Preface

This section discusses the conventions used in this guide, ways to provide feedback, additional help, and other Extreme Networks publications.

Text Conventions

The following tables list text conventions that are used throughout this guide.

Table 1: Notice Icons

Icon	Notice Type	Alerts you to...
	General Notice	Helpful tips and notices for using the product.
	Note	Important features or instructions.
	Caution	Risk of personal injury, system damage, or loss of data.
	Warning	Risk of severe personal injury.
<i>New!</i>	New Content	Displayed next to new content. This is searchable text within the PDF.

Table 2: Text Conventions

Convention	Description
Screen displays	This typeface indicates command syntax, or represents information as it appears on the screen.
The words enter and type	When you see the word “enter” in this guide, you must type something, and then press the Return or Enter key. Do not press the Return or Enter key when an instruction simply says “type.”
[Key] names	Key names are written with brackets, such as [Return] or [Esc] . If you must press two or more keys simultaneously, the key names are linked with a plus sign (+). Example: Press [Ctrl]+[Alt]+[Del]
<i>Words in italicized type</i>	Italics emphasize a point or denote new terms at the place where they are defined in the text. Italics are also used when referring to publication titles.

Platform-Dependent Conventions

Unless otherwise noted, all information applies to all platforms supported by ExtremeXOS® software, which are the following:

- ExtremeSwitching® switches
- Summit® switches
- SummitStack™

When a feature or feature implementation applies to specific platforms, the specific platform is noted in the heading for the section describing that implementation in the ExtremeXOS command documentation (see the Extreme Documentation page at <http://documentation.extremenetworks.com>). In many cases, although the command is available on all platforms, each platform uses specific keywords. These keywords specific to each platform are shown in the Syntax Description and discussed in the Usage Guidelines sections.

Providing Feedback to Us

We are always striving to improve our documentation and help you work better, so we want to hear from you! We welcome all feedback but especially want to know about:

- Content errors or confusing or conflicting information.
- Ideas for improvements to our documentation so you can find the information you need faster.
- Broken links or usability issues.

If you would like to provide feedback to the Extreme Networks Information Development team about this document, please contact us using our short [online feedback form](#). You can also email us directly at internalinfodev@extremenetworks.com.

Getting Help

If you require assistance, contact Extreme Networks using one of the following methods:

- **GTAC (Global Technical Assistance Center) for Immediate Support**
 - **Phone:** 1-800-998-2408 (toll-free in U.S. and Canada) or +1 408-579-2826. For the support phone number in your country, visit: www.extremenetworks.com/support/contact
 - **Email:** support@extremenetworks.com. To expedite your message, enter the product name or model number in the subject line.
- **Extreme Portal** — Search the GTAC knowledge base, manage support cases and service contracts, download software, and obtain product licensing, training, and certifications.
- **The Hub** — A forum for Extreme customers to connect with one another, answer questions, and share ideas and feedback. This community is monitored by Extreme Networks employees, but is not intended to replace specific guidance from GTAC.

Before contacting Extreme Networks for technical support, have the following information ready:

- Your Extreme Networks service contract number and/or serial numbers for all involved Extreme Networks products
- A description of the failure
- A description of any action(s) already taken to resolve the problem
- A description of your network environment (such as layout, cable type, other relevant environmental information)
- Network load at the time of trouble (if known)
- The device history (for example, if you have returned the device before, or if this is a recurring problem)
- Any related RMA (Return Material Authorization) numbers

Preface

This section discusses the conventions used in this guide, ways to provide feedback, additional help, and other Extreme Networks publications.

ABOUT THIS GUIDE

ABOUT THIS GUIDE

This manual supports the following access points, wireless controllers and service platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Note

In this document NX 9500 and NX 9510 are collectively referred to as NX 95XX.

Note

In this document NX 9600 and NX 9610 are collectively referred to as NX 96XX.

Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents.
- Bullets (•) indicate:
 - lists of alternatives
 - lists of required steps that are not necessarily sequential
 - action items
- Sequential lists (those describing step-by-step procedures) appear as numbered lists

Understanding Command Syntax

<p><variable></p>	<p>Variables are described with a short description enclosed within a '<' and a '>' pair. For example, the command, <code>nx9500-6C8809>show interface ge 1</code> is documented as: <code>show interface ge <1-2></code> where:</p> <ul style="list-style-type: none"> • show - is the command - displays information • interface - is the keyword - represents the interface type • <1-2> - is the variable - represents the ge interface index value <p>Note: Since this output is from an NX 95XX service platform, which supports only two (2) GE interfaces, the index value is shown as <1-2>. This value will vary depending on the platform type.</p>
<p> </p>	<p>The pipe symbol. This is used to separate the variables/keywords in a list. For example, the command, <code>nx9500-6C8809> show</code> is documented as: <code>show [adoption bluetooth bonjour boot]</code> where:</p> <ul style="list-style-type: none"> • show - is the command - displays information • [adoption bluetooth bonjour boot] - indicates the different keywords that can be combined with the <i>show</i> command. However, only one of the above option can be used at a time. <pre>show adoption ... show bluetooth ... show bonjour ...</pre>
<p>[]</p>	<p>Of the different keywords and variables listed inside a '[' & ']' pair, only one can be used. Each choice in the list is separated with a ' ' (pipe) symbol. For example, the command, <code>nx9500-6C8809# clear ...</code> is documented as: <code>[clear [arp-cache bonjour cdp counters crypto event-history firewall gre ip ipv6 l2tpv3-stats lcp license lldp logging mac-address-table mint role rtls spanning-tree traffic-shape vrrp]</code> where:</p> <ul style="list-style-type: none"> • clear - is the command • [arp-cache cdp bonjour counters crypto event-history firewall gre ip ipv6 l2tpv3-stats lcp license lldp logging mac-address-table mint role rtls spanning-tree traffic-shape vrrp] - indicates that these keywords are available for this command. However, only one can be used at a time.

<p>{ }</p>	<p>Any command/keyword/variable or a combination of them inside a '{ & }' pair is optional. All optional commands follow the same conventions as listed above. However, they are displayed italicized.</p> <p>For example, the command, <code>nx9500-6C8809> show adoption ...</code> is documented as: <code>show adoption info {on <DEVICE-NAME>}</code> here:</p> <ul style="list-style-type: none"> • <code>show adoption info</code> - is the command. This command can also be used as: <p><code>show adoption info</code> The command can also be extended as: <code>show adoption info {on <DEVICE-NAME>}</code> here:</p> <ul style="list-style-type: none"> • <code>{on <DEVICE-NAME>}</code> - is the optional keyword.
<p>command / keyword</p>	<p>The first word is always a command. Keywords are words that must be entered as is. Commands and keywords are mandatory.</p> <p>For example, the command, <code>nx9500-6C8809>show wireless</code> is documented as: <code>show wireless</code> where:</p> <ul style="list-style-type: none"> • <code>show</code> - is the command • <code>wireless</code> - is the keyword
<p>()</p>	<p>Any command/keyword/variable or a combination of them inside a '(&)' pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands.</p> <p>For example, the command, <code>crypto pki export request generate-rsa-key test autogen-subject-name ...</code> is documented as: <code>nx9500-6C8809#crypto pki export request generate-rsa-key test autogen-subject-name (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)</code> here:</p> <ul style="list-style-type: none"> • <code>crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME> auto-gen-subject-name</code> - is the command • <code><RSA-KEYPAIR-NAME></code> - is the RSA keypair name (in this example, the keypair name is 'test') • <code>(<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)</code> - is the set of recursive parameters (separated by commas) that can be used in any order.

INTRODUCTION

INTRODUCTION

This chapter describes the commands available within a device's CLI (Command Line Interface) structure. CLI is available for wireless controller, access points (APs), and service platforms.

Access the CLI by using:

- A terminal emulation program running on a computer connected to the serial port on the device (AP, wireless controller, and service platform).
- A Telnet session through SSH (Secure Shell) over a network.

Configuration for connecting to a Controller using a terminal emulator

If connecting through the serial port, use the following settings to configure your terminal emulator:

<i>Bits Per Second</i>	19200 For AP 8533, AP 8432, AP 7622, AP 7632, AP 7622, AP 7612, AP 7602, AP 7562, AP 7532, AP 7522, AP 7502, AP 6562, AP 6522 model access points set this value to 115200.
<i>Data Bits</i>	8
<i>Parity</i>	None
<i>Stop Bit</i>	1
<i>Flow Control</i>	None

When a CLI session is established, complete the following (user input is in **bold**):

```
login as: <username>  
administrator's login password: <password>
```

User Credentials

Use the following credentials when logging into a device for the first time:

User Name	admin
Password	admin123

When logging into the CLI for the first time, you are prompted to change the password. Reset the password and use it for subsequent logins.

Examples in this reference guide

Examples used in this reference guide are generic to the each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation "Supported in the following platforms." For an example, see below:

Supported in the following platforms:

- Wireless Controller – RFS 4000

The above example indicates the command is only available for a RFS 4000 model wireless controller.

CLI Overview

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.

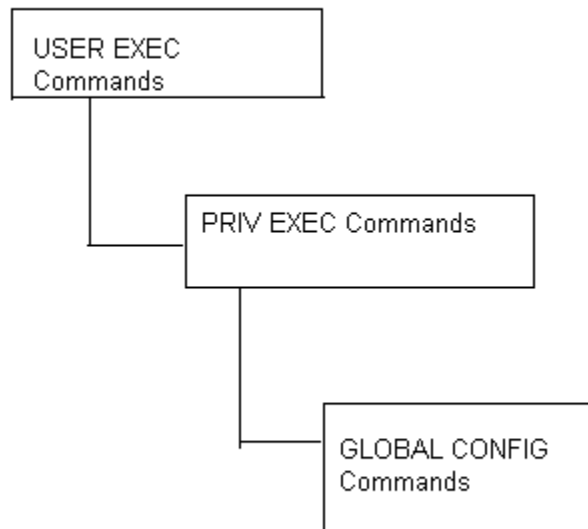

Figure: Hierarchy of User Modes

Command Modes

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is reserved for tasks that do not change the device's (wireless controller, service platform, or AP) configuration.

```
rfs4000-6DB5D4>
```

The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

```
rfs4000-6DB5D4>enable
rfs4000-6DB5D4#
```

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing 'commit' command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

```
rfs4000-6DB5D4#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs4000-6DB5D4(config)#
```

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

```
rfs4000-6DB5D4(config)#aaa-policy test
rfs4000-6DB5D4(config-aaa-policy-test)#
```

The following table summarizes the available controller commands:

Table 3: Controller CLI Modes and Commands

User Exec Mode	Priv Exec Mode	Global Configuration Mode
captive-portal-page-upload	archive	aaa-policy
change-passwd	boot	aaa-tacacs-policy
clear	captive-portal-page-upload	alias
clock	cd	AP 6522
cluster	change-passwd	AP 6562
commit	clear	AP 7502
connect	clock	AP 7522
create-cluster	cluster	AP 7532
crypto	commit	AP 7562
crypto-cmp-cert-update	configure	AP 7602
database	connect	AP 7612
database-backup	copy	AP 7622

Table 3: Controller CLI Modes and Commands (continued)

User Exec Mode	Priv Exec Mode	Global Configuration Mode
database-restore	cpe (supported on NX 7500, NX 9600 and VX 9000)	AP 7632
debug	create-cluster	AP 7662
device-upgrade	crypto	AP 8163
disable	crypto-cmp-cert-updated	AP 8432
enable	database	AP 8533
file-sync	database-backup	application
help	database-restore	application-group
join-cluster	debug	application-policy
l2tpv3	delete	
logging	device-upgrade	auto-provisioning-policy
mint	diff	bgp
no	dir	bonjour-gw-discovery-policy

opendns	edit	bonjour-gw-query-forwarding-policy
page	enable	captive-portal
ping	erase	clear
ping6	factory-reset	client-identity
revert	file-sync	client-identity-group
service	halt	clone
show	help	crypto-cmp-policy
ssh	join-cluster	customize
telnet	l2tpv3	database-client-policy (supported only on VX 9000)
terminal	logging	database-policy (supported only on NX 9500, NX 9600, and VX 9000)
time-it	mint	device
traceroute	mkdir	device-categorization
traceroute6	more	dhcp-server-policy
virtual-machine (supported only on NX 9500, NX 96XX and VX 9000)	no	dhcp6-server-policy
watch	on	dns-whitelist
write	opendns	event-system-policy
clrscr	page	firewall-policy
exit	ping	global-association-list

Table 3: Controller CLI Modes and Commands (continued)

User Exec Mode	Priv Exec Mode	Global Configuration Mode
	ping6	guest-management
	pwd	help
	raid (supported only on NX 9500 and NX 7530)	host
	re-elect	igmp-snoop-policy (This command has been deprecated. IGMP snooping is now configurable under the profile/device configuration mode. For more information, see ip on page 1154.
	reload	inline-password-encryption
	remote-debug	ip
	rename	ipv6
	revert	ipv6-router-advertisement-policy
	rmdir	l2tpv3
	self	mac
	service	management-policy
	show	meshpoint
	ssh	meshpoint-qos-policy
	t5 (supported only on RFS 4000, NX 9600, and VX 9000)	mint-policy
	telnet	nac-list
	terminal	no
	time-it	nsight-policy
	traceroute	NX 5500 (supported only on NX 9600 and VX 9000)
	traceroute6	NX 7500 (supported only on NX 9600 and VX 9000)
	upgrade	NX 9000 (supported only on NX 9600 and VX 9000)
	upgrade-abort	NX 9600
	virtual-machine (supported only on NX 9600 and VX 9000)	passpoint-policy
	watch	password-encryption
	write	profile
	clrscr	radio-qos-policy
	exit	radius-group
		radius-server-policy

Table 3: Controller CLI Modes and Commands (continued)

User Exec Mode	Priv Exec Mode	Global Configuration Mode
		radius-user-pool-policy
		rename
		roaming-assist-policy
		role-policy
		route-map
		routing-policy
		rtl-server-policy
		schedule-policy
		self
		sensor-policy
		smart-rf-policy
		t5 (supported only on NX 7500, NX 9600 and VX 9000)
		url-filter (supported only on NX 9600 and VX 9000)
		url-list (supported only on NX 9600 and VX 9000)
		vx9000 (supported only on NX 9600 and VX 9000)
		web-filter-policy
		wips-policy
		wlan
		wlan-qos-policy
		write
		clrscr
		commit
		do
		end
		exit
		revert
		service
		show

Getting Context Sensitive Help

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

Command	Description
(prompt)# help	Displays a brief description of the help system
(prompt)# abbreviated-command-entry?	Lists commands in the current mode that begin with a particular character string
(prompt)# abbreviated-command-entry<Tab>	Completes a partial command name
(prompt)# ?	Lists all commands available in the command mode
(prompt)# command ?	Lists the available syntax options (arguments and keywords) for the command
(prompt)# command keyword ?	Lists the next available syntax option for the command

Note

The system prompt varies depending on the configuration mode.

Note

Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

Note

The escape character used through out the CLI is "\". To enter a "\" use "\\" instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

```
rfs4000-6DB5D4#service?
service Service Commands
rfs4000-6DB5D4#service
```

Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the "?". This form of help is called command syntax help. It shows the keywords or arguments available based on the command/keyword and argument already entered.

```
rfs4000-6DB5D4#service ?
  block-adopter-config-update      Block configuration updates from the
  bluetooth                        Bluetooth service commands
  clear                             Clear adoption history
  cli-tables-skin                  Choose a formatting layout/skin for CLI
                                   tabular outputs (EXPERIMENTAL-Applies only
                                   to certain commands)
  cluster                          Cluster Protocol
  copy                             Copy files or directories
  delete                           Delete sessions
  delete-offline-aps               Delete Access Points that are configured
                                   but offline
  force-send-config                 Resend configuration to the device
  force-update-vm-stats             Force VM statistics to be pushed up to the
                                   NOC
```

load-balancing	Wireless load-balancing service commands
load-ssh-authorized-keys	Load Ssh authorized keys
locator	Enable leds flashing on the device
mint	MiNT protocol
pktpcap	Start packet capture
pm	Process Monitor
radio	Radio parameters
radius	Radius test
request-full-config-from-adopter	Request full configuration from the adopter
set	Set global options
show	Show running system information
signal	Send a signal to a process
smart-rf	Smart-RF Management Commands
snmp	Snmp
ssm	Command related to ssm
start-shell	Provide shell access
syslog	Syslog service
trace	Trace a process for system calls and signals
troubleshoot	Troubleshooting
wireless	Wireless commands

rfs4000-6DB5D4#

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, "configure terminal" can be abbreviated as **conf t**. Since the abbreviated command is unique, the wireless controller accepts the abbreviation and executes the command.

Enter the help command (available in any command mode) to provide the following description:

```
rfs4000-6DB5D4>help
```

When using the CLI, help is provided at the command line when typing '?'. If no help is available, the help content will be empty. Backup until entering a '?' shows the help content.

There are two styles of help provided:

1. Full help. Available when entering a command argument (e.g. 'show ?'). This will describe each possible argument.
2. Partial help. Available when an abbreviated argument is entered. This will display which arguments match the input (e.g. 'show ve?').

```
rfs4000-6DB5D4>
```

Using the No Command

Almost every command has a **no** form. Use **no** to disable a feature or function or return it to its default. Use the command without the **no** keyword to re-enable a disabled feature.

Basic Conventions

Keep the following conventions in mind while working within the CLI structure:

- Use ? at the end of a command to display available sub-modes. Type the first few characters of the sub-mode and press the tab key to add the sub-mode. Continue using ? until you reach the last sub-mode.
- Pre-defined CLI commands and keywords are case-insensitive: `cfg` = `Cfg` = `CFG`. However (for clarity), CLI commands and keywords are displayed (in this guide) using mixed case. For example, `apPolicy`, `trapHosts`, `channellInfo`.

- Enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive.

Using CLI Editing Features and Shortcuts

A variety of shortcuts and edit features are available. The following sections describe these features:

- [Moving the Cursor on the Command Line](#)
- [Completing a Partial Command Name](#)
- [Command Output pagination](#)

Moving the Cursor on the Command Line

The following table shows the key combinations or sequences to move the command line cursor. **Ctrl** defines the control key, which must be pressed simultaneously with its associated letter key. **Esc** means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions. The bold characters indicate the relation between a letter and its function.

Table: Keystrokes Details

Keystrokes	Function Summary	Function Details
Left Arrow or Ctrl-B	Back character	Moves the cursor one character to the left When entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt.
Right Arrow or Ctrl-F	Forward character	Moves the cursor one character to the right
Esc- B	Back word	Moves the cursor back one word
Esc- F	Forward word	Moves the cursor forward one word
Ctrl-A	Beginning of line	Moves the cursor to the beginning of the command line
Ctrl-E	End of line	Moves the cursor to the end of the command line
Ctrl-D		Deletes the current character
Ctrl-U		Deletes text up to cursor
Ctrl-K		Deletes from the cursor to end of the line
Ctrl-P		Obtains the prior command from memory
Ctrl-N		Obtains the next command from memory
Esc-C		Converts the letter at the cursor to uppercase
Esc-L		Converts the letter at the cursor to lowercase
Esc-D		Deletes the remainder of a word
Ctrl-W		Deletes the word up to the cursor
Ctrl-Z		Returns to the root prompt
Ctrl-T		Transposes the character to the left of the cursor with the character located at the cursor
Ctrl-L		Clears the screen

Completing a Partial Command Name

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a **Tab** key, press **Ctrl-L**.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter "conf" within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with **conf**.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

```
rfs4000-6DB5D4#conf[TAB]
rfs4000-6DB5D4#configure
```

When using the command completion feature, the CLI displays the full command name. The command is not executed until the **Return** or **Enter** key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (?) to obtain a list of commands beginning with that set of characters. Do not leave a space between the last letter and the question mark (?).

In the following example, all commands, available in the current context, starting with the characters 'co' are listed:

```
rfs4000-6DB5D44#co?
  commit      Commit all changes made in this session
  configure   Enter configuration mode
  connect     Open a console connection to a remote device
  copy        Copy from one file to another

rfs4000-6DB5D4#
```

Note

The characters entered before the question mark are reprinted to the screen to complete the command entry.

Command Output pagination

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a

```
--More--
```

prompt displays at the bottom of the screen. To resume the output, press the Enter key to scroll down one line or press the **Space bar** to display the next full screen of output.

Creating Profiles

Profiles are sort of a 'template' representation of configuration. The system has:

- a default profile for each of the following wireless controllers:
 - RFS 4000
- a default profile for each of the following service platforms:

- NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000
- a default profile for each of the following access points:
 - AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533

You can modify a default profile. In the following example, an IP address is assigned to the management port on the default RFS 4000 profile.

```
rfs4000-6DB5D4(config)#profile rfs4000 default-rfs4000
rfs4000-6DB5D4(config-profile-default-rfs4000)#interface me1
rfs4000-6DB5D4(config-profile-default-rfs4000-if-me1)#ip address 172.16.10.2/24
rfs4000-6DB5D4(config-profile-default-rfs4000-if-me1)#commit
rfs4000-6DB5D4(config-profile-default-rfs4000)#exit
rfs4000-6DB5D4(config)#
```

The following command displays a default AP 7562 profile configuration:

```
rfs4000-6DB5D4(config-profile-default-ap7562)#
rfs4000-6DB5D4(config-profile-default-ap7562)#show context
profile ap7562 default-ap7562

```

Change the default profile by creating vlan 150 and mapping to ge3 Physical interface

Log on to the controller in config mode and follow the procedure below:

```
rfs4000-6DB5D4(config-profile-default-rfs4000)# interface vlan 150
rfs4000-6DB5D4(config-profile-default-rfs4000-if-vlan150)# ip address 192.168.150.20/24
rfs4000-6DB5D4(config-profile-default-rfs4000-if-vlan150)# exit
rfs4000-6DB5D4(config-profile-default-rfs4000)# interface ge 3
rfs4000-6DB5D4(config-profile-default-rfs4000-if-ge3)# switchport access vlan 150
rfs4000-6DB5D4(config-profile-default-rfs4000-if-ge3)# commit write
[OK]
rfs4000-6DB5D4(config-profile-default-rfs4000-if-ge3)#show interface vlan 150
Interface vlan150 is UP
  Hardware-type: vlan, Mode: Layer 3, Address: 00-15-70-81-70-1D

Enabling Remote Administration

A terminal server may function in remote administration mode if either the terminal services role is not installed on the machine or the client used to invoke the session has enabled the admin controller.

- A terminal emulation program running on a computer connected to the serial port on the controller. The serial port is located on the front of the controller.
- A Telnet session through a SSH (Secure Shell) over a network. The Telnet session may or may not use SSH depending on how the controller is configured. Using SSH for remote administration tasks is recommended.

Configuring Telnet for Management Access

To enable Telnet for management access, use the serial console to login to the device and perform the following:

- 1 The session, by default, opens in the USER EXEC mode (one of the two access levels of the EXEC mode). Access the PRIV EXEC mode from the USER EXEC mode.

