDP or LLDP neighbor table entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear counters [all|bridge|router|thread]`

| | |
|--|---|
| counters [all bridge router thread] | Clears counters on a system <ul style="list-style-type: none"> • all - Clears all counters irrespective of the interface type • bridge - Clears bridge counters • router - Clears router counters • thread - Clears per-thread counters |
|--|---|

- `clear counters [ap|wireless-client] {<MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}`

| | |
|----------------------------------|---|
| counters [ap wireless-client] | Clears counters on a system <ul style="list-style-type: none"> • ap - Clears access point wireless counters • wireless-client - Clears wireless client counters |
| <MAC> | The following keyword is common to the 'ap' and 'wireless-client' parameters: <ul style="list-style-type: none"> • <MAC> - Optional. Clears counters of the AP/wireless client identified by the <MAC> keyword. Specify the MAC address of the AP or wireless client. <p>The system clears all AP or wireless client counters, if no MAC address is specified.</p> |

| | |
|---|--|
| <p>on <DEVICE-OR-DOMAIN-NAME></p> | <p>The following keyword is recursive and is applicable to the <MAC> parameter:</p> <ul style="list-style-type: none"> on <DEVICE-OR-DOMAIN-NAME> - Optional. Clears AP/wireless-client counters on a specified device or RF Domain <ul style="list-style-type: none"> <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain. <p>If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.</p> |
| <pre>• clear counters interface [<INTERFACE-NAME> all ge <1-X> me1 port-channel <1-X> pppoe1 vlan <1-4094> wwan1 xge <1-4>]</pre> | |
| <p>counters interface [<INTERFACE-NAME> all ge <1-X> me1 port-channel <1-X> pppoe1 vlan <1-4094> wwan1 xge <1-4>]</p> | <p>Clears interface counters for a specified interface</p> <ul style="list-style-type: none"> <INTERFACE-NAME> - Clears a specified interface counters. Specify the interface name. all - Clears all interface counters ge <1-X> - Clears GigabitEthernet interface counters. Specify the GigabitEthernet interface index from 1 - X. me1 - Clears FastEthernet interface counters port-channel <1- X> - Clears port-channel interface counters. Specify the port channel interface index from 1 - X. <p>Note: The number of port-channel interfaces supported varies for different device types. For example, RFS4000 supports 3 port-channels.</p> <ul style="list-style-type: none"> pppoe1 - Clears <i>Point-to-Point Protocol over Ethernet</i> (PPPoE) interface counters vlan <1-4094> - Clears interface counters. Specify the <i>Switch Virtual Interface</i> (SVI) VLAN ID from 1 - 4094. wwan1 - Clears wireless WAN interface counters xge <1-4> - Clears TenGigabitEthernet interface counters. Specify the GigabitEthernet interface index from 1 - 4. |
| <pre>• clear counters radio {<MAC/HOSTNAME> <1-X>} {(on <DEVICE-OR-DOMAIN-NAME>)}</pre> | |
| <p>counters radio</p> | <p>Clears wireless radio counters</p> |
| <p><MAC/HOSTNAME> <1-X></p> | <p>Clears counters of a radio identified by the <MAC/HOSTNAME> keyword.</p> <ul style="list-style-type: none"> <MAC/HOSTNAME> - Optional. Specify the hostname or MAC address. Optionally, append the interface number to form radio ID in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX <ul style="list-style-type: none"> <1-X> - Optional. Specify the radio index (if not specified as part of the radio ID). The maximum number of radio antennas supported varies with the access point type. <p>If no MAC address or radio index is specified, the system clears all radio counters.</p> |
| <p>on <DEVICE-OR-DOMAIN-NAME></p> | <p>The following keyword is recursive and is applicable to the <MAC> parameter:</p> <ul style="list-style-type: none"> on <DEVICE-OR-DOMAIN-NAME> - Optional. Clears AP/wireless-client counters on a specified device or RF Domain <p>If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.</p> |
| <pre>• clear crypto ike sa [<IP> all] {on <DEVICE-NAME>}</pre> | |
| <p>crypto</p> | <p>Clears encryption module database</p> |

| | |
|--|---|
| ike sa [<IP> all] | Clears <i>Internet Key Exchange</i> (IKE) security associations (SAs) <ul style="list-style-type: none"> • <IP> - Clears IKE SAs for a certain peer • all - Clears IKE SAs for all peers |
| on <DEVICE-NAME> | Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • clear crypto ipsec sa {on <DEVICE-NAME>} | |
| crypto | Clears encryption module database |
| ipsec sa {on <DEVICE-NAME>} | Clears <i>Internet Protocol Security</i> (IPSec) database SAs <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears IPSec SA entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • clear eguest registration statistics | |
| eguest registration statistics | Clears EGuest registration server counters. When cleared EGuest registration details are deleted, and the <i>show > eguest > registration > statistics</i> command output is null. This command is applicable only on the NX95XX, NX9600, and the VX9000 model platforms. |
| <ul style="list-style-type: none"> • clear event-history | |
| event-history | Clears event history cache entries |
| <ul style="list-style-type: none"> • clear firewall [dhcp snoop-table dos stats flows [ipv4 ipv6] neighbors snoop-table] {on <DEVICE-NAME>} | |
| firewall | Clears firewall event entries |
| dhcp snoop-table | Clears DHCP snoop table entries |
| dos stats | Clears denial of service statistics |
| flows [ipv4 ipv6] | Clears established IPv4 or IPv6 firewall sessions |
| neighbors snoop-table | Clears IPv6 neighbors snoop-table entries |
| on <DEVICE-NAME> | The following keywords are common to the DHCP, DOS, and flows parameters: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears DHCP snoop table entries, denial of service statistics, or the established firewall sessions on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • clear gre stats {on <DEVICE-NAME>} | |
| gre stats | Clears GRE tunnel statistics |
| on <DEVICE-NAME> | Optional. GRE tunnel statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

• `clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}`

| | |

| <p>out</p> | <p>Optional. Clears soft-reconfiguration outbound route updates. Optionally specify the device on which to execute this command.</p> |
| <p>on <DEVICE-NAME></p> | <p>The following keyword is recursive and optional.</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears BGP sessions on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP or service platform. |

• `clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}`

| | |
|---|---|
| <p>ip bgp [<IP> all external]</p> | <p>Clears BGP routing table information based on the option selected</p> <ul style="list-style-type: none"> • <IP> - Clears the BGP peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all - Clears route updates received from all BGP peers • external - Clears route updates received from external BGP peers <p>This command is applicable only to the RFS4000, RFS6000, and NX95XX series service platforms.</p> <p>In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect.</p> |
|---|---|

| | |
|---|--|
| soft {in out} | <p>Optional. Enables soft-reconfiguration of route updates for the specified IP address. This option allows routing tables to be reconfigured without clearing BGP sessions.</p> <ul style="list-style-type: none"> • in – Optional. Enables soft reconfiguration of inbound route updates • out – Optional. Enables soft reconfiguration of outbound route updates <p>Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The <code>clear > ip > bgp</code> command clears BGP sessions. To reduce loss of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.</p> |
| on <DEVICE-NAME> | <p>Optional. Clears soft-reconfiguration inbound/outbound route updates on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP or service platform. |
| <ul style="list-style-type: none"> • <code>clear ip bgp process {on <DEVICE-NAME>}</code> | |
| ip bgp process | <p>Clears all BGP processes running</p> <p>This command is applicable only to the RFS4000, RFS6000, NX95XX, NX9600 platforms.</p> |
| on <DEVICE-NAME> | <p>Optional. Clears all BGP processes on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP or service platform. |
| <ul style="list-style-type: none"> • <code>clear ip dhcp bindings [<IP> all] {on <DEVICE-NAME>}</code> | |
| ip | <p>Clears a <i>Dynamic Host Configuration Protocol</i> (DHCP) server's IP address bindings entries</p> |
| dhcp bindings | <p>Clears DHCP server's connections and address binding entries</p> |
| <IP> | <p>Clears specific address binding entries. Specify the IP address to clear binding entries.</p> |
| all | <p>Clears all address binding entries</p> |
| on <DEVICE-NAME> | <p>Optional. Clears a specified address binding or all address bindings on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>clear ip ospf process {on <DEVICE-NAME>}</code> | |
| ip ospf process | <p>Clears already enabled <i>open shortest path first</i> (OSPF) process and restarts the process</p> |
| on <DEVICE-NAME> | <p>Optional. Clears OSPF process on a specified device</p> <p>OSPF is a link-state <i>interior gateway protocol</i> (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet layer which makes routing decisions based solely on the destination IP address found in IP packets.</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

| | |
|--|---|
| <ul style="list-style-type: none"> • <code>clear ipv6 neighbor-cache {on <DEVICE-NAME>}</code> | |
| clear ipv6 neighbor-cache | Clears IPv6 neighbor cache entries |
| on <DEVICE-NAME> | Optional. Clears IPv6 neighbor cache entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

| on <DEVICE-NAME> | <p>Optional. Clears role based LDAP server statistics on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>clear rtls [aeroscout ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>} on <DEVICE-OR-DOMAIN-NAME>}</code> | |
| rtls | Clears <i>Real Time Location Service</i> (RTLS) statistics |
| aeroscout | Clears RTLS Aeroscout statistics |
| ekahau | Clears RTLS Ekahau statistics |
| <MAC/DEVICE-NAME> | <p>This keyword is common to the 'aeroscout' and 'ekahau' parameters.</p> <ul style="list-style-type: none"> • <MAC/DEVICE-NAME> - Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP's MAC address or hostname. |
| on <DEVICE-OR-DOMAIN-NAME> | <p>This keyword is common to the 'aeroscout' and 'ekahau' parameters.</p> <ul style="list-style-type: none"> • on <DEVICE-OR-DOMAIN-NAME> - Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified device or RF Domain <ul style="list-style-type: none"> • <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain. |

- `clear spanning-tree detected-protocols {on <DEVICE-NAME>}`

| | |
|--------------------|--|
| spanning-tree | Clears spanning tree protocols on an interface, and also restarts protocol migration |
| detected-protocols | Restarts protocol migration |
| on <DEVICE-NAME> | Optional. Clears spanning tree protocols on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Optional. Specify the name of the AP, wireless controller, or service platform. |

- `clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|vlan <1-4094>|wwan1|xge <1-4>]} {on <DEVICE-NAME>}`

| | |
|--|---|
| spanning-tree | Clears spanning tree protocols on an interface and restarts protocol migration |
| detected-protocols | Restarts protocol migration |
| interface [<INTERFACE-NAME> ge <1-X> me1 port-channel <1-X> pppoe1 vlan <1-4094> wwan1 xge <1-4>] | Optional. Clears spanning tree entries on different interfaces <ul style="list-style-type: none"> • <INTERFACE-NAME> - Clears detected spanning tree entries on a specified interface. Specify the interface name. • ge <1-X> - Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X • me1 - Clears FastEthernet interface spanning tree entries • port-channel <1- X> - Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X. <p>The number of port-channel interfaces supported varies for different device types. For example, RFS4000 supports 3 port-channels.</p> <ul style="list-style-type: none"> • pppoe1 - Clears detected spanning tree entries for PPPoE interface. • vlan <1-4094> - Clears detected spanning tree entries for the selected VLAN interface. Select a SVI VLAN ID from 1 - 4094. • wwan1 - Clears detected spanning tree entries for wireless WAN interface • xge <1-4> - Clears detected spanning tree entries for TenGigabitEthernet interfaces. Specify the GigabitEthernet interface index from 1 - 4. |
| on <DEVICE-NAME> | Optional. Clears spanning tree protocol entries on a selected device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `clear traffic-shape statistics {class <1-4>} {(on <DEVICE-NAME>)}`

| | |
|--------------------------|---|
| traffic-shape statistics | Clears traffic shaping statistics |
| class <1-4> | Optional. Clears traffic shaping statistics for a specific traffic class <ul style="list-style-type: none"> • <1-4> - Specify the traffic class from 1 - 4. <p>Note: If the traffic class is not specified, the system clears all traffic shaping statistics.</p> |
| on <DEVICE-NAME> | Optional. Clears traffic shaping statistics for the specified traffic class on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the access point, wireless controller, or service platform. <p>Note: For more information on configuring traffic-shape, see interface.</p> |

- `clear vrrp [error-stats|stats] {on <DEVICE-NAME>}`

| | |
|------|---|
| vrrp | Clears <i>Virtual Router Redundancy Protocol</i> (VRRP) statistics for a device |
|------|---|

| | |
|-----------------------------------|--|
| error-stats {on <DEVICE-NAME>} | <p>Clears global error statistics</p> <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Clears VRRP global error statistics on a selected device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| stats {on <DEVICE-NAME>} | <p>Clears VRRP related statistics</p> <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Clears VRRP related statistics on a selected device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

3.1.7 clock

► Privileged Exec Mode Commands

Sets a device's system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device's clock is set without resetting the time zone, the time is displayed relative to the *Universal Time Coordinated* (UTC) – Greenwich Time. To display time in the local time zone format, in the device's configuration mode, use the `timezone` command to reset the time zone. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see [timezone](#).

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

Parameters

- `clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}`

| | |
|------------------|--|
| clock set | Sets a device's system clock |
| <HH:MM:SS> | Sets the current time (in military format hours, minutes and seconds) Note: By default the WiNG software displays time in the 24-hour clock format. This setting cannot be changed. |
| <1-31> | Sets the numerical day of the month |
| <MONTH> | Sets the month of the year from Jan - Dec |
| <1993-2035> | Sets a valid four digit year from 1993 - 2035 |
| on <DEVICE-NAME> | Optional. Sets the clock on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Example

The following commands set the time zone and clock for the logged device:

```
nx9500-6C8809 (config-device-B4-C7-99-6C-88-09) #timezone America/Los_Angeles
nx9500-6C8809#clock set 00:25:10 16 Jan 2017
nx9500-6C8809#show clock
2017-01-16 03:31:16 IST
nx9500-6C8809#
```

3.1.8 cluster

► *Privileged Exec Mode Commands*

Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cluster start-election
```

Parameters

- cluster start-election

| | |
|----------------|--------------------------------------|
| start-election | Starts a new cluster master election |
|----------------|--------------------------------------|

Example

```
rfs4000-880DA7#cluster start-election
rfs4000-880DA7#
```

Related Commands

| | |
|-----------------------|---|
| <i>create-cluster</i> | Creates a new cluster on a specified device |
| <i>join-cluster</i> | Adds a controller, as cluster member, to an existing cluster of devices |

3.1.9 configure

► *Privileged Exec Mode Commands*

Enters the configuration mode. Use this command to enter the current device's configuration mode, or enable configuration from the terminal.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
configure {self|terminal}
```

Parameters

- `configure {self|terminal}`

| | |
|----------|---|
| self | Optional. Enables the current device's configuration mode |
| terminal | Optional. Enables configuration from the terminal |

Example

```
rfs6000-81742D#configure self
Enter configuration commands, one per line. End with CNTL/Z.
rfs6000-81742D(config-device-00-15-70-81-74-2D)#

rfs6000-81742D#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs6000-81742D(config)#
```

3.1.10 connect

► *Privileged Exec Mode Commands*

Begins a console connection to a remote device using the remote device's MiNT ID or name

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

Parameters

- connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

| | |
|----------------------|---|
| mint-id <MINT-ID> | Connects to a remote system using the MiNT ID <ul style="list-style-type: none"> • <MINT-ID> - Specify the remote device's MiNT ID. |
| <REMOTE-DEVICE-NAME> | Connects to a remote system using its name <ul style="list-style-type: none"> • <REMOTE-DEVICE-NAME> - Specify the remote device's name. |

Example

```
nx9500-6C8809#show mint lsp-db
9 LSPs in LSP-db of 19.6C.88.09:

3.1.11 copy

► Privileged Exec Mode Commands

Copies a file (config,log,txt...etc) from any location to the access point, wireless controller, or service platform and vice-versa

NOTE: Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config.

Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is better to erase the existing start-up config file and then copy the new config file to the startup config.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

Parameters

- copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]

| | |
|--------------------|--|
| <SOURCE-FILE> | Specify the source file to copy. |
| <SOURCE-URL> | Specify the source file's location (URL). |
| <DESTINATION-FILE> | Specify the destination file to copy to. |
| <DESTINATION-URL> | Specify the destination file's location (URL). |

Example

```
Transferring file snmpd.log to remote TFTP server.
rfs6000-81742D#copy flash:/log/snmpd.log
tftp://10.233.89.183:/snmpd.log
Accessing running-config file from remote TFTP server into switch running-config.
rfs6000-81742D#copy tftp://10.233.89.183:/running-config running-config
```

3.1.12 cpe

► Privileged Exec Mode Commands

Enables a WiNG controller to perform certain operations on *Customer Premises Equipment* (CPEs) through an adopted T5 controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a *Digital Subscriber Line* (DSL) as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
cpe [boot|reload|upgrade]
cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}
cpe [reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

NOTE: These commands can also be executed on the T5 profile and device context. For more information, see [T5 Profile Config Commands](#).

Parameters

- cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}

| | |
|---------------------|---|
| cpe boot system | Changes the image used by a CPE to boot. When reloading, the CPE uses the specified image. |
| cpe [<1-24> all] | Identifies the CPE(s) on which this change is implemented <ul style="list-style-type: none"> • <1-24> - Reloads only those CPEs whose IDs have been specified. Specify the ID from 1 - 24. • all - Reloads all CPEs |
| [primary secondary] | Select the next boot image <ul style="list-style-type: none"> • primary - Uses the primary image when reloading • secondary - Uses the secondary image when reloading |
| on <T5-DEVICE-NAME> | Optional. Performs this operation on a specified T5 device <ul style="list-style-type: none"> • <T5-DEVICE-NAME> - Specify the T5 device's hostname. |

- `cpe [reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}`

| | |
|--|--|
| <code>cpe [reload upgrade <IMAGE-LOCATION>]</code> | <p>Performs the following operations on CPEs</p> <ul style="list-style-type: none"> • reload - Reloads the device • upgrade <IMAGE-LOCATION> - Upgrades the device • <IMAGE-LOCATION> - Specify the location of the firmware image. Both IPv4 and IPv6 addresses are supported. Use one of the following options to provide the location: IPv4 URLs: <code>tftp://<hostname IP>[:port]/path/file</code> <code>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file</code> <code>sftp://<user>:<passwd>@<hostname IP>[:port]/path/file</code> <code>http://<hostname IP>[:port]/path/file</code> <code>cf:/path/file</code> <code>usb<n>:/path/file</code> IPv6 URLs: <code>tftp://<hostname [IPv6]>[:port]/path/file</code> <code>ftp://<user>:<passwd>@<hostname [IPv6]>[:port]/path/file</code> <code>sftp://<user>:<passwd>@<hostname [IPv6]>[:port]/path/file</code> <code>http://<hostname [IPv6]>[:port]/path/file</code> <p>Note: After specifying the operation to perform, identify the device(s).</p> |
| <code>cpe [<1-24> all]</code> | <p>Identifies the CPE(s) on which the operation is performed</p> <ul style="list-style-type: none"> • <1-24> - Configures the CPE's ID from 1 - 24 • all - Configures all CPEs |
| <code>on <T5-DEVICE-NAME></code> | <p>Optional. Performs this operation on a specified T5 device</p> <ul style="list-style-type: none"> • <T5-DEVICE-NAME> - Specify the T5 device's hostname. |

Example

```

nx9500-6C8809#show t5 cpe boot on t5-ED7C6C
-----
  DEVICE  PRIMARY VERSION  SECONDARY VERSION  NEXT BOOT  UPGRADE STATUS  UPGRADE
  PROGRESS %
-----
  cpe1    5.4.2.0-010R    5.4.2.0-006B      primary    none            0
  cpe2    5.4.2.0-010R    5.4.2.0-006B      primary    none            0
-----

```

3.1.13 create-cluster

► *Privileged Exec Mode Commands*

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

Parameters

- create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}

| | |
|------------------------|--|
| create-cluster | Creates a cluster |
| name <CLUSTER-NAME> | Configures the cluster name <ul style="list-style-type: none"> • <CLUSTER-NAME> - Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters. |
| ip <IP> | Specifies the device's IP address used for cluster creation <ul style="list-style-type: none"> • <IP> - Specify the device's IP address in the A.B.C.D format. |
| level [1 2] | Optional. Configures the routing level for this cluster <ul style="list-style-type: none"> • 1 - Configures level 1 (local) routing • 2 - Configures level 2 (inter-site) routing |

Example

```
rfs4000-229D58#create-cluster name TechPubs ip 192.168.13.8 level 2
... creating cluster
... committing the changes
... saving the changes
Please Wait .

Related Commands

| | |
|---------------------|--|
| <i>cluster</i> | Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member. |
| <i>join-cluster</i> | Adds a wireless controller, access point, or service platform, as cluster member, to an existing cluster of devices |

3.1.14 crypto

► Privileged Exec Mode Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name, etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate *Certificate Signing Request* (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
crypto [key|pki]

crypto key [export|generate|import|zeroize]

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
{background|on|passphrase}

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase
<KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background|on|passphrase}

crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase
<KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}

crypto pki [authenticate|export|generate|import|zeroize]

crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background} {(on
<DEVICE-NAME>)}

crypto pki export [request|trustpoint]

crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
[autogen-subject-name|subject-name]

crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-
address <IP>)

crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|
use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE>
<CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,
fqdn <FQDN>,ip-address <IP>)

crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-
address <IP>,on <DEVICE-NAME>)}

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address
<IP>,on <DEVICE-NAME>)}

crypto pki import [certificate|crl|trustpoint]

crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background} {(on <DEVICE-NAME>)}

crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

Parameters

- crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

| | |
|--|--|
| key | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
| export rsa <RSA-KEYPAIR-NAME> | Exports an existing RSA Keypair to a specified destination <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. |
| <EXPORT-TO-URL> | Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported. After specifying the destination address (where the RSA keypair is exported), configure one of the following parameters: background or passphrase. |
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts RSA Keypair before exporting <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify a passphrase to encrypt the RSA keypair. • background - Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to all of the above parameters: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs export operation on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

| | |
|-----|--|
| key | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
|-----|--|

| | |
|---|--|
| generate rsa <RSA-KEYPAIR-NAME> [2048 4096] | Generates a new RSA Keypair <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. • [2048 4096] - Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits. <p>After specifying the key size, optionally specify the device (access point or controller) to generate the key on.</p> |
| on <DEVICE-NAME> | Optional. Generates the new RSA Keypair on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background} passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)} }</pre> | |
| key | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
| import rsa <RSA-KEYPAIR-NAME> | Imports a RSA Keypair from a specified source <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. |
| <IMPORT-FROM-URL> | Specify the RSA Keypair source address. Both IPv4 and IPv6 address formats are supported. <p>After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase.</p> |
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Decrypts the RSA Keypair after importing <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify the passphrase to decrypt the RSA keypair. • background - Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to the 'background' and 'passphrase' keywords: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs import operation on a specific device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)} }</pre> | |
| key | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
| zeroize rsa <RSA-KEYPAIR-NAME> | Deletes a specified RSA Keypair <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. <p>Note: All device certificates associated with this key will also be deleted.</p> |
| force | Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion. |

| | |
|---|--|
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Deletes all certificates associated with the RSA Keypair on a specified device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto pki authenticate <TRUSTPOINT-NAME> <URL> {background} {(on <DEVICE-NAME>) }</pre> | |
| pki | Enables <i>Private Key Infrastructure</i> (PKI) management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated <i>Certificate Authority</i> (CA) certificates. |
| authenticate <TRUSTPOINT-NAME> | Authenticates a trustpoint and imports the corresponding CA certificate <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name. |
| <URL> | Specify CA's location. Both IPv4 and IPv6 address formats are supported. Note: The CA certificate is imported from the specified location. |
| background | Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the authentication on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs authentication on a specified device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <pre>• crypto pki export request [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)</pre> | |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| export request | Exports CSR to the CA for digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key. |
| [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair or uses an existing RSA Keypair <ul style="list-style-type: none"> generate-rsa-key - Generates a new RSA Keypair for digital authentication use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| autogen-subject-name | Auto generates subject name from configuration parameters. The subject name identifies the certificate. |
| <EXPORT-TO-URL> | Specify the CA's location. Both IPv4 and IPv6 address formats are supported. Note: The CSR is exported to the specified location. |
| email <SEND-TO-EMAIL> | Exports CSR to a specified e-mail address <ul style="list-style-type: none"> <SEND-TO-EMAIL> - Specify the CA's e-mail address. |
| fqdn <FQDN> | Exports CSR to a specified <i>Fully Qualified Domain Name</i> (FQDN) <ul style="list-style-type: none"> <FQDN> - Specify the CA's FQDN. |
| ip-address <IP> | Exports CSR to a specified device or system <ul style="list-style-type: none"> <IP> - Specify the CA's IP address. |

- `crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>, email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>)`

| | |
|--|--|
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| export request | Exports CSR to the CA for a digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key. |
| [generate-rsa-key short [generate-rsa-key use-rsa-key] use-rsa-key] <RSA-KEYPAIR-NAME> | <p>Generates a new RSA Keypair or uses an existing RSA Keypair</p> <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication • short [generate-rsa-key use-rsa-key] - Generates and exports a shorter version of the CSR <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it. • use-rsa-key - Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name. • use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| subject-name <COMMON-NAME> | <p>Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate</p> <ul style="list-style-type: none"> • <COMMON-NAME> - Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length). |
| <COUNTRY> | Sets the deployment country code (2 character ISO code) |
| <STATE> | Sets the state name (2 to 64 characters in length) |
| <CITY> | Sets the city name (2 to 64 characters in length) |
| <ORGANIZATION> | Sets the organization name (2 to 64 characters in length) |
| <ORGANIZATION-UNIT> | Sets the organization unit (2 to 64 characters in length) |
| <EXPORT-TO-URL> | Specify the CA's location. Both IPv4 and IPv6 address formats are supported. The CSR is exported to the specified location. |
| email <SEND-TO-EMAIL> | Exports CSR to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> - Specify the CA's e-mail address. |
| fqdn <FQDN> | Exports CSR to a specified FQDN <ul style="list-style-type: none"> • <FQDN> - Specify the CA's FQDN. |
| ip-address <IP> | Exports CSR to a specified device or system <ul style="list-style-type: none"> • <IP> - Specify the CA's IP address. |
| | <ul style="list-style-type: none"> • <code>crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background} passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}</code> |
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |

| | |
|--|---|
| export trustpoint <TRUSTPOINT-NAME> | Exports a trustpoint along with CA certificate, <i>Certificate Revocation List</i> (CRL), server certificate, and private key <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| <EXPORT-TO-URL> | Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here. |
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts the key with a passphrase before exporting <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify the passphrase to encrypt the trustpoint. <ul style="list-style-type: none"> • background - Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to the 'background' and 'passphrase' keywords: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs export operation on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • <code>crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}</code> | |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates. |
| generate | Generates a certificate and a trustpoint |
| self-signed <TRUSTPOINT-NAME> | Generates a self-signed certificate and a trustpoint <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify a name for the certificate and its trustpoint. |
| [generate-rsa-key] use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair, or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication • use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| autogen-subject-name | Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate. |
| email <SEND-TO-EMAIL> | Optional. Exports the self-signed certificate to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> - Specify the e-mail address. |
| fqdn <FQDN> | Optional. Exports the self-signed certificate to a specified FQDN <ul style="list-style-type: none"> • <FQDN> - Specify the FQDN. |
| ip-address <IP> | Optional. Exports the self-signed certificate to a specified device or system <ul style="list-style-type: none"> • <IP> - Specify the device's IP address. |
| on <DEVICE-NAME> | Optional. Exports the self-signed certificate on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

- `crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> { (email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>, on <DEVICE-NAME>) }`

| | |
|---|---|
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates. |
| generate self-signed <TRUSTPOINT-NAME> | Generates a self-signed certificate and a trustpoint <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify a name for the certificate and its trustpoint. |
| [generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair, or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key - Generates a new RSA Keypair for digital authentication • use-rsa-key - Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| subject-name <COMMON-NAME> | Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate <ul style="list-style-type: none"> • <COMMON-NAME> - Specify the common name used with this certificate. The name should enable you to identify the certificate easily and should not exceed 2 to 64 characters in length. |
| <COUNTRY> | Sets the deployment country code (2 character ISO code) |
| <STATE> | Sets the state name (2 to 64 characters in length) |
| <CITY> | Sets the city name (2 to 64 characters in length) |
| <ORGANIZATION> | Sets the organization name (2 to 64 characters in length) |
| <ORGANIZATION-UNIT> | Sets the organization unit (2 to 64 characters in length) |
| email <SEND-TO-EMAIL> | Optional. Exports the self-signed certificate to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> - Specify the e-mail address. |
| fqdn <FQDN> | Optional. Exports the self-signed certificate to a specified FQDN <ul style="list-style-type: none"> • <FQDN> - Specify the FQDN. |
| ip-address <IP> | Optional. Exports the self-signed certificate to a specified device or system <ul style="list-style-type: none"> • <IP> - Specify the device's IP address. |

- `crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} { (on <DEVICE-NAME>) }`

| | |
|-------------------------------------|---|
| pkc | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, <i>Certificate Revocation List</i> (CRL), or a trustpoint to the selected device |
| [certificate crl] <TRUSTPOINT-NAME> | Imports a signed server certificate or CRL <ul style="list-style-type: none"> • certificate - Imports signed server certificate • crl - Imports CRL <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported. The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here. |

| | |
|--|--|
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs import operation on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. <pre> • crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)} </pre> |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, CRL, or a trustpoint to the selected device |
| trustpoint <TRUSTPOINT-NAME> | Imports a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported. |
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Decrypts trustpoint with a passphrase after importing <ul style="list-style-type: none"> <KEY-PASSPHRASE> - Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on. <ul style="list-style-type: none"> background - Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs import operation on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. <pre> • crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)} </pre> |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| zeroize trustpoint <TRUSTPOINT-NAME> | Deletes a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated). |
| del-key | Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Deletes the trustpoint on a specified device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:

```
tftp://<hostname|IP>[:port]/path/file
ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
sftp://<user>@<hostname|IP>[:port]/path/file
http://<hostname|IP>[:port]/path/file
cf:/path/file
usb<n>:/path/file
```

- IPv6 URLs:

```
tftp://<hostname|[IPv6]>[:port]/path/file
ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
http://<hostname|[IPv6]>[:port]/path/file
```

Example

```
rfs6000-81742D#crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs6000-81742D#

rfs6000-81742D#crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs6000-81742D#

rfs6000-81742D#crypto pki generate self-signed word generate-rsa-key word autogen-
subject-name fqdn word
Successfully generated self-signed certificate
rfs6000-81742D#

rfs6000-81742D#crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-
trustpoint
rfs6000-81742D#

rfs6000-81742D#crypto pki authenticate word url background
Import of CA certificate started in background
rfs6000-81742D#

rfs6000-81742D#crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs6000-81742D#
```

3.1.15 crypto-cmp-cert-update

► *Privileged Exec Mode Commands*

Triggers a *Certificate Management Protocol* (CMP) certificate update on a specified device or devices

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

Parameters

- `crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}`

| | |
|--|--|
| <pre>crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}</pre> | <p>Triggers a CMP certificate update on a specified device or devices</p> <ul style="list-style-type: none"> • <code><TRUSTPOINT-NAME></code> – Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the <code>crypto-cmp-policy</code> context to configure the trustpoint. • <code>on <DEVICE-NAME></code> – Optional. Triggers a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list. <ul style="list-style-type: none"> • <code><DEVICE-NAME></code> – Specify the name of the AP, wireless controller, or service platform. |
|--|--|

Example

```
rfs4000-229D58#crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58#
```

3.1.16 database

► Privileged Exec Mode Commands

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight). Vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements.

If enforcing authenticated access to the database, use this command to generate the keyfile. Every keyfile has a set of associated users having a username and password. Database access is provided only if the keyfile and the user credentials entered during database login match.

NOTE: For information on enabling database authentication, see [Enabling Database Authentication](#).

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
database [drop|keyfile|repair]

database drop [all|captive-portal|nsight]

database repair {on <DEVICE-NAME>}

database keyfile [export|generate|import|zerzoise]
database keyfile generate
database keyfile [export|import] <URL>
database keyfile zerzoise
```

Parameters

- database drop [all|captive-portal|nsight]

| | |
|--|--|
| database drop [all captive-portal nsight] | Drops (deletes) all or a specified database. Execute the command on the database host. <ul style="list-style-type: none"> • all - Drops all databases, captive portal and NSight. • captive-portal - Drops captive-portal database only • nsight - Drops NSight database only |
|--|--|

- database repair {on <DEVICE-NAME>}

| | |
|-------------------------------------|---|
| database repair on <DEVICE-NAME> | Enables automatic repairing of all databases. Execute the command on the database host. <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Specifies the name of the access point, wireless controller, or service platform hosting the database. When specified, databases on the specified device are periodically checked through to identify and remove obsolete data documents. <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. <p>If no device is specified, the system repairs all databases.</p> |
|-------------------------------------|---|

- `database keyfile [generate|zerzoise]`

| | |
|---|--|
| database keyfile [generate zerzoise] | <p>Enables management of database keyfiles. This command is part of a series of configurations that are required to enforce authentication on the database. Use this command to generate keyfiles associated with the database. After generating the keyfile, create the users having the database access. For information on creating database users, see service.</p> <ul style="list-style-type: none"> • <code>generate</code> - Generates the keyfile. Execute the command on the primary database host. • <code>zerzoise</code> - Deletes a keyfile. |
|---|--|

- `database keyfile [export|import] <URL>`

| | |
|--|---|
| database keyfile [export import] <URL> | <p>Enables database keyfile management. This command is part of a series of configurations required to enforce database authentication. Use this command to exchange keyfiles between replica set members.</p> <ul style="list-style-type: none"> • <code>export</code> - Exports the keyfile to a specified location on an FTP/SFTP/TFTP server. Execute the command on the primary database host. • <code>import</code> - Imports the keyfile from a specified location. Execute the command on the replica set members. <p>The following parameter is common to both of the above keywords:</p> <ul style="list-style-type: none"> • <code><URL></code> - Specify the location to/from where the keyfile is to be exported/imported. Use one of the following options: <code>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file</code> <code>sftp://<user>:<passwd>@<hostname IP>[:port]/path/file</code> <code>tftp://<hostname IP>[:port]/path/file</code> |
|--|---|

- `database keyfile zerzoise`

| | |
|------------------------------|---|
| database keyfile zerzoise | <p>Enables the management of database keyfiles</p> <ul style="list-style-type: none"> • <code>zerzoise</code> - Deletes an existing keyfile. |
|------------------------------|---|

Example

```

nx9500-6C8809#database repair on nx9500-6C8809
nx9500-6C8809#

nx9500-6C8809#database keyfile generate
Database keyfile successfully generated
nx9500-6C8809#

nx9500-6C8809#database keyfile zeroize
Database keyfile successfully removed
nx9500-6C8809#

vx9000-1A1809#database keyfile generate
Database keyfile successfully generated
vx9000-1A1809#

vx9000-1A1809#database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
vx9000-1A1809#

vx9000-D031F2#database keyfile import ftp://1.1.1.111/db-key
Database keyfile successfully imported
vx9000-D031F2#

```

Related Commands

| <i>database-backup</i> | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server |
| <i>database-restore</i> | Restores a previously exported database [captive-portal and/or NSight] |

3.1.17 database-backup

► *Privileged Exec Mode Commands*

Backs up captive-portal/NSight database to a specified location and file on an FTP or SFTP server

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
database-backup database [captive-portal|nsight|nsight-placement-info] <URL>

database-backup database [captive-portal|nsight] <URL>
database-backup database nsight-placement-info <URL>
```

Parameters

- database-backup database [captive-portal|nsight] <URL>

| | |
|--|---|
| database-backup database [captive-portal nsight] | Backs up captive portal and/or NSight database to a specified location. Select the database to backup: <ul style="list-style-type: none"> • captive-portal - Backs up captive portal database • nsight - Backs up NSight database After specifying the database type, configure the destination location. |
| <URL> | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: <pre>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz</pre> |

- database-backup database nsight-placement-info <URL>

| | |
|--|---|
| database-backup database nsight-placement-info <URL> | Backs up the NSight access point placement related details to a specified location <ul style="list-style-type: none"> • <URL> - Specify the URL in one of the following formats: <pre>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz tftp://<hostname IP>[:port]/path/file.tar.gz</pre> |
|--|---|

Example

Related Commands

| | |
|-------------------------|---|
| <i>database</i> | Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and NSight) |
| <i>database-restore</i> | Restores a previously exported (backed up) database [captive-portal and/or NSight] |

3.1.18 database-restore

► *Privileged Exec Mode Commands*

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
database-restore database [captive-portal|nsight] <URL>
```

Parameters

- database-restore database [captive-portal|nsight] <URL>

| | |
|---|---|
| database-restore database [captive-portal nsight] | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type: <ul style="list-style-type: none"> • captive-portal - Restores captive portal database • nsight - Restores NSight database After specifying the database type, configure the destination location and file name from where the files are restored. |
| <URL> | Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz |

Example

```
nx9500-6C8809#database-restore database nsight  
ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

Related Commands

| | |
|------------------------|--|
| <i>database</i> | Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and NSight) |
| <i>database-backup</i> | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server |

3.1.19 delete

► *Privileged Exec Mode Commands*

Deletes a specified file from the device's file system

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

Parameters

- delete [/force <FILE>|/recursive <FILE>|<FILE>]

| | |
|-------------------|--|
| /force <FILE> | Forces deletion without a prompt |
| /recursive <FILE> | Performs a recursive delete |
| <FILE> | Specifies the file name <ul style="list-style-type: none"> • Deletes the file specified by the <FILE> parameter |

Example

```
rfs6000-81742D#delete flash:/out.tar flash:/out.tar.gz
Delete flash:/out.tar [y/n]? y
Delete flash:/out.tar.gz [y/n]? y

rfs6000-81742D#delete /force flash:/tmp.txt
rrfs6000-81742D#

rfs6000-81742D#delete /recursive flash:/backup/
Delete flash:/backup//fileMgmt_350_180B.core

[y/n]? y
Delete

flash:/backup//fileMgmt_350_18212X.core_bk

[y/n]? n

Delete flash:/backup//imish_1087_18381X.core.gz

[y/n]? n
rfs6000-81742D#
```

3.1.20 device-upgrade

► Privileged Exec Mode Commands

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms)

NOTE: A NOC controller's capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – NX95XX (NX9500 and NX9510), NX9600
- Site controller – RFS4000, RFS6000, NX5500, NX75XX, or NX95XX

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
device-upgrade [<MAC/HOSTNAME>|all|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|

3.1.21 diff

► Privileged Exec Mode Commands

Displays the differences between two files on a device's file system or a particular URL

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
diff [<FILE>|<URL>] [<FILE>|<URL>]
```

Parameters

- diff [<FILE>|<URL>] [<FILE>|<URL>]

| | |
|--------|---|
| <FILE> | The first <FILE> is the source file for the diff command. The second <FILE> is used for comparison. |
| <URL> | The first <URL> is the source file's URL. The second <URL> is the second file's URL. |

Example

```
nx9500-6C8809#diff startup-config running-config

3.1.22 dir

► Privileged Exec Mode Commands

Lists files on a device's file system

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
dir {/all|/recursive|<DIR>|all-file systems}
```

Parameters

```
• dir {/all|/recursive|<DIR>|all-file systems}
```

| | |
|------------------|--|
| /all | Optional. Lists all files |
| /recursive | Optional. Lists files recursively |
| <DIR> | Optional. Lists files in the named file path |
| all-file systems | Optional. Lists files on all file systems |

Example

```
nx9500-6C8809#dir flash:/
Directory of flash:/

3.1.23 disable

▶ *Privileged Exec Mode Commands*

Turns off (disables) the privileged mode command set. This command returns to the User Executable mode.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
disable
```

Parameters

None

Example

```
rf6000-81742D#disable
rf6000-81742D>
```

3.1.24 edit

► *Privileged Exec Mode Commands*

Edits a text file on the device's file system

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
edit <FILE>
```

Parameters

- edit <FILE>

| | |
|---------------------------|---|
| <code><FILE></code> | Specify the name of the file to modify. |
|---------------------------|---|

Example

```

3.1.25 enable

▶ *Privileged Exec Mode Commands*

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
enable
```

Parameters

None

Example

```
rfs6000-81742D#enable
rfs6000-81742D#
```

3.1.26 erase

► Privileged Exec Mode Commands

Erases a device's (wireless controller, access point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
erase [flash:|nvram:|startup-config|usb1:|usb2:|usb3:|usb4:]
```

```
erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]
```

```
erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}
```

Parameters

- erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]

| | |
|----------------|---|
| flash: | Erases everything in the device's flash: file |
| nvram: | Erases everything in the device's nvram: file |
| startup-config | Erases the device's startup configuration file. The startup configuration file is used to configure the device when it reboots. |
| usb1: | Erases everything in the device's usb1: file |
| usb2: | Erases everything in the device's usb2: file |
| usb3: | Erases everything in the device's usb3: file |
| usb4: | Erases everything in the device's usb4: file |

- erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}

| | |
|-----------------|---|
| startup-config: | Erases the startup configuration file on a specified device or devices in a specified RF Domain. The specified device(s) are reloaded after the startup configuration file is erased. Use the '<HOSTNAME/MAC>' or 'on <DOMAIN-NAME>' options to identify the device or RF Domain respectively. Once executed, the configuration file, for the targeted device or for all device(s) in the targeted RF Domain, is also erased from the adopting controller's configuration file. The are automatically reloaded once the startup configuration file has been erased. |
| <HOSTNAME/MAC> | Optional. Erases the startup configuration file on the device identified by the <HOSTNAME/MAC> keyword. Specify the device's hostname or MAC address. |

| | |
|--|--|
| <pre>on <DOMAIN-NAME> {containing <SUB- STRING>} exclude-controllers exclude-rf-domain- manager filter <DEVICE- TYPE>}</pre> | <p>Optional. Erases the startup configuration file on all devices or specified device(s) in a specified RF Domain</p> <ul style="list-style-type: none"> • <DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: <ul style="list-style-type: none"> • containing <SUB-STRING> – Optional. Executes the command on all devices containing a specified sub-string in their hostname <ul style="list-style-type: none"> • <SUB-STRING> – Specify the sub-string to match. The startup configuration file is erased on all devices whose hostname contains the sub-string specified here. • exclude-controllers – Optional. Executes the command on all devices excluding controllers. The startup configuration file is erased on all devices except controllers. • exclude-rf-domain-manager – Optional. Executes the command on all devices excluding RF Domain managers. The startup configuration file is erased on all devices except RF Domain managers. • filter <DEVICE-TYPE> – Optional. Executes the command on all devices of a specified type <ul style="list-style-type: none"> • <DEVICE-TYPE> – Specify the device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8532, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, and VX9000. The startup configuration file is erased on all devices of the type specified here. For example, if AP6521 is the device-type specified, the startup configuration file on all AP6521s, within the RF Domain, is erased. |
|--|--|

Example

```
nx9500-6C8809#erase ?
cf:           Erase everything in cf:
flash:       Erase everything in flash:
nvram:       Erase everything in nvram:
startup-config  Reset configuration to factory default
usb1:        Erase everything in usb1:
usb2:        Erase everything in usb2:

nx9500-6C8809#
```

3.1.27 ex3500

► *Privileged Exec Mode Commands*

Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP-related configurations.

The copy keyword provides multiple copy options. It allows you to upload or download code images or configuration files between the switch's flash memory and an FTP/TFTP server. When you save the system code or configuration settings to a file on an FTP/TFTP server, that file can later be downloaded to the switch to restore system operation. The success of the file transfer depends on the accessibility of the FTP/TFTP server and the quality of the network connection.

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600

Syntax

```

ex3500 [adoptd|boot|copy|delete|ip]

ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>

ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [file|ftp|running-config|startup-config|tftp|unit]

ex3500 copy [file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [ftp|tftp] [add-to-running-config|file|https-certificate|public-key|
running-config|startup-config]

ex3500 copy [ftp|tftp] add-to-running-config <FTP/TFTP-SERVER-IP> <USER-NAME>
<PASSWORD> <SOURCE-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [ftp|tftp] file <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2]
<SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [ftp|tftp] https-certificate <FTP/TFTP-SERVER-IP> <USER-NAME>
<PASSWORD> <SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD>
on <EX3500-DEVICE-NAME>

ex3500 copy [ftp|tftp] public-key <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>
[1|2] <SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [ftp|tftp] [running-config|startup-config] <FTP/TFTP-SERVER-IP> <USER-
NAME> <PASSWORD> <SOURCE-CONFIG-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy running-config [file <DEST-FILE-NAME>|ftp <FTP-SERVER-IP> <USER-NAME>
<PASSWORD> <DEST-FILE-NAME>|startup-config|tftp <TFTP-SERVER-IP> <DEST-FILE-
NAME>] on <EX3500-DEVICE-NAME>

ex3500 copy startup-config [file <DEST-FILE-NAME>|ftp <FTP-SERVER-IP> <USER-NAME>
<PASSWORD> <DEST-FILE-NAME>|running-config|tftp <TFTP-SERVER-IP> <DEST-FILE-
NAME>] on <EX3500-DEVICE-NAME>

ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-
DEVICE-NAME>

ex3500 delete [file|public-key]

ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>] on <EX3500-
DEVICE-NAME>

ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>

```

```
ex3500 ip ssh [crypto|save]
ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh crypto zeroize [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME>
```

Parameters

- ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>

| | |
|---|---|
| ex3500 adoptd upgrade | Upgrades an adopted EX3500 switch Note: After an upgrade, reboot the EX3500 switch to initiate the new image. To view an EX3500's current image version, use the <i>show > version > on <EX3500-DEVICE-NAME></i> command. |
| <URL> | Specifies the location and image file name in the following format: tftp://<IP>[/path]/file |
| on <EX3500-DEVICE-NAME> | Executes the command on a specified EX3500 switch <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> - Specify the EX3500 switch's hostname. |
| <ul style="list-style-type: none"> • ex3500 boot system <1-1> (config opcode) <FILE-NAME> on <EX3500-DEVICE-NAME> | |
| ex3500 boot system | Boots a EX3500 switch using a specified configuration file |
| <1-1> | Identifies the EX3500 unit by its ID number. Specify the EX3500 ID from 1 - 1. Note: As of now only one (1) EX3500 unit can be managed through a NOC controller. |
| (config opcode) <FILE-NAME> | The following keywords are recursive: Specifies the image file to use for booting. The options are: <ul style="list-style-type: none"> • config - Uses the configuration file to boot the switch • opcode - Uses the <i>Operation Code</i> (opcode), which is the runtime code, to boot the switch. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device. The following parameter is common to the 'config' and opcode' keywords: <ul style="list-style-type: none"> • <FILE-NAME> - Specify the configuration/runtime-code file name. |
| on <EX3500-DEVICE-NAME> | Reloads a specified EX3500 switch <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> - Specify the EX3500 switch's hostname. You can also specify its MAC address. |
| <ul style="list-style-type: none"> • ex3500 copy file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME> | |
| ex3500 copy | Copies a configuration file to another file |
| file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> | Copies a specified file (this is the source configuration file) <ul style="list-style-type: none"> • file - Copies the specified source file to a specified file (this is the destination configuration file) • <SOURCE-FILE-NAME> - Specify the source configuration file's name • <DEST-FILE-NAME> - Specify the destination configuration file's name. Contd.. |

| | |
|--|--|
| | <p>When specifying the destination file name, keep in mind the following points:</p> <ul style="list-style-type: none"> - It should not contain slashes (\ or /), - It should not exceed 32 characters for files on the switch, or 127 characters for files on the server. |
| on <EX3500-DEVICE-NAME> | <p>Copies the file to a specified EX3500 switch</p> <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> – Specify the EX3500 switch's hostname. The specified source file is copied to specified destination file on the EX3500 identified here. |
| <ul style="list-style-type: none"> • <code>ex3500 copy [ftp tftp] add-to-running-config <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <SOURCE-FILE-NAME> on <EX3500-DEVICE-NAME></code> | |
| ex3500 copy [ftp tftp] | <p>Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.</p> <p>This command also allows you to add a remote system's running configuration to the current system configuration.</p> |
| add-to-running-config | <p>Adds a remote system's running configuration to the current system</p> |
| <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> | <p>Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server.</p> <ul style="list-style-type: none"> • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <ul style="list-style-type: none"> • <PASSWORD> – Specify the password applicable for the above specified FTP server user name. |
| <SOURCE-FILE-NAME> | <p>After specifying the server details, specify the name of the running configuration file.</p> <ul style="list-style-type: none"> • <SOURCE-FILE-NAME> – Specify the source file's name. |
| on <EX3500-DEVICE-NAME> | <p>Copies the file to a specified EX3500 switch</p> <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> – Specify the EX3500 switch's hostname. The specified source file is copied to specified destination file on the EX3500 identified here. |
| <ul style="list-style-type: none"> • <code>ex3500 copy [ftp tftp] file <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1 2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME></code> | |
| ex3500 copy [ftp tftp] | <p>Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.</p> |
| file | <p>Copies to a specified file system</p> |
| <FTP/TFTP-SERVER-IP> <USER-NAME> <PASS-WORD> | <p>Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server.</p> <ul style="list-style-type: none"> • <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> – If using a FTP server, specify the FTP server's user name (should be an authorized user) <ul style="list-style-type: none"> • <PASSWORD> – Specify the password applicable for the above specified FTP server user name. |

| | |
|--|---|
| [1 2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> | After specifying the server details, select the file type and specify the name of the source and destination file names. <ul style="list-style-type: none"> [1 2] - Select the file type from 1 - 2. <ul style="list-style-type: none"> 1 - Copies the EX3500 configuration file. 2 - Copies the opcode, which is the runtime code. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device. <ul style="list-style-type: none"> <SOURCE-FILE-NAME> - Specify the source file's name. <DEST-FILE-NAME> - Specify the destination file's name. |
| on <EX3500-DEVICE-NAME> | Copies the file to a specified EX3500 device <ul style="list-style-type: none"> <EX3500-DEVICE-NAME> - Specify the EX3500 device's hostname. The specified source file is copied to specified destination file on the EX3500 identified here. |
| <pre>ex3500 copy [ftp tftp] https-certificate <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD> on <EX3500-DEVICE-NAME></pre> | |
| ex3500 copy [ftp tftp] | Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc. |
| https-certificate | Copies HTTPS secure site certificate from the FTP or TFTP server to the switch |
| <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> | Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server. <ul style="list-style-type: none"> <FTP/TFTP-SERVER-IP> - Specify the FTP or TFTP server's IP address in the A.B.C.D format. <USER-NAME> - If using a FTP server, specify the FTP server's user name (should be an authorized user) <ul style="list-style-type: none"> <PASSWORD> - Specify the password applicable for the above specified FTP server user name. |
| <SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD> | After identifying the FTP or TFTP server, specify the following: <ul style="list-style-type: none"> <SOURCE-CERT-FILE-NAME> - Specify the source HTTPS secure site certificate file name. <SOURCE-PVT-KEY-FILE-NAME> - Specify the source private-key file name. <PVT-PASS-WORD> - Specify the private password. |
| on <EX3500-DEVICE-NAME> | Copies the file to a specified EX3500 device <ul style="list-style-type: none"> <EX3500-DEVICE-NAME> - Specify the EX3500 device's hostname. |
| <pre>ex3500 copy [ftp tftp] public-key <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1 2] <SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> on <EX3500-DEVICE-NAME></pre> | |
| ex3500 copy [ftp tftp] | Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc. |
| public-key | Copies the SSH public key from the FTP or TFTP server to the switch |

| | |
|--|---|
| <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> | Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server. <ul style="list-style-type: none"> • <FTP/TFTP-SERVER-IP> - Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> - If using a FTP server, specify the FTP server's user name (should be an authorized user) <ul style="list-style-type: none"> • <PASSWORD> - Specify the password applicable for the above specified FTP server user name. |
| [1 2] <SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> | After identifying the FTP or TFTP server, specify the following: <ul style="list-style-type: none"> • [1 2] - Configures the SSH public key type as RS or DSA <ul style="list-style-type: none"> • 1 - Configures the public key type as RSA • 2 - Configures the public key type as DSA • <SOURCE-PUB-KEY-FILE-NAME> - Specifies the source public key file name • <USER-NAME> - Specifies the public key's user name. |
| on <EX3500-DEVICE-NAME> | Copies the public key to a specified EX3500 device <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> - Specify the EX3500 device's hostname. |
| <ul style="list-style-type: none"> • <code>ex3500 copy [ftp tftp] [running-config startup-config] <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME></code> | |
| ex3500 copy [ftp tftp] | Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc. |
| [running-config] startup-config] | Copies the running or startup configuration file to one of the following destinations: file system, FTP server, or TFTP server The running configuration file can be copied to the startup configuration file and vice versa. |
| <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> | If copying to a FTP/TFTP server, configure the following parameters: <ul style="list-style-type: none"> • <FTP/TFTP-SERVER-IP> - Specify the FTP or TFTP server's IP address in the A.B.C.D format. • <USER-NAME> - If using a FTP server, specify the FTP server's user name (should be an authorized user) <ul style="list-style-type: none"> • <PASSWORD> - Specify the password applicable for the above specified FTP server user name. |
| <DEST-FILE-NAME> | Configures the destination file name. The running or startup configuration file is copied to the specified destination file. <ul style="list-style-type: none"> • <DEST-FILE-NAME> - Specify the destination file name. You can also copy the running configuration file to the startup configuration file and vice versa. |
| on <EX3500-DEVICE-NAME> | Copies the running or startup configuration file on to a specified EX3500 device <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> - Specify the EX3500 device's hostname. |
| <ul style="list-style-type: none"> • <code>ex3500 copy unit file <1-1> [1 2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME></code> | |
| ex3500 copy unit | Copies from a EX3500 switch |

| | |
|--|--|
| file <1-1> [1 2] | <p>Copies the file system from the EX3500 switch identified by the unit number</p> <ul style="list-style-type: none"> • <1-1> – Specify the unit number from 1 - 1. • [1 2] – Select the file type from 1 - 2. <ul style="list-style-type: none"> • 1 – Copies the selected unit’s configuration file. • 2 – Copies the selected unit’s opcode, which is the runtime code. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device. |
| <SOURCE-FILE-NAME> | <p>Configures the source file name</p> <ul style="list-style-type: none"> • <SOURCE-FILE-NAME> – Specify the source file name. You can copy the running configuration file to the startup configuration file and vice versa. |
| <DEST-FILE-NAME> | <p>Configures the destination file name. The running or startup configuration file is copied to the specified file.</p> <ul style="list-style-type: none"> • <DEST-FILE-NAME> – Specify the destination file name. You can copy the running configuration file to the startup configuration file and vice versa. |
| on <EX3500-DEVICE-NAME> | <p>Copies the running or startup configuration file on to a specified EX3500 device</p> <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname. |
| <pre>• ex3500 delete file [name <FILE-NAME> unit <1-1> name <FILE-NAME>] on <EX3500-DEVICE-NAME></pre> | |
| ex3500 delete file | <p>Deletes a file or image on a specified EX3500 device</p> |
| name <FILE-NAME> | <p>Specifies the file to delete. The specified file is deleted.</p> <ul style="list-style-type: none"> • <FILE-NAME> – Specify the file name. |
| unit <1-1> name <FILE-NAME> | <p>Identifies the unit in the stackable system on which the file is located</p> <ul style="list-style-type: none"> • <1-1> – Select the unit from 1 - 1. <ul style="list-style-type: none"> • name – After identifying the unit, specify the file to delete. The specified file is deleted. <ul style="list-style-type: none"> • <FILE-NAME> – Specify the file name. |
| on <EX3500-DEVICE-NAME> | <p>Executes the command on a specified EX3500 device</p> <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname. |
| <pre>• ex3500 delete public-key <USER-NAME> [dsa rsa] on <EX3500-DEVICE-NAME></pre> | |
| ex3500 delete public-key <USER-NAME> [dsa rsa] | <p>Deletes a specified user’s public key</p> <ul style="list-style-type: none"> • <USER-NAME> – Specify the SSH user’s name. <ul style="list-style-type: none"> • dsa – Deletes the specified user’s DSA (version 2) key • rsa – Deletes the specified user’s RSA (version 1) key |
| on <EX3500-DEVICE-NAME> | <p>Executes the command on a specified EX3500 device</p> <ul style="list-style-type: none"> • <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname. |

- `ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>`

| | |
|---|---|
| <code>ex3500 ip ssh crypto host-key generates [dsa rsa]</code> | <p>Generates the host-key pair (public and private). This host key is used by the SSH server to negotiate a session key and encryption method with the client trying to connect to it.</p> <ul style="list-style-type: none"> • <code>dsa</code> – Generates DSA (version 2) key type • <code>rsa</code> – Generates RSA (version 1) key type <p>Note: The RSA Version 1 is used only for SSHv1.5 clients, whereas DSA Version 2 is used only for SSHv2 clients.</p> <p>Note: This generated host-key pair is stored in the volatile memory (i.e RAM). To save the host-key pair in the flash memory, use the <code>ex3500 > ip > ssh > save > host-key</code> command.</p> |
| <code>on <EX3500-DEVICE-NAME></code> | <p>Executes the command on a specified EX3500 device</p> <ul style="list-style-type: none"> • <code><EX3500-DEVICE-NAME></code> – Specify the EX3500 device's hostname. |
| <ul style="list-style-type: none"> • <code>ex3500 ip ssh zeroize [dsa rsa] <EX3500-DEVICE-NAME></code> | |
| <code>ex3500 ip ssh zeroize [dsa rsa]</code> | <p>Removes the host-key (DSA and RSA) from the volatile memory (i.e. RAM)</p> |
| <code>on <EX3500-DEVICE-NAME></code> | <p>Executes the command on a specified EX3500 device</p> <ul style="list-style-type: none"> • <code><EX3500-DEVICE-NAME></code> – Specify the EX3500 device's hostname. |
| <ul style="list-style-type: none"> • <code>ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME></code> | |
| <code>ex3500 ip ssh save host-key</code> | <p>Saves the host-key (DSA and RSA) to the flash memory</p> |
| <code>on <EX3500-DEVICE-NAME></code> | <p>Executes the command on a specified EX3500 device</p> <ul style="list-style-type: none"> • <code><EX3500-DEVICE-NAME></code> – Specify the EX3500 device's hostname. |

Usage Guidelines

When using the `ex3500` command and its parameters, keep in mind the following:

- Destination file names should not:
 - Contain slashes (`\` or `/`),
 - Exceed 32 characters for files on the switch, or 127 characters for files on the server
- The FTP server's default user name is set as "anonymous".
- The Boot ROM and Loader cannot be uploaded or downloaded from the FTP/TFTP server. Follow instructions provided in the release notes for new firmware, or contact your distributor for help.
- The "Factory_Default_Config.cfg" can be used as the source to copy from, but cannot be used as the destination.
- Although the switch supports only two operation code files, the maximum number of user-defined configuration files supported is 16.

Example

```
nx9500-6C8809#ex3500 adopted upgrade tftp://192.168.0.99/ex3500-adopted-5.8.5.0.img on ex3524-ED5EAC
Flash programming started
Flash programming completed
Successful
nx9500-6C8809#
```

```
nx9500-6C8809#ex3500 copy tftp file 10.2.0.100 1 m360.bix m360.bix on ex3524-ED5EAC
\Write to FLASH Programming.
-Write to FLASH finish.
Success.
nx9500-6C8809#
```

```
nx9500-6C8809#ex3500 copy tftp startup-config 10.2.0.99 startup.01 startup on ex3524-ED5EAC
TFTP server ip address: 10.1.0.99
Flash programming started.
Flash programming completed.
Success.
nx9500-6C8809#
```

3.1.28 factory-reset

► Privileged Exec Mode Commands

Erases startup configuration on a specified device or all devices within a specified RF Domain

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
factory-reset [<HOSTNAME/MAC>|config-all|config-device-only|on <RF-DOMAIN-NAME>]
factory-reset <HOSTNAME/MAC> {<HOSTNAME/MAC>}

factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|
exclude-rf-domain-manager|filter <DEVICE-TYPE>}

factory-reset [config-all|config-device-only] [<HOSTNAME/MAC> {<HOSTNAME/MAC>}|
on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-
domain-manager|filter <DEVICE-TYPE>}]
```

Parameters

- factory-reset <HOSTNAME/MAC> {<HOSTNAME/MAC>}

| | |
|---|--|
| factory-reset | Erases startup configuration and reloads device(s) based on the parameters passed For more information on the actions performed by this command, see Actions performed by the factory-reset command . |
| <HOSTNAME/MAC> {<HOSTNAME/ MAC>} | Erases startup configuration and reloads the device identified by the <HOSTNAME/ MAC> keyword. Specify the device's hostname or MAC address. <ul style="list-style-type: none"> • <HOSTNAME/MAC> - Optional. You can optionally specify multiple space-separated devices. |
| | <ul style="list-style-type: none"> • factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING> exclude-controllers exclude-rf-domain-manager filter <DEVICE-TYPE>} |
| factory-reset | Erases startup configuration and reloads device(s) based on the parameters passed For more information on the actions performed by this command, see Actions performed by the factory-reset command . |
| on <RF-DOMAIN-NAME> {containing <SUB-STRING> exclude-controllers exclude-rf-domain- manager filter <DEVICE- TYPE>}] | Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain identified by the <RF-DOMAIN-NAME> keyword <ul style="list-style-type: none"> • <RF-DOMAIN-NAME> - Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: <ul style="list-style-type: none"> • containing <SUB-STRING> - Optional. Executes the command on all devices containing a specified sub-string in their hostname <ul style="list-style-type: none"> • <SUB-STRING> - Specify the sub-string to match. Contd... |

| | |
|--|---|
| | <ul style="list-style-type: none"> • <code>exclude-controllers</code> - Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller. • <code>exclude-rf-domain-manager</code> - Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, site controller, or RF Domain manager. • <code>filter <DEVICE-TYPE></code> - Optional. Executes the command on all devices of a specified type <ul style="list-style-type: none"> • <code><DEVICE-TYPE></code> - Specify the device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, and VX9000. The startup configuration is erased on all devices of the type specified here. For example, if AP6521 is the device-type specified, the command is executed on all AP6521s within the specified RF Domain. |
| <p>• <code>factory-reset [config-all config-device-only] [<HOSTNAME/MAC> {<HOSTNAME/MAC>} on <RF-DOMAIN-NAME> {containing <SUB-STRING> exclude-controllers exclude-rf-domain-manager filter <DEVICE-TYPE>}]</code></p> | |
| factory-reset | <p>Erases startup configuration and reloads device(s) based on the parameters passed</p> <p>For more information on the actions performed by this command, see Actions performed by the factory-reset command.</p> |
| [config-all config-device-only] | <p>Erases startup configuration and reloads only controller-adopted devices or the controller as well as its adopted devices</p> <ul style="list-style-type: none"> • <code>config-all</code> - Erases startup configuration on the controller and all devices adopted by it • <code>config-device-only</code> - Erases startup configuration only on the devices adopted by the controller |
| <HOSTNAME/MAC> {<HOSTNAME/MAC>} | <p>This parameter is common to the 'config-all' and 'config-device-only' keywords:</p> <ul style="list-style-type: none"> • <code><HOSTNAME/MAC></code> - Erases startup configuration and reloads the device identified by the <code><HOSTNAME/MAC></code> keyword. Specify the device's hostname or MAC address. • <code><HOSTNAME/MAC></code> - Optional. You can optionally specify multiple space-separated devices. |
| | <p>The following parameters are common to the 'config-all' and 'config-device-only' keywords:</p> <ul style="list-style-type: none"> • <code>on <RF-DOMAIN-NAME></code> - Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain <ul style="list-style-type: none"> • <code><RF-DOMAIN-NAME></code> - Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: <ul style="list-style-type: none"> • <code>containing <SUB-STRING></code> - Optional. Executes the command on all devices containing a specified sub-string in their hostname • <code><SUB-STRING></code> - Specify the sub-string to match. • <code>exclude-controllers</code> - Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller. <p>Contd...</p> |

| | |
|---|---|
| <pre>on <RF-DOMAIN-NAME> {containing <SUB-STRING> exclude-controllers exclude-rf-domain- manager filter <DEVICE- TYPE>}}</pre> | <ul style="list-style-type: none"> • exclude-rf-domain-manager - Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager. • filter <DEVICE-TYPE> - Optional. Executes the command on all devices of a specified type <ul style="list-style-type: none"> • <DEVICE-TYPE> - Specify the device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, and VX9000. The startup configuration is erased on all devices of the type specified here. For example, if AP6521 is the device-type specified, the command is executed on all AP6521s within the specified RF Domain. |
|---|---|

Usage Guidelines Actions performed by the factory-reset command.

The action taken by this command depends on the parameters passed.

- For the *'factory-reset [<DEVICE-NAME>/on <RF-DOMAIN-NAME>']* options, the command:
 - Erases startup configuration on the target device (or) all devices in the target RF Domain.
 - Erases the device configuration entries from the controller's configuration for the target device (or) for all the devices in the target RF Domain.
 - Reloads the target device (or) all devices in the target RF Domain.
- For the *'factory-reset config-all [<DEVICE-NAME>/on <RF-DOMAIN-NAME>']* options, the command:
 - Erases startup configuration on the target device (or) all devices in the target RF Domain.
 - Erases the device configuration entries from the controller's configuration for the target device (or) for all the devices in the target RF Domain.
- For the *'factory-reset config-device-only [<DEVICE-NAME>/on <RF-DOMAIN-NAME>']* options, the command:
 - Erases startup configuration on the target device (or) all devices in the target RF Domain.

Example

```
nx7500-7F3609#factory-reset config-all ap6522-5A873C
In progress ....
Erased startup-config - success 1 fail 0
Successful device deletion - total 1
nx7500-7F3609#

rfs6000-18072B# factory-reset B4-C7-99-5A-87-3C
In progress ....
Erased startup-config and initiated reload - success 1 fail 0
Successful device deletion - total 1
rfs6000-18072B#
```

The following example displays the access points in the RF Domain 'rfd1':

```
nx7500-7F3609#show wireless ap on rfd1
-----
MODE           : radio modes - W = WLAN, S=Sensor, ' ' (Space) = radio not present
-----
-----
AP-NAME        AP-LOCATION  RF-DOMAIN    AP-MAC        #RADIO    MODE    #CLIENT
IPv4   IPv6
-----
-----
```

```

ap7131-1180FC          rfd1    00-23-68-11-80-FC    2 W-W          0    0.0.0.0
::
ap6522-551648         rfd1    B4-C7-99-55-16-48    2 W-W          0    0.0.0.0
::
ap8232-7F0DF8          rfd1    FC-0A-81-7F-0D-F8    2 W-W          0
0.0.0.0                ::
-----
-----

```

```

Total number of APs displayed: 3
nx7500-7F3609#

```

Note, the factory-reset command executed on an RF Domain with the 'exclude-rf-domain-manager' option erases the startup configuration on all devices other than the RF Domain manager.

```

nx7500-7F3609#factory-reset config-device-only on rfd1 exclude-rf-domain-manager

```

```

In progress ....
Erased startup-config -
ap7131-1180FC: OK
ap6522-551648: OK

```

```

nx7500-7F3609#

```

```

nx7500-7F3609# factory-reset on rfd2
In progress ....
Erased startup-config and initiated reload -
ap650-A6566C: OK,Reload scheduled in 60 seconds...
ap4532-34505C: OK,Reload scheduled in 60 seconds...
ap650-345000: OK,Reload scheduled in 60 seconds...

```

```

Successful device deletion - total 3
nx7500-7F3609#

```

3.1.29 file-sync

► *Privileged Exec Mode Commands*

Syncs trustpoint and/or EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adopted access points.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point is configured to use EAP-TLS authentication.
- Execute the command on the controller adopting the access points.
- Ensure that the X.509 certificate file is installed on the controller.