```
rfs4000-6DB5D4>en
rfs4000-6DB5D4#>
```

- 2 Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
rfs4000-6DB5D4>en
rfs4000-6DB5D4#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs4000-6DB5D4(config)#
```

- 3 Go to 'default-management-policy' mode.

```
rfs4000-6DB5D4(config)#management-policy ?
MANAGEMENT Name of the management policy to be configured (will be created
if it does not exist)
```

```
rfs4000-6DB5D4(config)#management-policy default
rfs4000-6DB5D4(config-management-policy-default)#
```

- 4 Enter Telnet and the port number at the command prompt. Note, the port number is optional. If you do not specify the port, the system, by default, assigns port 23 for Telnet. Commit your changes. Telnet is enabled.

```
rfs4000-6DB5D4(config-management-policy-default)#telnet
rfs4000-6DB5D4(config-management-policy-default)#commit write
```

```
rfs4000-6DB5D4(config-management-policy-default)#end
rfs4000-6DB5D4#exit
```

- 5 Connect to the controller through Telnet using its configured IP address. If logging in for the first time, use the following credentials:

User Name	admin
Password	admin123 Note: When logging in for the first time, you will be prompted to change the password. Re-set the password and use it for subsequent logins.

- 6 To change password, on subsequent logins, access the default management-policy configuration mode and enter the username, new password, role, and access details.

```
rfs4000-6DB5D4(config-management-policy-default)#user testuser password test@123

Configuring SSH for Management Access

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access on a device, login through the serial console and perform the following:

- 1 The session, by default, opens in the USER EXEC mode (one of the two access levels of the EXEC mode). Access the PRIV EXEC mode from the USER EXEC mode.

```
rfs4000-6DB5D4>en
rfs4000-6DB5D4#
```

- 2 Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
rfs4000-6DB5D4>en
rfs4000-6DB5D4#configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.
 rfs4000-6DB5D4(config)#

- Go to 'default-management-policy' mode.

```
rfs4000-6DB5D4(config)#management-policy ?
  MANAGEMENT Name of the management policy to be configured (will be created
                if it does not exist)
```

```
rfs4000-6DB5D4(config)#management-policy default
rfs4000-6DB5D4(config-management-policy-default)#
```

- Enter SSH at the command prompt.

```
rfs4000-6DB5D4(config-management-policy-default)#ssh
rfs4000-6DB5D4(config-management-policy-default)#commit write
rfs4000-6DB5D4(config-management-policy-default)#end
rfs4000-6DB5D4#exit
```

- Connect to the controller through SSH using its configured IP address. If logging in for the first time, use the following credentials:

User Name	admin
Password	admin123
	Note: When logging in for the first time, you will be prompted to change the password. Re-set the password and use it for subsequent logins.

- On subsequent logins, to change the password, access the default management-policy configuration mode and enter the username, new password, role, and access details.

USER EXEC MODE COMMANDS

USER EXEC MODE COMMANDS

Logging in to the wireless controller places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

```
<DEVICE>>?
```

```
Command commands:
```

```
  captive-portal-page-upload  Captive portal internal and advanced page upload
  change-passwd               Change password
  clear                       Clear
  clock                       Configure software system clock
  cluster                    Cluster commands
  commit                     Commit all changes made in this session
  connect                    Open a console connection to a remote device
  create-cluster             Create a cluster
  crypto                     Encryption related commands
  crypto-cmp-cert-update     Update the cmp certs
  database                   Database
  database-backup            Backup database
  database-restore          Restore database
  debug                     Debugging functions
  device-upgrade            Device firmware upgrade
  disable                   Turn off privileged mode command
  enable                    Turn on privileged mode command
  file-sync                 File sync between controller and adoptees
  help                      Description of the interactive help system
  join-cluster              Join the cluster
  l2tpv3                    L2tpv3 protocol
  logging                   Modify message logging facilities
  mint                      MiNT protocol
  no                        Negate a command or set its defaults
  on                        On RF-Domain
 .opendns                   OpenDNS configuration
  page                      Toggle paging
  ping                      Send ICMP echo messages
  ping6                     Send ICMPv6 echo messages
  revert                    Revert changes
  service                   Service Commands
  show                      Show running system information
  ssh                       Open an ssh connection
  telnet                    Open a telnet connection
  terminal                  Set terminal line parameters
  time-it                   Check how long a particular command took between
                           request and completion of response
  traceroute                Trace route to destination
  traceroute6               Trace route to destination(IPv6)
  virtual-machine           Virtual Machine
  watch                     Repeat the specific CLI command at a periodic
                           interval
  write                     Write running configuration to memory or
```

```

terminal
clrscr          Clears the display screen
exit           Exit from the CLI

<DEVICE>>

```

user-exec-commands

The following table summarizes the User Exec Configuration Mode commands:

Table 4: User Exec Mode Commands

Command	Description
captive-portal-page-upload (user and privi exec modes) on page 27	Uploads captive portal advanced pages
change-passwd (user and privi exec modes) on page 31	Changes the password of a logged user
clear (user and privi exec modes) on page 32	Resets the last saved command
clock (user and privi exec modes) on page 44	Configures the system clock
cluster (user and privi exec modes) on page 46	Accesses the cluster context
connect (user and privi exec modes) on page 46	Establishes a console connection to a remote device
create-cluster (user and privi exec modes) on page 47	Creates a new cluster on a specified device
crypto (user and privi exec modes) on page 49	Enables encryption
crypto-cmp-cert-policy (user and privi exec modes) on page 58	Triggers a CMP certificate update on a specified device or devices
database (user and privi exec modes) on page 59	Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)
database-backup (user and privi exec modes) on page 63	Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server
database-restore (user and privi exec modes) on page 64	Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.
device-upgrade (user and privi exec modes) on page 65	Configures device firmware upgrade settings
disable on page 73	Turns off (disables) the privileged mode command set
enable on page 73	Turns on (enables) the privileged mode command set
join-cluster (user and privi exec modes) on page 77	Adds a device (Access Point, wireless controller, or service platform) to an existing cluster of devices
file-sync (user and privi exec modes) on page 74	Configures parameters enabling syncing of PKCS#12 and wireless-bridge certificate between the staging-controller and adopted access points
l2tpv3 (user and privi exec modes) on page 79	Establishes or brings down L2TPv3 (Layer 2 Tunneling Protocol Version 3) tunnels
logging (user and privi exec modes) on page 80	Modifies message logging facilities

Table 4: User Exec Mode Commands (continued)

Command	Description
mint (user and privi exec modes) on page 82	Configures MiNT protocol
no (user exec mode) on page 83	Negates a command or sets its default
opendns (user and privi exec modes) on page 86	Connects to the OpenDNS site using OpenDNS registered credentials (username, password) OR OpenDNS API token to fetch the OpenDNS device_id. This command is a part of the process integrating access points, controllers, and service platforms with OpenDNS.
page (user and privi exec modes) on page 89	Toggles a device's (Access Point, wireless controller, or service platform) paging function
ping (user and privi exec modes) on page 90	Sends ICMP echo messages to a user-specified location
ping6 (user and privi exec modes) on page 91	Sends ICMPv6 echo messages to a user-specified location
ssh (user and privi exec modes) on page 93	Opens an SSH connection between two network devices
telnet (user and privi exec modes) on page 94	Opens a Telnet session
terminal (user and privi exec modes) on page 95	Sets the length and width of the terminal window
time-it (user and privi exec modes) on page 96	Verifies the time taken by a particular command between request and response
traceroute (user-privi-exec-mode) on page 96	Traces the route to its defined IPv4 destination
traceroute6 (user-privi-exec-mode) on page 97	Traces the route to its defined IPv6 destination
watch on page 104	Repeats a specific CLI command at a periodic interval
virtual-machine	Installs, configures, and monitors the status of VMs (<i>virtual machines</i>). This command is specific to the NX 9500 and NX 9510 series service platforms.
exit (user exec mode) on page 103	Ends the current CLI session and closes the session window

Note

For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see [COMMON COMMANDS](#) on page 640.

Note

The input parameter <HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore (_) character.

captive-portal-page-upload (user and privi exec modes)

Uploads captive portal advanced pages to adopted access points. Use this command to provide access points with specific captive portal configurations, so that they can successfully provision login,

welcome, and condition pages to clients attempting to access the wireless network using the captive portal.

Note

Ensure that the captive portal pages to upload are *.tar files.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME> |cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME> |all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME> |all] {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME> |all]
{from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME> |all|on rf-domain [<DOMAIN-NAME> |
all]]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

Parameters

```
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME> |all] {upload-time <TIME>}
```

captive-portal-page-upload <CAPTIVE-PORTAL-NAME>	Uploads advanced pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter <ul style="list-style-type: none">• <CAPTIVE-PORTAL-NAME> - Specify captive portal's name (should be existing and configured).
<MAC/HOSTNAME>	Uploads to a specified AP <ul style="list-style-type: none">• <MAC/HOSTNAME> - Specify the AP's MAC address or hostname.
all	Uploads to all APs
upload-time <TIME>	Schedules an AP upload time <ul style="list-style-type: none">• <TIME> - Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. The scheduled upload time is your local system's time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device. To view a list of uploaded captive portal files, execute the show > captive-portal-page-upload > list-files <CAPTIVE-PORTAL-NAME> command.

```
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME> |all]
{from-controller} {(upload-time <TIME>)}
```

captive-portal-page-upload <CAPTIVE-PORTAL-NAME>	Uploads advanced pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter <ul style="list-style-type: none"> • <CAPTIVE-PORTAL-NAME> – Specify the captive portal’s name (should be existing and configured).
rf-domain [<DOMAIN-NAME> all]	Uploads to all APs within a specified RF Domain or all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> – Uploads to APs within a specified RF Domain. Specify the RF Domain name. • all – Uploads to APs across all RF Domains
from-controller	Optional. Uploads captive-portal pages to APs via the controller to which the APs are adopted
upload-time <TIME>	Schedules an AP upload time <ul style="list-style-type: none"> • <TIME> – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format. <p>The scheduled upload time is your local system’s time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.</p> <p>To view a list of uploaded captive portal files, execute the show > captive-portal-page-upload > list-files <CAPTIVE-PORTAL-NAME> command.</p>

```
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME>|all|on rf-domain [<DOMAIN-NAME>|all]]
```

captive-portal-page-upload cancel-upload	Cancels a scheduled AP upload
cancel-upload [<MAC/HOSTNAME> all on rf-domain [<DOMAIN-NAME> all]]	Select one of the following options: <ul style="list-style-type: none"> • <MAC/HOSTNAME> – Cancels scheduled upload to a specified AP. Specify the AP’s MAC address or hostname. • all – Cancels all scheduled AP uploads • on rf- domain – Cancels all scheduled uploads within a specified RF Domain or all RF Domains <ul style="list-style-type: none"> • <DOMAIN-NAME> – Cancels scheduled uploads within a specified RF Domain. Specify the RF Domain name. • all – Cancels scheduled uploads across all RF Domains

```
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
```

captive-portal-page-upload delete-file	Deletes a specified captive portal’s uploaded captive-portal Web page files
<CAPTIVE-PORTAL-NAME> <FILE-NAME>	Identifies the captive-portal and Web pages to delete <ul style="list-style-type: none"> • <CAPTIVE-PORTAL-NAME> – Specify the captive portal name. • <FILE-NAME> – Specify the file name. The specified internal captive portal page is deleted.

```
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

captive-portal-page-upload load-file	Loads captive-portal advanced pages
<CAPTIVE-PORTAL-NAME> <URL>	<p>Specify the captive portal's name and location. The captive portal should be existing and configured.</p> <p>IPv4 URLs:</p> <ul style="list-style-type: none"> • tftp://<hostname IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname IP>[:port]/path/file • sftp://<user>:<passwd>@<hostname IP>[:port]/path/file • http://<hostname IP>[:port]/path/file • cf:/path/file • usb<n>:/path/file <p>IPv6 URLs:</p> <ul style="list-style-type: none"> • tftp://<hostname IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname IPv6>[:port]/path/file • http://<hostname IPv6>[:port]/path/file <p>Note: The captive portal pages are downloaded to the controller from the location specified here. After downloading use the captive-portal-page-upload > <CAPTIVE-PORTAL-NAME> > <DEVICE-OR-DOMAIN-NAME> command to upload these pages to APs.</p>

Examples (User Executable Mode)

```
ap6562-B1A214>captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/

```

change-passwd (user and privi exec modes)

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

Parameters

```
change passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

<OLD-PASSWORD>	Optional. Specify the existing password.
<NEW-PASSWORD>	Specify the new password.
Note: The password can also be changed interactively. To do so, press [Enter] after the command.	

Usage Guidelines

A password must be from 1 - 64 characters.

Examples (User Executable Mode)

```
rfs4000-6DB5D4>change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs4000-6DB5D4#write memory
OK
rfs4000-6DB5D4>
```

Examples (Privilege Executable Mode)

```
nx9500-6C8809#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
nx9500-6C8809#write memory
OK
nx9500-6C8809#
```

clear (user and privi exec modes)

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode in which the clear command is executed.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}
```

Parameters

```
clear arp-cache {on <DEVICE-NAME>}
```

arp-cache	Clears ARP (Address Resolution Protocol) cache entries on a AP, wireless controller, or service platform. This protocol matches the layer 3 IP addresses to the layer 2 MAC addresses.
on <DEVICE-NAME>	Optional. Clears ARP cache entries on a specified device <ul style="list-style-type: none"><DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear bonjour cache {on <DEVICE-NAME>}
```

bonjour cache	Clears all Bonjour cached statistics. Once cleared the system has to re-discover available Bonjour services.
on <DEVICE-NAME>	Optional. Clears all Bonjour cached statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
```

cdp	Clears CDP (Cisco Discovery Protocol) (CDP) table entries
lldp	Clears LLDP (Link Layer Discovery Protocol) table entries
neighbors	Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step
on <DEVICE-NAME>	Optional. Clears CDP or LLDP neighbor table entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}] {(on <DEVICE-OR-DOMAIN-NAME>)}
```

counters	Clears counters based on the parameters passed. The options are: AP, radio, and wireless clients.
ap <MAC>	Clears counters for all APs or a specified AP <ul style="list-style-type: none"> • <MAC> - Optional. Specify the AP's MAC address. <p>Note: If no MAC address is specified, all AP counters are cleared.</p>
radio <MAC/DEVICE-NAME> <1-X>	Clears radio interface counters on a specified device or on all devices <ul style="list-style-type: none"> • <MAC/DEVICE-NAME> - Optional. Specify the device's hostname or MAC address. Optionally, append the radio interface number (to the radio ID) using one of the following formats: AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX (where RX is the interface number). • <1-X> - Optional. Identifies the radio interface by its index. Specify the radio interface index, if not specified as part of the radio ID. Note, the number of radio interfaces available varies with the access point type. <p>Note: If no device name or MAC address is specified, all radio interface counters are cleared.</p>
wireless-client <MAC>	Clears counters for all wireless clients or a specified wireless client <ul style="list-style-type: none"> • <MAC> - Optional. Specify the wireless client's MAC address. <p>Note: If no MAC address is specified, all wireless client counters are cleared.</p>
on <DEVICE-OR-DOMAIN-NAME>	The following option is common to all of the above keywords: <ul style="list-style-type: none"> • on <DEVICE-OR-DOMAIN-NAME> - Optional. Clears AP, radio, or wireless client counters on a specified AP, wireless controller, service platform, or RF Domain. • <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
```

crypto	Clears encryption module's cached statistics
ike sa [<IP> all]	Clears IKE (Internet Key Exchange) SAs (security associations) <ul style="list-style-type: none"> • <IP> - Clears IKE SA entries for the peer identified by the <IP> keyword • all - Clears IKE SA entries for all peers
on <DEVICE-NAME>	Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear crypto ipsec sa {on <DEVICE-NAME>}
```

crypto	Clears encryption module's cached statistics
ipsec sa {on <DEVICE-NAME>}	Clears IPsec(Internet Protocol Security) database SAs <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears IPsec SA entries on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear eguest registration statistics
```

eguest registration statistics	Clears EGuest registration server counters. When cleared EGuest registration details are deleted, and the show > eguest > registration > statistics command output is null. This command is applicable only on the NX 95XX, NX 96XX, and VX 9000 model service platforms.
--------------------------------	---

```
clear gre stats {on <DEVICE-NAME>}
```

gre stats	Clears GRE tunnel statistics
on <DEVICE-NAME>	Optional. Clears GRE tunnel statistics on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear event-history
```

event-history	Clears event history cache entries
---------------	------------------------------------

```
clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}
```

ip bgp [<IP> all external]	<p>Clears on-going BGP sessions based on the option selected</p> <ul style="list-style-type: none"> • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all – Clears all BGP peer sessions • external – Clears eBGP (external BGP) peer sessions <p>This command is applicable only to the RFS 4000, NX 95XX, NX 96XX, and VX 9000 platforms.</p> <p>Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The clear > ip > bgp command clears BGP sessions. To reduce lose of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.</p>
in prefix-filter	<p>Optional. Clears inbound route updates</p> <ul style="list-style-type: none"> • prefix-filter – Optional. Clears the existing ORF (Outbound Route Filtering) prefix-list
on <DEVICE-NAME>	<p>Optional. Clears route updates on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip bgp [<IP>|all|external] {out} {(on <DEVICE-NAME>)}
```

ip bgp [<IP> all external]	<p>Clears on-going BGP sessions based on the option selected</p> <ul style="list-style-type: none"> • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address. • all – Clears all BGP peer sessions • external – Clears eBGP peer sessions <p>This command is applicable only to the RFS 4000, NX 95XX, NX 96XX, and VX 9000 platforms.</p>
out	<p>Optional. Clears outbound route updates. Optionally specify the device on which to execute this command.</p>
on <DEVICE-NAME>	<p>The following keyword is recursive and optional.</p> <ul style="list-style-type: none"> • on <DEVICE-NAME> – Optional. Clears BGP sessions on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip bgp [<IP>|all|external] {soft {in/out}} {on <DEVICE-NAME>}
```

ip bgp [<IP> all external]	<p>Clears on-going BGP sessions based on the option selected</p> <ul style="list-style-type: none"> • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer’s IP address. • all – Clears all BGP peer sessions • external – Clears external BGP (eBGP) peer sessions <p>This command is applicable only to the RFS 4000, NX 95XX, NX 96XX, and VX 9000 platforms.</p>
soft {in out}	<p>Optional. Initiates soft-reconfiguration of route updates for the specified IP address</p> <ul style="list-style-type: none"> • in – Optional. Enables soft reconfiguration of inbound route updates • out – Optional. Enables soft reconfiguration of outbound route updates <p>Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The clear > ip > bgp command clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.</p>
on <DEVICE-NAME>	<p>Optional. Initiates soft reconfiguration inbound/outbound route updates on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip bgp process {on <DEVICE-NAME>}
```

ip bgp process	<p>Clears all BGP processes running</p> <p>This command is applicable only to the RFS 4000, NX 95XX, NX 96XX, and VX 9000 platforms.</p>
on <DEVICE-NAME>	<p>Optional. Clears all BGP processes on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP or service platform.

```
clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}
```

ip	Clears a DHCP (Dynamic Host Configuration Protocol) server’s IP address binding entries
dhcp bindings	Clears DHCP connections and server bindings
<IP>	Clears specific address binding entries. Specify the IP address to clear binding entries.
all	Clears all address binding entries
on <DEVICE-NAME>	<p>Optional. Clears a specified address binding or all address bindings on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear ip ospf process {on <DEVICE-NAME>}
```

ip ospf process	Clears already enabled <i>Open Shortest Path First</i> (OSPF) process and restarts the process
on <DEVICE-NAME>	Optional. Clears OSPF process on a specified device OSPF is a link-state IGP (interior gateway protocol). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets. <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
```

clear ipv6 neighbor-cache	Clears IPv6 neighbor cache entries
on <DEVICE-NAME>	Optional. Clears IPv6 neighbor cache entries on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear lacp [<1-4> counters|counters]
```

clear lacp [<1-4> counters counters]	Clears LACP (Link Aggregation Control Protocol) counters for a specified port-channel group or all port-channel groups configured <ul style="list-style-type: none"> • <1-4> counters – Clears LACP counters for a specified port-channel. Specify the port-channel index number from 1 - 4. Note, LACP is supported only on the NX 5500, NX 75XX, and NX 95XX model service platforms. However, the NX 95XX series service platforms support only two (2) port-channels, and the other model service platforms support four (4) port-channels. • counters – Clears LACP counters for all configured port-channels on the device
--------------------------------------	--

```
clear mac-address-table{address <MAC>/vlan <1-4094>} {on <DEVICE-NAME>}
```

mac-address-table	Clears MAC address forwarding table data based on the parameters passed Use this command to clear the following: all or specified MAC addresses from the system, all MAC addresses on a specified interface, all MAC addresses on a specified VLAN, or the authentication state of a MAC address.
address <MAC>	Optional. Clears a specified MAC address from the MAC address table. <ul style="list-style-type: none"> • <MAC> – Specify the MAC address in one of the following formats: AA-BB-CC-DD-EE-FF or AA:BB:CC:DD:EE:FF or AABB.CCDD.EEFF <p>Note: If executed without specifying any MAC address(es), all MAC addresses from the MAC address table will be removed.</p>

vlan <1-4094>	Optional. Clears all MAC addresses for a specified VLAN <ul style="list-style-type: none"> • <1-4094> – Specify the VLAN ID from 1 - 4094
on <DEVICE-NAME>	Optional. Clears a single MAC entry or all MAC entries, for the specified VLAN on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear mac-address-table {interface [<IF-NAME>/ge <1-X>/port-channel <1-X>]} {on <DEVICE-NAME>}
```

mac-address-table	Clears MAC address forwarding table data based on the parameters passed Use this command to clear the following: all or specified MAC addresses from the system, all MAC addresses on a specified interface, all MAC addresses on a specified VLAN, or the authentication state of a MAC address.
interface	Clears all MAC addresses for the selected interface. Use the options available to specify the interface.
<IF-NAME>	Clears MAC address forwarding table for the specified layer 2 interface (Ethernet port) <ul style="list-style-type: none"> • <IF-NAME> – Specify the layer 2 interface name.
ge <1-X>	Clears MAC address forwarding table for the specified GigabitEthernet interface <ul style="list-style-type: none"> • <1-X> – Specify the GigabitEthernet interface index from 1 - X. <p>Note: The number of GE interfaces supported varies for different device types.</p>
port-channel <1-X>	Clears MAC address forwarding table for the specified port-channel interface <ul style="list-style-type: none"> • <1-X> – Specify the port-channel interface index from 1 - X. <p>Note: The number of port-channel interfaces supported varies for different device types.</p>
on <DEVICE-NAME>	Optional. Clears the MAC address forwarding table, for the selected interface, on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear mac-address-table mac-auth-state address <MAC> vlan <1-4904> {on <DEVICE-NAME>}
```

mac-address-table mac-auth-state address <MAC> vlan <1-4904>	<p>Clears MAC addresses learned from a particular VLAN when WLAN MAC authentication and captive-portal fall back is enabled. Access points/controllers provide WLAN access to clients whose MAC address has been learned and stored in their MAC address tables. Use this command to clear a specified MAC address on the MAC address table. Once cleared the client has to re-authenticate, and is provided access only on successful authentication.</p> <ul style="list-style-type: none"> • <MAC> - Specify the MAC address to clear. <ul style="list-style-type: none"> • vlan <1-4904> - Specify the VLAN interface from 1 - 4094. In the AP/controller's MAC address table, the specified MAC address is cleared on the specified VLAN interface.
on <DEVICE-NAME>	<p>Optional. Clears the specified MAC address on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. <p>Note: If a device is not specified, the system clears the MAC address on all devices.</p>

```
clear mint mlcp history {on <DEVICE-NAME>}
```

mint	Clears MINT related information
mlcp history	Clears <i>MiNT Link Creation Protocol</i> (MLCP) client history
on <DEVICE-NAME>	<p>Optional. Clears MLCP client history on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear role ldap-stats {on <DEVICE-NAME>}
```

role ldap-stats	Clears LDAP (Lightweight Directory Access Protocol) server statistics
on <DEVICE-NAME>	<p>Optional. Clears LDAP server statistics on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
clear rtls [aer scout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}|
on <DEVICE-OR-DOMAIN-NAME>}
```

rtls	Clears RTLS (Real Time Location Service) statistics
aer scout	Clears RTLS Aer scout statistics
ekahau	Clears RTLS Ekahau statistics

<MAC/DEVICE-NAME>	<p>This keyword is common to the 'aeroscout' and 'ekahau' parameters.</p> <ul style="list-style-type: none"> • <MAC/DEVICE-NAME> – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP's MAC address or hostname.
on <DEVICE-OR-DOMAIN-NAME>	<p>This keyword is common to the 'aeroscout' and 'ekahau' parameters.</p> <ul style="list-style-type: none"> • on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, service platform, or RF Domain • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
clear spanning-tree detected-protocols {on <DEVICE-NAME>}
```

spanning-tree	Clears spanning tree entries on an interface and restarts protocol migration
detected-protocols	Restarts protocol migration
on <DEVICE-NAME>	<p>Optional. Clears spanning tree entries on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1]} {on <DEVICE-NAME>}
```

spanning-tree	Clears spanning tree entries on an interface and restarts protocol migration
detected-protocols	Restarts protocol migration
interface [<INTERFACE-NAME> ge <1-X> me1 port-channel <1-X> pppoe1 up1 vlan <1-4094> wwan1]	<p>Optional. Clears spanning tree entries on different interfaces</p> <ul style="list-style-type: none"> • <INTERFACE-NAME> – Clears detected spanning tree entries on a specified interface. Specify the interface name. • ge <1-X> – Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X. • me1 – Clears FastEthernet interface spanning tree entries • port-channel <1-X> – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X. The number of port-channel interfaces supported varies for different device types. • pppoe1 – Clears detected spanning tree entries for PPPoE (Point-to-Point Protocol over Ethernet) interface • up1 – Clears detected spanning tree entries for the WAN Ethernet interface • vlan <1-4094> – Clears detected spanning tree entries for the selected VLAN interface. Select a SVI (Switch Virtual Interface) VLAN ID from 1- 4094. • wwan1 – Clears detected spanning tree entries for wireless WAN interface.
on <DEVICE-NAME>	<p>Optional. Clears spanning tree entries on a specified device</p> <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
clear traffic-shape statistics class <1-4> {(on <DEVICE-NAME>)}
```

traffic-shape statistics	Clears traffic shaping statistics
class <1-4>	Clears traffic shaping statistics for a specific traffic class <ul style="list-style-type: none"> • <1-4> - Specify the traffic class from 1 - 4. <p>Note: If the traffic class is not specified, the system clears all traffic shaping statistics.</p>
on <DEVICE-NAME>	Optional. Clears traffic shaping statistics for the specified traffic class on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> - Specify the name of the access point, wireless controller, or service platform. <p>Note: For more information on configuring traffic-shape, see traffic-shape on page 1224.</p>

```
clear vrrp [error-stats|stats] {on <DEVICE-NAME>}
```

vrrp	Clears VRRP (<i>Virtual Router Redundancy Protocol</i>) statistics VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.
error-stats	Clears global error statistics
stats	Clears VRRP related statistics
on <DEVICE-NAME>	This following keywords are common to the 'error-stats' and 'stats' parameters: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Clears VRRP statistics on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

Examples (User Exec Mode)

```
rfs4000-229D58>clear event-history
rfs4000-229D58>clear spanning-tree detected-protocols interface port-channel 1

clock (user and privi exec modes)

Sets a device's system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device's clock is set without resetting the time zone, the time is displayed relative to the UTC (Universal Time Coordinated) - Greenwich Time. To display time in the local time zone format, in the device's configuration mode, use the `timezone` command. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see [timezone](#).

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

Parameters

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

clock set	Sets a device's software system clock
<HH:MM:SS>	Sets the current time (in military format hours, minutes, and seconds) Note: By default, the WiNG software displays time in the 24-hour clock format. This setting cannot be changed.
<1-31>	Sets the numerical day of the month
<MONTH>	Sets the month of the year (Jan to Dec)
<1993-2035>	Sets a valid four digit year from 1993 - 2035
on <DEVICE-NAME>	Optional. Sets the clock on a specified device <ul style="list-style-type: none">• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

Examples (User Exec Mode)

The following commands set the time zone and clock for the logged device:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#timezone America/Los_Angeles
nx9500-6C8809>clock set 11:24:30 21 Jan 2017
nx9500-6C8809>show clock
2017-01-21 12:14:14 PST
nx9500-6C8809>
```

Note, if the clock is set without resetting the time zone, the time displays as UTC time, as shown in the following example:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#no timezone
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#commit
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show clock
2017-01-21 19:15:55 UTC

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

Examples (Privi Exec Mode)

```
ap8432-070235(config-device-74-67-F7-07-02-35)#timezone America/Los_Angeles
ap8432-070235#clock set 12:51:10 21 Dec 2017
ap8432-070235#show clock
2017-12-21 04:52:06 PST
ap8432-070235#
```

cluster (user and privi exec modes)

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member. Commands executed under this context are executed on all members of the cluster.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
cluster start-election
```

Parameters

```
cluster start-election
```

start-election	Starts a new cluster master election
----------------	--------------------------------------

Examples (User Exec Mode)

```
nx9500-6C8809>cluster start-election
nx9500-6C8809>
```

Examples (Privi Exec Mode)

```
rfs4000-229D58#cluster start-election
rfs4000-229D58#
```

Related Commands

create-cluster (user and privi exec modes) on page 47	Creates a new cluster on the specified device
join-cluster (user and privi exec modes) on page 77	Adds a wireless controller or service platform, as a member, to an existing cluster of controllers

connect (user and privi exec modes)

Begins a console connection to a remote device using the remote device's MiNT ID or name

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

Parameters

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

mint-id <MINT-ID>	Connects to the remote system using its MiNT ID <ul style="list-style-type: none"><MINT-ID> - Specify the remote device's MiNT ID.
<REMOTE-DEVICE-NAME>	Connects to the remote system using its name <ul style="list-style-type: none"><REMOTE-DEVICE-NAME> - Specify the remote device's name.

Examples (User Exec Mode)

create-cluster (user and privi exec modes)

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

Parameters

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

create-cluster	Creates a cluster
name <CLUSTER-NAME>	Configures the cluster name <ul style="list-style-type: none">• <CLUSTER-NAME> - Specify a cluster name. Define a name for the cluster that uniquely identifies its configuration or profile support requirements. The name cannot exceed 64 characters.
ip <IP>	Specifies the device's IP address used for cluster creation <ul style="list-style-type: none">• <IP> - Specify the device's IP address in the A.B.C.D format.
level [1 2]	Optional. Configures the routing level for this cluster <ul style="list-style-type: none">• 1 - Configures level 1 (local) routing• 2 - Configures level 2 (inter-site) routing

Examples (User Exec Mode)

Related Commands

cluster (user and privi exec modes) on page 46	Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.
join-cluster (user and privi exec modes) on page 77	Adds a wireless controller or service platform, as a member, to an existing cluster of controllers

crypto (user and privi exec modes)

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate *Certificate Signing Request (CSR)*.

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```

on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION>
<ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {(on
<DEVICE-NAME>)}
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background/passphrase
<KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

Parameters

```
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background/passphrase <KEY-
PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
export rsa <RSA-KEYPAIR-NAME>	Exports an existing RSA Keypair to a specified destination <ul style="list-style-type: none"> <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name.
<EXPORT-TO-URL>	Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported. After specifying the destination address (where the RSA Keypair is exported), configure one of the following parameters: background or passphrase.
background	Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

passphrase <KEY-PASSPHRASE> background	Optional. Encrypts RSA Keypair before exporting <ul style="list-style-type: none"> • <KEY-PASSPHRASE> – Specify a passphrase to encrypt the RSA Keypair. • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.
on <DEVICE-NAME>	The following parameter is recursive and common to all of the above parameters: <ul style="list-style-type: none"> • on <DEVICE-NAME> – Optional. Performs export operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
generate rsa <RSA-KEYPAIR-NAME> [2048 4096]	Generates a new RSA Keypair <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name. • [2048 4096] – Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits. <p>After specifying the key size, optionally specify the device (access point or controller) to generate the key on.</p>
on <DEVICE-NAME>	Optional. Generates the new RSA Keypair on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
import rsa <RSA-KEYPAIR-NAME>	Imports a RSA Keypair from a specified source <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.
<IMPORT-FROM-URL>	Specify the RSA Keypair source address. Both IPv4 and IPv6 address formats are supported. After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase.
background	Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

passphrase <KEY-PASSPHRASE> background	Optional. Decrypts the RSA Keypair after importing <ul style="list-style-type: none"> • <KEY-PASSPHRASE> - Specify the passphrase to decrypt the RSA Keypair. • background - Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point, controller, or service platform) to perform the import on.
on <DEVICE-NAME>	The following parameter is recursive and common to the 'background' and 'passphrase' keywords: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs import operation on a specific device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
```

key	Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
zeroize rsa <RSA-KEYPAIR-NAME>	Deletes a specified RSA Keypair <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> - Specify the RSA Keypair name. <p>Note: All device certificates associated with this key will also be deleted.</p>
force	Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion.
on <DEVICE-NAME>	The following parameter is recursive and optional: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Deletes all certificates associated with the RSA Keypair on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
crypto pki authenticate <TRUSTPOINT-NAME> <URL> {background} {(on <DEVICE-NAME>)}
```

pki	Enables Private Key Infrastructure (PKI) management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated Certificate Authority (CA) certificates.
authenticate <TRUSTPOINT-NAME>	Authenticates a trustpoint and imports the corresponding CA certificate <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> - Specify the trustpoint name.
url	Specify CA's location. Both IPv4 and IPv6 address formats are supported. <p>Note: The CA certificate is imported from the specified location.</p>
background	Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point, controller, or service platform) to perform the export on.
on <DEVICE-NAME>	The following parameter is recursive and optional: <ul style="list-style-type: none"> • on <DEVICE-NAME> - Optional. Performs authentication on a specified device • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>  
autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
export request	Exports CSR to the CA for digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key.
[generate-rsa-key use-rsa-key] <RSA- KEYPAIR-NAME>	Generates a new RSA Keypair or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key – Generates a new RSA Keypair for digital authentication • use-rsa-key – Uses an existing RSA Keypair for digital authentication • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
autogen-subject- name	Auto generates subject name from configuration parameters. The subject name identifies the certificate.
<EXPORT-TO-URL>	Specify the CA's location. Both IPv4 and IPv6 address formats are supported. Note: The CSR is exported to the specified location.
email <SEND-TO- EMAIL>	Exports CSR to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> – Specify the CA's e-mail address.
fqdn <FQDN>	Exports CSR to a specified Fully Qualified Domain Name (FQDN) <ul style="list-style-type: none"> • <FQDN> – Specify the CA's FQDN.
ip-address <IP>	Exports CSR to a specified device or system <ul style="list-style-type: none"> • <IP> – Specify the CA's IP address.

```
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-
key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION>
<ORGANIZATION-UNIT>
(<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
export request	Exports CSR to the CA for a digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key.
[generate-rsa-key short [generate-rsa-key use-rsa- key] use-rsa-key] <RSA- KEYPAIR-NAME>	Generates a new RSA Keypair or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key – Generates a new RSA Keypair for digital authentication • short [generate-rsa-key use-rsa-key] – Generates and exports a shorter version of the CSR <ul style="list-style-type: none"> • generate-rsa-key – Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it. • use-rsa-key – Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name. • use-rsa-key – Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
subject-name <COMMON- NAME>	Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate <ul style="list-style-type: none"> • <COMMON-NAME> – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).

<COUNTRY>	Sets the deployment country code (2 character ISO code)
<STATE>	Sets the state name (2 to 64 characters in length)
<CITY>	Sets the city name (2 to 64 characters in length)
<ORGANIZATION>	Sets the organization name (2 to 64 characters in length)
<ORGANIZATION-UNIT>	Sets the organization unit (2 to 64 characters in length)
<EXPORT-TO-URL>	Specify the CA's location. Both IPv4 and IPv6 address formats are supported. The CSR is exported to the specified location.
email <SEND-TO-EMAIL>	Exports CSR to a specified e-mail address <ul style="list-style-type: none"> <SEND-TO-EMAIL> - Specify the CA's e-mail address.
fqdn <FQDN>	Exports CSR to a specified FQDN <ul style="list-style-type: none"> <FQDN> - Specify the CA's FQDN.
ip-address <IP>	Exports CSR to a specified device or system <ul style="list-style-type: none"> <IP> - Specify the CA's IP address.

```
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
{background/passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
export trustpoint <TRUSTPOINT-NAME>	Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name (should be authenticated).
<EXPORT-TO-URL>	Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here.
background	Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on
passphrase <KEY-PASSPHRASE> background	Optional. Encrypts the key with a passphrase before exporting <ul style="list-style-type: none"> <KEY-PASSPHRASE> - Specify the passphrase to encrypt the trustpoint. background - Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.
on <DEVICE-NAME>	The following parameter is recursive and common to the 'background' and 'passphrase' keywords: <ul style="list-style-type: none"> on <DEVICE-NAME> - Optional. Performs export operation on a specified device <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address
<IP>,
on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.
generate	Generates a certificate and a trustpoint

self-signed <TRUSTPOINT-NAME>	Generates a self-signed certificate and a trustpoint <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.
[generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME>	Generates a new RSA Keypair, or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key – Generates a new RSA Keypair for digital authentication • use-rsa-key – Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
autogen-subject-name	Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate.
email <SEND-TO-EMAIL>	Optional. Exports the self-signed certificate to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> – Specify the e-mail address.
fqdn <FQDN>	Optional. Exports the self-signed certificate to a specified FQDN <ul style="list-style-type: none"> • <FQDN> – Specify the FQDN.
ip-address <IP>	Optional. Exports the self-signed certificate to a specified device or system <ul style="list-style-type: none"> • <IP> – Specify the device’s IP address.
on <DEVICE-NAME>	Optional. Exports the self-signed certificate on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION>
<ORGANIZATION-UNIT> { (email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>, on <DEVICE-NAME> ) }
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.
generate self-signed <TRUSTPOINT-NAME>	Generates a self-signed certificate and a trustpoint <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.
[generate-rsa-key use-rsa-key] <RSA-KEYPAIR-NAME>	Generates a new RSA Keypair, or uses an existing RSA Keypair <ul style="list-style-type: none"> • generate-rsa-key – Generates a new RSA Keypair for digital authentication • use-rsa-key – Uses an existing RSA Keypair for digital authentication <ul style="list-style-type: none"> • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.
subject-name <COMMON-NAME>	Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate <ul style="list-style-type: none"> • <COMMON-NAME> – Specify the common name used with this certificate. The name should enable you to identify the certificate easily and should not exceed 2 to 64 characters in length.
<COUNTRY>	Sets the deployment country code (2 character ISO code)
<STATE>	Sets the state name (2 to 64 characters in length)
<CITY>	Sets the city name (2 to 64 characters in length)
<ORGANIZATION>	Sets the organization name (2 to 64 characters in length)
<ORGANIZATION-UNIT>	Sets the organization unit (2 to 64 characters in length)

email <SEND-TO-EMAIL>	Optional. Exports the self-signed certificate to a specified e-mail address <ul style="list-style-type: none"> • <SEND-TO-EMAIL> – Specify the e-mail address.
fqdn <FQDN>	Optional. Exports the self-signed certificate to a specified FQDN <ul style="list-style-type: none"> • <FQDN> – Specify the FQDN.
ip-address <IP>	Optional. Exports the self-signed certificate to a specified device or system <ul style="list-style-type: none"> • <IP> – Specify the device’s IP address.

```
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
import	Imports certificates, Certificate Revocation List (CRL), or a trustpoint to the selected device
[certificate crl] <TRUSTPOINT-NAME>	Imports a signed server certificate or CRL <ul style="list-style-type: none"> • certificate – Imports signed server certificate • crl – Imports CRL • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
<IMPORT-FROM-URL>	Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported. The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here.
background	Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.
on <DEVICE-NAME>	The following parameter is recursive and optional: <ul style="list-style-type: none"> • on <DEVICE-NAME> – Optional. Performs import operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background/passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
import	Imports certificates, CRL, or a trustpoint to the selected device
trustpoint <TRUSTPOINT-NAME>	Imports a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
<IMPORT-FROM-URL>	Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported.
background	Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

passphrase <KEY-PASSPHRASE> background	Optional. Decrypts trustpoint with a passphrase after importing <ul style="list-style-type: none"> • <KEY-PASSPHRASE> – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on. • background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on.
on <DEVICE-NAME>	The following parameter is recursive and optional: <ul style="list-style-type: none"> • on <DEVICE-NAME> – Optional. Performs import operation on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

pki	Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
zeroize trustpoint <TRUSTPOINT-NAME>	Imports certificates, <i>Certificate Revocation List</i> (CRL), or a trustpoint to the selected device
[certificate crl] <TRUSTPOINT-NAME>	Deletes a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
del-key	Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.
on <DEVICE-NAME>	The following parameter is recursive and optional: <ul style="list-style-type: none"> • on <DEVICE-NAME> – Optional. Deletes the trustpoint on a specified device • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:

```
tftp://<hostname|IPv4>[:port]/path/file
```

```
ftp://<user>:<passwd>@<hostname|IPv4>[:port]/path/file
```

```
sftp://<user>@<hostname|IPv4>[:port]/path/file
```

```
http://<hostname|IPv4>[:port]/path/file
```

```
cf:/path/file usb<n>:/path/file
```

- IPv6 URLs:

```
tftp://<hostname|IPv6>[:port]/path/file
```

```
ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
```

```
sftp://<user>@<hostname|IPv6>[:port]/path/file
```

```
http://<hostname|IPv6>[:port]/path/file
```

Examples (User Exec Mode)

```
rfs4000-229D58>crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs4000-229D58>
rfs4000-229D58>crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs4000-229D58>
rfs4000-229D58>crypto pki generate self-signed word generate-rsa-key word autogen-subject-
name fqdn word
Successfully generated self-signed certificate
rfs4000-229D58>
rfs4000-229D58>crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs4000-229D58>
rfs4000-229D58>crypto pki authenticate word url background
Import of CA certificate started in background
rfs4000-229D58>
rfs4000-229D58>crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs4000-229D58>
```

Examples (Privi Exec Mode)

```
NOC-NX9500#crypto key generate rsa key 2048
RSA key size > 2048. Key generation started in background.
NOC-NX9500#c
```

Related Commands

<code>no (user exec mode)</code> on page 83	Removes server certificates, trustpoints and their associated certificates
---	--

crypto-cmp-cert-policy (user and privi exec modes)

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

Parameters

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

```
crypto-cmp-cert-update
<TRUSTPOINT-NAME> on
<DEVICE-NAME>
```

Triggers a CMP certificate update on a specified device or devices

- <TRUSTPOINT-NAME> - Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context mode to configure the trustpoint.
- on <DEVICE-NAME> - Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.
 - <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

Example (User Exec Mode)

```
rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
```

Example (Privi Exec Mode)

```
NOC-NX9500#crypto-cmp-cert-update test on NOC-NX9500
CMP Cert update success
NOC-NX9500#
```

database (user and privi exec modes)

Enables automatic repairing (vacuuming) and dropping of captive-portal and NSight databases

If enforcing authenticated access to the database, use this command to generate the keyfile. Every keyfile has a set of associated users having a username and password. Access to the database is allowed only if the user credentials entered during database login are valid. For more information on enabling database authentication, see [Enabling Database Authentication](#).

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
database [drop|keyfile|repair]
database drop [all|captive-portal|nsight]
database repair {on <DEVICE-NAME>}
database keyfile [export|generate|import|zerzoise]
database keyfile generate
database keyfile [export|import] <URL>
database keyfile zerzoise
```

Parameters

```
database drop [all|captive-portal|nsight]
```

database drop [all|captive-portal|nsight]

Drops (deletes) all or a specified database. Execute the command on the database.