Syncing of trustpoint/wireless-bridge certificate can to be automated. To automate file syncing, in the controller’s device/profile configuration mode, execute the following command: *file-sync [auto/count <1-20>]*. For more information, see *file-sync*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
file-sync [cancel|load-file|trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain
[<DOMAIN-NAME>|all]]
file-sync load-file [trustpoint|wireless-bridge]]
file-sync load-file [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] <URL>
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|
rf-domain [<DOMAIN-NAME>|all] {from-controller}] {reset-radio|upload-time <TIME>}
```

Parameters

- file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]

| | |
|---|--|
| <pre>file-sync cancel [trustpoint wireless-bridge] [<DEVICE-NAME> all rf-domain [<DOMAIN-NAME> all]]</pre> | <p>Cancels scheduled file synchronization</p> <ul style="list-style-type: none"> • trustpoint - Cancels scheduled trustpoint synchronization on a specified AP, all APs, or APs within a specified RF Domain • wireless-bridge - Cancels scheduled wireless-bridge certificate synchronization on a specified AP, all APs, or APs within a specified RF Domain <ul style="list-style-type: none"> • <DEVICE-NAME> - Cancels scheduled trustpoint/certificate synchronization on a specified AP. Specify the AP’s hostname or MAC address. <p>Contd..</p> |
|---|--|

| | |
|---|---|
| | <ul style="list-style-type: none"> • all - Cancels scheduled trustpoint/certificate synchronization on all APs • rf-domain [<DOMAIN-NAME> all] - Cancels scheduled trustpoint/certificate synchronization on all APs in a specified RF Domain or in all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> - Cancels scheduled trustpoint/certificate synchronization on all APs within a specified RF Domain. Specify the RF Domain's name. • all - Cancels scheduled trustpoint/certificate synchronization on all RF Domains |
| <ul style="list-style-type: none"> • file-sync load-file [trustpoint wireless-bridge] <URL> | |
| <pre>file-sync load-file [trustpoint wireless-bridge] <URL></pre> | <p>Loads the following files on to the staging controller:</p> <ul style="list-style-type: none"> • trustpoint - Loads the trustpoint, including CA certificate, server certificate and private key • wireless-bridge - Loads the wireless-bridge certificate to the staging controller <p>Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.</p> <ul style="list-style-type: none"> • <URL> - Provide the trustpoint/certificate location using one of the following formats: tftp://<hostname IP>[:port]/path/file ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file http://<hostname IP>[:port]/path/file cf:/path/file usb<n>:/path/file <p>Note: Both IPv4 and IPv6 address types are supported.</p> |
| <ul style="list-style-type: none"> • file-sync [trustpoint <TRUSTPOINT-NAME> wireless-bridge] [<DEVICE-NAME> all rf-domain [<DOMAIN-NAME> all] {from-controller}] {reset-radio upload-time <TIME>} | |
| <pre>file-sync trustpoint <TRUSTPOINT- NAME> [<DEVICE-NAME> all rf-domain [<DOMAIN-NAME> all] from-controller]</pre> | <p>Configures file-syncing parameters</p> <ul style="list-style-type: none"> • trustpoint <TRUSTPOINT-NAME> - Syncs a specified trustpoint between controller and its adopted APs <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name. • wireless-bridge - Syncs wireless-bridge certificate between controller and its adopted APs <p>After specifying the file that is to be synced, configure following file-sync parameters:</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Syncs trustpoint/certificate with a specified AP. Specify the AP's hostname or MAC address. • all - Syncs trustpoint/certificate with all APs • rf-domain [<DOMAIN-NAME> all] from-controller - Syncs trustpoint/certificate with all APs in a specified RF Domain or in all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> - Select to sync with APs within a specified RF Domain. Specify the RF Domain's name. • all - Select to sync with APs across all RF Domains <ul style="list-style-type: none"> • from-controller - Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager <p>After specifying the access points, specify the following options: reset-radio and upload-time.</p> |

| | |
|--------------------|---|
| reset-radio | This keyword is recursive and applicable to all of the above parameters. Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the 'bridge EAP username' and 'bridge EAP password'. |
| upload-time <TIME> | This keyword is recursive and applicable to all of the above parameters. <ul style="list-style-type: none"> upload-time - Optional. Schedules certificate upload at a specified time <ul style="list-style-type: none"> <TIME> - Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed. |

Example

```
rfs6000-81742D#file-sync wireless-bridge ap7131-11E6C4 upload-time 06/01/2017-12:30
```

```
-----
                CONTROLLER                STATUS                MESSAGE
-----
      B4-C7-99-6D-CD-4B                Success                Queued 1 APs to upload
-----
rfs6000-81742D#
```

The following command uploads certificate to all access points:

```
rfs6000-81742D#file-sync wireless-bridge all upload-time 06/01/2017-23:42
```

3.1.30 halt

► *Privileged Exec Mode Commands*

Stops (halts) a device (access point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
halt {force} {(on <DEVICE-NAME>)}
```

Parameters

- halt {force} {(on <DEVICE-NAME>)}

| | |
|------------------|---|
| halt | Halts a device |
| force | Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes, etc. |
| on <DEVICE-NAME> | <p>The following keywords are recursive and applicable to the 'force' parameter:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Specifies the name of the device to be halted • <DEVICE-NAME> - Enter the name of the AP, wireless controller, or service platform. <p>If the device name is not specified, the logged device is halted.</p> |

Example

```
nx9500-6C8809#halt on rfs6000-81742D
nx9500-6C8809#
```

3.1.31 join-cluster

► Privileged Exec Mode Commands

Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster. Note, a cluster can be only formed of devices of the same model type.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode
[active|standby]}
```

Parameters

- join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}

| | |
|-----------------------|--|
| join-cluster | Adds a access point, wireless controller, or service platform to an existing cluster |
| <IP> | Specify the cluster member's IP address. |
| user <USERNAME> | Specify a user account with super user privileges on the new cluster member. |
| password <WORD> | Specify password for the account specified in the user parameter. |
| level [1 2] | Optional. Configures the routing level <ul style="list-style-type: none"> • 1 - Configures level 1 routing • 2 - Configures level 2 routing |
| mode [active standby] | Optional. Configures the cluster mode <ul style="list-style-type: none"> • active - Configures cluster mode as active • standby - Configures cluster mode as standby |

Usage Guidelines

To add a device to an existing cluster:

- configure a static IP address on the device (access point, wireless controller, or service platform).
- provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

Example

```
rfs6000-81742D#join-cluster 192.168.13.16 user admin password superuser level 1
mode standby
... connecting to 192.168.13.16
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs6000-81742D#
```

```

rfs6000-81742D#show context
!
! Configuration of RFS6000 version 5.9.1.0-012D
!
!
version 2.5
!
!
.....
interface gel
  switchport mode access
  switchport access vlan 1
interface vlan1
  ip address 192.168.13.16/24
  ip dhcp client request options all
  no ipv6 enable
  no ipv6 request-dhcpv6-options
cluster name TechPubs
cluster mode standby
cluster member ip 192.168.13.16 level 1
  logging on
  logging console warnings
  logging buffered warnings
!
!
end
rfs6000-81742D#

```

Related Commands

| | |
|-----------------------|--|
| <i>cluster</i> | Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member. |
| <i>create-cluster</i> | Creates a new cluster on a specified device |

3.1.32 l2tpv3

► Privileged Exec Mode Commands

Establishes or brings down an L2TPv3 tunnel

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
l2tpv3 tunnel [<TUNNEL-NAME>|all]

l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}

l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

Parameters

- l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}

| | |
|---|---|
| l2tpv3 tunnel <TUNNEL-NAME> [down up] | Establishes or brings down an L2TPv3 tunnel <ul style="list-style-type: none"> • <TUNNEL-NAME> - Specify the tunnel name. <ul style="list-style-type: none"> • down - Brings down the specified tunnel • up - Establishes the specified tunnel |
| on <DEVICE-NAME> | Optional. Establishes or brings down a tunnel on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down up] {on <DEVICE-NAME>} | |
| l2tpv3 tunnel <TUNNEL-NAME> | Establishes or brings down an L2TPv3 tunnel <ul style="list-style-type: none"> • <TUNNEL-NAME> - Specify the tunnel name. |
| session <SESSION-NAME> [down up] | Establishes or brings down a session in the specified tunnel <ul style="list-style-type: none"> • <SESSION-NAME> - Specify the session name. <ul style="list-style-type: none"> • down - Brings down the specified tunnel session • up - Establishes the specified tunnel session |
| on <DEVICE-NAME> | Optional. Establishes or brings down a tunnel session on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| <ul style="list-style-type: none"> • l2tpv3 tunnel all [down up] {on <DEVICE-NAME>} | |
| l2tpv3 tunnel | Establishes or brings down a L2TPv3 tunnel |
| all [down up] | Establishes or brings down all L2TPv3 tunnels <ul style="list-style-type: none"> • down - Brings down all tunnels • up - Establishes all tunnels |

| | |
|------------------|--|
| on <DEVICE-NAME> | Optional. Establishes or brings down all tunnels on a specified device <ul style="list-style-type: none">• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
|------------------|--|

Example

```
rfs6000-81742D#l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs6000-81742D
```

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see [Chapter 22, L2TPV3-POLICY](#).

3.1.33 logging

► *Privileged Exec Mode Commands*

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|
informational|warnings|notifications}
```

Parameters

```
• logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|
informational|notifications|warnings}
```

| | |
|---------|---|
| monitor | <p>Sets terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.</p> <ul style="list-style-type: none"> • <0-7> - Optional. Enter the logging severity level from 0 - 7. The various levels and their implications are: • alerts - Optional. Immediate action needed (severity=1) • critical - Optional. Critical conditions (severity=2) • debugging - Optional. Debugging messages (severity=7) • emergencies - Optional. System is unusable (severity=0) • errors - Optional. Error conditions (severity=3) • informational - Optional. Informational messages (severity=6) • notifications - Optional. Normal but significant conditions (severity=5) • warnings - Optional. Warning conditions (severity=4) <p>Note: Ensure that the logging module is enabled, before configuring the message logging level. To enable message logging, in the device's configuration mode, execute the <i>logging > on</i> command. Message logging can also be enabled on a profile.</p> |
|---------|---|

Example

```
rfs6000-81742D(config-device-00-15-70-81-74-2D)#logging on
rfs6000-81742D#logging monitor debugging
rfs6000-81742D#show logging
Logging module: enabled
  Aggregation time: disabled
  Console logging: level warnings
  Monitor logging: disabled
  Buffered logging: level warnings
  Syslog logging: level warnings
    Facility: local7

Log Buffer (70096 bytes):

Apr 04 12:43:02 2017: %DIAG-4-FAN_UNDERSPEED: Fan fan 1 under speed: 0 RPM is under
limit 2000 RPM
Apr 04 12:33:02 2017: %DIAG-4-FAN_UNDERSPEED: Fan fan 1 under speed: 0 RPM is under
limit 2000 RPM
--More--
rfs6000-81742D#
```

Related Commands

| | |
|-----------|--------------------------------------|
| <i>no</i> | Resets terminal lines logging levels |
|-----------|--------------------------------------|

3.1.34 mint

► Privileged Exec Mode Commands

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mint [ping|traceroute]
mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}
mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>}
```

Parameters

- `mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}`

| | |
|--|---|
| ping <MINT-ID> | Sends a MiNT echo message to a specified destination <ul style="list-style-type: none"> • <MINT-ID> - Specify the destination device's MiNT ID. |
| count <1-10000> | Optional. Sets the pings to the MiNT destination <ul style="list-style-type: none"> • <1-10000> - Specify a value from 1 - 60. The default is 3. |
| size <1-64000> | Optional. Sets the MiNT payload size in bytes <ul style="list-style-type: none"> • <1-64000> - Specify a value from 1 - 640000 bytes. The default is 64 bytes. |
| timeout <1-10> | Optional. Sets a response time in seconds <ul style="list-style-type: none"> • <1-10> - Specify a value from 1 - 10 seconds. The default is 1 second. |
| <ul style="list-style-type: none"> • <code>mint traceroute <MINT-ID> {destination-port <1-65535> max-hops <1-255> source-port <1-65535> timeout <1-255>}</code> | |
| traceroute <MINT-ID> | Prints the route packets trace to a device <ul style="list-style-type: none"> • <MINT-ID> - Specify the destination device's MiNT ID. |
| destination-port <1-65535> | Optional. Sets the <i>Equal-cost Multi-path</i> (ECMP) routing destination port <ul style="list-style-type: none"> • <1-65535> - Specify a value from 1 - 65535. The default port is 45. |
| max-hops <1-255> | Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction <ul style="list-style-type: none"> • <1-255> - Specify a value from 1 - 255. The default is 30. |
| source-port <1-65535> | Optional. Sets the ECMP source port <ul style="list-style-type: none"> • <1-65535> - Specify a value from 1 - 65535. The default port is 45. |
| timeout <1-255> | Optional. Sets the minimum response time period <ul style="list-style-type: none"> • <1-255> - Specify a value from 1 - 255 seconds. The default is 30 seconds. |

Example

```
rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
  Response from 68.88.0D.A7: id=1 time=0.364 ms
  Response from 68.88.0D.A7: id=2 time=0.333 ms
  Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
```

3.1.35 mkdir

► *Privileged Exec Mode Commands*

Creates a new directory in the file system

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mkdir <DIR>
```

Parameters

- mkdir <DIR>

| | |
|--------------------------|---|
| <code><DIR></code> | Specify a directory name. Note: A directory, specified by the <DIR> parameter, is created within the file system. |
|--------------------------|---|

Example

```
rfs4000-880DA7#dir
Directory of flash:/.
```

| | | | | |
|------|------------|----------|------|---------------|
| drwx | Tue Sep 27 | 06:25:15 | 2016 | log |

rfs4000-880DA7#
```

3.1.36 more

► Privileged Exec Mode Commands

Displays files on the device's file system. This command navigates and displays specific files in the device's file system. Provide the complete path to the file `more <file>`.

The more command also displays the startup configuration file.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
more <FILE>
```

Parameters

- more <FILE>

| | |
|---------------------------|-------------------------------------|
| <code><FILE></code> | Specify the file name and location. |
|---------------------------|-------------------------------------|

Example

```
rfs4000-880DA7#more flash:/archived_logs/startup.5.log
00-07-42-05-30-17
May 30 05:37:43 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/logd"
May 30 05:37:43 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/isDiag"
May 30 05:37:48 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/rim"
May 30 05:37:51 2017: %DIAG-4-FAN_UNDERSPEED: Fan fan 1 under speed: 0 RPM is under
limit 2000 RPM
May 30 05:38:18 2017: %PM-6-PROCSTART: Starting process "/etc/init.d/cfgd"
May 30 05:38:19 2017: %KERN-6-INFO: up1 { no link }.
May 30 05:38:19 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/nsm"
May 30 05:38:21 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/mstp"
May 30 05:38:21 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/hsd"
May 30 05:38:22 2017: %PM-6-PROCSTART: Starting process "/etc/init.d/dpd2.init"
May 30 05:38:22 2017: %PM-6-PROCSTART: Starting process "/usr/sbin/ssm"
--More--
rfs4000-880DA7#
```

3.1.37 no

► Privileged Exec Mode Commands

Use the no command to revert a command or a set of parameters to their default. This command is useful to turn off an enabled feature or to revert to default settings.

The no commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [adoption|captive-portal|cpe|crypto|debug|logging|page|raid|service|
terminal|upgrade|virtual-machine|wireless]
```

```
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
```

NOTE: The *no > adoption* command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

```
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>]
{on <DEVICE-OR-DOMAIN-NAME>}
```

```
no crypto pki [server|trustpoint]
```

```
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}}|
on <DEVICE-NAME>}
```

```
no logging monitor
```

```
no page
```

```
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
```

```
no service block-adopter-config-update
```

```
no service locator {on <DEVICE-NAME>}
```

```
no service snmp sysoid wing5
```

```
no service ssm trace pattern {<WORD>} {(on <DEVICE-NAME>)}
```

```
no service wireless [trace pattern {<WORD>} {(on <DEVICE-NAME>)}|unsanctioned ap
air-terminate <BSSID> {on <DOMAIN-NAME>}]
```

```
no terminal [length|width]
```

```
no upgrade <PATCH-NAME> {on <DEVICE-NAME>}
```

```
no wireless client [all|<MAC>]
```

```

no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}

```

The following command is available only on the NX95XX series service platforms:

```

no cpe led cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
no raid locate

```

Parameters

- no <PARAMETERS>

| | |
|-----------------|---|
| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |
|-----------------|---|

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Example

```

rfs4000-229D58#no adoption
rfs4000-229D58#

rfs6000-81742D#no page
rfs6000-81742D#

```

3.1.38 on

► *Privileged Exec Mode Commands*

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

Parameters

- on rf-domain [<RF-DOMAIN-NAME>|all]

| | |
|--|--|
| <pre>on rf-domain [<RF-DOMAIN-NAME> all]</pre> | <p>Enters the RF Domain context based on the parameter specified</p> <ul style="list-style-type: none"> • <RF-DOMAIN-NAME> - Specify the RF Domain name. Enters the specified RF Domain context. • all - Specifies all RF Domains. |
|--|--|

Example

```

3.1.39 `opendns`

► *Privileged Exec Mode Commands*

Fetches the OpenDNS `device_id` from the OpenDNS site. Use this command to fetch the OpenDNS `device_id`. Once fetched, apply the `device_id` to WLANs that are to be OpenDNS enabled.

OpenDNS is a free DNS service that enables swift Web navigation without frequent outages. It is more reliable than other available DNS services, and provides the following services: DNS query resolution, Web-filtering, protection against virus and malware attacks, performance enhancement, etc.

This command is part of a set of configurations that are required to integrate WiNG devices with OpenDNS. When integrated, DNS queries going out of the WiNG device (access point, controller, or service platform) are re-directed to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers that act as proxy DNS servers. For more information on enabling OpenDNS support, see *Enabling OpenDNS Support*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
opendns [APIToken|username]
```

```
opendns APIToken <OPENDNS-APITOKEN>
```

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

Note, you can use either of the above commands to fetch the `device_id` from the OpenDNS site.

Parameters

- `opendns APIToken <OPENDNS-APITOKEN>`

| | |
|--|--|
| <code>opendns</code> | Fetches the <code>device_id</code> from the OpenDNS site using the OpenDNS API token |
| <code>APIToken <OPENDNS-APITOKEN></code> | Configures the OpenDNS APIToken. This is the token provided you by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"> • <code><OPENDNS-APITOKEN></code> - Provide the OpenDNS API token (should be a valid token). For every valid OpenDNS API token provided a <code>device_id</code> is returned. Apply this <code>device_id</code> to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the <code>device_id</code> in the WLAN context, see <i>opendns</i> . |
| <ul style="list-style-type: none"> • <code>opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL></code> | |
| <code>opendns</code> | Fetches the <code>device_id</code> from the OpenDNS site using the OpenDNS credentials |
| <code>username <USERNAME></code> | Configures the OpenDNS user name. This is your OpenDNS email ID provided by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"> • <code><USERNAME></code> - Provide the OpenDNS user name (should be a valid OpenDNS username). |

| | |
|----------------------------|---|
| password <OPENDNS-PSWD> | Configures the password associated with the user name specified in the previous step <ul style="list-style-type: none"> <OPENDNS-PSWD> - Provide the OpenDNS password (should be a valid OpenDNS password). |
| label <LABEL> | Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal. <ul style="list-style-type: none"> <LABEL> - Specify your network label. <p>For every set of username, password, and label passed only one unique device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see opendns.</p> |

Example

```
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label
company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#

nx9600-7F3C7F#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 001480fe36dcb245
nx9600-7F3C7F#
```

Example Enabling OpenDNS Support

The following example shows how to enable OpenDNS support'

1 Fetch the OpenDNS device_id from the OpenDNS site.

a In the User/Privilege executable mode execute one of the following commands:

```
nx9500-6C874D#opendns APIToken <OPENDNS-APITOKEN>
nx9500-6C8809#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 001480fe36dcb245
nx9500-6C8809#
OR
nx9500-6C8809#opendns username <USERNAME> password <OPENDNS-PSWD> label
<LABEL>
```

Note, the *OpenDNS API token* and/or *user account credentials* are provided the OpenDNS service provider when subscribing for the OpenDNS service.

b Apply the device_id fetched in the step 1 to the WLAN.

```
nx9500-6C8809(config-wlan-opendns)#opendns device-id <OPENDNS-DEVICE-ID>
nx9500-6C8809(config-wlan-opendns)#opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
ssid opendns
bridging-mode local
encryption-type none
authentication-type none
opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#
```

Once applied, DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.

2 Configure a DHCP server policy, and set the DHCP pool's DNS server configuration to point to the OpenDNS servers.

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#dns-server
208.67.222.222
```

Note, you can configure any one of the following OpenDNS servers:
208.67.222.222 OR **208.67.222.220**

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#show context
dhcp-pool opendnsPool
  dns-server 208.67.222.222
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#
```

- 3 Apply the DHCP server policy configured in step 2 on the access point, controller, or service platform.

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#use dhcp-server-policy
opendns
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory
| include use
  use profile default-nx9000
  use rf-domain TechPubs
  use database-policy default
  use nsight-policy noc
  use dhcp-server-policy opendns
  use auto-provisioning-policy TechPubs
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

When configured, DNS queries are forwarded by the access point, controller, or service platform to the specified OpenDNS resolver.

- 4 Configure an IP Access Control List with the following permit and deny rules:

```
nx9500-6C8809(config-ip-acl-OpenDNS)#permit udp any host 208.67.222.222 eq
dns rule-precedence 1 rule-description "allow dns queries only to OpenDNS"

nx9500-6C8809(config-ip-acl-OpenDNS)#deny udp any any eq dns rule-precedence
10 rule-description "block all DNS queries"

nx9500-6C8809(config-ip-acl-OpenDNS)#permit ip any any rule-precedence 100
rule-description "allow all other ip packets"

nx9500-6C8809(config-ip-acl-OpenDNS)#show context
ip access-list OpenDNS
  permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description
  "allow dns queries only to OpenDNS"
  deny udp any any eq dns rule-precedence 10 rule-description "block all dns
  queries"
  permit ip any any rule-precedence 100 rule-description "allow all other ip
  packets"
nx9500-6C8809config-ip-acl-OpenDNS)#
```

When configured and applied in the WLAN context, the IP ACL prevents wireless clients from adding their own DNS servers to bypass the Web filtering and network policies enforced by OpenDNS.

- 5 Apply the IP ACL configured in step 4 in the WLAN context.

```
nx9500-6C8809(config-wlan-opendns)#use ip-access-list out OpenDNS
nx9500-6C8809(config-wlan-opendns)#show context
```

wlan opendns

```
ssid opendns
```

```
vlan 1
```

```
bridging-mode local
```

```
encryption-type none
```

```
authentication-type none
```

```
use ip-access-list in OpenDNS
```

```
use ip-access-list out OpenDNS
```

```
opendns device-id 0014AADF8EDC6C59
```

```
nx9500-6C8809(config-wlan-opendns)#
```

When applied to the WLAN, only the DNS queries directed to the OpenDNS server are forwarded. All other DNS queries are dropped.

3.1.40 page

► *Privileged Exec Mode Commands*

Toggles controller paging. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
page
```

Parameters

None

Example

```

rfs6000-81742D#page
rfs6000-81742D#

```

Related Commands

| | |
|-----------|----------------------------|
| <i>no</i> | Disables controller paging |
|-----------|----------------------------|

3.1.41 ping

► Privileged Exec Mode Commands

Sends *Internet Controller Message Protocol* (ICMP) echo messages to a user-specified location

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

Parameters

```
• ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

| | |
|--|--|
| <IP/HOSTNAME> | Specify the destination IP address or hostname to ping. When entered without any parameters, this command prompts for an IP address or a hostname. |
| count <1-10000> | Optional. Sets the pings to the specified destination <ul style="list-style-type: none"> • <1-10000> - Specify a value from 1 - 10000. The default is 5. |
| dont-fragment {count size} | Optional. Sets the dont-fragment bit in the ping packet. Packets with the dont-fragment bit specified, are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified <i>Maximum Transmission Unit</i> (MTU) value, an error message is sent from the device trying to fragment it. <ul style="list-style-type: none"> • count <1-10000> - Sets the pings to the specified destination from 1 - 10000. The default is 5. • size - <1-64000> - Sets the size of ping payload size from 1 - 64000 bytes. The default is 100 bytes. |
| size <1-64000> | Optional. Sets the ping packet's size in bytes <ul style="list-style-type: none"> • <1-64000> - Specify the ping payload size from 1 - 64000 bytes. The default is 100 bytes. |
| source [<IP> pppoe vlan <1-4094> wwan] | Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination. <ul style="list-style-type: none"> • <IP> - Specifies the source IP address • pppoe - Selects the PPP over Ethernet interface • vlan <1-4094> - Selects the VLAN interface from 1 - 4094 • wwan - Selects the wireless WAN interface |

Example

```
rfs6000-81742D#ping 192.168.13.13 count 4
PING 192.168.13.13 (192.168.13.13) 100(128) bytes of data.
108 bytes from 192.168.13.13: icmp_seq=1 ttl=64 time=0.356 ms
108 bytes from 192.168.13.13: icmp_seq=2 ttl=64 time=0.211 ms
108 bytes from 192.168.13.13: icmp_seq=3 ttl=64 time=0.199 ms
108 bytes from 192.168.13.13: icmp_seq=4 ttl=64 time=0.215 ms

--- 192.168.13.13 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 2999ms
rtt min/avg/max/mdev = 0.199/0.245/0.356/0.065 ms
rfs6000-81742D#

rfs6000-81742D#ping 10.233.89.182 source vlan 1
PING 10.233.89.182 (10.233.89.182) from 192.168.13.24 vlan1: 100(128) bytes of
data.
From 192.168.13.2 icmp_seq=1 Packet filtered
From 192.168.13.2 icmp_seq=2 Packet filtered
From 192.168.13.2 icmp_seq=3 Packet filtered
From 192.168.13.2 icmp_seq=4 Packet filtered
From 192.168.13.2 icmp_seq=5 Packet filtered

--- 10.233.89.182 ping statistics ---
5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 3997ms

rfs6000-81742D#
```

3.1.42 ping6

► Privileged Exec Mode Commands

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}
```

Parameters

```
• ping <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}
```

| | |
|-----------------|--|
| <IPv6/HOSTNAME> | Specify the destination IPv6 address or hostname. |
| <INTF-NAME> | Optional. Specify the interface name for link local/broadcast address |
| count <1-10000> | Optional. Sets the pings to the specified IPv6 destination <ul style="list-style-type: none"> • <1-10000> - Specify a value from 1 - 10000. The default is 5. |
| size <1-64000> | Optional. Sets the IPv6 ping payload size in bytes <ul style="list-style-type: none"> • <1-64000> - Specify the ping payload size from 1 - 64000. The default is 100 bytes. |

Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS> command`. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information, see [ipv6](#).

Example

```
rfs4000-880DA7#ping6 2001:10:10:10:10:10:10:2 count 6 size 200
PING 2001:10:10:10:10:10:10:2(2001:10:10:10:10:10:10:2) 200 data bytes
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=1 ttl=64 time=0.509 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=2 ttl=64 time=0.323 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=3 ttl=64 time=0.318 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=4 ttl=64 time=0.317 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=5 ttl=64 time=0.314 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=6 ttl=64 time=0.318 ms

--- 2001:10:10:10:10:10:10:2 ping statistics ---
6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.314/0.349/0.509/0.075 ms
rfs4000-880DA7#
```

3.1.43 pwd

► *Privileged Exec Mode Commands*

Displays the full path of the present working directory, similar to the UNIX pwd command

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
pwd
```

Parameters

None

Example

```
rfs4000-229D58#pwd
flash:/
rfs4000-229D58#

rfs4000-229D58#dir
Directory of flash:/

rfs4000-229D58#
```

3.1.44 re-elect

► *Privileged Exec Mode Commands*

Re-elects the tunnel controller (wireless controller or service platform)

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

Parameters

- re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}

| | |
|------------------------------|--|
| re-elect tunnel-controller | Re-elects the tunnel controller |
| <WORD> {on <DEVICE-NAME>} | Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches <WORD> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Re-elects the tunnel controller on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

Example

```
rfs4000-880DA7#re-elect tunnel-controller
OK
rfs4000-880DA7#
```

3.1.45 reload

► *Privileged Exec Mode Commands*

Halts a device or devices and performs a warm reboot

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```

reload {<DEVICE-MAC-OR-HOSTNAME>|at|cancel|force|in|on|staggered}
reload {( <DEVICE-MAC-OR-HOSTNAME> )}
reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
reload {force} {( <DEVICE-MAC-OR-HOSTNAME>|on <DOMAIN-NAME>|staggered)}
reload {force} {( <DEVICE-MAC-OR-HOSTNAME> )}
reload {force} {on <DOMAIN-NAME> {staggered}|staggered {<DEVICE-MAC-OR-HOSTNAME>|
on <DOMAIN-NAME>}} {containing <WORD>|exclude-controllers|exclude-rf-domain-
manager|filter <DEVICE-TYPE>}
reload {in <1-999>} {list|on}
reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}
reload {in <1-999>} {on <DEVICE-OR-DOMAIN-NAME>}
reload {on <DOMAIN-NAME>} {containing <WORD>|exclude-controllers|exclude-rf-
domain-manager|filter <DEVICE-TYPE>}
reload {staggered} {( <DEVICE-MAC-OR-HOSTNAME>|on <DOMAIN-NAME> } {containing
<WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
    
```

Parameters

- reload {(<DEVICE-MAC-OR-HOSTNAME>)}

| | |
|------------------------------------|--|
| reload <DEVICE-MAC-OR-HOSTNAME> | <p>Initiates device(s) reload and configures associated parameters</p> <p>The following keyword is recursive and allows you to specify multiple devices:</p> <ul style="list-style-type: none"> • <DEVICE-MAC-OR-HOSTNAME> - Optional. Reloads a specified device(s), identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. <p>If no device is specified, the system reloads the logged device.</p> |
| | <ul style="list-style-type: none"> • reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}} |
| reload at | <p>Initiates device(s) reload and configures associated parameters</p> <ul style="list-style-type: none"> • at - Optional. Schedules a reload at a specified time and day. Use the following keywords to specify the time and day: <TIME>, <1-31>, <MONTH>, and <1993-2035>. |
| <TIME> | Specifies the time in the HH:MM:SS format |

| | |
|--|--|
| <1-31> | Specifies the day of the month from 1 - 31 |
| <MONTH> | Specifies the month from Jan - Dec |
| <1993-2035> | Specifies the year from 1993 - 2035. It should be a valid 4 digit year. |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Performs reload at the scheduled time, on a specified device or all devices within a specified RF Domain <ul style="list-style-type: none"> <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain. When a RF Domain name is provided, all devices within the specified RF Domain are reloaded at the scheduled time. If no device is specified, the reload is scheduled on the logged device. |
| <ul style="list-style-type: none"> • reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>} | |
| reload cancel on <DEVICE-OR-DOMAIN-NAME> | Cancels pending/scheduled reloads of device(s) <ul style="list-style-type: none"> cancel - Optional. Cancels all pending reloads on <DEVICE-OR-DOMAIN-NAME> - Optional. Cancels reloads pending on a specified device or all devices within a specified RF Domain <ul style="list-style-type: none"> <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain. If no device is specified, the system cancels reloads pending on the logged device. |
| <ul style="list-style-type: none"> • reload {force} {(<DEVICE-MAC-OR-HOSTNAME>)} | |
| reload force | Initiates device(s) reload and configures associated parameters <ul style="list-style-type: none"> force - Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes, etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain. |
| <DEVICE-MAC-OR-HOSTNAME> | This keyword is recursive and allows you to specify multiple devices. <ul style="list-style-type: none"> <DEVICE-MAC-OR-HOSTNAME> - Optional. Forces a reload on a specified device identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. When executed, the specified device(s) are forced to halt and a warm reboot is performed. If no device is specified, the system forcefully reloads the logged device. |
| <ul style="list-style-type: none"> • reload {force} {on <DOMAIN-NAME> {staggered} staggered {<DEVICE-MAC-OR-HOSTNAME> on <DOMAIN-NAME>}} {containing <WORD> exclude-controllers exclude-rf-domain-manager filter <DEVICE-TYPE>} | |
| reload force | Initiates device(s) reload and configures associated parameters <ul style="list-style-type: none"> force - Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes, etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain. |
| on <DOMAIN-NAME> staggered | Optional. Forces a reload on all devices in a RF Domain <ul style="list-style-type: none"> <DOMAIN-NAME> - Optional. Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed. staggered - Optional. Enables staggered reload of devices (one at a time) without network impact. Use this option when rebooting multiple devices within an RF Domain. When executed, all devices within the specified RF Domain are forced to halt and reboot in a staggered manner. |

| | |
|---|--|
| <pre>staggered {<DEVICE-MAC-OR- HOSTNAME>} on <DOMAIN-NAME>}</pre> | <p>Optional. Enables staggered reload of devices (one at a time) without network impact</p> <ul style="list-style-type: none"> • <DEVICE-MAC-OR-HOSTNAME> - Optional. Forces a reload on specified device(s) identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are forced to halt and a warm reboot is performed. • on <DOMAIN-NAME> - Optional. Forces a reload on all devices in a RF Domain. Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed. <p>If no device or RF Domain is specified, the system forcefully reloads the logged device.</p> |
| <pre>{containing <WORD> exclude-controllers exclude-rf-domain- manager filter <DEVICE-TYPE>}</pre> | <p>When forcefully reloading devices in a RF Domain, you can use following options to filter specific devices or device types:</p> <ul style="list-style-type: none"> • containing <WORD> - Optional. Filters out devices containing a specified sub-string in their hostnames <ul style="list-style-type: none"> • <WORD> - Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and forcefully reloaded. • exclude-controllers - Optional. Excludes all controllers in the specified RF Domain from the reload process • exclude-rf-domain-manager - Optional. Excludes the RF Domain manager from the reload process • filter <DEVICE-TYPE> - Optional. Filters devices by the device type specified. Select the type of device. All devices, of the specified type, within the specified RF Domain, are forcefully reloaded. <ul style="list-style-type: none"> • <DEVICE-TYPE> - Select the type of device to reload. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, VX9000, t5. |
| <p style="text-align: center;">• reload {in <1-999>} {list {<LINE> all} on <DEVICE-OR-DOMAIN-NAME>}</p> | |
| <pre>reload in <1-999></pre> | <p>Initiates device(s) reload and configures associated parameters</p> <ul style="list-style-type: none"> • in - Optional. Performs a reload after a specified time period <ul style="list-style-type: none"> • <1-999> - Specify the time from 1 - 999 minutes |

|---|--|

Example

```
rfs7000-6DCD4B#reload at 12:30:00 31 Mar 2015 on rfs6000-81742D
Reload scheduled at 2015-03-31 12:30:00 UTC ...
rfs7000-6DCD4B#

rfs7000-6DCD4B#reload cancel on rfs6000-81742D
Scheduled reload cancelled.
rfs7000-6DCD4B#
```

The following example schedules a reload on all non-controller devices in the RF Domain 'default':

```
rfs7000-6DCD4B#reload on default exclude-controllers
ap8132-711728: OK

rfs7000-6DCD4B#
```

3.1.46 rename

► *Privileged Exec Mode Commands*

Renames a file in the devices' file system

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
rename <OLD-FILE-NAME> <NEW-FILE-NAME>
```

Parameters

- rename <OLD-FILE-NAME> <NEW-FILE-NAME>

| | |
|-----------------|-----------------------------|
| <OLD-FILE-NAME> | Specify the file to rename. |
| <NEW-FILE-NAME> | Specify the new file name. |

Example

```
rfs4000-880DA7#dir
Directory of flash:/

3.1.47 rmdir

► *Privileged Exec Mode Commands*

Deletes an existing directory from the file system (only empty directories can be removed)

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
rmdir <DIR>
```

Parameters

- rmdir <DIR>

| | |
|-------------|--|
| rmdir <DIR> | Specifies the directory name Note: The directory, specified by the <DIR> parameter, is removed from the file system. |
|-------------|--|

Example

```
rfs4000-880DA7#dir
Directory of flash:/.
```

| | | |
|-------------|---------------------------------|---------------|
| drwx | Wed Sep 14 13:54:10 2016 | log |

rfs4000-880DA7#
```

3.1.48 self

► *Privileged Exec Mode Commands*

Enters the logged device's configuration context

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
self
```

Parameters

None

Example

```
rfs6000-81742D#self
Enter configuration commands, one per line. End with CNTL/Z.
rfs6000-81742D(config-device-00-15-70-81-74-2D)#
```

3.1.49 ssh

► Privileged Exec Mode Commands

Opens a *Secure Shell* (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

Parameters

```
• ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

| | |
|-------------------------------|---|
| <IP/HOSTNAME> | Specify the remote system's IP address or hostname. |
| <USERNAME> | Specify the name of the user requesting the SSH connection. |
| <INF-NAME/ LINK-LOCAL-ADD> | Optional. Specify the interface's name or link local address. |

Usage Guidelines

To exit the other device's context, use the command that is relevant to that device.

Example

```
nx9500-6C8809#ssh 192.168.13.16 admin
admin@192.168.13.16's password:
rfs6000-81742D>
```

3.1.50 t5

► Privileged Exec Mode Commands

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device's file system
- write running configuration to the T5 device's memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on re-wiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

NOTE: For more information on other T5 CPE related commands, see [cpe](#).

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

Parameters

- t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}

| | |
|--|---|
| copy <SOURCE-FILE-NAME> <DEST-FILE-NAME> | <p>Copies file to an external server</p> <ul style="list-style-type: none"> • <SOURCE-FILE-NAME> - Specify the source file name. • <DEST-FILE-NAME> - Specify the destination file name. <p>The content from the source file is copied to the destination file.</p> <p>The source or destination files can be local or remote FTP or TFTP files. The source file also can be a pre-defined keyword. At least one of the files should be a local file. Use this command to copy the startup and/or running configurations to an external server.</p> |
| delete <FILE-NAME> | <p>Deletes files on the T5 device's file system</p> <ul style="list-style-type: none"> • <FILE-NAME> - Specify the file name. The specified file is deleted. |

| | |
|--|---|
| rename <SOURCE-FILE-NAME> <DEST-FILE-NAME> | Renames a file on the T5 device's file system <ul style="list-style-type: none"> • <SOURCE-FILE-NAME> - Specify the source file name • <DEST-FILE-NAME> - Specify the new file name. The source file is renamed to the input provided here. |
| write memory | Writes running configuration to an adopted T5 device's memory <ul style="list-style-type: none"> • memory - Writes running configuration to the T5 device's <i>non-volatile</i> (NV) memory. |
| on <T5-DEVICE-NAME> | Optional. Executes these operation on a specified T5 device <ul style="list-style-type: none"> • <T5-DEVICE-NAME> - Specify the T5 device's hostname. |

Example

```

nx9500-6C8809#t5 write memory on t5-ED7C6C
Success
nx9500-6C8809#

```

3.1.51 telnet

► Privileged Exec Mode Commands

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

Parameters

- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

| | |
|---------------|--|
| <IP/HOSTNAME> | Configures the remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session will be established between the connecting system and the remote system. <ul style="list-style-type: none"> • <IP> - Specify the remote system's IPv4 or IPv6 address or hostname. |
| <TCP-PORT> | Optional. Specify the <i>Transmission Control Protocol</i> (TCP) port. |
| <INTF-NAME> | Optional. Specify the interface name for the link local address. |

Usage Guidelines

To exit the other device's context, use the command relevant to that device.

Example

```
nx9500-6C8809#telnet 192.168.13.22
```

```
Entering character mode
Escape character is '^]'.

```

```

ap7131-11E6C4 login: admin
Password:
ap7131-11E6C4>
```

3.1.52 terminal

► *Privileged Exec Mode Commands*

Sets the number of characters per line, and the number of lines displayed within the terminal window

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
terminal [length|width] <0-512>
```

Parameters

- terminal [length|width] <0-512>

| | |
|----------------|---|
| length <0-512> | Sets the number of lines displayed on the terminal window <ul style="list-style-type: none"> • <0-512> - Specify a value from 0 - 512. |
| width <0-512> | Sets the width or number of characters displayed on the terminal window <ul style="list-style-type: none"> • <0-512> - Specify a value from 0 - 512. |

Example

```
rfs6000-81742D#terminal length 150
rfs6000-81742D#terminal width 215
rfs6000-81742D#show terminal
Terminal Type: xterm
Length: 150      Width: 215
rfs6000-81742D#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets the width of the terminal window or the number of lines displayed on a terminal window |
|-----------|---|

3.1.53 time-it

► *Privileged Exec Mode Commands*

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
time-it <COMMAND>
```

Parameters

- time-it <COMMAND>

| | |
|-------------------|---|
| time-it <COMMAND> | Verifies the time taken by a particular command to execute and provide a result |
| | • <COMMAND> - Specify the command name. |

Example

```
rfs6000-81742D#time-it config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
That took 0.00 seconds..
rfs6000-81742D(config)#
```

3.1.54 traceroute

► *Privileged Exec Mode Commands*

Traces the route to a defined destination

Use '--help' or '-h' to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
traceroute <WORD>
```

Parameters

- traceroute <WORD>

| | |
|---------------------------|--|
| <code><WORD></code> | Traces the route to a IP address or hostname <ul style="list-style-type: none"> • <code><WORD></code> - Specify the IPv4 address or hostname. |
|---------------------------|--|

Example

```
nx9500-6C8809#traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 46 byte packets
 1 192.168.13.16 (192.168.13.16)  0.479 ms  0.207 ms  0.199 ms
nx9500-6C8809#
```

3.1.55 traceroute6

► *Privileged Exec Mode Commands*

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
traceroute6 <WORD>
```

Parameters

- traceroute6 <WORD>

| | |
|--------------------|--|
| traceroute6 <WORD> | Traces the route to a IPv6 address or hostname |
| | • <WORD> - Specify the IPv6 address or hostname. |

Example

```
rfs4000-880DA7#traceroute6 2001:10:10:10:10:10:10:2
traceroute to 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:2) from
2001:10:10:10:10:10:10:1, 30 hops max, 16 byte packets
 1 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:2) 0.622 ms 0.497 ms 0.531
ms
rfs4000-880DA7#
```

3.1.56 upgrade

► Privileged Exec Mode Commands

Upgrades a device's software image

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
upgrade [<FILE>|<URL>|dhcp-vendor-options]
upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>} {<DEVICE-NAME>}
upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>} {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-managers|filter <DEVICE-TYPE>}
```

Parameters

- upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}

| | |
|------------|---|
| <FILE> | Specify the target firmware image location in the following format: cf:/path/file usb1:/path/file usb2:/path/file usb<n>:/path/file |
| <URL> | Specify the target firmware image location. Use one of the following formats: IPv4 URLs: tftp://<hostname IP>[:port]/path/file ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file http://<hostname IP>[:port]/path/file cf:/path/file usb<n>:/path/file IPv6 URLs: tftp://<hostname [IPv6]>[:port]/path/file ftp://<user>:<passwd>@<hostname [IPv6]>[:port]/path/file sftp://<user>:<passwd>@<hostname [IPv6]>[:port]/path/file http://<hostname [IPv6]>[:port]/path/file |
| background | Optional. Performs upgrade in the background |

| | |
|---|--|
| on <DEVICE-NAME> | Optional. Upgrades the software image on a specified remote device <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| on <RF-DOMAIN-NAME> | Optional. Upgrades the software image on all devices within a specified RF Domain <ul style="list-style-type: none"> <RF-DOMAIN-NAME> - Specify the name of the RF Domain. |
| <ul style="list-style-type: none"> upgrade dhcp-vendor-options {<DEVICE-NAME>} {<DEVICE-NAME>} | |
| dhcp-vendor-options | Uses DHCP vendor options to upgrade device(s) |
| <DEVICE-NAME> {<DEVICE-NAME>} | Optional. Uses DHCP vendor options to upgrade a specified device. Specify the name of the AP, wireless controller, or service platform. <ul style="list-style-type: none"> <DEVICE-NAME> - Optional. You can optionally specify multiple comma-separated device names/MAC addresses to upgrade. |
| <ul style="list-style-type: none"> upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>} {containing <SUB-STRING> exclude-controllers exclude-rf-domain-managers filter <DEVICE-TYPE>} | |
| dhcp-vendor-options | Uses DHCP vendor options to upgrade device(s) |
| on <RF-DOMAIN-NAME> {containing <SUB-STRING> exclude-controllers exclude-rf-domain-managers filter <DEVICE-TYPE>} | Optional. Uses DHCP vendor options to upgrade all devices or specified device(s) within the RF Domain identified by the <RF-DOMAIN-NAME> keyword <ul style="list-style-type: none"> <RF-DOMAIN-NAME> - Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, all devices within the RF Domain are upgraded. These filters are: <ul style="list-style-type: none"> containing <SUB-STRING> - Optional. Upgrades all devices, within the specified RF Domain, containing a specified sub-string in their hostname <ul style="list-style-type: none"> <SUB-STRING> - Specify the sub-string to match. exclude-controllers - Optional. Upgrades all devices, within the specified RF Domain, excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller. exclude-rf-domain-manager - Optional. Upgrades all devices, within the specified RF Domain, excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager. filter <DEVICE-TYPE> - Optional. Executes the command on all devices, within the specified RF Domain, of a specified type <ul style="list-style-type: none"> <DEVICE-TYPE> - Specify the device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP8232, AP8432, AP8533, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, and VX9000. Upgrades all devices of the type specified here. For example, if AP6521 is the device-type specified, all AP6521s within the specified RF Domain are upgraded |

Example

```
nx9500-6C8809#show boot
```

3.1.58 virtual-machine

► *Privileged Exec Mode Commands*

Installs, configures, and monitors the status of virtual machines (VMs) installed on a WING controller

Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

Syntax

```
virtual-machine [assign-usb-ports|export|install|restart|set|start|
stop|uninstall]

virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

virtual-machine install [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}

virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan]

virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]

virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|
vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-
INDEX>| vnc [disable|enable]] [<VM-NAME>|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}
```

The following virtual-machine commands are supported only on the VX9000 platform:

```
virtual-machine volume-group [add-drive|replace-drive|resize-drive|resize-volume-
group]

virtual-machine volume-group [add-drive|replace-drive] <BLOCK-DEVICE-LABEL>

virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABLE> <NEW-BLOCK-
DEVICE-LABEL>

virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>
```

Parameters

- virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

| | |
|------------------------------|---|
| assign-usb-ports team-vowlan | <p>Assigns USB ports to TEAM-VoWLAN on a specified device</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Specify the device name. <p>Note: Use the no > virtual-machine > assign-usb-ports to reassign the port to WING.</p> <p>Note: TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.</p> |
|------------------------------|---|

- virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

| | |
|------------------------|--|
| virtual-machine export | <p>Exports an existing VM image and settings. Use this command to export the VM to another <NX54XX> or <NX65XX> device in the same domain.</p> <ul style="list-style-type: none"> • <VM-NAME> - Specify the VM name. <ul style="list-style-type: none"> • <FILE> - Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location. • <URL> - Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path: <p>Contd..</p> |
|------------------------|--|

| | |
|--------------------------------|---|
| | <pre>tftp://<hostname IP>[:port]/path/file ftp://<user>:<passwd>@<hostname IP>[:port]/path/file sftp://<user>:<passwd>@<hostname IP>[:port]/path/file http://<hostname IP>[:port]/path/file</pre> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. <p>Note: The VM should be in a stop state during the export process. Note: If the destination is a device, the image is copied to a predefined location (VM archive).</p> |
| | <pre>• virtual-machine install [<VM-NAME> adsp team-centro team-rls team-vowlan] {on <DEVICE-NAME>}</pre> |
| <p>virtual-machine install</p> | <p>Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:</p> <ul style="list-style-type: none"> • <VM-NAME> - Installs a VM having name specified by <VM-NAME> keyword. • adsp - Installs ADSP • team-centro - Installs the VM TEAM-Centro image • team-rls - Installs the VM TEAM-RLS image • team-vowlan - Installs the VM TEAM-VoWLAN image <p>Specify the device on which to install the VM.</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
| | <pre>• virtual-machine set [autostart [ignore start] memory <512-8192> vcpus <1-4> vif-count <0-2> vif-mac <VIF-INDEX> <MAC-INDEX> vif-to-vmif <VIF-INDEX> <VMIF- INDEX> vnc [disable enable]] [<VM-NAME> team-urc team-rls team-vowlan] {on <DEVICE-NAME>}</pre> |
| <p>virtual-machine set</p> | <p>Configures the VM settings</p> <ul style="list-style-type: none"> • autostart - Specifies whether to autostart the VM on system reboot <ul style="list-style-type: none"> • ignore - Enables autostart on each system reboot • start - Disables autostart • memory - Defines the VM memory size <ul style="list-style-type: none"> • <512-8192> - Specify the VM memory from 512 - 8192 MB. The default is 1024 MB. • vcpus - Specifies the number of VCPUS for this VM <ul style="list-style-type: none"> • <1-4> - Specify the number of VCPUS from 1- 4. • vif-count - Configures or resets the VM's VIFs <ul style="list-style-type: none"> • <0-2> - Specify the VIF number from 0 - 2. • vif-mac - Configures the MAC address of the selected virtual network interface <ul style="list-style-type: none"> • <1-2> - Select the VIF <ul style="list-style-type: none"> • <1-8> - Specify the MAC index for the selected VIF <ul style="list-style-type: none"> • <MAC> - Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format. <p>Contd..</p> |

| | |
|------------------------------|---|
| | <p>Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the 'set' keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard I2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM's interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.</p> <ul style="list-style-type: none"> vif-to-vmif - Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. <p>WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the twelve ports for <NX9500> on the dataplane bridge. This mapping determines the destination for service platform routing.</p> <p>By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.</p> <ul style="list-style-type: none"> vnc - Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client. <ul style="list-style-type: none"> disable - Disables VNC port enable - Enables VNC port <p>After configuring the VM settings, identify the VM to apply the settings.</p> <ul style="list-style-type: none"> <VM-NAME> - Applies these settings to the VM identified by the <VM-NAME> keyword. Specify the VM name. adsp - Applies these settings to the ADSP VM team-urc - Applies these settings to the VM TEAM-URC team-rls - Applies these settings to the VM TEAM-RLS team-vowlan - Applies these settings to the VM TEAM-VoWLAN |
| | <ul style="list-style-type: none"> virtual-machine start [<VM-NAME> adsp team-urc team-rls team-vowlan] {on <DEVICE-NAME>} |
| <p>virtual-machine start</p> | <p>Starts the VM, based on the parameters passed. Select one of the following options:</p> <ul style="list-style-type: none"> <VM-NAME> - Starts the VM identified by the <VM-NAME> keyword. Specify the VM name. adsp - Starts the ADSP VM team-urc - Starts the VM TEAM-URC team-rls - Starts the VM TEAM-RLS team-vowlan - Starts the VM TEAM-VoWLAN <p>The following keywords are common to all of the above parameters:</p> <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. |

```
• virtual-machine stop [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}
```

| | |
|------------------------------|---|
| virtual-machine stop hard | <p>Stops the VM, based on the parameters passed. Select one of the following options:</p> <ul style="list-style-type: none"> • <VM-NAME> - Stops the VM identified by the <VM-NAME> keyword. Specify the VM name. • ADSP - Stops the ADSP VM • team-urc - Stops the VM TEAM-URC • team-rls - Stops the VM TEAM-RLS • team-vowlan - Stops the VM TEAM-VoWLAN <p>The following keywords are common to all of the above parameters:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. <p>Note: The option 'hard' forces the selected VM to shutdown.</p> |
|------------------------------|---|

```
• virtual-machine uninstall [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}
```

| | |
|------------------------------|---|
| virtual-machine uninstall | <p>Uninstalls the specified VM</p> <ul style="list-style-type: none"> • <VM-NAME> - Uninstalls the VM identified by the <VM-NAME> keyword. Specify the VM name. • ADSP - Uninstalls the ADSP VM • team-urc - Uninstalls the VM TEAM-URC • team-rls - Uninstalls the VM TEAM-RLS • team-vowlan - Uninstalls the VM TEAM-VoWLAN <p>The following keywords are common to all of the above parameters:</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. <p>Note: This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.</p> |
|------------------------------|---|

```
• virtual-machine volume-group [add-drive|resize-drive] <BLOCK-DEVICE-LABEL>
```

| | |
|---|---|
| virtual-machine volume-group [add- drive resize-drive] <BLOCK-DEVICE- LABEL>] | <p>Enables provisioning of logical volume-groups on the VX9000 platform. Logical volume-groups are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives. However, volume-groups can be provisioned only on new VX9000 installation and cannot be added to existing VX9000 installation.</p> <p>Note: The logical volume-group is supported only on a VX9000 running the WiNG 5.9.1 image.</p> <p>Contd..</p> |
|---|---|

| | |
|---|---|
| | <ul style="list-style-type: none"> • <code>add-drive</code> - Adds a new block-device to the VM. Note, currently a maximum of 3 (three) block devices can be added. To add a new drive, first halt the VM, In the Hypervisor, add a new storage disk to the VM and restart the VM. Once the VM comes up, use this command to add the new drive. To identify the new drive execute the <code>show > virtual-machine > volume-group > status</code> command. • <code>resize-drive</code> - Resizes a drive in the VM's volume group. To increase the size of a drive in the volume-group, first halt the VM. In the Hypervisor, increase the size of the existing secondary storage drive and restart the VM. Once the VM comes up, use this command to resize the drive. To identify the drive with the additional free space, execute the <code>show > virtual-machine > volume-group > status</code> command. <p>The following keyword is common to all of the above parameters:</p> <ul style="list-style-type: none"> • <code><BLOCK-DEVICE-LABEL></code> -Specify the block-device label to be added or resized depending on the action being performed. |
| | <ul style="list-style-type: none"> • <code>virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABEL> <NEW-BLOCK-DEVICE-LABEL>]</code> |
| <p><code>virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABEL> <NEW-BLOCK-DEVICE-LABEL>]</code></p> | <p>Enables provisioning of VMs as logical volume-groups on the VX9000 platform. Logical volume-group VMs are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives.</p> <ul style="list-style-type: none"> • <code>replace-drive</code> - Replaces an existing block-device with a new block-device in a volume-group. To replace a drive in the volume-group, first halt the VM. In the Hypervisor, add the new drive and restart the VM. Once the VM comes up, use this command to replace an existing drive with the new drive. To identify the drive with the additional free space, execute the <code>show > virtual-machine > volume-group > status</code> command • <code><BLOCK-DEVICE-LABEL></code> -Specify the block-device label to be replaced. • <code><BLOCK-DEVICE-LABEL></code> - Specify the replacement block-device label. |
| | <ul style="list-style-type: none"> • <code>virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>]</code> |
| <p><code>virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>]</code></p> | <p>Enables provisioning of VMs as logical volume-groups on the VX9000 platform. Logical volume-group VMs are created on the primary storage device, allowing the database storage to be expanded to include additional storage drives</p> <ul style="list-style-type: none"> • <code>resize-volume-group</code> - Adds drive space to an existing block-device in the volume-group • <code><BLOCK-DEVICE-LABEL></code> -Specify the block-device label to which additional drive space is to be provided |

Example

The following examples show the VM installation process:

Installation media: USB

```
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media
usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

Installation media: pre-installed disk image

```
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/
win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on
<DEVICE-NAME>
```

In the preceding example, the command is executed on the device identified by the <DEVICE-NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

Installation media: VM archive

```
<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-
NAME> vcpus 3
```

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

Exporting an installed VM:

```
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

```
nx9500-6C8809#virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.

3.1.59 watch

► *Privileged Exec Mode Commands*

Repeats a specified CLI command at periodic intervals

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
watch <1-3600> <LINE>
```

Parameters

- watch <1-3600> <LINE>

| | |
|----------------|---|
| watch <1-3600> | Repeats a CLI command at a specified interval |
| <1-3600> | Select an interval from 1 - 3600 seconds. Pressing CTRL-Z halts execution of the command. |
| <LINE> | Specify the CLI command name. |

Example

```
rfs6000-81742D#watch 1 show clock
rfs6000-81742D#
```

3.1.60 exit

► *Privileged Exec Mode Commands*

Ends the current CLI session and closes the session window

For more information, see *exit*.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP8232, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
exit
```

Parameters

None

Example

```
rfs6000-81742D#exit
```

3.1.61 raid

► *Privileged Exec Mode Commands*

Enables *Redundant Array of Independent Disks* (RAID) management

RAID is a group of one or more independent, physical drives, referred to as an array or drive group. These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to “RAID degraded”. The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

- Verify the current array status
- Start and monitor array consistency checks
- Retrieve date and time of the last consistency check
- Shut down drives before physically removing them
- Install new drives
- Assign drives as hot spares
- Identify a degraded drive
- Deactivate an alarm (triggered when a drive is removed from the array)

Supported in the following platforms:

- Service Platforms — NX7530, NX9500, NX9510

NOTE: RAID controller drive arrays are available within NX7530 and NX95XX series service platforms (NX9500 and NX9510 models) only. However, they can be administrated on behalf of a NX9500 profile by a different model service platform or controller. The NX9500 service platform includes a single Intel MegaRAID controller, configured to provide a single virtual drive. This virtual drive is of the RAID-1 type, and has a maximum of two physical drives. In addition to these two drives, there are three hot spares, which are used in case of a primary drive failure.

Syntax

```
raid [check|install|locate|remove|silence|spare]
```

```
raid [check|silence]
```

```
raid [install|locate|remove|spare] drive <0-4>
```

Parameters

- `raid [check|silence]`

| | |
|---------|---|
| check | <p>Starts a consistency check on the RAID array. Use the <code>show > raid</code> command to view consistency check status.</p> <p>A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures.</p> |
| silence | <p>Deactivates an alarm</p> <p>When enabled, an audible alarm is triggered when a drive in the array fails. The <code>silence</code> command deactivates the alarm (sound).</p> <p>Note: To enable RAID alarm, in the device configuration mode, use the <code>raid > alarm > enable</code> command. A NX9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see raid.</p> |

- `raid [install|locate|remove|spare] drive <0-4>`

| | |
|---------------|---|
| install <0-4> | <p>Installs a new drive, inserted in one of the available slots, in the array. Specify the drive number.</p> <p>Drives 0 and 1 are the array drives. Drives 2, 3, and 4 are the hot spare drives. You can include the new drive in a degraded array, or enable it as a hot spare.</p> <p>If the array is in a degraded state, the re-build process is triggered and the new drive is used to repair the degraded array.</p> |
| locate <0-4> | <p>Enables LEDs to blink on a specified drive. Specify the drive number.</p> <p>Blinking LEDs enable you correctly locate a drive.</p> |
| remove <0-4> | <p>Removes (shuts down) a disk from the array, before it is physically removed from its slot. Specify the drive number containing the disk.</p> <p>Use this command to also remove a hot spare.</p> |
| spare <0-4> | <p>Converts an unused drive into a hot spare. Specify the drive number.</p> |

Example

```
nx9500-6C874D#raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added
nx9500-6C874D#
```

4 GLOBAL CONFIGURATION COMMANDS

This chapter summarizes the global-configuration commands in the CLI command structure.

The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the PRIV EXEC mode:

```
<DEVICE>#configure terminal
<DEVICE>(config)#
```

NOTE: The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a *commit write memory* command is issued.