- all – Drops all databases, captive portal and NSight
- captive-portal – Drops the captive-portal database
- nsight – Drops the NSight database

database repair {on <DEVICE-NAME>}

database repair on <DEVICE-NAME>

Enables automatic repairing of all databases. Repairing (vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements. Execute the command on the database host.

- on <DEVICE-NAME> – Optional. Specifies the name of the database host. When specified, databases on the specified host are periodically checked to identify and remove obsolete data documents.
- <DEVICE-NAME> – Specify the name of the access point, wireless controller, or service platform.

Note: If no device is specified, the system repairs all databases.

database keyfile generate

database keyfile generate

Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to generate database keyfiles. After generating the keyfile, create the username and password combination required to access the database. For information on creating database users see, [service](#) on page 647. For information on enabling database authentication, see [Enabling Database Authentication](#).

- generate – Generates the keyfile. In case of a replica-set deployment, execute the command on the primary database host. Once generated, export the keyfile to a specified location from where it is imported on to the replica-set hosts.

database keyfile [export|import] <URL>

database keyfile [export|import] <URL>

Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to exchange keyfiles between replica set members.

- export – Exports the keyfile to a specified location on an FTP/SFTP/TFTP server. Execute the command on the database host on which the keyfile has been generated.
- import – Imports the keyfile from a specified location. Execute the command on the replica set members.

The following parameter is common to both of the above keywords:

- <URL> – Specify the location to/from where the keyfile is to be exported/imported. Use one of the following options to specify the keyfile location:

ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file

sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file

tftp://<hostname|IP>[:port]/path/file

database keyfile zerzoise

database keyfile zerzoise

Enables database keyfile management. Use this command to delete keyfiles

- zerzoise – Deletes an existing keyfile.

Example (User Exec Mode)

```
nx9500-6C8809nx9500-6C8809>database repair on nx9500-6C8809
nx9500-6C8809>
nx9500-6C8809>database keyfile generate
Database keyfile successfully generated
nx9500-6C8809nx9500-6C8809>
nx9500-6C8809>database keyfile zeroize
Database keyfile successfully removed
nx9500-6C8809nx9500-6C8809>
```

Example (Privl Exec Mode)

```
vx9000-1A1809#database keyfile generate
Database keyfile successfully generated
vx9000-1A1809#
vx9000-1A1809#database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
vx9000-1A1809#
vx9000-D031F2#database keyfile import ftp://1.1.1.111/db-key
Database keyfile successfully imported
vx9000-D031F2#
```

Example: Enabling Database Authentication

Follow the steps below to enable database authentication.

- 1 On the primary database host,
 - a Generate the database keyfile.

```
Primary-DB-HOST>database keyfile generate
Database keyfile successfully generated
Primary-DB-HOST>
```
 - b Use the **show > database > keyfile** command to view the generated keyfile.

- c Export the keyfile to an external location. This is required only in case of database replica-set deployment.
- ```
Primary-DB-HOST>database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
Primary-DB-HOST>
```
- d Create the users that are allowed access to the database.
- ```
Primary-DB-HOST#service database authentication create-user username techpubs
password techPubs@123
Database user [techpubs] created.
Primary-DB-HOST#
```
- e View the database user account created.
- ```
Primary-DB-HOST#show database users

 DATABASE USER

 techpubs

Primary-DB-HOST#
```
- 2 On the replica set host, import the keyfile from the location specified in Step 1 c.
- ```
Secondary-DB-HOST#database keyfile import ftp://1.1.1.111/db-key
```
- 3 In the database-policy context, --- (used on the NSight/EGuest database hosts)
- a Enable authentication.
- ```

Related Commands

database-backup (user and privi exec modes) on page 63	Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server
database-restore (user and privi exec modes) on page 64	Restores a previously exported database [captive-portal and/or NSight]

database-policy global config on page 363	Documents database-policy configuration commands. Use this option to enable the database.
database-client-policy global-config on page 359	Documents database-client-policy configuration commands. Use this option to configure the database host details (IP address or hostname). If enforcing database authentication, use it to configure the users having database access. Once configured, use the policy in the NSight/EGuest server's device config context.
service on page 647	Documents the database user account configuration details

database-backup (user and privi exec modes)

Backs up captive-portal and/or NSight database to a specified location and file on an FTP, SFTP, or TFTP server. Execute this command on the database host.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
database-backup database [captive-portal|nsight|nsight-placement-info] <URL>
database-backup database [captive-portal|nsight] <URL>
database-backup database nsight-placement-info <URL>
```

Parameters

```
database-backup database [captive-portal|nsight] <URL>
```

database-backup database [captive-portal nsight]	Backs up captive portal and/or NSight database to a specified location. Select the database to backup: <ul style="list-style-type: none"> • captive-portal - Backs up captive portal database • nsight - Backs up NSight database After specifying the database type, configure the destination location.
<URL>	Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz

```
database-backup database nsight-placement-info <URL>
```

database-backup database nsight-placement-info <URL>	Backs up the NSight access point placement related details to a specified location <ul style="list-style-type: none"> • <URL> - Specify the URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz tftp://<hostname IP>[:port]/path/file.tar.gz
--	--

Example (User Exec Mode)

```
NS-DB-nx9510-6C87EF>database-backup database nsight tftp://192.168.9.50/testbckup
NS-DB-nx9510-6C87EF>show database backup-status
Last Database Backup Status : In_Progress(Starting tftp transfer.)
Last Database Backup Time   : 2018-01-01 12:48:05
NS-DB-nx9510-6C87EF>show database backup-status
Last Database Backup Status : Successful
Last Database Backup Time   : Mon Jan 01 12:48:08 IST 2018
NS-DB-nx9510-6C87EF>
```

Example (Privi Exec Mode)

```
NS-DB-nx9510-6C87EF#database-backup database nsight-placement-info tftp://192.168.9.50/
plmentinfo
NS-DB-nx9510-6C87EF#show database backup-status
Last Database Backup Status : Successful
Last Database Backup Time   : Mon Jan 01 12:48:48 IST 2018

```

Related Commands

database (user and privi exec modes) on page 59	Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and/or NSight)
database-restore (user and privi exec modes) on page 64	Restores a previously exported (backed up) database (captive-portal and/or NSight)]

database-restore (user and privi exec modes)

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

Syntax

```
database-restore database [captive-portal|nsight] <URL>
```

Parameters

```
database-restore database [captive-portal|nsight] <URL>
```

database-restore database [captive-portal nsight]	Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type: <ul style="list-style-type: none"> • captive-portal – Restores captive portal database • nsight – Restores NSight database After specifying the database type, configure the destination location and file name from where the files are restored.
<URL>	Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz tftp://<hostname IP>[:port]/path/file.tar.gz

Example (User Exec Mode)

```
nx9500-6C8809>database-restore database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

Example (Privi Exec Mode)

```
nx9500-6C874D#database-restore database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

database-backup (user and privi exec modes) on page 63	Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server

device-upgrade (user and privi exec modes)

Enables firmware upgrade on an adopted device or a set of adopted devices (Access Points, wireless controllers, and service platforms)

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

In an HM (hierarchically managed) network, this command enables centralized device upgradation across the network.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single NOC (Network Operations Center) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy respectively. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

Note

Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.

Use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain.

Note

If the persist-images option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the 'persist-images' option), see [device-upgrade](#) on page 981.

Note

A NOC controller's capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – NX 95XX, NX 96XX, VX 9000
- Site controller – RFS 4000, NX 5500, or NX 75XX

Note

Standalone devices have to be manually upgraded.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
device-upgrade [<MAC/HOSTNAME>|all|ap6522|ap6562|ap7161|ap7502|ap7522|ap7532|ap7602|

{(<MAC/HOSTNAME>|force|from-controller|no-reboot|reboot-time <TIME>/staggered-reboot|
upgrade-time <TIME>)}
```

Parameters

```
device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>/upgrade-time <TIME>
{no-reboot|reboot-time <TIME>}}
```

<MAC/HOSTNAME>	Upgrades firmware on the device identified by the <MAC/HOSTNAME> keyword <ul style="list-style-type: none"> • <MAC/HOSTNAME> - Specify the device's MAC address or hostname.
no-reboot	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME>	Optional. Schedules an automatic reboot after a successful upgrade <ul style="list-style-type: none"> • <TIME> - Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
upgrade-time <TIME> {no-reboot reboot-time <TIME>}	Optional. Schedules an automatic device firmware upgrade <ul style="list-style-type: none"> • <TIME> - Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade: <ul style="list-style-type: none"> • no-reboot - Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted) • reboot-time <TIME> - Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

```
device-upgrade all {force/no-reboot/reboot-time <TIME>/upgrade-time <TIME>
{no-reboot/reboot-time <TIME>}} {(staggered-reboot)}
```

all	Upgrades firmware on all devices
force	Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.
no-reboot	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME>	Optional. Schedules an automatic reboot after a successful upgrade <ul style="list-style-type: none"> • <TIME> - Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
upgrade-time <TIME> {no-reboot reboot-time <TIME>}	Optional. Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time <ul style="list-style-type: none"> • <TIME> - Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade: <ul style="list-style-type: none"> • no-reboot - Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted) • reboot-time <TIME> - Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
staggered-reboot	This keyword is recursive and common to all of the above. <ul style="list-style-type: none"> • Optional. Enables staggered reboot (one at a time), without network impact

```
device-upgrade [ap6522|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|
ap7622|ap7632|ap7662|ap81xx|ap8432|ap8533|rfs4000|nx5500|nx75xx|nx9000|nx9600|vx9000]
all {force/no-reboot/reboot-time <TIME>/upgrade-time <TIME>
{no-reboot/reboot-time <TIME>}} {(staggered-reboot)}
```

device-upgrade <DEVICE-TYPE> all	Upgrades firmware on all devices of a specific type. Select the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 75XX, NX 95XX, NX 96XX, and VX 9000. After selecting the device type, schedule an automatic upgrade and/or an automatic reboot.
force	Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.
no-reboot	Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
reboot-time <TIME>	Optional. Schedules an automatic reboot after a successful upgrade <ul style="list-style-type: none"> • <TIME> – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
upgrade-time <TIME> {no-reboot reboot-time <TIME>}	Optional. Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time <ul style="list-style-type: none"> • <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade: <ul style="list-style-type: none"> • no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted) • reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
staggered-reboot	This keyword is recursive and common to all of the above. <ul style="list-style-type: none"> • Optional. Enables staggered reboot (one at a time), without network impact

```
device-upgrade cancel-upgrade [<MAC/HOSTNAME>|all|ap6522|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|ap7612|ap7622|ap7632|ap7662|ap81xx|ap8432|ap8533|rfs4000|nx5500|nx75xx|nx9000|nx9600|vx9000|on rf-domain [<RF-DOMAIN-NAME>|all]]
```

cancel-upgrade	Cancels a scheduled firmware upgrade based on the parameters passed. This command provides the following options to cancel scheduled firmware upgrades: <ul style="list-style-type: none"> • Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames. • Cancels upgrade on all devices within the network • Cancels upgrade on all devices of a specific type. Specify the device type. • Cancels upgrade on specific device(s) or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.
cancel-upgrade [<MAC/ HOSTNAME> all]	Cancels a scheduled firmware upgrade on a specified device or on all devices <ul style="list-style-type: none"> • <MAC/HOSTNAME> – Cancels a scheduled upgrade on the device identified by the <MAC/HOSTNAME> keyword. Specify the device's MAC address or hostname. • all – Cancels scheduled upgrade on all devices

cancel-upgrade <DEVICE-TYPE> all	Cancels scheduled firmware upgrade on all devices of a specific type. Select the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 75XX, NX 95XX, NX 96XX, and VX 9000.
cancel-upgrade on rf-domain [<RF- DOMAIN-NAME> all]	Cancels scheduled firmware upgrade on all devices in a specified RF Domain or all RF Domains <ul style="list-style-type: none"> • <RF-DOMAIN-NAME> - Cancels scheduled device upgrade on all devices in a specified RF Domain. Specify the RF Domain name. • all - Cancels scheduled device upgrade on all devices across all RF Domains

```
device-upgrade load-image [ap6522|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|
ap7612|ap7622|ap7632|ap7662|ap81xx|ap8432|ap8533|rfs4000|nx500|nx9000|nx9600|vx9000]
{<IMAGE-URL>/on <DEVICE-OR-DOMAIN-NAME>}
```

load-image <DEVICE-TYPE>	Loads device firmware image from a specified location. Use this command to specify the device type and the location of the corresponding image file. <ul style="list-style-type: none"> • <DEVICE-TYPE> - Specify the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 75XX, NX 95XX, NX 96XX, and VX 9000. <p>After specifying the device type, provide the location of the required device firmware image.</p>
<IMAGE-URL>	Specify the device's firmware image location in one of the following formats: IPv4 URLs: <ul style="list-style-type: none"> • tftp://<hostname IP>[:port]/path/file • ftp://<user>:<passwd>@<hostname IP>[:port]/path/file • sftp://<user>:<passwd>@<hostname IP>[:port]/path/file • http://<hostname IP>[:port]/path/file • cf:/path/file • usb<n>:/path/file IPv6 URLs: <ul style="list-style-type: none"> • tftp://<hostname IPv6>[:port]/path/file • ftp://<user>:<passwd>@<hostname IPv6>[:port]/path/file • sftp://<user>:<passwd>@<hostname IPv6>[:port]/path/file • http://<hostname IPv6>[:port]/path/file
on <DEVICE-OR-DOMAIN- NAME>	Specify the name of the device or RF Domain. The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded. <ul style="list-style-type: none"> • <DEVICE-OR-DOMAIN-NAME> - Specify the name of the AP, wireless controller, service platform, or RF Domain.

```
device-upgrade rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|
filter location <WORD>] [all|ap6522|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap7602|

vx9000] {( <MAC/HOSTNAME>/force/from-controller/no-reboot/reboot-time <TIME>/
staggered-reboot/upgrade-time <TIME>)}
```

rf-domain [<RF-DOMAIN-NAME> all containing <WORD> filter location <WORD>]	<p>Upgrades firmware on devices in a specified RF Domain or all RF Domains. Devices within a RF Domain are upgraded through the RF Domain manager.</p> <ul style="list-style-type: none"> • <RF-DOMAIN-NAME> - Upgrades devices in the RF Domain identified by the <RF-DOMAIN-NAME> keyword. • <RF-DOMAIN-NAME> - Specify the RF Domain name. • all - Upgrades devices across all RF Domains • containing <WORD> - Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the <WORD> keyword are filtered. Devices on the filtered RF Domains are upgraded. • filter location <WORD> - Filters devices by their location. All devices with location matching the <WORD> keyword are upgraded.
<DEVICE-TYPE>	<p>After specifying the RF Domain, select the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 75XX, NX 95XX, NX 96XX, and VX 9000. After specifying the RF Domain and the device type, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.</p>
<MAC/HOSTNAME>	<p>Optional. Use this option to identify specific devices for upgradation. Specify the device's MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.</p> <p>Note: If no MAC address or hostname is specified, all devices of the type selected are upgraded.</p>
force	<p>Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.</p>
from-controller	<p>Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.</p>
no-reboot {staggered-reboot}	<p>Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)</p>
reboot-time <TIME> {staggered-reboot}	<p>Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.</p>
staggered-reboot	<p>This keyword is common to all of the above. Optional. Enables staggered reboot (one at a time) without network impact</p>
upgrade-time <TIME> {no-reboot reboot-time <TIME>}	<p>Optional. Schedules an automatic firmware upgrade</p> <ul style="list-style-type: none"> • <TIME> - Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. After a scheduled upgrade, the following actions can be performed. <ul style="list-style-type: none"> • no-reboot - Optional. Disables automatic reboot after a successful upgrade the device must be manually restarted) • reboot-time <TIME> - Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

disable

This command can be executed in the Priv Exec Mode only. This command turns off (disables) the privileged mode command set and returns you to the User Executable Mode. The prompt changes from *nx9500-6C8809#* to *nx9500-6C8809>*.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

`disable`

Parameters

None

Examples

```

nx9500-6C8809#disable
nx9500-6C8809>

```

enable

Turns on (enables) the privileged mode command set. The prompt changes from *nx9500-6C8809>* to *nx9500-6C8809#*. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

enable

Parameters

None

Examples

```
nx9500-6C8809>enable
nx9500-6C8809#
```

file-sync (user and privi exec modes)

Syncs trustpoint and/or EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adopted access points.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point is configured to use EAP-TLS authentication.
- Execute the command on the controller adopting the access points.
- Ensure that the X.509 certificate file is installed on the controller.

Syncing of trustpoint/wireless-bridge certificate can be automated. To automate file syncing, in the controller's device/profile configuration mode, execute the following command: **file-sync [auto|count <1-20>]**. For more information, see [file-sync](#) on page 999.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
file-sync [cancel|load-file|trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
file-sync load-file [trustpoint|wireless-bridge]
file-sync load-file [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] <URL>
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]] {from-controller} {reset-radio/upload-time <TIME>}
```

Parameters

```
file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
```

```
file-sync cancel [trustpoint|
wireless-bridge] [<DEVICE-
NAME>| all|rf-domain
[<DOMAIN-NAME>| all]]
```

Cancels scheduled file synchronization

- trustpoint – Cancels scheduled trustpoint synchronization on a specified AP, all APs, or APs within a specified RF Domain
- wireless-bridge – Cancels scheduled wireless-bridge certificate synchronization on a specified AP, all APs, or APs within a specified RF Domain
 - <DEVICE-NAME> – Cancels scheduled trustpoint/certificate synchronization on a specified AP. Specify the AP's hostname or MAC address.
 - all – Cancels scheduled trustpoint/certificate synchronization on all APs
 - rf-domain [<DOMAIN-NAME>|all] – Cancels scheduled trustpoint/certificate synchronization on all APs in a specified RF Domain or in all RF Domains
 - <DOMAIN-NAME> – Cancels scheduled trustpoint/certificate synchronization on all APs within a specified RF Domain. Specify the RF Domain's name.
 - all – Cancels scheduled trustpoint/certificate synchronization on all RF Domains

```
file-sync load-file [trustpoint|wireless-bridge] <URL>
```

```
file-sync load-file [trustpoint|
wireless-bridge] <URL>
```

Loads the following files on to the staging controller:

- trustpoint – Loads the trustpoint, including CA certificate, server certificate and private key
- wireless-bridge – Loads the wireless-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.
- <URL> – Provide the trustpoint/certificate location using one of the following formats:

```
tftp://<hostname|IP>[:port]/path/file
```

```
ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
```

```
sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
```

```
http://<hostname|IP>[:port]/path/file
```

Note: Both IPv4 and IPv6 address types are supported.

```
cf:/path/file
```

```
usb<n>:/path/file
```

```
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|
all|rf-domain [<DOMAIN-NAME>|all]] {from-controller} {reset-radio|upload-time <TIME>}
```

<pre>file-sync trustpoint <TRUSTPOINT-NAME> [<DEVICE-NAME>] all rf- domain [<DOMAIN-NAME> all] from-controller]</pre>	<p>Configures file-syncing parameters</p> <ul style="list-style-type: none"> trustpoint <TRUSTPOINT-NAME> - Syncs a specified trustpoint between controller and its adopted APs <ul style="list-style-type: none"> <TRUSTPOINT-NAME> - Specify the trustpoint name. wireless-bridge - Syncs wireless-bridge certificate between controller and its adopted APs <p>After specifying the file that is to be synced, configure following file-sync parameters:</p> <ul style="list-style-type: none"> <DEVICE-NAME> - Syncs trustpoint/certificate with a specified AP. Specify the AP's hostname or MAC address. all - Syncs trustpoint/certificate with all APs rf-domain [<DOMAIN-NAME> all] from-controller - Syncs trustpoint/certificate with all APs in a specified RF Domain or in all RF Domains <ul style="list-style-type: none"> <DOMAIN-NAME> - Select to sync with APs within a specified RF Domain. Specify the RF Domain's name. all - Select to sync with APs across all RF Domains <p>from-controller - Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager</p> <p>After specifying the access points, specify the following options: reset-radio and upload-time.</p>
<pre>reset-radio</pre>	<p>This keyword is recursive and applicable to all of the above parameters. Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the 'bridge EAP username' and 'bridge EAP password'.</p>
<pre>upload-time <TIME></pre>	<p>This keyword is recursive and applicable to all of the above parameters.</p> <ul style="list-style-type: none"> upload-time - Optional. Schedules certificate upload at a specified time <ul style="list-style-type: none"> <TIME> - Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.

Example (User Exec Mode)

```
NOC-NX9500>file-sync wireless-bridge ap7161-11E6C4 upload-time 06/01/2018-12:30
```

CONTROLLER	STATUS	MESSAGE
B4-C7-99-6C-88-09	Success	Queued 1 APs to upload

```
NOC-NX9500>
```

The following command uploads certificate to all access points:

```
NOC-NX9500>file-sync wireless-bridge all upload-time 06/01/2018-23:42
```

Example (Privi Exec Mode)

```
rfs4000-6DB5D4#file-sync wireless-bridge ap7161-11E6C4 upload-time 06/01/2018-12:30
```

CONTROLLER	STATUS	MESSAGE
B4-C7-99-6D-B5-D4	Success	Queued 1 APs to upload

```
rfs4000-6DB5D4#
```

The following command uploads certificate to all access points:

```
rfs4000-6DB5D4#file-sync wireless-bridge all upload-time 06/01/2018-23:42
```

join-cluster (user and privi exec modes)

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster. Note, a cluster can be only formed of devices of the same model type.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
join-cluster <IP> user <USERNAME> password <WORD> { level | mode }  
join-cluster <IP> user <USERNAME> password <WORD> { level [1|2] | mode [active|standby] }
```

Parameters

```
join-cluster <IP> user <USERNAME> password <WORD> { level [1|2] | mode [active|standby] }
```

join-cluster	Adds a access point wireless controller, or service platform to an existing cluster
<IP>	Specify the cluster member's IP address.
user <USERNAME>	Specify a user account with super user privileges on the new cluster member
password <WORD>	Specify password for the account specified in the user parameter
level [1 2]	Optional. Configures the routing level <ul style="list-style-type: none">• 1 - Configures level 1 routing• 2 - Configures level 2 routing
mode [active standby]	Optional. Configures the cluster mode <ul style="list-style-type: none">• active - Configures this cluster as active• standby - Configures this cluster to be on standby mode

Usage Guidelines

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding a device to a cluster, execute the "write memory" command to ensure the configuration persists across reboots.

Examples (User Exec Mode)

```
rfs4000-229D58>join-cluster 192.168.13.15 user admin password superuser level 1  
mode standby  
... connecting to 192.168.13.15  
... applying cluster configuration
```

Related Commands

create-cluster (user and privi exec modes) on page 47	Creates a new cluster on the specified device
cluster (user and privi exec modes) on page 46	Initiates cluster context. The cluster context enables centralized management and configuration of all cluster members from any one member.

l2tpv3 (user and privi exec modes)

Establishes or brings down a *Layer 2 Tunnel Protocol Version 3* (L2TPV3) tunnel

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
l2tpv3 tunnel [<TUNNEL-NAME>|all]
l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

Parameters

```
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
```

l2tpv3 tunnel	Establishes or brings down L2TPV3 tunnels
<TUNNEL-NAME> [down up]	Specifies the tunnel name to establish or bring down <ul style="list-style-type: none">• down - Brings down the specified tunnel• up - Establishes the specified tunnel
on <DEVICE-NAME>	Optional. Establishes or brings down a tunnel on a specified device <ul style="list-style-type: none">• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
```

l2tpv3 tunnel	Establishes or brings down L2TPV3 tunnels
<TUNNEL-NAME> [session <SESSION-NAME>] [down up]	Establishes or brings down a specified session inside an L2TPV3 tunnel <ul style="list-style-type: none">• <TUNNEL-NAME> - Specify the tunnel name.• session <SESSION-NAME> - Identifies a specific session<ul style="list-style-type: none"><SESSION-NAME> - Specify the session name.down - Brings down the session identified by the <SESSION-NAME> keywordup - Establishes the session identified by the <SESSION-NAME> keyword
on <DEVICE-NAME>	Optional. Establishes or brings down a tunnel session on a specified device <ul style="list-style-type: none">• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

```
l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

l2tpv3 tunnel	Establishes or brings down L2TPV3 tunnel
all [down up]	Establishes or brings down all L2TPV3 tunnels <ul style="list-style-type: none"> • down – Brings down all tunnels • up – Establishes all tunnels
on <DEVICE-NAME>	Optional. Establishes or brings down all tunnels on a specified device <ul style="list-style-type: none"> • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples (User Exec Mode)

```
nx9500-6C8809>l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on nx9500-6C8809
```

Example (Privi Exec Mode)

```
nx9500-6C8809#l2tpv3 tunnel TestTunnel session TestTunnelSession1 up on rfs4000-6DB5D4
```

Note

For more information on the L2TPV3 tunnel configuration mode and commands, see [L2TPV3-POLICY](#).

logging (user and privi exec modes)

Modifies message logging settings

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings}
```

Parameters

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings}
```

monitor Sets the terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.

- <0-7> - Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:
- alerts - Optional. Immediate action needed (severity=1)
- critical - Optional. Critical conditions (severity=2)
- debugging - Optional. Debugging messages (severity=7)
- emergencies - Optional. System is unusable (severity=0)
- errors - Optional. Error conditions (severity=3)
- informational - Optional. Informational messages (severity=6)
- notifications - Optional. Normal but significant conditions (severity=5)
- warnings - Optional. Warning conditions (severity=4)

Note: Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device's configuration mode, execute the logging > on command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.

Example (User Exec Mode)

```
NOC-NX9500(config-device-B4-C7-99-6C-88-09)#logging on
NOC-NX9500>logging monitor debugging
NOC-NX9500>show logging
```

```
Logging module: enabled
  Aggregation time: disabled
  Console logging: level debugging
  Monitor logging: level debugging
  Buffered logging: level warnings
  Syslog logging: level warnings
  Facility: local7
```

Log Buffer (2208029 bytes):

Related Commands

no (user exec mode) on page 83	Resets terminal lines logging levels
no (priv-exec-mode) on page 189	

mint (user and privi exec modes)

Uses MiNT protocol to perform a ping and trace route to a remote device

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
mint [ping|traceroute]
mint ping <MINT-ID> {(count <1-10000>/size <1-64000>/timeout <1-10>)}
mint traceroute <MINT-ID> {(destination-port <1-65535>/max-hops <1-255>/
source-port <1-65535>/timeout <1-255>)}
```

Parameters

```
mint ping <MINT-ID> {(count <1-10000>/size <1-64000>/timeout <1-10>)}
```

ping <MINT-ID>	Sends a MiNT echo message to a specified destination <ul style="list-style-type: none">• <MINT-ID> - Specify the destination device's MiNT ID.
count <1-10000>	Optional. Sets the number of ping packets sent to the specified MiNT destination <ul style="list-style-type: none">• <1-60> - Specify a value from 1 - 10000. The default is 3.
size <1-64000>	Optional. Sets the MiNT payload size in bytes <ul style="list-style-type: none">• <1-64000> - Specify a value from 1 - 640000. The default is 64 bytes.
timeout <1-10>	Optional. Sets a response time in seconds <ul style="list-style-type: none">• <1-10> - Specify a value from 1 sec - 10 sec. The default is 1 second.

```
mint traceroute <MINT-ID> {(destination-port <1-65535>/max-hops <1-255>/
source-port <1-65535>/timeout <1-255>)}
```

traceroute <MINT-ID>	Prints the route packets trace to a device <ul style="list-style-type: none">• <MINT-ID> - Specify the destination device's MiNT ID.
destination-port <1-65535>	Optional. Sets the <i>Equal-cost Multi-path</i> (ECMP) routing destination port <ul style="list-style-type: none">• <1-65535> - Specify a value from 1 - 65535. The default port is 45.
max-hops <1-255>	Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction <ul style="list-style-type: none">• <1-255> - Specify a value from 1 - 255. The default is 30.
source-port <1-65535>	Optional. Sets the ECMP source port <ul style="list-style-type: none">• <1-65535> - Specify a value from 1 - 65535. The default port is 45.
timeout <1-255>	Optional. Sets the minimum response time period in seconds <ul style="list-style-type: none">• <1-65535> - Specify a value from 1 sec - 255 sec. The default is 30 seconds.

Example (User Exec Mode)

```
NOC-NX9500>mint ping 4D.83.30.A4
MiNT ping 4D.83.30.A4 with 64 bytes of data.
  Response from 4D.83.30.A4: id=16777216 time=0.262 ms
  Response from 4D.83.30.A4: id=33554432 time=2.025 ms
  Response from 4D.83.30.A4: id=50331648 time=0.256 ms

--- 4D.83.30.A4 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.256/0.848/2.025 ms
NOC-NX9500>
```

Example (Privi Exec Mode)

```
rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
  Response from 68.88.0D.A7: id=1 time=0.364 ms
  Response from 68.88.0D.A7: id=2 time=0.333 ms
  Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
```

no (user exec mode)

Use the `no` command to remove a setting or to revert a setting to its default value.

Note

The commands have their own set of parameters that can be reset.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
no [adoption|captive-portal|crypto|debug|logging|page|service|terminal|virtual-machine|
wireless]
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-
DOMAIN-NAME>}
no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}/on <DEVICE-
NAME>}
no logging monitor
no page
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service snmp sysoid wing5
no service block-adopter-config-update
no service ssm trace pattern {<WORD>} {on <DEVICE-NAME>}
no service wireless [trace pattern {<WORD>} {on <DEVICE-NAME>}|
unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}]
no service locator {on <DEVICE-NAME>}
no terminal [length|width]
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
no wireless client [all|<MAC>]
no wireless client all {filter/on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

no <PARAMETERS>

no <PARAMETERS>	Resets or reverts settings based on the parameters passed
-----------------	---

Usage Guidelines

The *no* command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

```
nx9500-6C8809>no adoption
nx9500-6C8809>no page
nx9500-6C8809>no service cli-tables-expand line
```

on (user and privi exec modes)

Executes the following commands in the RF Domain context: *clrscr*, *do*, *end*, *exit*, *help*, *service*, and *show*

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

Parameters

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

on rf-domain [<RF-DOMAIN-NAME> all]	Enters the RF Domain context based on the parameter specified <ul style="list-style-type: none">• <RF-DOMAIN-NAME> - Specify the RF Domain name. Enters the specified RF Domain context.• all - Specifies all RF Domains.
-------------------------------------	--

Example (User Exec Mode)

```
nx9500-6C8809>on rf-domain TechPubs
nx9500-6C8809(TechPubs)>?
on RF-Domain Mode commands:
```

```
clrscr  Clears the display screen
do      Run commands from Exec mode
end     End current mode and change to EXEC mode
exit   End current mode and down to previous mode
help   Description of the interactive help system
service Service Commands
show   Show running system information
```

```
nx9500-6C8809(TechPubs)>
nx9500-6C8809(rf-domain-all)>?
on RF-Domain Mode commands:
```

```
clrscr  Clears the display screen
do      Run commands from Exec mode
end     End current mode and change to EXEC mode
exit   End current mode and down to previous mode
help   Description of the interactive help system
service Service Commands
show   Show running system information
```

```
nx9500-6C8809(rf-domain-all)>
```

Example (Privi Exec Mode)

```
nx9500-6C8809#on rf-domain TechPubs
nx9500-6C8809(TechPubs)#
NOC-NX9500#on rf-domain default
NOC-NX9500(default)#?
on RF-Domain Mode commands:
```

```
clrscr  Clears the display screen
do      Run commands from Exec mode
end     End current mode and change to EXEC mode
exit   End current mode and down to previous mode
help   Description of the interactive help system
service Service Commands
show   Show running system information
```

```
NOC-NX9500(default)#
```

```
NOC-NX9500(default)#show sessions on RFS6K-SITE1-VLAN20
```

NOC-NX9500(default)#
```

opendns (user and privi exec modes)

Fetches the OpenDNS device_id from the OpenDNS site. Use this command to fetch the OpenDNS device_id. Once fetched, apply the device_id to WLANs that are to be OpenDNS enabled.

OpenDNS is a free DNS service that enables swift Web navigation without frequent outages. It is a reliable DNS service that provides the following services: DNS query resolution, Web-filtering, protection against virus and malware attacks, performance enhancement, etc.

This command is part of a set of configurations that are required to integrate WiNG devices with OpenDNS. When integrated, DNS queries going out of the WiNG device (access point, controller, or service platform) are re-directed to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers that act as proxy DNS servers.

For more information on integrating WiNG devices with OpenDNS site, see [Example: Enabling OpenDNS Support](#) on page 87.

Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
opendns [APIToken|username]
opendns APIToken <OPENDNS-APITOKEN>
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

Note

Note, as per the current implementation both of the above commands can be used to fetch the device_id from the OpenDNS site.

Parameters

```
opendns APIToken <OPENDNS-APITOKEN>
```

opendns	Fetches the device_id from the OpenDNS site using the OpenDNS API token
APIToken <OPENDNS-APITOKEN>	Configures the OpenDNS APIToken. This is the token provided you by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none">• <OPENDNS-APITOKEN> - Provide the OpenDNS API token (should be a valid token). For every valid OpenDNS API token provided a device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see opendns on page 586.

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

opendns	Fetches the device_id from the OpenDNS site using the OpenDNS credentials
username <USERNAME>	Configures the OpenDNS user name. This is your OpenDNS email ID provided by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"> <USERNAME> - Provide the OpenDNS user name (should be a valid OpenDNS username).
password <OPENDNS-PSWD>	Configures the password associated with the user name specified in the previous step <ul style="list-style-type: none"> <OPENDNS-PSWD> - Provide the OpenDNS password (should be a valid OpenDNS password).
label <LABEL>	Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal. <ul style="list-style-type: none"> <LABEL> - Specify your network label. <p>For every set of user name, password, and label passed only one unique device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see opendns on page 586.</p>

Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Example

```
ap7161-E6D512>opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7161-E6D512>
nx9600-7F3C7F>opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073 device_id =
001480fe36dcb245
nx9600-7F3C7F>
```

Example: Enabling OpenDNS Support

The following example shows how to enable OpenDNS support:

- 1 Fetch the OpenDNS device_id from the OpenDNS site.
 - a In the User/Privilege executable mode execute one of the following commands:

```
nx9500-6C8809#opendns APIToken <OPENDNS-APITOKEN>
nx9500-6C8809#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 001480fe36dcb245nx9500-6C8809#
```

OR

```
nx9500-6C8809#opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

Note

The *OpenDNS API token* and/or *user account credentials* are provided the OpenDNS service provider when subscribing for the OpenDNS service.

- b Apply the device_id fetched in the step 1 to the WLAN.

```
nx9500-6C8809(config-wlan-opendns)#opendns device-id <OPENDNS-DEVICE-ID>
nx9500-6C8809(config-wlan-opendns)#opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
```

```
ssid opendns
bridging-mode local
encryption-type none
authentication-type none
opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#
```

Note

Once applied, DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.

- 2 Configure a DHCP server policy, and set the DHCP pool's DNS server configuration to point to the OpenDNS servers.

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#dns-server 208.67.222.222
```

Note

You can configure any one of the following OpenDNS servers: 208.67.222.222 OR 208.67.222.220

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#show context
```

```
dhcp-pool opendnsPool  
dns-server 208.67.222.222
```

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#
```

- 3 Apply the DHCP server policy configured in step 2 on the access point, controller, or service platform.

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#use dhcp-server-policy opendns
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory | include
use
use profile default-nx9000
use rf-domain TechPubs
use database-policy default
use nsight-policy noc
use dhcp-server-policy opendns
use auto-provisioning-policy TechPubs
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

Note

When configured, DNS queries are forwarded by the access point, controller, or service platform to the specified OpenDNS resolver.

- 4 Configure an IP Access Control List with the following permit and deny rules:

```
nx9500-6C8809(config-ip-acl-OpenDNS)#permit udp any host 208.67.222.222 eq dns rule-
precedence 1 rule-description "allow dns queries only to OpenDNS"
```

```
nx9500-6C8809(config-ip-acl-OpenDNS)#deny udp any any eq dns rule-precedence 10 rule-
description "block all DNS queries"
```

```
nx9500-6C8809(config-ip-acl-OpenDNS)#permit ip any any rule-precedence 100 rule-
description "allow all other ip packets"
```

```
nx9500-6C8809(config-ip-acl-OpenDNS)#show context
```

```
ip access-list OpenDNS  
permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow dns  
queries only to OpenDNS"  
deny udp any any eq dns rule-precedence 10 rule-description "block all dns queries"
```

```
permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
nx9500-6C8809(config-ip-acl-OpenDNS)#
```

Note

When configured and applied in the WLAN context, the IP ACL prevents wireless clients from adding their own DNS servers to bypass the Web filtering and network policies enforced by OpenDNS.

- 5 Apply the IP ACL configured in step 4 in the WLAN context.
- ```
nx9500-6C8809(config-wlan-opendns)#use ip-access-list out OpenDNS
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 vlan 1
 bridging-mode local
 encryption-type none
 authentication-type none
 use ip-access-list in OpenDNS
 use ip-access-list out OpenDNS
 opendns device-id 0014AADF8EDC6C59
nx9500-6C8809(config-wlan-opendns)#
```
- 

#### Note

When applied to the WLAN, only the DNS queries directed to the OpenDNS server are forwarded. All other DNS queries are dropped.

---

*page (user and privi exec modes)*

Toggles a device's paging function. Enabling this option displays the CLI command output page by page, instead of running the entire output at once.

---

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

---

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

page 83

`no (priv-exec-mode) on` Disables paging  
page 189

## *ping (user and privi exec modes)*

Sends ICMP (Internet Controller Message Protocol) echo messages to a user-specified location

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

## Parameters

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|
source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

```

### Examples (Priv Exec Mode)

```
rfs4000-229D58#ping 10.233.89.182 source vlan 1
PING 10.233.89.182 (10.233.89.182) from 192.168.13.24 vlan1: 100(128) bytes of data.
From 192.168.13.2 icmp_seq=1 Packet filtered
From 192.168.13.2 icmp_seq=2 Packet filtered
From 192.168.13.2 icmp_seq=3 Packet filtered
From 192.168.13.2 icmp_seq=4 Packet filtered
From 192.168.13.2 icmp_seq=5 Packet filtered

--- 10.233.89.182 ping statistics ---
5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 3997ms

rfs4000-229D58#
```

### ping6 (user and privi exec modes)

Sends ICMPv6 echo messages to a user-specified IPv6 address

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

## Parameters

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

|                 |                                                                                                                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv6/HOSTNAME> | Specify the destination IPv6 address or hostname.                                                                                                                                              |
| <INTF-NAME>     | Specify the interface name for link local/broadcast address                                                                                                                                    |
| count <1-10000> | Optional. Sets the pings to the specified IPv6 destination <ul style="list-style-type: none"><li>• &lt;1-10000&gt; - Specify a value from 1 - 10000. The default is 5.</li></ul>               |
| size <1-64000>  | Optional. Sets the IPv6 ping payload size in bytes <ul style="list-style-type: none"><li>• &lt;1-64000&gt; - Specify the ping payload size from 1 - 64000. The default is 100 bytes.</li></ul> |

## Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the **ipv6 > address <IPv6-ADDRESS>** command. After configuring the IPv6 address, use the **ipv6 > enable** command to enable IPv6. For more information, see [ipv6](#) on page 1162 (profile config mode).

## Examples (User Exec Mode)

```
rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief

--- 2001:10:10:10:10:10:10:2 ping statistics ---
6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.314/0.349/0.509/0.075 ms
rfs4000-880DA7#

```

*ssh* (user and privi exec modes)

Opens a SSH (Secure Shell) connection between two network devices

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

#### Parameters

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

|                            |                                                                                |
|----------------------------|--------------------------------------------------------------------------------|
| <IP/HOSTNAME>              | Specify the remote system's IP address or hostname.                            |
| <USERNAME>                 | Specify the name of the user requesting SSH connection with the remote system. |
| <INF-NAME/ LINK-LOCAL-ADD> | Optional. Specify the interface's name or link local address.                  |

#### Example (User Exec Mode)

```

NOC-NX9500>ssh 10.234.160.13 admin
admin@10.234.160.13's password:
ap8432-070235>>ssh 192.168.13.24 admin
admin@192.168.13.24's password:
rfs4000-6DB5D4>

```

#### Example (Privi Exec Mode)

```

ap7532-DF9A4C#ssh 10.234.160.13 admin
admin@10.234.160.13's password:
ap8432-070235>

```

## telnet (user and privi exec modes)

Opens a Telnet session between two network devices

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

### Parameters

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

|               |                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IP/HOSTNAME> | Configures the destination remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system. <ul style="list-style-type: none"><li>• &lt;IP/HOSTNAME&gt; - Specify the remote system's IPv4 or IPv6 address or hostname.</li></ul> |
| <TCP-PORT>    | Optional. Specify the <i>Transmission Control Protocol</i> (TCP) port number.                                                                                                                                                                                                                                  |
| <INTF-NAME>   | Optional. Specify the interface name for the link local address.                                                                                                                                                                                                                                               |

### Examples (User Exec Mode)

```
NOC-NX9500>telnet 10.234.160.11
telnet: cannot connect to remote host (10.234.160.11): Connection refused
NOC-NX9500>telnet 10.234.160.13
```

```
Entering character mode
Escape character is '^']'.
```

```

```

*terminal (user and privi exec modes)*

Sets the length and width of the CLI display window on a terminal

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
terminal [length|width] <0-512>
```

#### Parameters

```
terminal [length|width] <0-512>
```

|                |                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| length <0-512> | Sets the number of lines displayed on a terminal window <ul style="list-style-type: none"><li>• &lt;0-512&gt; – Specify a value from 0 - 512.</li></ul>                    |
| width <0-512>  | Sets the width (the number of characters displayed) of the terminal window <ul style="list-style-type: none"><li>• &lt;0-512&gt; – Specify a value from 0 - 512.</li></ul> |

#### Example (User Exec Mode)

```
ap8432-070235>show terminal
Terminal Type: xterm
Length: 24 Width: 80
ap8432-070235>
ap8432-070235>terminal length 80
ap8432-070235>terminal width 100
ap8432-070235>show terminal
Terminal Type: xterm
Length: 80 Width: 100
ap8432-070235>
```

#### Example (Privi Exec Mode)

```
NOC-NX9500#show terminal
Terminal Type: xterm
Length: 24 Width: 80
NOC-NX9500#
NOC-NX9500#terminal length 30
NOC-NX9500#terminal width 100
NOC-NX9500#show terminal
Terminal Type: xterm
Length: 30 Width: 100
NOC-NX9500#
```

### *time-it (user and privi exec modes)*

Verifies the time taken by a particular command between request and response

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
time-it <COMMAND>
```

### Parameters

```
time-it <COMMAND>
```

`time-it <COMMAND>` Verifies the time taken by a particular command to execute and provide a result

- `<COMMAND>` – Specify the command.