```
<DEVICE>(config)#?
Global configuration commands:
aaa-policy
```

```
aaa-tacacs-policy
```

```

| | |
|------------------------------------|--|
| bonjour-gw-query-forwarding-policy | Bonjour Gateway Query forwarding policy |
| captive-portal | Configure a captive portal |
| clear | Clear |
| client-identity | Client identity (DHCP Device Fingerprinting) |
| client-identity-group | Client identity group (DHCP Fingerprint Database) |
| clone | Clone configuration object |
| crypto-cmp-policy | CMP policy |
| customize | Customize the output of summary cli commands |
| database-client-policy | Configure database client policy |
| database-policy | Configure database policy |
| device | Configuration on multiple devices |
| device-categorization | Configure a device categorization object |
| dhcp-server-policy | DHCP server policy |
| dhcpv6-server-policy | DHCPv6 server related configuration |
| dns-whitelist | Configure a whitelist |
| event-system-policy | Configure an event system policy |
| ex3500 | Ex3500 device |
| ex3500-management-policy | Configure an ex3500 management policy |
| ex3500-qos-class-map-policy | Configure an ex3500 qos class-map policy |
| ex3500-qos-policy-map | Configure an ex3500 qos policy-map |
| ex3524 | EX3524 wireless controller |
| ex3548 | EX3548 wireless controller |
| firewall-policy | Configure firewall policy |
| global-association-list | Configure a global association list |
| guest-management | Configure a guest management policy |
| help | Description of the interactive help system |
| host | Enter the configuration context of a device by specifying its hostname |
| igmp-snoop-policy | Create igmp snoop policy |
| inline-password-encryption | Store encryption key in the startup configuration file |
| ip | Internet Protocol (IP) |
| ipv6 | Internet Protocol version 6 (IPv6) |
| ipv6-router-advertisement-policy | IPv6 Router Advertisement related configuration |
| l2tpv3 | L2tpv3 tunnel protocol |
| mac | MAC configuration |
| management-policy | Configure a management policy |
| meshpoint | Create a new MESHPOINT or enter MESHPOINT configuration context for one or more MESHPOINTS |
| meshpoint-qos-policy | Configure a meshpoint quality-of-service policy |
| mint-policy | Configure the global mint policy |
| nac-list | Configure a network access control list |
| no | . |
| nsight-policy | Configure a Nsight policy |
| nx45xx | NX45XX integrated services platform |
| nx5500 | NX5500 wireless controller |
| nx65xx | NX65XX integrated services platform |
| nx75xx | NX75XX wireless controller |
| nx9000 | NX9000 wireless controller |
| passpoint-policy | Configure a passpoint policy |
| password-encryption | Encrypt passwords in configuration |
| profile | Profile related commands - if no parameters are given, all profiles are selected |
| radio-qos-policy | Configure a radio quality-of-service policy |
| radius-group | Configure radius user group parameters |
| radius-server-policy | Create device onboard radius policy |
| radius-user-pool-policy | Configure Radius User Pool |
| rename | Clone configuration object |
| replace | Replace configuration object |

| | |
|-----------------------|---|
| rf-domain | Create a RF Domain or enter rf-domain context for one or more rf-domains |
| rfs4000 | RFS4000 wireless controller |
| rfs6000 | RFS6000 wireless controller |
| rfs7000 | RFS7000 wireless controller |
| roaming-assist-policy | Configure a roaming-assist policy |
| role-policy | Role based firewall policy |
| route-map | Dynamic routing route map Configuration |
| routing-policy | Policy Based Routing Configuration |
| rtl-server-policy | Configure a rtl server policy |
| schedule-policy | Configure a schedule policy |
| self | Config context of the device currently logged into |
| sensor-policy | Configure a sensor policy |
| smart-rf-policy | Configure a Smart-RF policy |
| t5 | T5 DSL switch |
| url-filter | Configure a url filter |
| url-list | Configure a URL list |
| vx9000 | VX9000 wireless controller |
| web-filter-policy | Configure a web filter policy |
| wips-policy | Configure a wips policy |
| wlan | Create a new WLAN or enter WLAN configuration context for one or more WLANs |
| wlan-qos-policy | Configure a wlan quality-of-service policy |
| write | Write running configuration to memory or terminal |
| clrscr | Clears the display screen |
| commit | Commit all changes made in this session |
| do | Run commands from Exec mode |
| end | End current mode and change to EXEC mode |
| exit | End current mode and down to previous mode |
| revert | Revert changes |
| service | Service Commands |
| show | Show running system information |

<DEVICE>(config)#

4.1 Global Configuration Commands

► GLOBAL CONFIGURATION COMMANDS

The following table summarizes Global Configuration mode commands:

Table 4.1 *Global Config Commands*

| Command | Description | Reference |
|---------------------------|--|------------------|
| <i>aaa-policy</i> | Creates a AAA policy and enters its configuration mode. This policy enables administrators to define access control within the network. | <i>page 4-9</i> |
| <i>aaa-tacacs-policy</i> | Creates a AAA-TACACS policy and enters its configuration mode. This policy provides access control to network devices such as routers, network access servers, and other computing devices through centralized servers. | <i>page 4-20</i> |
| <i>alias</i> | Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed -string, etc. | <i>page 4-11</i> |
| <i>ap6521</i> | Adds an AP6521 to the network | <i>page 4-22</i> |
| <i>ap6522</i> | Adds an AP6522 to the network | <i>page 4-23</i> |
| <i>ap6532</i> | Adds an AP6532 to the network | <i>page 4-24</i> |
| <i>ap6562</i> | Adds an AP6562 to the network | <i>page 4-25</i> |
| <i>ap71xx</i> | Adds an AP7161 to the network | <i>page 4-26</i> |
| <i>ap7502</i> | Adds an AP7502 to the network | <i>page 4-27</i> |
| <i>ap7522</i> | Adds an AP7522 to the network | <i>page 4-28</i> |
| <i>ap7532</i> | Adds an AP7532 to the network | <i>page 4-29</i> |
| <i>ap7562</i> | Adds an AP7562 to the network | <i>page 4-30</i> |
| <i>ap7602</i> | Adds an AP7602 to the network | <i>page 4-31</i> |
| <i>ap7612</i> | Adds an AP7612 to the network | <i>page 4-32</i> |
| <i>ap7622</i> | Adds an AP7622 to the network | <i>page 4-33</i> |
| <i>ap7632</i> | Adds an AP7632 to the network | <i>page 4-34</i> |
| <i>ap7662</i> | Adds an AP7662 to the network | <i>page 4-35</i> |
| <i>ap81xx</i> | Adds an AP81XX to the network | <i>page 4-36</i> |
| <i>ap82xx</i> | Adds an AP82XX to the network | <i>page 4-37</i> |
| <i>ap8432</i> | Adds an AP8432 to the network | <i>page 4-38</i> |
| <i>ap8533</i> | Adds an AP8533 to the network | <i>page 4-39</i> |
| <i>application</i> | Creates an application definition and enters its configuration mode. This command allows you to create a customized application detection definition. | <i>page 4-40</i> |
| <i>application-group</i> | Creates an application group and enters its configuration mode | <i>page 4-48</i> |
| <i>application-policy</i> | Creates an application policy and enters its configuration mode. This policy defines the actions executed on recognized HTTP (e.g. Facebook), enterprise (e.g. Webex) and peer-to-peer (e.g. gaming) applications or application-categories. | <i>page 4-55</i> |

Table 4.1 *Global Config Commands*

| Command | Description | Reference |
|---|---|-------------------|
| <i>association-acl-policy</i> | Creates an association ACL policy and enters its configuration mode. This policy restricts access by specifying a client MAC address or range of addresses to either include or exclude from WLAN connectivity. | <i>page 4-78</i> |
| <i>auto-provisioning-policy</i> | Creates an auto provisioning policy and enters its configuration mode. This policy defines the process by which an access point discovers controllers and associates with it. | <i>page 4-79</i> |
| <i>bgp</i> | Configures <i>Border Gateway Protocol</i> (BGP) settings | <i>page 4-81</i> |
| <i>bonjour-gw-discovery-policy</i> | Creates a Bonjour GW Discovery policy and enters its configuration mode. This policy configures the VLANs on which Bonjour services are located. | <i>page 4-84</i> |
| <i>bonjour-gw-forwarding-policy</i> | Configures a Bonjour GW Forwarding policy and enters its configuration mode. This policy enables the discovery of services on VLANs not visible to the device running the Bonjour Gateway. | <i>page 4-90</i> |
| <i>bonjour-gw-query-forwarding-policy</i> | Creates a Bonjour GW Query Forwarding policy and enters its configuration mode. This policy enables Bonjour query forwarding across multiple VLANs. | <i>page 4-92</i> |
| <i>captive portal</i> | Creates a captive portal and enters its configuration mode | <i>page 4-93</i> |
| <i>clear</i> | Clears the event history | <i>page 4-146</i> |
| <i>client-identity</i> | Creates a client identity definition and enters its configuration mode. This feature enables client identification through DHCP device fingerprinting. | <i>page 4-147</i> |
| <i>client-identity-group</i> | Creates a new client identity group and enters its configuration mode | <i>page 4-156</i> |
| <i>clone</i> | Clones a specified configuration object | <i>page 4-164</i> |
| <i>crypto-cmp-policy</i> | Creates a crypto <i>Certificate Management Protocol</i> (CMP) policy and enters its configuration mode. CMP is an Internet protocol designed to obtain and manage digital certificates in a <i>Public Key Infrastructure</i> (PKI) network. | <i>page 4-165</i> |
| <i>customize</i> | Customizes the CLI command summary output | <i>page 4-166</i> |
| <i>database-client-policy</i> | Creates a database client policy and enters its configuration mode. The database client policy configures the IP address or hostname of the VX9000 hosting the <i>captive-portal/NSight database</i> . Use this option when deploying a split NSight/EGuest deployment. | <i>page 4-177</i> |
| <i>database-policy</i> | Creates a database policy and enters its configuration mode. This policy enables the database, and also configures the database replica set. | <i>page 4-184</i> |
| <i>device</i> | Specifies configuration on multiple devices | <i>page 4-192</i> |
| <i>device-categorization</i> | Creates a device categorization list and enters its configuration mode. The list categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network. | <i>page 4-194</i> |
| <i>dhcp-server-policy</i> | Creates a DHCP server policy and enters its configuration mode. This policy allows hosts on an IP network to request and be assigned IP addresses and discover information about the network. | <i>page 4-200</i> |

Table 4.1 *Global Config Commands*

| Command | Description | Reference |
|---|--|-------------------|
| <i>dhcpv6-server-policy</i> | Creates a DHCPv6 server policy and enters its configuration mode. This policy configures hosts with IPv6 addresses, IP prefixes and other configuration attributes required on an IPv6 network. | <i>page 4-201</i> |
| <i>dns-whitelist</i> | Creates a DNS whitelist and enters its configuration mode. A DNS whitelist is used with a captive portal to provide access services to requesting wireless clients. | <i>page 4-203</i> |
| <i>event-system-policy</i> | Creates an Event system policy and enters its configuration mode. This policy enables administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. | <i>page 4-209</i> |
| <i>ex3500</i> | Creates an EX3500 time range list and enters its configuration mode | <i>page 4-227</i> |
| <i>ex3500-management-policy</i> | Creates an EX3500 management policy and enters its configuration mode. This policy controls access to the EX3500 switch from management stations using SNMP. | <i>page 4-233</i> |
| <i>ex3500-qos-class-map-policy</i> | Creates an EX3500 QoS class map policy and enters its configuration mode. The QoS policy map assigns priority to mission critical EX3500 switch data traffic, prevent EX3500 switch bandwidth congestion, and prevent packet drops. | <i>page 4-254</i> |
| <i>ex3500-qos-policy-map</i> | Creates an EX3500 QoS policy map and enters its configuration mode. This policy defines rules that filter traffic exchanged between the EX3500 switch and its connected devices. | <i>page 4-262</i> |
| <i>ex3524</i> | Adds a EX3524 switch to the network | <i>page 4-277</i> |
| <i>ex3548</i> | Adds a EX3548 switch to the network | <i>page 4-279</i> |
| <i>firewall-policy</i> | Creates a firewall policy and enters its configuration mode. This policy configures safe guards against <i>denial of service</i> (DoS) attacks and packet storms. It also configures firewall parameters, such as logging, application layer gateway, TCP protocol checks, state flow checks, etc. | <i>page 4-280</i> |
| <i>global-association-list</i> | Creates a global list of client MAC addresses | <i>page 4-282</i> |
| <i>guest-management</i> | Creates a guest management policy and enters its configuration mode. This policy redirects guest users to a registration portal, upon association to a captive portal <i>Service Set Identifier</i> (SSID). | <i>page 4-286</i> |
| <i>host</i> | Sets the system's network name | <i>page 4-297</i> |
| <i>inline-password-encryption</i> | Stores the encryption key in the startup configuration file | <i>page 4-298</i> |
| <i>ip</i> | Creates a <i>IP access control list</i> (ACL) and/or a <i>Simple Network Management Protocol</i> (SNMP) ACL, and enters its configuration mode | <i>page 4-299</i> |
| <i>ipv6</i> | Creates a IPv6 ACL and enters its configuration mode | <i>page 4-301</i> |
| <i>ipv6-router-advertisement-policy</i> | Creates an IPv6 <i>router advertisement</i> (RA) policy and enters its configuration mode | <i>page 4-302</i> |
| <i>l2tpv3</i> | Creates <i>Layer 2 Tunneling Protocol Version 3</i> (L2TPV3) tunnel policy and enters its configuration mode. This policy defines control and encapsulation protocols for tunneling layer 2 frames between two IP nodes. | <i>page 4-320</i> |

Table 4.1 *Global Config Commands*

| Command | Description | Reference |
|--------------------------------|---|----------------------------|
| <i>mac</i> | Configures MAC access lists (goes to the MAC ACL mode) | page 4-322 |
| <i>management-policy</i> | Creates a management policy and enters its configuration context. This policy configures services that run on a device, such as welcome messages, banners, etc. | page 4-323 |
| <i>meshpoint</i> | Creates a meshpoint and enters its configuration mode | page 4-325 |
| <i>meshpoint-qos-policy</i> | Creates a meshpoint <i>quality of service</i> (QoS) policy and enters its configuration mode | page 4-327 |
| <i>mint-policy</i> | Creates a MiNT security policy and enters its configuration mode | page 4-328 |
| <i>nac-list</i> | Creates a network ACL and enters its configuration mode | page 4-329 |
| <i>no</i> | Negates a command or sets its default | page 4-335 |
| <i>nsight-policy</i> | Creates an NSight policy and enters its configuration mode | page 4-339 |
| <i>passpoint-policy</i> | Creates a new passpoint policy and enters its configuration mode | page 4-350 |
| <i>password-encryption</i> | Enables password encryption | page 4-352 |
| <i>profile</i> | Creates a device profile and enters its configuration mode | page 4-353 |
| <i>radio-qos-policy</i> | Creates a radio qos policy and enters its configuration mode | page 4-357 |
| <i>radius-group</i> | Creates a RADIUS group and enters its configuration mode | page 4-358 |
| <i>radius-server-policy</i> | Creates a RADIUS server policy and enters its configuration mode | page 4-359 |
| <i>radius-user-pool-policy</i> | Creates a RADIUS user pool policy and enters its configuration mode | page 4-361 |
| <i>rename</i> | Renames an existing <i>top-level object</i> (TLO) | page 4-362 |
| <i>replace</i> | Selects an existing device by its MAC address or hostname and replaces it with a new device having a different MAC address | page 4-364 |
| <i>rf-domain</i> | Creates an RF Domain and enters its configuration mode | page 4-366 |
| <i>rfs4000</i> | Adds an RFS4000 to the network | page 4-404 |
| <i>rfs6000</i> | Adds an RFS6000 to the network | page 4-403 |
| <i>nx5500</i> | Adds an NX5500 to the network | page 4-405 |
| <i>nx75xx</i> | Adds an NX75XX to the network | page 4-406 |
| <i>nx9000</i> | Adds a NX9500 or NX9510 to the network | page 4-407 |
| <i>roaming-assist-policy</i> | Configures a roaming assist policy and enters its configuration mode. This policy enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc. | page 4-408 |
| <i>role-policy</i> | Creates a role policy and enters its configuration mode | page 4-410 |
| <i>route-map</i> | Creates a dynamic BGP route map and enters its configuration mode | page 4-411 |
| <i>routing-policy</i> | Creates a routing policy and enters its configuration mode | page 4-412 |
| <i>rtl-server-policy</i> | Creates an RTL server policy and enters its configuration mode. The RTL server policy provides the exact location (URL) at which the Euclid server can be reached. | page 4-413 |
| <i>schedule-policy</i> | Creates a schedule policy and enters its configuration mode | page 4-419 |

Table 4.1 *Global Config Commands*

| Command | Description | Reference |
|--------------------------|---|-------------------|
| <i>self</i> | Displays a logged device's configuration context | <i>page 4-426</i> |
| <i>sensor-policy</i> | Creates a sensor policy and enters its configuration mode | <i>page 4-427</i> |
| <i>smart-rf-policy</i> | Creates a Smart RF policy and enters its configuration mode | <i>page 4-436</i> |
| <i>t5</i> | Configures a t5 wireless controller. This command is applicable only on the RFS4000, RFS6000, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, and VX9000 platforms. | <i>page 4-438</i> |
| <i>web-filter-policy</i> | Creates a Web Filtering policy and enters its configuration mode | <i>page 4-440</i> |
| <i>wips-policy</i> | Creates a WIPS policy and enters its configuration mode | <i>page 4-451</i> |
| <i>wlan</i> | Creates a <i>Wireless Local Area Network</i> (WLAN) and enters its configuration mode | <i>page 4-452</i> |
| <i>wlan-qos-policy</i> | Creates a WLAN QoS policy and enters its configuration mode | <i>page 4-549</i> |
| <i>url-filter</i> | Creates an URL filter and enters its configuration mode. URL filtering is a licensed feature. | <i>page 4-551</i> |
| <i>url-list</i> | Creates an URL list and enters its configuration mode. | <i>page 4-565</i> |
| <i>vx9000</i> | Configures a <i>Virtual WLAN Controller</i> (V-WLC) in a <i>virtual machine</i> (VM) environment | <i>page 4-571</i> |

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *COMMON COMMANDS*.

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.

4.1.1 aaa-policy

► Global Configuration Commands

Configures an *Authentication, Accounting, and Authorization* (AAA) policy. Network administrators can use an AAA policy to define access control within the network.

A controller, service platform, or access point can interoperate with external RADIUS and LDAP servers (AAA Servers) to provide an additional user database and authentication resource. Each WLAN can maintain its own unique AAA configuration. Up to six servers can be configured for providing AAA services.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
aaa-policy <AAA-POLICY-NAME>
```

Parameters

- `aaa-policy <AAA-POLICY-NAME>`

| | |
|-------------------|---|
| <AAA-POLICY-NAME> | Specify the AAA policy name. If the policy does not exist, it is created. |
|-------------------|---|

Example

```
rfs6000-81742D(config)#aaa-policy test
rfs6000-81742D(config-aaa-policy-test)#?
AAA Policy Mode commands:
  accounting          Configure accounting parameters
  attribute           Configure RADIUS attributes in access and accounting
                    requests
  authentication      Configure authentication parameters
  health-check        Configure server health-check parameters
  mac-address-format  Configure the format in which the MAC address must be
                    filled in the Radius-Request frames
  no                  Negate a command or set its defaults
  proxy-attribute     Configure radius attribute behavior when proxying
                    through controller or rf-domain-manager
  server-pooling-mode Configure the method of selecting a server from the
                    pool of configured AAA servers
  use                 Set setting to use

  clrscr             Clears the display screen
  commit             Commit all changes made in this session
  do                 Run commands from Exec mode
  end                End current mode and change to EXEC mode
  exit               End current mode and down to previous mode
  help              Description of the interactive help system
  revert             Revert changes
  service            Service Commands
  show              Show running system information
  write             Write running configuration to memory or terminal

rfs6000-81742D(config-aaa-policy-test)#
```

Related Commands

| | |
|-----------|--------------------------------|
| <i>no</i> | Removes an existing AAA policy |
|-----------|--------------------------------|

NOTE: For more information on the AAA policy commands, see *Chapter 8, AAA-POLICY*.

4.1.2 alias

► *Global Configuration Commands*

Configures the following types of aliases: network, VLAN, host, string, network-service, etc.

Aliases are objects having a unique name and content that is determined by the alias type (network, VLAN, and network-service).

A typical large enterprise network consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a *top-level-object* (TLO). An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

The different aliases types supported are:

- address-range alias – Maps a user-friendly name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.20 through 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.
- host alias – Maps a user-friendly name to a specific host (identified by its IP address. For example, 192.168.10.23). A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location's local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.
- network alias – Maps a user-friendly name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location's network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.
- network-group alias – Maps a user-friendly name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.10-192.168.10.20.

A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created.

A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.

- network-service alias – Maps a user-friendly name to service protocols and ports. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.

Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.

- number alias – Maps a user-friendly name to a number
- vlan alias – Maps a user-friendly name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set at 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26, but utilizes the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.
- string alias – Maps a user-friendly name to a specific string (for example, RF Domain name). A string alias can be utilized at different deployments. For example, if the main domain at a remote location is called *loc1.domain.com* and at another deployment location it is called *loc2.domain.com*, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the *loc1.domain.com* domain and at the other with the *loc2.domain.com* domain.
- encrypted-string alias – Maps a user-friendly name to a string value. The string value of this alias is encrypted when "password-encryption" is enabled. Encrypted-string aliases can be used for string configuration parameters that are encrypted by the "password-encryption" feature.
- hashed-string alias – Maps a user-friendly name to a hashed-string value. Hashed-string aliases can be used for string configuration parameters that are hashed, such as passwords.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]
```

```
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
```

```
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
```

```
alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>
```

```
alias host <HOST-ALIAS-NAME> <HOST-IP>
```

```
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
```

```
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
```

```
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to
<ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|network
<NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|
tftp|www)}

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

Parameters

- alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

| | |
|---|--|
| address-range <ADDRESS-RANGE-ALIAS-NAME> | Creates an address-range alias, defining a range of IP addresses <ul style="list-style-type: none"> • <ADDRESS-RANGE-ALIAS-NAME> - Specify the address-range alias name. Alias name should begin with '\$'. |
| <STARTING-IP> to <ENDING-IP> | Associates a range of IP addresses with this address-range alias <ul style="list-style-type: none"> • <STARTING-IP> - Specify the first IP address in the range. • to <ENDING-IP> - Specify the last IP address in the range. |
| <ul style="list-style-type: none"> • alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0 2] <LINE> | |
| encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> | Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. For more information, see snmp-server . <ul style="list-style-type: none"> • <ENCRYPTED-STRING-ALIAS-NAME> - Specify the encrypted-string alias name. Alias name should begin with '\$'. |
| [0 2] <LINE> | Configures the value associated with the alias name specified in the previous step <ul style="list-style-type: none"> • [0 2] <LINE> - Configures the alias value Note, if password-encryption is enabled, in the <i>show > running-config</i> output, this clear text is displayed as an encrypted string, as shown below: <pre>nx9500-6C8809(config)#show running-config !..... alias encrypted-string \$enString 2 fABMK2is7UToNiZE3MQXbgAAAAxB0ZIysdqseJwr6AH/Da// ! --More-- nx9500-6C8809</pre> In the above <i>show > running-config</i> output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text. CoTnd.. |

| | |
|---|---|
| | <p>However, if password-encryption is disabled the clear text is displayed as is:</p> <pre> nx9500-6C8809(config)#show running-config !..... ! alias encrypted-string \$enString 0 test11223344 ! --More-- nx9500-6C8809 </pre> <p>For more information on enabling password-encryption, see password-encryption.</p> |
| | <ul style="list-style-type: none"> • <code>alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE></code> |
| hashed-string <HASHED-STRING-ALIAS-NAME> | <p>Creates an alias for a hashed string. Use this alias for configuration values that are hashed strings, such as passwords. For example, in the management-policy, use it to define the privilege mode password. For more information, see .</p> <ul style="list-style-type: none"> • <HASHED-STRING-ALIAS-NAME> - Specify the hashed-string alias name. <p>Alias name should begin with '\$'.</p> |
| <LINE> | <p>Configures the hashed-string value associated with this alias.</p> <pre> nx9500-6C8809(config)#show running-config ! alias encrypted-string \$WRITE 2 sBqVCDaoxs3oByF5PCSuFAAAAAAd7HT2+EtT/1/BXm9c4SBDv ! alias hashed-string \$PriMode 1 faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112ecfc75 0--More-- nx9500-6C8809 </pre> <p>In the above <code>show > running-config</code> output, the '1' displayed before the hashed-string alias value indicates that the displayed text is hashed and not a clear text.</p> |
| | <ul style="list-style-type: none"> • <code>alias host <HOST-ALIAS-NAME> <HOST-IP></code> |
| host <HOST-ALIAS-NAME> | <p>Creates a host alias, defining a single network host</p> <ul style="list-style-type: none"> • <HOST-ALIAS-NAME> - Specify the host alias name. <p>Alias name should begin with '\$'.</p> |
| <HOST-IP> | <p>Associates the network host's IP address with this host alias. For example, 'alias host \$HOST 1.1.1.100'. In this example, the host alias name is: <i>\$HOST</i> and the host IP address it is mapped to is: <i>1.1.1.100</i>.</p> <ul style="list-style-type: none"> • <HOST-IP> - Specify the network host's IP address. |
| | <ul style="list-style-type: none"> • <code>alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK></code> |
| network <NETWORK-ALIAS-NAME> | <p>Creates a network alias, defining a single network address</p> <ul style="list-style-type: none"> • <NETWORK-ALIAS-NAME> - Specify the network alias name. <p>Alias name should begin with '\$'.</p> |
| <NETWORK-ADDRESS/MASK> | <p>Associates a single network with this network alias. For example, 'alias network \$NET 1.1.1.0/24'. In this example, the network alias name is: <i>\$NET</i> and the network it is mapped to is: <i>1.1.1.0/24</i>.</p> <ul style="list-style-type: none"> • <NETWORK-ADDRESS/MASK> - Specify the network's address and mask. |

- `alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}| network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]`

| | |
|---|--|
| <pre>network <NETWORK-GROUP- ALIAS-NAME></pre> | <p>Creates a network-group alias</p> <ul style="list-style-type: none"> • <NETWORK-GROUP-ALIAS-NAME> - Specify the network-group alias name. <p>Alias name should begin with '\$'.</p> <p>The network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level.</p> <p>After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.</p> |
| <pre>address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}</pre> | <p>Associates a range of IP addresses with this network-group alias</p> <ul style="list-style-type: none"> • <STARTING-IP> - Specify the first IP address in the range. • to <ENDING-IP> - Specify the last IP address in the range. • <STARTING-IP> to <ENDING-IP> - Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured. |
| <pre>host <HOST-IP> {<HOST-IP>}</pre> | <p>Associates a single or multiple hosts with this network-group alias</p> <ul style="list-style-type: none"> • <HOST-IP> - Specify the hosts' IP address. • <HOST-IP> - Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured. |
| <pre>network <NETWORK- ADDRESS/MASK> {<NETWORK- ADDRESS/MASK>}</pre> | <p>Associates a single or multiple networks with this network-group alias</p> <ul style="list-style-type: none"> • <NETWORK-ADDRESS/MASK> - Specify the network's address and mask. • <NETWORK-ADDRESS/MASK> - Optional. Specifies more than one network. A maximum of eight (8) networks can be configured. |
| <pre>• alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254> <WORD> eigrp gre igmp igp ospf vrrp] {(<1-65535> <WORD> bgp dns ftp ftp-data gopher https ldap nntp ntp pop3 proto sip smtp sourceport [<1-65535> <WORD>] ssh telnet tftp www)}</pre> | |
| <pre>alias network-service <NETWORK- SERVICE-ALIAS- NAME></pre> | <p>Configures an alias that specifies available network services and the corresponding source and destination software ports</p> <ul style="list-style-type: none"> • <NETWORK-SERVICE-ALIAS-NAME> - Specify a network-service alias name. <p>Alias name should begin with '\$'.</p> <p>Network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level.</p> |
| <pre>proto [<0-254> <WORD> eigrp gre igmp igp ospf vrrp]</pre> | <p>Use one of the following options to associate an Internet protocol with this network-service alias:</p> <ul style="list-style-type: none"> • <0-254> - Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the <i>Protocol</i> field of the IPv4 header and the <i>Next Header</i> field of IPv6 header. For example, the <i>User Datagram Protocol's</i> (UDP) designated number is 17. • <WORD> - Identifies the protocol by its name. Specify the protocol name. • eigrp - Selects <i>Enhanced Interior Gateway Routing Protocol</i> (EIGRP). The protocol number 88. <p>Contd..</p> |

| | |
|--|--|
| | <ul style="list-style-type: none"> • gre – Selects <i>Generic Routing Encapsulation</i> (GRE). The protocol number is 47. • igmp – Selects <i>Internet Group Management Protocol</i> (IGMP). The protocol number is 2. • igp – Selects <i>Interior Gateway Protocol</i> (IGP). The protocol number is 9. • ospf – Selects <i>Open Shortest Path First</i> (OSPF). The protocol number is 89. • vrrp – Selects <i>Virtual Router Redundancy Protocol</i> (VRRP). The protocol number is 112. |
| <pre>{(<1-65535> <WORD> bgp dns ftp ftp-data gopher https ldap nntp ntp pop3 proto sip smtp sourceport [<1-65535> <WORD>] ssh telnet tftp www)}</pre> | <p>After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.</p> <ul style="list-style-type: none"> • <1-65535> – Optional. Configures a destination port number from 1 - 65535 • <WORD> – Optional. Identifies the destination port by the service name provided. For example, the <i>secure shell</i> (SSH) service uses TCP port 22. • bgp – Optional. Configures the default <i>Border Gateway Protocol</i> (BGP) services port (179) • dns – Optional. Configures the default <i>Domain Name System</i> (DNS) services port (53) • ftp – Optional. Configures the default <i>File Transfer Protocol</i> (FTP) control services port (21) • ftp-data – Optional. Configures the default FTP data services port (20) • gopher – Optional. Configures the default gopher services port (70) • https – Optional. Configures the default HTTPS services port (443) • ldap – Optional. Configures the default <i>Lightweight Directory Access Protocol</i> (LDAP) services port (389) • nntp – Optional. Configures the default Newsgroup (NNTP) services port (119) • ntp – Optional. Configures the default <i>Network Time Protocol</i> (NTP) services port (123) • POP3 – Optional. Configures the default <i>Post Office Protocol</i> (POP3) services port (110) • proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step. • sip – Optional. Configures the default <i>Session Initiation Protocol</i> (SIP) services port (5060) • smtp – Optional. Configures the default <i>Simple Mail Transfer Protocol</i> (SMTP) services port (25) • sourceport [<1-65535> <WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports. <ul style="list-style-type: none"> • <1-65535> – Specify the source port from 1 - 65535. • <WORD> – Specify the source port range, for example 1-10. • ssh – Optional. Configures the default SSH services port (22) • telnet – Optional. Configures the default Telnet services port (23) • tftp – Optional. Configures the default <i>Trivial File Transfer Protocol</i> (TFTP) services port (69) |

- `alias number <NUMBER-ALIAS-NAME> <0-4294967295>`

| | |
|--|--|
| alias number <NUMBER-ALIAS-NAME> <0-4294967295> | <p>Creates a number alias identified by the <NUMBER-ALIAS-NAME> keyword. Number aliases map a name to a numeric value. For example, 'alias number \$NUMBER 100'</p> <ul style="list-style-type: none"> • The number alias name is: \$NUMBER • The value assigned is: 100 <p>The value referenced by alias \$NUMBER, wherever used, is 100.</p> <ul style="list-style-type: none"> • <NUMBER-ALIAS-NAME> - Specify the number alias name. <ul style="list-style-type: none"> • <0-4294967295> - Specify the number, from 0 - 4294967295, assigned to the number alias created. <p>Alias name should begin with '\$'.</p> |
|--|--|

- `alias string <STRING-ALIAS-NAME> <LINE>`

| | |
|-------------------------------------|--|
| alias string <STRING-ALIAS-NAME> | <p>Creates a string alias identified by the <STRING-ALIAS-NAME> keyword</p> <ul style="list-style-type: none"> • <STRING-ALIAS-NAME> - Specify the string alias name. <ul style="list-style-type: none"> • <LINE> - Specify the string value associated with the specified <STRING-ALIAS-NAME> keyword. <p>String aliases map a name to an arbitrary string value. For example, 'alias string \$DOMAIN test.example_company.com'.</p> <ul style="list-style-type: none"> • The string alias name is: \$DOMAIN • The value assigned is: test.example_company.com (a domain name) <p>The value referenced by alias \$DOMAIN, wherever used, is test.example_company.com.</p> <p>Alias name should begin with '\$'.</p> <p>You can also use a string alias to configure the Bonjour Service instance name. Once configured, use the string alias in the Bonjour Gateway Discovery Policy context to specify the Bonjour service instance name to be used as the match criteria. For more information, see allow-service.</p> |
|-------------------------------------|--|

- `alias vlan <VLAN-ALIAS-NAME> <1-4094>`

| | |
|---------------------------------|--|
| alias vlan <VLAN-ALIAS-NAME> | <p>Creates a VLAN alias identified by the <VLAN-ALIAS-NAME> keyword</p> <ul style="list-style-type: none"> • <VLAN-ALIAS-NAME> - Specify the VLAN alias name. <p>Alias name should begin with '\$'.</p> |
| <1-4094> | <p>Maps the VLAN alias to a VLAN ID</p> <ul style="list-style-type: none"> • <1-4094> - Specify the VLAN ID from 1 - 4094. |

Example

```
rfs4000-229D58 (config)##alias address-range $AddRanAlias 192.168.13.10 to
192.168.13.13

rfs4000-229D58 (config)#alias network $NetworkAlias 192.168.13.0/24

rfs4000-229D58 (config)#alias host $HostAlias 192.168.13.100

rfs4000-229D58 (config)#alias vlan $VlanAlias 1

rfs4000-229D58 (config)#alias address-range $AddRangeAlias 192.168.13.2 to 192.16
8.13.10

rfs4000-229D58 (config)#alias network-service $NetServAlias proto igmp
```

```
rfs4000-229D58(config)#show running-config | include alias
alias network-group $NetGrAlias address-range 192.168.13.7 to 192.168.13.9
192.168.13.20 to 192.168.13.25
alias network $NetworkAlias 192.168.13.0/24
alias host $HostAlias 192.168.13.10
alias address-range $AddRangeAlias 192.168.13.2 to 192.168.13.10
alias network-service $NetServAlias proto igmp
alias vlan $VlanAlias 1
rfs4000-229D58(config)#
```

```
nx9500-6C8809(config)#alias number $NUMBER 100
```

```
nx9500-6C8809(config)#show context include-factory | include alias
alias string $DOMAIN test.examplecompany.com
alias string $DOMAIN2 test.example_company.com
alias number $NUMBER 100
alias string $SN B4C7996C8809
nx9500-6C8809(config)#
```

The following examples show encrypted-string alias configuration:

```
nx9500-6C8809(config)#alias encrypted-string $WRITE 0 private
nx9500-6C8809(config)#alias encrypted-string $READ 0 public
```

```
nx9500-6C8809(config)#show context | include alias
alias vlan $BLR-01 1
alias string $IN-Blr-EcoSpace-Floor-4 IBEF4
alias encrypted-string $READ 0 public
alias encrypted-string $WRITE 0 private
nx9500-6C8809(config)#
```

The following example shows the encrypted-string aliases, configured in the previous example, used in the management-policy:

```
nx9500-6C8809(config-management-policy-default)#snmp-server community 0 $WRITE rw
nx9500-6C8809(config-management-policy-default)#snmp-server community 0 $READ ro
```

```

4.1.3 aaa-tacacs-policy

► Global Configuration Commands

Configures AAA *Terminal Access Controller Access-Control System+* (TACACS) policy. TACACS+ is a protocol created by CISCO Systems which provides access control to network devices such as routers, network access servers and other networked computing devices through one or more centralized servers. TACACS provides separate authentication, authorization, and accounting services running on different servers.

TACACS controls user access to devices and network resources while providing separate accounting, authentication, and authorization services. Some of the services provided by TACACS are:

- Authorizing each command with the TACACS+ server before execution.
- Accounting each session's logon and log off events.
- Authenticating each user with the TACACS+ server before enabling access to network resources.

Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>
```

Parameters

- aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

| | |
|---|--|
| <code><AAA-TACACS-POLICY-NAME></code> | Specify the AAA-TACACS policy name. If the policy does not exist, it is created. |
|---|--|

Example

```
rfs6000-81742D(config)#aaa-tacacs-policy testpolicy
rfs6000-81742D(config-aaa-tacacs-policy-testpolicy)#?
AAA TACACS Policy Mode commands:
  accounting      Configure accounting parameters
  authentication   Configure authentication parameters
  authorization    Configure authorization parameters
  no              Negate a command or set its defaults

  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit           End current mode and down to previous mode
  help           Description of the interactive help system
  revert         Revert changes
  service        Service Commands
  show           Show running system information
  write         Write running configuration to memory or terminal

rfs6000-81742D(config-aaa-tacacs-policy-testpolicy)#
```

Related Commands

|-----------|---------------------------------------|
| <i>no</i> | Removes an existing AAA TACACS policy |
|-----------|---------------------------------------|

NOTE: For more information on the AAA-TACACS policy commands, see *Chapter 25, AAA-TACACS-POLICY*.

4.1.4 ap6521

► Global Configuration Commands

Adds an AP6521 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP6521
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap6521 <MAC>
```

Parameters

- ap6521 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP6521's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap6521 FC-0A-81-42-93-6C
nx9500-6C8809(config-device-FC-0A-81-42-93-6C)#show context
ap6521 FC-0A-81-42-93-6C
  use profile default-ap6521
  use rf-domain default
  hostname ap6521-42936C
nx9500-6C8809(config-device-FC-0A-81-42-93-6C)#
```

```
nx9500-6C8809(config)#show wireless ap configured
```

```
-----
-----
  IDX          NAME                MAC                PROFILE           RF-DOMAIN         ADOPTED-BY
-----
  1    ap6521-42936C    FC-0A-81-42-93-6C    default-ap6521    default           B4-C7-

| <i>no</i> | Removes an AP6521 from the network |
|-----------|------------------------------------|

4.1.5 ap6522

► Global Configuration Commands

Adds an AP6522 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP6522
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap6522 <MAC>
```

Parameters

- ap6522 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP6522's MAC address. |
|--------------------------|-----------------------------------|

Example

```

nx9500-6C8809(config)#ap6522 B4-C7-99-58-72-58
nx9500-6C8809(config-device-B4-C7-99-58-72-58)#show context
ap6522 B4-C7-99-58-72-58
  use profile default-ap6522
  use rf-domain default
  hostname ap6522-587258
nx9500-6C8809(config-device-B4-C7-99-58-72-58)#

nx9500-6C8809(config)#show wireless ap configured
-----
      IDX          NAME                MAC                PROFILE          RF-DOMAIN        ADOPTED-BY
-----
      1  ap6521-42936C      FC-0A-81-42-93-6C  default-ap6521   default          B4-C7-
99-6C-88-09
      2  ap6522-587258    B4-C7-99-58-72-58  default-ap6522  default        B4-C7-99-6C-

4.1.6 ap6532

► Global Configuration Commands

Adds an AP6532 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP6532
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap6532 <MAC>
```

Parameters

- ap6532 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP6532's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap6532 00-23-68-31-16-59
nx9500-6C8809(config-device-B4-C7-99-58-72-58)#show context
ap6532 00-23-68-31-16-59
  use profile default-ap6532
  use rf-domain default
  hostname ap6532-311659

4.1.7 ap6562

► Global Configuration Commands

Adds an AP6562 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP6562
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap6562 <MAC>
```

Parameters

- ap6562 <MAC>

| | |
|-------|-----------------------------------|
| <MAC> | Specify the AP6562's MAC address. |
|-------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap6562 00-23-09-0E-12-60
nx9500-6C8809(config-device-00-23-09-0E-12-60)#show context

4.1.9 ap7502

► *Global Configuration Commands*

Adds an AP7502 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7502
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7502 <MAC>
```

Parameters

- ap7502 <MAC>

| | |
|-------|-----------------------------------|
| <MAC> | Specify the AP7502's MAC address. |
|-------|-----------------------------------|

Example

```
rfs6000-81742D(config)#ap7502 00-23-68-99-BF-A8
rfs6000-81742D(config-device-00-23-68-99-BF-A8)#
```

4.1.10 ap7522

► *Global Configuration Commands*

Adds an AP7522 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point – AP7522
- Wireless Controllers – RFS4000, RFS6000
- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7522 <MAC>
```

Parameters

- ap7522 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP7522's MAC address. |
|--------------------------|-----------------------------------|

Example

```
rfs6000-81742D(config)#ap7522 00-23-09-0E-12-63
rfs6000-81742D(config-device-00-23-09-0E-12-63)#
```

4.1.11 ap7532

► *Global Configuration Commands*

Adds an AP7532 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7532
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7532 <MAC>
```

Parameters

- ap7532 <MAC>

| | |
|-------|-----------------------------------|
| <MAC> | Specify the AP7532's MAC address. |
|-------|-----------------------------------|

Example

```
rfs6000-81742D(config)#ap7532 00-23-09-0E-12-71
rfs6000-81742D(config-device-00-23-09-0E-12-71)#
```

4.1.13 ap7602

► Global Configuration Commands

Adds an AP7602 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7602
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7602 <MAC>
```

Parameters

- ap7602 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP7602's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap7602 11-2C-3b-01-aa-23
nx9500-6C8809(config-device-11-2C-3B-01-AA-23)#show context
ap7602 11-2C-3B-01-AA-23
  use profile default-ap7602
  use rf-domain default
  hostname ap7602-01AA23

|-----------|------------------------------------|
| <i>no</i> | Removes an AP7602 from the network |
|-----------|------------------------------------|

4.1.14 ap7612

► Global Configuration Commands

Adds an AP7612 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7612
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7612 <MAC>
```

Parameters

- ap7612 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP7612's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap7612 10-1c-AB-11-0E-20
nx9500-6C8809(config-device-10-1c-AB-11-0E-20)#show context
ap7612 10-1C-AB-11-0E-20
  use profile default-ap7612
  use rf-domain default
  hostname ap7612-110E20
nx9500-6C8809(config-device-10-1c-AB-11-0E-20)#
```

Related Commands

| | |
|-----------|------------------------------------|
| <i>no</i> | Removes an AP7612 from the network |
|-----------|------------------------------------|

4.1.15 ap7622

► *Global Configuration Commands*

Adds an AP7622 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7622
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7622 <MAC>
```

Parameters

- ap7622 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP7622's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config-device-01-11-CD-21-0B-13)#show con
ap7622 01-11-CD-21-0B-13
  use profile default-ap7622
  use rf-domain default
  hostname ap7622-210B13
nx9500-6C8809(config-device-01-11-CD-21-0B-13)#
```

Related Commands

| | |
|-----------|------------------------------------|
| <i>no</i> | Removes an AP7622 from the network |
|-----------|------------------------------------|

4.1.16 ap7632

► Global Configuration Commands

Adds an AP7632 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7632
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7632 <MAC>
```

Parameters

- ap7632 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP7632's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap7632 23-12-A1-F0-12-02
nx9500-6C8809(config-device-23-12-A1-F0-12-02)#show context
ap7632 23-12-A1-F0-12-02
  use profile default-ap7632
  use rf-domain default
  hostname ap7632-F01202
nx9500-6C8809(config-device-23-12-A1-F0-12-02)#
```

Related Commands

4.1.17 ap7662

► Global Configuration Commands

Adds an AP7662 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP7662
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap7662 <MAC>
```

Parameters

- ap7662 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP7662's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap7662 20-12-bd-4C-31-5F
nx9500-6C8809(config-device-20-12-BD-4C-31-5F)#show context
ap7662 20-12-BD-4C-31-5F
  use profile default-ap7662
  use rf-domain default
  hostname ap7662-4C315F

4.1.18 ap81xx

► Global Configuration Commands

Adds an AP81XX series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP81XX
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap81xx <MAC>
```

Parameters

- ap81xx <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP81XX's MAC address. |
|--------------------------|-----------------------------------|

Example

```
rfs6000-81742D#ap81xx B4-C7-99-71-17-28
rfs6000-81742D(config-device-B4-C7-99-71-17-28)#show context

4.1.19 ap82xx

► Global Configuration Commands

Adds an AP82XX series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap82xx <MAC>
```

Parameters

- ap82xx <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP82XX's MAC address. |
|--------------------------|-----------------------------------|

Example

```
rfs6000-81742D(config-device-00-23-68-14-77-48)

4.1.20 ap8432

► Global Configuration Commands

Adds an AP8432 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Access Point — AP8432
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ap8432 <MAC>
```

Parameters

- ap8432 <MAC>

| | |
|--------------------------|-----------------------------------|
| <code><MAC></code> | Specify the AP8432's MAC address. |
|--------------------------|-----------------------------------|

Example

```
nx9500-6C8809(config)#ap8432 84-24-8D-80-C2-AC

4.1.22 application

► *Global Configuration Commands*

The following table lists the commands that enable you to enter the Application definition configuration mode:

Table 4.2 *Application-Policy Config Command*

| Command | Description | Reference |
|---|--|------------------|
| <i>application</i> | Creates a new application definition and enters its configuration mode. This command allows you to create a customized application detection definition. | <i>page 4-41</i> |
| <i>application-config-mode commands</i> | Summarizes application definition configuration mode commands | <i>page 4-42</i> |

4.1.22.1 application

► *application*

Creates a new application definition and enters its configuration mode

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
application <APPLICATION-NAME>
```

Parameters

- application <APPLICATION-NAME>

| | |
|-----------------------------------|--|
| application <APPLICATION-NAME> | Creates a new application definition and enters its configuration mode <ul style="list-style-type: none"> • <APPLICATION-NAME> - Specify a name of the new application definition. It is created if not already existing in the system. |
|-----------------------------------|--|

Example

```
nx9500-6C8809(config)#application Bing
nx9500-6C8809(config-application-Bing)#?
Application Mode commands:
  app-category  Set application category (default is custom)
  description   Add application description
  https        Secure HTTP
  no           Negate a command or set its defaults
  use          Set setting to use

  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help        Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-application-Bing)#
```

Related Commands

| | |

4.1.22.2 application-config-mode commands

► *application*

The following table summarizes Application definition configuration mode commands:

Table 4.3 *Application- Config-Mode Commands*

| Command | Description | Reference |
|---------------------|--|------------------|
| <i>app-category</i> | Configures the category for this application definition | <i>page 4-43</i> |
| <i>description</i> | Configures a description for this application definition | <i>page 4-44</i> |
| <i>https</i> | Configures the HTTPS common-name attribute value for this application category's server certificate. Applicable only to applications using HTTPS protocol. | <i>page 4-45</i> |
| <i>use</i> | Associates a network-service alias or a URL list with this application definition. Applicable for applications using protocols other than HTTPS. | <i>page 4-46</i> |
| <i>no</i> | Removes or resets this application definition's configured settings | <i>page 4-47</i> |

4.1.22.2.1 app-category

► *application-config-mode* commands

Configures the category for this application definition

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
app-category <APP-CATEGORY-NAME>
```

Parameters

- `app-category <APP-CATEGORY-NAME>`

| | |
|-------------------------------------|---|
| app-category <APP-CATEGORY-NAME> | Select the category best suited for this application definition. There are twenty three categories. These are: business, conference, custom, database, filetransfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and Web. The default setting is custom. Use this option to categorize your internal custom applications, so that they do not appear as unknown traffic. |
|-------------------------------------|---|

Example

```

nx9500-6C8809(config-application-Bing)#app-category [TAB]
business          conference      custom
database          filetransfer   gaming
generic           im             mail
mobile            network\      other
p2p               remote_control sharehosting
social\ networking streaming      tunnel
voip              web

nx9500-6C8809(config-application-Bing)#

nx9500-6C8809(config-application-Bing)#app-category streaming

nx9500-6C8809(config-application-Bing)#show context
application Bing
  app-category streaming
nx9500-6C8809(config-application-Bing)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Resets application category to default (custom) |
|-----------|---|

4.1.22.2.2 description

► *application-config-mode commands*

Configures a description for this application definition

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
description <WORD>
```

Parameters

- description <WORD>

| | |
|-----------------------|--|
| description <WORD> | Configures a description for this application <ul style="list-style-type: none"> • <WORD> - Specify a description not exceeding 80 characters in length. Enter the descriptive text within double quotes. |
|-----------------------|--|

Example

```

nx9500-6C8809(config-application-Bing)#description "Bing is Microsoft's Web search
engine"

nx9500-6C8809(config-application-Bing)#show context
application Bing
  description "Bing is Microsoft's Web search engine"
  app-category streaming
nx9500-6C8809(config-application-Bing)#

```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes this description configured for this application |
|-----------|--|

4.1.22.2.3 https

▶ *application-config-mode commands*

Configures the HTTPS parameter type, attribute type, match criteria for the HTTPS server name and 64 character maximum server name attribute used in the HTTPS server message exchange

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
https server-cert common-name [contains|ends-with] <WORD>
```

Parameters

- `https server-cert common-name [contains|ends-with] <WORD>`

| | |
|--|--|
| <code>https server-cert</code> | Configures the HTTPS parameter type as server certificate |
| <code>common-name [contains ends-with] <WORD></code> | Configures the HTTPS attribute match criteria as common name. This is the only option applicable when the HTTPS parameter type is set to server-cert. Use one of the following options to provide the common-name attribute value used as the match criteria: <ul style="list-style-type: none"> • <code>contains</code> – Filters applications having common-name attributes containing the string specified here • <code>ends-with</code> – Filters applications ending with the string specified here • <code><WORD></code> – Specify the string to match (should not exceed 64 characters). |

Example

```

nx9500-6C8809(config-application-Bing)#https server-cert common-name exact
bing.com

nx9500-6C8809(config-application-Bing)#show context
application Bing
description "Bing is Microsoft's web search engine"
app-category streaming
https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the HTTPS common-name attribute value configured with this application category |
|-----------|---|

4.1.22.2.4 use

► *application-config-mode commands*

Associates a network-service alias or a URL list with this application definition

For applications using protocols other than HTTPS, use this command to define the protocols, ports, and/or URL host name to match.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

Parameters

- use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]

| | |
|---|---|
| use | Configures this application definition to use a network-service alias or a URL list |
| network-service <NETWORK-SERVICE-ALIAS-NAME> | Associates a network-service alias with this application definition <ul style="list-style-type: none"> • <NETWORK-SERVICE-ALIAS-NAME> - Specify the network-service alias name (should be existing and configured). The network-service alias should specify the protocols and ports to match. |
| url-list <URL-LIST-NAME> | Associates a URL list with this application definition. URL lists are utilized for whitelisting and blacklisting Web application URLs from being launched and consuming bandwidth within the WiNG managed network. <ul style="list-style-type: none"> • <URL-LIST-NAME> - Specify the URL list name (should be existing and configured). The URL list should specify the HTTP URL host names to match. |

Example

```

nx9500-6C8809(config-application-Bing)#use url-list Bing

nx9500-6C8809(config-application-Bing)#show context
application Bing
description "Bing is Microsoft's web search engine"
app-category streaming
use url-list Bing
https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the network-service alias or the URL list associated with this application definition |
|-----------|---|

4.1.22.2.5 no

▶ *application-config-mode commands*

Removes or resets this application definition's configured settings

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [app-category|description|https|use]
no [app-category|description]
no https server-cert common-name [contains|ends-with] <WORD>
no use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

Parameters

- no <PARAMETERS>

| | |
|-----------------|--|
| no <PARAMETERS> | Removes or resets this application definition's configured settings based on the parameters passed |
|-----------------|--|

Example

The following example displays the application definition 'Bing' parameters before the 'no' commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
  description "Bing is Microsoft's web search engine"
  app-category streaming
  use url-list Bing
  https server-cert common-name exact bing.com
nx9500-6C8809config-application-Bing)#
```

```
nx9500-6C8809(config-application-Bing)#no description
nx9500-6C8809(config-application-Bing)#no https server-cert common-name exact
bing.com
```

The following example displays the application definition 'Bing' parameters after the 'no' commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
  app-category streaming
  use url-list Bing
nx9500-6C8809(config-application-Bing)#
```

4.1.23 application-group

▶ *Global Configuration Commands*

The following table lists the commands that enable you to create a new application group and enter its configuration mode:

Table 4.4 *Application-Group Config Command*

| Command | Description | Reference |
|--|---|------------------|
| <i>application-group</i> | Creates a new application group and enters its configuration mode | <i>page 4-49</i> |
| <i>application-group-mode commands</i> | Summarizes application group configuration mode commands | <i>page 4-50</i> |

4.1.23.1 application-group

▶ *application-group*

An application group is a collection of system-provided and/or user-defined applications. It is a subset of the total number of supported applications. There are a total of 299 system-provided applications.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
application-group <APPLICATION-GROUP-NAME>
```

Parameters

- application-group <APPLICATION-GROUP-NAME>

| | |
|---|--|
| application-group <APPLICATION-GROUP-NAME> | Creates an application group and enters its configuration mode <ul style="list-style-type: none"> • <APPLICATION-GROUP-NAME - Specify the application group name. If an application group with the specified name does not exist, it is created. The name should not exceed 32 characters in length. |
|---|--|

Example

```
nx9500-6C8809(config)#application-group amazon
nx9500-6C8809(config-app-group-amazon)#?
Application Group Mode commands:
  application  Add application to group
  description  Add application-group description
  no          Negate a command or set its defaults

  clrscr      Clears the display screen
  commit      Commit all changes made in this session
  do          Run commands from Exec mode
  end         End current mode and change to EXEC mode
  exit        End current mode and down to previous mode
  help        Description of the interactive help system
  revert      Revert changes
  service     Service Commands
  show        Show running system information
  write       Write running configuration to memory or terminal

nx9500-6C8809(config-app-group-amazon)#
```

Related Commands

| | |
|-----------|---------------------------------------|
| <i>no</i> | Removes an existing application group |
|-----------|---------------------------------------|

4.1.23.2 application-group-mode commands

▶ *application-group*

The following table summarizes the application group configuration mode commands:

Table 4.5 *Application-Group-Config-Mode Commands*

| Command | Description | Reference |
|--------------------|---|------------------|
| <i>application</i> | Adds an application to this application group | <i>page 4-51</i> |
| <i>description</i> | Configures a description for this application group | <i>page 4-53</i> |
| <i>no</i> | Removes this application group's configured parameters (application and/or description) | <i>page 4-54</i> |

4.1.23.21 application

▶ *application-group-mode* commands

Adds an application to this application group. You can add a system-provided or user-defined application.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
application <APPLICATION-NAME>
```

Parameters

- application <APPLICATION-NAME>

| | |
|--|---|
| <pre>application <APPLICATION- NAME></pre> | <p>Configures the application to be added to this application group</p> <ul style="list-style-type: none"> • <APPLICATION-NAME> - Provide the application name (should be available as an option in the system). A maximum of eight (8) applications can be added to a group. <p>If the desired application is not available as an option, use the <i>application</i> command to add it.</p> |
|--|---|

Example

To view all applications available in the system, use [TAB], as shown in the following example:

```
nx9500-6C8809(config-app-group-test)#application [TAB]
Display all 299 possibilities? (y or n)
1-clickshare-com          1-upload-com
1-upload-to                10upload-com

--More--
nx9500-6C8809(config-app-group-test)#
```

Select the desired application from the list displayed, as shown in the following examples:

```
nx9500-6C8809(config-app-group-amazon)#application amazon [TAB]
amazon-prime-music amazon-prime-video amazon_cloud amazon_shop
nx9500-6C8809(config-app-group-amazon)#

nx9500-6C8809(config-app-group-amazon)#application amazon-prime-music
nx9500-6C8809(config-app-group-amazon)#application amazon-prime-video
nx9500-6C8809(config-app-group-amazon)#application amazon_cloud
nx9500-6C8809(config-app-group-amazon)#application amazon_shop

nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
application amazon-prime-music
application amazon-prime-video
application amazon_cloud
application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

Note, the system returns an error message if the application entered is not listed, as shown in the following example:

```
nx9500-6C8809(config-app-group-test)#application bing
% Error: application 'bing' is not defined
nx9500-6C8809(config-app-group-test)#
```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes a specified application from this application group |
|-----------|---|

4.1.23.2.2 description

► *application-group-mode commands*

Configures a description for this application group

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
description <WORD>
```

Parameters

- description <WORD>

| | |
|-----------------------|--|
| description <WORD> | Configures a description for this application group that uniquely differentiates it from other existing application groups <ul style="list-style-type: none"> • <WORD> - Provide a description not exceeding 80 characters in length. |
|-----------------------|--|

Example

```

nx9500-6C8809(config-app-group-amazon)#description "This application-group lists
all Amazon applications."

nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
description "This application-group lists all Amazon applications."
application amazon-prime-music
application amazon-prime-video
application amazon_cloud
application amazon_shop
nx9500-6C8809(config-app-group-amazon)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes the description configured for this application group |
|-----------|---|

4.1.23.2.3 no

▶ *application-group-mode commands*

Removes this application group's configured parameters (application and/or description)

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
no [application <APPLICATION-NAME>|description]
```

Parameters

- no [application <APPLICATION-NAME>|description]

| | |
|-----------------|---|
| no <PARAMETERS> | Removes an application associated with this group, and removes this group's description |
|-----------------|---|

Example

The following example displays the application-group 'amazon' configuration before the execution of 'no' commands:

```
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
  description "This application-group lists all Amazon applications."
  application amazon-prime-music
  application amazon-prime-video
  application amazon_cloud
  application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

```
nx9500-6C8809(config-app-group-amazon)#no application amazon_cloud
nx9500-6C8809(config-app-group-amazon)#no description
```

The following example displays the application-group 'amazon' configuration after the execution of 'no' commands:

```
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
  application amazon-prime-music
  application amazon-prime-video
  application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

4.1.24 application-policy

► *Global Configuration Commands*

The following table lists the commands that enable you to enter the Application policy configuration mode:

Table 4.6 *Application-Policy Config Command*

| Command | Description | Reference |
|---|---|------------------|
| <i>application-policy</i> | Creates an application policy and enters its configuration mode | <i>page 4-56</i> |
| <i>application-policy-mode commands</i> | Summarizes the application policy configuration mode commands | <i>page 4-58</i> |

4.1.24.1 application-policy

▶ *application-policy*

When an application is recognized and classified by the WiNG application recognition engine, administrator defined actions can be applied to that specific application. An application policy defines the rules or actions executed on recognized applications (for example, Facebook) or application-categories (for example, social-networking). The following are the rules/actions that can be applied in an application policy:

- *Allow* - Allow packets for a specific application or application category
- *Deny* - Deny packets for a a specific application or application category
- *Mark* - Mark packets with DSCP/8021p value for a specific application or application category
- *Rate-limit* - Rate limit packets from specific application types.

For each rule defined, a precedence is assigned to resolve conflicting rules for applications and categories. A *deny* rule is exclusive, as no other action can be combined with a deny. An *allow* rule is redundant with other actions, since the default action is allow. An allow rule is useful when wanting to deny packets for a category, but wanting to allow a few applications in the same category to proceed. In such a cases, add an allow rule for applications with a higher precedence then a deny rule for that category.

Mark actions mark packets for a recognized application and category with DSCP/8021p values used for QoS. *Rate-limits* create a rate-limiter applied to packets recognized for an application and category. Ingress and egress rates need to be specified for the rate-limiter, but both are not required. Mark and rate-limit are the only two actions that can be combined for an application and category. All other combinations are invalid.

Once created and configured, apply the application policy at the following levels within the network to enforce application assurance:

- RADIUS CoA usage – In the device/profile configuration mode, use the *application-policy > radius > <APPLICATION-POLICY-NAME>* command to apply the policy to every user successfully authenticated by the RADIUS server.
- User role – In the role-policy-user-role configuration mode, use the *use > application-policy <APPLICATION-POLICY-NAME>* command to apply the policy to all users assigned to the role.
- WLAN – In the WLAN configuration mode, use the *use > application-policy <APPLICATION-POLICY-NAME>* command to apply the policy to all users accessing the WLAN.
- Bridge VLAN – In the bridge VLAN configuration mode, use the *use > application-policy <APPLICATION-POLICY-NAME>* command to apply the policy for the traffic corresponding to the bridged VLAN.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
application-policy <APPLICATION-POLICY-NAME>
```

Parameters

- application-policy <APPLICATION-POLICY-NAME>

| | |
|---|--|
| application-policy <APPLICATION-POLICY-NAME> | Specify the application policy name. If an application policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length. |
|---|--|

Example

```

nx9500-6C8809(config)#application-policy TestAppliPolicy
nx9500-6C8809(config-app-policy-TestAppliPolicy)#?
Application Policy Mode commands:
  allow          Allow packets
  deny           Deny packets
  description    Application policy description
  enforcement-time Configure policy enforcement based on time
  logging        Application recognition logging
  mark           Mark packets
  no             Negate a command or set its defaults
  rate-limit     Rate-limit packets

  clrscr        Clears the display screen
  commit        Commit all changes made in this session
  do            Run commands from Exec mode
  end           End current mode and change to EXEC mode
  exit          End current mode and down to previous mode
  help         Description of the interactive help system
  revert        Revert changes
  service       Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

nx9500-6C8809(config-app-policy-TestAppliPolicy)#

```

Related Commands

| | |
|-----------|--|
| <i>no</i> | Removes an existing application policy |
|-----------|--|

4.1.24.2 application-policy-mode commands

▶ *application-policy*

The following table summarizes Application policy configuration mode commands:

Table 4.7 *Application- Policy-Mode Commands*

| Command | Description | Reference |
|-------------------------|---|------------------|
| <i>allow</i> | Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied | <i>page 4-59</i> |
| <i>deny</i> | Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied | <i>page 4-62</i> |
| <i>description</i> | Configures a brief description for this application policy that enables you to differentiate it from other application policies | <i>page 4-65</i> |
| <i>enforcement-time</i> | Configures an enforcement time period in days and hours for this application policy. The policy is enforced only during the specified time period. | <i>page 4-66</i> |
| <i>logging</i> | Enables logging of application recognition hits made by the DPI engine. It also sets the logging level. | <i>page 4-68</i> |
| <i>mark</i> | Creates a mark rule and configures the match criteria based on which packets are filtered and marked with 802.1p priority value or <i>Differentiated Service Code Point</i> (DSCP) code | <i>page 4-70</i> |
| <i>rate-limit</i> | Creates a rate-limit rule and configures the match criteria based on which incoming and outgoing packets are filtered and the configured rate limits applied | <i>page 4-73</i> |
| <i>no</i> | Removes or resets this application policy's settings | <i>page 4-76</i> |

4.1.24.2.1 allow

► *application-policy-mode commands*

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

- allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
 - schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)

| | |
|---|--|
| allow | Creates an allow rule and configures the match criteria. The options are app-category and application. |
| app-category [<APP-CATEGORY-NAME> all] | <p>Uses application category as the match criteria</p> <ul style="list-style-type: none"> • <APP-CATEGORY-NAME> - Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system forwards the packet or else drops it. • all - The system forwards all packets irrespective of the application category. |
| application <APPLICATION-NAME> | <p>Uses application name as the match criteria</p> <ul style="list-style-type: none"> • <APPLICATION-NAME> - Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system forwards the packet. <p>The WiNG database provides approximately 381 canned applications. In addition to these, the database also includes custom-made applications. These are application definitions created using the <i>application</i> command.</p> |
| schedule <SCHEDULE-POLICY-NAME> | <p>Schedules an enforcement time for this allow rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> • schedule <SCHEDULE-POLICY-NAME> - Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy > enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). <p>Contd..</p> |

| | |
|--------------------|--|
| | <ul style="list-style-type: none"> • <SCHEDULE-POLICY-NAME> - Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time.</p> |
| precedence <1-256> | <p>Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</p> <p>Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>.</p> <p>The action required is: Allow <i>youtube</i> packets and deny all other applications belonging to app-category <i>streaming</i>.</p> <p>The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p> |

Example

The following example shows how to view all built-in, system provided applications:

```
nx9500-6C8809(config-app-policy-test)#allow application [TAB]
Display all 366 possibilities? (y or n)
1-clickshare-com          1-upload-com
1-upload-to              10upload-com
123upload-pl            139pan-com
163pan-com              1clickshare-net
1fichier-com            1kxun
2channel                2gis
2shared-com             360mobile
4fastfile-com           4share-ws
Dota\ 2                 EA\ Origin
--More--
nx9500-6C8809(config-app-policy-test)#
```

The following examples show two *allow* rules, allowing access to all packets belonging to the *application category* 'business' and the *application* 'Bing':

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bi [TAB]
Bing                    BitTorrent                BitTorrent_encrypted
BitTorrent_plain        BitTorrent_uTP            BitTorrent_uTP_encrypted
nx9500-6C8809(config-app-policy-Bing)#
```

Note: Bing is not one of the WiNG built-in database applications. It is a customized application created using the *application* command.

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
```

```

nx9500-6C8809(config-app-policy-Bing)#allow app-category [TAB]
all          antivirus\ update      audio
business    conference             custom
database     filetransfer             gaming
generic       im                    mail
mobile        network\ management         other
p2p          remote_control             social\ networking
standard     streaming                  tunnel
video        voip                       web
nx9500-6C8809(config-app-policy-Bing)#

```

```

nx9500-6C8809(config-app-policy-Bing)#allow app-category business precedence 2

```

```

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
allow application Bing precedence 1
allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#

```

The following example shows an application policy 'SocialNet' having an allow rule with an associated schedule policy named 'FaceBook':

```

nx9500-6C8809(config-app-policy-SocialNet)#allow application facebook schedule
Facebook precedence 1

nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
description "This application policy relates to Social Networking sites."
allow application facebook schedule FaceBook precedence 1
nx9500-6C8809(config-app-policy-SocialNet)#

```

The schedule policy 'FaceBook' configuration is as follows. As per this policy, the above allow rule will apply to all FaceBook packets every Friday between 13:00 and 18:00 hours.

```

nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
description "Allows FaceBook traffic on Fridays."
time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#

```

Related Commands

| | |
|-----------|---|
| <i>no</i> | Removes this allow rule from the application policy |
|-----------|---|

4.1.24.2.2 deny

► *application-policy-mode commands*

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

Parameters

```
• deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

| | |
|--|---|
| deny | Creates a deny rule and configures the match criteria. The options are app-category and application. |
| app-category [<APP-CATEGORY-NAME> all] | <p>Uses application category as the match criteria</p> <ul style="list-style-type: none"> • <APP-CATEGORY-NAME> - Specify the application category name. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system drops the packet. • all - The system drops all packets irrespective of the application category. |
| application <APPLICATION-NAME> | <p>Uses application name as the match criteria</p> <ul style="list-style-type: none"> • <APPLICATION-NAME> - Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system drops the packet. <p>There are approximately some 381 canned applications in the database. In addition to these, the database displays custom-made applications also. These are application definitions created using the application command.</p> |
| schedule <SCHEDULE-POLICY-NAME> | <p>Schedules an enforcement time for this deny rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> • schedule <SCHEDULE-POLICY-NAME> - Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy > enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all'). <p>Contd..</p> |

| | |
|--------------------|---|
| | <ul style="list-style-type: none"> <SCHEDULE-POLICY-NAME> - Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule. <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see enforcement-time.</p> |
| precedence <1-256> | <p>Assigns a precedence value for this deny rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</p> <p>Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>.</p> <p>The action required is: Allow <i>youtube</i> packets and deny all other applications belonging to app-category <i>streaming</i>.</p> <p>The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p> |

Example

The following example shows one *deny* rule, denying access to all packets belonging to the application category 'social\ networking':

```
nx9500-6C8809(config-app-policy-Bing)#deny app-category social\ networking
precedence 3

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

The following example displays the schedule policy 'DenyS-N' settings. The time-rule defined in the policy is *all weekdays from 9:30 AM to 11:30 PM*.

```
nx9500-6C8809(config-schedule-policy-DenyS-N)#show context
schedule-policy DenyS-N
description "Denies all social Networking sites on weekdays."
time-rule days weekdays start-time 09:30 end-time 23:30
nx9500-6C8809(config-schedule-policy-DenyS-N)#
```

The following example displays the schedule policy 'FaceBook' settings. The time-rule defined in the policy is *Friday from 1:00 PM to 6:00 PM*.

```
nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
description "Allows FaceBook traffic on Fridays."
time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#
```

The following example shows an application policy 'SocialNet' defining an *allow* and *deny* rule. Both rules have different enforcement time, which is defined by their respective schedule policies (DentS-N and FaceBook). As per these two schedule policy settings, this application policy:

- Denies all social\ networking sites on weekdays (barring Fridays between 1:00 PM to 6:00 PM) from 9:30 AM to 11:30 PM.

On Fridays, between 1:00 PM to 6:00 PM, it:

- Denies all social\ networking sites except Facebook.
- ```
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
description "This application policy relates to Social Networking sites."
allow application facebook schedule FaceBook precedence 1
deny app-category "social networking" schedule DenyS-N precedence 2
nx9500-6C8809(config-app-policy-SocialNet)#
```

### 4.1.24.2.3 description

#### ▶ *application-policy-mode commands*

Configures a brief description for this application policy that enables you to differentiate it from other application policies

#### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
description <LINE>
```

#### Parameters

- description <LINE>

|                    |                                                                               |
|--------------------|-------------------------------------------------------------------------------|
| description <LINE> | Configures this application policy's description                              |
|                    | • <LINE> - Specify a brief description not exceeding 80 characters in length. |

#### Example

```

nx9500-6C8809(config-app-policy-Bing)#description "This application policy allows
Bing search engine packets"

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#

```

#### Related Commands

|-----------|-----------------------------------------------|
| <i>no</i> | Removes this application policy's description |
|-----------|-----------------------------------------------|

#### 4.1.24.2.4 enforcement-time

##### ▶ *application-policy-mode commands*

Configures an enforcement time period in days and hours for this application policy. The enforcement time is applicable only to those rules, within the application policy, that do not have a schedule policy associated. By default an application policy is enforced on all days.

**NOTE:** Schedule policies are a means of enforcing allow/deny/mark/rate-limit rules at different time periods. If no schedule policy is applied, all rules within an application policy are enforced at the time specified using this enforcement-time command. For more information on configuring a schedule policy, see *schedule-policy*.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|
saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

#### Parameters

- enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>enforcement-time days</p>                               | <p>Enforces this application policy on only on the days specified here</p> <ul style="list-style-type: none"> <li>• sunday – Enforces the policy only on Sundays</li> <li>• monday – Enforces the policy only on Mondays</li> <li>• tuesday – Enforces the policy only on Tuesdays</li> <li>• wednesday – Enforces the policy only on Wednesdays</li> <li>• thursday – Enforces the policy only on Thursdays</li> <li>• friday – Enforces the policy only on Fridays</li> <li>• saturday – Enforces the policy only on Saturdays</li> <li>• all – Enforces the policy on all days. This is the default setting.</li> <li>• weekends – Enforces the policy only on weekends</li> <li>• weekdays – Enforces the policy only on weekdays</li> </ul> <p>In case no enforcement time is specified, the application policy is enforced on all days (i.e., always active).</p> <p>If using schedule policies with the allow/deny/mark/rate-limit rules, the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting of 'all').</p> |
| <p>start-time &lt;HH:MM&gt;<br/>end-time &lt;HH:MM&gt;</p> | <p>Optional. Configures this application policy's enforcement period</p> <ul style="list-style-type: none"> <li>• start-time – Configures the start time. This is the time at which the application policy enforcement begins.</li> <li>• end-time – Configures the end time. This is the time at which the application policy enforcement ends.</li> <li>• &lt;HH:MM&gt; – Specify the start and end time in the HH:MM format.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Example**

```
nx9500-6C8809(config-app-policy-Bing)#enforcement-time days weekdays start-time
10:30 end-time 20:00

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 10:30 end-time 20:00

### 4.1.24.2.5 logging

#### ▶ *application-policy-mode commands*

Enables DPI application recognition logging. It also sets the logging level.

DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
logging [level|on]
```

```
logging on
```

```
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

#### Parameters

- logging on

|                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging on                                                                                                                                                        | Enables logging of application recognition hits made by the DPI engine. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <ul style="list-style-type: none"> <li>• logging level [&lt;0-7&gt; alerts critical debugging emergencies errors informational notifications warnings]</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| logging level<br>[<0-7> alerts <br>critical debugging <br>emergencies errors <br>informational <br>notifications <br>warnings]                                    | <p>Sets the logging level for application recognition hits made by the DPI engine. This option is disabled by default.</p> <ul style="list-style-type: none"> <li>• &lt;0-7&gt; – Sets the message logging severity level on a scale of 0 - 7</li> <li>• emergencies – Severity level 0: System is unusable</li> <li>• alerts – Severity level 1: Requires immediate action</li> <li>• critical – Severity level 2: Critical conditions</li> <li>• errors – Severity level 3: Error conditions</li> <li>• warnings – Severity level 4: Warning conditions</li> <li>• notifications – Severity level 5: Normal but significant conditions (this is the default setting)</li> <li>• informational – Severity level 6: Informational messages</li> <li>• debugging – Severity level 7: Debugging messages</li> </ul> |

**Example**

```
nx9500-6C8809(config-app-policy-Bing)#logging level critical

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

**Related Commands**

|           |                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Resets the logging level to default (notifications). And the <i>no &gt; logging &gt; on</i> command disables DPI logging. |
|-----------|---------------------------------------------------------------------------------------------------------------------------|

#### 4.1.24.2.6 mark

##### ▶ *application-policy-mode commands*

Creates a mark rule and configures the match criteria based on which packets are marked

Marks packets, matching a specified set of application categories or applications/protocols, with 802.1p priority level or *Differentiated Services Code Point (DSCP) type of service (ToS)* code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
[8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

#### Parameters

- mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] [8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mark                                   | Creates a mark rule and configures the match criteria. When applied, the rule marks packets, matching the criteria configured here, with 802.1p priority value or DSCP code. The match criteria options are: app-category and application.                                                                                                                                                                                                                                                                                                                                                                                                   |
| app-category [<APP-CATEGORY-NAME> all] | Uses application category as the match criteria <ul style="list-style-type: none"> <li>• &lt;APP-CATEGORY-NAME&gt; - Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system marks the packet.</li> <li>• all - The system marks all packets irrespective of the application category.</li> </ul> |
| application <APPLICATION-NAME>         | Uses application name as the match criteria <ul style="list-style-type: none"> <li>• &lt;APPLICATION-NAME&gt; - Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system marks the packet.</li> </ul> <p>The WiNG database provides approximately 381 canned applications. In addition to these, the database includes custom-made applications. These are application definitions created using the <i>application</i> command.</p>                                                                                                                      |
| 8021p <0-7>                            | Marks packets matching the specified criteria with 802.1p priority value <ul style="list-style-type: none"> <li>• &lt;0-7&gt; - Specify a value from 0 - 7.</li> </ul> <p>The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet's MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.</p>                                                              |

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dscp <0-63>                        | <p>Marks packets matching the specified criteria with DSCP ToS code</p> <ul style="list-style-type: none"> <li>• &lt;0-63&gt; – Specify a value from 0 - 63.</li> </ul> <p>The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet's IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| schedule<br><SCHEDULE-POLICY-NAME> | <p>Schedules an enforcement time for this mark rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> <li>• schedule &lt;SCHEDULE-POLICY-NAME&gt; – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy &gt; enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all').</li> <li>• &lt;SCHEDULE-POLICY-NAME&gt; – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</li> </ul> <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see <a href="#">enforcement-time</a>.</p> |
| precedence <1-256>                 | <p>Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</p> <p>Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>.</p> <p>The action required is: Allow <i>youtube</i> packets and deny all other applications belonging to app-category <i>streaming</i>.</p> <p>The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p>                                                                                                                                                                                                                                                                    |

**Example**

```

nx9500-6C8809(config-app-policy-Bing)#mark app-category video dscp 9 precedence 4
nx9500-6C8809(config-app-policy-Bing)#mark application facetime dscp 10 precedence
5

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
logging level critical
nx9500-6C8809(config-app-policy-Bing)#

```

#### 4.1.24.2.7 rate-limit

##### ► *application-policy-mode commands*

Creates a rate-limit rule and configures the match criteria

##### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] ([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

##### Parameters

```
• rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] ([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rate-limit                             | Creates a rate-limit rule and configures the match criteria. When applied, the rule applies a rate-limit to packets that match the criteria configured here. These packets could be incoming, outgoing, or both. The match criteria options are: app-category and application.                                                                                                                                                                                                                                                                                                                                                                                  |
| app-category [<APP-CATEGORY-NAME> all] | <p>Uses application category as the match criteria</p> <ul style="list-style-type: none"> <li>• &lt;APP-CATEGORY-NAME&gt; - Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system rate-limits the packet.</li> <li>• all - The system rate-limits all packets irrespective of the application category.</li> </ul> |
| application <APPLICATION-NAME>         | <p>Uses application name as the match criteria</p> <ul style="list-style-type: none"> <li>• &lt;APPLICATION-NAME&gt; - Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system rate-limits the packet.</li> </ul>                                                                                                                                                                                                                                                                                                                                                           |
| [egress ingress]                       | <p>The egress and ingress parameters are recursive and can be used to rate limit either incoming, outgoing, or both incoming and outgoing traffic.</p> <ul style="list-style-type: none"> <li>• egress - Selects the traffic type as outgoing</li> <li>• ingress - Selects the traffic type as outgoing</li> </ul> <p>After selecting the traffic type (incoming/outgoing) configure the rate and maximum burst size.</p>                                                                                                                                                                                                                                       |

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>schedule<br/>&lt;SCHEDULE-POLICY-NAME&gt;</p> | <p>Schedules an enforcement time for this rate-limit rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> <li>• schedule &lt;SCHEDULE-POLICY-NAME&gt; - Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy &gt; enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all').</li> <li>• &lt;SCHEDULE-POLICY-NAME&gt; - Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</li> </ul> <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see <a href="#">enforcement-time</a>.</p> |
| <p>precedence &lt;1-256&gt;</p>                  | <p>Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</p> <p>Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>.<br/>The action required is: Allow <i>youtube</i> packets and deny all other applications belonging to app-category <i>streaming</i>.</p> <p>The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p>                                                                                                                                                                                                                                                                             |

**Example**

```

nx9500-6C8809(config-app-policy-Bing)#rate-limit application BGP ingress rate 100
max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-
burst-size 25 precedence 6
logging level critical

nx9500-6C8809(config-app-policy-Bing)#

```

**Related Commands**

|           |                                                          |
|-----------|----------------------------------------------------------|
| <i>no</i> | Removes this rate-limit rule from the application policy |
|-----------|----------------------------------------------------------|

#### 4.1.24.2.8 no

► *application-policy-mode commands*

Removes or resets this application policy's settings

#### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [allow|deny|description|enforcement-time|logging|mark|rate-limit]

no allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
precedence <1-256>

no deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
precedence <1-256>

no description

no enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|
saturday|all|weekends|weekdays]

no logging [level|on]

no mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
precedence <1-256>

no rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-
NAME>] precedence <0-256>
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this application policy settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------------|

#### Example

The following example shows the application policy 'Bing' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-
burst-size 25 precedence 6
logging level critical

nx9500-6C8809(config-app-policy-Bing)#

nx9500-6C8809(config-app-policy-Bing)#no allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#no deny app-category social\ networking
precedence 3
```

The following example shows the application policy 'Bing' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 12:30 end-time 20:00
 allow application Bing precedence 1
 mark app-category video dscp 9 precedence 4
 mark application facetime dscp 10 precedence 5
 rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-
burst-size 25 precedence 6
 logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

## 4.1.25 association-acl-policy

### ► Global Configuration Commands

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>
```

#### Parameters

- association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

|                               |                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------|
| <ASSOCIATION-ACL-POLICY-NAME> | Specify the association ACL policy name. If the policy does not exist, it is created. |
|-------------------------------|---------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#association-acl-policy test
rfs6000-81742D(config-assoc-acl-test)#?
Association ACL Mode commands:
deny Specify MAC addresses to be denied
no Negate a command or set its defaults
permit Specify MAC addresses to be permitted

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs6000-81742D(config-assoc-acl-test)#
```

#### Related Commands

|           |                                    |
|-----------|------------------------------------|
| <i>no</i> | Resets values or disables commands |
|-----------|------------------------------------|

**NOTE:** For more information on the association-acl-policy, see [Chapter 10, ASSOCIATION-ACL-POLICY](#).

## 4.1.26 auto-provisioning-policy

### ► Global Configuration Commands

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>
```

#### Parameters

- auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

|                                                    |                                                                                         |
|----------------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>&lt;AUTO-PROVISIONING-POLICY-NAME&gt;</code> | Specify the auto provisioning policy name. If the policy does not exist, it is created. |
|----------------------------------------------------|-----------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#auto-provisioning-policy test
rfs6000-81742D(config-auto-provisioning-policy-test)#?
Auto-Provisioning Policy Mode commands:
 Auto-Provisioning Policy Mode commands:
 adopt Add rule for device adoption
 auto-create-rfd-template When RF Domain specified by the matching rule
 template does not exist create new RF Domain
 automatically
 default-adoption Adopt devices even when no matching rules are
 found. Assign default profile and default
 rf-domain
 deny Add rule to deny device adoption
 evaluate-always Set the flag to evaluate the policy everytime,
 regardless of previous adoption status
 no Negate a command or set its defaults
 redirect Add rule to redirect device adoption
 upgrade Add rule for device upgrade

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-auto-provisioning-policy-test)#
```

#### Related Commands

|                 |                                              |
|-----------------|----------------------------------------------|
| <code>no</code> | Removes an existing Auto Provisioning policy |
|-----------------|----------------------------------------------|

**NOTE:** For more information on the auto-provisioning-policy, see *Chapter 9, AUTO-PROVISIONING-POLICY*.

## 4.1.27 bgp

### ► Global Configuration Commands

Configures *Border Gateway Protocol* (BGP) settings

BGP is an inter-ISP routing protocol which establishes routing between *Internet Service Providers* (ISPs). ISPs use BGP to exchange routing and reachability information between *Autonomous Systems* (AS) on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use *Interior Gateway Protocol* (IGP) and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a *graceful* close (all outstanding data is delivered before the connection is closed).