### Examples

```
ap8432-070235>time-it enable
That took 0.00 seconds..
ap8432-070235#
```

#### Example (Privi Exec Mode)

```
rfs4000-229D58#time-it config terminal
Enter configuration commands, one per line. End with CNTL/Z.
That took 0.00 seconds..
rfs4000-229D58(config)#
```

### *traceroute (user-privi-exec-mode)*

Traces the route to a defined destination

Use '--help' or '-h' to display a complete list of parameters for the traceroute command

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
traceroute <LINE>
```

### Parameters

```
traceroute <LINE>
```

|                   |                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------|
| traceroute <LINE> | Traces the route to a destination IP address or hostname                                                           |
|                   | <ul style="list-style-type: none"><li>• &lt;LINE&gt; - Specify the destination IPv4 address or hostname.</li></ul> |

### Example (User Exec Mode)

```
NOC-NX9500>traceroute 10.234.160.13
traceroute to 10.234.160.13 (10.234.160.13), 30 hops max, 46 byte packets
 1 10.234.160.13 (10.234.160.13) 0.315 ms 0.159 ms 0.137 ms
NOC-NX9500>
```

### Example (Privi Exec Mode)

```
NOC-NX9500#traceroute 10.234.160.11
traceroute to 10.234.160.11 (10.234.160.11), 30 hops max, 46 byte packets
 1 10.234.160.11 (10.234.160.11) 8.115 ms 0.410 ms 0.370 ms
NOC-NX9500#
```

### traceroute6 (user-privi-exec-mode)

Traces the route to a specified IPv6 destination

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
traceroute6 <LINE>
```

### Parameters

```
traceroute6 <LINE>
```

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| traceroute6 <LINE> | Traces the route to a destination IPv6 address or hostname                                                         |
|                    | <ul style="list-style-type: none"><li>• &lt;LINE&gt; - Specify the destination IPv6 address or hostname.</li></ul> |

### Example (User Exec Mode)

```
rfs4000-6DB5D4>traceroute6 2001:10:10:10:10:10:10:1
traceroute to 2001:10:10:10:10:10:10:1 (2001:10:10:10:10:10:10:1) from
2001:10:10:10:10:10:10:2, 30 hops max, 16 byte packets
 1 2001:10:10:10:10:10:10:1 (2001:10:10:10:10:10:10:1) 6.054 ms 0.448 ms 0.555 ms
rfs4000-6DB5D4>
```

### Example (Priv Exec Mode)

```
rfs4000-229D587#traceroute6 2001:10:10:10:10:10:10:2
traceroute to 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) from
2001:10:10:10:10:10:10:1, 30 hops max, 16 byte packets
 1 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) 0.622 ms 0.497 ms 0.531 ms
rfs4000-229D58#
```

*virtual-machine* (user and privi exec modes)

Installs, configures, and monitors the status of virtual machines (VMs)

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
virtual-machine install [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
virtual-machine restart [<VM-NAME>|hard|adsp|team-urc|team-rls|team-vowlan]
virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]
virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|
vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|
vnc [disable|enable]] [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

The following virtual-machine commands are supported only on the VX 9000 platform:

```
virtual-machine volume-group [add-drive|replace-drive|resize-drive|resize-volume-group]
virtual-machine volume-group [add-drive|replace-drive] <BLOCK-DEVICE-LABEL>
virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABLE> <NEW-BLOCK-DEVICE-
LABEL>
virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>
```

### Parameters

```
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
```

assign-usb-ports team-vowlan

Assigns USB ports to TEAM-VoWLAN on a specified device

- on <DEVICE-NAME> – Optional. Specify the device name.

**Note:** Use the **no > virtual-machine > assign-usb-ports** command to reassign the port to WiNG.

**Note:** TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

```
virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
```

virtual-machine export

Exports an existing VM image and settings. Use this command to export the VM to another device in the same domain.

- <VM-NAME> – Specify the VM name.
- <FILE> – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
- <URL> – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
  - tftp://<hostname|IP>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - http://<hostname|IP>[:port]/path/file
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** The VM should be in a stop state during the export process.

**Note:** If the destination is a device, the image is copied to a predefined location (VM archive).

```
virtual-machine install [<VM-NAME>|adsp|team-centro|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine install

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.

- <VM-NAME> – Specify the VM name.
- adsp – Installs ADSP
- team-centro – Installs the VM TEAM-Centro image
- team-rls – Installs the VM TEAM-RLS image
- team-vowlan – Installs the VM TEAM-VoWLAN image

Specify the device on which to install the VM.

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine set [autostart [ignore|start]]|memory <512-8192>|vcpus <1-4>|vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc [disable|enable]] [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine  
set

Configures the VM settings

- autostart – Specifies whether to autostart the VM on system reboot
  - ignore – Enables autostart on each system reboot
  - start – Disables autostart
- memory – Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
- vcpus – Specifies the number of VCPUS for this VM
  - <1-4> – Specify the number of VCPUS from 1- 4.
- vif-count – Configures or resets the VM's VIFs
  - <0-2> – Specify the VIF number from 0 - 2.
- vif-mac – Configures the MAC address of the selected virtual network interface
  - <1-2> – Select the VIF
    - <1-8> – Specify the MAC index for the selected VIF
    - <MAC> – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the 'set' keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard I2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM's interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.

- vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the twelve ports for NX 95XX on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

- vnc – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - disable – Disables VNC port
  - enable – Enables VNC port

After configuring the VM settings, identify the VM to apply the settings.

- <VM-NAME> – Applies these settings to the VM identified by the <VM-NAME> keyword. Specify the VM name.
- adsp – Applies these settings to the ADSP VM
- team-urc – Applies these settings to the VM TEAM-URC
- team-rls – Applies these settings to the VM TEAM-RLS
- team-vowlan – Applies these settings to the VM TEAM-VoWLAN

```
virtual-machine start [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine start Starts the VM, based on the parameters passed. Select one of the following options:

- <VM-NAME> - Starts the VM identified by the <VM-NAME> keyword. Specify the VM name.
- adsp - Starts the ADSP VM
- team-urc - Starts the VM TEAM-URC
- team-rls - Starts the VM TEAM-RLS
- team-vowlan - Starts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine stop [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine stop hard Stops the VM, based on the parameters passed. Select one of the following options:

- <VM-NAME> - Stops the VM identified by the <VM-NAME> keyword. Specify the VM name.
- ADSP - Stops the ADSP VM
- team-urc - Stops the VM TEAM-URC
- team-rls - Stops the VM TEAM-RLS team-vowlan - Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. Note: The option 'hard' forces the selected VM to shutdown.

**Note:** The option 'hard' forces the selected VM to shutdown.

```
virtual-machine uninstall [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine uninstall Uninstalls the specified VM

- <VM-NAME> - Uninstalls the VM identified by the <VM-NAME> keyword. Specify the VM name.
- ADSP - Uninstalls the ADSP VM
- team-urc - Uninstalls the VM TEAM-URC
- team-rls - Uninstalls the VM TEAM-RLS team-vowlan - Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

```
virtual-machine volume-group [add-drive|resize-drive] <BLOCK-DEVICE-LABEL>
```

|                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|-----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

The following examples show the VM installation process:

### Insatllation media: USB

```
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/
win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

## Installation media: pre-installed disk image

```
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/
win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>
In the preceding example, the command is executed on the device identified by the <DEVICE-
NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the
install media as first boot device.
```

## Installation media: VM archive

```
<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3
In the preceding example, the default configuration attached with the VM archive overrides
any parameters specified.
```

## Exporting an installed VM:

```
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
In the preceding example, the command copies the VM archive on to the URL (VM should be in
stop state).
<DEVICE>>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
<DEVICE>>
VX 9000-DE6F97>virtual-machine add-drive sdb
VX 9000-DE6F97>show virtual-machine volume-group status

Logical Volume: lv1

STATUS : available
SIZE : 81.89 GiB
VOLUME GROUP : vg0
PHYSICAL VOLUMES :
 sda10 : 73.90 GiB
 sdc1 : 8.00 GiB
AVAILABLE DISKS :
 sdb : size: 8590MB

* indicates a drive that must be resized

VX 9000-DE6F97>
```

*exit (user exec mode)*

Ends the current CLI session and closes the session window

For more information, see [exit](#).

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

`exit`

## Parameters

None

## Examples

```
nx9500-6C8809>exit
```

### *watch*

Repeats the specified CLI command at periodic intervals

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
watch <1-3600> <LINE>
```

### Parameters

```
watch <1-3600> <LINE>
```

|          |                                                                                       |
|----------|---------------------------------------------------------------------------------------|
| watch    | Repeats a CLI command at a specified interval (in seconds)                            |
| <1-3600> | Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command. |
| <LINE>   | Specify the CLI command.                                                              |

### Examples

In the following example, the controller pings the specified IP address once in every 40 seconds.

```
NOC-NX9500>watch 40 ping 10.234.160.13
PING 10.234.160.13 (10.234.160.13) 100(128) bytes of data.
108 bytes from 10.234.160.13: icmp_seq=1 ttl=64 time=0.257 ms

# PRIVILEGED EXEC MODE COMMANDS

## PRIVILEGED EXEC MODE COMMANDS

---

Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

### Note

To password-protect the Privilege mode, in the Management Policy, configure the `privilege-mode-password`. For more information, see [privilege-mode-password](#) on page 1532.

---

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

```
<DEVICE>>enable
<DEVICE>#
```

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

```
<DEVICE>#?
Privileged command commands:
 <DEVICE>#?
Privileged command commands:
 archive Manage archive files
 boot Boot commands
 captive-portal-page-upload Captive portal internal and advanced page upload

| format          | Format file system                                                                                                 |
| halt            | Halt the system                                                                                                    |
| help            | Description of the interactive help system                                                                         |
| join-cluster    | Join the cluster                                                                                                   |
| l2tpv3          | L2tpv3 protocol                                                                                                    |
| logging         | Modify message logging facilities                                                                                  |
| mint            | MiNT protocol                                                                                                      |
| mkdir           | Create a directory                                                                                                 |
| more            | Display the contents of a file                                                                                     |
| no              | Negate a command or set its defaults                                                                               |
| on              | On RF-Domain                                                                                                       |
| opendns         | Opendns username/password configuration                                                                            |
| page            | Toggle paging                                                                                                      |
| ping            | Send ICMP echo messages                                                                                            |
| ping6           | Send ICMPv6 echo messages                                                                                          |
| pwd             | Display current directory                                                                                          |
| raid            | RAID operations                                                                                                    |
| re-elect        | Perform re-election                                                                                                |
| reload          | Halt and perform a warm reboot                                                                                     |
| remote-debug    | Troubleshoot remote system(s)                                                                                      |
| rename          | Rename a file                                                                                                      |
| revert          | Revert changes                                                                                                     |
| rmdir           | Delete a directory                                                                                                 |
| self            | Config context of the device currently logged into                                                                 |
| service         | Service Commands                                                                                                   |
| show            | Show running system information                                                                                    |
| ssh             | Open an ssh connection                                                                                             |
| t5              | T5 commands                                                                                                        |
| telnet          | Open a telnet connection                                                                                           |
| terminal        | Set terminal line parameters                                                                                       |
| time-it         | Check how long a particular command took between request and completion of response                                |
| traceroute      | Trace route to destination                                                                                         |
| traceroute6     | Trace route to destination(IPv6)                                                                                   |
| upgrade         | Upgrade software image                                                                                             |
| upgrade-abort   | Abort an ongoing upgrade                                                                                           |
| virtual-machine | Virtual Machine                                                                                                    |
| watch           | Repeat the specific CLI command at a periodic interval                                                             |
| write           | Write running configuration to memory or terminal                                                                  |
| clrscr          | Clears the display screen                                                                                          |
| exit            | Exit from the CLI                                                                                                  |
| <DEVICE>        |                                                                                                                    |

## privileged-exec-commands

The following table summarizes the PRIV EXEC configuration mode commands:

**Table 5: Privileged Exec Commands**

| Command                                                                           | Description                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">archive</a> on page 109                                               | Manages file archive operations                                                                                                                                                                                                             |
| <a href="#">boot</a> on page 111                                                  | Specifies the boot partition as primary or secondary. The device boots using the image stored in the specified partition.                                                                                                                   |
| <a href="#">captive-portal-page-upload (user and privi exec modes)</a> on page 27 | Uploads captive portal advanced pages to adopted access points                                                                                                                                                                              |
| <a href="#">cd</a> on page 116                                                    | Changes the current directory                                                                                                                                                                                                               |
| <a href="#">change-passwd (user and privi exec modes)</a> on page 31              | Changes the password of the currently logged-in user                                                                                                                                                                                        |
| <a href="#">clear (user and privi exec modes)</a> on page 32                      | Clears parameters, cache entries, table entries, and other similar entries                                                                                                                                                                  |
| <a href="#">clock (user and privi exec modes)</a> on page 44                      | Configures the system clock                                                                                                                                                                                                                 |
| <a href="#">cluster (user and privi exec modes)</a> on page 46                    | Initiates a cluster context                                                                                                                                                                                                                 |
| <a href="#">configure</a>                                                         | Enters the global configuration mode                                                                                                                                                                                                        |
| <a href="#">connect (user and privi exec modes)</a> on page 46                    | Begins a console connection to a remote device                                                                                                                                                                                              |
| <a href="#">copy</a> on page 133                                                  | Clears parameters, cache entries, table entries, and other similar entries                                                                                                                                                                  |
| <a href="#">cpe (privilege-exec-mode)</a> on page 134                             | Enables adopted T5 CPE (Customer Premises Equipment) device(s) management. Use this command to perform the following operations on the CPEs: boot, reload, upgrade. This command is specific to the RFS 4000, NX 95XX, and NX 96XX devices. |
| <a href="#">create-cluster (user and privi exec modes)</a> on page 47             | Creates a new cluster on a specified device                                                                                                                                                                                                 |
| <a href="#">crypto (user and privi exec modes)</a> on page 49                     | Enables encryption                                                                                                                                                                                                                          |
| <a href="#">crypto-cmp-cert-policy (user and privi exec modes)</a> on page 58     | Triggers a CMP certificate update on a specified device or devices                                                                                                                                                                          |
| <a href="#">database (user and privi exec modes)</a> on page 59                   | Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)                                                                                                                                               |
| <a href="#">database-backup (user and privi exec modes)</a> on page 63            | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server                                                                                                                                    |
| <a href="#">database-backup (user and privi exec modes)</a> on page 63            | Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.                                                  |
| <a href="#">delete</a> on page 161                                                | Deletes a specified file from the system                                                                                                                                                                                                    |
| <a href="#">device-upgrade (user and privi exec modes)</a> on page 65             | Configures device firmware upgrade parameters                                                                                                                                                                                               |
| <a href="#">diff</a> on page 162                                                  | Displays the differences between two files                                                                                                                                                                                                  |
| <a href="#">dir</a> on page 162                                                   | Displays the list of files on a file system                                                                                                                                                                                                 |

**Table 5: Privileged Exec Commands (continued)**

| Command                                                          | Description                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>disable</code> on page 164                                 | Disables the privileged mode command set                                                                                                                                                                                                                      |
| <code>edit</code> on page 164                                    | Edits a text file                                                                                                                                                                                                                                             |
| <code>enable</code> on page 165                                  | Turns on (enables) the privileged mode commands set                                                                                                                                                                                                           |
| <code>erase</code> on page 165                                   | Erases a file system                                                                                                                                                                                                                                          |
| <code>ex3500</code> on page 167                                  | Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP related configurations.                                                                                                           |
| <code>factory-reset</code> on page 175                           | Erases startup configuration on a specified device or all devices within a specified RF Domain                                                                                                                                                                |
| <code>file-sync (user and privi exec modes)</code> on page 74    | Configures parameters enabling syncing of PKCS#12 and wireless-bridge certificate between the staging-controller and adopted access points                                                                                                                    |
| <code>halt</code> on page 181                                    | Halts a device (Access Point, wireless controller, or service platform)                                                                                                                                                                                       |
| <code>join-cluster (user and privi exec modes)</code> on page 77 | Adds a device (Access Point, wireless controller, or service platform), as cluster member, to an existing cluster of devices                                                                                                                                  |
| <code>l2tpv3 (user and privi exec modes)</code> on page 79       | Establishes or brings down L2TPV3 tunnels                                                                                                                                                                                                                     |
| <code>logging (user and privi exec modes)</code> on page 80      | Modifies message logging parameters                                                                                                                                                                                                                           |
| <code>mint (user and privi exec modes)</code> on page 82         | Configures MINT protocols                                                                                                                                                                                                                                     |
| <code>mkdir</code> on page 188                                   | Creates a new directory in the file system                                                                                                                                                                                                                    |
| <code>more</code> on page 189                                    | Displays the contents of a file                                                                                                                                                                                                                               |
| <code>on (user and privi exec modes)</code> on page 84           | Reverts a command or sets values to their default                                                                                                                                                                                                             |
| <code>on (user and privi exec modes)</code> on page 84           | Executes the following commands in the RF Domain context: <code>clrscr</code> , <code>do</code> , <code>end</code> , <code>exit</code> , <code>help</code> , <code>service</code> , and <code>show</code>                                                     |
| <code>opendns (user and privi exec modes)</code> on page 86      | Connects to the OpenDNS site using OpenDNS registered credentials (username, password) OR OpenDNS API token to fetch the OpenDNS device_id. This command is a part of the process integrating access points, controllers, and service platforms with OpenDNS. |
| <code>page (user and privi exec modes)</code> on page 89         | Toggles a device's (Access Point, wireless controller, or service platform) paging function                                                                                                                                                                   |
| <code>ping (user and privi exec modes)</code> on page 90         | Sends ICMP echo messages to a user-specified location                                                                                                                                                                                                         |
| <code>ping6 (user and privi exec modes)</code> on page 91        | Sends ICMPv6 echo messages to a user-specified location                                                                                                                                                                                                       |
| <code>pwd</code> on page 199                                     | Displays the current directory                                                                                                                                                                                                                                |
| <code>re-elect</code> on page 200                                | Re-elects the tunnel controller (wireless controller, service platform, or Access Point)                                                                                                                                                                      |
| <code>reload</code> on page 200                                  | Halts a device (wireless controller, service platform, or Access Point) and performs a warm reboot                                                                                                                                                            |
| <code>rename</code> on page 205                                  | Renames a file in the existing file system                                                                                                                                                                                                                    |

**Table 5: Privileged Exec Commands (continued)**

| Command                                                                | Description                                                                                                                                   |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">rmdir</a> on page 206                                      | Deletes an existing file from the file system                                                                                                 |
| <a href="#">self</a> on page 207                                       | Displays the configuration context of the device                                                                                              |
| <a href="#">ssh (user and privi exec modes)</a> on page 93             | Connects to another device using a secure shell                                                                                               |
| <a href="#">t5 (privi exec mode)</a> on page 208                       | Executes the following operations on a T5 device: copy, rename, delete, and write. This command is specific to the RFS 4000, NX 95XX devices. |
| <a href="#">telnet (user and privi exec modes)</a> on page 94          | Opens a Telnet session                                                                                                                        |
| <a href="#">terminal (user and privi exec modes)</a> on page 95        | Sets the length and width of the terminal window                                                                                              |
| <a href="#">time-it (user and privi exec modes)</a> on page 96         | Verifies the time taken by a particular command between request and response                                                                  |
| <a href="#">traceroute (user-privi-exec-mode)</a> on page 96           | Traces the route to a defined IPv4 destination                                                                                                |
| <a href="#">traceroute6 (user-privi-exec-mode)</a> on page 97          | Traces the route to a defined IPv6 destination                                                                                                |
| <a href="#">upgrade</a> on page 214                                    | Upgrades the software image                                                                                                                   |
| <a href="#">upgrade-abort</a> on page 218                              | Aborts an ongoing software image upgrade                                                                                                      |
| <a href="#">exit (privi exec mode)</a> on page 167                     | Ends the current CLI session and closes the session window                                                                                    |
| <a href="#">watch</a> on page 226                                      | Repeats the specific CLI command at a periodic interval                                                                                       |
| <a href="#">virtual-machine (user and privi exec modes)</a> on page 98 | Installs, configures, and monitors the status of VMs. This command is specific to the NX 9500 and NX 9510 series service platforms.           |
| <a href="#">raid</a> on page 225                                       | Enables RAID management. This command is specific to the NX 9500 series service platforms.                                                    |

**Note**

For information on common commands (clscr, commit, help, revert, service, show, write, and exit), see [COMMON COMMANDS](#) on page 640.

**Note**

The input parameter <HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore ( \_ ) character.

*archive*

Manages file archive operations

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
archive tar /table [<FILE>|<URL>]
archive tar /create [<FILE>|<URL>] <FILE>
archive tar /xtract [<FILE>|<URL>] <DIR>
```

### Parameters

```
archive tar /table [<FILE>|<URL>]
```

|        |                                                      |
|--------|------------------------------------------------------|
| tar    | Manipulates (creates, lists, or extracts) a tar file |
| /table | Lists the files in a tar file                        |
| <FILE> | Defines a tar filename                               |
| <URL>  | Sets the tar file URL                                |

```
archive tar /create [<FILE>|<URL>] <FILE>
```

|         |                                                     |
|---------|-----------------------------------------------------|
| tar     | Manipulates (creates, lists or extracts) a tar file |
| /create | Creates a tar file                                  |
| <FILE>  | Defines tar filename                                |
| <URL>   | Sets the tar file URL                               |

```
archive tar /xtract [<FILE>|<URL>] <DIR>
```

|         |                                                                                                                                                                                                   |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tar     | Manipulates (creates, lists or extracts) a tar file                                                                                                                                               |
| /xtract | Extracts content from a tar file                                                                                                                                                                  |
| <FILE>  | Defines tar filename                                                                                                                                                                              |
| <URL>   | Sets the tar file URL                                                                                                                                                                             |
| <DIR>   | Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted. |

### Examples

Following examples show how to zip the folder flash:/log/?

```
nx9500-6C8809#dir flash:/
```

```
Directory of flash:/
```

```

nx9500-6C8809#

```

## *boot*

Boots up a specified device or the logged device. The WiNG devices have two partitions: primary and secondary. Each of these partition contains an image of the operating system. Whenever the device boots up, it loads the image from the partition specified here.