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list]
<LIST-NAME>
```

#### Parameters

```
• bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-
list] <LIST-NAME>
```

## 4.1.28 bonjour-gateway-discovery-policy

### ► *Global Configuration Commands*

The following table lists the commands that allows you to create a Bonjour Gateway Discovery Policy:

**Table 4.8** *Bonjour-Gateway-Discovery Config Commands*

| Command                                               | Description                                                                  | Reference        |
|-------------------------------------------------------|------------------------------------------------------------------------------|------------------|
| <i>bonjour-gw-discovery-policy</i>                    | Creates a Bonjour Gateway Discovery policy and enters its configuration mode | <i>page 4-84</i> |
| <i>bonjour-gateway-discovery-policy-mode commands</i> | Summarizes Bonjour Gateway Discovery policy configuration mode commands      | <i>page 4-86</i> |

### 4.1.28.1 bonjour-gw-discovery-policy

#### ► *bonjour-gateway-discovery-policy*

Bonjour is Apple's zero-configuration networking (Zeroconf) implementation. Bonjour enables automatic IP address assignment, name to address resolution, and service discovery without having to configure a DHCP server, DNS server, and Directory server. When configured and applied on a WLAN, the Bonjour Gateway Discovery policy queries for and locates Bonjour devices (printers, computers, file-sharing servers, etc.) and services these computers provide over a local network. Bonjour works only within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

Use this command to configure a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access points, wireless controllers, or service platforms.

When configured and applied, this feature enables discovery of Bonjour services on local and/or tunneled VLANs.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

#### Parameters

- `bonjour-gw-discovery-policy <POLICY-NAME>`

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;POLICY-NAME&gt;</code> | <p>Specify the Bonjour GW Discovery policy name. If the policy does not exist, it is created. In the Bonjour GW Discovery policy configuration mode, use the <code>allow-service</code> keyword to configure the services that the Bonjour gateway is allowed to discover. A maximum of 16 (sixteen) service rules can be created. Optionally, you can restrict this facility for users on specific VLANs. To do so, specify the VLAN IDs.</p> <p>Execute the <code>bonjour-gw-forwarding-policy</code> command to enable forwarding of Bonjour service responses across VLANs.</p> <p>To associate a Bonjour GW Discovery policy with a WLAN, in the WLAN configuration mode, execute the following command: <code>use &gt; bonjour-gw-discovery-policy &gt; &lt;POLICY-NAME&gt;</code>. For more information, see <a href="#">use</a>.</p> <p>To associate a Bonjour GW Discovery policy with a VLAN, in the interface VLAN configuration mode, execute the following command: <code>use &gt; bonjour-gw-discovery-policy &gt; &lt;POLICY-NAME&gt;</code>. For more information, see <a href="#">use</a>.</p> <p>To associate a Bonjour GW Discovery policy with a user role, in the role-policy - user-role - configuration mode, execute the following command: <code>use &gt; bonjour-gw-discovery-policy &gt; &lt;POLICY-NAME&gt;</code>. For more information, see <a href="#">use</a>.</p> |

### 4.1.28.2 bonjour-gateway-discovery-policy-mode commands

► *bonjour-gateway-discovery-policy*

The following table summarizes the Bonjour Gateway Discovery Policy configuration mode commands:

**Table 4.9** *Bonjour-Gateway-Discovery-Policy-Mode Commands*

| Command              | Description                                                                                                                                            | Reference        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <i>allow-service</i> | Configures the Bonjour Services that can be discovered on Local or Tunneled VLANs. It configures the local VLANs on which these services can be found. | <i>page 4-87</i> |
| <i>no</i>            | Removes or modifies the Bonjour Gateway Discovery policy settings                                                                                      | <i>page 4-89</i> |

### 4.1.28.2.1 allow-service

#### ► *bonjour-gateway-discovery-policy-mode commands*

Enables discovery of Bonjour devices and the services they provide on Local or Tunneled VLANs

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
allow-service <BONJOUR-SERVICE-NAME> [local|tunneled]
```

```
allow-service <BONJOUR-SERVICE-NAME> local {instance-name contains <WORD>}
({service-vlans <WORD>})
```

```
allow-service <BONJOUR-SERVICE-NAME> tunneled {instance-name contains <WORD>}
```

#### Parameters

- allow-service <BONJOUR-SERVICE-NAME> local {instance-name contains <WORD>}
 ({service-vlans <WORD>})

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow-service<br><BONJOUR-<br>SERVICE-NAME> | Configures the services that can be discovered by the Bonjour gateway. And also configures the VLANs on which the selected services can be discovered. <ul style="list-style-type: none"> <li>• &lt;BONJOUR-SERVICE-NAME&gt; - You can either select the Bonjour services from a set of system-provided, pre-defined Apple services, or use an existing alias to define a service not available in the predefined list.</li> </ul> <p>The predefined Apple services available are: Afp, AirPlay, AirPort, AirPrint, AirTunes, AppleTimeMachine, Chromecast, Daap, HomeSharing, Printer, and Scanner.</p> <p>Use the &lt;WORD&gt; keyword to define a service not included in the system-provided, pre-defined list. Ensure this device is registered with the <i>Multicast DNS Responder</i> (mDNSResponder).</p>                                                                                                                                                                                                   |
| local                                       | Select to enable the discovery of the selected Bonjour Services on the local VLAN                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| instance-name<br>contains <WORD>            | Optional. Specifies the selected Bonjour service's instance name. When specified, the Bonjour service discovery queries contain the instance name. of the service to be discovered. <p>This option is useful especially in large distributed, enterprise networks. Use it to create different instances of a Bonjour service for the different organizations or departments (VLANs) within your network. Creating instances allows you to advertise specific service instances for a specific set of VLANs, instead of advertising top-level Bonjour Services to various allocated VLAN(s).</p> <ul style="list-style-type: none"> <li>• contains &lt;WORD&gt; - Specify the instance name. You can either directly specify the string value to be used as a match criteria, or use a string alias (for example, \$BONJOUR-STRING) to identify the string to match. If using a string alias, ensure that it is existing and configured. For information on configuring a string alias, see <i>alias</i>.</li> </ul> |
| service-vlans<br><WORD>                     | Optional. Configures a VLAN or a list of VLANs on which the selected service is discoverable. When specified, Bonjour discovery queries are delivered to all clients on the specified VLANs. Applicable only if enabling Bonjour Services discovery on local VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- `allow-service <BONJOUR-SERVICE-NAME> tunneled {instance-name contains <WORD>}`

|                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <code>allow-service &lt;BONJOUR-SERVICE-NAME&gt;</code> | <p>Configures the services that can be discovered by the Bonjour gateway. And also configures the VLANs on which the selected services can be discovered.</p> <ul style="list-style-type: none"> <li>• <code>&lt;BONJOUR-SERVICE-NAME&gt;</code> - You can either select the Bonjour Services from a set of system-provided, pre-defined Apple services, or use an existing alias to define a service not available in the predefined list.</li> </ul> <p>The predefined Apple services available are: Afp, AirPlay, AirPort, AirPrint, AirTunes, AppleTimeMachine, Chromecast, Daap, HomeSharing, Printer, and Scanner.</p> <p>Use the <code>&lt;WORD&gt;</code> keyword to define a service not included in the system-provided, predefined list.</p>                                                                                                                           |
| <code>tunneled</code>                                   | <p>Select to enable the discovery of the selected Bonjour Services on tunneled VLANs</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>instance-name contains &lt;WORD&gt;</code>        | <p>Optional. Adds a Bonjour Service instance name. If you have a large enterprise network, use this option to create different Bonjour Service instances for the different organizations or departments (VLANs) within your network. Creating instances allows you to advertise specific service instances for a specific set of VLANs, instead of advertising top-level Bonjour Services to various allocated VLAN(s).</p> <ul style="list-style-type: none"> <li>• <code>contains &lt;WORD&gt;</code> - Specify the sub-string to match. You can either directly specify the string value to be used as a match criteria, or use a string alias (for example, <code>\$BONJOUR-STRING</code>) to identify the string to match. If using a string alias, ensure that it is existing and configured. For information on configuring aliases, see <a href="#">alias</a>.</li> </ul> |

**Example**

```

nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#allow-service Printer local instance-name contains $Bonjour_Service service-vlans 1,2

```

```

nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
 allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#

```

Following example configures the string alias named `$Bonjour_Service`:

```

nx9500-6C8809(config)#alias string $Bonjour_Service admin
nx9500-6C8809(config)#commit
nx9500-6C8809(config)#show context include-factory | include alias string
alias string $Bonjour_Service admin
nx9500-6C8809(config)#

```

|-----------------|---------------------------------------------------------------------------|
| <code>no</code> | <p>Removes or modifies this Bonjour Gateway Discovery Policy settings</p> |
|-----------------|---------------------------------------------------------------------------|

### 4.1.28.2.2 no

#### ► *bonjour-gateway-discovery-policy-mode commands*

Removes or modifies the Bonjour Gateway Discovery policy settings

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no allow-service <BONJOUR-SERVICE-NAME> [local|tunneled] {service-vlans <WORD>}
```

#### Parameters

- no allow-service <BONJOUR-SERVICE-NAME> [local|tunneled] {service-vlans <WORD>}

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| no <parameters> | Removes allow-service rules in the selected Bonjour GW Discovery policy, based on the parameters passed |
|-----------------|---------------------------------------------------------------------------------------------------------|

#### Example

The following example shows the Bonjour GW Discovery policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains
 $Bonjour_Service
 allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
```

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test1)#no allow-service Afp
local
```

The following example shows the Bonjour GW Discovery policy 'test' settings after the 'no' command was executed:

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains
 $Bonjour_Service
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
```

## 4.1.29 bonjour-gw-forwarding-policy

### ► Global Configuration Commands

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
bonjour-gw-forwarding-policy <POLICY-NAME>
```

#### Parameters

- `bonjour-gw-forwarding-policy <POLICY-NAME>`

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;POLICY-NAME&gt;</code> | <p>Specify the Bonjour GW Forwarding policy name. If the policy does not exist, it is created.</p> <p>To receive Bonjour service responses from specific VLANs, specify the VLAN IDs. In the Bonjour GW Forwarding policy configuration mode, provide a list of VLAN IDs from which Bonjour responses can be received (format: 10-20, 25, 30-35). And then specify the list of client VLANs that can access Bonjour services.</p> <p>Execute the <code>bonjour-gw-discovery-policy</code> command to define the Bonjour services allowed on local and tunneled VLANs.</p> <p>To associate a Bonjour GW Forwarding policy with a device or profile, in the profile/device configuration mode, execute the <code>use &gt; bonjour-gw-forwarding-policy &gt; &lt;POLICY-NAME&gt;</code> command. For more information, see <a href="#">use</a>.</p> |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```

 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-bonjour-gw-forwarding-policy-TestPolicy)#
```

**Related Commands**

---

*no*Removes an existing Bonjour GW Forwarding policy

---

## 4.1.30 bonjour-gw-query-forwarding-policy

### ► Global Configuration Commands

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
bonjour-gw-query-forwarding-policy <POLICY-NAME>
```

#### Parameters

- `bonjour-gw-query-forwarding-policy <POLICY-NAME>`

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;POLICY-NAME&gt;</code> | <p>Specify the Bonjour GW Query Forwarding policy name. If the policy does not exist, it is created.</p> <p>In the Bonjour GW Query Forwarding policy configuration mode, specify the 'from' and 'to' VLAN(s). The <i>from-vlans</i> option configures the VLAN(s) that are the source of the Bonjour queries. The <i>to-vlans</i> option configures the destination VLAN(s) that can access the Bonjour queries.</p> <p>To associate a Bonjour GW Query Forwarding policy with a device or profile, in the profile/device configuration mode, execute the <i>use &gt; bonjour-gw-query-forwarding-policy &gt; &lt;POLICY-NAME&gt;</i> command. For more information, see <i>use</i>.</p> |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#bonjour-gw-query-forwarding-policy TestPolicy
rfs6000-81742D(config-bonjour-gw-query-forwarding-policy-test)#?
(config-bonjour-gw-query-forwarding-policy) commands:
 forward-bonjour-query Forwards bonjour query across vlans
 no Negate a command or set its defaults

## 4.1.31 captive portal

### ► *Global Configuration Commands*

The following table lists the commands that enable you to create a new captive portal policy and enter its configuration mode:

**Table 4.10** *Captive-Portal Config Commands*

| Command                             | Description                                                    | Reference        |
|-------------------------------------|----------------------------------------------------------------|------------------|
| <i>captive-portal</i>               | Creates a new captive portal and enters its configuration mode | <i>page 4-94</i> |
| <i>captive-portal-mode commands</i> | Summarizes captive portal configuration commands               | <i>page 4-96</i> |

### 4.1.31.1 captive-portal

#### ► *captive portal*

Configures a captive portal policy and enters its configuration mode. Once created and configured, use the captive portal policy in the WLAN context, and in the device/profile contexts of the access point or controller hosting the captive portal server.

A captive portal provides secure access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the wireless network. Once logged into the captive portal, additional Acknowledgment, Agreement, Welcome, No Service, and Fail pages provide the administrator options to customize the screen flow and user appearance.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a data center.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
captive-portal <CAPTIVE-PORTAL-NAME>
```

#### **Parameters**

- `captive-portal <CAPTIVE-PORTAL-NAME>`

|                       |                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| <CAPTIVE-PORTAL-NAME> | Specify the captive portal name. If a captive portal with the specified name does not exist, it is created. |
|-----------------------|-------------------------------------------------------------------------------------------------------------|

**Example**

```

rfs6000-81742D(config)#captive-portal test
rfs6000-81742D(config-captive-portal-test)#?
Captive Portal Mode commands:
access-time Allowed access time for the client. Used when
 there is no session time in radius response
access-type Access type of this captive portal
accounting Configure how accounting records are created for
 this captive portal policy
bypass Bypass captive portal
connection-mode Connection mode for this captive portal
custom-auth Custom user information
data-limit Enforce data limit for clients
inactivity-timeout Inactivity timeout in seconds. If a frame is not
 received from client for this amount of time,
 then current session will be removed
ipv6 Internet Protocol version 6 (IPv6)
localization Configure the FQDN address to get the
 localization parameters for the client
logout-fqdn Configure the FQDN address to logout the session
 from client
no Negate a command or set its defaults
oauth OAuth 2.0 authentication configuration
php-helper Configure the captive portal to use a server for
 help with php
post-authentication-vlan Configure post authentication vlan for captive
 portal users
radius-vlan-assignment Enable radius vlan assignment for captive portal
 users
redirection Configure connection redirection parameters
report-loyalty-application Report customer loyalty application presence in
 clients
server Configure captive portal server parameters
simultaneous-users Particular username can only be used by a
 certain number of MAC addresses at a time
terms-agreement User needs to agree for terms and conditions
use Set setting to use
webpage Configure captive portal webpage parameters
webpage-auto-upload Enable automatic upload of internal and advanced
 webpages
webpage-location The location of the webpages to be used for
 authentication. These pages can either be hosted
 on the system or on an external web server.
welcome-back Welcome back page settings

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or
 terminal

rfs6000-81742D(config-captive-portal-test)#

```

### 4.1.31.2 captive-portal-mode commands

#### ► *captive portal*

The following table summarizes captive portal configuration mode commands:

**Table 4.11** *Captive-Portal-Mode Commands*

| Command                           | Description                                                                                                                                                                             | Reference         |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>access-time</i>                | Defines a client's access time. It is used when no session time is defined in the RADIUS response.                                                                                      | <i>page 4-98</i>  |
| <i>access-type</i>                | Configures a captive portal's access type                                                                                                                                               | <i>page 4-99</i>  |
| <i>accounting</i>                 | Enables a captive portal's accounting records                                                                                                                                           | <i>page 4-100</i> |
| <i>bypass</i>                     | Enables bypassing of captive portal detection requests from wireless clients                                                                                                            | <i>page 4-102</i> |
| <i>connection-mode</i>            | Configures a captive portal's connection mode                                                                                                                                           | <i>page 4-103</i> |
| <i>custom-auth</i>                | Configures custom user information                                                                                                                                                      | <i>page 4-104</i> |
| <i>data-limit</i>                 | Enforces data limit on captive portal clients                                                                                                                                           | <i>page 4-105</i> |
| <i>inactivity-timeout</i>         | Defines an inactivity timeout in seconds                                                                                                                                                | <i>page 4-106</i> |
| <i>ipv6</i>                       | Configures the IPv6 address of the internal captive portal server                                                                                                                       | <i>page 4-107</i> |
| <i>localization</i>               | Configures an FQDN address string that enables the client to receive localization parameters. This command also allows the configuration of a response message.                         | <i>page 4-108</i> |
| <i>logout-fqdn</i>                | Clears the logout FQDN address                                                                                                                                                          | <i>page 4-110</i> |
| <i>no</i>                         | Reverts the selected captive portal's settings to default                                                                                                                               | <i>page 4-111</i> |
| <i>oauth</i>                      | Enables OAuth-based authentication support on the captive portal. When enabled, OAuth allows captive-portal users to sign in to guest WLANs using their Facebook or Google credentials. | <i>page 4-113</i> |
| <i>php-helper</i>                 | Configures a PHP helper to serve the captive portal's PHP splash pages to guest users using social-media to login to the captive portal.                                                | <i>page 4-115</i> |
| <i>post-authentication-vlan</i>   | Assigns a post authentication RADIUS VLAN for this captive portal's users                                                                                                               | <i>page 4-117</i> |
| <i>radius-vlan-assignment</i>     | Assigns a RADIUS VLAN for this captive portal                                                                                                                                           | <i>page 4-118</i> |
| <i>redirection</i>                | Enables redirection of client connections to specified destination ports                                                                                                                | <i>page 4-119</i> |
| <i>report-loyalty-application</i> | Enables detection of captive portal client's <i>loyalty application</i> presence and stores this information in the captive portal's user database                                      | <i>page 4-120</i> |
| <i>server</i>                     | Configures the captive portal server settings                                                                                                                                           | <i>page 4-121</i> |
| <i>simultaneous-users</i>         | Specifies a username used by a MAC address pool                                                                                                                                         | <i>page 4-123</i> |
| <i>terms-agreement</i>            | Enforces the user to agree to terms and conditions (included in login page) for captive portal access                                                                                   | <i>page 4-124</i> |
| <i>use</i>                        | Associates a AAA policy and a DNS whitelist with a captive portal                                                                                                                       | <i>page 4-125</i> |
| <i>webpage</i>                    | Configures captive portal Web page settings                                                                                                                                             | <i>page 4-127</i> |

**Table 4.11** *Captive-Portal-Mode Commands*

| <b>Command</b>                                                         | <b>Description</b>                                                                                                                                                                                                                     | <b>Reference</b>  |
|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>webpage-auto-upload</i>                                             | Enables automatic upload of advanced Web pages on a captive portal                                                                                                                                                                     | <i>page 4-135</i> |
| <i>webpage-location</i>                                                | Specifies the location of Web pages used for captive portal authentication                                                                                                                                                             | <i>page 4-136</i> |
| <i>welcome-back</i>                                                    | Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins                                                                                                                   | <i>page 4-137</i> |
| <i>configuring device registration with dynamic VLAN assignment</i>    | Documents configuration details required to enable device registration with dynamic VLAN assignment in a multi-vendor environment                                                                                                      | <i>page 4-139</i> |
| <i>configuring WeChat Wi-Fi hotspot support in WiNG captive portal</i> | Documents configuration details required to support the WeChat WiFi hotspot, so that WeChat users, on their first connect to a WiNG access point, can automatically authenticate with the WeChat server through an intermediate server | <i>page 4-141</i> |
| <i>configuring ExtremeGuest captive-portal</i>                         | Documents the basic configurations required to deploy an ExtremeGuest setup                                                                                                                                                            | <i>page 4-143</i> |

### 4.1.31.2.1 access-time

#### ▶ *captive-portal-mode commands*

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
access-time <10-10080>
```

#### Parameters

- access-time <10-10080>

|                           |                                                                                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| access-time<br><10-10080> | Defines the duration wireless clients are allowed access to the Internet using this captive portal policy <ul style="list-style-type: none"> <li>• &lt;10-10080&gt; - Specify a value from 10 - 10080 minutes. The default is 1440 minutes.</li> </ul> |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-captive-portal-test)#access-time 35

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 access-time 35
rfs6000-81742D(config-captive-portal-test)#
```

#### Related Commands

|           |                                                             |
|-----------|-------------------------------------------------------------|
| <i>no</i> | Reverts to the default permitted access time (1440 minutes) |
|-----------|-------------------------------------------------------------|

### 4.1.31.2.2 access-type

#### ▶ captive-portal-mode commands

Defines the captive portal's access type. The authentication scheme configured here is applied to wireless clients using this captive portal.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
access-type [custom-auth-radius|logging|no-auth|radius|registration]
```

#### Parameters

- access-type [custom-auth-radius|logging|no-auth|radius|registration]

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| custom-auth-radius | Specifies the custom user information used for authentication (RADIUS lookup of given information, such as name, e-mail address, telephone, etc.). When configured, accessing clients are required to provide a 1-32 character lookup data string used to authenticate their credentials.<br><br>When selecting this option, use the custom-auth command to configure the required user information.                                                 |
| logging            | Provides users access without authentication. The system logs access details of users allowed access.                                                                                                                                                                                                                                                                                                                                                |
| no-auth            | Defines no authentication required for a guest (guest is redirected to welcome message). Provides users access to the captive portal without authentication.                                                                                                                                                                                                                                                                                         |
| radius             | Enables RADIUS authentication for wireless clients. Provides captive portal access to successfully authenticated users only. This is the default setting.                                                                                                                                                                                                                                                                                            |
| registration       | Enables captive portal's clients to self register in the captive portal's database. When configured, a requesting client's user credentials require authentication locally or through social media credential exchange and validation.<br><br>If enabled, use the <i>webpage &gt; internal &gt; registration &gt; field</i> command to customize the registration page. If not customized, the default, built-in registration Web page is displayed. |

#### Example

```
rfs6000-81742D(config-captive-portal-test)#access-type logging

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
rfs6000-81742D(config-captive-portal-test)#
```

#### Related Commands

|           |                                                                       |
|-----------|-----------------------------------------------------------------------|
| <i>no</i> | Removes the captive portal access type or reverts to default (radius) |
|-----------|-----------------------------------------------------------------------|

### 4.1.31.2.3 accounting

#### ▶ *captive-portal-mode commands*

Enables support for accounting messages for this captive portal

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted, etc. Accounting enables tracking of captive portal services consumed by clients.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
accounting [radius|syslog]
```

```
accounting radius
```

```
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-
controller|through-rf-domain-manager]}
```

#### Parameters

- accounting radius

|                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radius                                                                     | Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                                                                            | <ul style="list-style-type: none"> <li>• accounting syslog host &lt;IP/HOSTNAME&gt; {port &lt;1-65535&gt;} {proxy-mode [none through-controller through-rf-domain-manager]}</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| syslog<br>host <IP/<br>HOSTNAME>                                           | Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default. <ul style="list-style-type: none"> <li>• host &lt;IP/HOSTNAME&gt; - Specifies the destination where accounting messages are sent. Specify the destination's IP address or hostname.</li> </ul> |
| port <1-65535>                                                             | Optional. Specifies the syslog server's listener port <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify the UDP port from 1- 65535. The default is 514.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| proxy-mode [none <br>through-controller <br>through-rf-domain-<br>manager] | Optional. Specifies the mode of proxying the syslog server <ul style="list-style-type: none"> <li>• none - Accounting messages are sent directly to the syslog server</li> <li>• through-controller - Accounting messages are sent through the controller configuring the device</li> <li>• through-rf-domain-manager - Accounting messages are sent through the local RF Domain manager</li> </ul>                                                                                                                                                                                                              |

**Example**

```
rfs6000-81742D(config-captive-portal-test)#accounting syslog host 172.16.10.13
port 1

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
access-type logging
access-time 35
accounting syslog host 172.16.10.13 port 1
rfs6000-81742D(config-captive-portal-test)#
```

**Related Commands**

|           |                                                     |
|-----------|-----------------------------------------------------|
| <i>no</i> | Disables accounting records for this captive portal |
|-----------|-----------------------------------------------------|

#### 4.1.31.2.4 bypass

▶ *captive-portal-mode commands*

Enables bypassing of captive portal detection requests from wireless clients

Certain devices, such as Apple IOS devices send *Captive Network Assistant* (CNA) requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
bypass captive-portal-detection
```

##### Parameters

- `bypass captive-portal-detection`

|                                 |                                            |
|---------------------------------|--------------------------------------------|
| bypass captive-portal-detection | Bypasses captive portal detection requests |
|---------------------------------|--------------------------------------------|

##### Example

```
rfs4000-229D58 (config-captive-portal-test)#bypass captive-portal-detection

rfs4000-229D58 (config-captive-portal-test)#show context
captive-portal test
bypass captive-portal-detection
rfs4000-229D58 (config-captive-portal-test)#
```

##### Related Commands

|           |                                                         |
|-----------|---------------------------------------------------------|
| <i>no</i> | Disables bypassing of captive portal detection requests |
|-----------|---------------------------------------------------------|

#### 4.1.31.2.5 connection-mode

##### ▶ *captive-portal-mode commands*

Configures a captive portal's mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same *Uniform Resource Identifier* (URI), so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
connection-mode [http|https]
```

##### Parameters

- connection-mode [http|https]

|       |                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------|
| http  | Sets HTTP as the default connection mode. This is the default setting.                                                                         |
| https | Sets HTTPS as the default connection mode<br>HTTPS is a more secure version of HTTP, and uses encryption while sending and receiving requests. |

##### Example

```
rfs6000-81742D(config-captive-portal-test)#connection-mode https

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 connection-mode https
 accounting syslog host 172.16.10.13 port 1
rfs6000-81742D(config-captive-portal-test)#
```

##### Related Commands

|           |                                               |
|-----------|-----------------------------------------------|
| <i>no</i> | Removes this captive portal's connection mode |
|-----------|-----------------------------------------------|

#### 4.1.31.2.6 custom-auth

##### ▶ *captive-portal-mode commands*

Configures custom user information

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
custom-auth info <LINE>
```

##### Parameters

- custom-auth info <LINE>

|             |                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info <LINE> | Configures information used for RADIUS lookup when custom-auth RADIUS access type is configured <ul style="list-style-type: none"> <li>• &lt;LINE&gt; - Guest data needs to be provided. Specify the name, e-mail address, and telephone number of the user.</li> </ul> |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

##### Example

```
rfs6000-81742D(config-captive-portal-test)#custom-auth info bob
bob@examplecompany.com

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
accounting syslog host 172.16.10.13 port 1
rfs6000-81742D(config-captive-portal-test)#
```

##### Related Commands

|           |                                                                     |
|-----------|---------------------------------------------------------------------|
| <i>no</i> | Removes custom user information configured with this captive portal |
|-----------|---------------------------------------------------------------------|

### 4.1.31.2.7 data-limit

#### ▶ captive-portal-mode commands

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
data-limit <1-102400> {action [log-and-disconnect|log-only]}
```

#### Parameters

- data-limit <1-102400> {action [log-and-disconnect|log-only]}

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data-limit<br><1-102400>                    | Sets a captive portal client's data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer. <ul style="list-style-type: none"> <li>• &lt;1-102400&gt; - Specify a value from 1 - 102400 MB.</li> </ul>                                                                                                                                                                                                                                                                                                 |
| action<br>[log-and-disconnect <br>log-only] | Optional. Specifies the action taken when a client exceeds the configured data limit. The options are: <ul style="list-style-type: none"> <li>• log-and-disconnect - When selected, an entry is added to the log file any time a captive portal client exceeds the data limit, and the client is disconnected.</li> <li>• log-only - When selected, an entry is added to the log file any time a captive portal client exceeds the data limit. the client, however, remains connected to the captive portal. This is the default setting.</li> </ul> |

#### Example

```
rfs6000-81742D(config-captive-portal-test)#data-limit 200 action log-and-
disconnect

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 data-limit 200 action log-and-disconnect
rfs6000-81742D(config-captive-portal-test)#
```

### 4.1.31.2.8 inactivity-timeout

▶ *captive-portal-mode commands*

Defines the inactivity timeout in seconds. If a frame is not received from a client for the specified interval the current session is terminated.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
inactivity-timeout <60-86400>
```

**Parameters**

- `inactivity-timeout <60-86400>`

|            |                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <60-86400> | <p>Defines the interval for which a captive portal session is kept alive without receiving a frame from the client. The session is automatically terminated once this interval is over.</p> <ul style="list-style-type: none"> <li>• &lt;60-86400&gt; - Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.</li> </ul> |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-captive-portal-test)#inactivity-timeout 750

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
accounting syslog host 172.16.10.13 port 1
rfs6000-81742D(config-captive-portal-test)#
```

### 4.1.31.2.9 ipv6

#### ▶ *captive-portal-mode commands*

Configures the internal captive portal server's (running on the centralized mode) IPv6 address. If using centralized server mode, use this option to define the controller, service platform, or access point resource's (hosting the captive portal) IPv6 address. For information on configuring the server mode, see [server](#).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ipv6 server host <IPv6>
```

#### Parameters

- `ipv6 server host <IPv6>`

|                            |                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 server host<br><IPv6> | Configures the IPv6 address of the internal captive portal server <ul style="list-style-type: none"> <li>• &lt;IPv6&gt; – Specify the captive portal server's global IPv6 address.</li> </ul> |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-captive-portal-test2)#ipv6 server host
2001:10:10:10:6d:33:fa:8b
```

```
rfs6000-81742D(config-captive-portal-test2)#show context
captive-portal test2
 access-type OAuth
 ipv6 server host 2001:10:10:10:6d:33:fa:8b
 OAuth client-id Google TechPubs.printer.google.com
rfs6000-81742D(config-captive-portal-test2)#
```

#### Related Commands

|-----------|--------------------------------------------------|
| <i>no</i> | Removes the captive portal server's IPv6 address |
|-----------|--------------------------------------------------|

### 4.1.31.2.10 localization

#### ▶ *captive-portal-mode commands*

Configures an FQDN address string that enables the client to receive localization parameters. Use this option to add a URL to trigger a one-time redirect on demand. The defined URL is triggered from a mobile application to derive location information from the wireless network so an application can be localized to a particular store or region.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
localization [fqdn <WORD>|response <WORD>]
```

#### Parameters

```
• localization [fqdn <WORD>|response <WORD>]
```

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| localization    | Configures an FQDN address string that enables the client to receive localization parameters. This command also allows the configuration of a response message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| fqdn <WORD>     | Configures the FQDN address string, which is used to obtain localization parameters for the captive portal's client. <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the FQDN address string. For example, local.guestaccess.com</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| response <WORD> | Configures a message, which is sent back to the client in response to the client's localization HTTP requests <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the response message (should not exceed 512 characters in length). The following built-in query tags can be included in the response message: <ul style="list-style-type: none"> <li>WING_TAG_CLIENT_IP' -Captive portal client IPv4 address</li> <li>'WING_TAG_CLIENT_MAC' - Captive portal client MAC address</li> <li>'WING_TAG_WLAN_SSID ' - Captive portal client WLAN ssid</li> <li>'WING_TAG_AP_MAC' - Captive portal client AP MAC address</li> <li>'WING_TAG_AP_NAME' - Captive portal client AP Name</li> <li>'WING_TAG_RF_DOMAIN' - Captive portal client RF Domain</li> <li>'WING_TAG_USERNAME' - Captive portal authentication username</li> <li>'WING_TAG_USERTYPE' - Captive portal usertype</li> </ul> </li> </ul> <p>(new/return/refresh) Example:-<br/> &lt;local&gt;&lt;site&gt;WING_TAG_RF_DOMAIN&lt;/site&gt;&lt;ap&gt;WING_TAG_AP_NAME&lt;/ap&gt;&lt;/local&gt;</p> |

**4.1.31.2.11 logout-fqdn**▶ *captive-portal-mode commands*

Configures the *Fully Qualified Domain Name* (FQDN) address to logout of the session from the client

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
logout-fqdn <WORD>
```

**Parameters**

- logout-fqdn <WORD>

|                    |                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logout-fqdn <WORD> | Configures the FQDN address used to logout <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Provide the FQDN address (for example, logout.guestaccess.com).</li> </ul> |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-captive-portal-test)#logout-fqdn logout.testuser.com

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 logout-fqdn logout.testuser.com
rfs6000-81742D(config-captive-portal-test)#
```

### Parameters

- no <PARAMETERS>

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this captive portal's settings, based on the parameters passed. |
|-----------------|-----------------------------------------------------------------------------------|

### Example

The following example shows the captive portal 'test' settings before the 'no' commands are executed:

```
rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 accounting syslog host 172.16.10.13 port 1
rfs6000-81742D(config-captive-portal-test)#
```

```
rfs6000-81742D(config-captive-portal-test)#no accounting syslog
rfs6000-81742D(config-captive-portal-test)#no access-type
```

The following example shows the captive portal 'test' settings after the 'no' commands are executed:

```
rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
rfs6000-81742D(config-captive-portal-test)#
```

### 4.1.31.2.13 oauth

#### ▶ *captive-portal-mode commands*

Enables OAuth-driven Google and/or Facebook authentication on captive portals that use internal Web pages.

To enable Google and Facebook captive-portal authentication:

- Enforce captive-portal authentication on the WLAN to which wireless-clients associate. For information, see *captive-portal-enforcement*.
- Set captive-portal Web page location to internal. For more information, see *webpage-location*.
- Register your captive-portal individually on Google/FaceBook APIs and generate a *client-id* and *client-secret*. The client-ids retrieved during registration are the IDs for the WiNG application running on the access point/controller. The WiNG application uses these client-ids to access the Google and Facebook Auth APIs, and authenticate the guest client on behalf of the user.

If enabling OAuth-driven Google and/or Facebook authentication on the captive portal, use this command to configure the Google/Facebook client-ids. Once enabled, the captive portal landing page, displayed on the client's browser, provides the Facebook and Google login buttons.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
oauth
```

```
oauth client-id [facebook|google] <WORD>
```

#### Parameters

- `oauth`

|                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oauth                                                                                                           | Execute this command without the associated keywords to enable OAuth on this captive-portal. If enabling OAuth, ensure the captive-portal Web page location is configured as advanced or external.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <ul style="list-style-type: none"> <li>• <code>oauth client-id [facebook google] &lt;WORD&gt;</code></li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| oauth client-id [facebook google] <WORD>                                                                        | <p>Configures the client-ids retrieved from the Google and Facebook API manager portals during registration</p> <ul style="list-style-type: none"> <li>• <code>facebook</code> - Configures the Facebook API client-id (is a 15 digit entity)</li> <li>• <code>google</code> - Configures the Google API client-id (is a 12 digit number) <ul style="list-style-type: none"> <li>• <code>&lt;WORD&gt;</code> - Provide the Facebook/Google client-id.</li> </ul> </li> </ul> <p>If the captive-portal Web page location is advanced or external, and you are enabling OAuth support, you need not configure the client-id. In such a scenario, the client-id is configured through the EGuest server UI and not the WiNG CLI.</p> |

**Example**

```

nx7500-6DCD39 (config-captive-portal-test2)#OAuth
nx7500-6DCD39 (config-captive-portal-test2)#OAuth client-id Google
xxxxxxxxxxxxx.apps.googleusercontent.com Facebook yyyyyyyyyyyyyyy
nx7500-6DCD39 (config-captive-portal-test2)#show context
captive-portal test2
 server host guest.social.com
 oauth
 oauth client-id Google xxxxxxxxxxxxx.apps.googleusercontent.com Facebook
yyyyyyyyyyyyyyyyyy
nx7500-6DCD39 (config-captive-portal-test)#

```

In the above example:

- xxxxxxxxxxxxx - Is the 12 digit numeric part of your Google client-id.
- yyyyyyyyyyyyyyy - Is the 15 digit Facebook client-id

|-----------|------------------------------------------------------------------------|
| <i>no</i> | Removes all OAuth client identities configured for this captive portal |
|-----------|------------------------------------------------------------------------|

#### 4.1.31.2.14 php-helper

##### ▶ *captive-portal-mode commands*

Configures a PHP helper to serve the PHP splash pages to guest users logging in to the captive portal using social-media credentials. Configure a PHP helper only if the following criteria are fulfilled:

- OAuth-based authentication is enabled on the captive portal.
- The captive-portal server mode is “self”.
- The access point, hosting the captive-portal server, has low memory space (for example, the AP6511, AP6521, AP6522, AP6532, and AP7502 model access points).
- A hotspot server, hosting the captive-portal PHP splash pages, is up and running.

The WiNG software introduces HybridAuth support on captive portals. HybridAuth is an open-source, social-sign on PHP Library. In addition to Google and Facebook, it allows a variety of third-party social authentications, such as LinkedIn, Twitter, Live, Yahoo, OpenID, etc. However, HybridAuth uses space-consuming PHP splash pages that cannot be loaded on access points with low memory space. These access points can only serve the initial landing page, where guests clicking on a social login button are redirected by the *php-helper* to a PHP page hosted on the *PHP-helper*.

To create PHP splash pages, use the splash template configuration tool available on the *ExtremeGuest* (EGuest) dashboard. Upload the generated tar to both the hotspot server and the php helper. Note, the EGuest dashboard can be launched from the WiNG controller (NX9500/NX9600/VX9000) enabled as the EGuest server.

For more information on enabling the EGuest server, see *eguest-server (VX9000 only)*.

For more information on configuring an EGuest captive portal, see *configuring ExtremeGuest captive-portal*.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
php-helper [controller|domain-manager]
php-helper controller <IP/HOSTNAME> hosting-vlan-interface <0-4096>
php-helper domain-manager <IP/HOSTNAME>
```

#### Parameters

- `php-helper controller <IP/HOSTNAME> hosting-vlan-interface <0-4094>]`

|                                 |                                                                                                                                                                                                                           |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| php-helper                      | Configures the php-helper parameters                                                                                                                                                                                      |
| controller <IP/HOSTNAME>        | Configures the controller adopting the captive-portal access point as the php-helper <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the adopting controller's IP address or host name.</li> </ul> |
| hosting-vlan-interface <0-4096> | Optional. Configures the VLAN on which the php-helper is reachable <ul style="list-style-type: none"> <li>• &lt;0-4096&gt; - Specify the VLAN hosting the php-helper from 0 - 4096.</li> </ul>                            |

- `php-helper domain-manager <IP/HOSTNAME>`

|                                                 |                                                                                                                                                                                                                                  |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>php-helper</code>                         | Configures the php-helper parameters                                                                                                                                                                                             |
| <code>domain-manager &lt;IP/HOSTNAME&gt;</code> | Configures the captive-portal access point's RF Domain manager as the php-helper <ul style="list-style-type: none"> <li>• <code>&lt;IP/HOSTNAME&gt;</code> - Specify the RF Domain manager's IP address or host name.</li> </ul> |

### Example

To enable php-helper configure the following parameters in the captive-portal context:

```
ap6532-3163A4 (config-captive-portal-php-helper) #oauth

ap6532-3163A4 (config-captive-portal-php-helper) #php-helper controller nx9500-6C8809

ap6532-3163A4 (config-captive-portal-php-helper) #server mode self

ap6532-3163A4 (config-captive-portal-php-helper) #server host cpsocial.extreme.com
```

Note, when configuring the server, specify the server's hostname and not the IP address, because some social media do not allow IP address as a redirect URI.

```
ap6532-3163A4 (config-captive-portal-php-helper) #show running-config captive-portal php-helper
captive-portal php-helper
 server host cpsocial.extreme.com
 php-helper controller nx9500-6C8809
 oauth
 webpage internal registration field city type text enable label "City" placeholder "Enter City"
 webpage internal registration field street type text enable label "Address" placeholder "123 Any Street"
 webpage internal registration field name type text enable label "Full Name" placeholder --More--
ap6532-3163A4 (config-captive-portal-php-helper) #
```

### Related Commands

|-----------------|--------------------------------------|
| <code>no</code> | Removes the PHP helper configuration |
|-----------------|--------------------------------------|

**4.1.31.2.15 post-authentication-vlan**▶ *captive-portal-mode commands*

Configures the VLAN that is assigned to this captive portal's users upon successful authentication

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]
```

**Parameters**

- `post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]`

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| post-authentication-vlan [<1-4096> <VLAN-ALIAS>] | <p>Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal's users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN.</p> <ul style="list-style-type: none"> <li>• &lt;1-4096&gt; - Specify the VLAN's number from 1 - 4096.</li> <li>• &lt;VLAN-ALIAS&gt; - Specify the VLAN alias (should be existing and configured).</li> </ul> <p>VLAN alias names begin with a '\$'.</p> |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-captive-portal-test)#post-authentication-vlan 1

rfs4000-229D58 (config-captive-portal-test)#show context
captive-portal test
 post-authentication-vlan 1
rfs4000-229D58 (config-captive-portal-test)#
```

**Related Commands**

|                               |                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------|
| <i>no</i>                     | Removes the post authentication RADIUS VLAN assigned to this captive portal's users |
| <i>radius-vlan-assignment</i> | Enables assignment of a RADIUS VLAN for this captive portal                         |

#### 4.1.31.2.16 radius-vlan-assignment

▶ *captive-portal-mode commands*

Enables assignment of a RADIUS VLAN for this captive portal

When enabled, if the RADIUS server as part of the authentication process returns a client's VLAN-ID in a RADIUS access-accept packet, all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server's VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
radius-vlan-assignment
```

**Parameters**

None

**Example**

```
rfs4000-229D58 (config-captive-portal-test)#radius-vlan-assignment

rfs4000-229D58 (config-captive-portal-test)#show context
captive-portal test
 post-authentication-vlan 1
 radius-vlan-assignment
rfs4000-229D58 (config-captive-portal-test)#
```

**Related Commands**

|---------------------------------|---------------------------------------------------------------------------|
| <i>no</i>                       | Disables assignment of a RADIUS VLAN for this captive portal              |
| <i>post-authentication-vlan</i> | Assigns a post authentication RADIUS VLAN for this captive portal's users |

**4.1.31.2.17 redirection****▶ captive-portal-mode commands**

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
redirection ports <LIST-OF-PORTS>
```

**Parameters**

- redirection ports <LIST-OF-PORTS>

|                       |                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ports <LIST-OF-PORTS> | Configures destination ports considered for redirecting client connection<br>A maximum of 16 ports can be specified in a comma-separated list. Standard ports 80 and 443 are always considered for client connections regardless of what's entered by the administrator. |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58 (config-captive-portal-test)#redirection ports 1,2,3

rfs4000-229D58 (config-captive-portal-test)#show context
captive-portal test
 redirection ports 1-3
rfs4000-229D58 (config-captive-portal-test)#
```

| <i>no</i> | Disables redirection of client connection |
|-----------|-------------------------------------------|

### 4.1.31.2.18 report-loyalty-application

#### ▶ captive-portal-mode commands

Enables detection of captive portal client's usage of a selected (preferred) loyalty application

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
report-loyalty-application {custom-app <APPLICATION-NAME>}
```

#### Parameters

- report-loyalty-application {custom-app <APPLICATION-NAME>}

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| report-loyalty-application {custom-app <APPLICATION-NAME>} | <p>Reports a captive portal client's loyalty application presence and stores this information in the captive portal's user database. The client's loyalty application detection occurs on the access point to which the client is associated. Retail administrators can use this information to assess whether patrons' loyalty application usage is as per expectation within specific retail environments. This option is disabled by default.</p> <ul style="list-style-type: none"> <li>• custom-app &lt;APPLICATION-NAME&gt; - Optional. Uses a custom application definition as match criteria. <ul style="list-style-type: none"> <li>• &lt;APPLICATION-NAME&gt; - Specify the custom application name (should be existing and configured). Ensure that the application specified is available and configured. If not, create an application definition. For more information, see <a href="#">application</a>.</li> </ul> </li> </ul> <p>If no custom application definition is specified, the system uses localization to detect application presence.</p> |

|-----------|-------------------------------------------------------------|
| <i>no</i> | Disables detection of customer-loyalty application presence |
|-----------|-------------------------------------------------------------|

### 4.1.31.2.19 server

#### ▶ *captive-portal-mode commands*

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the captive-portal server hosting the captive portal Web pages.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
server [host|mode]
```

```
server host <IP/HOSTNAME>
```

```
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]
```

#### Parameters

- server host <IP/HOSTNAME>

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host <IP/HOSTNAME> | <p>Configures the internal captive portal server (wireless controller, access point, service platform)</p> <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the IPv4/IPv6 address or hostname of the captive portal server.</li> </ul> <p>For centralized-controller mode, the server host should be a virtual hostname and not an IP address.</p> <p>If enabling OAuth (social-media login) on the captive portal, configure the server's hostname and not the IP address. This is because some social media do not allow IP address as redirect-uri. For more information, see <i>oauth</i> and <i>php-helper</i>.</p>                                                  |
|                    | <ul style="list-style-type: none"> <li>• server mode [centralized centralized-controller {hosting-vlan-interface &lt;0-4096&gt;} self]</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mode               | <p>Configures the captive portal server mode. This parameter identifies the device that will capture and redirect a wireless user's Web browser session to a landing page where the user has to provide login credentials in order to access the managed network. The WiNG captive portal implementation is very flexible and allows captive portal services to reside anywhere within the WiNG managed network. For example, the capture and redirection can be performed directly by the access points at the edge of the network, centrally on the controllers or service platforms managing the access points, or on dedicated wireless controller deployed within an isolated network.</p> |
| centralized        | <p>Select this option if capture and redirection is provided by a designated wireless controller/service platform on the network defined using an IPv4/IPv6 address or hostname. This dedicated device can either be managing the dependent/independent access points or be a dedicated device deployed over the intermediate network.</p> <p>Ensure the IPv4 address or hostname of the WiNG wireless controller performing the capture and redirection is defined in the captive portal policy. And also, that the wireless controller is reachable via MINT.</p>                                                                                                                             |

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 4.1.31.2.20 simultaneous-users

#### ▶ *captive-portal-mode commands*

Specifies the number of users (client MAC addresses) that can simultaneously logon to the captive portal. This option is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
simultaneous-users <1-8192>
```

#### Parameters

- simultaneous-users <1-8192>

|                                |                                                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| simultaneous-users<br><1-8192> | Specifies the number of MAC addresses that can simultaneously access the captive portal<br><br>• <1-8192> - Select a number from 1 - 8192. |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-captive-portal-test)#simultaneous-users 5

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
server host 172.16.10.9
simultaneous-users 5
rfs6000-81742D(config-captive-portal-test)#
```

#### Related Commands

| <i>no</i> | Resets or disables captive portal commands |
|-----------|--------------------------------------------|

#### 4.1.31.2.21 terms-agreement

##### ▶ *captive-portal-mode commands*

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

When enabled, the system enforces a previously registered user to re-confirm the terms of agreement, on successive log ins, only if the interval between the last log out and the current log in exceeds the *agreement-refresh* timeout configured in the WLAN context. For more information on configuring the agreement-refresh timeout value, see *registration*.

For example:

If the agreement-refresh timeout is set at 20 minutes, the following two possibilities can arise:

- The interval between logging out and re-logging *exceeds* 20 minutes - in which case the user is served the Terms of Agreement page on successful authentication.
- The interval between logging out and re-logging is *less than* 20 minutes - in which case the user is provided direct Internet access.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
terms-agreement
```

#### Parameters

None

#### Example

```
rfs6000-81742D(config-captive-portal-test)#terms-agreement

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test

| <i>no</i> | Resets or disables captive portal commands |
|-----------|--------------------------------------------|

**4.1.31.2.22 use****▶ captive-portal-mode commands**

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

For more information on AAA policies, see [AAA-POLICY](#).

For more information on DNS whitelists, see [dns-whitelist](#).

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]
```

**Parameters**

- use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aaa-policy<br><AAA-POLICY-NAME>       | Associates a AAA policy with this captive portal. AAA policies validate user credentials and provide captive portal access to the network. <ul style="list-style-type: none"> <li>• &lt;AAA-POLICY-NAME&gt; - Specify the AAA policy name.</li> </ul>                                                                                                                                                                                                           |
| dns-whitelist<br><DNS-WHITELIST-NAME> | Associates a DNS whitelist to use with this captive portal. A DNS whitelist defines a set of allowed destination IP addresses. DNS whitelists restrict captive portal access. <ul style="list-style-type: none"> <li>• &lt;DNS-WHITELIST-NAME&gt; - Specify the DNS whitelist name.</li> </ul> <p>To effectively host captive portal pages on an external Web server, the IP address of the destination Web server(s) should be added to the DNS whitelist.</p> |

**Example**

```
rfs6000-81742D(config-captive-portal-test)#use aaa-policy test
rfs6000-81742D(config-captive-portal-test)#use dns-whitelist test
rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
server host 172.16.10.9
simultaneous-users 5
terms-agreement
use aaa-policy test
use dns-whitelist test
rfs6000-81742D(config-captive-portal-test)#
```

### 4.1.31.2.23 webpage

#### ▶ *captive-portal-mode commands*

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. These pages are:

- acknowledgment – This page displays details for the user to acknowledge
- agreement – This page displays “Terms and Conditions” that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due to unavailability of critical services.
- registration – This page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

| external       | Indicates Web pages being served are hosted on an external (to the captive portal) server resource                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| acknowledgment | Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| agreement      | Indicates the page is displayed for “Terms & Conditions”<br>The agreement page provides conditions that must be agreed to before captive portal access is permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| fail           | Indicates the page is displayed for login failure<br>The fail page asserts authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| login {post}   | Indicates the page is displayed for getting user credentials. This page is displayed by default. <ul style="list-style-type: none"> <li>post – Optional. Redirects users to post externally during authentication</li> </ul> The login page prompts the user for a username and password to access the captive portal and proceed to either the agreement page (if used) or the welcome page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| no-service     | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are: <ul style="list-style-type: none"> <li>The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated</li> <li>The external captive portal server is not reachable</li> <li>The connectivity between the adopted AP and controller is lost</li> <li>The external DHCP server is not reachable</li> </ul> To provide this service, enable the following: <ul style="list-style-type: none"> <li>External captive portal server monitoring</li> <li>AAA server monitoring. This enables detection of RADIUS server failure.</li> <li>External DHCP server monitoring</li> </ul> For more information on enabling these critical resource monitoring, see <a href="#">service</a> . |
| registration   | Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database<br>Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| welcome        | Indicates the page is displayed after a user has been successfully authenticated<br>The welcome page asserts a user has logged in successfully and can access the captive portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| no-service                                                                                                                                                                                               | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are: <ul style="list-style-type: none"> <li>• The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated</li> <li>• The external captive portal server is not reachable</li> <li>• The connectivity between the adopted AP and controller is lost</li> <li>• The external DHCP server is not reachable</li> </ul> To provide this service, enable the following: <ul style="list-style-type: none"> <li>• External captive portal server monitoring</li> <li>• AAA server monitoring. This enables detection of RADIUS server failure.</li> <li>• External DHCP server monitoring</li> <li>• AP to controller connectivity monitoring</li> </ul> For more information on enabling these critical resource monitoring, see <a href="#">wlan</a> . |

#### 4.1.31.2.24 webpage-auto-upload

▶ *captive-portal-mode commands*

Enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as *advanced*. For more information, see *webpage-location*.

If this feature is enabled, access points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the access points, the controller shall distribute the Web pages uploaded on it to the access points.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
webpage-auto-upload
```

**Parameters**

None

**Example**

```
rfs6000-81742D(config-captive-portal-test)#webpage-auto-upload

rfs6000-81742D(config-captive-portal-test)#show context
captive-portal test
 webpage-auto-upload
 logout-fqdn logout.testuser.com
rfs6000-81742D(config-captive-portal-test)#
```

**Related Commands**

|-------------------------|-----------------------------------------------------------------------|
| <i>no</i>               | Disables automatic upload of advanced Web pages on a captive portal   |
| <i>webpage</i>          | Configures Web pages displayed when interacting with a captive portal |
| <i>webpage-location</i> | Specifies the location of the Web pages used for authentication       |

### 4.1.31.2.25 webpage-location

#### ▶ *captive-portal-mode commands*

Specifies the location of the Web pages used for authentication. These pages can either be hosted on the system or on an external Web server.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
webpage-location [advanced|external|internal]
```

#### Parameters

- webpage-location [advanced|external|internal]

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| advanced | Uses Web pages for login, welcome, failure, and terms created and stored on the controller. Select <i>advanced</i> to use a custom-developed directory full of Web page content that can be copied in and out of the controller, service platform, or access point.<br><br>If selecting advanced, enable the <i>webpage-auto-upload</i> option to automatically launch the advanced pages to requesting clients upon association. For more information, see <i>webpage-auto-upload</i> . |
| external | Uses Web pages for login, welcome, failure, and terms located on an external server. Provide the URL for each of these pages.                                                                                                                                                                                                                                                                                                                                                            |
| internal | Uses Web pages for login, welcome, and failure that are automatically generated                                                                                                                                                                                                                                                                                                                                                                                                          |

#### Example

```
rfs6000-81742D(config-captive-portal-test)#webpage-location external

rfs6000-81742D(config-captive-portal-test)#show context

|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <i>no</i>                  | Resets or disables captive portal Web page settings                                                                      |
| <i>webpage</i>             | Configures a captive portal's Web page (acknowledgment, agreement, login, welcome, fail, no-service, and terms) settings |
| <i>webpage-auto-upload</i> | Enables an automatic upload of advanced Web pages on a captive portal                                                    |

### 4.1.31.2.26 welcome-back

#### ▶ captive-portal-mode commands

Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins. When enabled, a registered captive-portal guest user, on subsequent logins, is served the *Acknowledgement* page only if:

- The *agreement-refresh* option is enabled for device-based (device and device-OTP) registration, and
- The interval between logout and login is *lesser* than the *agreement-refresh* timeout configured in the WLAN context. If this interval *exceeds* the agreement-refresh timeout, the user is served the *Agreement* page. For more information on configuring the agreement-refresh timeout value, see [registration](#).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
welcome-back pass-through
```

#### Parameters

- welcome-back pass-through

|                              |                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| welcome-back<br>pass-through | Enables display of the Acknowledgement page to an already registered user on subsequent captive-portal log-ins, provided the interval between logout and login is lesser than the <i>agreement-refresh</i> timeout <ul style="list-style-type: none"> <li>• pass-through – Provides user direct Internet access, from the Welcome-back page, without any user action</li> </ul> |

### 4.1.31.2.27 configuring device registration with dynamic VLAN assignment

#### ▶ *captive-portal-mode commands*

This section provides the configurations required to enable device registration with dynamic VLAN assignment in a multi-vendor environment.

- 1 Create vendor-specific RADIUS user groups and assign an allowed VLAN to each group, as shown in the following examples:

```
nx9500-6C8809 (config) #radius-group Apple
nx9500-6C8809 (config-radius-group-Apple) #policy vlan 200
nx9500-6C8809 (config) #radius-group Samsung
nx9500-6C8809 (config-radius-group-Samsung) #policy vlan 100
nx9500-6C8809 (config) #radius-group Devices
nx9500-6C8809 (config-radius-group-Devices) #policy vlan 1
```

Note, if necessary, configure the session-time for each of the above configured RADIUS group. This is the duration for which a RADIUS group client's session remains active after successful authentication. Upon expiration, the RADIUS session is terminated. Use the `policy > session-time > <5-144000>` command to specify the session-time.

- 2 Create a RADIUS user pool, add users to the pool, and assign the users to the vendor-specific user groups: as shown in the following examples:

```
nx9500-6C8809 (config) #radius-user-pool-policy Vendor-Devices
nx9500-6C8809 (config-radius-user-pool-Vendor-Devices) #user Samsung password 0
samsung group Samsung
nx9500-6C8809 (config-radius-user-pool-Vendor-Devices) #user test password 0
test123 group Apple
```

- 3 Create a RADIUS server policy, and associate the RADIUS groups and user pool created in steps 1 and 2 respectively, as shown in the following examples:

```
nx9500-6C8809 (config) #radius-server-policy Guest-Radius
nx9500-6C8809 (config-radius-server-policy-Guest-Radius) #use radius-user-pool-
policy Vendor-Devices
nx9500-6C8809 (config-radius-server-policy-Guest-Radius) #use radius-group
Samsung
nx9500-6C8809 (config-radius-server-policy-Guest-Radius) #use radius-group Sony
nx9500-6C8809 (config-radius-server-policy-Guest-Radius) #use radius-group
Apple
```

- 4 Create an AAA Policy, on the controller, and configure the authentication server as self, as shown in the following example:

```
nx9500-6C8809 (config) #aaa-policy OnBoard-NX
nx9500-6C8809 (config-aaa-policy-OnBoard-NX) #authentication server 1 onboard
controller
nx9500-6C8809 (config-aaa-policy-OnBoard-NX) #show context
aaa-policy OnBoard-NX
authentication server 1 onboard self
nx9500-6C8809 (config-aaa-policy-OnBoard-NX) #
```

- 5 Create a captive-portal, and point to the captive-portal's server, enable RADIUS VLAN assignment, and associate the AAA policy, as shown in the following examples:

```

nx9500-6C8809 (config) #captive-portal DeviceRegistration
nx9500-6C8809 (config-captive-portal-DeviceRegistration) #server host
captive.extremenoc.com
nx9500-6C8809 (config-captive-portal-DeviceRegistration) #radius-vlan-
assignment
nx9500-6C8809 (config-captive-portal-DeviceRegistration) #use aaa-policy
OnBoard-NX
nx9500-6C8809 (config-captive-portal-DeviceRegistration) #access-type radius

```

- 6 Configure a WLAN and enable RADIUS VLAN assignment, as shown in the following examples:

```

nx9500-6C8809 (config) #wlan CP-OnBoarding
nx9500-6C8809 (config-wlan-CP-OnBoarding) #ssid CP-OnBoarding
nx9500-6C8809 (config-wlan-CP-OnBoarding) #radius vlan-assignment
nx9500-6C8809 (config-wlan-CP-OnBoarding) #use aaa-policy OnBoard-NX
nx9500-6C8809 (config-wlan-CP-OnBoarding) #use captive-portal
DeviceRegistration
nx9500-6C8809 (config-wlan-CP-OnBoarding) #captive-portal-enforcement fall-back
nx9500-6C8809 (config-wlan-CP-OnBoarding) #registration device group-name
Devices expiry-time 4320
nx9500-6C8809 (config-wlan-CP-OnBoarding) #authentication-type mac

```

- 7 Create an access point profile, associate the RADIUS server policy, captive-portal policy to it, and also assign the WLAN to the AP radio, as shown in the following examples:

```

nx9500-6C8809 (config-profile-SITE-10) #use radius-server-policy Guest-Radius
nx9500-6C8809 (config-profile-SITE-10) #use captive-portal server
DeviceRegistration
nx9500-6C8809 (config-profile-SITE-10-if-radio2) #wlan CP-OnBoarding bss 1
primary
nx9500-6C8809 (config-profile-SITE-10-if-gel) #switchport mode trunk
nx9500-6C8809 (config-profile-SITE-10-if-gel) #switchport trunk native vlan 90
nx9500-6C8809 (config-profile-SITE-10-if-gel) #switchport trunk allowed vlan
1,90,1000-1002
nx9500-6C8809 (config-profile-SITE-10-if-gel) #no switchport trunk native
tagged

```

- 8 Use the access point profile in the access point's device context.

#### 4.1.31.2.28 configuring WeChat Wi-Fi hotspot support in WiNG captive portal

##### ▶ *captive-portal-mode commands*

WeChat is a popular messaging app used in China with more than 500 million installations. WeChat's WiFi hotspot solution allows businesses to provide Internet access to their customers. The WiNG captive portal can be configured to incorporate the WeChat WiFi hotspot, so that WeChat users, on their first connect to a WiNG access point, can automatically authenticate with the WeChat server through an intermediate server.

This section provides an example that shows the configurations required to be made on the WiNG portal to enable WeChat Wi-Fi hotspot.

- 1 Create an AAA policy re-directing the WiNG captive portal user to WeChat's AAA server for authentication, as shown in the following example:

```
nx9500-6C8809 (config) #aaa-policy cloud2
nx9500-6C8809 (config-aaa-policy-cloud2) #authentication server 1 host
cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809 (config-aaa-policy-cloud2) #show context
aaa-policy cloud2
authentication server 1 host cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809 (config-aaa-policy-cloud2) #
```

Note, Synchroweb is an *independent software vendor* (ISV), whose third-party software is being used as the intermediate server. The AAA server and RADIUS accounting server configured in AAA policy must be as per the specification provided by the ISV.

- 2 Create a DNS whitelist, whitelisting WeChat's server name in order to initiate RADIUS authentication. The "qq.com" domain name is where WeChat server can be reached.

```
nx9500-6C8809 (config) #dns-whitelist wxWL
nx9500-6C8809 (config-dns-whitelist-wxWL) #permit cloud2.synchroweb.com
nx9500-6C8809 (config-dns-whitelist-wxWL) #permit qq.com suffix
nx9500-6C8809 (config-dns-whitelist-wxWL) #show context
dns-whitelist wxWL
permit qq.com suffix
permit cloud2.synchroweb.com
nx9500-6C8809 (config-dns-whitelist-wxWL) #
```

- 3 Create a captive portal and associate the AAA policy and DNS whitelist created in steps 1 & 2, as shown in the following example:

```
nx9500-6C8809 (config) #captive-portal wxCP
nx9500-6C8809 (config-captive-portal-wxCP) #use aaa-policy cloud2
nx9500-6C8809 (config-captive-portal-wxCP) #use dns-whitelist wxWL
```

- 4 Configure the following captive portal parameters:

```
nx9500-6C8809 (config) #captive-portal wxCP
nx9500-6C8809 (config-captive-portal-wxCP) #access-time 10
nx9500-6C8809 (config-captive-portal-wxCP) #server host guest.extreme.com
nx9500-6C8809 (config-captive-portal-wxCP) #webpage-location external
nx9500-6C8809 (config-captive-portal-wxCP) #webpage external login http://
cloud2.synchroweb.com/wechat.nx/index.php?c=WING_TAG_CLIENT_MAC
```

```

nx9500-6C8809(config-captive-portal-wxCP)#show context
captive-portal wxCP
access-time 10
server host guest.extreme.com
webpage-location external
webpage external login http://cloud2.synchroweb.com/wechat.nx/
index.phpc=WING_TAG_CLIENT_MAC
use aaa-policy cloud2
use dns-whitelist wxWL
--More--
nx9500-6C8809(config-captive-portal-wxCP)#

```

Note, the login URL configured here must be as per the specifications provided by the ISV.

Note, the access-type remains unchanged (i.e radius, which is the default setting). The access-time is set to a minimum value (10 minutes in this example) in order to avoid the default value of 24 hours being applied, in case the RADIUS response does not contain the session-timeout attribute.

#### 5 Create a WLAN and associate the captive portal created in step 3:

```

nx9500-6C8809(config)#wlan wxOpen
nx9500-6C8809(config-wlan-wxOpen)#ssid wxOpen
nx9500-6C8809(config-wlan-wxOpen)#vlan 200
nx9500-6C8809(config-wlan-wxOpen)##use captive-portal wxCP
nx9500-6C8809(config-wlan-wxOpen)#captive-portal-enforcement
nx9500-6C8809(config-wlan-wxOpen)#show context
wlan wxOpen
ssid wxOpen
vlan 200
bridging-mode local
encryption-type none
authentication-type none
use captive-portal wxCP
captive-portal-enforcement
nx9500-6C8809(config-wlan-wxOpen)#

```

Note, the modes of authentication and encryption remain unchanged (i.e none, which is the default setting for both parameters). Ensure captive-portal-enforcement is enabled on the WLAN.

#### 4.1.31.2.29 configuring ExtremeGuest captive-portal

##### ▶ *captive-portal-mode commands*

This section documents the basic configurations required to deploy an *ExtremeGuest* (EGuest) setup. A typical EGuest deployment consists of the EGuest server, EGuest captive-portal database, and NOC adopting the access points. The EGuest server and database can be hosted only on the VX9000 platform.

In the following example, the EGuest server and database are hosted on the same device.

- 1 On the EGuest server/database host,
  - a enable the EGuest daemon. When enabled, the EGuset server is up and running.
 

```
EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#eguest-server
```
  - b apply a database-policy to enable the EGuest database.
 

```
EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#use database-policy default
```
  - c configure the NTP server. This is to ensure time synchronization across replica-set members (this is mandatory in replica-set deployments and should be configured either on the replica-set members' device or profile context).
 

```
EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#ntp server time.nist.govt
```
- 2 On the NOC,
  - a create an AAA policy with the following configurations:
    - Configure the EGuest server (configured in Step 1) as the authentication and accounting RADIUS server.
 

```
NOC(config-aaa-policy-EguestAAA)#authentication server 1 host EG-Server secret 0 extreme123
NOC(config-aaa-policy-EguestAAA)#accounting server 1 host EG-Server secret 0 extreme123
```
    - Configure the proxy-mode as 'through-controller'. When configured, all requests to the server are proxied through the NOC.
 

```
NOC(config-aaa-policy-EguestAAA)#authentication server 1 proxy-mode through-controller
NOC(config-aaa-policy-EguestAAA)#accounting server 1 proxy-mode through-controller
```

```
NOC(config-aaa-policy-EguestAAA)#show context
aaa-policy EguestAAA
accounting server 1 host EG-OnBServer secret 0 extreme123
accounting server 1 proxy-mode through-controller
authentication server 1 host EG-Server secret 0 extreme123
authentication server 1 proxy-mode through-controller
NOC(config-aaa-policy-EguestAAA)#
```
  - b Create a DNS whitelist. Note, DNS whitelist configuration is required only if enabling OAuth on the EGuest captive-portal. When created and used on the EGuest captive-portal, the DNS whitelist renders social plugin buttons on the client prior to successful captive portal authentication.
    - Configure the following permit rules:
 

```
NOC(config-dns-whitelist-EguestDNS)#permit fbstatic-a.akamaihd.net
NOC(config-dns-whitelist-EguestDNS)#permit connect facebook.net
NOC(config-dns-whitelist-EguestDNS)#permit facebook.com suffix
NOC(config-dns-whitelist-EguestDNS)#permit fbcdn.net suffix
```

```

NOC (config-dns-whitelist-EguestDNS) #permit googleapis.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit google.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit googleusercontent.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit linkedin.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit static.lidn.com
NOC (config-dns-whitelist-EguestDNS) #permit twitter.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit twimg.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit instagramstatic-a.akamaihd.net
NOC (config-dns-whitelist-EguestDNS) #permit instagram.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit ssl.gstatic.com
NOC (config-dns-whitelist-EguestDNS) #permit extremenetworks.com suffix
NOC (config-dns-whitelist-EguestDNS) #permit local.extreme.com

```

c Create a captive-portal with the following configurations:

- Specify the captive-portal server.

```
NOC (config-captive-portal-EguestCP) #server host guest.extreme.com
```

- Use the AAA policy created in Step 2 a.

```
NOC (config-captive-portal-EguestCP) #use aaa-policy EguestAAA
```

- Enable social-media authentication. This setting is optional.

```
NOC (config-captive-portal-EguestCP) #oauth
```

- Use the DNS whitelist created in Step 2 b. Note, the DNS whitelist is required only if enabling OAuth on the captive-portal.

```
NOC (config-captive-portal-EguestCP) #use dns-whitelist EguestDNS
```

- Configure the webpage-location as advanced. Note, webpage-location should be 'advanced' if using pages created with EGuest splash templates.

```
NOC (config-captive-portal-EguestCP) #webpage-location advanced
```

d Create a WLAN policy with the following configurations:

- Enable MAC authentication.

```
NOC (config-wlan-EguestWLAN) #authentication-type mac
```

- Use the AAA policy created in Step 2 a.

```
NOC (config-wlan-EguestWLAN) #use aaa-policy EguestAAA
```

*--When used, access points/controllers forward registration requests to the EGuest server specified in the AAA policy. However, ensure that the `registration > external > follow-aaa` option is configured on the WLAN. See below.*

```
NOC (config-wlan-EguestWLAN) #registration external follow-aaa
```

*--This enables the use of the Authentication and Accounting servers specified in the AAA policy applied on the WLAN.*

- Use the captive-portal created in Step 2 c.

```
NOC (config-wlan-EguestWLAN) #use captive-portal EguestCP
```

- Enable captive-portal enforcement with fall-back.

```
NOC (config-wlan-EguestWLAN) #captive-portal-enforcement fall-back
```

- Configure the following guest registration parameters:

```
NOC(config-wlan-EguestWLAN)#registration device group-name Eguest expiry-time
4320 agreement-refresh 1440
```

--This is the RADIUS group assigned to registered users post authentication.

```
NOC(config-wlan-EguestWLAN)#show context
wlan EguestWLAN
ssid _EXTREME-GUEST-NRF2017
vlan 1
bridging-mode local
encryption-type none
authentication-type mac
no answer-broadcast-probes
no client-client-communication
wireless-client hold-time 300
use aaa-policy EguestAAA
use captive-portal EguestCP
captive-portal-enforcement fall-back
registration device group-name Eguest expiry-time 4320 agreement-refresh 1440
registration external follow-aaa
mac-authentication cached-credentials
NOC(config-wlan-EguestWLAN)#
```

- e In the NOC's self context, configure the EGuest server.

```
NOC(config-device-74-67-F7-5C-64-4A)#eguest-server host 1 EG-Server https
```

- 3 In the Access Point's device or profile context,
  - a Use the captive-portal configured in Step 2 c.
 

```
Eguest-AP(config-device-74-67-F7-5C-64-4A)#use captive-portal EguestCP
```
- 4 To view EGuest registration status and statistics, on the EGuest server, use the following commands:
 

```
EG-Server-DB#show eguest registration statistics
EG-Server-DB#show eguest registration status
```
- 5 To clear EGuest registration statistics, on the EGuest server, use the following command:
 

```
EG-Server-DB#clear eguest registration statistics
```

#### Related Commands

|                                    |                                                                                                                                                                                                                                           |

## 4.1.32 clear

### ► Global Configuration Commands

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where executed.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
clear event-history
```

#### Parameters

- clear event-history

|               |                               |
|---------------|-------------------------------|
| event-history | Clears the event history file |
|---------------|-------------------------------|

#### Example

```
rfs4000-880DA7(config)#show event-history

### 4.1.33 client-identity

#### ► *Global Configuration Commands*

With an increase in *Bring Your Own Device* (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization's security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain.

Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

The following table summarizes the commands available for creating and configuring a set of new client identity parameters:

**Table 4.12** *Client-Identity-Config Commands*

| Command                              | Description                                                           | Reference         |
|--------------------------------------|-----------------------------------------------------------------------|-------------------|
| <i>client-identity</i>               | Creates a new client identity and enters its configuration mode       | <i>page 4-148</i> |
| <i>client-identity-mode commands</i> | Invokes the client identity policy configuration mode commands        | <i>page 4-150</i> |
| <i>client-identity-group</i>         | Creates a new client identity group and enters its configuration mode | <i>page 4-156</i> |

### 4.1.33.1 client-identity

#### ► *client-identity*

Creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network. The client-identity feature enables device fingerprinting.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client's device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP, etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation, etc. This method accurately classifies a client's TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP, etc.

This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

The WiNG software provides a set of built-in device fingerprints that load by default and identify client device types. Use the *service > show > client-identity-defaults* command to view default client identity fingerprints.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
client-identity <CLIENT-IDENTITY-NAME>
```

#### Parameters

- *client-identity* <CLIENT-IDENTITY-NAME>

|                                                         |                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>client-identity &lt;CLIENT-IDENTITY-NAME&gt;</pre> | <p>Creates a new client identity policy and enters its configuration mode</p> <ul style="list-style-type: none"> <li>• &lt;CLIENT-IDENTITY-NAME&gt; – Specify a client identity policy name. If the client identity policy does not exist, it is created.</li> </ul> |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Usage Guidelines

The following points should be considered when configuring the client identity (device fingerprinting) feature:

- Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see *enforce-dhcp*.
- Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints, it will be difficult to identify the device type.
- When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).

## Example

```
rfs4000-229D58(config)#client-identity test
rfs4000-229D58(config-client-identity-test)#?
Client Identity Mode commands:
 dhcp Add a DHCP option based match criteria
 dhcp-match-message-type Specify DHCP message type to match
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-test)#
```

Use the *service > show > client-identity-defaults* command to view default, built-in, system-provided client identity fingerprints:

```
nx9500-6C8809#service show client-identity-defaults
client-identity Android-2-1
 dhcp 1 message-type request option 55 exact hexstring 0103061c21333a3b79
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.1
client-identity Android-2-2
 dhcp 1 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
client-identity Android-2-3
 dhcp 3 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
 dhcp 1 message-type request option-codes exact hexstring 353d32393c37
 dhcp 2 message-type request option-codes exact hexstring 353d3236393c37
 dhcp 10 message-type request option-codes exact hexstring 353d3236393c0c37
--More--
nx9500-6C8809#
```

### 4.1.33.2 client-identity-mode commands

#### ▶ *client-identity*

The following table summarizes client identity configuration mode commands:

**Table 4.13** *Client-Identity-Mode Commands*

| Command                        | Description                                                             | Reference         |
|--------------------------------|-------------------------------------------------------------------------|-------------------|
| <i>dhcp</i>                    | Configures the DHCP option match criteria for device fingerprinting     | <i>page 4-151</i> |
| <i>dhcp-match-message-type</i> | Configures the DHCP message type for device fingerprinting              | <i>page 4-154</i> |
| <i>no</i>                      | Removes the DHCP option (used for client identification) configurations | <i>page 4-155</i> |

### 4.1.33.2.1 dhcp

#### ▶ *client-identity-mode commands*

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device's *operating system* (OS). Options and option values contained in a client's messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
[contains|exact|starts-with] [ascii|hexstring] <WORD>
```

#### Parameters

- dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes] [contains|exact|starts-with] [ascii|hexstring] <WORD>

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dhcp <1-16>                        | <p>Adds a DHCP option match criteria signature</p> <ul style="list-style-type: none"> <li>• &lt;1-16&gt; – Specify an index for this DHCP match criteria from 1 - 16.</li> </ul> <p>A maximum of 16 match criteria can be configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| message-type<br>[discover request] | <p>Specifies the message type to which this DHCP match criteria is applicable</p> <ul style="list-style-type: none"> <li>• discover – Applies this match criteria to DHCP discover messages only. ### Usage Guidelines

The following DHCP options are useful for identifying different device types:

- Option 55: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client's order of preference.
- Client configured list of DHCP options (all options parsed into a hex string).
- Option 60: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

### Example

```
rfs4000-229D58 (config-client-identity-test)#dhcp 1 message-type request option
60 exact ascii MSFT\5.0
rfs4000-229D58 (config-client-identity-test)#dhcp 2 message-type discover option
2 exact hexstring 012456c22c44

rfs4000-229D58 (config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58 (config-client-identity-test)#
```

### 4.1.33.2 dhcp-match-message-type

#### ▶ *client-identity-mode commands*

Configures the DHCP message type to match

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dhcp-match-message-type [all|any|discover|request]
```

#### Parameters

- dhcp-match-message-type [all|any|discover|request]

|                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### 4.1.33.2.3 no

#### ▶ *client-identity-mode commands*

Removes the DHCP options match criteria configurations

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [dhcp <1-16>|dhcp-match-message-type]
```

#### Parameters

- no [dhcp <1-16>|dhcp-match-message-type]

|                         |                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dhcp <1-16>             | Removes the DHCP option match criteria rule identified by the <1-16> keyword <ul style="list-style-type: none"> <li>• &lt;1-16&gt; - Specify the DHCP option match criteria rule index</li> </ul> |
| dhcp-match-message-type | Removes the DHCP message type to match                                                                                                                                                            |

#### Example

The following example shows the client identity 'test' settings before the 'no' commands are executed:

```
rfs4000-229D58 (config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
 dhcp-match-message-type all
rfs4000-229D58 (config-client-identity-test)#
```

The following example shows the client identity 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58 (config-client-identity-test)#no dhcp 2

rfs4000-229D58 (config-client-identity-test)#no dhcp-match-message-type

rfs4000-229D58 (config-client-identity-test)#show context
client-identity test
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58 (config-client-identity-test)#
```

## 4.1.34 client-identity-group

### ▶ *client-identity*

The following table summarizes commands available to enter the client identity group configuration mode:

**Table 4.14** *Client-Identity-Group Config Commands*

| Command                                    | Description                                                           | Reference         |
|--------------------------------------------|-----------------------------------------------------------------------|-------------------|
| <i>client-identity-group</i>               | Creates a new client identity group and enters its configuration mode | <i>page 4-157</i> |
| <i>client-identity-group-mode commands</i> | Invokes the client identity group configuration mode commands         | <i>page 4-158</i> |
| <i>client-identity</i>                     | Creates new client identity policy and enters its configuration mode  | <i>page 4-147</i> |

### 4.1.34.1 client-identity-group

#### ▶ *client-identity-group*

Configures a new client identity group

A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

Device Fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

#### Parameters

- `client-identity-group <CLIENT-IDENTITY-GROUP-NAME>`

|                                                                      |                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>client-identity-group &lt;CLIENT-IDENTITY- GROUP-NAME&gt;</pre> | <p>Creates a new client identity group and enters its configuration mode</p> <ul style="list-style-type: none"> <li>• <code>&lt;CLIENT-IDENTITY-GROUP-NAME&gt;</code> - Specify a client identity group name. If the group does not exist, it is created.</li> </ul> |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config)#client-identity-group test
rfs4000-229D58 (config-client-identity-group-test)#
Client Identity group Mode commands:
 client-identity Client identity (DHCP Device Fingerprinting)
 load Load Client identity Fingerprints
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58 (config-client-identity-group-test)#
```

### 4.1.34.2 client-identity-group-mode commands

#### ▶ *client-identity-group*

The following table summarizes client identity group configuration mode commands:

**Table 4.15** *Client-Identity-Group-Mode Commands*

| Command                | Description                                                                                                | Reference         |
|------------------------|------------------------------------------------------------------------------------------------------------|-------------------|
| <i>client-identity</i> | Associates an existing and configured client identity (device fingerprint) with this client identity group | <i>page 4-159</i> |
| <i>load</i>            | Loads default (system-provided) client identity fingerprints                                               | <i>page 4-161</i> |
| <i>no</i>              | Removes the client identity associated with this client identity group                                     | <i>page 4-155</i> |

### 4.1.34.2.1 client-identity

#### ▶ *client-identity-group-mode commands*

Associates an existing and configured client identity (device fingerprint) with this client identity group

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

#### Parameters

- `client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>`

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-identity<br><CLIENT-IDENTITY-NAME> | Associates a client identity with this group <ul style="list-style-type: none"> <li>• &lt;CLIENT-IDENTITY-NAME&gt; - Specify a client identity name (should be existing and configured)</li> </ul>                                                                                                                                                                                                                         |
| precedence<br><1-10000>                   | Determines the order in which client identity is used <ul style="list-style-type: none"> <li>• &lt;1-10000&gt; - Specify this client identity precedence from &lt;1-10000&gt;.</li> </ul> <p>The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.</p> |

#### Example

The following example shows two client identities created and configured:

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.9.1.0-029R
!
!
!
version 2.5
!
!
client-identity TestClientIdentity
 dhcp 1 message-type request option-codes exact hexstring 5e4d36780b3a7f
!
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
 dhcp-match-message-type all
!
client-identity-group ClientIdentityGroup
 client-identity TestClientIdentity precedence 1
!
client-identity-group test
!
ip access-list BROADCAST-MULTICAST-CONTROL
 permit tcp any any rule-precedence 10 rule-description "permit all TCP traffic"
 --More--
rfs4000-229D58(config)#
```

The following example associates client identity 'test' with the client identity group 'test':

```
rfs4000-229D58(config-client-identity-group-test)#client-identity test precedence
1
```

The following example shows the client identity group 'test' with two associated client identities having precedence 1 and 2:

```
rfs4000-229D58(config-client-identity-group-test)#client-identity
TestClientIdentity precedence 2
rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
client-identity test precedence 1
client-identity TestClientIdentity precedence 2
rfs4000-229D58(config-client-identity-group-test)#
```

#### Related Commands

|-----------|-----------------------------------------------------------------------|
| <i>no</i> | Removes the client identity associated with the client identity group |
|-----------|-----------------------------------------------------------------------|

### 4.1.34.2.2 load

#### ▶ *client-identity-group-mode commands*

Loads default (built-in, system-provided) client identity fingerprints. This option is enabled by default.

The WiNG software provides some built-in client identity fingerprints that are automatically loaded when the client identity group is applied to a device (either directly or through the profile).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
load default-fingerprints
```

#### Parameters

- load default-fingerprints

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|
| load default-fingerprints | Loads client identity default fingerprints. This option is enabled by default. |
|---------------------------|--------------------------------------------------------------------------------|

#### Example

The auto-load default fingerprints option is enabled by default, as shown in the following example:

```
nx9500-6C8809(config-client-identity-group-test)#show context
client-identity-group test
 load default-fingerprints
nx9500-6C8809(config-client-identity-group-test)#
```

In scenarios where only customized client identities are to be applied, use the *no > load > default-fingerprints* command to disable auto-loading of default device fingerprints.

```
nx9500-6C8809(config-client-identity-group-test)#no load default-fingerprints

nx9500-6C8809(config-client-identity-group-test)#show context
client-identity-group test
 no load default-fingerprints
nx9500-6C8809(config-client-identity-group-test)#
```

Use the *service > show > client-identity-defaults* command to view default client identity fingerprints:

```
nx9500-6C8809#service show client-identity-defaults
client-identity Android-2-1
 dhcp 1 message-type request option 55 exact hexstring 0103061c21333a3b79
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.1
client-identity Android-2-2
 dhcp 1 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
client-identity Android-2-3
 dhcp 3 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
 dhcp 1 message-type request option-codes exact hexstring 353d32393c37
 dhcp 2 message-type request option-codes exact hexstring 353d3236393c37
 dhcp 10 message-type request option-codes exact hexstring 353d3236393c0c37
--More--
nx9500-6C8809#
```

|-----------|--------------------------------------------------------------------|
| <i>no</i> | Disables automatic loading of default client identity fingerprints |
|-----------|--------------------------------------------------------------------|

**4.1.34.2.3 no**▶ *client-identity-group-mode commands*

Removes the client identity associated with the client identity group

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [client-identity|load]
no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
no load default-fingerprints
```

**Parameters**

- no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>

|                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no client-identity<br><CLIENT-IDENTITY-NAME><br>precedence <1-10000> | <p>Disassociates a specified client identity from this client identity group</p> <ul style="list-style-type: none"> <li>• &lt;CLIENT-IDENTITY-NAME&gt; - Specify the client identity name.</li> <li>• precedence &lt;1-10000&gt; - Specify the above specified client identity's precedence value from &lt;1-10000&gt;.</li> </ul> <p>The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.</p> |
| no load default-fingerprints                                         | Disables automatic loading of built-in, system-provided client identity fingerprints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Example**

```
rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
 client-identity test precedence 1
rfs4000-229D58(config-client-identity-group-test)#

rfs4000-229D58(config-client-identity-group-test)#no client-identity test
rfs4000-229D58(config)#
```

|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>client-identity</i> | Associates an existing and configured client identity (device fingerprint) with this client identity group |
| <i>load</i>            | Loads default (built-in, system-provided) client identity fingerprints. This option is enabled by default. |

## 4.1.35 clone

### ► Global Configuration Commands

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
clone [TLO|device]
```

```
clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
```

```
clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>
```

#### Parameters

- clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                           |

```

## 4.1.36 crypto-cmp-policy

### ► Global Configuration Commands

Creates a crypto *Certificate Management Protocol* (CMP) policy and enters its configuration mode

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
```

#### Parameters

- `crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

|                                             |                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------|
| <code>&lt;CRYPTO-CMP-POLICY-NAME&gt;</code> | Specify the crypto CMP policy name. If the policy does not exist, it is created. |
|---------------------------------------------|----------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?
CMP Policy Mode commands:
 ca-server CMP CA Server configuration commands
 cert-key-size Set key size for certificate request
 cert-renewal-timeout Trigger a cert renewal request on timeout
 cross-cert-validate Validate cross-cert using factory-cert
 no Negate a command or set its defaults
 subjectAltName Configure subjectAltName value
 trustpoint Trustpoint for CMP
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-cmp-policy-CMP)#
```

#### Related Commands

|                 |                                    |
|-----------------|------------------------------------|
| <code>no</code> | Resets values or disables commands |
|-----------------|------------------------------------|

**NOTE:** For more information on the crypto CMP policy, see [Chapter 29, CRYPTO-CMP-POLICY](#).

## 4.1.37 customize

### ► Global Configuration Commands

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
customize [cdp-lldp-info-column-width|hostname-column-width|show-adoption-status|
show-wireless-client|show-wireless-client-stats|show-wireless-client-stats-rf|
show-wireless-meshpoint|show-wireless-meshpoint-accelerated-multicast|
show-wireless-meshpoint-neighbor-stats|show-wireless-meshpoint-neighbor-stats-rf
|show-wireless-mint-client|show-wireless-mint-client-stats|show-wireless-mint-
client-stats-rf|show-wireless-mint-portal|show-wireless-mint-portal-stats|
show-wireless-mint-portal-stats-rf|show-wireless-radio|show-wireless-radio-
stats|show-wireless-radio-stats-rf]
```

```
customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>
```

```
customize show-adoption-status (adopted-by, ap-name <1-64>, cdp-lldp-info, config-
status, last-adoption, msgs, uptime, version)
```

```

**Parameters**

- `customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>`

|                                   |                                                                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hostname-column-width <1-64>      | Configures default width of the hostname column in all show command outputs <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the hostname column width from 1 - 64 characters</li> </ul>                     |
| cdp-lldp-info-column-width <1-64> | Configures the column width in the <code>show &gt; cdp/lldp &gt; [neighbor report]</code> command output <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the column width from 1 - 64 characters</li> </ul> |

- `customize show-adoption-status (adopted-by,ap-name <1-64>,cdp-lldp-info,config-status,last-adoption,msgs,uptime,version)`

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show-adoption-status | Configures the information displayed in the <code>show &gt; adoption &gt; status</code> command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time.<br><br>The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime.<br><br>Where ever available, you can optionally use the <1-64> parameter to set the column width. |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- `customize show-wireless-client (ap-name <1-64>,auth,client-identity <1-32>,bss,enc,hostname <1-64>,ip,last-active,location <1-64>,mac,radio-alias <3-67>,radio-id,radio-type,role <1-32>,state,username <1-64>,vendor,vlan,wlan)`

|                      |                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show-wireless-client | Customizes the <code>show &gt; wireless &gt; client</code> command output<br><br>The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN. VLAN, and State.                                               |
| ap-name <1-64>       | Includes the ap-name column, which displays the name of the AP with which this client associates <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the ap-name column width from 1 - 64 characters</li> </ul> |
| auth                 | Includes the auth column, which displays the authorization protocol used by the wireless client                                                                                                                          |

|                            |                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-identity <1-32>     | Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see <i>client-identity</i> .<br><ul style="list-style-type: none"> <li>• &lt;1-32&gt; – Sets the client-identity column width from 1 - 32 characters</li> </ul> |
| bss                        | Includes the BSS column, which displays the BSS ID the wireless client is associated with                                                                                                                                                                                                                                        |
| enc                        | Includes the enc column, which displays the encryption suite used by the wireless client                                                                                                                                                                                                                                         |
| hostname <1-64>            | Includes the hostname column, which displays the wireless client's hostname<br><ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</li> </ul>                                                                                                                          |
| ip                         | Includes the IP column, which displays the wireless client's current IP address                                                                                                                                                                                                                                                  |
| last-active                | Includes the last-active column, which displays the time of last activity seen from the wireless client                                                                                                                                                                                                                          |
| location <1-64>            | Includes the location column, which displays the location of the client's associated access points<br><ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the location column width from 1 - 64 characters</li> </ul>                                                                                                   |
| mac                        | Includes the MAC column, which displays the wireless client's MAC address                                                                                                                                                                                                                                                        |
| radio-alias <3-67>         | Includes the radio-alias column, which displays the radio alias with the AP's hostname and radio interface number in the "HOSTNAME:RX" format<br><ul style="list-style-type: none"> <li>• &lt;3-64&gt; – Sets the radio-alias column width from 3 - 67 characters</li> </ul>                                                     |
| radio-id                   | Includes the radio-id column, which displays the radio ID with the AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format                                                                                                                                                                              |
| radio-type                 | Includes the radio-type column, which displays the wireless client's radio type                                                                                                                                                                                                                                                  |
| role <1-32>                | Includes the role column, which displays the client's role<br><ul style="list-style-type: none"> <li>• &lt;1-32&gt; – Sets the role column width from 1 - 32 characters</li> </ul>                                                                                                                                               |
| state                      | Includes the state column, which displays the wireless client's current availability state                                                                                                                                                                                                                                       |
| username <1-64>            | Includes the username column, which displays the wireless client's username<br><ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Specify the username column width from 1 - 64 characters.</li> </ul>                                                                                                                      |
| vendor                     | Includes the vendor column, which displays the wireless client's vendor ID                                                                                                                                                                                                                                                       |
| vlan                       | Includes the VLAN column, which displays the wireless client's assigned VLAN                                                                                                                                                                                                                                                     |
| wlan                       | Includes the WLAN column, which displays the wireless client's assigned WLAN                                                                                                                                                                                                                                                     |
|                            | <ul style="list-style-type: none"> <li>• customize <code>show-wireless-client-stats (hostname &lt;1-64&gt;, mac, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)</code></li> </ul>                                                                                     |
| show-wireless-client-stats | Customizes the <code>show &gt; wireless &gt; client &gt; statistics</code> command output<br>The columns displayed by default are: MAC, Tx bytes, RX bytes, Tx pkts, Rx pkts, and Tx bps, RX bps, T-Index, and Dropped pkts.                                                                                                     |
| hostname <1-64>            | Includes the hostname column, which displays the wireless client's hostname<br><ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</li> </ul>                                                                                                                          |
| mac                        | Includes the MAC column, which displays the wireless client's MAC address                                                                                                                                                                                                                                                        |
| rx-bytes                   | Includes the rx-bytes column, which displays the total number of bytes received by the wireless client                                                                                                                                                                                                                           |

| root-hostname <1-64>                      | Includes the root-hostname column, which displays the root AP's hostname to which this meshpoint is bound <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the root-hostname column width from 1 - 64 characters</li> </ul>                                                                                                                                                                    |
| root-mpid                                 | Includes the root-mpid column, which displays the bound root meshpoint identifier in the AA-BB-CC-DD-EE-FF format <ul style="list-style-type: none"> <li>• customize show-wireless-meshpoint-neighbor-stats (ap-hostname &lt;1-64&gt;, neighbor-hostname &lt;1-64&gt;, neighbor-ifid, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)</li> </ul> |
| show-wireless-meshpoint-neighbor-stats    | Customizes the <i>show &gt; wireless &gt; meshpoint &gt; neighbor &gt; statistics</i> command output<br>The columns displayed by default are: AP Hostname, Neighbor-IFID, TX bytes, RX bytes, Tx pkts, Rx pkts, Tx (bps), Rx (bps), T-Index (%), and Dropped pkts.                                                                                                                                         |
| ap-name <1-64>                            | Includes the ap-name column, which displays name of the AP reporting a neighbor <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the ap-name column width from 1 - 64 characters</li> </ul>                                                                                                                                                                                                    |
| neighbor-hostname <1-64>                  | Includes the neighbor-hostname column, which displays the reported neighbor's hostname <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the neighbor-hostname column width from 1 - 64 characters</li> </ul>                                                                                                                                                                                   |
| neighbor-ifid                             | Includes the neighbor-ifid column, which displays the neighbor's interface ID                                                                                                                                                                                                                                                                                                                              |
| rx-bytes                                  | Includes the rx-bytes column, which displays the total bytes received                                                                                                                                                                                                                                                                                                                                      |
| rx-errors                                 | Includes the rx-error column, which displays the total bytes of error received                                                                                                                                                                                                                                                                                                                             |
| rx-packets                                | Includes the rx-packets column, which displays the number of packets received                                                                                                                                                                                                                                                                                                                              |
| rx-throughput                             | Includes the rx-throughput column, which displays neighbor's received throughput                                                                                                                                                                                                                                                                                                                           |
| t-index                                   | Includes the t-index column, which displays the traffic utilization index at the neighbor end                                                                                                                                                                                                                                                                                                              |
| tx-bytes                                  | Includes the tx-bytes column, which displays the total bytes transmitted                                                                                                                                                                                                                                                                                                                                   |
| tx-dropped                                | Includes the tx-dropped column, which displays the total bytes dropped                                                                                                                                                                                                                                                                                                                                     |
| tx-packets                                | Includes the tx-packets column, which displays the number of packets transmitted                                                                                                                                                                                                                                                                                                                           |
| tx-throughput                             | Includes the tx-throughput column, which displays neighbor's transmitted throughput <ul style="list-style-type: none"> <li>• customize show-wireless-meshpoint-neighbor-stats-rf (ap-hostname &lt;1-64&gt;, average-retry-number, error-rate, neighbor-hostname &lt;1-64&gt;, neighbor-ifid, noise, q-index, rx-rate, signal, snr, t-index, tx-rate)</li> </ul>                                            |
| show-wireless-meshpoint-neighbor-stats-rf | Customizes the <i>show &gt; wireless &gt; meshpoint &gt; neighbor &gt; statistics &gt; rf</i> command output<br>The columns displayed by default are: AP Hostname, Neighbor-IFID, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-Rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).                                                                                                           |
| ap-name <1-64>                            | Includes the ap-name column, which displays name of the AP reporting a neighbor <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the ap-name column width from 1 - 64 characters</li> </ul>                                                                                                                                                                                                    |
| average-retry-number                      | Includes the average-retry-number column, which displays the average number of retransmissions made per packet.                                                                                                                                                                                                                                                                                            |
| error-rate                                | Includes the error-rate column                                                                                                                                                                                                                                                                                                                                                                             |
| neighbor-hostname <1-64>                  | Includes the neighbor-hostname, which displays reported neighbor's hostname <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the neighbor-hostname column width from 1 - 64 characters</li> </ul>                                                                                                                                                                                              |

The radio mode can be 2.4 GHz, 5.0 GHz, or sensor.                                                                                                                                                                                                         |
| state                        | Includes the state column, which displays the radio's current operational state<br><ul style="list-style-type: none"> <li>• customize show-wireless-radio-stats (radio-alias &lt;3-67&gt;, radio-id, radio-mac, rx-bytes, rx-errors, rx-packets, rx-throughput, tx-bytes, tx-dropped, tx-packets, tx-throughput)</li> </ul>        |
| show-wireless-radio-stats    | Customizes the show wireless radio statistics command output                                                                                                                                                                                                                                                                       |
| radio-alias <3-67>           | Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" format)<br><ul style="list-style-type: none"> <li>• &lt;3-67&gt; - Sets the radio-alias column width from 3 - 67 characters</li> </ul>                                             |
| radio-id                     | Includes the radio-id column, which displays the radio's ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format)                                                                                                                                                                      |
| radio-mac                    | Includes the radio-mac column, which displays the radio's base MAC address                                                                                                                                                                                                                                                         |
| rx-bytes                     | Includes the rx-bytes column, which displays the total number of bytes received by the radio                                                                                                                                                                                                                                       |
| rx-errors                    | Includes the rx-error column, which displays the total number of errors received by the radio                                                                                                                                                                                                                                      |
| rx-packets                   | Includes the rx-packets column, which displays the total number of packets received by the radio                                                                                                                                                                                                                                   |
| rx-throughput                | Includes the rx-throughput column, which displays the receive throughput at the radio                                                                                                                                                                                                                                              |
| tx-bytes                     | Includes the tx-bytes column, which displays the total number of bytes transmitted by the radio                                                                                                                                                                                                                                    |
| tx-dropped                   | Includes the tx-dropped column, which displays the total number of packets dropped by the radio                                                                                                                                                                                                                                    |
| tx-packets                   | Includes the tx-packets column, which displays the total number of packets transmitted by the radio                                                                                                                                                                                                                                |
| tx-throughput                | Includes the tx-throughput column, which displays the transmission throughput at the radio<br><ul style="list-style-type: none"> <li>• customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias &lt;3-67&gt;, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)</li> </ul> |
| show-wireless-radio-stats-rf | Customizes the show wireless radio stats RF command output                                                                                                                                                                                                                                                                         |
| average-retry-number         | Includes the average-retry-number column, which displays the average number of retransmissions per packet                                                                                                                                                                                                                          |

|                    |                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| error-rate         | Includes the error-rate column, which displays the rate of error for the radio                                                                                                                                                 |
| noise              | Includes the noise column, which displays the noise detected by the radio                                                                                                                                                      |
| q-index            | Includes the q-index column, which displays the RF quality index<br>Higher values indicate better RF quality.                                                                                                                  |
| radio-alias <3-67> | Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" format)<br>• <3-67> - Sets the radio-alias column width from 3 - 67 characters |
| radio-id           | Includes the radio-id column, which displays the radio's ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format)                                                                  |
| radio-mac          | Includes the radio-mac column, which displays the radio's base MAC address                                                                                                                                                     |
| rx-rate            | Includes the rx-rate column, which displays the receive rate at the particular radio                                                                                                                                           |
| signal             | Includes the signal column, which displays the signal strength at the particular radio                                                                                                                                         |
| snr                | Includes the snr column, which displays the signal-to-noise ratio at the particular radio                                                                                                                                      |
| t-index            | Includes the t-index column, which displays the traffic utilization index at the particular radio                                                                                                                              |
| tx-rate            | Includes the tx-rate column, which displays the packet transmission rate at the particular radio                                                                                                                               |

**Example**

The following example shows the shows the `show > adoption > status` command output before customizing the output:

```
rfs6000-81742D#show adoption status

## 4.1.38 database-client-policy

### ► *Global Configuration Commands*

The following table summarizes the config database client policy commands:

**Table 4.16** *Database-Client-Policy Config Commands*

| Command                                     | Description                                                        | Reference         |
|---------------------------------------------|--------------------------------------------------------------------|-------------------|
| <i>database-client-policy</i>               | Creates a database-client policy and enters its configuration mode | <i>page 4-178</i> |
| <i>database-client-policy-mode commands</i> | Summarizes the database client policy mode commands                | <i>page 4-180</i> |

### 4.1.38.1 database-client-policy

#### ► *database-client-policy*

Creates a database-client-policy and enters its configuration mode. The database-client-policy configures the IP address or hostname of the *database* host, and is used on the NSight/EGuest server's device context. However, the database-client-policy is required only in a split deployment, where the server and database are hosted on separate boxes. In such a scenario, the database-client-policy enables the server to identify the database host.

If enforcing database authentication, configure the user-name and password required to access the database on the database-client-policy. For more information on enabling database authentication, see *database*.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

#### Syntax

```
database-client-policy <DATABASE-CLIENT-POLICY-NAME>
```

#### Parameters

- database-client-policy <DATABASE-CLIENT-POLICY-NAME>

|                                                  |                                                                                                                                                                                     |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-policy<br><DATABASE-CLIENT-POLICY-NAME> | Specify the database-client-policy name. If the policy does not exist, it is created.<br>Once created and configured, use this policy in the NSight/EGuest server's device context. |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
vx9000-34B78B(config)#database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#?
Database Client Policy Mode commands:
 authentication Database authentication
 database-server Add database server
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

To setup a database/server environment, with the database and the server hosted n separate hosts:

- 1 On the database host, use the database policy. This brings up the database server.
- 2 On the NSight/EGuest server, create the database-client-policy, and configure the database host's IP address or hostname.

```

vx9000-34B78B(config)#database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#database-server
192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
 database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#

```

- 3 Use this database-client-policy in the NSight/EGuest server's device configuration context. Once applied, the server posts details to the database specified in the policy.

```

vx9000-34B78B(config-device-00-0C-29-34-B7-8B)#use database-client-policy
DBClientPolicy

vx9000-34B78B(config-device-00-0C-29-34-B7-8B)#show context include-factory |
include database-client-policy
use database-client-policy DBClientPolicy
vx9000-34B78B(config-device-00-0C-29-34-B7-8B)#

```

|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i>                           | Removes an existing database-client-policy                                                                                                                                                                                                                                                                                                         |
| <i>database-policy</i>              | Documents database policy configuration commands. If enforcing authenticated database access, use this command to enable authentication on the database and configure the username and password.                                                                                                                                                   |
| <i>nsight-policy</i>                | Documents NSight policy configuration commands. The NSight policy is a tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted database. |
| <i>use</i> (profile/device context) | Uses a database-client-policy in the VX9000's device or profile context                                                                                                                                                                                                                                                                            |
| <i>database</i>                     | Drops or repairs a database. Also provides database keyfile management capabilities. If enforcing authenticated access to the database, use this command to generate, export, import, and zerzoise the keyfile.                                                                                                                                    |

### 4.1.38.2 database-client-policy-mode commands

#### ▶ *database-client-policy*

The following table summarizes database-client-policy configuration mode commands:

**Table 4.17** *Database-Client-Policy-Config-Mode Commands*

| Command                | Description                                                                                                                                     | Reference         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>authentication</i>  | Configures the captive-portal/NSight database users                                                                                             | <i>page 4-181</i> |
| <i>database-server</i> | Configures the database host's IP address or hostname. Use this command to configure the IP address or hostname of the VM hosting the database. | <i>page 4-182</i> |
| <i>no</i>              | Removes the database host's IP/hostname configuration                                                                                           | <i>page 4-183</i> |

### 4.1.38.2.1 authentication

#### ▶ *database-client-policy-mode commands*

Configures the database's username and password

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

#### Syntax

```
authentication username <USER-NAME> password <PASSWORD>
```

#### Parameters

- authentication username <USER-NAME> password <PASSWORD>

|                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>authentication username &lt;USER- NAME&gt; password &lt;PASSWORD&gt;</pre> | <p>Configures the username and password required to access the database. Note, username and password specified here should be the same as those already created on the database host. For more information on creating database users, see <i>service</i>.</p> <ul style="list-style-type: none"> <li>• username &lt;USER-NAME&gt; - Configures the user name</li> <li>• password &lt;PASSWORD&gt; - Configures the password for the username specified above.</li> </ul> <p>However, ensure database authentication is enabled in the database-policy. For more information on database-policy, see <i>database-policy</i>. For more information on enabling database authentication, see <i>database</i></p> |
|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
vx9000-65672(config-database-client-policy-DBClientPolicy)# authentication
username extreme password 2 test@12345

vx9000-656725#show running-config database-client-policy replica-set
database-client-policy replica-set
 database-server 13.13.13.3
 database-server 14.14.14.2
 authentication username extreme password 2 q4cUyedmA4BFsn1kg/
 xjCQAAAAliMbdRXXKblQbsyrwMGdVzv
vx9000-656725#
```

#### Related Commands

|           |                                                    |
|-----------|----------------------------------------------------|
| <i>no</i> | Removes an existing database username and password |
|-----------|----------------------------------------------------|

### 4.1.38.2.2 database-server

#### ▶ *database-client-policy-mode commands*

Configures the IPv4/IPv6 address or hostname of the VM hosting the database

#### Supported in the following platforms:

- Service Platforms — VX9000

#### Syntax

```
database-server [<IP>|<HOSTNAME>|<IPv6>]
```

#### Parameters

- `database-server [<IP>|<HOSTNAME>|<IPv6>]`

|                                             |                                                                                                                                                                                                                                                                                              |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-server<br>[<IP> <HOSTNAME> <IPv6>] | Identifies the database host using one of the following options: <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specifies the host's IPv4 address</li> <li>• &lt;HOSTNAME&gt; - Specifies the host's hostname</li> <li>• &lt;IPv6&gt; - Specifies the host's IPv6 address.</li> </ul> |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#database-server
192.168.13.10
```

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
```

```
database-server 192.168.13.10
```

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

#### Related Commands

|           |                                                                                       |
|-----------|---------------------------------------------------------------------------------------|
| <i>no</i> | Removes the database server's (the VM hosting the database) IP/hostname configuration |
|-----------|---------------------------------------------------------------------------------------|

**4.1.38.2.3 no**▶ *database-client-policy-mode commands*

Removes the database host's IP/hostname configuration

**Supported in the following platforms:**

- Service Platforms — VX9000

**Syntax**

```
no [authentication|database-server]
no authentication username <USER-NAME>
no database-server [<IP>|<HOST-NAME>|<IPv6>]
```

**Parameters**

- no [authentication|database-server]

|                    |                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| no database-server | Removes the database VM's IPv4/IPv6 address or hostname associated with this database client policy. Also removes database user details. |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#

vx9000-34B78B(config-database-client-policy-DBClientPolicy)#no database-server

vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

### 4.1.39 database-policy

▶ *Global Configuration Commands*

The following table summarizes the config database policy commands:

**Table 4.18** *Database-Policy Config Commands*

| Command                              | Description                                                 | Reference         |
|--------------------------------------|-------------------------------------------------------------|-------------------|
| <i>database-policy</i>               | Creates a database policy and enters its configuration mode | <i>page 4-185</i> |
| <i>database-policy-mode commands</i> | Lists database policy configuration mode commands           | <i>page 4-186</i> |

### 4.1.39.1 database-policy

#### ▶ *database-policy*

Creates a database-policy and enters its configuration mode. After creating the database-policy, use it on the database host. This enables the database. If deploying a database replica-set, use this command to define the replica set configurations.

To enforce database authentication, enable authentication on the database-policy, and configure the username and password required to access the database. Note, this command is part of a set of configurations that are required to enable authentication. For more information on the entire set of configurations, see *database*.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, VX9000

#### Syntax

```
database-policy <DATABASE-POLICY-NAME>
```

#### Parameters

- *database-policy* <DATABASE-POLICY-NAME>

|                                           |                                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------|
| database-policy<br><DATABASE-POLICY-NAME> | Specify the database policy name. If the policy does not exist, it is created. |
|-------------------------------------------|--------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-database-policy-test)#?
Database Policy Mode commands:
 authentication Database authentication
 no Negate a command or set its defaults
 replica-set Replica Set
 shutdown Disable database server

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal
nx9500-6C8809(config-database-policy-test)#
```

#### Related Commands

|           |                                     |
|-----------|-------------------------------------|
| <i>no</i> | Removes an existing database policy |
|-----------|-------------------------------------|

### 4.1.39.2 database-policy-mode commands

#### ▶ *database-policy*

The following table summarizes database-policy configuration mode commands:

**Table 4.19** *Database-Policy-Config-Mode Commands*

| <b>Command</b>        | <b>Description</b>                                                                                       | <b>Reference</b>  |
|-----------------------|----------------------------------------------------------------------------------------------------------|-------------------|
| <i>authentication</i> | Enables database authentication and configures the username and password required to access the database | <i>page 4-187</i> |
| <i>replica-set</i>    | Adds a member to a database replica set                                                                  | <i>page 4-188</i> |
| <i>shutdown</i>       | Shuts down the database server                                                                           | <i>page 4-190</i> |
| <i>no</i>             | Removes a member from the database replica set                                                           | <i>page 4-191</i> |

### 4.1.39.2.1 authentication

#### ▶ *database-policy-mode commands*

Enables database authentication. When enabled and applied on the database host, this policy enforces authenticated access to the database. This command also configures the username and password required to access the database.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000

#### Syntax

```
authentication
authentication username <USER-NAME> password <PASSWORD>
```

#### Parameters

- authentication

|                |                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication | Enables database authentication on this database-policy. When executed without the associated keywords, the command enables authentication on the database host using the policy. Execute the command along with the username and password inputs to configure the user credentials required for access the database. |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- authentication username <USER-NAME> password <PASSWORD>

|                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication<br>username <USER-NAME><br>password <PASSWORD> | <p>Configures the username and password required to access the database. Note, username and password specified here should be the same as those already created on the database host. For more information, see <a href="#">service</a>.</p> <ul style="list-style-type: none"> <li>• username &lt;USER-NAME&gt; - Configures the database username</li> <li>• password &lt;PASSWORD&gt; - Configures the password for the username specified above</li> </ul> <p>Users using these credentials are allowed database access. In case of a split NSight/EGuest deployment, ensure that the database-client-policy running on the NSight/EGuest server has the same user details configured.</p> <p>For information on creating database-client-policy, see <a href="#">database-client-policy</a></p> <p>For more information on enabling database authentication, see <a href="#">database</a>.</p> |

nx9500-6C8809(config-database-policy-test)#
```

#### Related Commands

|           |                                                                                        |
|-----------|----------------------------------------------------------------------------------------|
| <i>no</i> | Disables database authentication, and removes the username and password configuration. |
|-----------|----------------------------------------------------------------------------------------|

### 4.1.39.2.2 replica-set

#### ▶ *database-policy-mode commands*

Adds a member to a database replica set. A replica-set is a group of devices (replica-set members) running the database instances that maintain the same data set. Replica sets provide redundancy and high availability and are the basis for all production deployments. The replica set usually consists of: an arbiter, a primary member, and one or more secondary members. The primary member and the secondary member(s) maintain replicas of the data set.

Before deploying a replica set, ensure that each of the replica-set member:

- has the DB instances installed, and
- is able to communicate with every other member in the set.

After ensuring the above,

- Create a database policy (with identical replica-set configuration) on each of the member devices, and
- Use the database policy in the member device's configuration mode.

These member devices elect a primary member, which begins accepting client-write operations. Remaining devices in the replica-set, with the exception of the arbiter, are designated as secondary members.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000, NX7500, NX5500

#### Syntax

```
replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}
```

#### Parameters

- replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}

|                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>replica-set member [&lt;IP&gt; &lt;FQDN&gt;] {arbiter priority &lt;0- 255&gt;}</pre> | <p>Adds a member to the database replica set. To identify the member, use one of the following options:</p> <ul style="list-style-type: none"> <li>• &lt;IP&gt; – Specify the member's IP address.</li> <li>• &lt;FQDN&gt; – Specify the member's <i>Fully Qualified Domain Name</i> (FQDN).</li> </ul> <p>After specifying the IP address or FQDN, specify the following:</p> <ul style="list-style-type: none"> <li>• arbiter – Optional. Select to configure the member as the arbiter.</li> <li>• priority &lt;0-255&gt; – Optional. Configures the priority of a non-arbiter member of the replica set <ul style="list-style-type: none"> <li>• &lt;0-255&gt; – Specify the priority from 0 - 255. This value determines the member's position within the replica set as primary or secondary. It also helps in electing the fall-back primary member in the eventuality of the current primary member being unreachable.</li> </ul> </li> </ul> <p>A replica set should have at least three members. The maximum number of members can go up to fifty (50). However, configuring a three-member replica set is recommended. Replica sets should have odd number of members. In case of an even-numbered replica set, add an arbiter to make the member count odd. This ensures that at least one member gets a majority vote in the primary-member election.</p> |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.14
arbiter

nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.16
priority 1

nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.12
priority 2

nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.14 arbiter
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

**Related Commands**

|           |                                                |
|-----------|------------------------------------------------|
| <i>no</i> | Removes a member from the database replica set |
|-----------|------------------------------------------------|

### 4.1.39.2.3 shutdown

▶ *database-policy-mode commands*

Shuts down the database server. The factory default is set as *no shutdown*.

**Supported in the following platforms:**

- Service Platforms — NX9500, NX9600, VX9000, NX7500, NX5500

**Syntax**

```
shutdown
```

**Parameters**

None

**Example**

```

nx9500-6C8809(config-database-policy-test)#shutdown

nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 shutdown
nx9500-6C8809(config-database-policy-test)#

```

**Related Commands**

|           |                             |
|-----------|-----------------------------|
| <i>no</i> | Enables the database server |
|-----------|-----------------------------|

#### 4.1.39.2.4 no

##### ▶ *database-policy-mode commands*

Removes or reverts the database policy settings to default values

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9600, VX9000, NX7500, NX5500

#### Syntax

```
no [authentication|replica-set|shutdown]
no authentication {username <USER-NAME>}
no replica-set member [<IP>|<FQDN>]
no shutdown
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes a member from the database replica set, or brings up a database server that is down. Also disables database authentication and removes user |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

The following example shows a three-member replica set:

```
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.14 arbiter
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

In the following example the arbiter is being removed, leaving the replica set with only two members:

```
nx9500-6C8809(config-database-policy-test)#no replica-set member 192.168.13.14
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

Since a replica set must have at least three members, another member must be added to this replica set. This member may or may not be an arbiter.

```
nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.8
priority 3
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.16 priority 1
 replica-set member 192.168.13.8 priority 3
nx9500-6C8809(config-database-policy-test)#
```

## 4.1.40 device

### ► Global Configuration Commands

Enables simultaneous configuration of multiple devices

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
device {containing|filter}
```

```
device {containing <STRING>} {filter type [ap6521|ap6522|ap6532|ap6562|ap71xx|
ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|
ap8432|ap8533|ex3524|ex3548|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600|t5|
vx9000]}
```

```
device {filter type [ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|
ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|ex3524|
ex3548|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600|t5|vx9000]}
```

#### Parameters

- device {containing <STRING>} {filter type [ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|ex3524|ex3548|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600|t5|vx9000]}

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device                       | Enters a device's configuration mode. Use this command to simultaneously configure devices having similar configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| containing <STRING>          | Optional. Configures the string to search for in the device's hostname. All devices having hostnames containing the string specified here are filtered, and can be configured simultaneously. <ul style="list-style-type: none"> <li>• &lt;STRING&gt; - Specify the string to search for in the device's hostname.</li> </ul>                                                                                                                                                                                                                                                                |
| filter type<br><DEVICE-TYPE> | Optional. Filters out a specific device type. After specifying the hostname string, select the device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533, EX3524, EX3548, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, t5, and VX9000 (V-WLC). <p>The t5 option is applicable only on the NX7500, NX7510, NX7520, NX7530, NX95XX, NX9500, NX9510, and NX9600 platforms.</p> <p>The VX9000 option is applicable only to the NX9500, NX9510, and NX9600 platforms.</p> |
|                              | <ul style="list-style-type: none"> <li>• device {filter type [ap6521 ap6522 ap6532 ap6562 ap71xx ap7502 ap7522 ap7532 ap7562 ap7602 ap7612 ap7622 ap7632 ap7662 ap81xx ap82xx ap8432 ap8533 ex3524 ex3548 rfs4000 rfs6000 nx5500 nx75xx nx9000 nx9600 t5 vx9000]}</li> </ul>                                                                                                                                                                                                                                                                                                                 |
| device                       | Configures a basic device profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>filter type &lt;DEVICE-TYPE&gt;</pre> | <p>Optional. Filters out a specific device type. The options are: AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533, EX3524, EX3548, RFS4000, RFS6000, NX5500, NX75XX, NX95XX, NX9600, t5, and VX9000 (V-WLC).</p> <p>The t5 option is applicable only on the NX7500, NX7510, NX7520, NX7530, NX95XX, NX9500, NX9510, and NX9600 platforms.</p> <p>The VX9000 option is applicable only to the NX9500, NX9510, and NX9600 platforms.</p> |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config)#device filter type ap7532
rfs6000-81742D(config-device-{'type': 'ap7532'})#
```

**Related Commands**

|           |                                           |
|-----------|-------------------------------------------|
| <i>no</i> | Removes multiple devices from the network |
|-----------|-------------------------------------------|

## 4.1.41 device-categorization

### ► *Global Configuration Commands*

Categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.

The following table summarizes the device categorization mode commands:

**Table 4.20** *Device-Categorization Config Command*

| Command                                    | Description                                                            | Reference         |
|--------------------------------------------|------------------------------------------------------------------------|-------------------|
| <i>device-categorization</i>               | Creates a device categorization list and enters its configuration mode | <i>page 4-195</i> |
| <i>device-categorization-mode commands</i> | Summarizes device categorization list configuration mode commands      | <i>page 4-196</i> |

### 4.1.41.1 device-categorization

#### ► *device-categorization*

Configures a device categorization list

Proper classification and categorization of devices (access points, clients, etc.) helps suppress unnecessary unauthorized access point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

Authorized access points and clients are generally known to you and conform with your organization's security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or access point's radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>
```

#### Parameters

- *device-categorization* <DEVICE-CATEGORIZATION-LIST-NAME>

|                                                      |                                                                                                          |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <code>&lt;DEVICE-CATEGORIZATION-LIST-NAME&gt;</code> | Specify the device categorization list name. If a list with the same name does not exist, it is created. |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#device-categorization rfs6000
rfs6000-81742D(config-device-categorization-rfs6000)#?
Device Category Mode commands:
 mark-device Add a device
 no Negate a command or set its defaults

```

#### Related Commands

|           |                                                |
|-----------|------------------------------------------------|
| <i>no</i> | Removes an existing device categorization list |
|-----------|------------------------------------------------|

### 4.1.41.2 device-categorization-mode commands

#### ▶ *device-categorization*

The following table summarizes device categorization configuration mode commands:

**Table 4.21** *Device-Categorization-Mode Commands*

| Command            | Description                                          | Reference         |
|--------------------|------------------------------------------------------|-------------------|
| <i>mark-device</i> | Adds a device to the device categorization list      | <i>page 4-197</i> |
| <i>no</i>          | Removes a device from the device categorization list | <i>page 4-199</i> |

### 4.1.41.2.1 mark-device

#### ▶ *device-categorization-mode commands*

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mark-device <1-1000> [sanctioned|neighboring] [ap|client]
```

```
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
```

```
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
```

#### Parameters

- mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000>                          | Configures the device categorization entry index number                                                                                                                                                                                                                                                                                                                                                              |
| sanctioned                        | Marks a device as sanctioned. A sanctioned device is authorized to use network resources.                                                                                                                                                                                                                                                                                                                            |
| neighboring                       | Marks a device as neighboring. A neighboring device is a neighbor in the same network as this device.                                                                                                                                                                                                                                                                                                                |
| ap<br>{mac <MAC> <br>ssid <SSID>} | <p>Marks a specified AP as sanctioned or neighboring based on its MAC address or SSID</p> <ul style="list-style-type: none"> <li>• mac &lt;MAC&gt; - Optional. Specify the AP's MAC address</li> <li>• ssid &lt;SSID&gt; - Optional. Specify the AP's SSID. After specifying the SSID, you can optionally specify its MAC SSID.</li> </ul> <p>All APs are marked if no specific MAC address or SSID is provided.</p> |

- mark-device [sanctioned|neighboring] client {mac <MAC>}

|                    |                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000>           | Configures the device categorization entry index number                                                                                                                                                                   |
| sanctioned         | Marks the wireless client as sanctioned. A sanctioned device is authorized to use network resources.                                                                                                                      |
| neighboring        | Marks the wireless client as neighboring. A neighboring device is a neighbor in the same network as this device.                                                                                                          |
| client {mac <MAC>} | <p>Marks a specified wireless client as sanctioned or neighboring based on its MAC address</p> <ul style="list-style-type: none"> <li>• mac &lt;MAC&gt; - Optional. Specify the wireless client's MAC address.</li> </ul> |

**Example**

```
rfs6000-81742D(config-device-categorization-rfs6000)#mark-device 1 sanctioned ap
mac 11-22-33-44-55-66

rfs6000-81742D(config-device-categorization-rfs6000)#show context
device-categorization rfs6000
 mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs6000-81742D(config-device-categorization-rfs6000)#
```

**Related Commands**

|           |                                                      |
|-----------|------------------------------------------------------|
| <i>no</i> | Removes an entry from the device categorization list |
|-----------|------------------------------------------------------|

### 4.1.41.2.2 no

#### ▶ *device-categorization-mode commands*

Removes a device from the device categorization list

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no mark-device <1-1000> [neighboring|sanctioned] [ap|client]
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                          |
|-----------------|------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes a mark device (AP or wireless client) entry from this device categorization list |
|-----------------|------------------------------------------------------------------------------------------|

#### Example

The following example shows the device categorization list 'rfs6000' settings before the 'no' command is executed:

```
rfs6000-81742D(config-device-categorization-rfs6000)#show context
device-categorization rfs6000
 mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs6000-81742D(config-device-categorization-rfs6000)#
```

```
rfs6000-81742D(config-device-categorization-rfs6000)#no mark-device 1 sanctioned
ap mac 11-22-33-44-55-66
```

The following example shows the device categorization list 'rfs6000' settings after the 'no' command is executed:

```
rfs6000-81742D(config-device-categorization-rfs6000)#show context
device-categorization rfs6000
rfs6000-81742D(config-device-categorization-rfs6000)#
```

#### Related Commands

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <i>mark-device</i> | Adds a device to a list of sanctioned or neighboring devices |
|--------------------|--------------------------------------------------------------|

## 4.1.42 dhcp-server-policy

### ► Global Configuration Commands

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dhcp-server-policy <DHCP-SERVER-POLICY-NAME>
```

#### Parameters

- dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

|                           |                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------|
| <DHCP-SERVER-POLICY-NAME> | Specify the DHCPv4 server policy name. If the policy does not exist, it is created. |
|---------------------------|-------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#dhcp-server-policy test
rfs6000-81742D(config-dhcp-policy-test)#?
DHCP policy Mode commands:
 bootp BOOTP specific configuration
 dhcp-class Configure DHCP class (for address allocation using DHCP
 user-class options)
 dhcp-pool Configure DHCP server address pool
 dhcp-server Activating dhcp server based on criteria
 no Negate a command or set its defaults
 option Define DHCP server option
 ping Specify ping parameters used by DHCP Server

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-dhcp-policy-test)#
```

#### Related Commands

|           |                                        |
|-----------|----------------------------------------|
| <i>no</i> | Removes an existing DHCP server policy |
|-----------|----------------------------------------|

**NOTE:** For more information on DHCP policy, see [Chapter 12, DHCP-SERVER-POLICY](#).

## 4.1.43 dhcpv6-server-policy

### ► Global Configuration Commands

Creates a DHCPv6 server policy and enters its configuration mode

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>
```

#### Parameters

- dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

|                                                |                                                                                     |
|------------------------------------------------|-------------------------------------------------------------------------------------|
| <code>&lt;DHCPv6-SERVER-POLICY-NAME&gt;</code> | Specify the DHCPv6 server policy name. If the policy does not exist, it is created. |
|------------------------------------------------|-------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-dhcpv6-server-policy-test)#?
DHCPv6 server policy Mode commands:
 dhcpv6-pool Configure DHCPV6 server address pool
 no Negate a command or set its defaults
 option Define DHCPv6 server option
 restrict-vendor-options Restrict vendor specific options to be sent in
 server reply
 server-preference Server preference value sent in the reply, by the
 server to client

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-dhcpv6-server-policy-test)#
```

**Related Commands**

## 4.1.44 dns-whitelist

### ► *Global Configuration Commands*

Configures a DNS whitelist. A DNS whitelist is a list of domains allowed access to the network.

The following table lists DNS Whitelist configuration mode commands:

**Table 4.22** *DNS-Whitelist Config Commands*

| <b>Command</b>                     | <b>Description</b>                                        | <b>Reference</b>  |
|------------------------------------|-----------------------------------------------------------|-------------------|
| <i>dns-whitelist</i>               | Creates a DNS whitelist and enters its configuration mode | <i>page 4-204</i> |
| <i>dns-whitelist-mode commands</i> | Summarizes DNS whitelist configuration mode commands      | <i>page 4-205</i> |

### 4.1.44.1 dns-whitelist

#### ► *dns-whitelist*

Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
dns-whitelist <DNS-WHITELIST-NAME>
```

#### Parameters

- dns-whitelist <DNS-WHITELIST-NAME>

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| <DNS-WHITELIST-NAME> | Specify the DNS whitelist name. If the whitelist does not exist, it is created. |
|----------------------|---------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#dns-whitelist test
rfs6000-81742D(config-dns-whitelist-test)#?
DNS Whitelist Mode commands:
 no Negate a command or set its defaults
 permit Match a host

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-dns-whitelist-test)#
```

#### Related Commands

|           |                                   |
|-----------|-----------------------------------|
| <i>no</i> | Removes an existing DNS Whitelist |
|-----------|-----------------------------------|

#### 4.1.44.2 dns-whitelist-mode commands

▶ *dns-whitelist*

The following table summarizes DNS Whitelist configuration mode commands:

**Table 4.23** *DNS-Whitelist-Mode Commands*

| Command       | Description                                                                          | Reference         |
|---------------|--------------------------------------------------------------------------------------|-------------------|
| <i>permit</i> | Permits a host, existing on a DNS whitelist, access to the network or captive portal | <i>page 4-206</i> |
| <i>no</i>     | Negates a command or reverts to default                                              | <i>page 4-207</i> |

### 4.1.44.2.1 permit

#### ▶ *dns-whitelist-mode commands*

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

#### Parameters

- permit <IPv4/IPv6/HOSTNAME> {suffix}

|                          |                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv4/IPv6/<br>HOSTNAME> | Adds a device to the DNS whitelist <ul style="list-style-type: none"> <li>• &lt;IPv4/IPv6/HOSTNAME&gt; - Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist.</li> </ul> A maximum of 256 entries can be made. |
| suffix                   | Optional. Matches any hostname or domain name including the specified name as suffix                                                                                                                                                                                              |

#### Example

```
rfs6000-81742D(config-dns-whitelist-test)#permit example_company.com suffix

rfs6000-81742D(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
rfs6000-81742D(config-dns-whitelist-test)#
```

#### Related Commands

|           |                               |
|-----------|-------------------------------|
| <i>no</i> | Removes a DNS whitelist entry |
|-----------|-------------------------------|

**4.1.44.2.2 no**▶ *dns-whitelist-mode commands*

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no permit <IPv4/IPv6/HOSTNAME>
```

**Parameters**

- no permit <IPv4/IPv6/HOSTNAME>

|                          |                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv4/IPv6/<br>HOSTNAME> | Removes a device from the DNS whitelist (identifies the device by its IP address or hostname) <ul style="list-style-type: none"> <li>• &lt;IPv4/IPv6/HOSTNAME&gt; - Specify the device's IPv4/IPv6 address or hostname.</li> </ul> |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
rfs6000-81742D(config-dns-whitelist-test)#

rfs6000-81742D(config-dns-whitelist-test)#no permit example_company.com

rfs6000-81742D(config-dns-whitelist-test)#show context
dns-whitelist test
rfs6000-81742D(config-dns-whitelist-test)#
```

**Related Commands**

|---------------|------------------------------------|
| <i>permit</i> | Adds a device to the DNS whitelist |
|---------------|------------------------------------|

## 4.1.45 end

### ► *Global Configuration Commands*

Ends and exits the current mode and moves to the PRIV EXEC mode

The prompt changes to the PRIV EXEC mode.

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
end
```

#### **Parameters**

None

#### **Example**

```
rfs4000-229D58 (config) #end
rfs4000-229D58 #
```

## 4.1.46 event-system-policy

### ► *Global Configuration Commands*

The following table lists event system configuration mode commands:

**Table 4.24** *Event-System-Policy Config Command*

| Command                                  | Description                                                      | Reference         |
|------------------------------------------|------------------------------------------------------------------|-------------------|
| <i>event-system-policy</i>               | Creates an event system policy and enters its configuration mode | <i>page 4-210</i> |
| <i>event-system-policy-mode commands</i> | Summarizes event system policy configuration mode commands       | <i>page 4-211</i> |

### 4.1.46.1 event-system-policy

#### ► *event-system-policy*

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administrated in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the *show > event-system-policy* command.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
event-system-policy <EVENT-SYSTEM-POLICY-NAME>
```

#### Parameters

- *event-system-policy* <EVENT-SYSTEM-POLICY-NAME>

|                            |                                                                                    |
|----------------------------|------------------------------------------------------------------------------------|
| <EVENT-SYSTEM-POLICY-NAME> | Specify the event system policy name. If the policy does not exist, it is created. |
|----------------------------|------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81701D(config)#event-system-policy event-testpolicy
rfs6000-81701D(config-event-system-policy-event-testpolicy)#?
Event System Policy Mode commands:
 event Configure an event
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81701D(config-event-system-policy-event-testpolicy)#
```

#### Related Commands

|           |                                |
|-----------|--------------------------------|
| <i>no</i> | Removes an event system policy |
|-----------|--------------------------------|

#### 4.1.46.2 event-system-policy-mode commands

▶ *event-system-policy*

The following table summarizes event system policy configuration mode commands:

**Table 4.25** *Event-System-Policy Mode Commands*

| Command      | Description                             | Reference         |
|--------------|-----------------------------------------|-------------------|
| <i>event</i> | Configures an event                     | <i>page 4-212</i> |
| <i>no</i>    | Negates a command or reverts to default | <i>page 4-225</i> |

#### 4.1.46.2.1 event

► *event-system-policy-mode commands*

Configures an event and sets the action performed when the event happens

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
event <EVENT-TYPE> <EVENT-NAME> (email, forward-to-switch, snmp, syslog)
[default|on|off]
The event types are:
```

```

| snmp              | Logs an SNMP event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| syslog            | Logs an event to syslog                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| default           | Performs the default action for the event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| off               | Switches the event off, when the event happens, and no action is performed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| on                | Switches the event on, when the event happens, and the configured action is taken                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Example**

```
rfs4000-229D58(config-event-system-policy-event-testpolicy)#event aaa radius-
discon-msg email on forward-to-switch default snmp default syslog default
rfs4000-229D58(config-event-system-policy-event-testpolicy)#

rfs4000-229D58(config-event-system-policy-testpolicy)#show context
event-system-policy test
 event aaa radius-discon-msg email on
rfs4000-229D58(config-event-system-policy-testpolicy)#

nx9500-6C8809(config-event-system-policy-test)#event database database-exception
syslog default snmp default forward-to-switch default email default

nx9500-6C8809(config-event-system-policy-test)#event database operation-failed
syslog default snmp default forward-to-switch default email default
```

```
nx9500-6C8809(config-event-system-policy-test)#show context include-factory |
grep operation-failed
 event database operation-failed syslog default snmp default forward-to-switch
 default email default
nx9500-6C8809(config-event-system-policy-test)#
```

**Related Commands**

|-----------|-------------------------------------|
| <i>no</i> | Resets or disables event monitoring |
|-----------|-------------------------------------|

**4.1.46.2.2 no**▶ *event-system-policy-mode commands*

Negates an event monitoring configuration

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no event <EVENT-TYPE> <EVENT-NAME> [email|forward-to-switch|snmp|syslog]
[default|on|off]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes event monitoring and message forwarding activity based on the parameters passed<br><br>The system stops network monitoring for the occurrence of the specified event and no notification is sent if the event occurs. |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs4000-229D58(config-event-system-policy-TestPolicy)#event ap adopted syslog
default
```

```
rfs4000-229D58(config-event-system-policy-TestPolicy)#no event ap adopted syslog
```

## 4.1.47 ex3500

### ► GLOBAL CONFIGURATION COMMANDS

The following table lists EX3500 time-range configuration mode commands. It also provides links to other EX3500 related configuration modes:

**Table 4.26** *EX3500-Time-Range-List Config Command*

| Command                                       | Description                                                              | Reference         |
|-----------------------------------------------|--------------------------------------------------------------------------|-------------------|
| <i>ex3500</i>                                 | Creates an EX3500 time range list and enters its configuration mode      | <i>page 4-227</i> |
| <i>ex3500-time-range-config-mode commands</i> | Summarizes EX3500 time range list configuration mode commands            | <i>page 4-228</i> |
| <i>ex3500-management-policy</i>               | Creates an EX3500 management policy and enters its configuration mode    | <i>page 4-233</i> |
| <i>ex3500-qos-class-map-policy</i>            | Creates an EX3500 QoS class map policy and enters its configuration mode | <i>page 4-254</i> |
| <i>ex3500-qos-policy-map</i>                  | Creates an EX3500 QoS policy map and enters its configuration mode       | <i>page 4-262</i> |
| <i>ex3524</i>                                 | Adds a EX3524 switch to the network                                      | <i>page 4-277</i> |
| <i>ex3548</i>                                 | Adds a EX3548 switch to the network                                      | <i>page 4-279</i> |

### 4.1.47.1 ex3500

#### ► ex3500

Creates an EX3500 time range list and enters its configuration mode

An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four *Small Form Factor Pluggable* (SFP) transceiver slots for fiber connectivity. The EX3500 series switch can adopt to a WiNG NOC controller and be managed by it. The EX3500 time range values configured here are used in EX3500 MAC ACL firewall rules that filter an EX3500's incoming and outgoing traffic. For more information on creating EX3500 MAC ACL rules, see [ex3500](#) and [access-group](#).