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
boot system [primary|secondary] {on <DEVICE-NAME>}
```

### **Parameters**

```
boot system [primary|secondary] {on <DEVICE-NAME>}
```

|                            |                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| system [primary secondary] | Specifies the image used to boot up <ul style="list-style-type: none"> <li>primary – Uses the primary image to boot</li> <li>secondary – Uses the secondary image to boot</li> </ul>                                                                        |
| on <DEVICE-NAME>           | Optional. Boots a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> <p><b>Note:</b> If no device is specified, the logged device boots up.</p> |

### Examples

```
nx9500-6C8809#show boot
```

| IMAGE     | BUILD DATE          | INSTALL DATE        | VERSION      |
|-----------|---------------------|---------------------|--------------|
| Primary   | 01/26/2018 01:48:56 | 01/30/2018 15:02:18 | 5.9.2.0-012D |
| Secondary | 01/15/2018 13:13:38 | 01/17/2018 13:36:50 | 5.9.2.0-010D |

```
Current Boot : Primary
Next Boot : Primary
Software Fallback : Enabled
VM support : Not present
nx9500-6C8809#
nx9500-6C8809#boot system secondary
Updated system boot partition
nx9500-6C8809#
nx9500-6C8809#show boot
```

| IMAGE     | BUILD DATE          | INSTALL DATE        | VERSION      |
|-----------|---------------------|---------------------|--------------|
| Primary   | 01/26/2018 01:48:56 | 01/30/2018 15:02:18 | 5.9.2.0-012D |
| Secondary | 01/15/2018 13:13:38 | 01/17/2018 13:36:50 | 5.9.2.0-010D |

```
Current Boot : Primary
Next Boot : Secondary
Software Fallback : Enabled
VM support : Not present
nx9500-6C8809#
```

### *captive-portal-page-upload (user and privi exec modes)*

Uploads captive portal advanced pages to adopted access points. Use this command to provide access points with specific captive portal configurations, so that they can successfully provision login, welcome, and condition pages to clients attempting to access the wireless network using the captive portal.

#### Note

Ensure that the captive portal pages to upload are \*.tar files.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all] {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME>|all]
{from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME>|all|on rf-domain [<DOMAIN-NAME>|
all]]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

## Parameters

```
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all] {upload-time <TIME>}
```

The following example lists captive portal CP-BW uploaded files:

```

nx7500-7F2C13@show captive-portal-page-upload list-files CP-BW

 NAME SIZE LAST MODIFIED

CP-BW-1.tar.gz 6133 2017-05-16 10:38:40
CP-BW.tar.gz 3370 2017-05-16 10:45:44

nx7500-7F2C13#

```

*cd*

Changes the current directory

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

```
cd {<DIR>}
```

**Parameters**

```
cd {<DIR>}
```

<DIR> Optional. Changes the current directory to the directory identified by the <DIR> keyword. If a directory name is not provided, the system displays the current directory.

**Examples**

```

rfs4000-229D58#cd flash:/log/
rfs4000-229D58#pwd
flash:/log/
rfs4000-229D58#

```

## *change-passwd* (user and privi exec modes)

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

### Parameters

```
change passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

<OLD-PASSWORD> Optional. Specify the existing password.

<NEW-PASSWORD> Specify the new password.

**Note:** The password can also be changed interactively. To do so, press **[Enter]** after the command.

### Usage Guidelines

A password must be from 1 - 64 characters.

### Examples (User Executable Mode)

```
rfs4000-6DB5D4>change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs4000-6DB5D4#write memory
OK
rfs4000-6DB5D4>
```

### Examples (Privilege Executable Mode)

```
nx9500-6C8809#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
nx9500-6C8809#write memory
OK
nx9500-6C8809#
```

*clear* (user and privi exec modes)

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode in which the clear command is executed.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
clear [arp-cache|bonjour|cdp|counters|crypto|eguest|event-history|gre|ip|ipv6|lacp|lldp|

```

```
clear traffic-shape statistics class <1-4> {(on <DEVICE-NAME>)}
clear vrrp [error-stats|stats] {on <DEVICE-NAME>}
```

### Parameters

```
clear arp-cache {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arp-cache        | Clears ARP (Address Resolution Protocol) cache entries on a AP, wireless controller, or service platform. This protocol matches the layer 3 IP addresses to the layer 2 MAC addresses.                 |
| on <DEVICE-NAME> | Optional. Clears ARP cache entries on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
clear bonjour cache {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bonjour cache    | Clears all Bonjour cached statistics. Once cleared the system has to re-discover available Bonjour services.                                                                                                       |
| on <DEVICE-NAME> | Optional. Clears all Bonjour cached statistics on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cdp              | Clears CDP (Cisco Discovery Protocol) (CDP) table entries                                                                                                                                                               |
| lldp             | Clears LLDP (Link Layer Discovery Protocol ) table entries                                                                                                                                                              |
| neighbors        | Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step                                                                                                                            |
| on <DEVICE-NAME> | Optional. Clears CDP or LLDP neighbor table entries on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}] {(on <DEVICE-OR-DOMAIN-NAME>)}
```

| on <DEVICE-NAME> | Optional. Clears OSPF process on a specified device<br>OSPF is a link-state IGP (interior gateway protocol). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets. <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

| vrrp             | Clears VRRP ( <i>Virtual Router Redundancy Protocol</i> ) statistics<br>VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |
| error-stats      | Clears global error statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### clock (user and privi exec modes)

Sets a device's system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device's clock is set without resetting the time zone, the time is displayed relative to the UTC (Universal Time Coordinated) - Greenwich Time. To display time in the local time zone format, in the device's configuration mode, use the `timezone` command. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see [timezone](#).

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

### Parameters

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clock set        | Sets a device's software system clock                                                                                                                                                               |
| <HH:MM:SS>       | Sets the current time (in military format hours, minutes, and seconds)<br><br><b>Note:</b> By default, the WiNG software displays time in the 24-hour clock format. This setting cannot be changed. |
| <1-31>           | Sets the numerical day of the month                                                                                                                                                                 |
| <MONTH>          | Sets the month of the year (Jan to Dec)                                                                                                                                                             |
| <1993-2035>      | Sets a valid four digit year from 1993 - 2035                                                                                                                                                       |
| on <DEVICE-NAME> | Optional. Sets the clock on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul>        |

### Examples (User Exec Mode)

The following commands set the time zone and clock for the logged device:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#timezone America/Los_Angeles
nx9500-6C8809>clock set 11:24:30 21 Jan 2017
nx9500-6C8809>show clock
2017-01-21 12:14:14 PST
nx9500-6C8809>
```

Note, if the clock is set without resetting the time zone, the time displays as UTC time, as shown in the following example:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#no timezone
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#commit
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show clock
2017-01-21 19:15:55 UTC

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

### Examples (Privileged Exec Mode)

```
ap8432-070235(config-device-74-67-F7-07-02-35)#timezone America/Los_Angeles
ap8432-070235#clock set 12:51:10 21 Dec 2017
ap8432-070235#show clock
2017-12-21 04:52:06 PST
ap8432-070235#
```

## cluster (user and privi exec modes)

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member. Commands executed under this context are executed on all members of the cluster.

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
cluster start-election
```

### Parameters

```
cluster start-election
```

|                |                                      |
|----------------|--------------------------------------|
| start-election | Starts a new cluster master election |
|----------------|--------------------------------------|

### Examples (User Exec Mode)

```
nx9500-6C8809>cluster start-election
nx9500-6C8809>
```

### Examples (Privi Exec Mode)

```
rfs4000-229D58#cluster start-election
rfs4000-229D58#
```

### Related Commands

|                                                                       |                                                                                                    |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">create-cluster (user and privi exec modes)</a> on page 47 | Creates a new cluster on the specified device                                                      |
| <a href="#">join-cluster (user and privi exec modes)</a> on page 77   | Adds a wireless controller or service platform, as a member, to an existing cluster of controllers |

## configure

Enters the configuration mode. Use this command to enter the current device's configuration mode, or enable configuration from the terminal.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
configure {self|terminal}
```

## Parameters

configure {self|terminal}

|          |                                                             |
|----------|-------------------------------------------------------------|
| self     | Optional. Enables the logged-in device's configuration mode |
| terminal | Optional. Enables configuration from the terminal           |

## Examples

```
nx9500-6C8809#configure self
Enter configuration commands, one per line. End with CNTL/Z.
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
NOC-NX9500#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
NOC-NX9500(config)#
```

*connect (user and privi exec modes)*

Begins a console connection to a remote device using the remote device's MiNT ID or name

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

## Parameters

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

|                      |                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mint-id <MINT-ID>    | Connects to the remote system using its MiNT ID <ul style="list-style-type: none"><li>• &lt;MINT-ID&gt; - Specify the remote device's MiNT ID.</li></ul>      |
| <REMOTE-DEVICE-NAME> | Connects to the remote system using its name <ul style="list-style-type: none"><li>• &lt;REMOTE-DEVICE-NAME&gt; - Specify the remote device's name.</li></ul> |

## Examples (User Exec Mode)

```
NOC-NX9500>show mint lsp-db
5 LSPs in LSP-db of 19.6C.88.09:
LSP 19.6C.88.09 at level 1, hostname "NOC-NX9500", 2 adjacencies, seqnum 1518782
LSP 19.6D.B5.D4 at level 1, hostname "RFS6K-SITE2-VLAN192", 2 adjacencies, seqnum 1971569
LSP 19.74.B4.5C at level 1, hostname "ap8132-74B45C", 1 adjacencies, seqnum 1741167
LSP 4D.83.30.A4 at level 1, hostname "ap7522-8330A4", 1 adjacencies, seqnum 518868
LSP 70.38.06.49 at level 1, hostname "RFS6K-SITE1-VLAN20", 2 adjacencies, seqnum 1389974

```

### copy

Copies a file (config,log,txt...etc) from any location to the Access Point, wireless controller, or service platform and vice-versa

#### Note

Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config. Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is better to erase the existing start-up config file and then copy the new config file to the startup config.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

#### Parameters

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

|                    |                                                |
|--------------------|------------------------------------------------|
| <SOURCE-FILE>      | Specify the source file to copy.               |
| <SOURCE-URL>       | Specify the source file's location (URL).      |
| <DESTINATION-FILE> | Specify the destination file to copy to.       |
| <DESTINATION-URL>  | Specify the destination file's location (URL). |

## Examples

Transferring file snmpd.log to remote TFTP server.

```
rfs4000-229D58#copy flash:/log/snmpd.log tftp://10.233.89.183:/snmpd.log
Accessing running-config file from remote TFTP server into switch running-config.
rfs4000-229D58#copy tftp://10.233.89.183:/running-config running-config
```

*cpe (privilege-exec-mode)*

Enables a WiNG controller to perform certain operations on CPEs (Customer Premises Equipments) through an adopted T5 controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL (Digital Subscriber Line) as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

### Supported in the following platforms:

- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
cpe [boot|reload|upgrade]
cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}
cpe [reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

#### Note

These commands can also be executed on the T5 profile and device context. For more information, see [T5 Profile Config Commands](#) on page 1285.

### Parameters

```
cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}
```

|                     |                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cpe boot system     | Changes the image used by a CPE to boot. When reloading, the CPE uses the specified image.                                                                                                                                                     |
| cpe [<1-24> all]    | Identifies the CPE(s) on which this change is implemented <ul style="list-style-type: none"><li>• &lt;1-24&gt; - Reloads only those CPEs whose IDs have been specified. Specify the ID from 1 - 24.</li><li>• all - Reloads all CPEs</li></ul> |
| [primary secondary] | Select the next boot image <ul style="list-style-type: none"><li>• primary - Uses the primary image when reloading</li><li>• secondary - Uses the secondary image when reloading</li></ul>                                                     |
| on <T5-DEVICE-NAME> | Optional. Performs this operation on a specified T5 device <ul style="list-style-type: none"><li>• &lt;T5-DEVICE-NAME&gt; - Specify the T5 device's hostname.</li></ul>                                                                        |

```
cpe [reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| on <T5-DEVICE-NAME>                       | <p>Optional. Performs this operation on a specified T5 device</p> <ul style="list-style-type: none"> <li>• &lt;T5-DEVICE-NAME&gt; - Specify the T5 device's hostname.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Example

```
nx9500-6C8809#show t5 cpe boot on t5-ED7C6C
```

```

 DEVICE PRIMARY VERSION SECONDARY VERSION NEXT BOOT UPGRADE STATUS UPGRADE
 PROGRESS %

 cpe1 5.4.2.0-010R 5.4.2.0-006B primary none 0
 cpe2 5.4.2.0-010R 5.4.2.0-006B primary none 0

```

```
nx9500-6C8809#
nx9500-6C8809#cpe boot system cpe 1 secondary on t5-ED7C6C
Updated T5 CPE system boot partition
nx9500-6C8809#
```

### *create-cluster (user and privi exec modes)*

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

#### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

#### Parameters

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

|                     |                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create-cluster      | Creates a cluster                                                                                                                                                                                                                                                            |
| name <CLUSTER-NAME> | Configures the cluster name <ul style="list-style-type: none"><li>• &lt;CLUSTER-NAME&gt; - Specify a cluster name. Define a name for the cluster that uniquely identifies its configuration or profile support requirements. The name cannot exceed 64 characters.</li></ul> |
| ip <IP>             | Specifies the device's IP address used for cluster creation <ul style="list-style-type: none"><li>• &lt;IP&gt; - Specify the device's IP address in the A.B.C.D format.</li></ul>                                                                                            |
| level [1 2]         | Optional. Configures the routing level for this cluster <ul style="list-style-type: none"><li>• 1 - Configures level 1 (local) routing</li><li>• 2 - Configures level 2 (inter-site) routing</li></ul>                                                                       |

|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">cluster (user and privi exec modes)</a> on page 46      | Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member. |
| <a href="#">join-cluster (user and privi exec modes)</a> on page 77 | Adds a wireless controller or service platform, as a member, to an existing cluster of controllers                                   |

#### *crypto (user and privi exec modes)*

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate *Certificate Signing Request (CSR)*.

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

---

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background/on/passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
{background/passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background/on/passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background/passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
crypto pki [authenticate|export|generate|import|zeroize]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background} {(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]
crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
[autogen-subject-name|subject-name]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name [<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-
key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION>
<ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background/passphrase <KEY-
PASSPHRASE> background}
{(on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address
<IP>,
on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION>
<ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {(on
<DEVICE-NAME>)}
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background/passphrase
<KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

## Parameters

```
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background/passphrase <KEY-
PASSPHRASE> background} {(on <DEVICE-NAME>)}
```

|                               |                                                                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key                           | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.                                                                                                                                                |
| export rsa <RSA-KEYPAIR-NAME> | Exports an existing RSA Keypair to a specified destination <ul style="list-style-type: none"> <li>&lt;RSA-KEYPAIR-NAME&gt; - Specify the RSA Keypair name.</li> </ul>                                                                             |
| <EXPORT-TO-URL>               | Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported. After specifying the destination address (where the RSA Keypair is exported), configure one of the following parameters: background or passphrase. |
| background                    | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.                                                                     |

|                                           |                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| passphrase <KEY-PASSPHRASE><br>background | Optional. Encrypts RSA Keypair before exporting <ul style="list-style-type: none"> <li>• &lt;KEY-PASSPHRASE&gt; – Specify a passphrase to encrypt the RSA Keypair.</li> <li>• background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.</li> </ul> |
| on <DEVICE-NAME>                          | The following parameter is recursive and common to all of the above parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Performs export operation on a specified device</li> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                      |

```
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
```

```
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}
```

|                                        |                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pki                                    | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.                                                                                                                                                        |
| zeroize trustpoint <TRUSTPOINT-NAME>   | Imports certificates, <i>Certificate Revocation List</i> (CRL), or a trustpoint to the selected device                                                                                                                                                                                        |
| [certificate crl]<br><TRUSTPOINT-NAME> | Deletes a trustpoint and its associated CA certificate, server certificate, and private key <ul style="list-style-type: none"> <li>• &lt;TRUSTPOINT-NAME&gt; – Specify the trustpoint name (should be authenticated).</li> </ul>                                                              |
| del-key                                | Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.                                                                                                                                                               |
| on <DEVICE-NAME>                       | The following parameter is recursive and optional: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Deletes the trustpoint on a specified device</li> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

### Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:

```
tftp://<hostname|IPv4>[:port]/path/file
```

```
ftp://<user>:<passwd>@<hostname|IPv4>[:port]/path/file
```

```
sftp://<user>@<hostname|IPv4>[:port]/path/file
```

```
http://<hostname|IPv4>[:port]/path/file
```

```
cf:/path/file usb<n>:/path/file
```

- IPv6 URLs:

```
tftp://<hostname|IPv6>[:port]/path/file
```

```
ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
```

```
sftp://<user>@<hostname|IPv6>[:port]/path/file
```

```
http://<hostname|IPv6>[:port]/path/file
```

### Examples (User Exec Mode)

```
rfs4000-229D58>crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs4000-229D58>
rfs4000-229D58>crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs4000-229D58>
rfs4000-229D58>crypto pki generate self-signed word generate-rsa-key word autogen-subject-
name fqdn word
Successfully generated self-signed certificate
rfs4000-229D58>
rfs4000-229D58>crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs4000-229D58>
rfs4000-229D58>crypto pki authenticate word url background
Import of CA certificate started in background
rfs4000-229D58>
rfs4000-229D58>crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs4000-229D58>
```

### Examples (Privi Exec Mode)

```
NOC-NX9500#crypto key generate rsa key 2048
RSA key size > 2048. Key generation started in background.
NOC-NX9500#c
```

|---------------------------------------------|----------------------------------------------------------------------------|
| <code>no (user exec mode)</code> on page 83 | Removes server certificates, trustpoints and their associated certificates |
|---------------------------------------------|----------------------------------------------------------------------------|

### *crypto-cmp-cert-policy (user and privi exec modes)*

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

### Parameters

```
crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}
```

```
crypto-cmp-cert-update
<TRUSTPOINT-NAME> on
<DEVICE-NAME>
```

Triggers a CMP certificate update on a specified device or devices

- <TRUSTPOINT-NAME> - Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context mode to configure the trustpoint.
- on <DEVICE-NAME> - Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.  
    <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.

### Example (User Exec Mode)

```
rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
```

### Example (Privi Exec Mode)

```
NOC-NX9500#crypto-cmp-cert-update test on NOC-NX9500
CMP Cert update success
NOC-NX9500#
```

*database (user and privi exec modes)*

Enables automatic repairing (vacuuming) and dropping of captive-portal and NSight databases

If enforcing authenticated access to the database, use this command to generate the keyfile. Every keyfile has a set of associated users having a username and password. Access to the database is allowed only if the user credentials entered during database login are valid. For more information on enabling database authentication, see [Enabling Database Authentication](#).

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
database [drop|keyfile|repair]
database drop [all|captive-portal|nsight]
database repair {on <DEVICE-NAME>}
database keyfile [export|generate|import|zerzoise]
database keyfile generate
database keyfile [export|import] <URL>
database keyfile zerzoise
```

### Parameters

```
database drop [all|captive-portal|nsight]
```

database drop [all|captive-portal|nsight]

Drops (deletes) all or a specified database. Execute the command on the database.

- all – Drops all databases, captive portal and NSight
- captive-portal – Drops the captive-portal database
- nsight – Drops the NSight database

database repair {on <DEVICE-NAME>}

database repair on <DEVICE-NAME>

Enables automatic repairing of all databases. Repairing (vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements. Execute the command on the database host.

- on <DEVICE-NAME> – Optional. Specifies the name of the database host. When specified, databases on the specified host are periodically checked to identify and remove obsolete data documents.
- <DEVICE-NAME> – Specify the name of the access point, wireless controller, or service platform.

**Note:** If no device is specified, the system repairs all databases.

database keyfile generate

database keyfile generate

Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to generate database keyfiles. After generating the keyfile, create the username and password combination required to access the database. For information on creating database users see, [service](#) on page 647. For information on enabling database authentication, see [Enabling Database Authentication](#).

- generate – Generates the keyfile. In case of a replica-set deployment, execute the command on the primary database host. Once generated, export the keyfile to a specified location from where it is imported on to the replica-set hosts.

database keyfile [export|import] <URL>

database keyfile [export|import] <URL>

Enables database keyfile management. This command is part of a set of configurations required to enforce database authentication. Use this command to exchange keyfiles between replica set members.