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
ex3500 time-range <TIME-RANGE-NAME>
```

#### Parameters

- ex3500 time-range <TIME-RANGE-NAME>

|                                        |                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 time-range<br><TIME-RANGE-NAME> | Configures EX3500 time range list and enters its configuration mode <ul style="list-style-type: none"> <li>• &lt;TIME-RANGE-NAME&gt; - Enter a name for this EX3500 time range. If the time range does not exist, it is created.</li> </ul> |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#ex3500 time-range EX3500_TimeRange_02
nx9500-6C8809(config-ex3500-time-range-EX3500_TimeRange_02)#?
EX3500 Time Range Configuration commands:
 absolute Absolute time and date
 no Negate a command or set its defaults
 periodic Periodic time and date

### 4.1.47.2 ex3500-time-range-config-mode commands

#### ▶ ex3500

The following table summarizes EX3500 time-range configuration mode commands:

**Table 4.27** EX3500-Time-Range-Mode Commands

| Command         | Description                                                            | Reference         |
|-----------------|------------------------------------------------------------------------|-------------------|
| <i>absolute</i> | Configures an absolute time range rule for this EX3500 time range list | <i>page 4-229</i> |
| <i>periodic</i> | Configures a periodic time range rule for this EX3500 time range list  | <i>page 4-230</i> |
| <i>no</i>       | Removes this EX3500 time range list settings                           | <i>page 4-232</i> |

### 4.1.47.2.1 absolute

#### ▶ *ex3500-time-range-config-mode commands*

Configures an absolute time range rule for this EX3500 time range list

Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31>
<MONTH> <2013-2037>}
```

#### Parameters

```
• absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31>
<MONTH> <2013-2037>}
```

|-----------|-----------------------------------------------------------------------|

### 4.1.47.2.2 periodic

▶ *ex3500-time-range-config-mode commands*

Configures a periodic time range rule for this EX3500 time range list

Periodic time ranges are configured to recur based on periodicity such as daily, weekly, weekends, weekdays, and on specific week days, such as on every successive Sunday.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|
weekdays|weekend] <0-23> <0-59> to [<023> <0-59>|daily|friday|monday|saturday|
sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence
<1-7>
```

#### Parameters

```
• periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|
weekdays|weekend] <0-23> <0-59> to [<023> <0-59>|daily|friday|monday|saturday|
sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence
<1-7>
```

## 4.1.48 ex3500-management-policy

### ► *Global Configuration Commands*

The following table lists EX3500 management policy configuration mode commands:

**Table 4.28** *EX3500-Management-Policy Config Command*

| Command                                         | Description                                                              | Reference         |
|-------------------------------------------------|--------------------------------------------------------------------------|-------------------|
| <i>ex3500-management-policy</i>                 | Creates an EX3500 management policy and enters its configuration mode    | <i>page 4-234</i> |
| <i>ex3500-management-policy config commands</i> | Summarizes EX3500 management policy configuration mode commands          | <i>page 4-236</i> |
| <i>ex3500</i>                                   | Creates an EX3500 time range list and enters its configuration mode      | <i>page 4-226</i> |
| <i>ex3500-qos-class-map-policy</i>              | Creates an EX3500 QoS class map policy and enters its configuration mode | <i>page 4-254</i> |
| <i>ex3500-qos-policy-map</i>                    | Creates an EX3500 QoS policy map and enters its configuration mode       | <i>page 4-262</i> |
| <i>ex3524</i>                                   | Adds a EX3524 switch to the network                                      | <i>page 4-277</i> |
| <i>ex3548</i>                                   | Adds a EX3548 switch to the network                                      | <i>page 4-279</i> |

### 4.1.48.1 ex3500-management-policy

#### ► *ex3500-management-policy*

Creates an EX3500 management policy and enters its configuration mode. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

The EX3500 management policy is either applied:

- Individually on an adopted EX3500 series switch (in the device configuration mode), or
- To a EX3524 and/or EX3548 profile, which is then applied to an adopted EX3500 series switch.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX9500 and NX7500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

WiNG can partially manage an EX3500 without using DHCP option 193, provided the EX3500 is directly configured to specify the IPv4 addresses of potential WiNG adopters. To identify the potential WiNG adopter, in the EX3500's device configuration mode specify the adopter's IPv4 address using the *controller > host > <IP-ADDRESS>* command. WiNG service platforms leave the proprietary operating system running the EX3500 switches unmodified, and partially manage them utilizing standardized WiNG interfaces. WiNG service platforms use a translation layer to communicate with the EX3500.

#### **Supported in the following platforms:**

- Service Platforms — NX7500, NX9500

#### **Syntax**

```
ex3500-management-policy <POLICY-NAME>
```

#### **Parameters**

- *ex3500-management-policy <POLICY-NAME>*

|                            |                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------|
| <i>&lt;POLICY-NAME&gt;</i> | Specify the EX3500 management policy name. If the policy does not exist, it is created. |
|----------------------------|-----------------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config)#ex3500-management-policy test
nx9500-6C8809(config-ex3500-management-policy-test)#?
EX3500 Management Mode commands:
enable Modifies enable password parameters
http Hyper Text Terminal Protocol (HTTP)
memory Memory utilization
no Negate a command or set its defaults
process-cpu Process-cpu utilization
snmp-server Enable SNMP server configuration
ssh Secure Shell server connections
username Login TACACS server port

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-management-policy-test)#

```

**Related Commands**

|           |                                       |
|-----------|---------------------------------------|
| <i>no</i> | Removes this EX3500 management policy |
|-----------|---------------------------------------|

#### 4.1.48.2 ex3500-management-policy config commands

##### ► *ex3500-management-policy*

The following table summarizes EX3500 management policy configuration mode commands:

**Table 4.29** *EX3500-Management-Policy Config Mode Commands*

| Command            | Description                                                                                                                                                                                                           | Reference         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>enable</i>      | Configures an executive password for this EX3500 management policy                                                                                                                                                    | <i>page 4-237</i> |
| <i>http</i>        | Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch                                                                                                                           | <i>page 4-239</i> |
| <i>memory</i>      | Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values                                                                                                                        | <i>page 4-240</i> |
| <i>process-cpu</i> | Configures the EX3500's CPU (processor) utilization rising (upper) and falling (lower) threshold values                                                                                                               | <i>page 4-241</i> |
| <i>snmp-server</i> | Configures <i>Simple Network Management Protocol</i> (SNMP) server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP. | <i>page 4-242</i> |
| <i>ssh</i>         | Configures the SSH server settings used to authenticate Secure Shell (SSH) connection to a EX3500 switch                                                                                                              | <i>page 4-249</i> |
| <i>username</i>    | Configures a EX3500 switch user settings                                                                                                                                                                              | <i>page 4-251</i> |
| <i>no</i>          | Removes or reverts this EX3500 management policy settings                                                                                                                                                             | <i>page 4-252</i> |

### 4.1.48.2.1 enable

#### ▶ *ex3500-management-policy config commands*

Configures an executive password for this EX3500 management policy

Each EX3500 management policy can have a unique executive password with its own privilege level assigned. Utilize these passwords as specific EX3500 management sessions require priority over others.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
enable password [0|7|level]
```

```
enable password [0|7] <PASSWORD>
```

```
enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]
```

#### Parameters

- `enable password [0|7] <PASSWORD>`

|                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>enable password [0 7] &lt;PASSWORD&gt;</code>                                                                                         | <p>Creates a new executive password for this EX3500 management policy. The password could be in clear text or encrypted</p> <ul style="list-style-type: none"> <li>• 0 - Configures a clear text password using ASCII characters (should be 1 - 32 characters long)</li> <li>• 7 - Configures an encrypted password using HEX characters (should be 32 characters long)</li> <li>• &lt;PASSWORD&gt; - Specify the password.</li> </ul> |
| <ul style="list-style-type: none"> <li>• <code>enable password level &lt;0-15&gt; [0 &lt;PASSWORD&gt; 7 &lt;PASSWORD&gt;]</code></li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>enable password level &lt;0-15&gt;</code>                                                                                             | <p>Creates a new executive password for this EX3500 management policy and sets its privilege level</p> <ul style="list-style-type: none"> <li>• &lt;0-15&gt; - Specify the privilege level for this executive password from 0 - 15. Lower values have higher priority, to slot and prioritize executive passwords and EX3500 management sessions.</li> </ul>                                                                           |
| <code>[0 7] &lt;PASSWORD&gt;</code>                                                                                                         | <p>After setting the privilege level, configure the password, which could be in clear text or encrypted</p> <ul style="list-style-type: none"> <li>• 0 - Configures a clear text password using ASCII characters (should be 1 - 32 characters long)</li> <li>• 7 - Configures an encrypted password using HEX characters (should be 32 characters long)</li> <li>• &lt;PASSWORD&gt; - Specify the password.</li> </ul>                 |

#### Example

```

nx9500-6C8809(config-ex3500-management-policy-test)#enable password level 3 7
12345678901020304050607080929291

nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809(config-ex3500-management-policy-test)#

```

**Related Commands**

|           |                                                                 |
|-----------|-----------------------------------------------------------------|
| <i>no</i> | Removes a executive password from this EX3500 management policy |
|-----------|-----------------------------------------------------------------|

### 4.1.48.2.2 http

► *ex3500-management-policy config commands*

Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
http [port <1-65535>|secure-port <1-65535>|secure-server|server]
```

#### Parameters

- `http [port <1-65535>|secure-port <1-65535>|secure-server|server]`

|                                          |                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>http</code>                        | Configures following HTTP settings: port, secure-port, secure-server, and server                                                                                                                                                                                                                         |
| <code>port &lt;1-65535&gt;</code>        | Configures the HTTP port number. This is the port used to connect to the HTTP server. <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify a value from 1 - 65535. The default port is 80.</li> </ul>                                                                                      |
| <code>secure-port &lt;1-65535&gt;</code> | Enables secure HTTP connection over a designated secure port. Ensure that the HTTP secure server is enabled before specifying the secure-server port. <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify the secure HTTP server port from 1 - 65535. The default port is 443.</li> </ul> |
| <code>secure-server</code>               | Enables HTTP secure server. This option is disabled by default.                                                                                                                                                                                                                                          |
| <code>server</code>                      | Enables HTTP server. This option is enabled by default. Consequently, HTTP management access is allowed by default.                                                                                                                                                                                      |

#### Example

```

nx9500-6C8809 (config-ex3500-management-policy-test)#http secure-server

nx9500-6C8809 (config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 http secure-server
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809 (config-ex3500-management-policy-test)#

```

#### Related Commands

|           |                                                                             |
|-----------|-----------------------------------------------------------------------------|
| <i>no</i> | Reverts to default HTTP server settings (HTTP server enabled, HTTP port 80) |
|-----------|-----------------------------------------------------------------------------|

### 4.1.48.2.3 memory

#### ► *ex3500-management-policy config commands*

Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the memory utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
memory [falling-threshold|rising-threshold] <1-100>
```

#### Parameters

- memory [falling-threshold|rising-threshold] <1-100>

|                              |                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| memory                       | Configures the EX3500's memory utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.                                                           |
| falling-threshold<br><1-100> | Configures the falling threshold for the EX3500 memory utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the falling threshold as a percentage from 1 - 100. The default is 70%.</li> </ul> |
| rising-threshold<br><1-100>  | Configures the rising threshold for the EX3500's memory utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the rising threshold as a percentage from 1 - 100. The default is 90%.</li> </ul> |

#### Example

```
nx9500-6C8809(config-ex3500-management-policy-test)#memory falling-threshold 50
nx9500-6C8809(config-ex3500-management-policy-test)#memory rising-threshold 95

|-----------|--------------------------------------------------------------------------------------------------------|
| <i>no</i> | Reverts the memory utilization's falling-threshold and/or rising threshold to 70% and 90% respectively |
|-----------|--------------------------------------------------------------------------------------------------------|

#### 4.1.48.2.4 process-cpu

► *ex3500-management-policy config commands*

Configures the EX3500's CPU (processor) utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the CPU utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

#### Parameters

- process-cpu [falling-threshold|rising-threshold] <1-100>

|                              |                                                                                                                                                                                                                       |

#### 4.1.48.2.5 snmp-server

► *ex3500-management-policy config commands*

Configures *Simple Network Management Protocol* (SNMP) server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

SNMP is an application layer protocol that facilitates the exchange of management information between the management stations and a managed EX3500 switch. SNMP-enabled devices listen on port 162 (by default) for SNMP packets from the management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string is used to gather statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system's performance and other parameters.

##### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

##### Syntax

```
snmp-server {community|contact|enable|engine-id|group|host|location|notify-
filter|user|view}

snmp-server {community <STRING> {ro|rw}}

snmp-server {contact <NAME>}

snmp-server {enable traps {authentication|link-up-down}}

snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}

snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|
read <WORD>|write <WORD>}}

snmp-server {host <IP> [<STRING>|inform]}

snmp-server {host <IP> <STRING> version [v1|v2c|v3 [auth|noauth|priv]] {udp-port
<1-65535>}}

snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>] <STRING>
version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}}

snmp-server {location <WORD>}

snmp-server {notify-filter <WORD> remote <IP>}

snmp-server {user <USER-NAME> <GROUP-NAME> [remote-host|v1|v2c|v3]}

snmp-server {user <USER-NAME> <GROUP-NAME> remote-host <IP> v3 [auth|encrypted
auth] [md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|des56] <WORD>}}

snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}

snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}
```

**Parameters**

- `snmp-server {community <STRING> {ro|rw}}`

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### 4.1.48.2.6 ssh

#### ► *ex3500-management-policy config commands*

Configures the SSH server settings used to authenticate *Secure Shell* (SSH) connection to a EX3500 switch

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

#### Parameters

- ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]

|                              |                                                                                                                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ssh                          | Enables SSH management access to an EX3500 switch. This option is disabled by default. Use this command to configure SSH access settings.                                                                                                                                                                                  |
| authentication-retries <1-5> | Configures the maximum number of retries made to connect to the SSH server resource <ul style="list-style-type: none"> <li>• &lt;1-5&gt; - Specify a value from 1 - 5. The default setting is 3.</li> </ul>                                                                                                                |
| server                       | Enables SSH server connection                                                                                                                                                                                                                                                                                              |
| server-key size <512-1024>   | Configures the SSH server key size <ul style="list-style-type: none"> <li>• &lt;512-1024&gt; - Specify the SSH server key from 512 - 1,024. The default length is 768.</li> </ul>                                                                                                                                          |
| timeout <1-120>              | Configures the SSH server resource inactivity timeout value in seconds. When the specified time is exceeded, the SSH server resource becomes unreachable and must be re-authenticated. <ul style="list-style-type: none"> <li>• &lt;1-120&gt; - Specify a value from 1 120 seconds. The default is 120 seconds.</li> </ul> |

#### Example

```
nx9500-6C8809(config-ex3500-management-policy-test)#ssh authentication-retries 4

### 4.1.48.2.7 username

#### ▶ *ex3500-management-policy config commands*

Configures a EX3500 switch user settings

The EX3500 switch user details are stored in a local database on the NX9500, NX7500, or WiNG VM. You can configure multiple users, each having a unique name, access level, and password.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

#### Parameters

- username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]

|                              |                                                                                                                                                                                                                                                                                         |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username<br><USER-NAME>      | Configures the TACACS server port username <ul style="list-style-type: none"> <li>• &lt;USER-NAME&gt; - Specify the user name (should not exceed 32 characters)</li> </ul>                                                                                                              |
| access-level <0-15>          | Configures the access level for this user. This value determines the access priority of each user requesting access and interoperability with EX3500 switch. <ul style="list-style-type: none"> <li>• &lt;0-15&gt; - Specify the access level from 0 - 15. The default is 0.</li> </ul> |
| nopassword                   | Allows user to login without a password                                                                                                                                                                                                                                                 |
| password [0 7]<br><PASSWORD> | Configures the password for this user <ul style="list-style-type: none"> <li>• 0 - Configures a plain text password</li> <li>• 7 - Configures an encrypted password (should be 32 characters in length)</li> <li>• &lt;PASSWORD&gt; - Specify the password.</li> </ul>                  |

#### Example

## 4.1.49 ex3500-qos-class-map-policy

### ► Global Configuration Commands

The following table lists EX3500 QoS class map policy configuration mode commands:

**Table 4.30** *EX3500-QoS-Class-Map Config Command*

| Command                                            | Description                                                              | Reference         |
|----------------------------------------------------|--------------------------------------------------------------------------|-------------------|
| <i>ex3500-qos-class-map-policy</i>                 | Creates an EX3500 QoS class map policy and enters its configuration mode | <i>page 4-255</i> |
| <i>ex3500-qos-class-map-policy config commands</i> | Summarizes EX3500 QoS class map policy configuration mode commands       | <i>page 4-256</i> |
| <i>ex3500-qos-policy-map</i>                       | Creates an EX3500 QoS policy map and enters its configuration mode       | <i>page 4-262</i> |
| <i>ex3500</i>                                      | Creates an EX3500 time range list and enters its configuration mode      | <i>page 4-226</i> |
| <i>ex3500-management-policy</i>                    | Creates an EX3500 management policy and enters its configuration mode    | <i>page 4-233</i> |
| <i>ex3524</i>                                      | Adds a EX3524 switch to the network                                      | <i>page 4-277</i> |
| <i>ex3548</i>                                      | Adds a EX3548 switch to the network                                      | <i>page 4-279</i> |

### 4.1.49.1 ex3500-qos-class-map-policy

#### ► *ex3500-qos-class-map-policy*

Creates a EX3500 *Quality of Service* (QoS) class map policy and enters its configuration mode

A QoS class map policy contains a set of *Differentiated Services* (DiffServ) classification criteria that are used to classify incoming traffic into different category and provide differentiated service based on this classification. Each policy defines a set match criteria rules that use objects, such as access lists, IP precedence or DSCP values, and VLANs. When configured and applied, the policy classifies traffic based on layer 2, layer 3, or layer 4 information contained in each incoming packet.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
ex3500-qos-class-map-policy <POLICY-NAME>
```

#### Parameters

- `ex3500-qos-class-map-policy <POLICY-NAME>`

|                                  |                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------|
| <code>&lt;POLICY-NAME&gt;</code> | Specify the EX3500 QoS class map policy name. If the policy does not exist, it is created. |
|----------------------------------|--------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#ex3500-qos-class-map-policy dscp
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#?
EX3500_Qos_class_map Mode commands:
 description Class-map description
 match Defines the match criteria to classify traffic
 no Negate a command or set its defaults
 rename Redefines the name of class-map

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

### 4.1.49.2.1 description

▶ *ex3500-qos-class-map-policy config commands*

Configures this EX3500 QoS class map policy's description

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
description <LINE>
```

#### Parameters

- description <LINE>

|                    |                                                                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <LINE> | Configures this EX3500 QoS class map policy's description <ul style="list-style-type: none"> <li>• &lt;LINE&gt; - Enter a description that allows to you differentiate it from other policies with similar configuration (should not exceed 64 characters)</li> </ul> |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#description "Matches
packets marked for DSCP service 3"
```

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

#### Related Commands

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>no</i> | Removes this EX3500 QoS class map policy's description |
|-----------|--------------------------------------------------------|

### 4.1.49.2.2 match

► *ex3500-qos-class-map-policy config commands*

Configures match criteria rules used to classify traffic

Access lists, IP precedence, DSCP values, or VLANs are commonly used to classify traffic. Access lists select traffic based on layer 2, layer 3, or layer 4 information contained in each packet.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

#### Parameters

```
• match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

| vlan <1-4094>                         | <p>Configures the VLAN to match</p> <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN ID.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Usage Guidelines

When configuring match entries, take into consideration the following points:

- Deny rules included in an ACL (associated with a EX3500 QoS class map policy) are ignored whenever an incoming packet matches the ACL.
- A class map policy cannot include both IP ACL or IP precedence rule and a VLAN rule.
- A class map policy containing a MAC ACL or VLAN rule cannot include either an IP ACL or a IP precedence rule.
- A class map policy can include a maximum of 16 match entries.

### Example

```

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#match ip dscp 3

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
 match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#

nx9500-6C8809(config-ex3500-qos-class-map-policy-test2)#match ip precedence 1

```

### 4.1.49.2.3 rename

► *ex3500-qos-class-map-policy config commands*

Renames an existing EX3500 QoS class map policy

**Supported in the following platforms:**

- Service Platforms — NX7500, NX9500

**Syntax**

```
rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>
```

**Parameters**

- rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>

|                                                                                     |                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rename <EX3500-QOS-CLASS-MAP-POLICY-NAME><br><NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME> | <p>Renames an existing EX3500 QoS class map</p> <ul style="list-style-type: none"> <li>• &lt;EX3500-QOS-CLASS-MAP-POLICY-NAME&gt; - Enter the EX3500 QoS class map's current name.</li> <li>• &lt;NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME&gt; - Enter the new name.</li> </ul> |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp test test2
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename test2 IP_Precedence

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp IP_Precedence test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#

```

**4.1.49.2.4 no**

▶ *ex3500-qos-class-map-policy config commands*

Removes this EX3500 QoS class map policy's description and match criteria

**Supported in the following platforms:**

- Service Platforms — NX7500, NX9500

**Syntax**

```
no [description|match]

no description

no match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl]
<ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes the EX3500 QoS class map policy's settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------------|

**Example**

The following example shows the EX3500 QoS class map policy 'test' settings before the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
 match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no description
```

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no match ip dscp
```

The following example shows the EX3500 QoS class map policy 'test' settings after the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

## 4.1.50 ex3500-qos-policy-map

### ► *Global Configuration Commands*

The following table lists EX3500 QoS policy map configuration mode commands:

**Table 4.32** *EX3500-QoS-Policy-Map Config Command*

| Command                                      | Description                                                   | Reference         |
|----------------------------------------------|---------------------------------------------------------------|-------------------|
| <i>ex3500-qos-policy-map</i>                 | Creates a EX3500 policy map and enters its configuration mode | <i>page 4-263</i> |
| <i>ex3500-qos-policy-map config commands</i> | Summarizes EX3500 QoS policy map configuration mode commands  | <i>page 4-264</i> |

### 4.1.50.1 ex3500-qos-policy-map

#### ► *ex3500-qos-policy-map*

Creates an EX3500 policy map and enters its configuration mode

An EX3500 policy map contains one or more EX3500 QoS class maps traffic classifications (existing and configured) and can be attached to multiple interfaces. Creates an EX3500 policy map, and then use the class parameter to configure policies for traffic that matches the criteria defined in the EX3500 QoS class map policy. For more information, see *match*.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

#### Parameters

- `ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>`

|                                                 |                                      |
|-------------------------------------------------|--------------------------------------|
| <code>&lt;EX3500-QOS-POLICY-MAP-NAME&gt;</code> | Specify the EX3500 policy map's name |
|-------------------------------------------------|--------------------------------------|

#### Example

```
nx9500-6C8809(config)#ex3500-qos-policy-map testPolicyMap
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#?
EX3500_Qos_policy_map Mode commands:

### 4.1.50.2 ex3500-qos-policy-map config commands

#### ▶ *ex3500-qos-policy-map*

The following table summarizes EX3500 QoS policy map configuration mode commands:

**Table 4.33** *EX3500-QoS-Policy-Map Commands*

| Command            | Description                                                                                                                                               | Reference         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>class</i>       | Creates a policy map class and enters its configuration mode                                                                                              | <i>page 4-265</i> |
| <i>description</i> | Configures this EX3500 QoS policy map's description                                                                                                       | <i>page 4-275</i> |
| <i>no</i>          | Removes this EX3500 QoS policy map's settings. Use this keyword to remove or modify the description and to remove the QoS traffic classification created. | <i>page 4-276</i> |

### 4.1.50.2.1 class

#### ▶ *ex3500-qos-policy-map config commands*

Creates a policy map class and enters its configuration mode. The policy map class is a traffic classification upon which a policy can act.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

#### Parameters

- class <EX3500-QoS-CLASS-MAP-POLICY-NAME>

|                                    |                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------|
| <EX3500-QoS-CLASS-MAP-POLICY-NAME> | Specify the EX3500 QoS class map policy's name (should be existing and configured) |
|------------------------------------|------------------------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#class dscp
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#?
commands:
 no Negate a command or set its defaults
 police Defines a policer for classified traffic
 set Classify IP traffic

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode

#### 4.1.50.2.2 ex3500-qos-policy-map-class-config commands

▶ *class*

The following table summarizes the policy map class configuration mode commands

**Table 4.34** EX3500-Policy-Map-Class Config Command

| Command       | Description                                                                                                          | Reference         |
|---------------|----------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>police</i> | Configures an enforcer for classified traffic                                                                        | <i>page 4-267</i> |
| <i>set</i>    | Sets <i>class of service</i> (CoS) value, <i>per-hop behavior</i> (PHB) value, and IP DSCP value in matching packets | <i>page 4-272</i> |
| <i>no</i>     | Removes this traffic classification's settings                                                                       | <i>page 4-274</i> |

### 4.1.50.2.3 police

▶ *ex3500-qos-policy-map-class-config commands*

Configures an enforcer for classified traffic

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
police [flow|srtcm-color-aware|srtcm-color-blind|trtcm-color-aware|trtcm-color-blind]
```

```
police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]
```

```
police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]
```

```
police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]
```

#### Parameters

- `police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]`

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| [srtcm-color-aware srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000>                                                                                                                                    | <p>Configures an enforcer for classified traffic based on <i>single rate three color meter</i> (srTCM) mode. The srTCM as defined in RFC 2697 meters a traffic stream and processes its packets according to three traffic parameters - <i>Committed Information Rate</i> (CIR), <i>Committed Burst Size</i> (BC), and <i>Excess Burst Size</i> (BE).</p> <ul style="list-style-type: none"> <li>srtcm-color-blind - Single rate three color meter in color-blind mode</li> <li>srtcm-color-aware - Single rate three color meter in color-aware mode</li> </ul> <p>The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.</p> <ul style="list-style-type: none"> <li>&lt;0-1000000&gt; - Configures the CIR from 0 -1000000 kilobits per second.</li> <li>&lt;0-16000000&gt; - Configures the BC from 0 - 1600000 bytes.</li> <li>&lt;0-16000000&gt; - Configures the BE from 0 - 1600000 bytes.</li> </ul> <p>The behavior of the meter is specified in terms of its mode and two token buckets, C and E, which both share the common rate CIR. The maximum size of the token bucket C is BC and the maximum size of the token bucket E is BE.</p> <p>The token buckets C and E are initially full, that is, the token count <math>T_c(0) = BC</math> and the token count <math>T_e(0) = BE</math>. Thereafter, the token counts <math>T_c</math> and <math>T_e</math> are updated CIR times per second as follows:</p> <ul style="list-style-type: none"> <li>If <math>T_c</math> is less than BC, <math>T_c</math> is incremented by one, else</li> <li>If <math>T_e</math> is less than BE, <math>T_e</math> is incremented by one, else</li> <li>neither <math>T_c</math> nor <math>T_e</math> is incremented.</li> </ul> <p>When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-blind mode:</p> <ul style="list-style-type: none"> <li>If <math>T_c(t)-B &gt; 0</math>, the packet is green and <math>T_c</math> is decremented by B down to the minimum value of 0, else</li> <li>if <math>T_e(t)-B &gt; 0</math>, the packets is yellow and <math>T_e</math> is decremented by B down to the minimum value of 0,</li> <li>else the packet is red and neither <math>T_c</math> nor <math>T_e</math> is decremented.</li> </ul> <p>Contd..</p> |

The trTCM as defined in RFC 2698 meters a traffic stream and processes its packets based on two rates - <i>Committed Information Rate</i> (CIR) and <i>Peak Information Rate</i> (PIR), and their associated burst sizes - <i>Committed Burst Size</i> (BC) and <i>Peak Burst Size</i> (BP).</p> <ul style="list-style-type: none"> <li>• trtcm-color-blind - Two rate three color meter in color-blind mode</li> <li>• trtcm-color-aware - Two rate three color meter in color-aware mode <ul style="list-style-type: none"> <li>• <code>&lt;0-1000000&gt;</code> - Configures the CIR from 0 - 1000000 kilobits per second <ul style="list-style-type: none"> <li>• <code>&lt;0-16000000&gt;</code> - Configures the BC from 0 - 1600000 bytes. <ul style="list-style-type: none"> <li>• <code>&lt;0-1000000&gt;</code> - Configures the PIR from 0 - 1000000 kilobits per second</li> <li>• <code>&lt;0-16000000&gt;</code> - Configures the BP from 0 - 1600000 bytes</li> </ul> </li> </ul> </li> </ul> </li> </ul> <p>The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.</p> <p>Contd..</p> |

**Usage Guidelines**

When configuring the traffic class enforcer parameters, take into consideration the following factors:

- You can configure up to 200 enforcers/policers (i.e., class maps) for ingress ports.
- The committed-rate cannot exceed the configured interface speed, and the committed-burst cannot exceed 16 Mbytes.

**Example**

The following example uses the police trtcm-color-blind command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

#### 4.1.50.2.4 set

▶ *ex3500-qos-policy-map-class-config commands*

Sets *class of service* (CoS) value, *per-hop behavior* (PHB) value, and IP DSCP value in matching packets

##### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

##### Syntax

```
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

##### Parameters

- set [cos <0-7>|ip dscp <0-63>|phb <0-7>]

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| set            | Sets the match criteria used to identify and classify traffic into different classes. The match criteria options are: CoS, IP DSCP, and PHB values.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| cos <0-7>      | Configures the CoS value for a matching packet (as specified by the match command) in the packet's VLAN tag <ul style="list-style-type: none"> <li>• &lt;0-7&gt; - Specify a value from 0 - 7. The CoS is modified to the value specified here.</li> </ul>                                                                                                                                                                                                                                                                                                                      |
| ip dscp <0-63> | Modifies the IP DSCP value in a matching packet (as specified by the match command) <ul style="list-style-type: none"> <li>• &lt;0-63&gt; - Specify a value from 0 - 63. The DSCP value is modified to the value specified here.</li> </ul>                                                                                                                                                                                                                                                                                                                                     |
| phb <0-7>      | Configures a PHB value for a matching packets <ul style="list-style-type: none"> <li>• &lt;0-7&gt; - Specify a value from 0 - 7.</li> </ul> <p>The PHB label is composed of five bits, three bits for per-hop behavior, and two bits for the color scheme used to control queue congestion. A packet is marked green, yellow, or red as per the following:</p> <ul style="list-style-type: none"> <li>• green if it does not exceed the CIR and BC limits</li> <li>• yellow if it exceeds the CIR and BC limits, but not the BE limit, and</li> <li>• red otherwise.</li> </ul> |

##### Example

The following example uses the *set > phb* command to classify the service that incoming packets will receive, and then uses the *police > trtcm-color-blind* command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000 bytes, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
nx9500-6C8809 (config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2) #set
phb 3

nx9500-6C8809 (config-ex3500-qos-policy-map-testPolicyMap-pmap-class-
test2) #police
trtcm-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-action
0 violate-action drop

nx9500-6C8809 (config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2) #show
context
class test2
set phb 3
police trtcm-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-
action 0 violate-action drop
nx9500-6C8809 (config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2) #
```

The following example uses the `set > ip dscp` command to classify the service that incoming packets will receive, and then uses the `police > flow` command to limit the average bandwidth to 100,000 Kbps, the burst rate to 4000 bytes, and configure the response to drop any violating packets:

```

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#set ip
dscp 3

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#police
flow 100000 4000 conform-action transmit violate-action drop

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show
context
class dscp
 set ip dscp 3
 police flow 100000 4000 conform-action transmit violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#

```

EX3500 QoS Policy Map"

nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
 description "This is a test EX3500 QoS Policy Map"
 class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#

```

##### Related Commands

|           |                                                  |
|-----------|--------------------------------------------------|
| <i>no</i> | Removes this EX3500 QoS policy map's description |
|-----------|--------------------------------------------------|

#### 4.1.50.2.7 no

▶ *ex3500-qos-policy-map config commands*

Removes this EX3500 QoS policy map's settings. Use this keyword to remove the description and to remove the QoS traffic classification created.

**Supported in the following platforms:**

- Service Platforms — NX7500, NX9500

**Syntax**

```
no [class <EX3500-QoS-POLICY-MAP-NAME>|description]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                              |
|-----------------|------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes this EX3500 QoS policy map's settings based on the parameters passed |
|-----------------|------------------------------------------------------------------------------|

**Example**

The following example shows the EX3500 QoS policy map 'test' settings before the 'no' command are executed:

```

nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
 description "This is a test EX3500 QoS Policy Map"
 class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#

nx9500-6C8809(config-ex3500-qos-policy-map-test)#no description

nx9500-6C8809(config-ex3500-qos-policy-map-test)#no class test

```

The following example shows the EX3500 QoS policy map 'test' settings after the 'no' command are executed:

```

nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#

```

## 4.1.51 ex3524

### ► Global Configuration Commands

Adds a EX3524 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four *Small Form Factor Pluggable* (SFP) transceiver slots for fiber connectivity.

To enable layer 3 adoption of the logged EX3524 switch to a NOC controller, navigate to the EX3524 switch's device configuration mode and execute the following command: `controller > host > <IP/HOSTNAME>`.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX9500 and NX7500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
ex3524 <DEVICE-EX3524-MAC>
```

#### Parameters

- `ex3524 <DEVICE-EX3524-MAC>`

|                     |                                              |
|---------------------|----------------------------------------------|
| <DEVICE-EX3524-MAC> | Specifies the MAC address of a EX3524 switch |
|---------------------|----------------------------------------------|

#### Example

```

## 4.1.52 ex3548

### ► Global Configuration Commands

Adds a EX3548 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX9500

#### Syntax

```
ex3548 <DEVICE-EX3548-MAC>
```

#### Parameters

- ex3548 <DEVICE-EX3548-MAC>

|                     |                                              |
|---------------------|----------------------------------------------|
| <DEVICE-EX3548-MAC> | Specifies the MAC address of a EX3548 switch |
|---------------------|----------------------------------------------|

#### Example

```
nx9500-6C8809(config)#ex3548 22-65-78-09-12-35
nx9500-6C8809(config-device-22-65-78-09-12-35)#?

| <i>no</i> | Removes a EX3548 switch from the network |
|-----------|------------------------------------------|

## 4.1.53 firewall-policy

### ► Global Configuration Commands

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
firewall-policy <FIREWALL-POLICY-NAME>
```

#### Parameters

- firewall-policy <FIREWALL-POLICY-NAME>

|                        |                                                                                       |
|------------------------|---------------------------------------------------------------------------------------|
| <FIREWALL-POLICY-NAME> | Specify the firewall policy name. If a firewall policy does not exist, it is created. |
|------------------------|---------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#firewall-policy test
rfs6000-81742D(config-fw-policy-test)#?
Firewall policy Mode commands:
 acl-logging Log on flow creating traffic
 alg Enable ALG
 clamp Clamp value
 dhcp-offer-convert Enable conversion of broadcast dhcp offers to
 unicast
 dns-snoop DNS Snooping
 firewall Wireless firewall
 flow Firewall flow
 ip Internet Protocol (IP)
 ip-mac Action based on ip-mac table
 ipv6 Internet Protocol version 6 (IPv6)
 ipv6-mac Action based on ipv6-mac table
 logging Firewall enhanced logging
 no Negate a command or set its defaults
 proxy-arp Enable generation of ARP responses on behalf
 of another device
 proxy-nd Enable generation of ND responses (for IPv6)
 on behalf of another device
 stateful-packet-inspection-l2
 Enable stateful packet inspection in layer2
 firewall
 storm-control Storm-control
 virtual-defragmentation
 Enable virtual defragmentation for IPv4
 packets (recommended for proper functioning
 of firewall)

## 4.1.54 global-association-list

### ► Global Configuration Commands

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an *Association Access Control List* (ACL). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client's MAC address, the global association ACL is checked. Once authenticated, the client's credentials are cached on the access point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
global-association-list <GLOBAL-ASSOC-LIST-NAME>
```

#### Parameters

- global-association-list <GLOBAL-ASSOC-LIST-NAME>

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <GLOBAL-ASSOC-LIST-NAME> | <p>Specify the global association list name. If a list with the same name does not exist, it is created.</p> <p>Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see <a href="#">use</a>.</p> <p>The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see <a href="#">association-list</a>.</p> |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config)#global-association-list my-clients
rfs4000-229D58 (config-global-assoc-list-my-clients)#?
Global Association List Mode commands:
 default-action Configure the default action when the client MAC does not
 match any rule
 deny Specify MAC addresses to be denied
 no Negate a command or set its defaults
 permit Specify MAC addresses to be permitted

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
```

```

show Show running system information
write Write running configuration to memory or terminal

```

```
rfs4000-229D58 (config-global-assoc-list-my-clients) #
```

To enable global-association-list controlled client association, execute the following commands:

- 1 Create a global association list, and configure it as shown in the following examples:

```
rfs4000-229D58 (config) #global-association-list vtt-list
```

```

rfs4000-880DA7 (config-global-assoc-list-vtt-list) #permit 01-22-33-44-55-66
description sample
rfs4000-880DA7 (config-global-assoc-list-vtt-list) #permit 40-B8-9A-39-F1-27
description acer
rfs4000-880DA7 (config-global-assoc-list-vtt-list) #permit 42-B8-9A-39-F1-27
description ami
rfs4000-880DA7 (config-global-assoc-list-vtt-list) #permit 6C-40-08-B2-80-6C
description mac
rfs4000-880DA7 (config-global-assoc-list-vtt-list) #permit E0-98-61-34-11-47
description my_mobile

```

```

rfs4000-880DA7 (config-global-assoc-list-vtt-list) #show context
global-association-list vtt-list
default-action deny
permit 01-22-33-44-55-66 description sample
permit 40-B8-9A-39-F1-27 description acer
permit 42-B8-9A-39-F1-27 description ami
permit 6C-40-08-B2-80-6C description mac
permit E0-98-61-34-11-47 description my_mobile
rfs4000-880DA7 (config-global-assoc-list-vtt-list) #

```

- 2 Attach this global association list to the profile or device context of the access point *or* controller, as shown in the following examples:
- 3 On the access point's profile context:

Note: Ensure that the global association list is associated with the profile being applied on the access point.

```
rfs4000-880DA7 (config-profile-testAP6522) #use global-association-list server vtt-list
```

```

rfs4000-880DA7 (config-profile-testAP6522) #show context include-factory |
include g
lobal-association-list
service global-association-list blacklist-interval 60
use global-association-list server vtt-list
rfs4000-880DA7 (config-profile-testAP6522) #

```

- 4 On the access point's device context:

```

ap6522 (config-device-B4-C7-99-EA-DF-2C) #use global-association-list server vtt-list
ap6522 (config-device-B4-C7-99-EA-DF-2C) #show context include-factory | in
clude global-association-list
use global-association-list server vtt-list
ap6522 (config-device-B4-C7-99-EA-DF-2C) #

```

- 5 On the controller's device context:

```
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#use global-association-list
server vtt-list
```

```
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#show context include-factory
| in
clude global-association-list
use global-association-list server vtt-list
ap6522(config-device-B4-C7-99-EA-DF-2C)#
```

- 6 Attach this global association list with the WLAN, as shown in the following example:

```
rfs4000-880DA7(config-wlan-GLAssList)#association-list global vtt-list
```

```
rfs4000-880DA7(config-wlan-GLAssList)#show context include-factory | include
association-list
association-list global vtt-list
rfs4000-880DA7(config-wlan-GLAssList)#
```

## 4.1.55 guest-management

### ► *Global Configuration Commands*

The following table summarizes the guest management policy configuration mode commands:

**Table 4.35** *Guest-Management Policy Config Command*

| Command                               | Description                                                         | Reference         |
|---------------------------------------|---------------------------------------------------------------------|-------------------|
| <i>guest-management</i>               | Creates a guest management policy and enters its configuration mode | <i>page 4-286</i> |
| <i>guest-management-mode commands</i> | Summarizes guest management policy configuration mode commands      | <i>page 4-287</i> |

### 4.1.55.1 guest-management

#### ► *guest-management*

Configures a guest management policy that redirects guest users to a registration portal upon association to a captive portal. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) where previously, not-registered guest users can register. The internally hosted captive portal registration page can be customized based on business requirements.

Use the guest management policy commands to configure parameters, such as E-mail host and SMS gateway along with the credentials required for sending pass code to guest via e-mail and SMS. You can configure up to 32 different guest management policies. Each guest management policy allows you to configure the SMS gateway, SMS message body, E-mail SMTP server, E-mail subject contents, and E-mail message body. Although, at any point-in-time, multiple guest management policies may exist, only one guest management policy can be active per device.

Guest registration is supported only on the NX95XX and NX7500 series service platforms. However, the number of user identity entries supported on each varies. It is 2 million and 1 million user-identity entries for the NX95XX and NX75XX model service platforms respectively.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
guest-management <POLICY-NAME>
```

#### Parameters

- `guest-management <POLICY-NAME>`

|               |                                                                                        |
|---------------|----------------------------------------------------------------------------------------|
| <POLICY-NAME> | Specify the guest management policy name. If the policy does not exist, it is created. |
|---------------|----------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#guest-management guest
nx9500-6C8809(config-guest-management-guest)#?
Guest Management Mode commands:
 email Email guest-notification configuration
 guest-database-backup Configure guest-database-backup parameters
 guest-database-export Configure guest-database-export parameters
 no Negate a command or set its defaults
 sms SMS guest-notification configuration
 sms-over-smtp Sms-over-smtp configuration to email sms gateway
 address

### 4.1.55.2 guest-management-mode commands

#### ► *guest-management*

The following table summarizes guest management policy configuration mode commands:

**Table 4.36** *Guest-Management-Policy-Config-Mode Commands*

| <b>Command</b>               | <b>Description</b>                                                                                                                                                                                                                                       | <b>Reference</b>  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>email</i>                 | Configures guest user e-mail notification settings                                                                                                                                                                                                       | <i>page 4-288</i> |
| <i>guest-database-backup</i> | Enables periodic backup of the captive portal's guest registration user database                                                                                                                                                                         | <i>page 4-290</i> |
| <i>guest-database-export</i> | Schedules an export of the Guest Management User database to a specified external server                                                                                                                                                                 | <i>page 4-291</i> |
| <i>sms</i>                   | Configures guest user SMS notification settings                                                                                                                                                                                                          | <i>page 4-292</i> |
| <i>sms-over-smtp</i>         | Configures an e-mail host server along with sender credentials and the recipient's gateway e-mail address to which the message is e-mailed. The gateway server converts the e-mail into SMS and forwards the message to the guest users's mobile device. | <i>page 4-294</i> |
| <i>no</i>                    | Removes this guest management policy settings                                                                                                                                                                                                            | <i>page 4-296</i> |

### 4.1.55.2.1 email

#### ▶ *guest-management-mode commands*

Configures guest user e-mail notification settings. When configured, guest users can register themselves with their e-mail credentials as a primary key for authentication. The captive portal system provides the pass code for their registration. Guest users need to use their registered e-mail, mobile, or member ID and the received pass code for subsequent logins to the captive portal.

This option is disabled by default.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
email [host|message|subject]

email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security
[none|ssl|starttls] username <USER-NAME> password <PASSWORD>

email message <LINE>

email subject <LINE>
```

#### Parameters

- email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| email                                             | Configures guest user e-mail notification settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| host<br>[<IP/HOSTNAME> <br><HOST-ALIAS-<br>NAME>] | Configures the SMTP server's IP address or hostname used for guest management e-mail traffic, guest user credential validation, and pass code reception. Optionally you can use an existing host alias to identify the SMTP server host. <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; – Specify the SMTP server's IPv4 address or hostname.</li> <li>• &lt;HOST-ALIAS-NAME&gt; – Specify the host alias name (should be existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.</li> </ul> |
| sender<br><EMAIL-ADDRESS>                         | Configures the sender's name for the guest user receiving the passcode required for registering their guest E-mail credentials using SMTP. <ul style="list-style-type: none"> <li>• &lt;EMAIL-SENDER&gt; – Specify the sender's name (should not exceed 100 characters).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 4.1.55.2.2 guest-database-backup

▶ *guest-management-mode commands*

Enables periodic backup of a captive portal's guest registration user database. This option is enabled by default.

**Supported in the following platforms:**

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
guest-database-backup enable {<TIME>}
```

**Parameters**

- `guest-database-backup enable {<TIME>}`

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>guest-database-backup enable &lt;TIME&gt;</code> | <p>Enables periodic backup of a captive portal's guest registration user database. This command also allows you to configure the time at which the system starts backing up the database. The default backup-start time is '00:00' (midnight every day).</p> <ul style="list-style-type: none"> <li>• <code>&lt;TIME&gt;</code> - Optional. Resets the periodic database backup-start time to a user-defined value in the HH;MM format. When specified, the system starts periodic backup of the database, every day, at the specified time.</li> </ul> |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-guest-management-test)#guest-database-backup enable 12:30
vnx9500-6C8809(config-guest-management-test)#show context
guest-management test
 guest-database-backup enable 12:30
nx9500-6C8809(config-guest-management-test)#
```

### 4.1.55.2.3 guest-database-export

#### ► *guest-management-mode commands*

Schedules an export of the Guest Management user database to a specified external server. This option is enabled by default.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
guest-database-export <TIME> frequency <1-168> url-directory <URL> {(format [csv|json]|last-visit-within <1-168>)}
```

#### Parameters

- `guest-database-export <TIME> frequency <1-168> url-directory <URL> {(format [csv|json]|last-visit-within <1-168>)}`

|                              |                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| guest-database-export <TIME> | Schedules an export of the Guest Management User collection to an external server <ul style="list-style-type: none"> <li>• &lt;TIME&gt; - Configures the start time of the export operation in the HH:MM format</li> </ul>                                                                                                                                          |
| frequency <1-168>            | Configures the user collection export frequency in hours <ul style="list-style-type: none"> <li>• &lt;1-168&gt; - Configures the frequency from 1 - 168 hours. If the frequency is set at 3 hours, the user database is exported once in every 3 hours. The default is 4 hours.</li> </ul>                                                                          |
| url-directory <URL>          | Configures external server's URL and directory to where the collection is exported <ul style="list-style-type: none"> <li>• &lt;URL&gt; - Specify the external server's URL</li> </ul>                                                                                                                                                                              |
| format [csv json]            | Optional. Configures the file format <ul style="list-style-type: none"> <li>• csv - Exports collection to the specified location in CSV format. This is the default setting.</li> <li>• json - Exports collection to the specified location in JSON format</li> </ul>                                                                                               |
| last-visit-within <1-168>    | Configures a filters guest users who have last visited within a specified period of time <ul style="list-style-type: none"> <li>• &lt;1-168&gt; - Specify a time period from 1 - 168 hours. If for example, the last-visit-within value is set at 2 hours, then only the last two hours guest user collections will be exported. The default is 4 hours.</li> </ul> |

#### Example

```
nx9500-6C8809(config-guest-management-gm1)#guest-database-export 10:30 frequency
6 url-directory ftp://admin:xxxxxx@192.168.13.10/dbe_dir format json last-visit
-within 168

nx9500-6C8809(config-guest-management-test)#show context
guest-management test
 guest-database-export 12:30 frequency 20 url-directory ftp://
admin:xxxxxx@192.168.13.10/dbe_dir format json last-visit-within 168
nx9500-6C8809(config-guest-management-test)#
```

#### 4.1.55.2.4 sms

##### ▶ *guest-management-mode commands*

Configures guest user SMS notification settings

When configured, guest users can register themselves with their e-mail or mobile device ID as the primary key for authentication. The captive portal provides the pass code for registration. Guest users use their registered e-mail or mobile device ID and the received pass code for subsequent logins to the captive portal.

**NOTE:** When using SMS, ensure that the WLAN's mode of authentication is set to *none* and the mode of registration is set to *user*. In other words, captive portal authentication must always enforce guest registration.

SMS is similar to MAC address-based self registration, but in addition the captive portal sends an SMS message, containing an access code, to the user's mobile phone number provided at the time of registration. The captive portal verifies the code, returns the *Welcome* page and provides access. This allows the administrator to verify the phone number provided and can be traced back to a specific individual should the need arise.

The default gateway used with SMS is *Clickatell*. A pass code can be sent with SMS to the guest user directly using Clickatell, or the pass code can be sent via e-mail to the SMS Clickatell gateway server, and Clickatell sends the pass code SMS to the guest user.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
sms [host|message]
```

```
sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}
```

```
sms message <LINE>
```

#### Parameters

- sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}

### 4.1.55.2.5 sms-over-smtp

#### ▶ *guest-management-mode commands*

Configures an e-mail host server (for example: smtp.gmail.com) along with sender related credentials and the recipient gateway e-mail address to which the message is E-mailed. The gateway server converts the e-mail into SMS and sends the message to the guest users's mobile device.

When sending an e-mail, the e-mail client interacts with a SMTP server to handle the content transmission. The SMTP server on the host may have conversations with other SMTP servers to deliver the e-mail.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```

sms-over-smtp [host|message|subject]

sms-over-smtp host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient
<EMAIL-ADDRESS>

sms-over-smtp message <LINE>

sms-over-smtp subject <LINE>

```

#### Parameters

- sms-over-smtp host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Example**

```
nx9500-6C8809(config-guest-management-test3)#show context
guest-management test3
 sms-over-smtp host test sender bob@extremenetworks.com security ssl username bob
 password bob@123 recipient john@extremenetworks.com
nx9500-6C8809(config-guest-management-test3)#

nx9500-6C8809(config-guest-management-test)#no sms-over-smtp host

nx9500-6C8809(config-guest-management-test3)#show context
guest-management test3
nx9500-6C8809(config-guest-management-test3)#
```

## 4.1.56 host

### ► *Global Configuration Commands*

Enters the configuration context of a remote device using its hostname

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
host <DEVICE-NAME>
```

#### Parameters

- host <DEVICE-NAME>

|               |                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| <DEVICE-NAME> | Specify the device's hostname. All discovered devices are displayed when 'Tab' is pressed to auto complete this command. |
|---------------|--------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58(config)#host rfs4000-229D58
rfs4000-229D58(config-device-00-23-68-22-9D-58)#
```

## 4.1.57 inline-password-encryption

### ► *Global Configuration Commands*

Stores the encryption key in the startup configuration file

By default, the encryption key is not stored in the startup-config file. Use the inline-password-encryption command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
inline-password-encryption
```

#### Parameters

None

#### Usage Guidelines

When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

#### Example

The following command uses the specified password for encryption key and stores it outside of startup-config:

```
rfs6000-81742D(config)#password-encryption secret 2 12345678
```

```
rfs6000-81742D(config)#commit write memory
```

The following command moves the same password to the startup-config and encrypts it with the master key:

```
rfs6000-81742D(config)#inline-password-encryption
```

#### Related Commands

|                            |                                                                          |
|----------------------------|--------------------------------------------------------------------------|
| <i>no</i>                  | Disables storing of the encryption key in the startup configuration file |
| <i>password-encryption</i> | Enables password encryption                                              |

## 4.1.58 ip

### ► Global Configuration Commands

Creates a IP *access control list* (ACL) and/or a SNMP IP ACL

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ip [access-list|snmp-access-list]
ip access-list <IP-ACL-NAME>
ip snmp-access-list <IP-SNMP-ACL-NAME>
```

#### Parameters

- ip access-list <IP-ACL-NAME>

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 4.1.59 ipv6

### ► Global Configuration Commands

Creates a IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ipv6 access-list <IPv6-ACL-NAME>
```

#### Parameters

- ipv6 access-list <IPv6-ACL-NAME>

|                                |                                                                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| access-list<br><IPv6-ACL-NAME> | Configures an IPv6 access list and enters its configuration mode <ul style="list-style-type: none"> <li>• &lt;IPv6-ACL-NAME&gt; - Specify the IPv6 ACL name. If the access list does not exist, it is created.</li> </ul> |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config)#ipv6 access-list IPv6ACLTest
rfs4000-229D58 (config-ipv6-acl-IPv6ACLTest)#?
IPv6 Access Control Mode commands:
deny Specify packets to reject
no Negate a command or set its defaults
permit Specify packets to forward

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs4000-229D58 (config-ipv6-acl-IPv6ACLTest)#
```

## 4.1.60 ipv6-router-advertisement-policy

### ► Global Configuration Commands

The following table lists the IPv6 *router advertisement* (RA) policy configuration commands:

**Table 4.37** IPv6-Router-Advertisement-Policy-Config Commands

| Command                                               | Description                                                    | Reference         |
|-------------------------------------------------------|----------------------------------------------------------------|-------------------|
| <i>ipv6-router-advertisement-policy</i>               | Creates a new IPv6 RA policy and enters its configuration mode | <i>page 4-303</i> |
| <i>ipv6-router-advertisement-policy-mode commands</i> | Summarizes the IPv6 RA policy configuration mode commands      | <i>page 4-305</i> |

## 4.1.60.1 ipv6-router-advertisement-policy

### ► *ipv6-router-advertisement-policy*

Creates an IPv6 RA policy and enters its configuration mode

An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message, which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ipv6-router-advertisement-policy <POLICY-NAME>
```

#### Parameters

- `ipv6-router-advertisement-policy <POLICY-NAME>`

|                                                                   |                                                                              |
|-------------------------------------------------------------------|------------------------------------------------------------------------------|
| <code>ipv6-router-advertisement-policy &lt;POLICY-NAME&gt;</code> | Specify an IPv6 RA policy name. If the policy does not exist, it is created. |
|-------------------------------------------------------------------|------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config)#ipv6-router-advertisement-policy test
rfs4000-229D58 (config-ipv6-radv-policy-test)#?
IPv6 Router Advertisement Policy Mode commands:
 advertise Option to advertise in router advertisement
 assist-neighbor-discovery Send the Source Link Layer address option
 in Router Advertisement to assist in
 neighbor discovery
 check-ra-consistency Check if the parameters advertised by other
 routers on the link are in conflict with
 those configured on this router. Conflicts
 are logged.
 dns-server DNS Server
 domain-name Configure domain-name
 managed-config-flag Set the managed-address-configuration flag
 in Router Advertisements. When set, it
 indicates that the addresses are available
 via DHCPv6
 nd-reachable-time Time that a node assumes a neighbor is
 reachable after having received a
 reachability confirmation
 no Negate a command or set its defaults
 ns-interval Time between retransmitted Neighbor
 Solicitation messages
 other-config-flag Set the other-configuration flag in Router
 Advertisements. When set, it indicates that
 other configuration information is
```

## 4.1.60.2 ipv6-router-advertisement-policy-mode commands

### ► *ipv6-router-advertisement-policy*

The following table summarizes IPv6 router advertisement policy configuration commands:

**Table 4.38** *IPv6-Router-Advertisement-Policy-Config-Mode Commands*

| Command                                | Description                                                                                                                             | Reference         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>advertise</i>                       | Enables advertisement of IPv6 <i>maximum transmission unit</i> (MTU) and hop-count value in RAs                                         | <i>page 4-306</i> |
| <i>assist-neighbor-discovery</i>       | Enables advertisement of the source link layer address in RAs                                                                           | <i>page 4-307</i> |
| <i>check-ra-consistency</i>            | Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link | <i>page 4-308</i> |
| <i>dns-server</i>                      | Configures the DNS server's IPv6 address and lifetime advertised in RAs                                                                 | <i>page 4-309</i> |
| <i>domain-name</i>                     | Configures the Domain name search label advertised in RAs                                                                               | <i>page 4-310</i> |
| <i>managed-config-flag</i>             | Sets the managed address configuration flag in RAs                                                                                      | <i>page 4-311</i> |
| <i>nd-reachable-time</i>               | Enables advertisement of neighbor reachable time in RAs                                                                                 | <i>page 4-312</i> |
| <i>no</i>                              | Removes or reverts router advertisement policy settings                                                                                 | <i>page 4-313</i> |
| <i>ns-interval</i>                     | Configures the interval between two successive retransmitted <i>neighbor solicitation</i> (NS) messages                                 | <i>page 4-314</i> |
| <i>other-config-flag</i>               | Sets the other-configuration flag in RAs                                                                                                | <i>page 4-315</i> |
| <i>ra</i>                              | Configures RA related parameters, such as the interval between two unsolicited successive RAs                                           | <i>page 4-316</i> |
| <i>router-lifetime</i>                 | Configures the default router's lifetime, in seconds, advertised in RAs                                                                 | <i>page 4-317</i> |
| <i>router-preference</i>               | Configures the router preference field value advertised in RAs                                                                          | <i>page 4-318</i> |
| <i>unicast-solicited-advertisement</i> | Enables unicasting of solicited RAs                                                                                                     | <i>page 4-319</i> |

### 4.1.60.2.1 advertise

► *ipv6-router-advertisement-policy-mode commands*

Enables advertisement of IPv6 MTU and hop-count value in RAs

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
advertise [hop-limit|mtu]
```

**Parameters**

- advertise [hop-limit|mtu]

|                              |                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------|
| advertise<br>[hop-limit mtu] | Enables advertisement of IPv6 MTU and hop-count value in RAs. Both these features are disabled by default. |
|------------------------------|------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-ipv6-radv-policy-test)#advertise hop-limit
rfs6000-81742D(config-ipv6-radv-policy-test)#advertise mtu
rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

**Related Commands**

|           |                                                               |
|-----------|---------------------------------------------------------------|
| <i>no</i> | Disables advertisement of IPv6 MTU and hop-count value in RAs |
|-----------|---------------------------------------------------------------|

### 4.1.60.2.2 assist-neighbor-discovery

▶ *ipv6-router-advertisement-policy-mode commands*

Enables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
assist-neighbor-discovery
```

**Parameters**

None

**Example**

```
rf6000-81742D(config-ipv6-radv-policy-test)#assist-neighbor-discovery
```

**Related Commands**

|           |                                                                    |
|-----------|--------------------------------------------------------------------|
| <i>no</i> | Disables the advertisement of the source link layer address in RAs |
|-----------|--------------------------------------------------------------------|

### 4.1.60.2.3 check-ra-consistency

▶ *ipv6-router-advertisement-policy-mode commands*

Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
check-ra-consistency
```

**Parameters**

None

**Example**

```

rfs6000-81742D(config-ipv6-radv-policy-test)#check-ra-consistency

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
 check-ra-consistency
rfs6000-81742D(config-ipv6-radv-policy-test)#

```

**Related Commands**

|           |                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Disables comparison of interface-specific parameters advertised by other routers, within the link, with those advertised with this router |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|

#### 4.1.60.2.4 dns-server

► *ipv6-router-advertisement-policy-mode commands*

Configures the DNS server's IPv6 address and lifetime. The configured values are advertised in RAs.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}
```

##### Parameters

```
• dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}
```

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dns-server <IPv6>                    | Configures the DNS server's IPv6 address<br><br>Enables the use of a DNS server to resolve host names to IPv6 addresses. When an IPv6 host is configured with the address of a DNS server, the host sends DNS name queries to the server for resolution.<br><br>• <IPv6> – Specify the DNS server's address. This address is advertised in RAs. A maximum of four (4) entries can be made per policy. |
| lifetime [<4-3600> expired infinite] | Optional. Configures the DNS server's (identified by the <IPv6> parameter) lifetime<br><br>• <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.<br>• expired – Advertises that this DNS server's lifetime has expired and should not be used<br>• infinite – Advertises that this DNS server's lifetime is infinite                      |

##### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#dns-server 2002::2 lifetime 3000

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

##### Related Commands

|           |                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the DNS server settings advertised in RAs. Once removed these values are not advertised in RAs. |
|-----------|---------------------------------------------------------------------------------------------------------|

### 4.1.60.2.5 domain-name

#### ► *ipv6-router-advertisement-policy-mode commands*

Configures the Domain name search label advertised in RAs

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}
```

#### Parameters

- domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain-name<br><WORD>                    | Configures the Domain name search label advertised in RAs<br><br>Enter a <i>fully qualified domain name</i> (FQDN), which is an unambiguous domain name available in a router advertisement resource. To distinguish an FQDN from a regular domain name, a trailing period is added. For example, somehost.example.com.<br><br>• <WORD> - Specify the Domain name search label. A maximum of four (4) entries can be made per policy. |
| lifetime [<4-3600> <br>expired infinite] | Optional. Configures the Domain name search label's lifetime<br><br>• <4-3600> - Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.<br><br>• expired - Advertises that this Domain name search label's lifetime has expired and should not be used<br><br>• infinite - Advertises that this Domain name search label's lifetime is infinite                                         |

#### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#domain-name TechPubs lifetime
infinite

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

#### Related Commands

|           |                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the Domain name settings advertised in RAs. Once removed these values are not advertised in RAs. |
|-----------|----------------------------------------------------------------------------------------------------------|

### 4.1.60.2.6 managed-config-flag

#### ► *ipv6-router-advertisement-policy-mode commands*

Sets the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
managed-config-flag
```

#### Parameters

None

#### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#managed-config-flag

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
managed-config-flag
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

#### Related Commands

|           |                                                                  |
|-----------|------------------------------------------------------------------|
| <i>no</i> | Removes the managed address configuration flag advertised in RAs |
|-----------|------------------------------------------------------------------|

#### 4.1.60.2.7 nd-reachable-time

► *ipv6-router-advertisement-policy-mode commands*

Enables advertisement of neighbor discovery reachable time in RAs. This feature is disabled by default.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
nd-reachable-time [<5000-3600000>|global]
```

##### Parameters

- nd-reachable-time [<5000-3600000>|global]

|                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>nd-reachable-time [&lt;5000-3600000&gt;  global]</pre> | <p>Configures the interval, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation from the neighbor. Therefore, a neighbor is reachable, after being discovered, for a period specified here. This value is advertised in RAs. Use one of the following options:</p> <ul style="list-style-type: none"> <li>• &lt;5000-3600000&gt; - Configures an interface-specific value. Specify a value from 5000 - 3600000 milliseconds. The default is 5000 milliseconds.</li> <li>• global - Advertises the neighbor reachable time configured for the system. This is the value configured at the device configuration mode. For more information, see <a href="#">use</a>.</li> </ul> |

|-----------|----------------------------------------------------------|
| <i>no</i> | Disables advertisement of neighbor reachable time in RAs |
|-----------|----------------------------------------------------------|

#### 4.1.60.2.8 no

##### ▶ *ipv6-router-advertisement-policy-mode commands*

Removes or reverts router advertisement policy settings. Use the no command to remove or revert the interface-specific parameters that are advertised by link router.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [advertise [hop-limit|mtu]|assist-neighbor-discovery|check-ra-consistency|
dns-server <IPv6>|domain-name <WORD>|managed-config-flag|nd-reachable-time|
ns-interval|other-config-flag|ra [interval|suppress]|router-lifetime|
unicast-solicited-advertisement]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this IPv6 router advertisement policy's settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
managed-config-flag
nd-reachable-time global
advertise mtu

rfs6000-81742D(config-ipv6-radv-policy-test)#
```

### 4.1.60.2.9 ns-interval

► *ipv6-router-advertisement-policy-mode commands*

Configures the *neighbor solicitation* (NS) retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
ns-interval [<1000-3600000>|global]
```

#### Parameters

- ns-interval [<1000-3600000>|global]

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>ns-interval [&lt;1000-3600000&gt;] global]</pre> | <p>Configures the NS interval advertised in RAs. Use one of the following options:</p> <ul style="list-style-type: none"> <li>• &lt;1000-3600000&gt; – Specify a value from 1000 - 3600000 milliseconds. The default is 1000 milliseconds.</li> <li>• global – Advertises the NS interval configured for the system. This is configured on the device in the device configuration mode. For more information, see <i>ipv6</i>.</li> </ul> |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#ns-interval 3000

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 managed-config-flag
 nd-reachable-time global
 ns-interval 3000
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

#### Related Commands

|-----------|----------------------------------------------|
| <i>no</i> | Disables advertisement of NS interval in RAs |
|-----------|----------------------------------------------|

**4.1.60.2.10 other-config-flag**▶ *ipv6-router-advertisement-policy-mode commands*

Sets the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
other-config-flag
```

**Parameters**

None

**Example**

```
rf6000-81742D(config-ipv6-radv-policy-test)#other-config-flag
```

**Related Commands**

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>no</i> | Removes the other-config-flag advertised on RAs |
|-----------|-------------------------------------------------|

#### 4.1.60.2.11 ra

##### ► *ipv6-router-advertisement-policy-mode commands*

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
ra [interval <3-1800>|suppress]
```

##### Parameters

- ra [interval <3-1800>|suppress]

|                   |                                                                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval <3-1800> | Configures the interval, in seconds, between two unsolicited successive RAs <ul style="list-style-type: none"> <li>• &lt;3-1800&gt; - Specify a value from 3 - 1800 seconds. The default is 300 seconds.</li> </ul> The router-lifetime should be at least three times the specified router interval. |
| suppress          | Enables the suppression of RAs. When enabled, the transmission of RAs in IPv6 packets is suppressed. This option is disabled by default.<br>The <i>no &gt; ra &gt; suppress</i> command enables the sending of RAs.                                                                                   |

##### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#ra interval 200
rfs6000-81742D(config-ipv6-radv-policy-test)#ra suppress

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 ra suppress
 ra interval 200
 managed-config-flag
 nd-reachable-time global
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

##### Related Commands

|           |                                                         |
|-----------|---------------------------------------------------------|
| <i>no</i> | Removes the RA interval, and enables the sending of RAs |
|-----------|---------------------------------------------------------|

#### 4.1.60.2.12 router-lifetime

► *ipv6-router-advertisement-policy-mode commands*

Configures the default router's lifetime, in seconds, advertised in RAs

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
router-lifetime <0-9000>
```

**Parameters**

- router-lifetime <0-9000>

|                             |                                                                                                                                                                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| router-lifetime<br><0-9000> | Configures the default router's lifetime <ul style="list-style-type: none"> <li>• &lt;0-9000&gt; - Specify a value from 0 - 9000 seconds. The default value is 1500 seconds. A value of "0" indicates that this router is not the default router.</li> </ul> |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-ipv6-radv-policy-test)#router-lifetime 2000

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 ra suppress
 ra interval 200
 managed-config-flag
 nd-reachable-time global
 router-lifetime 2000
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

**Related Commands**

|           |                                       |
|-----------|---------------------------------------|
| <i>no</i> | Removes the default router's lifetime |
|-----------|---------------------------------------|

### 4.1.60.2.13 router-preference

#### ▶ *ipv6-router-advertisement-policy-mode commands*

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
router-preference [high|medium|low]
```

#### Parameters

- router-preference [high|medium|low]

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| router-preference<br>[high medium low] | <p>Sets this router's preference over other routers, in the link, to be the default router. The options are high, low, and medium. The default value is medium.</p> <p>The following points should be taken into consideration when configuring router preference:</p> <ul style="list-style-type: none"> <li>• For a router to be selected as a default router, the router's lifetime should not be equal to "0".</li> <li>• To enable default router selection, using router information contained in RAs, configure default router selection on that interface.</li> </ul> |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config-ipv6-radv-policy-test)#router-preference high

rfs6000-81742D(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test

 ra interval 200
 managed-config-flag
 nd-reachable-time global
 router-lifetime 2000
 advertise mtu
 advertise hop-limit
 router-preference high
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
rfs6000-81742D(config-ipv6-radv-policy-test)#
```

**4.1.60.2.14 unicast-solicited-advertisement**▶ *ipv6-router-advertisement-policy-mode commands*

Enables unicasting of solicited RAs. This feature is disabled by default.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
unicast-solicited-advertisement
```

**Parameters**

None

**Example**

```
rfs6000-81742D(config-ipv6-radv-policy-test)#unicast-solicited-advertisement

rfs6000-81742D(config-ipv6-radv-policy-test)#show context

## 4.1.61 l2tpv3

### ► Global Configuration Commands

Configures a *Layer 2 Tunnel Protocol Version 3* (L2TPv3) tunnel policy, used to create one or more L2TPv3 tunnels

The L2TPv3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPv3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPv3 tunnels can be created between any vendor devices supporting L2TPv3 protocol.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

#### Parameters

- l2tpv3 policy <L2TPV3-POLICY-NAME>

|                                       |                                                                                                                                                                                                                                        |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l2tpv3 policy<br><L2TPV3-POLICY-NAME> | Configures an L2TPv3 tunnel policy <ul style="list-style-type: none"> <li>• &lt;L2TPV3-POLICY-NAME&gt; - Specify a policy name. The policy is created if it does not exist. To modify an existing L2TPv3, specify its name.</li> </ul> |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#l2tpv3 policy L2TPV3Policy1
rfs6000-81742D(config-l2tpv3-policy-L2TPV3Policy1)#?
L2tpv3 Policy Mode commands:
 cookie-size Size of the cookie field present in each l2tpv3 data
 message
 failover-delay Time interval for re-establishing the tunnel after
 the failover (RF-Domain
 manager/VRRP-master/Cluster-master failover)
 force-l2-path-recovery Enables force learning of servers, gateways etc.,
 behind the l2tpv3 tunnel when the tunnel is
 established
 hello-interval Configure the time interval (in seconds) between
 l2tpv3 Hello keep-alive messages exchanged in l2tpv3
 control connection
 no Negate a command or set its defaults
 reconnect-attempts Maximum number of attempts to reestablish the
 tunnel.
 reconnect-interval Time interval between the successive attempts to
 reestablish the l2tpv3 tunnel
 retry-attempts Configure the maximum number of retransmissions for
 signaling message
 retry-interval Time interval (in seconds) before the initiating a
 retransmission of any l2tpv3 signaling message
 rx-window-size Number of signaling messages that can be received
 without sending the acknowledgement
 tx-window-size Number of signaling messages that can be sent
 without receiving the acknowledgement

## 4.1.62 mac

### ► Global Configuration Commands

Configures a MAC ACLs

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac access-list <MAC-ACL-NAME>
```

#### Parameters

- mac access-list <MAC-ACL-NAME>

|                               |                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| access-list<br><MAC-ACL-NAME> | Configures a MAC access control list <ul style="list-style-type: none"> <li>• &lt;MAC-ACL-NAME&gt; - Specify the MAC ACL name. If the access control list does not exist, it is created.</li> </ul> |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#mac access-list test
rfs6000-81742D(config-mac-acl-test)#?
MAC Extended ACL Configuration commands:
deny Specify packets to reject
disable Disable rule if not needed
no Negate a command or set its defaults
permit Specify packets to forward

clrscr Clears the display screen
commit Commit all changes made in this session
end End current mode and change to EXEC mode

rfs6000-81742D(config-mac-acl-test)#
```

#### Related Commands

|           |                                   |
|-----------|-----------------------------------|
| <i>no</i> | Removes a MAC access control list |
|-----------|-----------------------------------|

**NOTE:** For more information on MAC access control lists, see [Chapter 11, ACCESS-LIST](#).

## 4.1.63 management-policy

### ► Global Configuration Commands

Configures a management policy. Management policies include services that run on a device, welcome messages, banners, etc.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
management-policy <MANAGEMENT-POLICY-NAME>
```

#### Parameters

- management-policy <MANAGEMENT-POLICY-NAME>

|                                             |                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------|
| <code>&lt;MANAGEMENT-POLICY-NAME&gt;</code> | Specify the management policy name. If the policy does not exist, it is created. |
|---------------------------------------------|----------------------------------------------------------------------------------|

#### Example

```
<DEVICE>(config)#management-policy test
<DEVICE>(config-management-policy-test)#?
Management Mode commands:
 aaa-login Set authentication for logins
 allowed-locations Add allowed locations
 banner Define a login banner
 ftp Enable FTP server
 http Hyper Text Terminal Protocol (HTTP)
 https Secure HTTP
 idle-session-timeout Configure idle timeout for a configuration session
 (GUI or CLI)
 ipv6 IPv6 Protocol
 no Negate a command or set its defaults
 passwd-retry Lockout user if too many consecutive login failures
 privilege-mode-password Set the password for entering CLI privilege mode
 rest-server Enable rest server for device on-boarding
 functionality
 restrict-access Restrict management access to the device
 snmp-server SNMP
 ssh Enable ssh
 t5 T5 configuration
 telnet Enable telnet
 user Add a user account

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

<DEVICE>(config-management-policy-test)#
```

**Related Commands**

---

|           |                                       |
|-----------|---------------------------------------|
| <i>no</i> | Removes an existing management policy |
|-----------|---------------------------------------|

---

---

**NOTE:** For more information on Management policy configuration, see *Chapter 15, MANAGEMENT-POLICY*.

---

---

## 4.1.64 meshpoint

### ► Global Configuration Commands

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

#### Parameters

- meshpoint [<MESHPOINT-NAME>|containing <WORD>]

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <MESHPOINT-NAME>  | Specify the meshpoint name. If the meshpoint does not exist, it is created. |
| containing <WORD> | Selects existing meshpoints containing the sub-string <WORD> in their names |

#### Example

```
rfs6000-81742D(config)#meshpoint TestMeshpoint
rfs6000-81742D(config-meshpoint-TestMeshpoint)#?
Mesh Point Mode commands:
 allowed-vlans Set the allowed VLANs
 beacon-format The beacon format of this meshpoint
 control-vlan VLAN for meshpoint control traffic
 data-rates Specify the 802.11 rates to be supported on this meshpoint
 description Configure a description of the usage of this meshpoint
 force Force suboptimal paths
 meshid Configure the Service Set Identifier for this meshpoint
 neighbor Configure neighbor specific parameters
 no Negate a command or set its defaults
 root Set this meshpoint as root
 security-mode The security mode of this meshpoint
 shutdown Shutdown this meshpoint
 use Set setting to use
 wpa2 Modify ccmp wpa2 related parameters

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-meshpoint-TestMeshpoint)#
```

#### Related Commands

|           |                               |
|-----------|-------------------------------|
| <i>no</i> | Removes an existing meshpoint |
|-----------|-------------------------------|

**NOTE:** For more information on Meshpoint configuration, see *Chapter 26, MESHPOINT*.

---

---

## 4.1.65 meshpoint-qos-policy

### ► Global Configuration Commands

Configures a set of parameters that defines the meshpoint *quality of service* (QoS) policy

#### Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP7161, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>
```

#### Parameters

- meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

|                             |                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------|
| <MESHPOINT-QOS-POLICY-NAME> | Specify the meshpoint QoS policy name. If the policy does not exist, it is created. |
|-----------------------------|-------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#meshpoint-qos-policy TestMeshpointQoS
rfs6000-81742D(config-meshpoint-qos-TestMeshpointQoS)#?
Mesh Point QoS Mode commands:
 accelerated-multicast Configure accelerated multicast streams address and
 forwarding QoS classification
 no Negate a command or set its defaults
 rate-limit Configure traffic rate-limiting parameters on a
 per-meshpoint/per-neighbor basis

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-meshpoint-qos-TestMeshpointQoS)#
```

#### Related Commands

|           |                                          |
|-----------|------------------------------------------|
| <i>no</i> | Removes an existing meshpoint QoS policy |
|-----------|------------------------------------------|

**NOTE:** For more information on Meshpoint QoS policy configuration, see *Chapter 26, MESHPOINT*.

## 4.1.66 mint-policy

### ► Global Configuration Commands

Configures the global MiNT policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mint-policy global-default
```

#### Parameters

- mint-policy global-default

|                |                                           |
|----------------|-------------------------------------------|
| global-default | Configures the global default MiNT policy |
|----------------|-------------------------------------------|

#### Example

```
rfs6000-81742D(config)#mint-policy global-default
rfs6000-81742D(config-mint-policy-global-default)#?
Mint Policy Mode commands:
 level Mint routing level
 lsp LSP
 mtu Configure the global Mint MTU
 no Negate a command or set its defaults
 router Mint router
 udp Configure mint UDP/IP encapsulation

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-mint-policy-global-default)#
```

#### Related Commands

|           |                                 |
|-----------|---------------------------------|
| <i>no</i> | Removes an existing MiNT policy |
|-----------|---------------------------------|

**NOTE:** For more information on MiNT policy configuration, see [Chapter 14, MINT-POLICY](#).

## 4.1.67 nac-list

### ► *Global Configuration Commands*

A *Network Access Control* (NAC) policy configures a list of devices that can access a network based on their MAC addresses.

The following table lists NAC list configuration mode commands:

**Table 4.39** *NAC-List Config Command*

| Command                       | Description                                          | Reference         |
|-------------------------------|------------------------------------------------------|-------------------|
| <i>nac-list</i>               | Creates a NAC list and enters its configuration mode | <i>page 4-330</i> |
| <i>nac-list-mode commands</i> | Summarizes NAC list configuration mode commands      | <i>page 4-331</i> |

### 4.1.67.1 nac-list

#### ► *nac-list*

Configures a NAC list that manages access to the network

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nac-list <NAC-LIST-NAME>
```

#### Parameters

- `nac-list <NAC-LIST-NAME>`

|                 |                                                                           |
|-----------------|---------------------------------------------------------------------------|
| <NAC-LIST-NAME> | Specify the NAC list name. If the NAC list does not exist, it is created. |
|-----------------|---------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#nac-list test
rfs6000-81742D(config-nac-list-test)#?
NAC List Mode commands:
 exclude Specify MAC addresses to be excluded from the NAC enforcement list
 include Specify MAC addresses to be included in the NAC enforcement list
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-nac-list-test)#
```

#### Related Commands

|           |                    |
|-----------|--------------------|
| <i>no</i> | Removes a NAC list |
|-----------|--------------------|

### 4.1.67.2 nac-list-mode commands

▶ *nac-list*

The following table summarizes NAC list configuration mode commands:

**Table 4.40** *NAC-List-Mode Commands*

| Command        | Description                                                        | Reference         |
|----------------|--------------------------------------------------------------------|-------------------|
| <i>exclude</i> | Specifies the MAC addresses excluded from the NAC enforcement list | <i>page 4-332</i> |
| <i>include</i> | Specifies the MAC addresses included in the NAC enforcement list   | <i>page 4-333</i> |
| <i>no</i>      | Cancels an exclude or include NAC list rule                        | <i>page 4-334</i> |

### 4.1.67.2.1 exclude

▶ *nac-list-mode commands*

Specifies the MAC addresses excluded from the NAC enforcement list

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

#### Parameters

- exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

|                        |                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <START-MAC>            | Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list <ul style="list-style-type: none"> <li>• &lt;START-MAC&gt; - Specify the first MAC address in the range.</li> </ul> Use this parameter to specify a single MAC address. |
| <END-MAC>              | Specifies the last MAC address in the range (optional if a single MAC is added to the list) <ul style="list-style-type: none"> <li>• &lt;END-MAC&gt; - Specify the last MAC address in the range.</li> </ul>                                                                |
| precedence<br><1-1000> | Sets the rule precedence. Exclude entries are checked in the order of their rule precedence. <ul style="list-style-type: none"> <li>• &lt;1-1000&gt; - Specify a value from 1 - 1000.</li> </ul>                                                                            |

#### Example

```
rfs6000-81742D(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1
rfs6000-81742D(config-nac-list-test)#show context
nac-list test
exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
rfs6000-81742D(config-nac-list-test)#
```

### 4.1.67.2.2 include

#### ▶ *nac-list-mode commands*

Specifies the MAC addresses included in the NAC enforcement list

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

#### Parameters

- include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

|                        |                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <START-MAC>            | Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list <ul style="list-style-type: none"> <li>• &lt;START-MAC&gt; - Specify the first MAC address in the range.</li> </ul> Use this parameter to specify a single MAC address. |
| <END-MAC>              | Specifies the last MAC address in the range (optional if a single MAC is added to the list) <ul style="list-style-type: none"> <li>• &lt;END-MAC&gt; - Specify the last MAC address in the range.</li> </ul>                                                              |
| precedence<br><1-1000> | Sets the rule precedence. Include entries are checked in the order of their rule precedence. <ul style="list-style-type: none"> <li>• &lt;1-1000&gt; - Specify a value from 1 - 1000.</li> </ul>                                                                          |

#### Example

```
rfs6000-81742D(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2
rfs6000-81742D(config-nac-list-test)#show context
nac-list test
 exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs6000-81742D(config-nac-list-test)#
```

### 4.1.67.2.3 no

#### ► *nac-list-mode commands*

Cancels an exclude or include NAC list rule

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [exclude|include]
```

```
no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                            |
|-----------------|----------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this NAC list's settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------|

#### Example

The following example shows the NAC list 'test' settings before the 'no' command is executed:

```
rfs6000-81742D(config-nac-list-test)#show context
nac-list test
 exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs6000-81742D(config-nac-list-test)#

rfs6000-81742D(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1
```

The following example shows the NAC list 'test' settings after the 'no' command is executed:

```
rfs6000-81742D(config-nac-list-test)#show context
nac-list test
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs6000-81742D(config-nac-list-test)#
```

#### Related Commands

|                |                                                                |
|----------------|----------------------------------------------------------------|
| <i>exclude</i> | Specifies MAC addresses excluded from the NAC enforcement list |
| <i>include</i> | Specifies MAC addresses included in the NAC enforcement list   |

## 4.1.68 no

### ► *Global Configuration Commands*

Negates a command, or reverts configured settings to their default

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```

The following 'no' commands are specific to the RFS4000, RFS6000, and NX95XX platforms:

```
no t5 <T5-DEVICE-MAC>
```

The following 'no' commands are specific to the RFS4000, RFS6000, and NX95XX platforms:

```
no bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-
list] <LIST-NAME>
```

The following 'no' commands are specific to the NX95XX series service platforms:

```
no route-map <ROUTE-MAP-NAME>
```

The following 'no' commands are specific to the AP6522, AP6532, AP7161, AP7502, AP7522, AP7532, AP8132, RFS4000, RFS6000 platforms:

```
no url-filter <URL-FILTER-NAME>
no url-list <URL-LIST-NAME>
no web-filter-name <WEB-FILTER-NAME>
```

The following 'no' command is specific to the VX9000 virtual machine platform:

```
no database-client-policy <POLICY-NAME>
```

## Parameters

- no <PARAMETERS>

|                 |                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets settings, configurable in the global configuration mode, based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------------------------------------|

## Example

```

<DEVICE>(config)#no ?
aaa-policy Delete a aaa policy
aaa-tacacs-policy Delete a aaa tacacs policy
alias Alias
ap650 Delete an AP650 access point
ap6511 Delete an AP6511 access point
ap6521 Delete an AP6521 access point
ap6522 Delete an AP6522 access point
ap6532 Delete an AP6532 access point
ap6562 Delete an AP6562 access point
ap71xx Delete an AP7161 access point
ap7502 Delete an AP7502 access point
ap7522 Delete an AP7522 access point
ap7532 Delete an AP7532 access point
ap7562 Delete an AP7562 access point
ap7602 Delete an AP7602 access point
ap7612 Delete an AP7612 access point
ap7622 Delete an AP7622 access point
ap7632 Delete an AP7632 access point
ap7662 Delete an AP7662 access point
ap81xx Delete an AP81XX access point

```

|                                    |                                                                       |
|------------------------------------|-----------------------------------------------------------------------|
| ap82xx                             | Delete an AP82XX access point                                         |
| ap8432                             | Delete an AP8432 access point                                         |
| ap8533                             | Delete an AP8533 access point                                         |
| application                        | Delete an application                                                 |
| application-group                  | Delete an application-group                                           |
| application-policy                 | Delete an application policy                                          |
| association-acl-policy             | Delete an association-acl policy                                      |
| auto-provisioning-policy           | Delete an auto-provisioning policy                                    |
| bgp                                | BGP Configuration                                                     |
| bonjour-gw-discovery-policy        | Disable Bonjour Gateway discovery policy                              |
| bonjour-gw-forwarding-policy       | Disable Bonjour Gateway Forwarding policy                             |
| bonjour-gw-query-forwarding-policy | Disable Bonjour Gateway Query Forwarding policy                       |
| captive-portal                     | Delete a captive portal                                               |
| client-identity                    | Client identity (DHCP Device Fingerprinting)                          |
| client-identity-group              | Client identity group (DHCP Fingerprint Database)                     |
| crypto-cmp-policy                  | CMP policy                                                            |
| customize                          | Restore the custom cli commands to default                            |
| database-client-policy             | Configure database policy                                             |
| database-policy                    | Configure database policy                                             |
| device                             | Delete multiple devices                                               |
| device-categorization              | Delete device categorization object                                   |
| dhcp-server-policy                 | DHCP server policy                                                    |
| dhcpv6-server-policy               | DHCPv6 server related configuration                                   |
| dns-whitelist                      | Delete a whitelist object                                             |
| event-system-policy                | Delete a event system policy                                          |
| ex3500                             | EX3500 device                                                         |
| ex3500-management-policy           | Delete a ex3500 management policy                                     |
| ex3500-qos-class-map-policy        | Delete a ex3500 qos class-map policy                                  |
| ex3500-qos-policy-map              | Delete a ex3500 qos policy-map                                        |

| ex3548                             | Delete an EX3548 wireless controller                                  |
| firewall-policy                    | Configure firewall policy                                             |
| global-association-list            | Delete a global association list                                      |
| guest-management                   | Delete a guest management policy                                      |
| igmp-snoop-policy                  | Remove device onboard igmp snoop policy                               |
| inline-password-encryption         | Disable storing encryption key in the startup configuration file      |
| ip                                 | Internet Protocol (IP)                                                |
| ipv6                               | Internet Protocol version 6 (IPv6)                                    |
| ipv6-router-advertisement-policy   | IPv6 Router Advertisement related configuration                       |
| l2tpv3                             | Negate a command or set its defaults                                  |
| mac                                | MAC configuration                                                     |
| management-policy                  | Delete a management policy                                            |
| meshpoint                          | Delete a meshpoint object                                             |
| meshpoint-qos-policy               | Delete a mesh point QoS configuration policy                          |
| nac-list                           | Delete an network access control list                                 |
| nsight-policy                      | Delete a nsight policy                                                |
| nx5500                             | Delete an NX5500 wireless controller                                  |
| nx75xx                             | Delete an NX75XX wireless controller                                  |
| nx9000                             | Delete an NX9000 wireless controller                                  |
| passpoint-policy                   | Delete a passpoint configuration policy                               |
| password-encryption                | Disable password encryption in configuration                          |
| profile                            | Delete a profile and all its associated configuration                 |
| radio-qos-policy                   | Delete a radio QoS configuration policy                               |
| radius-group                       | Local radius server group configuration                               |
| radius-server-policy               | Remove device onboard radius policy                                   |
| radius-user-pool-policy            | Configure Radius User Pool                                            |
| rf-domain                          | Delete one or more RF-domains and all their associated configurations |

|                       |                                                   |
|-----------------------|---------------------------------------------------|
| rfs4000               | Delete an RFS4000 wireless controller             |
| rfs6000               | Delete an RFS6000 wireless controller             |
| roaming-assist-policy | Delete a roaming-assist policy                    |
| role-policy           | Role based firewall policy                        |
| route-map             | Dynamic routing route map Configuration           |
| routing-policy        | Policy Based Routing Configuration                |
| rtl-server-policy     | Delete a rtl server policy                        |
| schedule-policy       | Delete a schedule policy                          |
| sensor-policy         | Delete a sensor policy                            |
| smart-rf-policy       | Delete a smart-rf-policy                          |
| t5                    | Delete an T5 wireless controller                  |
| url-filter            | Delete a url filter                               |
| url-list              | Delete a URL list                                 |
| vx9000                | Delete an VX9000 wireless controller              |
| web-filter-policy     | Delete a web filter policy                        |
| wips-policy           | Delete a wips policy                              |
| wlan                  | Delete a wlan object                              |
| wlan-qos-policy       | Delete a wireless lan QoS configuration<br>policy |
| service               | Service Commands                                  |
| <DEVICE>(config)#     |                                                   |

## 4.1.69 nsight-policy

### ► *Global Configuration Commands*

The following table lists NSight policy configuration mode commands:

**Table 4.41** *NSight-Policy Config Command*

| Command                       | Description                                                | Reference         |
|-------------------------------|------------------------------------------------------------|-------------------|
| <i>nsight-policy</i>          | Creates an NSight policy and enters its configuration mode | <i>page 4-340</i> |
| <i>nsight-policy commands</i> | Summarizes NSight policy configuration mode commands       | <i>page 4-342</i> |

### 4.1.69.1 nsight-policy

#### ► *nsight-policy*

Creates an NSight policy and enters its configuration mode

The NSight policy is an advance management, analytics, reporting, and troubleshooting tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted database. This large, complex data is collated and presented on an NSight Dashboard that can be launched from the NSight-enabled NOC. For large networks, enabling NSight removes the inadequacies of the existing data collection, presentation, and analytics framework. It simplifies network monitoring, troubleshooting, and reporting.

**NOTE:** NSight is a licensed feature, and can be enabled only on the application of an NSight license in the NSight server's self mode.

The NSight features include:

- Network statistic and event visualization - Simplified and unified network views based on defined user roles
- Custom dashboards - Live network health information in real-time to optimally assist network administrators
- Live troubleshooting tools - Packet capture, wireless debug logs, TCP/IP ping and traceroute
- Interactive floor maps with timeline views - Visualize and identify potential issues and problems areas
- Real-time trend analysis - Simplify network growth planning
- Exceptionally responsive interface - Any information the admin needs is three, or less, clicks away

The WiNG NSight implementation consists of the following components:

- An NSight server
- A database. This database consists of AP statistics gathered by RF Domain managers.
- An NSight UI portal
- An NSight client hosted on the RF Domain manager, which periodically gathers statistics from APs and forwards to the NSight server.
- Event history - Event details for all APs adopted by the NOC. These are events received by the Cfgd every 30 seconds and sent to the MART server. Each event consists of the RF Domain name, wireless client MAC if applicable, AP MAC, event mnemonic, event timestamp, and the event string itself.

#### **Supported in the following platforms:**

- Service Platforms — NX7500, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
nsight-policy <NSIGHT-POLICY-NAME>
```

**Parameters**

- `nsight-policy <NSIGHT-POLICY-NAME>`

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| <NSIGHT-POLICY-NAME> | Specify the NSight policy name. If the policy does not exist, it is created. |
|----------------------|------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config)#nsight-policy test
nx9500-6C8809(config-nsight-policy-test)#?
Nsight Policy Mode commands:
 enable Enable this Nsight policy
 event-history-size Size of the event history collection
 history-ttl Time to live for historical data
 no Negate a command or set its defaults
 nsight-server Enable Nsight server functionality
 server Configure Nsight server

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-nsight-policy-test)#

```

**Related Commands**

|           |                                   |
|-----------|-----------------------------------|
| <i>no</i> | Removes an existing NSight policy |
|-----------|-----------------------------------|

### 4.1.69.2 nsight-policy commands

#### ► *nsight-policy*

The following table summarizes NSight policy configuration mode commands:

**Table 4.42** *NSight-Policy-Config Mode Commands*

| Command                   | Description                                                                                                            | Reference                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>enable</i>             | Enables this NSight policy                                                                                             | <a href="#">page 4-343</a> |
| <i>event-history-size</i> | Converts and sizes the NSight event history collection to a capped collection                                          | <a href="#">page 4-344</a> |
| <i>history-ttl</i>        | Configures the <i>time-to-live</i> (TTL), in days, for historical data related to clients and devices                  | <a href="#">page 4-345</a> |
| <i>nsight-server</i>      | Enables NSight server functionality and configures the SMTP report delivery settings                                   | <a href="#">page 4-346</a> |
| <i>server</i>             | Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host. | <a href="#">page 4-348</a> |
| <i>no</i>                 | Removes this NSight policy settings                                                                                    | <a href="#">page 4-349</a> |

#### 4.1.69.2.1 enable

▶ *nsight-policy commands*

Enables this NSight policy. The default setting is enabled.

##### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

##### Syntax

```
enable
```

##### Parameters

None

##### Example

```
nx9510-6C8A5C(config-nsight-policy-test2)#enable
```

##### Related Commands

|           |                             |
|-----------|-----------------------------|
| <i>no</i> | Disables this NSight policy |
|-----------|-----------------------------|

### 4.1.69.2.2 event-history-size

▶ *nsight-policy commands*

Converts and sizes the NSight event history collection to a capped collection. The conversion occurs when upgrading. Use this command to define the NSight event history collection's size and prevent its unbounded growth. Note, resizing the collection results in the collection contents being dropped.

**Supported in the following platforms:**

- Service Platforms — NX9500, NX9510, NX9600, VX9000

**Syntax**

```
event-history-size [high|low|medium]
```

**Parameters**

- event-history-size [high|low|medium]

|                                         |                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event-history-size<br>[high low medium] | Defines the size of the NSight event history collection. The options are: <ul style="list-style-type: none"> <li>• high - Sets the size at approximately 10 M events</li> <li>• low - Sets the size at approximately 500 K events. This is the default setting.</li> <li>• medium - Sets the size at approximately 5 M events</li> </ul> |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

nx9500-6C8809(config-nsight-policy-test)#event-history-size medium

nx9500-6C8809(config-nsight-policy-test)#show context
nsight-policy test
 event-history-size medium
nx9500-6C8809(config-nsight-policy-test)#

```

**Related Commands**

|           |                                                                   |
|-----------|-------------------------------------------------------------------|
| <i>no</i> | Reverts the NSight event history collection size to default (5 M) |
|-----------|-------------------------------------------------------------------|

### 4.1.69.2.3 history-ttl

#### ▶ *nsight-policy commands*

Configures the *time-to-live* (TTL), in days, for historical data related to clients, devices, and guest users. This is the duration for which clients, devices, or guest user related data is retained in the NSight database.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
history-ttl [clients|devices|guest-clients]
```

```
history-ttl [clients|devices] <1-3650>
```

```
history-ttl guest-clients <8-48>
```

#### Parameters

- `history-ttl [clients|devices] <1-3650>`

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>history-ttl [client devices] &lt;1-3650&gt;</pre> | <p>Configures the TTL for historical data related to clients and devices</p> <ul style="list-style-type: none"> <li>• <code>clients</code> - Configures the TTL for wireless clients related historical data</li> <li>• <code>devices</code> - Configures the TTL for devices (adopted access points or site controllers) related historical data</li> </ul> <p>The following is common to both the 'clients' and 'devices' keywords:</p> <ul style="list-style-type: none"> <li>• <code>&lt;1-3650&gt;</code> - Specify a value from 1 - 3650 days. The default for both (clients and devices) is 180 days.</li> </ul> |
| <pre>history-ttl guest-clients &lt;8-48&gt;</pre>      | <p>Configures the TTL for historical data related to clients and devices</p> <ul style="list-style-type: none"> <li>• <code>guest-clients</code> - Configures the TTL for guest-client related historical data</li> <li>• <code>&lt;8-48&gt;</code> - Specify a value from 8 - 48 hours. The default is 8 hours.</li> </ul>                                                                                                                                                                                                                                                                                             |

- `history-ttl guest-clients <8-48>`

#### Example

```
nx9500-6C8809(config-nsight-policy-test)#history-ttl clients 250

nx9500-6C8809(config-nsight-policy-test)#show context
nsight-policy test
 history-ttl clients 250
nx9500-6C8809(config-nsight-policy-test)#
```

#### Related Commands

|           |                                                                          |
|-----------|--------------------------------------------------------------------------|
| <i>no</i> | Reverts the NSight clients or devices TTL duration to default (180 days) |
|-----------|--------------------------------------------------------------------------|

#### 4.1.69.2.4 nsight-server

##### ► *nsight-policy commands*

Enables NSight server functionality and configures the SMTP report delivery settings.

#### Supported in the following platforms:

- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nsight-server {smtp-report-delivery|standalone}

nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>|security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]]}

nsight-server {standalone}
```

#### Parameters

```
• nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>|security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]]}
```

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight-server                                       | Enables NSight server functionality on the host using this NSight policy                                                                                                                                                                                                                                                                                                                                                              |
| smtp-report-delivery<br>host <WORD>                 | Optional. Configures SMTP report delivery settings <ul style="list-style-type: none"> <li>• host &lt;WORD&gt; - Configures the SMTP server host</li> <li>• &lt;WORD&gt; - Specify the SMTP server host's IP address or hostname.</li> </ul>                                                                                                                                                                                           |
| sender<br><EMAIL-ADD>                               | Optional. Configures the SMTP sender's e-mail address <ul style="list-style-type: none"> <li>• &lt;EMAIL-ADD&gt; - Specify the sender's e-mail address.</li> </ul>                                                                                                                                                                                                                                                                    |
| port <1-65535>                                      | Optional. Configures the SMTP server port <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; - Specify the port from 1 - 65535.</li> </ul>                                                                                                                                                                                                                                                                                      |
| security<br>[none ssl starttls]                     | Optional. Configures the encryption protocol used by the SMTP server. The options are: <ul style="list-style-type: none"> <li>• none - Uses no encryption</li> <li>• ssl - Uses SSL encryption</li> <li>• starttls - Uses STARTTLS encryption</li> </ul>                                                                                                                                                                              |
| username<br><USER-NAME><br>password<br>[0 2 <WORD>] | Optional. Configures the SMTP username <ul style="list-style-type: none"> <li>• &lt;USER-NAME&gt; Specify the user name</li> <li>• password [0 2 &lt;WORD&gt;] - Configures the password associated with the above configured user <ul style="list-style-type: none"> <li>• 0 - Configures a clear text password</li> <li>• 2 - Configures an encrypted password</li> <li>• &lt;WORD&gt; - Enter the password.</li> </ul> </li> </ul> |
| <pre>• nsight-server {standalone}</pre>             |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| nsight-server                                       | Enables NSight server functionality on the host using this NSight policy                                                                                                                                                                                                                                                                                                                                                              |
| standalone                                          | Optional. Configures NSight server as standalone. Use this option in the split NSight deployment scenario where the NSight server and database are hosted on separate hosts.                                                                                                                                                                                                                                                          |

**Example**

```
nx9510-6C8A5C(config-nsight-policy-test2)#nsight-server

nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
```

**Related Commands**

|           |                                                            |
|-----------|------------------------------------------------------------|
| <i>no</i> | Disables NSight server functionality on this NSight policy |
|-----------|------------------------------------------------------------|

#### 4.1.69.2.5 server

▶ *nsight-policy commands*

Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host.

**Supported in the following platforms:**

- Service Platforms — NX9500, NX9510, NX9600, VX9000

**Syntax**

```
server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}
```

**Parameters**

- `server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}`

|                                          |                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server host [<IP> <HOSTNAME> <X:X::X:X>] | Configures the NSight server host's address. Use one of the following options to identify the NSight server host: <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Configures the NSight server's IPv4 address</li> <li>• &lt;HOSTNAME&gt; - Configures the NSight server's hostname</li> <li>• &lt;X:X::X:X&gt; - Configures the NSight server's IPv6 address</li> </ul> |
| {http https}                             | Optional. Configures the protocol used to communicate with the NSight server <ul style="list-style-type: none"> <li>• http - Optional. Uses HTTP to communicate</li> <li>• https - Optional. Uses HTTPS to communicate (this is the default setting)</li> </ul>                                                                                                                |

**Example**

```

nx9510-6C8A5C(config-nsight-policy-test2)#server host 172.22.0.153 http
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 server host 172.22.0.153 http
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#

```

**Related Commands**

|           |                                                             |
|-----------|-------------------------------------------------------------|
| <i>no</i> | Removes NSight server host settings from this NSight policy |
|-----------|-------------------------------------------------------------|

**4.1.69.2.6 no**▶ *nsight-policy commands*

Removes NSight policy settings

**Supported in the following platforms:**

- Service Platforms — NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [enable|event-history-size|history-ttl [clients|devices|guest-clients] |
 nsight-server {smtp-report-delivery}|server host [<IP>|<HOSTNAME>|<X:X::X:X>]]
```

**Parameters**

- no <PARAMETERS>

|                 |                                                               |
|-----------------|---------------------------------------------------------------|
| no <PARAMETERS> | Removes NSight policy settings based on the parameters passed |
|-----------------|---------------------------------------------------------------|

**Example**

The following example shows the NSight policy 'test2' settings before the 'no' command is executed:

```
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 server host 172.22.0.153 http
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
```

```
nx9510-6C8A5C(config-nsight-policy-test2)#no server host 172.22.0.153
```

The following example shows the NSight policy 'test2' settings after the 'no' command is executed:

```
nx9500-6C8809(config-nsight-policy-test2)#show context
nsight-policy test2
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
```

## 4.1.70 passpoint-policy

### ► Global Configuration Commands

Creates a new passpoint policy and enters its configuration mode

The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
passpoint-policy <POLICY-NAME>
```

#### Parameters

- passpoint-policy <POLICY-NAME>

|                                   |                                                                                         |
|-----------------------------------|-----------------------------------------------------------------------------------------|
| passpoint-policy<br><POLICY-NAME> | Specify the passpoint policy name. If a passpoint policy does not exist, it is created. |
|-----------------------------------|-----------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58 (config)#passpoint-policy test
rfs4000-229D58 (config-passpoint-policy-test)#?
Passpoint Policy Mode commands:
 3gpp Configure a 3gpp plmn (public land mobile network) id
access-network-type Set the access network type for the passpoint
connection-capability Configure the connection capability for the passpoint
domain-name Add a domain-name for the passpoint
hessid Set a homogeneous ESSID value for the passpoint
internet Advertise the passpoint having internet access
ip-address-type Configure the advertised ip-address-type
nai-realm Configure a NAI realm for the passpoint
net-auth-type Add a network authentication type to the passpoint
no Negate a command or set its defaults
operator Add configuration related to the operator of the
 passpoint
osu Online signup
roam-consortium Add a roam consortium for the passpoint
venue Set the venue parameters of the passpoint
wan-metrics Set the wan-metrics of the passpoint

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
```

```
write Write running configuration to memory or terminal
rfs4000-229D58 (config-passpoint-policy-test)#
```

**Related Commands**

---

|           |                                      |
|-----------|--------------------------------------|
| <i>no</i> | Removes an existing passpoint policy |
|-----------|--------------------------------------|

---

**NOTE:** For more information on passpoint policy, see [Chapter 27, PASSPOINT POLICY](#).

---

## 4.1.71 password-encryption

### ► *Global Configuration Commands*

Enables password encryption and configures the passphrase used to encrypt passwords. When enabled, passwords configured within the system are not displayed as clear text.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
password-encryption secret 2 <LINE>
```

#### Parameters

- password-encryption secret 2 <LINE>

|                 |                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| secret 2 <LINE> | Encrypts passwords with a secret phrase <ul style="list-style-type: none"> <li>• 2 - Specifies the encryption type as either SHA256 or AES256</li> <li>• &lt;LINE&gt; - Specify the encryption passphrase.</li> </ul> |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#password-encryption secret 2 test@123
```

To confirm if password encryption is enabled, execute the following command:

```
nx9500-6C8809(config)#show password-encryption status
Password encryption is enabled
nx9500-6C8809(config)#
```

The following example shows the privilege-mode-password as encrypted text. Note, the digit '1' preceding the password implies that displayed text is the encrypted password and not clear text.

```
nx9500-6C8809(config-management-policy-test)#show context include-factory |
include privilege-mode-password
privilege-mode-password 1
bc28e4d82bb11fa75a3c56346441d48f50f19c47184e2575a59a6a5d18e63925
nx9500-6C8809(config-management-policy-test)#
```

#### Related Commands

|           |                              |
|-----------|------------------------------|
| <i>no</i> | Disables password encryption |
|-----------|------------------------------|

## 4.1.72 profile

### ► Global Configuration Commands

Configures profile related commands. If no parameters are given, all profiles are selected.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
profile {anyap|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|
ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap82xx|ap8432|ap8533|containing|filter
|rfs4000|rfs6000|nx5500|nx75xx|nx9000|nx9600|vx9000}
```

```

**Example**

```

<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#?
Profile Mode commands:
 adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning
 policy when adopted by another
 controller
 adoption Adoption configuration
 alias Alias
 application-policy Application Policy configuration
 area Set name of area where the system
 is located
 arp Address Resolution Protocol (ARP)
 auto-learn Auto learning
 autogen-uniqueid Autogenerate a unique id
 autoinstall Autoinstall settings
 bluetooth-detection Detect Bluetooth devices using the
 Bluetooth USB module - there will
 be interference on 2.4 Ghz radio in
 wlan mode
 bridge Ethernet bridge
 captive-portal Captive portal
 cdp Cisco Discovery Protocol
 cluster Cluster configuration
 configuration-persistence Enable persistence of configuration
 across reloads (startup config
 file)
 controller WLAN controller configuration
 critical-resource Critical Resource
 crypto Encryption related commands
 database Database command
 device-onboard Device-onboarding configuration
 device-upgrade Device firmware upgrade
 diag Diagnosis of packets
 dot1x 802.1X
 dpi Enable Deep-Packet-Inspection
 (Application Assurance)
 dscp-mapping Configure IP DSCP to 802.1p
 priority mapping for untagged

| export                             | Export a file                                                                       |
| file-sync                          | File sync between controller and adoptees                                           |
| floor                              | Set the floor within a area where the system is located                             |
| gre                                | GRE protocol                                                                        |
| http-analyze                       | Specify HTTP-Analysis configuration                                                 |
| interface                          | Select an interface to configure                                                    |
| ip                                 | Internet Protocol (IP)                                                              |
| ipv6                               | Internet Protocol version 6 (IPv6)                                                  |
| l2tpv3                             | L2tpv3 protocol                                                                     |
| l3e-lite-table                     | L3e lite Table                                                                      |
| led                                | Turn LEDs on/off on the device                                                      |
| led-timeout                        | Configure the time for the led to turn off after the last radio state change        |
| legacy-auto-downgrade              | Enable device firmware to auto downgrade when other legacy devices are detected     |
| legacy-auto-update                 | Auto upgrade of legacy devices                                                      |
| lldp                               | Link Layer Discovery Protocol                                                       |
| load-balancing                     | Configure load balancing parameter                                                  |
| logging                            | Modify message logging facilities                                                   |
| mac-address-table                  | MAC Address Table                                                                   |
| mac-auth                           | 802.1X                                                                              |
| management-server                  | Configure management server address                                                 |
| memory-profile                     | Memory profile to be used on the device                                             |
| meshpoint-device                   | Configure meshpoint device parameters                                               |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                             |
| min-misconfiguration-recovery-time | Check controller connectivity after configuration is received                       |
| mint                               | MiNT protocol                                                                       |
| misconfiguration-recovery-time     | Check controller connectivity after configuration is received                       |
| neighbor-inactivity-timeout        | Configure neighbor inactivity timeout                                               |
| neighbor-info-interval             | Configure neighbor information exchange interval                                    |
| no                                 | Negate a command or set its defaults                                                |
| noc                                | Configure the noc related setting                                                   |
| nsight                             | NSight                                                                              |
| ntp                                | Ntp server WORD                                                                     |
| offline-duration                   | Set duration for which a device remains unadopted before it generates offline event |
| otls                               | Omnitrail Location Server                                                           |
| power-config                       | Configure power mode                                                                |
| preferred-controller-group         | Controller group this system will prefer for adoption                               |
| preferred-tunnel-controller        | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic  |
| radius                             | Configure device-level radius authentication parameters                             |
| raid                               | RAID                                                                                |
| remove-override                    | Remove configuration item override from the device (so profile value                |

|                       |                                     |
|-----------------------|-------------------------------------|
| rf-domain-manager     | takes effect)                       |
| router                | RF Domain Manager                   |
| slot                  | Dynamic routing                     |
| spanning-tree         | PCI expansion Slot                  |
| traffic-class-mapping | Spanning tree                       |
|                       | Configure IPv6 traffic class to     |
|                       | 802.1p priority mapping for         |
|                       | untagged frames                     |
| traffic-shape         | Traffic shaping                     |
| trustpoint            | Assign a trustpoint to a service    |
| tunnel-controller     | Tunnel Controller group this        |
|                       | controller belongs to               |
| use                   | Set setting to use                  |
| vrrp                  | VRRP configuration                  |
| vrrp-state-check      | Publish interface via OSPF/BGP only |
|                       | if the interface VRRP state is not  |
|                       | BACKUP                              |
| wep-shared-key-auth   | Enable support for 802.11 WEP       |
|                       | shared key authentication           |
| zone                  | Configure Zone name                 |
| clrscr                | Clears the display screen           |
| commit                | Commit all changes made in this     |
|                       | session                             |
| do                    | Run commands from Exec mode         |
| end                   | End current mode and change to EXEC |
|                       | mode                                |
| exit                  | End current mode and down to        |
|                       | previous mode                       |

| write                 | Write running configuration to      |
|                       | memory or terminal                  |

<DEVICE>(config-profile-<PROFILE-NAME>)#

**Related Commands**

|           |                                                     |
|-----------|-----------------------------------------------------|
| <i>no</i> | Removes a profile and its associated configurations |
|-----------|-----------------------------------------------------|

**NOTE:** For more information on profiles and how to configure profiles, see *Chapter 7, PROFILES*.

## 4.1.73 radio-qos-policy

### ► Global Configuration Commands

Configures a radio *quality-of-service* (QoS) policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

#### Parameters

- radio-qos-policy <RADIO-QOS-POLICY-NAME>

|                         |                                                                                 |
|-------------------------|---------------------------------------------------------------------------------|
| <RADIO-QOS-POLICY-NAME> | Specify the radio QoS policy name. If the policy does not exist, it is created. |
|-------------------------|---------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#radio-qos-policy test
rfs6000-81742D(config-radio-qos-test)#?
Radio QoS Mode commands:
 accelerated-multicast Configure multicast streams for acceleration
 admission-control Configure admission-control on this radio for one or
 more access categories
 no Negate a command or set its defaults
 smart-aggregation Configure smart aggregation parameters
 wmm Configure 802.11e/Wireless MultiMedia parameters

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-radio-qos-test)#
```

#### Related Commands

|           |                                      |
|-----------|--------------------------------------|
| <i>no</i> | Removes an existing Radio QoS policy |
|-----------|--------------------------------------|

**NOTE:** For more information on radio qos policy, see [Chapter 17, RADIO-QOS-POLICY](#).

## 4.1.74 radius-group

### ► Global Configuration Commands

Configures RADIUS user group parameters

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radius-group <RADIUS-GROUP-NAME>
```

#### Parameters

- radius-group <RADIUS-GROUP-NAME>

|                     |                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <RADIUS-GROUP-NAME> | Specify a RADIUS user group name. The name should not exceed 64 characters. If the RADIUS user group does not exist, it is created. |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#radius-group testgroup
rfs6000-81742D(config-radius-group-testgroup)#?
Radius user group configuration commands:
 guest Make this group a Guest group
 no Negate a command or set its defaults
 policy Radius group access policy configuration
 rate-limit Set rate limit for group

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-radius-group-testgroup)#
```

#### Related Commands

|           |                                  |
|-----------|----------------------------------|
| <i>no</i> | Removes an existing RADIUS group |
|-----------|----------------------------------|

**NOTE:** For more information on RADIUS user group commands, see [Chapter 16, RADIUS-POLICY](#).

## 4.1.75 radius-server-policy

### ► Global Configuration Commands

Creates an onboard device RADIUS policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radius-server-policy <RADIUS-SERVER-POLICY-NAME>
```

#### Parameters

- radius-server-policy <RADIUS-SERVER-POLICY-NAME>

|                             |                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------|
| <RADIUS-SERVER-POLICY-NAME> | Specify the RADIUS server policy name. If the policy does not exist, it is created. |
|-----------------------------|-------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#radius-server-policy testpolicy
rfs6000-81742D(config-radius-server-policy-testpolicy)#?
Radius Configuration commands:
authentication Radius authentication
bypass Bypass Certificate Revocation List(CRL) check
chase-referral Enable chasing referrals from LDAP server
crl-check Enable Certificate Revocation List(CRL) check
ldap-agent LDAP Agent configuration parameters
ldap-group-verification Enable LDAP Group Verification setting
ldap-server LDAP server parameters
local RADIUS local realm
nas RADIUS client
no Negate a command or set its defaults
proxy RADIUS proxy server
session-resumption Enable session resumption/fast reauthentication by
 using cached attributes
termination Enable Eap termination for proxy requests
use Set setting to use

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs6000-81742D(config-radius-server-policy-testpolicy)#
```

#### Related Commands

|           |                                          |
|-----------|------------------------------------------|
| <i>no</i> | Removes an existing RADIUS server policy |
|-----------|------------------------------------------|

**NOTE:** For more information on RADIUS server policy commands, see *Chapter 16, RADIUS-POLICY*.

---

---

## 4.1.76 radius-user-pool-policy

### ► Global Configuration Commands

Configures a RADIUS user pool

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>
```

#### Parameters

- radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

|                                |                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------|
| <RADIUS-USER-POOL-POLICY-NAME> | Specify the RADIUS user pool policy name. If the policy does not exist, it is created. |
|--------------------------------|----------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#radius-user-pool-policy testpool
rfs6000-81742D(config-radius-user-pool-testpool)#?
Radius User Pool Mode commands:
 duration Set a guest user's access duration
 no Negate a command or set its defaults
 user Radius user configuration

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-radius-user-pool-testpool)#
```

## 4.1.77 rename

### ► Global Configuration Commands

Renames and existing TLO

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rename tlo <TLO-NAME>
```

#### Parameters

- rename tlo <TLO-NAME> <NEW-TLO-NAME>

|                                            |                                                                                                                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rename tlo<br><TLO-NAME><br><NEW-TLO-NAME> | Renames an existing TLO object <ul style="list-style-type: none"> <li>• &lt;TLO-NAME&gt; - Specify the TLO's name. This is the TLO that is to be renamed.</li> <li>• &lt;NEW-TLO-NAME&gt; - Specify the new name for this TLO</li> </ul> |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

The following example shows the top level objects available for renaming:

Enter rename and press Tab to list top level objects available for renaming.

```
nx9500-6C8809(config)#rename
aaa_policy
address_range_alias
ap300
app_policy

| <i>clone</i> | Creates a replica of an existing TLO or device |
|--------------|------------------------------------------------|

## 4.1.78 replace

### ► Global Configuration Commands

Selects an existing device by its MAC address or hostname and replaces it with a new device having a different MAC address. Internally, a new device is created with the new MAC address. The old device's configuration is copied to the new device, and then removed from the controller's configuration (i.e., the old device's configuration is no longer staged on the controller).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
replace device [<MAC-ADDRESS>|<HOSTNAME>] <NEW-MAC-ADDRESS>
```

#### Parameters

- replace device [<MAC-ADDRESS>|<HOSTNAME>] <NEW-MAC-ADDRESS>

|                            |                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replace device             | Replaces an existing device with a new device, such that the old device's configuration is copied on to the new device                                                                                                                                                                                                                                   |
| [<MAC-ADDRESS> <HOSTNAME>] | Identifies the device to replace by its MAC address or hostname <ul style="list-style-type: none"> <li>• &lt;MAC-ADDRESS&gt; - Identifies the device to replace by its MAC address. Specify the device's existing MAC address.</li> <li>• &lt;HOSTNAME&gt; - Identifies the device to replace by its hostname. Specify the device's hostname.</li> </ul> |
| <NEW-MAC-ADDRESS>          | Specifies the new device's MAC address<br>Both the new and old devices should of the same model type.                                                                                                                                                                                                                                                    |

#### Example

```
rfs4000-882A17(config)#replace device ap7131-4BF364 ?
AA-BB-CC-DD-EE-FF New device MAC address
rfs4000-882A17(config)#replace device ap7131-4BF364 00-15-0F-BB-98-30
```

The following example shows an existing AP7502 (MAC: DD-AA-BB-88-12-43) configuration staged on a VX9000 controller:

```
VX9000-NOC-DE9D(config-device-DD-AA-BB-88-12-43)#show context
ap7502 DD-AA-BB-88-12-43
use profile default-ap7502
use rf-domain default
hostname ap7502-881243
interface radio1
wlan theMOZART bss 1 primary
interface radio2
wlan theMOZART bss 1 primary
interface gel
switchport mode access
switchport access vlan 1
controller host 12.12.12.2
VX9000-NOC-DE9D(config-device-DD-AA-BB-88-12-43)#
```

The following example shows AP7502 (MAC: DD-AA-BB-88-12-43) replaced by another AP7502 having MAC address 11-22-33-44-55-66:

Note that the new AP7502 device has the same configuration as the old AP7502 device. The HOSTNAME remains the same. Consequently, objects that refer to this particular hostname need not be updated. For example, an hostname alias identifying this particular device, and TLOs using this alias, such as IP/MAC ACLs, remain unchanged.

```
VX9000-NOC-DE9D(config)#replace device DD-AA-BB-88-12-43 11-22-33-44-55-66
VX9000-NOC-DE9D(config)#ap7502 11-22-33-44-55-66
VX9000-NOC-DE9D(config-device-11-22-33-44-55-66)#show context
ap7502 11-22-33-44-55-66
 use profile default-ap7502
 use rf-domain default
 hostname ap7502-881243
 interface radiol
 wlan theMOZART bss 1 primary
 interface radio2
 wlan theMOZART bss 1 primary
 interface gel
 switchport mode access
 switchport access vlan 1
 controller host 12.12.12.2
VX9000-NOC-DE9D(config-device-11-22-33-44-55-66) #
```

## 4.1.79 rf-domain

### ► *Global Configuration Commands*

An RF Domain groups devices that can logically belong to one network.

The following table lists the RF Domain configuration mode commands:

**Table 4.43** *RF-Domain Config Commands*

| Command                        | Description                                                  | Reference         |
|--------------------------------|--------------------------------------------------------------|-------------------|
| <i>rf-domain</i>               | Creates a RF Domain policy and enters its configuration mode | <i>page 4-367</i> |
| <i>rf-domain-mode commands</i> | Invokes RF Domain configuration mode commands                | <i>page 4-369</i> |

### 4.1.79.1 rf-domain

#### ► *rf-domain*

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains. If the RF Domain does not exist, it is created.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller. RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller's configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.
- Single-site deployment - The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.
- Multi-site deployment - A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.
- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.
- Manually assigned - Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.
- Automatically assigned - Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point's model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see *AUTO-PROVISIONING-POLICY*.

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within in a site.
- Assign unique regional or regulatory configurations to devices deployed in different states or countries.
- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}
```

**Parameters**

- rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}

|                             |                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rf-domain                   | Creates a new RF Domain or enters its configuration context                                                                                                                                                                 |
| <RF-DOMAIN-NAME>            | Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.                                                                  |
| containing <RF-DOMAIN-NAME> | Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name <ul style="list-style-type: none"> <li>• &lt;RF-DOMAIN-NAME&gt; - Specify a sub-string of the RF Domain name.</li> </ul> |

**Example**

```
rfs6000-81742D(config)#rf-domain rfs6000
rfs6000-81742D(config-rf-domain-rfs6000)#?
RF Domain Mode commands:
alias Alias
channel-list Configure channel list to be advertised to wireless
 clients
contact Configure the contact
control-vlan VLAN for control traffic on this RF Domain
controller-managed RF Domain manager for this domain will be an adopting
 controller
country-code Configure the country of operation
geo-coordinates Configure geo coordinates for this device
layout Configure layout
location Configure the location
location-server LSENSE server configuration
mac-name Configure MAC address to name mappings
no Negate a command or set its defaults
nsight-sensor Enable sensor for Nsight
override-smartrf Configured RF Domain level overrides for smart-rf
override-wlan Configure RF Domain level overrides for wlan
sensor-server AirDefense sensor server configuration
stats Configure the stats related setting
timezone Configure the timezone
tree-node Configure tree node under which this rf-domain appears
use Set setting to use

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode

## 4.1.79.2 rf-domain-mode commands

### ► *rf-domain*

This section describes the default commands under RF Domain.

The following table summarizes RF Domain configuration commands:

**Table 4.44** *RF-Domain-Mode Commands*

| Command                   | Description                                                                                                                                            | Reference         |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>alias</i>              | Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed -string, etc. at the RF Domain level | <i>page 4-370</i> |
| <i>channel-list</i>       | Configures the channel list advertised by radios                                                                                                       | <i>page 4-377</i> |
| <i>contact</i>            | Configures network administrator's contact information (needed in case of any problems impacting the RF Domain)                                        | <i>page 4-378</i> |
| <i>control-vlan</i>       | Configures VLAN for traffic control on a RF Domain                                                                                                     | <i>page 4-379</i> |
| <i>controller-managed</i> | Configures the adopting controller or service platform as this RF Domain's manager                                                                     | <i>page 4-380</i> |
| <i>country-code</i>       | Configures the country of operation                                                                                                                    | <i>page 4-381</i> |
| <i>geo-coordinates</i>    | Configures the longitude and latitude of the RF Domain in order to fix its exact geographical location on a map                                        | <i>page 4-382</i> |
| <i>layout</i>             | Configures layout information                                                                                                                          | <i>page 4-383</i> |
| <i>location</i>           | Configures the physical location of a RF Domain                                                                                                        | <i>page 4-385</i> |
| <i>location-server</i>    | Configures an LSENSE server on the selected RF Domain. This command is supported only on the NX95XX series service platforms.                          | <i>page 4-386</i> |
| <i>mac-name</i>           | Maps MAC addresses to names                                                                                                                            | <i>page 4-387</i> |
| <i>no</i>                 | Negates a command or reverts configured settings to their default                                                                                      | <i>page 4-388</i> |
| <i>override-smart-rf</i>  | Configures RF Domain level overrides for Smart RF                                                                                                      | <i>page 4-390</i> |
| <i>override-wlan</i>      | Configures RF Domain level overrides for a WLAN                                                                                                        | <i>page 4-391</i> |
| <i>sensor-server</i>      | Configures an AirDefense sensor server on this RF Domain                                                                                               | <i>page 4-394</i> |
| <i>stats</i>              | Configures stats related settings on this RF Domain. These settings define how RF Domain statistics are updated.                                       | <i>page 4-396</i> |
| <i>timezone</i>           | Configures a RF Domain's geographic time zone                                                                                                          | <i>page 4-397</i> |
| <i>tree-node</i>          | Configures the hierarchical (tree-node) structure under which this RF Domain appears                                                                   | <i>page 4-399</i> |
| <i>use</i>                | Enables the use of a specified Smart RF and/or WIPS policy                                                                                             | <i>page 4-401</i> |

### 4.1.79.2.1 alias

#### ▶ *rf-domain-mode commands*

Configures network, VLAN, host, string, network-service, etc. aliases at the RF Domain level

For information on aliases, see [alias](#).

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]

alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>

alias hashed-string <HASHED-STRING-ALIAS-NAME> 1 <LINE>

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to
<ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www)}

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|
tftp|www)}

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

#### Parameters

- alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

|                                             |                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address-range<br><ADDRESS-RANGE-ALIAS-NAME> | <p>Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses.</p> <ul style="list-style-type: none"> <li>• &lt;ADDRESS-RANGE-ALIAS-NAME&gt; - Specify the address range alias name.</li> </ul> <p>Alias name should begin with '\$'.</p> |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>&lt;STARTING-IP&gt;<br/>to &lt;ENDING-IP&gt;</p>                                                 | <p>Associates a range of IP addresses with this address range alias</p> <ul style="list-style-type: none"> <li>• &lt;STARTING-IP&gt; - Specify the first IP address in the range.</li> <li>• to &lt;ENDING-IP&gt; - Specify the last IP address in the range.</li> </ul> <p>Aliases defined at any given level can be overridden at the next lower level. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p>• <code>alias encrypted-string &lt;ENCRYPTED-STRING-ALIAS-NAME&gt; [0 2] &lt;LINE&gt;</code></p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p>encrypted-string<br/>&lt;ENCRYPTED-STRING-ALIAS-NAME&gt;</p>                                     | <p>Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. For more information, see <a href="#">snmp-server</a>.</p> <ul style="list-style-type: none"> <li>• &lt;ENCRYPTED-STRING-ALIAS-NAME&gt; - Specify the encrypted-string alias name.</li> </ul> <p>Alias name should begin with '\$'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p>[0 2] &lt;LINE&gt;</p>                                                                           | <p>Configures the value associated with the alias name specified in the previous step</p> <ul style="list-style-type: none"> <li>• [0 2] &lt;LINE&gt; - Configures the alias value</li> </ul> <p>Note, if password-encryption is enabled, in the <code>show &gt; running-config</code> output, this clear text is displayed as an encrypted string, as shown below:</p> <pre> nx9500-6C8809(config)#show running-config !..... alias encrypted-string \$enString 2 fABMK2is7UToNiZE3MQXbgAAAAxB0ZIysdqsEJwr6AH/Da// ! --More-- nx9500-6C8809     </pre> <p>In the above output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text.</p> <p>However, if password-encryption is disabled the clear text is displayed as is:</p> <pre> nx9500-6C8809(config)#show running-config !..... ! alias encrypted-string \$enString 0 test11223344 ! --More-- nx9500-6C8809     </pre> <p>For more information on enabling password-encryption, see <a href="#">password-encryption</a>.</p> |
| <p>• <code>alias hashed-string &lt;HASHED-STRING-ALIAS-NAME&gt; &lt;LINE&gt;</code></p>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p>hashed-string<br/>&lt;HASHED-STRING-ALIAS-NAME&gt;</p>                                           | <p>Creates an alias for a hashed string. Use this alias for configuration values that are hashed string, such as passwords. For example, in the management-policy, use it to define the privilege mode password. For more information, see <a href="#">privilege-mode-password</a>.</p> <ul style="list-style-type: none"> <li>• &lt;HASHED-STRING-ALIAS-NAME&gt; - Specify the hashed-string alias name.</li> </ul> <p>Alias name should begin with '\$'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| alias string<br><STRING-ALIAS-NAME> | <p>Creates a string alias for this RF Domain. Or associates an existing string alias with this RF Domain. String aliases map a name to an arbitrary string value. For example, 'alias string \$DOMAIN test.example_company.com'. In this example, the string alias name is: \$DOMAIN and the string value it is mapped to is: test.example_company.com. In this example, the string alias refers to a domain name.</p> <ul style="list-style-type: none"> <li>• &lt;STRING-ALIAS-NAME&gt; - Specify the string alias name.</li> <li>• &lt;LINE&gt; - Specify the string value.</li> </ul> <p>Alias name should begin with '\$'.</p> <p>Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.</p> |
|                                     | <ul style="list-style-type: none"> <li>• <code>alias vlan &lt;VLAN-ALIAS-NAME&gt; &lt;1-4094&gt;</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| alias vlan<br><VLAN-ALIAS-NAME>     | <p>Creates a VLAN alias for this RF Domain. Or associates an existing VLAN alias with this RF Domain. A VLAN alias maps a name to a VLAN ID.</p> <ul style="list-style-type: none"> <li>• &lt;VLAN-ALIAS-NAME&gt; - Specify the VLAN alias name.</li> </ul> <p>Alias name should begin with '\$'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <1-4094>                            | <p>Maps the VLAN alias to a VLAN ID</p> <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN ID from 1 - 4094.</li> </ul> <p>Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Example**

```

rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.9.1.0-008B
!
!
!
version 2.5
!
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
!
alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!

```

```
alias vlan $TestVLANAlias 1
--More--
rfs4000-229D58(config)#
```

In the following examples, the global aliases '\$kerberos' and '\$TestVLANAlias' are associated with the RF Domain 'test' and overrides applied:

```
rfs4000-229D58(config-rf-domain-test)#alias network-service $kerberos proto tcp
749 750 80

rfs4000-229D58(config-rf-domain-test)#alias vlan $TestVLANAlias 10

rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
no country-code
alias network-service $kerberos proto tcp 749 750 80
alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#

nx9500-6C8809(config-rf-domain-test)#alias string $test example_company.com

nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
no country-code
alias string $test example_company.com
nx9500-6C8809(config-rf-domain-test)#
```

#### Example 1:

In the following examples, the network-group alias '\$test' is configured to include hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

```
rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24
192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to
192.168.4.20
```

Associate this network-group alias '\$test' to the RF Domain 'test' and override the 'host' element of the alias.

```
rfs4000-229D58(config-rf-domain-test)#alias network-group $test host
192.168.10.10
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
no country-code
alias network-service $kerberos proto tcp 749 750 80
alias network-group $test host 192.168.10.10
alias network-group $test network 192.168.2.0/24 192.168.3.0/24
alias network-group $test address-range 192.168.4.10 to 192.168.4.20
alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#
```

In the preceding example, the 'host' element of the network-group alias '\$test' has been overridden. But the 'network' and 'address-range' elements have been retained as is.

### 4.1.79.2.2 channel-list

#### ▶ *rf-domain-mode commands*

Configures the channel list advertised by radios. This command also enables a dynamic update of a channel list.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
channel-list [2.4GHz|5GHz|dynamic]
channel-list dynamic
channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

#### Parameters

- channel-list dynamic

|                                                                                                     |                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dynamic                                                                                             | Enables a dynamic update of a channel list                                                                                                                                                                             |
| <ul style="list-style-type: none"> <li>• channel-list [2.4GHz 5GHz] &lt;CHANNEL-LIST&gt;</li> </ul> |                                                                                                                                                                                                                        |
| 2.4GHz<br><CHANNEL-LIST>                                                                            | Configures the channel list advertised by radios operating in the 2.4 GHz mode <ul style="list-style-type: none"> <li>• &lt;CHANNEL-LIST&gt; - Specify the list of channels separated by commas or hyphens.</li> </ul> |
| 5GHz<br><CHANNEL-LIST>                                                                              | Configures the channel list advertised by radios operating in the 5.0 GHz mode <ul style="list-style-type: none"> <li>• &lt;CHANNEL-LIST&gt; - Specify the list of channels separated by commas or hyphens.</li> </ul> |

#### Example

```
rfs6000-81742D(config-rf-domain-default)#channel-list 2.4GHz 1-10
rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs6000-81742D(config-rf-domain-default)#
```

#### Related Commands

|           |                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list. |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.79.2.3 contact

#### ▶ *rf-domain-mode commands*

Configures the network administrator's contact details. The network administrator is responsible for addressing problems impacting the network.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
contact <WORD>
```

#### Parameters

- `contact <WORD>`

|                                   |                                                   |
|-----------------------------------|---------------------------------------------------|
| <code>contact &lt;WORD&gt;</code> | Specify contact details, such as name and number. |
|-----------------------------------|---------------------------------------------------|

#### Example

```
rfs6000-81742D(config-rf-domain-default)#contact Bob+14082778691

rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 no country-code
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs6000-81742D(config-rf-domain-default)#
```

#### Related Commands

|           |                                                   |
|-----------|---------------------------------------------------|
| <i>no</i> | Removes a network administrator's contact details |
|-----------|---------------------------------------------------|

#### 4.1.79.2.4 control-vlan

▶ *rf-domain-mode commands*

Configures the VLAN designated for traffic control in this RF Domain

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

**Parameters**

- control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]

|                              |                                                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [<1-4094> <VLAN-ALIAS-NAME>] | Specify the VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the control VLAN. If using a vlan-alias, ensure that the alias is existing and configured. |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
rfs6000-81742D(config-rf-domain-default)#control-vlan 1

rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 no country-code
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
 control-vlan 1
rfs6000-81742D(config-rf-domain-default)#
```

**Related Commands**

|           |                                                                |
|-----------|----------------------------------------------------------------|
| <i>no</i> | Disables the VLAN designated for controlling RF Domain traffic |
|-----------|----------------------------------------------------------------|

### 4.1.79.2.5 controller-managed

#### ▶ *rf-domain-mode commands*

Configures the adopting controller (wireless controller, access point, or service platform) as this RF Domain's manager. In other words, the RF Domain is controller managed, and the managing controller is the device managing the RF Domain.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
controller-managed
```

#### Parameters

None

#### Example

```
rfs4000-229D58 (config-rf-domain-test)#controller-managed
rfs4000-229D58 (config-rf-domain-test)#commit

rfs4000-229D58 (config-rf-domain-test)#show context
rf-domain test
country-code in
controller-managed
network-alias techPubs host 192.168.13.8
network-alias techPubs address-range 192.168.13.10 to 192.168.13.15
service-alias testing index 10 proto 9 destination-port range 21 21
rfs4000-229D58 (config-rf-domain-test)#
```

#### Related Commands

|           |                                                                                 |
|-----------|---------------------------------------------------------------------------------|
| <i>no</i> | Removes the adopting controller or service platform as this RF Domain's manager |
|-----------|---------------------------------------------------------------------------------|

### 4.1.79.2.6 country-code

#### ▶ *rf-domain-mode commands*

Configures a RF Domain's country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
country-code <WORD>
```

#### Parameters

- country-code <WORD>

### 4.1.79.2.7 geo-coordinates

#### ▶ *rf-domain-mode commands*

Configures the longitude and latitude of the RF Domain in order to fix its exact geographical location on a map. Use this command to define the geographical area where a common set of device configurations are deployed and managed by this RF Domain policy.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

#### Parameters

- `geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>`

|                                                                                                |                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.79.2.8 layout

#### ▶ *rf-domain-mode commands*

Configures the RF Domain layout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
layout [area|description|floor|map-location] {(area|description|floor|map-
location)}
```

```
layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|
map-location <URL> units [feet|meters]] {(area <AREA-NAME>|description <LINE>|
floor <FLOOR-NAME> {<1-4094>}|map-location <URL> units [feet|meters])}
```

#### Parameters

```
• layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|
map-location <URL> units [feet|meters]] {(area <AREA-NAME>|description <LINE>|
floor <FLOOR-NAME> {<1-4094>}|map-location <URL> units [feet|meters])}
```

### 4.1.79.2.9 location

#### ▶ *rf-domain-mode commands*

Configures the RF Domain's physical location's name. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a set of devices with common configurations are deployed and managed by a RF Domain policy.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
location <WORD>
```

#### Parameters

- location <WORD>

|                 |                                                                                                                                                                    |

#### 4.1.79.2.10 location-server

▶ *rf-domain-mode commands*

Configures the L-Sense server's IP address or hostname on the selected RF Domain. When configured, the AP7522, AP7532, AP7562, AP8432 and AP8533 model access points, within the RF Domain, extract and forward client-location related data to the specified L-Sense server.

L-Sense is a highly scalable indoor locationing platform that gathers location-related analytics, such as visitor trends, peak and off-peak times, dwell time, heat-maps, etc. to enable entrepreneurs deeper visibility at a venue. To enable the location tracking system, the L-Sense server should be up and running and the RF Domain Sensor configuration should point to the L-sense server.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
location-server 1 ip <LSENSE-SERVER-IP/HOSTNAME> {port [443|<1-65535>]}
```

#### Parameters

- `location-server 1 ip <LSENSE-SERVER-IP/HOSTNAME> {port [443|<1-65535>]}`

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                  |

### 4.1.79.2.11 mac-name

▶ *rf-domain-mode commands*

Configures a relevant name for each MAC address. Use this command to associate client names to specific connected client MAC addresses for improved client management.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
mac-name <MAC> <NAME>
```

#### Parameters

- mac-name <MAC> <NAME>

|                          |                                                                                                                                                                                                                                                                                                                                                                            |

|-----------|-----------------------------------------|
| <i>no</i> | Removes the MAC address to name mapping |
|-----------|-----------------------------------------|

**4.1.79.2.12 no**▶ *rf-domain-mode commands*

Negates a command or reverts configured settings to their default. When used in the config RF Domain mode, the `no` command negates or reverts

RF Domain settings.

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [alias|channel-list|contact|control-vlan|controller-managed|country-code|
geo-coordinates|layout|location|location-server|mac-name|nsight-sensor|
override-smartrf|override-wlan|sensor-server|stats|timezone|tree-node|use]

no [adoption-mode|channel-list [2.4GHz|5GHz|dynamic]|contact|control-vlan|
controller-managed|country-code|location|location-server 1|mac-name <MAC>||
nsight-sensor|sensor-server <1-3>|stats update-interval|timezone|tree-node]

no alias [address-range|host|network|network-group [address-range|host|network]|
network-service|number|string|vlan] <ALIAS-NAME>

no layout {(area <AREA-NAME>|floor <FLOOR-NAME>)}

no override-smartrf channel-list [2.4GHz|5GHz]

no override-wlan <WLAN-NAME> [shutdown|ssid|template|vlan-pool [<1-4094>|all]]|
wep128 [key <1-3>|transmit-key]|wpa-wpa2-psk]

no use [database-policy|license|nsight-policy|smart-rf-policy|wips-policy]
```

**Parameters**

- `no <PARAMETERS>`

|                                    |                                                                             |
|------------------------------------|-----------------------------------------------------------------------------|
| <code>no &lt;PARAMETERS&gt;</code> | Removes or reverts this RF Domain's settings based on the parameters passed |
|------------------------------------|-----------------------------------------------------------------------------|

**Example**

The following example shows the default RF Domain settings before the 'no' commands are executed:

```
rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
 location SanJose
 contact Bob+14082778691
 country-code us
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
 mac-name 11-22-33-44-55-66 TestDevice
 layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
 control-vlan 1
rfs6000-81742D(config-rf-domain-default)#

rfs6000-81742D(config-rf-domain-default)#no channel-list 2.4GHz 1-10
rfs6000-81742D(config-rf-domain-default)#no mac-name 11-22-33-44-55-66
rfs6000-81742D(config-rf-domain-default)#no location
rfs6000-81742D(config-rf-domain-default)#no control-vlan
```

The following example shows the default RF Domain settings after the 'no' commands are executed:

```
rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 country-code us
 layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
rfs6000-81742D(config-rf-domain-default)#
```

### 4.1.79.2.13 override-smart-rf

#### ▶ *rf-domain-mode commands*

Enables dynamic channel switching for Smart RF radios. This command allows you to configure an override list of channels that Smart RF can use for channel compensations on 2.4 GHz and 5.0 GHz radios.

When a radio fails or is faulty, a Smart RF policy provides automatic recovery by instructing neighboring access points to increase their transmit power to compensate for the coverage loss. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events and can ensure availability of adequate detector coverage.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
override-smartrf channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

#### Parameters

```
• override-smartrf channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

|                          |                                                                                                                                                                        |

### 4.1.79.2.14 override-wlan

#### ▶ *rf-domain-mode commands*

Configures RF Domain level overrides for a WLAN

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```

override-wlan <WLAN-NAME> [shutdown|ssid|template|vlan-pool|wep128|wpa-wpa2-psk]

override-wlan <WLAN-NAME> [shutdown|ssid <SSID>|template <TEMPLATE-NAME>|vlan-
pool <1-4094> {limit <0-8192>}]

override-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]

override-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key
<1-4>]

```

#### Parameters

- `override-wlan <WLAN-NAME> [shutdown|ssid <SSID>|template <TEMPLATE-NAME>|vlan-pool <1-4094> {limit <0-8192>}]`

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

After creating the WLAN, configure its override parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| shutdown                            | Shuts down WLAN operation on all mapped radios                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ssid <SSID>                         | Configures a override SSID associated with this WLAN <ul style="list-style-type: none"> <li>• &lt;SSID&gt; - Specify the SSID (should not exceed 32 characters in length).</li> </ul> Each WLAN provides associated wireless clients with a SSID. This has limitations, because it requires wireless clients to associate with different SSIDs to obtain QoS and security policies. However, a WiNG-managed RF Domain can have WLANs assigned and advertise a single SSID, and yet allow users to inherit different QoS or security policies.                                                                                                                                                                                                                             |
| template <TEMPLATE-NAME>            | Configures a template name for this RF Domain <ul style="list-style-type: none"> <li>• &lt;TEMPLATE-NAME&gt; - Specify the template name (should not exceed 32 characters in length).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| vlan-pool <1-4094> {limit <0-8192>} | Configures the override VLANs available to this WLAN <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN ID from 1 - 4094. <ul style="list-style-type: none"> <li>• limit &lt;0-8192&gt; - Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0.</li> </ul> </li> </ul> Controllers and service platforms allow the mapping of a WLAN to more than one VLAN. Wireless clients associating with a WLAN are assigned VLANs, from the pool representative of the WLAN, in a way that ensures proper load balancing across VLANs. Clients are tracked per VLAN, and assigned to the least used/loaded VLAN. Client VLAN usage is tracked on a per-WLAN basis. The maximum allowed client limit is 8192 per VLAN. |

#### 4.1.79.2.15 sensor-server

▶ *rf-domain-mode commands*

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems.

The *Wireless Intrusion Protection System* (WIPS) protects the controller managed network, wireless clients and access point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgement of a threat.

In addition to dedicated AirDefense sensors, an access point radio can function as a sensor and upload information to a dedicated WIPS server (external to the controller). Unique WIPS server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

##### Parameters

```
• sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

|                      |                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sensor-server <1-3>  | Configures an AirDefense sensor server parameters <ul style="list-style-type: none"> <li>• &lt;1-3&gt; - Select the server ID from 1 - 3. The server with the lowest defined ID is reached first. The default is 1.</li> </ul>                                                                                                  |

### 4.1.79.2.16 stats

#### ▶ *rf-domain-mode commands*

Configures stats settings that define how RF Domain statistics are updated

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
stats update-interval
```

```
stats update-interval [<5-300>|auto]
```

#### Parameters

- stats update-interval [<5-300>|auto]

|                                   |                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stats                             | Configures stats related settings on this RF Domain                                                                                                                                                                                                                                                                                        |
| update-interval<br>[<5-300> auto] | Configures the interval at which RF Domain statistics are updated. The options are: <ul style="list-style-type: none"> <li>• &lt;5-300&gt; - Specify an update interval from 5 - 300 seconds.</li> <li>• auto - The RF Domain manager automatically adjusts the update interval based on the load. This is the default setting.</li> </ul> |

#### Example

```
rfs6000-81742D(config-rf-domain-default)#stats update-interval 200
rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691

rfs6000-81742D(config-rf-domain-default)#
```

#### Related Commands

|           |                               |
|-----------|-------------------------------|
| <i>no</i> | Resets stats related settings |
|-----------|-------------------------------|

#### 4.1.79.2.17 timezone

##### ▶ *rf-domain-mode commands*

Configures the RF Domain's geographic time zone. By default all WiNG devices are shipped with the time zone and time format set to *Universal Time Coordinated* (UTC) and 24-hour clock respectively. If the time zone is not reset, all devices within the RF Domain will display time relative to the UTC - Greenwich Time. Resetting the time zone is recommended, especially for RF Domains deployed across different geographical locations. The time zone can either be set on a specific device or on an RF Domain. When configured as RF Domain setting, it applies to all devices within the domain. For more information on configuring the time zone on a device, see [timezone](#).

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
timezone <TIMEZONE>
```

##### Parameters

- timezone <TIMEZONE>

|                 |                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| time <TIMEZONE> | Specify the RF Domain's time zone. The configured time zone will apply to all devices within the selected RF Domain. |
|-----------------|----------------------------------------------------------------------------------------------------------------------|

##### Example

```
rfs6000-81742D(config-rf-domain-default)#timezone America/Los_Angeles

rfs6000-81742D(config-rf-domain-default)#show context
rf-domain default
contact Bob+14082778691
timezone America/Los_Angeles
stats update-interval 200
country-code us
sensor-server 2 ip 172.16.10.3
override-smartrf channel-list 2.4GHz 1,2,3
override-wlan test vlan-pool 2 limit 20
layout area Eospace floor Floor1 map-location www.firstfloor.com units meters
rfs6000-81742D(config-rf-domain-default)#
```

The built-in WiNG timezones are:

```
nx9500-6C8809(config-rf-domain-test)#timezone <TAB>
Africa/ Asia/ Atlantic/ Australia/ CET CST6CDT
EET EST5EDT Etc/ Europe/ MST7MDT Pacific/
PST8PDT US/ America/
nx9500-6C8809(config-rf-domain-test)#
```

Each of these time zones are further differentiated into sub time zones. For example, as shown in the following example:

```
nx9500-6C8809(config-rf-domain-test)#timezone Africa/
Africa/Cairo Africa/Casablanca Africa/Harare
Africa/Johannesburg Africa/Lagos Africa/Nairobi
nx9500-6C8809(config-rf-domain-test)#
```

|-----------|---------------------------------|
| <i>no</i> | Removes a RF Domain's time zone |
|-----------|---------------------------------|

### 4.1.79.2.18 tree-node

#### ▶ *rf-domain-mode commands*

Configures the hierarchical (tree-node) structure under which this RF Domain is located

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
tree-node [campus|city|country|region] {(campus|city|country|region)}
```

#### Parameters

- tree-node [campus|city|country|region] {(campus|city|country|region)}

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tree-node | Configures the hierarchical tree structure defining the RF Domain's location. The tree node hierarchy can be configured in any order, but will always appear as: <i>country &gt; region &gt; city &gt; campus</i> . Further, a higher node, such as country, cannot be defined under a lower node, such as region. An RF Domain can be placed under any one of the tree nodes. But, an RF Domain at the country level may have all four nodes defined. Whereas, an RF Domain restricted to a campus, cannot have the country, city, and region nodes.<br><br>At least one of these four nodes must be defined. This feature is disabled by default. |
| campus    | Configures the campus name for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| city      | Configures the city for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| country   | Configures the country for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| region    | Configures the region for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

#### Usage Guidelines

The following points need to be taken into consideration when creating the tree-node structure:

- Adding a *country* first is a good idea since *region*, *city*, and *campus* can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.
- A city and campus can be added in the tree structure as sub-nodes under a region. An RF Domain can be mapped anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.
- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.
- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.
- After creating the tree structure do a *commit* and *save* for the tree configuration to take effect and persist across reboots.

**Example**

```
rfs4000-229D58(config-rf-domain-test)#tree-node campus EcoSpace City Bangalore
country India region South
rfs4000-229D58(config-rf-domain-test)#

rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
country-code in
tree-node country India region South city Bangalore campus EcoSpace
rfs4000-229D58(config-rf-domain-test)#
```

### 4.1.79.2.19 use

#### ▶ *rf-domain-mode commands*

Associates the following with an RF Domain: database policy, NSight policy, sensor policy, Smart RF policy, WIPS policy, RTL server policy, and Web filtering license.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
use [database-policy|license|nsight-policy|rtl-server-policy|sensor-policy|
smart-rf-policy|wips-policy]
```

```
use [database-policy <DATABASE-POLICY-NAME>|license <WEB-FILTERING-LICENSE>|
nsight-policy <NSIGHT-POLICY-NAME>|rtl-server-policy <RTL-SERVER-POLICY-NAME>|
sensor-policy <SENSOR-POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|
wips-policy <WIPS-POLICY-NAME>]
```

#### Parameters

- use [database-policy <DATABASE-POLICY-NAME>|license <WEB-FILTERING-LICENSE>|nsight-policy <NSIGHT-POLICY-NAME>|rtl-server-policy <RTL-SERVER-POLICY-NAME>|sensor-policy <SENSOR-POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]

## 4.1.80 rfs6000

### ► *Global Configuration Commands*

Adds a RFS6000 wireless controller to the network

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rfs6000 <DEVICE-RFS6000-MAC>
```

#### Parameters

- rfs6000 <DEVICE-RFS6000-MAC>

|                                         |                                    |
|-----------------------------------------|------------------------------------|
| <code>&lt;DEVICE-RFS6000-MAC&gt;</code> | Specify the RFS6000's MAC address. |
|-----------------------------------------|------------------------------------|

#### Example

```
rfs6000-81742D(config)#rfs6000 11-20-30-40-50-61
rfs6000-81742D(config-device-11-20-30-40-50-61)#
```

#### Related Commands

|           |                                                        |
|-----------|--------------------------------------------------------|
| <i>no</i> | Removes a RFS6000 wireless controller from the network |
|-----------|--------------------------------------------------------|

## 4.1.81 rfs4000

### ► *Global Configuration Commands*

Adds an RFS4000 wireless controller to the network

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rfs4000 <DEVICE-RFS4000-MAC>
```

#### Parameters

- rfs4000 <DEVICE-RFS4000-MAC>

|                                         |                                    |
|-----------------------------------------|------------------------------------|
| <code>&lt;DEVICE-RFS4000-MAC&gt;</code> | Specify the RFS4000's MAC address. |
|-----------------------------------------|------------------------------------|

#### Example

```
rfs6000-81742D(config)#rfs4000 10-20-30-40-50-60
rfs6000-81742D(config-device-10-20-30-40-50-60)#
```

#### Related Commands

|           |                                                         |
|-----------|---------------------------------------------------------|
| <i>no</i> | Removes an RFS4000 wireless controller from the network |
|-----------|---------------------------------------------------------|

## 4.1.82 nx5500

### ► *Global Configuration Commands*

Adds an integrated NX5500 series service platform to the network. If a profile for this service platform is not available, a new profile is created.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nx5500 <DEVICE-NX5500-MAC>
```

#### Parameters

- nx5500 <DEVICE-NX5500-MAC>

|                     |                                                                |
|---------------------|----------------------------------------------------------------|
| <DEVICE-NX5500-MAC> | Specifies the MAC address of a NX5500 series service platform. |
|---------------------|----------------------------------------------------------------|

#### Example

```
nx9500-6C8809 (config) #nx5500 B4-C7-02-3C-FA-6E
nx9500-6C8809 (config-device-B4-C7-02-3C-FA-6E) #
```

#### Related Commands

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>no</i> | Removes a NX5500 series service platform from the network |
|-----------|-----------------------------------------------------------|

## 4.1.83 nx75xx

### ► Global Configuration Commands

Adds an integrated NX75XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**NOTE:** In this guide, NX7500, NX7510, NX7520, and NX7530 are collectively represented as a NX75XX series service platform.

#### Syntax

```
nx75xx <DEVICE-NX75XX-MAC>
```

#### Parameters

- nx75xx <DEVICE-NX75XX-MAC>

|                     |                                                                |
|---------------------|----------------------------------------------------------------|
| <DEVICE-NX75XX-MAC> | Specifies the MAC address of a NX75XX series service platform. |
|---------------------|----------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#nx75xx B4-C9-81-6C-FA-7C
nx9500-6C8809(config-device-B4-C9-81-6C-FA-7C)#show context
nx75xx B4-C9-81-6C-FA-7C
 use profile default-nx75xx
 use rf-domain default
 hostname nx75xx-6CFA7C
nx9500-6C8809(config-device-B4-C9-81-6C-FA-7C)#
```

```

#### Related Commands

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>no</i> | Removes a NX75XX series service platform from the network |
|-----------|-----------------------------------------------------------|

## 4.1.84 nx9000

### ► *Global Configuration Commands*

Adds a NX95XX series service platform to the network

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
nx9000 <DEVICE-NX95XX-MAC>
```

#### Parameters

- nx9000 <DEVICE-NX95XX-MAC>

|                     |                                                                |
|---------------------|----------------------------------------------------------------|
| <DEVICE-NX95XX-MAC> | Specifies the MAC address of a NX95XX series service platform. |
|---------------------|----------------------------------------------------------------|

#### Example

```
nx9500-6C8809 (config) #nx9000 B4-C7-89-7C-81-08
nx9500-6C8809 (config-device-B4-C7-89-7C-81-08) #
```

#### Related Commands

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <i>no</i> | Removes a NX95XX series service platform from the network |
|-----------|-----------------------------------------------------------|

## 4.1.85 roaming-assist-policy

### ► Global Configuration Commands

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
roaming-assist-policy <POLICY-NAME>
```

#### Parameters

- roaming-assist-policy <POLICY-NAME>

|               |                                                                                      |
|---------------|--------------------------------------------------------------------------------------|
| <POLICY-NAME> | Specify the roaming assist policy name. If the policy does not exist, it is created. |
|---------------|--------------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#roaming-assist-policy testPolicy
rfs6000-81742D(config-roaming-assist-policy-testPolicy)#?
Roaming Assist Mode commands:
 action Configure action - action is either to log / death
 aggressiveness Configure the roaming aggressiveness for a wireless
 client
 detection-threshold Configure the detection threshold - when exceeded,
 client monitoring starts
 disassoc-time Configure the disassociation time - time after which a
 disassociation is sent
 handoff-count Configure the handoff count - number of times client
 can exceed handoff threshold
 handoff-threshold Configure the handoff threshold - when exceeds an
 action is taken.
 monitoring-interval Configure the monitoring interval - interval at which
 client monitoring occurs
 no Negate a command or set its defaults
 sampling-interval Configure the sampling interval - interval at which
 client rssi values are checked

 write Write running configuration to memory or terminal

rfs6000-81742D(config-roaming-assist-policy-testPolicy)#
```

#### Related Commands

|           |                                           |
|-----------|-------------------------------------------|
| <i>no</i> | Removes an existing roaming assist policy |
|-----------|-------------------------------------------|

**NOTE:** For more information on roaming assist policy commands, see *Chapter 30, ROAMING ASSIST POLICY*.

---

---

## 4.1.86 role-policy

### ► Global Configuration Commands

Configures a role-based firewall policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
role-policy <ROLE-POLICY-NAME>
```

#### Parameters

- role-policy <ROLE-POLICY-NAME>

|                    |                                                                            |
|--------------------|----------------------------------------------------------------------------|
| <ROLE-POLICY-NAME> | Specify the role policy name. If the policy does not exist, it is created. |
|--------------------|----------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#role-policy role1
rfs6000-81742D(config-role-policy-role1)#?
Role Policy Mode commands:
 default-role Configuration for Wireless Clients not matching any role
 ldap-deadperiod Ldap dead period interval
 ldap-query Set the ldap query mode
 ldap-server Add a ldap server
 ldap-timeout Ldap query timeout interval
 no Negate a command or set its defaults
 user-role Create a role

 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Showrunning system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-role-policy-role1)#
```

#### Related Commands

|           |                                 |
|-----------|---------------------------------|
| <i>no</i> | Removes an existing role policy |
|-----------|---------------------------------|

**NOTE:** For more information on role policy commands, see [Chapter 18, ROLE-POLICY](#).

## 4.1.87 route-map

### ► Global Configuration Commands

Creates a dynamic BGP route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

#### Supported in the following platforms:

- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9600, VX9000

#### Syntax

```
route-map <ROUTE-MAP-NAME>
```

#### Parameters

- route-map <ROUTE-MAP-NAME>

|                               |                                                               |
|-------------------------------|---------------------------------------------------------------|
| route-map<br><ROUTE-MAP-NAME> | Creates a new BGP route map and enters its configuration mode |
|-------------------------------|---------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#route-map test
nx9500-6C8809(config-dr-route-map-test)#?
Route Map Mode commands:
deny Add a deny route map rule to deny set operations
no Negate a command or set its defaults
permit Add a permit route map rule to permit set operations

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

nx9500-6C8809(config-dr-route-map-test)#
```

#### Related Commands

|           |                                           |
|-----------|-------------------------------------------|
| <i>no</i> | Removes an existing dynamic BGP route map |
|-----------|-------------------------------------------|

**NOTE:** For more information on BGP route maps, see [Chapter 28, BORDER GATEWAY PROTOCOL](#).

## 4.1.88 routing-policy

### ► Global Configuration Commands

Configures a routing policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
routing-policy <ROUTING-POLICY-NAME>
```

#### Parameters

- routing-policy <ROUTING-POLICY-NAME>

|                       |                                                                               |
|-----------------------|-------------------------------------------------------------------------------|
| <ROUTING-POLICY-NAME> | Specify the routing policy name. If the policy does not exist, it is created. |
|-----------------------|-------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#routing-policy TestRoutingPolicy
rfs6000-81742D(config-routing-policy-TestRoutingPolicy)#?
Routing Policy Mode commands:
 apply-to-local-packets Use Policy Based Routing for packets generated by
 the device
 logging Enable logging for this Route Map
 no Negate a command or set its defaults
 route-map Create a Route Map
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-routing-policy-TestRoutingPolicy)#
```

#### Related Commands

|           |                                    |
|-----------|------------------------------------|
| <i>no</i> | Removes an existing routing policy |
|-----------|------------------------------------|

**NOTE:** For more information on routing policy commands, see [Chapter 24, ROUTING-POLICY](#).

## 4.1.89 rtl-server-policy

### ► Global Configuration Commands

The following table lists the *Real Time Locationing* (RTL) server policy configuration commands:

**Table 4.45** *RTL-Server-Policy Config Command*

| Command                                | Description                                                       | Reference         |
|----------------------------------------|-------------------------------------------------------------------|-------------------|
| <i>rtl-server-policy</i>               | Configures an RTL server policy and enters its configuration mode | <i>page 4-414</i> |
| <i>rtl-server-policy-mode commands</i> | Summarizes RTL server policy configuration mode commands          | <i>page 4-416</i> |

### 4.1.89.1 rtl-server-policy

#### ► *rtl-server-policy*

Creates an RTL server policy and enters its configuration mode. When configured and applied on an access point (AP7522, AP7532, AP8432, AP8533), this policy enables the sending of RSSI feeds from the access point to a third-party Euclid server. The RTL server policy provides the exact location (URL) of the Euclid server. The RSSI feeds sent are as per the sensor-policy configured and applied on the access point. Therefore, ensure that a sensor-policy, with the *rssi-interval-duration* specified, is existing, configured, and applied on the access points.

To initiate RSSI feed posts to the Euclid locationing server, use the RTL server policy on the:

- AP's device/profile context, or
- AP's RF Domain context.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rtl-server-policy <RTL-POLICY-NAME>
```

#### Parameters

- `rtl-server-policy <RTL-POLICY-NAME>`

|                          |                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------|
| <RTL-SERVER-POLICY-NAME> | Specify the RTL server policy name. If a RTL server policy with the specified name does not exist, it is created. |
|--------------------------|-------------------------------------------------------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config)#rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#?
RTL Server Policy Mode commands:
 no Negate a command or set its defaults
 url Configure the url to send the real time RSSI feed to

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-rtl-server-policy-test)#

```

**Related Commands**

|                                                        |                                                                                                                                                                                                                            |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i>                                              | Removes an existing RTL server policy                                                                                                                                                                                      |
| <i>use</i> (profile/device configuration mode command) | Documents the 'use' command in a device's profile or device configuration context. Use this option to associate this RTL server policy to an access point's profile or device.                                             |
| <i>use</i> (RF Domain configuration mode command)      | Documents the 'use' command in the RF Domain configuration context. Use this option to associate this RTL server policy to an RF Domain. When associated, the policy is applied to all access points within the RF Domain. |

## 4.1.89.2 rtl-server-policy-mode commands

### ▶ *rtl-server-policy*

The following table summarizes the RTL server policy configuration mode commands:

**Table 4.46** *RTL-Server-Policy Mode Commands*

| Command    | Description                                        | Reference         |
|------------|----------------------------------------------------|-------------------|
| <i>url</i> | Configures the third-party Euclid RTL server's URL | <i>page 4-417</i> |
| <i>no</i>  | Removes the Euclid RTL server's URL configuration  | <i>page 4-418</i> |

### 4.1.89.2.1 url

#### ► *rtl-server-policy-mode commands*

Configures the third-party Euclid RTL server's exact location. This is the URL at which the server can be reached.

#### Supported in the following platforms:

- Access Points — AP7522, AP7532, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX9500, NX9510, NX9600, VX9000

#### Syntax

```
url <URL>
```

#### Parameters

- url <URL>

|           |                                                                  |
|-----------|------------------------------------------------------------------|
| url <URL> | Configures the Euclid server's URL<br>• <URL> - Specify the URL. |
|-----------|------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config-rtl-server-policy-test)#url https://testrtlserver.com

nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
 url https://testrtlserver.com
nx9500-6C8809(config-rtl-server-policy-test)#

```

#### Related Commands

|           |                                            |
|-----------|--------------------------------------------|
| <i>no</i> | Removes the Euclid server's configured URL |
|-----------|--------------------------------------------|

**4.1.89.2.2 no**▶ *rtl-server-policy-mode commands*

Removes the Euclid locationing server's URL configuration

**Supported in the following platforms:**

- Access Points — AP7522, AP7532, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no url
```

**Parameters**

- no url

|        |                                 |
|--------|---------------------------------|
| no url | Removes the Euclid server's URL |
|--------|---------------------------------|

**Example**

The following example displays the RTL server policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
 url https://testrtlserver.com
nx9500-6C8809(config-rtl-server-policy-test)#

nx9500-6C8809(config-rtl-server-policy-test)#no url
```

The following example displays the RTL server policy 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#
```

## 4.1.90 schedule-policy

### ► *Global Configuration Commands*

The following table summarizes the config schedule policy commands:

**Table 4.47** *Schedule-Policy Config Commands*

| Command                              | Description                                                 | Reference         |
|--------------------------------------|-------------------------------------------------------------|-------------------|
| <i>schedule-policy</i>               | Creates a schedule policy and enters its configuration mode | <i>page 4-420</i> |
| <i>schedule-policy-mode commands</i> | Lists schedule policy configuration mode commands           | <i>page 4-421</i> |

### 4.1.90.1 schedule-policy

#### ► *schedule-policy*

Creates a schedule policy and enters its configuration mode. A schedule policy strategically enforces application filter policy rules during administrator assigned intervals.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
schedule-policy <SCHEDULE-POLICY-NAME>
```

#### Parameters

- `schedule-policy <SCHEDULE-POLICY-NAME>`

|                                           |                                                                                                                                    |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| schedule-policy<br><SCHEDULE-POLICY-NAME> | Specify the Schedule policy name. If the policy does not exist, it is created. The name should not exceed 32 characters in length. |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#?
Schedule Policy Mode commands:
 description Schedule policy description
 no Negate a command or set its defaults
 time-rule Configure a time rule

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-schedule-policy-test)#
```

#### Related Commands

|           |                                     |
|-----------|-------------------------------------|
| <i>no</i> | Removes an existing schedule policy |
|-----------|-------------------------------------|

## 4.1.90.2 schedule-policy-mode commands

### ▶ *schedule-policy*

The following table summarizes schedule-policy configuration mode commands:

**Table 4.48** *Schedule-Policy-Config-Mode Commands*

| Command            | Description                                                                                                                        | Reference         |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>description</i> | Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations | <i>page 4-422</i> |
| <i>time-rule</i>   | Configures a time rule specifying the days and optionally the start and end times                                                  | <i>page 4-423</i> |
| <i>no</i>          | Removes the selected schedule policy's settings                                                                                    | <i>page 4-425</i> |

### 4.1.90.2.1 description

#### ▸ *schedule-policy-mode commands*

Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
description <WORD>
```

#### Parameters

- `description <WORD>`

|                                       |                                                                                                                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>description &lt;WORD&gt;</code> | Configures this schedule policy's description <ul style="list-style-type: none"> <li>• <code>&lt;WORD&gt;</code> - Enter a description not exceeding 80 characters in length. The description should uniquely identify the policy from other policies with similar configuration.</li> </ul> |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```

nx9500-6C8809(config-schedule-policy-test)#description "Denies social networking
sites on weekdays."

nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
nx9500-6C8809(config-schedule-policy-test)#

```

#### Related Commands

|           |                                            |
|-----------|--------------------------------------------|
| <i>no</i> | Removes this schedule policy's description |
|-----------|--------------------------------------------|

### 4.1.90.2.2 time-rule

#### ► *schedule-policy-mode commands*

Configures a time rule specifying the days and optionally the start and end times. When applied to an application-policy rule, the schedule policy defines the enforcement time of the rule. For more information, see *application-policy*.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

#### Parameters

```
• time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

|                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time-rule                                                                                                    | Configures a time rule in days and hours and minutes<br><br>A schedule policy can have more than one non-overlapping time-rules. The following time-rules, having overlapping time periods, are invalid: 'weekdays, start-time 9:30 am, end-time 11:30 pm' and 'all, start-time 12:00 am, end-time 12:00 pm'.                                                                                                                                                                                                                                                                                                                                                 |
| days<br>[sunday monday <br>tuesday wednesday <br>thursday friday <br>saturday all <br>weekends <br>weekdays] | Specifies the days on which the time rule is applicable <ul style="list-style-type: none"> <li>• sunday – Applicable on Sundays only</li> <li>• monday – Applicable on Mondays only</li> <li>• tuesday – Applicable on Tuesdays only</li> <li>• wednesday – Applicable on Wednesdays only</li> <li>• thursday – Applicable on Thursdays only</li> <li>• friday – Applicable on Fridays only</li> <li>• saturday – Applicable on Saturdays only</li> <li>• weekends – Applicable on weekends only</li> <li>• weekdays – Applicable on weekdays only</li> <li>• all – Applicable on all days</li> </ul>                                                         |
| start-time <HH:MM><br>[end-time <HH:MM>]                                                                     | After specifying the days of enforcement, specify the following: <ul style="list-style-type: none"> <li>• start-time – Optional. Specifies the enforcement start time <ul style="list-style-type: none"> <li>• &lt;HH:MM&gt; – Specify the start time in hours and minutes in the HH:MM format.</li> </ul> </li> </ul> <p>If no start time is specified, the time rule is enforced, on the specified days, at all time.</p> <ul style="list-style-type: none"> <li>• end-time – Specifies the enforcement end time <ul style="list-style-type: none"> <li>• &lt;HH:MM&gt; – Specify the time in hours and minutes in the HH:MM format.</li> </ul> </li> </ul> |

**Example**

```
nx9500-6C8809(config-schedule-policy-test)#time-rule days weekdays start-time
10:00 end-time 23:30

nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
description "Denies social networking sites on weekdays."
time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#
```

**Related Commands**

|           |                                                |
|-----------|------------------------------------------------|
| <i>no</i> | Removes the time-rule from the schedule policy |
|-----------|------------------------------------------------|

### 4.1.90.2.3 no

#### ▸ *schedule-policy-mode commands*

Removes the selected schedule policy's settings

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [description|time-rule]
```

```
no description
```

```
no time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|
all|weekends|weekdays]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                       |
|-----------------|-----------------------------------------------------------------------|
| no <PARAMETERS> | Removes the schedule policy's settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------|

#### Example

The following example displays the schedule policy 'test' settings before the 'no' commands have been executed:

```
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
 time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#
```

The following example displays the schedule policy 'test' settings after the 'no' commands have been executed:

```
nx9500-6C8809(config-schedule-policy-test)#no description
nx9500-6C8809(config-schedule-policy-test)#no time-rule days weekdays

nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#
```

## 4.1.91 self

### ► *Global Configuration Commands*

Displays the logged device's configuration context

#### **Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
self
```

#### **Parameters**

None

#### **Example**

```
rfs6000-81742D(config)#self
rfs6000-81742D(config-device-00-15-70-37-FA-BE)#
```

## 4.1.92 sensor-policy

### ► *Global Configuration Commands*

The following table summarizes the config sensor policy commands:

**Table 4.49** *Sensor-Policy Config Commands*

| Command                            | Description                                               | Reference         |
|------------------------------------|-----------------------------------------------------------|-------------------|
| <i>sensor-policy</i>               | Creates a sensor policy and enters its configuration mode | <i>page 4-428</i> |
| <i>sensor-policy-mode commands</i> | Lists sensor policy configuration mode commands           | <i>page 4-430</i> |

### 4.1.92.1 sensor-policy

#### ► *sensor-policy*

In addition to WIPS support, sensor functionality has now been added for the Extreme Network's MPact locationing system. The MPact system for Wi-Fi locationing includes WiNG controllers, and access points functioning as sensors. Within the MPact architecture, sensors scan for RSSI data on an administrator defined interval and send to a dedicated MPact Server resource, as opposed to an ADSP server. The MPact Server collects the RSSI data from WiNG sensor devices, and calculates the location of Wi-Fi devices for MPact administrators.

Use this command to configure a policy defining the mode of scanning, the channels to scan (in case scan-mode is set to custom-scan), and the RSSI interval. For the sensor policy to take effect, use the policy either in the access point's RF Domain context or in the access point's device context.

**NOTE:** If a dedicated sensor is utilized with WIPS for rogue detection, any sensor policy used is discarded and not utilized by the sensor. To avoid this situation, use ADSP channel settings exclusively to configure the sensor and not the WiNG interface.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
sensor-policy <SENSOR-POLICY-NAME>
```

#### Parameters

- `sensor-policy <SENSOR-POLICY-NAME>`

|                                                              |                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>sensor-policy<br/>&lt;SENSOR-POLICY-<br/>NAME&gt;</pre> | <p>Specify the Sensor policy name. If a sensor policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length. No character spaces are permitted within the name. Define a name unique to the policy's channel and scan mode configuration to help differentiate it from other policies.</p> |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Usage Guidelines ADSP WIPS/MPact

Access point radios, functioning as sensors, along with AirDefense WIPS servers protect networks from attacks and unauthorized access. These access point sensors scan legal channels and (based on a WIPS policy settings) identify events potential threats to the managed network. These events are reported to the AirDefense WIPS server, which determines the action taken.

In addition to WIPS support, sensor functionality has now been added for the MPact locationing system. The MPact system for Wi-Fi locationing includes WiNG controllers and access points functioning as sensors. Within the MPact architecture, sensors scan for RSSI data on an administrator-defined interval and send to a dedicated MPact server resource, as opposed to an ADSP server. The MPact server collects the RSSI data from WiNG sensor devices, and calculates the location of Wi-Fi devices. With the introduction of the MPact platform, the data collected by access point radios, functioning as sensors, is also used by the MPact server to provide real-time locationing services.

**Example**

```

nx9500-6C8809(config)#sensor-policy test
nx9500-6C8809(config-sensor-policy-test)#?
Sensor Policy Mode commands:
 custom-scan Channel configuration in Custom Scan channels
 no Negate a command or set its defaults
 rssi-interval-duration Configure the periodicity of sending RSSI info from
 sensor to server
 scan-mode Configure the Scan mode

|-----------|-----------------------------------|
| <i>no</i> | Removes an existing sensor policy |
|-----------|-----------------------------------|

### 4.1.92.2 sensor-policy-mode commands

#### ▶ *sensor-policy*

The following table summarizes sensor-policy configuration mode commands:

**Table 4.50** *Sensor-Policy-Config-Mode Commands*

| Command                      | Description                                                                                                                                            | Reference         |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>custom-scan</i>           | Configures the channel scanning settings when the scan-mode is set to custom-scan                                                                      | <i>page 4-431</i> |
| <i>rss-interval-duration</i> | Configures the interval at which dedicated sensors scan channels for RSSI assessments and send the collected data to a specified MPact server resource | <i>page 4-433</i> |
| <i>scan-mode</i>             | Configures the mode of scanning used by dedicated sensors (access point radios)                                                                        | <i>page 4-434</i> |
| <i>no</i>                    | Removes or reverts to default a sensor policy's settings                                                                                               | <i>page 4-435</i> |

### 4.1.92.2.1 custom-scan

#### ▶ *sensor-policy-mode commands*

Configures the channel scanning settings when the *scan-mode* is set to *custom-scan*

**NOTE:** If the mode of scanning is set to *Custom-Scan*, use this command to configure the channels to be scanned. To set the mode of scanning to *custom-scan*, use the *scan-mode > Custom-Scan* command. For more information, see *scan-mode*.

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
custom-scan channel-frequency <CHANNEL-FREQUENCY> width [20MHz|40MHz-Bth|40MHz-Lower|40MHz-Upper|80MHz] scan-weight <SCAN-WEIGHT>
```

#### Parameters

- `custom-scan channel-frequency <CHANNEL-FREQUENCY> width [20MHz|40MHz-Both|40MHz-Lower|40MHz-Upper|80MHz] scan-weight <SCAN-WEIGHT>`

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| custom-scan                                            | Configures the custom-scan channel frequency, channel width, and scan weight                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| channel-frequency <CHANNEL-FREQUENCY>                  | Configures the channel frequency. A list of unique channels in the 2.4, 4.9, 5 and 6 GHz band can be collectively or individually enabled for customized channel scans and RSSI reporting. <ul style="list-style-type: none"> <li>• &lt;CHANNEL-FREQUENCY&gt; - Specify a single or multiple, 'comma-separated' channel frequencies.</li> </ul>                                                                                                                                                                                                                                         |
| width [20MHz 40MHz-Both 40MHz-Lower 40MHz-Upper 80MHz] | Configures the channel width. When custom channels are selected for RSSI scans, each selected channel can have its own width defined. Numerous channels have their width fixed at 20MHz, 802.11a radios support 20 and 40 MHz channel widths. <ul style="list-style-type: none"> <li>• 20MHz - Sets the channel width as 20 Mhz</li> <li>• 40Mhz-Both - Sets the channel width as 40Mhz-Both</li> <li>• 40Mhz-Lowe - Sets the channel width as 40Mhz-Lower</li> <li>• 40Mhz-Upper - Sets the channel width as 40Mhz-Upper</li> <li>• 80Mhz - Sets the channel width as 80Mhz</li> </ul> |
| scan-weight <SCAN-WEIGHT>                              | Configures the scan-weight (scanning duration) for each of the selected channels. Each selected channel can have its weight prioritized in respect to the amount of time a scan is permitted within the defined RSSI scan interval. <ul style="list-style-type: none"> <li>• &lt;SCAN-WEIGHT&gt; - Specify the scan weightage given to each selected channel.</li> </ul>                                                                                                                                                                                                                |

#### Example

```
nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
```

```
nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
```

```
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

**Related Commands**

|           |                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------|
| <i>no</i> | Removes channels from the channels-to-scan list in case of scan-mode being set to Custom-Scan |
|-----------|-----------------------------------------------------------------------------------------------|

### 4.1.92.2.2 rssi-interval-duration

#### ▶ *sensor-policy-mode commands*

Configures the interval, in seconds, at which dedicated sensors scan channels for RSSI assessments and send the RSSI data obtained to a specified server resource

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
rssi-interval-duration <1-60>
```

#### Parameters

- `rssi-interval-duration <1-60>`

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>rssi-interval-duration<br/>&lt;1-60&gt;</pre> | <p>Configures the RSSI interval duration in seconds. This is the interval at which the sensor scans channels for RSSI data and forwards the data to a dedicated server resource. The server calculates real-time locations of Wi-Fi devices based on the this data.</p> <ul style="list-style-type: none"> <li>• <code>&lt;1-60&gt;</code> – Specify the RSSI interval duration from 1 - 60 seconds. The default is 1 second.</li> </ul> <p>The channels scanned for RSSI assessment depends on the scan-mode selected. For more information, see <i>scan-mode</i> and <i>custom-scan</i>.</p> <p>Ensure that the server's IP address or hostname has been configured in the access point sensor's RF Domain context.</p> |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-sensor-policy-test)#rssi-interval-duration 30

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

#### Related Commands

|           |                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Resets the interval at which RSSI data is collected and sent by the sensor to the MPact server host to default (1 second) |
|-----------|---------------------------------------------------------------------------------------------------------------------------|

### 4.1.92.2.3 scan-mode

#### ► *sensor-policy-mode commands*

Configures the mode of scanning used by dedicated sensors (access point radios)

#### Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
scan-mode [Channel-Lock|Custom-Scan|Default-Scan]
scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>
scan-mode [Custom-Scan|Default-Scan]
```

#### Parameters

- scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>

|                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scan-mode                                                                                | Configures the mode of scanning used by the sensors to scan system-defined or user-defined channels for RSSI assessments. The options are: Channel-Lock, Custom-Scan, and Default-Scan.                                                                                                                                                                                                      |
| Channel-Lock<br>lock-frequency<br><LOCK-FREQUENCY>                                       | Configures the mode of scanning as Channel-Lock <ul style="list-style-type: none"> <li>• lock-frequency &lt;LOCK-FREQUENCY&gt; - Locks scanning for RSSI data to one specific channel identified by the &lt;LOCK-FREQUENCY&gt; parameter.</li> <li>• &lt;LOCK-FREQUENCY&gt; - Specify the channel frequency in MHz. When specified, the sensor scans only this specified channel.</li> </ul> |
| <ul style="list-style-type: none"> <li>• scan-mode [Custom-Scan Default-Scan]</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                              |
| scan-mode                                                                                | Configures the mode of scanning used by the sensor. The options are: channel-lock, custom-scan, and default-scan.                                                                                                                                                                                                                                                                            |
| Custom-Scan                                                                              | Configures the mode of scanning as Custom-Scan<br>Select this option to restrict scanning to user-defined channels. If selecting this option, use the <i>custom-scan &gt; channel-frequency</i> command to configure the channels scanned by the dedicated sensor. For more information, see <i>custom-scan</i> .                                                                            |
| Default-Scan                                                                             | Configures the mode of scanning as Default-Scan. This is the default setting.<br>By default the system has a fixed, built-in list of channels that are scanned. These channels are hard coded in a spread pattern of 1, 6, 11, 36, 40, 44, and 48. When selected, the dedicated sensor scans only these default channels.                                                                    |

#### Example

```
nx9500-6C8809(config-sensor-policy-test)#scan-mode Custom-Scan

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

#### Related Commands

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>no</i> | Reverts the scan-mode to default (Default-Scan) |
|-----------|-------------------------------------------------|

**4.1.92.2.4 no****▲ *sensor-policy-mode commands***

Removes or reverts to default a sensor policy's settings

**Supported in the following platforms:**

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
no [custom-scan|rssi-interval-duration|scan-mode]
no custom-scan channel-frequency <CHANNEL-FREQUENCY-LIST>
no rssi-interval-duration
no scan-mode
```

**Parameters**

- no <PARAMETERS>

|                 |                                                                                       |
|-----------------|---------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts to default a sensor policy settings based on the parameters passed |
|-----------------|---------------------------------------------------------------------------------------|

**Example**

The following example shows the sensor-policy 'test' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

The scan-mode is reverted back to the default setting of 'Default-Scan', as show in the following output:

```
nx9500-6C8809(config-sensor-policy-test)#no scan-mode
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Default-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#

nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2412
nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2417

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Default-Scan
nx9500-6C8809(config-sensor-policy-test)#
```

## 4.1.93 smart-rf-policy

### ► Global Configuration Commands

Configures a Smart RF policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

#### Parameters

- smart-rf-policy <SMART-RF-POLICY-NAME>

|                        |                                                                                |
|------------------------|--------------------------------------------------------------------------------|
| <SMART-RF-POLICY-NAME> | Specify the Smart RF policy name. If the policy does not exist, it is created. |
|------------------------|--------------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#smart-rf-policy test
rfs6000-81742D(config-smart-rf-policy-test)#?
Smart RF Mode commands:
 area Specify channel list/ power for an area
 assignable-power Specify the assignable power during power-assignment
 avoidance-time Time to avoid a channel once dfs/adaptivity
 avoidance is necessary
 channel-list Select channel list for smart-rf
 channel-width Select channel width for smart-rf
 coverage-hole-recovery Recover from coverage hole
 enable Enable this smart-rf policy
 group-by Configure grouping parameters
 interference-recovery Recover issues due to excessive noise and
 interference
 neighbor-recovery Recover issues due to faulty neighbor radios
 no Negate a command or set its defaults
 sensitivity Configure smart-rf sensitivity (Modifies various
 other smart-rf configuration items)
 smart-ocs-monitoring Smart off channel scanning

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or term

rfs6000-81742D(config-smart-rf-policy-test)#
```

#### Related Commands

|           |                                     |
|-----------|-------------------------------------|
| <i>no</i> | Removes an existing Smart RF policy |
|-----------|-------------------------------------|

**NOTE:** For more information on Smart RF policy commands, see *Chapter 19, SMART-RF-POLICY*.

---

---

## 4.1.94 t5

### ► Global Configuration Commands

Invokes the configuration mode of a t5 wireless controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices.

#### Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
t5 <T5-DEVICE-MAC>
```

#### Parameters

- t5 <T5-DEVICE-MAC>

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t5 <T5-DEVICE-MAC> | <p>Specify the t5 device's MAC address. The system enters the identified device's configuration mode.</p> <p>A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The <i>Customer Premises Equipment</i> (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a <i>Digital Subscriber Line</i> (DSL) as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.</p> <p>After logging on to the T5 device, use the 'cpe' keyword and configure the following mandatory settings:</p> <ul style="list-style-type: none"> <li>• vlan – Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices.</li> <li>• start ip – Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices.</li> <li>• end ip – Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.</li> </ul> |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```

rfs6000-81742D(config)#t5 B4:C7:99:ED:5C:2C
rfs6000-81742D(config-device-B4:C7:99:ED:5C:2C)#?
T5 Device Mode commands:
 adsp-sensor-server Configure WIPS server
 bridge Sets MAC address expiration time in the bridge address
 table
 clock Configure clock options
 cpe T5 CPE configuration
 hostname Set system's network name
 interface Select an interface to configure
 ip Internet Protocol (IP)
 no Negate a command or set its defaults
 ntp Configure NTP
 override-wlan Configure RF Domain level overrides for wlan
 password T5 password configuration
 qos QOS settings
 radius-server Radius server settings
 t5 T5 configuration
 t5-logging Modify message logging facilities
 use Set setting to use

## 4.1.95 web-filter-policy

### ► *Global Configuration Commands*

The following table lists commands that enable you to enter the Web Filter policy configuration mode:

**Table 4.51** *Commands Creating a Web-Filter-Policy*

| Command                                       | Description                                                       | Reference         |
|-----------------------------------------------|-------------------------------------------------------------------|-------------------|
| <i>web-filter-policy</i>                      | Creates a new Web Filter policy and enters its configuration mode | <i>page 4-552</i> |
| <i>web-filter-policy-config-mode commands</i> | Summarizes the Web Filter policy configuration mode commands      | <i>page 4-443</i> |

### 4.1.95.1 web-filter-policy

#### ► *web-filter-policy*

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, *hierarchically managed* (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable, etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see *url-filter*.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
web-filter-policy <WEB-FILTER-POLICY-NAME>
```

#### Parameters

- `web-filter-policy <WEB-FILTER-POLICY-NAME>`

|                                             |                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------|
| <code>&lt;WEB-FILTER-POLICY-NAME&gt;</code> | Specify the Web filter policy name. If the policy does not exist, it is created. |
|---------------------------------------------|----------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config)#web-filter-policy test
nx9500-6C8809(config-web-filter-policy-test)#?
Content Filter Mode commands:
 cache-max-recs Configure the maximum number of records in local cache
 cache-save-interval Configure the time a record is saved in local cache
 logging Select logging method
 no Negate a command or set its defaults
 server-host Configure URL classification server if it is not the
 adopted controller
 server-unreachable Permission to access website when classification server
 is unreachable (default is pass)
 uncategorized-url Permission to website when server fails to classify the
 URL request (default is pass)

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-web-filter-policy-test)#
```

**Related Commands**

|           |                                       |
|-----------|---------------------------------------|
| <i>no</i> | Removes an existing Web filter policy |
|-----------|---------------------------------------|

### 4.1.95.2 web-filter-policy-config-mode commands

#### ► *web-filter-policy*

The following table summarizes Web Filter policy configuration mode commands:

**Table 4.52** *Web-Filter-Policy-Config-Mode Commands*

| Command                    | Description                                                                                                                   | Reference         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>cache-max-recs</i>      | Configures the maximum number of records (URLs and Web pages) cached in the local database                                    | <i>page 4-444</i> |
| <i>cache-save-interval</i> | Configures the maximum time period for which a record (URL and Web page classification entry) is cached in the local database | <i>page 4-445</i> |
| <i>logging</i>             | Configures the method used to log Web filtering events                                                                        | <i>page 4-446</i> |
| <i>no</i>                  | Reverts the selected Web Filter policy settings to default                                                                    | <i>page 4-447</i> |
| <i>server-host</i>         | Configures the URL classification server in case it is not the adopted controller                                             | <i>page 4-448</i> |
| <i>server-unreachable</i>  | Configures the action taken in case the classification server is unreachable                                                  | <i>page 4-449</i> |
| <i>uncategorized-url</i>   | Configures the action taken in case the classification server fails to classify a URL/Website                                 | <i>page 4-450</i> |

### 4.1.95.2.1 cache-max-recs

► *web-filter-policy-config-mode commands*

Configures the maximum number of records (URL and Web page classification entries) cached in the local database

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
cache-max-recs <1-1000000>
```

#### Parameters

- `cache-max-recs <1-1000000>`

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>cache-max-recs &lt;1-1000000&gt;</pre> | <p>Specify the maximum number of records cached in the local database from 1 - 1000000.</p> <p>When configuring this value take into consideration the type of device using the Web Filter policy. The value should approximately be as per the following information:</p> <ul style="list-style-type: none"> <li>• NX95XX - &lt;1-1000000&gt; (default is 100000)</li> <li>• NX75XX - &lt;1-100000&gt; (default is 10000)</li> <li>• RFS Switches - &lt;1-10000&gt; (default is 1000)</li> <li>• Access Points - &lt;1-1500&gt; (default is 500)</li> </ul> |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809 (config-web-filter-policy-test)#cache-max-recs 9000

nx9500-6C8809 (config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
nx9500-6C8809 (config-web-filter-policy-test)#
```

#### Related Commands

|           |                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types. |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.95.2.2 cache-save-interval

► *web-filter-policy-config-mode commands*

Configures the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
cache-save-interval <1-86400>
```

#### Parameters

- cache-save-interval <1-86400>

|                               |                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| cache-save-interval <1-86400> | Specify the maximum time period, in seconds, for which a record is cached in the local database from 1 - 86400 seconds. The default is 60 seconds. |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-web-filter-policy-test)#cache-save-interval 1000

nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
nx9500-6C8809(config-web-filter-policy-test)#
```

#### Related Commands

|           |                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60) |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|

### 4.1.95.2.3 logging

▶ *web-filter-policy-config-mode commands*

Configures the method used to log Web filtering events

**Supported in the following platforms:**

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
logging [logfile|syslog]
```

**Parameters**

- logging [logfile|syslog]

|                             |                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging<br>[logfile syslog] | Selects the method used to log Web filtering events. The options are: <ul style="list-style-type: none"> <li>• logfile - Logs to a file.</li> <li>• syslog - Logs to the syslog server. This is the default setting.</li> </ul> |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Example**

```
nx9500-6C8809(config-web-filter-policy-test)#logging logfile
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 logging logfile
nx9500-6C8809(config-web-filter-policy-test)#
```

#### 4.1.95.2.4 no

##### ▶ *web-filter-policy-config-mode commands*

Reverts the selected Web Filter policy settings to default, based on the parameters passed

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
no [cache-max-recs|cache-save-interval|server-host|server-unreachable|
uncategorized-url]
```

#### Parameters

- no <PARAMETERS>

|                 |                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Reverts the selected Web Filter policy settings to default, based on the parameters passed. Specify the parameters to revert back to default value. |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

The following example shows the Web Filter policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 uncategorized-url block
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#

nx9500-6C8809(config-web-filter-policy-test)#no cache-max-recs
nx9500-6C8809(config-web-filter-policy-test)#no server-unreachable
nx9500-6C8809(config-web-filter-policy-test)#no uncategorized-url
```

The following example shows the Web Filter policy 'test' settings after the 'no' command has been executed:

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-save-interval 1000
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

### 4.1.95.2.5 server-host

#### ► *web-filter-policy-config-mode commands*

Configures the URL classification server in case it is not the adopted controller

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id
<SERVER-MiNT-ID>]
```

#### Parameters

- server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]

|                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>server-host [host-name &lt;SERVER-HOST- NAME&gt;  ip-address &lt;SERVER-IPv4&gt;  mint-id &lt;SERVER-MiNT-ID&gt;]</pre> | <p>Use one of the following options to identify the URL classification server:</p> <ul style="list-style-type: none"> <li>• host-name &lt;SERVER-HOST-NAME&gt; - Identifies the classification server by its hostname.</li> <li>• ip-address &lt;SERVER-IPv4&gt; - Identifies the classification server by its IP address.</li> <li>• mint-id &lt;SERVER-MiNT-ID&gt; - Identifies the classification server by its MiNT ID.</li> </ul> |
|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-web-filter-policy-test)#server-host ip-address 192.168.13.13

nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

#### Related Commands

|                      |                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------|
| <pre><i>no</i></pre> | <p>Removes the URL classification server's configured details, such as hostname, ip-address, or MiNT ID.</p> |
|----------------------|--------------------------------------------------------------------------------------------------------------|

#### 4.1.95.2.6 server-unreachable

▶ *web-filter-policy-config-mode commands*

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user's request for a URL/Website is either blocked or passed.

##### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

##### Syntax

```
server-unreachable [block|pass]
```

##### Parameters

- server-unreachable [block|pass]

|                                 |                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server-unreachable [block pass] | Configures the action taken in case the classification server is unreachable. The options are: <ul style="list-style-type: none"> <li>• block - Denies access to the requested URL/Website</li> <li>• pass - Allows access to the requested URL/Website. This is the default value.</li> </ul> |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

##### Example

```
nx9500-6C8809(config-web-filter-policy-test)#server-unreachable block

nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
cache-max-recs 9000
cache-save-interval 1000
server-unreachable block
server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

##### Related Commands

|           |                                                                                             |
|-----------|---------------------------------------------------------------------------------------------|
| <i>no</i> | Reverts the action taken in case the classification server is unreachable to default (pass) |
|-----------|---------------------------------------------------------------------------------------------|

### 4.1.95.2.7 uncategorized-url

► *web-filter-policy-config-mode commands*

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured the an end user's request for a non-classified URL/Website is either blocked or passed.

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
uncategorized-url [block|pass]
```

#### Parameters

- uncategorized-url [block|pass]

|                                   |                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uncategorized-url<br>[block pass] | Configures the action taken in case the classification server fails to classify a URL/Website. The options are: <ul style="list-style-type: none"> <li>• block – Denies access to the requested non-classified URL/Website</li> <li>• pass – Allows access to the requested non-classified URL/Website. This is the default value.</li> </ul> |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
nx9500-6C8809(config-web-filter-policy-test)#uncategorized-url block

nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 uncategorized-url block
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

#### Related Commands

|           |                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------|
| <i>no</i> | Reverts the action taken in case the classification server fails to classify a URL/Website to default (pass) |
|-----------|--------------------------------------------------------------------------------------------------------------|

## 4.1.96 wips-policy

### ► Global Configuration Commands

Configures a WIPS policy

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
wips-policy <WIPS-POLICY-NAME>
```

#### Parameters

- wips-policy <WIPS-POLICY-NAME>

|                                       |                                                                            |
|---------------------------------------|----------------------------------------------------------------------------|
| <code>&lt;WIPS-POLICY-NAME&gt;</code> | Specify the WIPS policy name. If the policy does not exist, it is created. |
|---------------------------------------|----------------------------------------------------------------------------|

#### Example

```
rfs6000-81742D(config)#wips-policy test
rfs6000-81742D(config-wips-policy-test)#?
Wips Policy Mode commands:
 ap-detection Rogue AP detection
 enable Enable this wips policy
 event Configure an event
 history-throttle-duration
 Configure the duration for which event duplicates
 are not stored in history
 interference-event Specify events which will contribute to smart-rf
 wifi interference calculations
 no Negate a command or set its defaults
 signature Signature to configure
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs6000-81742D(config-wips-policy-test)#
```

#### Related Commands

|           |                                 |
|-----------|---------------------------------|
| <i>no</i> | Removes an existing WIPS policy |
|-----------|---------------------------------|

**NOTE:** For more information on WIPS policy commands, see [Chapter 20, WIPS-POLICY](#).

## 4.1.97 wlan

### ► *Global Configuration Commands*

Configures a *Wireless Local Area Network* (WLAN)

The following table lists WLAN configuration mode commands:

**Table 4.53** *WLAN-Policy Config Commands*

| Command                   | Description                                                  | Reference         |
|---------------------------|--------------------------------------------------------------|-------------------|
| <i>wlan</i>               | Creates a new wireless LAN and enters its configuration mode | <i>page 4-453</i> |
| <i>wlan-mode commands</i> | Summarizes WLAN configuration mode commands                  | <i>page 4-457</i> |

### 4.1.97.1 wlan

#### ▶ wlan

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN's settings.

A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or *Orthogonal Frequency Division Multiplexing* (OFDM) modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected access point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each access point. A WLAN can be advertised from a single access point radio or can span multiple access points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHz radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHz and 5.0 GHz radios at the branch site to provide complete coverage.

The maximum number of WLANs supported by different devices is as follows:

- RFS4000 and RFS6000 wireless controllers – 32 WLANs
- NX95XX series service platforms – 1000 WLANs
- Access Points – 16 WLANs

#### Supported in the following platforms:

- Access Points — AP6521, AP6522, AP6532, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
wlan {<WLAN-NAME>|containing <WLAN-NAME>}
```

**Parameters**

- wlan {<WLAN-NAME>|containing <WLAN-NAME>}

|                           |                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wlan<br><WLAN-NAME>       | Configures a new WLAN <ul style="list-style-type: none"> <li>• &lt;WLAN-NAME&gt; - Optional. Specify the WLAN name.</li> </ul> <p>The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing, etc.).The name cannot exceed 32 characters.</p> |
| containing<br><WLAN-NAME> | Optional. Configures an existing WLAN's settings <ul style="list-style-type: none"> <li>• &lt;WLAN-NAME&gt; - Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN. This option allows you to select and enter the configuration mode of one or more WLANs.</li> </ul> |

**Example**

|                                       |                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------|
| rfs6000-81742D(config)#wlan 1         |                                                                                    |
| rfs6000-81742D(config-wlan-1)#?       |                                                                                    |
| Wireless LAN Mode commands:           |                                                                                    |
| accounting                            | Configure how accounting records are created for this wlan                         |
| acl                                   | Actions taken based on ACL configuration [packet drop being one of them]           |
| answer-broadcast-probes               | Include this wlan when responding to probe requests that do not specify an SSID    |
| assoc-response                        | Association response threshold                                                     |
| association-list                      | Configure the association list for the wlan                                        |
| authentication-type                   | The authentication type of this WLAN                                               |
| bridging-mode                         | Configure how packets to/from this wlan are bridged                                |
| broadcast-dhcp                        | Configure broadcast DHCP packet handling                                           |
| broadcast-ssid                        | Advertise the SSID of the WLAN in beacons                                          |
| captive-portal-enforcement            | Enable captive-portal enforcement on the wlan                                      |
| client-access                         | Enable client-access (normal data operations) on this wlan                         |
| client-client-communication           | Allow switching of frames from one wireless client to another on this wlan         |
| client-load-balancing                 | Configure load balancing of clients on this wlan                                   |
| controller-assisted-mobility          | Enable controller assisted mobility to determine wireless clients' VLAN assignment |
| data-rates                            | Specify the 802.11 rates to be supported on this wlan                              |
| description                           | Configure a description of the usage of this wlan                                  |
| downstream-group-addressed-forwarding | Enable downstream group addressed forwarding of packets                            |
| dpi                                   | Deep-Packet-Inspection (Application Assurance)                                     |
| dynamic-vlan-assignment               | Dynamic VLAN assignment configuration                                              |
| eap-types                             | Configure client access based on eap-type used for authentication                  |
| encryption-type                       | Configure the encryption to use on this wlan                                       |
| enforce-dhcp                          | Drop packets from Wireless Clients with static IP address                          |
| fast-bss-transition                   | Configure support for 802.11r Fast                                                 |

```

http-analyze BSS Transition
ip Enable HTTP URL analysis on the wlan
ip Internet Protocol (IP)
ipv6 Internet Protocol version 6 (IPv6)
kerberos Configure kerberos authentication
 parameters
mac-authentication
 Configure mac-authentication related
 parameters
no Negate a command or set its defaults
nsight Nsight Server
opendns OpenDNS related config for this wlan
protected-mgmt-frames
 Protected Management Frames (IEEE
 802.11w) related configuration (DEMO
 FEATURE)
proxy-arp-mode Configure handling of ARP requests
 with proxy-arp is enabled
proxy-nd-mode Configure handling of IPv6 ND
 requests with proxy-nd is enabled
qos-map Support the 802.11u QoS map element
 and frame
radio-resource-measurement
 Configure support for 802.11k Radio
 Resource Measurement
radius Configure RADIUS related parameters
registration Enable dynamic registration of device
 (or) user
relay-agent Configure dhcp relay agent info
shutdown Shutdown this wlan
ssid Configure the Service Set Identifier
 for this WLAN
t5-client-isolation
t5-security Isolate traffic among clients
 Configure encryption and
 authentication
time-based-access
use Configure client access based on time
 Set setting to use
vlan Configure the vlan where traffic from
 this wlan is mapped
vlan-pool-member
 Add a member vlan to the pool of
 vlans for the wlan (Note:
 configuration of a vlan-pool
 overrides the 'vlan' configuration)
wep128 Configure WEP128 parameters
wep64 Configure WEP64 parameters
wing-extensions
 Enable support for WiNG-Specific
 extensions to 802.11
wireless-client
 Configure wireless-client specific
 parameters
wpa-wpa2 Modify tkip-ccmp (wpa/wpa2) related
 parameters

clrscr Clears the display screen
commit Commit all changes made in this
 session
do Run commands from Exec mode
end End current mode and change to EXEC
 mode
exit End current mode and down to previous
 mode

write Write running configuration to memory
 or terminal

rfs6000-81742D(config-wlan-1)#

```

The following example shows how to use the 'containing' keyword to enter the configuration mode of an existing WLAN:

```
rfs6000-81742D(config)#wlan containing wlan1
rfs6000-81742D(config-wlan-{'containing': 'wlan1'})#
```

## 4.1.97.2 wlan-mode commands

### ► wlan

This section documents the WLAN configuration mode commands in detail.

Use the (config) instance to configure WLAN related parameters.

To navigate to this instance, use the following command:

```
<DEVICE>(config)#wlan <WLAN-NAME>
```

The following table summarizes WLAN configuration mode commands:

**Table 4.54** WLAN-Mode Commands

| Command                                      | Description                                                                                                                                                  | Reference         |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <i>accounting</i>                            | Defines a WLAN accounting configuration                                                                                                                      | <i>page 4-460</i> |
| <i>acl</i>                                   | Defines the actions based on an ACL rule configuration                                                                                                       | <i>page 4-462</i> |
| <i>answer-broadcast-probes</i>               | Allows a WLAN to respond to probes for broadcast ESS                                                                                                         | <i>page 4-464</i> |
| <i>assoc-response</i>                        | Configures a minimum <i>receive signal strength indication</i> (RSSI) value, below which the WLAN does not send a response to a client's association request | <i>page 4-465</i> |
| <i>association-list</i>                      | Attaches an existing global association list to a WLAN                                                                                                       | <i>page 4-466</i> |
| <i>authentication-type</i>                   | Sets a WLAN's authentication type                                                                                                                            | <i>page 4-467</i> |
| <i>bridging-mode</i>                         | Configures how packets to/from this WLAN are bridged                                                                                                         | <i>page 4-469</i> |
| <i>broadcast-dhcp</i>                        | Configures broadcast DHCP packet handling                                                                                                                    | <i>page 4-470</i> |
| <i>broadcast-ssid</i>                        | Advertises a WLAN's SSID in beacons                                                                                                                          | <i>page 4-471</i> |
| <i>captive-portal-enforcement</i>            | Configures a WLAN's captive portal enforcement                                                                                                               | <i>page 4-472</i> |
| <i>client-access</i>                         | Enables WLAN client access (normal data operations)                                                                                                          | <i>page 4-473</i> |
| <i>client-client-communication</i>           | Allows the switching of frames from one wireless client to another on a WLAN                                                                                 | <i>page 4-474</i> |
| <i>client-load-balancing</i>                 | Enables load balancing of WLAN clients                                                                                                                       | <i>page 4-475</i> |
| <i>controller-assisted-mobility</i>          | Enables controller assisted mobility to determine wireless clients' VLAN assignment                                                                          | <i>page 4-477</i> |
| <i>data-rates</i>                            | Specifies the 802.11 rates supported on the WLAN                                                                                                             | <i>page 4-478</i> |
| <i>description</i>                           | Sets a WLAN's description                                                                                                                                    | <i>page 4-481</i> |
| <i>downstream-group-addressed-forwarding</i> | Enables forwarding of downstream packets addressed to a group                                                                                                | <i>page 4-482</i> |
| <i>dpi</i>                                   | Enables extraction of metadata flows on the WLAN                                                                                                             | <i>page 4-483</i> |
| <i>dynamic-vlan-assignment</i>               | Configures dynamic VLAN assignment on this WLAN                                                                                                              | <i>page 4-485</i> |
| <i>eap-types</i>                             | Configures client access based on eap-type used for authentication                                                                                           | <i>page 4-486</i> |
| <i>encryption-type</i>                       | Sets a WLAN's encryption type                                                                                                                                | <i>page 4-488</i> |

**Table 4.54** *WLAN-Mode Commands*

| Command                           | Description                                                                                                                                                         | Reference                  |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>enforce-dhcp</i>               | Drops packets from clients with a static IP address                                                                                                                 | <a href="#">page 4-489</a> |
| <i>fast-bss-transition</i>        | Configures support for 802.11r fast BSS transition on a WLAN                                                                                                        | <a href="#">page 4-490</a> |
| <i>http-analyze</i>               | Enables HTTP URL analysis on the WLAN                                                                                                                               | <a href="#">page 4-491</a> |
| <i>ip</i>                         | Configures IPv4 settings on this WLAN                                                                                                                               | <a href="#">page 4-493</a> |
| <i>ipv6</i>                       | Configures IPv6 settings on this WLAN                                                                                                                               | <a href="#">page 4-494</a> |
| <i>kerberos</i>                   | Configures Kerberos authentication parameters                                                                                                                       | <a href="#">page 4-495</a> |
| <i>mac-authentication</i>         | Configures MAC authentication parameters                                                                                                                            | <a href="#">page 4-497</a> |
| <i>no</i>                         | Negates a command or reverts settings to their default                                                                                                              | <a href="#">page 4-498</a> |
| <i>nsight</i>                     | Enables retention of guest client history in the NSight database                                                                                                    | <a href="#">page 4-502</a> |
| <i>opendns</i>                    | Configures the device ID, which is embedded in each DNS query packet going out from an access point, wireless controller, or service platform to the OpenDNS server | <a href="#">page 4-503</a> |
| <i>protected-mgmt-frames</i>      | Enables and configures the WLAN's frame protection mode and security association                                                                                    | <a href="#">page 4-505</a> |
| <i>proxy-arp-mode</i>             | Enables the proxy ARP mode for ARP requests                                                                                                                         | <a href="#">page 4-507</a> |
| <i>proxy-nd-mode</i>              | Configures the proxy ND mode for this WLAN member clients as either strict or dynamic                                                                               | <a href="#">page 4-508</a> |
| <i>qos-map</i>                    | Enables support for 802.11u QoS map element and frames                                                                                                              | <a href="#">page 4-509</a> |
| <i>radio-resource-measurement</i> | Enables support for 802.11k radio resource measurement                                                                                                              | <a href="#">page 4-510</a> |
| <i>radius</i>                     | Configures RADIUS parameters                                                                                                                                        | <a href="#">page 4-511</a> |