- export – Exports the keyfile to a specified location on an FTP/SFTP/TFTP server. Execute the command on the database host on which the keyfile has been generated.
- import – Imports the keyfile from a specified location. Execute the command on the replica set members.

The following parameter is common to both of the above keywords:

- <URL> – Specify the location to/from where the keyfile is to be exported/imported. Use one of the following options to specify the keyfile location:

ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file

sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file

tftp://<hostname|IP>[:port]/path/file

database keyfile zerzoise

database keyfile zerzoise

Enables database keyfile management. Use this command to delete keyfiles

- zerzoise – Deletes an existing keyfile.

### Example (User Exec Mode)

```
nx9500-6C8809nx9500-6C8809>database repair on nx9500-6C8809
nx9500-6C8809>
nx9500-6C8809>database keyfile generate
Database keyfile successfully generated
nx9500-6C8809nx9500-6C8809>
nx9500-6C8809>database keyfile zeroize
Database keyfile successfully removed
nx9500-6C8809nx9500-6C8809>
```

### Example (Privl Exec Mode)

```
vx9000-1A1809#database keyfile generate
Database keyfile successfully generated
vx9000-1A1809#
vx9000-1A1809#database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
vx9000-1A1809#
vx9000-D031F2#database keyfile import ftp://1.1.1.111/db-key
Database keyfile successfully imported
vx9000-D031F2#
```

### Example: Enabling Database Authentication

Follow the steps below to enable database authentication.

- 1 On the primary database host,
  - a Generate the database keyfile.

```
Primary-DB-HOST>database keyfile generate
Database keyfile successfully generated
Primary-DB-HOST>
```
  - b Use the **show > database > keyfile** command to view the generated keyfile.

- c Export the keyfile to an external location. This is required only in case of database replica-set deployment.
- ```
Primary-DB-HOST>database keyfile export ftp://1.1.1.111/db-key
Database keyfile successfully exported
Primary-DB-HOST>
```
- d Create the users that are allowed access to the database.
- ```
Primary-DB-HOST#service database authentication create-user username techpubs
password techPubs@123
Database user [techpubs] created.
Primary-DB-HOST#
```
- e View the database user account created.
- ```
Primary-DB-HOST#show database users
-----
                DATABASE USER
-----
techpubs
-----
Primary-DB-HOST#
```
- 2 On the replica set host, import the keyfile from the location specified in Step 1 c.
- ```
Secondary-DB-HOST#database keyfile import ftp://1.1.1.111/db-key
```
- 3 In the database-policy context, --- (used on the NSight/EGuest database hosts)
- a Enable authentication.
- ```
Primary-DB-HOST(config-database-policy-techpubs)#authentication
```
- b Configure the user accounts created in Step 1 d.
- ```
Primary-DB-HOST(config-database-policy-techpubs)#authentication username techpubs
password S540QFZz9LzSOdX1ZJEqDgAAAy3b7Gty04Z/Ih2ruxn0Ynr
Primary-DB-HOST(config-database-policy-techpubs)#show context
database-policy techpubs
authentication
authentication username techpubs password 2 S540QFZz9LzSOdX1ZJEqDgAAAy3b7Gty04Z/
Ih2ruxn0Ynr
replica-set member nx7500-A02B91 arbiter
replica-set member vx9000-1A1809 priority 1
replica-set member vx9000-D031F2 priority 20
Primary-DB-HOST(config-database-policy-techpubs)#
```
- 4 In the database-client policy context --- (used on the NSight/EGuest server host), Note, this configuration is required only if the NSight/EGuest server and database are hosted on separate hosts.
- a Configure the user credentials created in Step 1 d.
- ```
NOC-Controller(config-database-client-policy-techpubs)#authentication username
techpubs password S540QFZz9LzSOdX1ZJEqDgAAAy3b7Gty04Z/Ih2ruxn0Ynr
```
- b View the configuration.
- ```
NOC-Controller(config-database-client-policy-techpubs)#show context
database-client-policy techpubs
authentication username techpubs password 2 S540QFZz9LzSOdX1ZJEqDgAAAy3b7Gty04Z/
Ih2ruxn0Ynr
NOC-Controller(config-database-client-policy-techpubs)#
```

### database-backup (user and privi exec modes)

Backs up captive-portal and/or NSight database to a specified location and file on an FTP, SFTP, or TFTP server. Execute this command on the database host.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
database-backup database [captive-portal|nsight|nsight-placement-info] <URL>
database-backup database [captive-portal|nsight] <URL>
database-backup database nsight-placement-info <URL>
```

### Parameters

```
database-backup database [captive-portal|nsight] <URL>
```

|                                                  |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-backup database [captive-portal nsight] | Backs up captive portal and/or NSight database to a specified location. Select the database to backup: <ul style="list-style-type: none"> <li>• captive-portal - Backs up captive portal database</li> <li>• nsight - Backs up NSight database After specifying the database type, configure the destination location.</li> </ul> |

|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <a href="#">database (user and privi exec modes)</a> on page 59         | Enables automatic repairing (vacuuming) and dropping of databases (captive-portal and/or NSight) |
| <a href="#">database-restore (user and privi exec modes)</a> on page 64 | Restores a previously exported (backed up) database (captive-portal and/or NSight)]              |

### *database-restore (user and privi exec modes)*

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
database-restore database [captive-portal|nsight] <URL>
```

### Parameters

```
database-restore database [captive-portal|nsight] <URL>
```

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-restore database [captive-portal  nsight] | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type: <ul style="list-style-type: none"> <li>• captive-portal – Restores captive portal database</li> <li>• nsight – Restores NSight database</li> </ul> After specifying the database type, configure the destination location and file name from where the files are restored. |
| <URL>                                              | Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats:<br>ftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz<br>sftp://<user>:<passwd>@<hostname IP>[:port]/path/file.tar.gz<br>tftp://<hostname IP>[:port]/path/file.tar.gz                                                   |

### Example (User Exec Mode)

```
nx9500-6C8809>database-restore database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

### Example (Privi Exec Mode)

```
nx9500-6C874D#database-restore database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

| database-backup (user and privi exec modes) on page 63 | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server |

### *device-upgrade (user and privi exec modes)*

Enables firmware upgrade on an adopted device or a set of adopted devices (Access Points, wireless controllers, and service platforms)

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

In an HM (hierarchically managed) network, this command enables centralized device upgradation across the network.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single NOC (Network Operations Center) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy respectively. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

#### Note

Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.

Use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain.

#### Note

If the persist-images option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the 'persist-images' option), see [device-upgrade](#) on page 981.

#### Note

A NOC controller's capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – NX 95XX, NX 96XX, VX 9000
- Site controller – RFS 4000, NX 5500, or NX 75XX

#### Note

Standalone devices have to be manually upgraded.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## delete

Deletes a specified file from the device's file system

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

### Parameters

```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

|            |                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------|
| /force     | Forces deletion without a prompt                                                                                                     |
| /recursive | Performs a recursive delete                                                                                                          |
| <FILE>     | Specifies the file name <ul style="list-style-type: none"> <li>• Deletes the file specified by the &lt;FILE&gt; parameter</li> </ul> |

### Examples

```

rfs4000-229D58#delete flash:/out.tar flash:/out.tar.gz
Delete flash:/out.tar [y/n]? y
Delete flash:/out.tar.gz [y/n]? y
rfs4000-229D58
rfs4000-229D58#delete /force flash:/tmp.txt
rfs4000-229D58#
rfs4000-229D58#delete /recursive flash:/backup/
Delete flash:/backup//fileMgmt_350_180B.core
[y/n]? y
Delete flash:/backup//fileMgmt_350_18212X.core_bk
[y/n]? n
Delete flash:/backup//imish_1087_18381X.core.gz

```

```
[y/n]? n
rfs4000-229D58
```

## *diff*

Displays the differences between two files on a device's file system or a particular URL

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
diff [<FILE>|<URL>] [<FILE>|<URL>]
```

### Parameters

```
diff [<FILE>|<URL>] [<FILE>|<URL>]
```

|                                                                                                            |
|------------------------------------------------------------------------------------------------------------|
| <FILE> The first <FILE> is the source file for the diff command. The second <FILE> is used for comparison. |
| <URL> The first <URL> is the source file's URL. The second <URL> is the second file's URL.                 |

### Examples

```
nx9500-6C8809#diff startup-config running-config

## *dir*

Lists files on a device's file system

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
dir {/all//recursive|<DIR>|all-filestems}
```

## Parameters

```
dir {/all//recursive|<DIR>|all-filestems}
```

|               |                                              |
|---------------|----------------------------------------------|
| /all          | Optional. Lists all files                    |
| /recursive    | Optional. Lists files recursively            |
| <DIR>         | Optional. Lists files in the named file path |
| all-filestems | Optional. Lists files on all file systems    |

## Examples

```
nx9500-6C8809#dir flash:/
```

```
Directory of flash:/
```

```

## *disable*

Turns off (disables) the privileged mode command set. This command returns to the User Executable mode.

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
disable
```

### **Parameters**

None

### **Examples**

```
nx9500-6C8809#disable
nx9500-6C8809>
```

## *edit*

Edits a text file on the device's file system

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
edit <FILE>
```

### **Parameters**

```
edit <FILE>
```

|        |                                         |
|--------|-----------------------------------------|
| <FILE> | Specify the name of the file to modify. |
|--------|-----------------------------------------|

### **Examples**

```
nx9500-6C8809#edit startup-config
GNU nano 1.2.4 File: startup-config

## enable

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
enable
```

### Parameters

None

### Examples

```

nx9500-6C8809#enable
nx9500-6C8809#

```

## erase

Erases a device's (wireless controller, Access Point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

erase [flash:|nvram:|startup-config|usb1:|usb2:|usb3:|usb4:]
erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]
erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|
exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}

```

## Parameters

erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]

|                |                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| flash:         | Erases everything in the device's flash: file                                                                                   |
| nvram:         | Erases everything in the device's nvram: file                                                                                   |
| startup-config | Erases the device's startup configuration file. The startup configuration file is used to configure the device when it reboots. |
| usb1:          | Erases everything in the device's usb1: file                                                                                    |
| usb2:          | Erases everything in the device's usb2: file                                                                                    |
| usb3:          | Erases everything in the device's usb3: file                                                                                    |
| usb4:          | Erases everything in the device's usb4: file                                                                                    |

erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}

|                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| startup-config:                                                                                               | Erases the startup configuration file on a specified device or devices in a specified RF Domain. The specified device(s) are reloaded after the startup configuration file is erased. Use the <b>&lt;HOSTNAME/MAC&gt;</b> or <b>on &lt;DOMAIN-NAME&gt;</b> options to identify the device or RF Domain respectively. Once executed, the configuration file, for the targeted device or for all device(s) in the targeted RF Domain, is also erased from the adopting controller's configuration file. They are automatically reloaded once the startup configuration file has been erased.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <HOSTNAME/MAC>                                                                                                | Optional. Erases the startup configuration file on the device identified by the <HOSTNAME/MAC> keyword. Specify the device's hostname or MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| on <DOMAIN-NAME> {containing <SUB-STRING> exclude-controllers exclude-rf-domain-manager filter <DEVICE-TYPE>} | <p>Optional. Erases the startup configuration file on all devices or specified device(s) in a specified RF Domain</p> <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; - Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are: <ul style="list-style-type: none"> <li>• containing &lt;SUB-STRING&gt; - Optional. Executes the command on all devices containing a specified sub-string in their hostname <ul style="list-style-type: none"> <li>&lt;SUB-STRING&gt; - Specify the sub-string to match. The startup configuration file is erased on all devices whose hostname contains the sub-string specified here.</li> </ul> </li> <li>• exclude-controllers - Optional. Executes the command on all devices excluding controllers. The startup configuration file is erased on all devices except controllers.</li> <li>• exclude-rf-domain-manager - Optional. Executes the command on all devices excluding RF Domain managers. The startup configuration file is erased on all devices except RF Domain managers.</li> <li>• filter &lt;DEVICE-TYPE&gt; - Optional. Executes the command on all devices of a specified type. <ul style="list-style-type: none"> <li>&lt;DEVICE-TYPE&gt; - Specify the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 7500, NX 95XX, NX 96XX, and VX 9000. The startup configuration file is erased on all devices of the type specified here. For example, if AP7602 is the device-type specified, the startup configuration file on all AP7602, within the RF Domain, is erased.</li> </ul> </li> </ul> </li> </ul> |

## Examples

```
nx9500-6C8809#erase ?
cf: Erase everything in cf:
flash: Erase everything in flash:
nvram: Erase everything in nvram:
startup-config Reset configuration to factory default
usb1: Erase everything in usb1:
usb2: Erase everything in usb2:
nx9500-6C8809#
```

### *exit (privi exec mode)*

Ends the current CLI session and closes the session window

For more information, see [exit](#).

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6532, AP 6562, AP 7502, AP 7522, AP 7532, AP 7161, AP 81XX, AP 8232
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 7500, NX 9500, NX 9510

### **Syntax**

```
exit
```

### **Parameters**

None

### **Examples**

```
<exsw1>#exit
```

### *ex3500*

Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP-related configurations.

The copy keyword provides multiple copy options. It allows you to upload or download code images or configuration files between the switch's flash memory and an FTP/TFTP server. When you save the system code or configuration settings to a file on an FTP/TFTP server, that file can later be downloaded to the switch to restore system operation. The success of the file transfer depends on the accessibility of the FTP/TFTP server and the quality of the network connection.

### **Supported in the following platforms:**

- Service Platforms — NX 95XX, NX 96XX, VX 9000

## Syntax

```
ex3500 [adoptd|boot|copy|delete|ip]
ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>
ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [file|ftp|running-config|startup-config|tftp|unit]
ex3500 copy [file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>]
ex3500 copy [ftp|tftp] [add-to-running-config|file|https-certificate|public-key|
running-config|startup-config]
ex3500 copy [ftp|tftp] add-to-running-config <FTP/TFTP-SERVER-IP> <USER-NAME>
<PASSWORD> <SOURCE-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] file <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2]
<SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] https-certificate <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>
<SOURCE-CERT-FILE-NAME> <SOURCE-PVT-KEY-FILE-NAME> <PVT-PASS-WORD> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] public-key <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> [1|2]
<SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [ftp|tftp] [running-config|startup-config] <FTP/TFTP-SERVER-IP> <USER-NAME>
<PASSWORD>
<SOURCE-CONFIG-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy running-config [file <DEST-FILE-NAME>|ftp <FTP-SERVER-IP> <USER-NAME>
<PASSWORD>
<DEST-FILE-NAME>|startup-config|tftp <TFTP-SERVER-IP> <DEST-FILE-NAME>] on <EX3500-DEVICE-
NAME>
ex3500 copy startup-config [file <DEST-FILE-NAME>|ftp <FTP-SERVER-IP> <USER-NAME>
<PASSWORD>
<DEST-FILE-NAME>|running-config|tftp <TFTP-SERVER-IP> <DEST-FILE-NAME>] on <EX3500-DEVICE-
NAME>
ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-
NAME>
ex3500 delete [file|public-key]
ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>] on <EX3500-DEVICE-NAME>
ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh [crypto|save]
ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh crypto zeroize [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME>
```

## Parameters

```
ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>
```

|                         |                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 adoptd upgrade   | Upgrades an adopted EX3500 switch After an upgrade, reboot the EX3500 switch to initiate the new image.<br><br><b>Note:</b> To view an EX3500's current image version, use the <b>show &gt; version &gt; on &lt;EX3500-DEVICE-NAME&gt;</b> command. |
| <URL>                   | Specifies the location and image file name in the following format: tftp://<IP>[/path]/file                                                                                                                                                         |
| on <EX3500-DEVICE-NAME> | Executes the command on a specified EX3500 switch <ul style="list-style-type: none"><li>&lt;EX3500-DEVICE-NAME&gt; - Specify the EX3500 switch's hostname.</li></ul>                                                                                |

```
ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>
```

|                    |                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 boot system | Boots a EX3500 switch using a specified configuration file                                                                                                                     |
| <1-1>              | Identifies the EX3500 unit by its ID number. Specify the EX3500 ID from 1 - 1.<br><br><b>Note:</b> As of now only one (1) EX3500 unit can be managed through a NOC controller. |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (config opcode) <FILE-NAME> | <p>The following keywords are recursive: Specifies the image file to use for booting. The options are:</p> <ul style="list-style-type: none"> <li>• config - Uses the configuration file to boot the switch</li> <li>• opcode - Uses the <i>Operation Code</i> (opcode), which is the runtime code, to boot the switch. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device.</li> </ul> <p>The following parameter is common to the 'config' and opcode' keywords:</p> <ul style="list-style-type: none"> <li>• &lt;FILE-NAME&gt; - Specify the configuration/runtime-code file name.</li> </ul> |
| on <EX3500-DEVICE-NAME>     | <p>Reloads a specified EX3500 switch</p> <ul style="list-style-type: none"> <li>• &lt;EX3500-DEVICE-NAME&gt; - Specify the EX3500 switch's hostname. ### Usage Guidelines

When using the ex3500 command and its parameters, keep in mind the following:

- Destination file names should not:
  - Contain slashes (\ or /),
  - Exceed 32 characters for files on the switch, or 127 characters for files on the server.
- The FTP server's default user name is set as "anonymous".
- The Boot ROM and Loader cannot be uploaded or downloaded from the FTP/TFTP server. Follow instructions provided in the release notes for new firmware, or contact your distributor for help.
- The "Factory\_Default\_Configure" can be used as the source to copy from, but cannot be used as the destination.
- Although the switch supports only two operation code files, the maximum number of user-defined configuration files supported is 16.

### Example

```

nx9500-6C8809#ex3500 adopted upgrade tftp://192.168.0.99/ex3500-adopted-5.8.5.0.img on
ex3524-ED5EAC
Flash programming started
Flash programming completed
Successful
nx9500-6C8809#
nx9500-6C8809#ex3500 copy tftp file 10.2.0.100 1 m360.bix m360.bix on ex3524-ED5EAC
\Write to FLASH Programming.
```

```

-Write to FLASH finish.
Success.
nx9500-6C8809#
nx9500-6C8809#ex3500 copy tftp startup-config 10.2.0.99 startup.01 startup on ex3524-ED5EAC
TFTP server ip address: 10.1.0.99
Flash programming started.

```

## factory-reset

Erases startup configuration on a specified device or all devices within a specified RF Domain

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

factory-reset [<HOSTNAME/MAC>|config-all|config-device-only|on <RF-DOMAIN-NAME>]
factory-reset <HOSTNAME/MAC> {<HOSTNAME/MAC>}
factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING>/exclude-controllers/
exclude-rf-domain-manager/filter <DEVICE-TYPE>}
factory-reset [config-all|config-device-only] [<HOSTNAME/MAC> {<HOSTNAME/MAC>}|on <RF-
DOMAIN-NAME>
{containing <SUB-STRING>/exclude-controllers/exclude-rf-domain-manager/filter <DEVICE-
TYPE>}]

```

### Parameters

```
factory-reset <HOSTNAME/MAC> {<HOSTNAME/MAC>}
```

|                                    |                                                                                                                                                                                                                                                |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| factory-reset                      | Erases startup configuration and reloads device(s) based on the parameters passed<br>For more information on the actions performed by this command, see <a href="#">Actions performed by the factory-reset command</a> .                       |

Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.</li> <li>exclude-rf-domain-manager - Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager.</li> <li>filter &lt;DEVICE-TYPE&gt; - Optional. Executes the command on all devices of a specified type <ul style="list-style-type: none"> <li>&lt;DEVICE-TYPE&gt; - Specify the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 75XX, NX 95XX, NX 96XX, and VX 9000.</li> </ul> </li> </ul> |

### Usage Guidelines (Actions performed by the factory-reset command)

The action taken by this command depends on the parameters passed.

- For the **factory-reset** [**<DEVICE-NAME>** | **on <RF-DOMAIN-NAME>**] options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller's configuration for the target device (or) for all the devices in the target RF Domain.
  - Reloads the target device (or) all devices in the target RF Domain.
- For the **factory-reset config-all** [**<DEVICE-NAME>** | **on <RF-DOMAIN-NAME>**] options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller's configuration for the target device (or) for all the devices in the target RF Domain.
- For the **factory-reset config-device-only** [**<DEVICE-NAME>** | **on <RF-DOMAIN-NAME>**] options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.

## Example

```
nx7500-7F3609#factory-reset config-all ap6522-5A873C
In progress
Erased startup-config - success 1 fail 0
Successful device deletion - total 1
nx7500-7F3609#
rfs4000-6DB5D4# factory-reset B4-C7-99-5A-87-3C
In progress
Erased startup-config and initiated reload - success 1 fail 0
Successful device deletion - total 1
rfs4000-6DB5D4#
```

### *file-sync (user and privi exec modes)*

Syncs trustpoint and/or EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adopted access points.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point is configured to use EAP-TLS authentication.
- Execute the command on the controller adopting the access points.
- Ensure that the X.509 certificate file is installed on the controller.

Syncing of trustpoint/wireless-bridge certificate can be automated. To automate file syncing, in the controller's device/profile configuration mode, execute the following command: **file-sync [auto|count <1-20>]**. For more information, see [file-sync](#) on page 999.

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
file-sync [cancel|load-file|trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge]
file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
file-sync load-file [trustpoint|wireless-bridge]
file-sync load-file [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] <URL>
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]] {from-controller} {reset-radio/upload-time <TIME>}
```

### Parameters

```
file-sync cancel [trustpoint|wireless-bridge] [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
```

```
file-sync cancel [trustpoint|
wireless-bridge] [<DEVICE-
NAME>|all|rf-domain
[<DOMAIN-NAME>|all]]
```

Cancels scheduled file synchronization

- trustpoint – Cancels scheduled trustpoint synchronization on a specified AP, all APs, or APs within a specified RF Domain
- wireless-bridge – Cancels scheduled wireless-bridge certificate synchronization on a specified AP, all APs, or APs within a specified RF Domain
  - <DEVICE-NAME> – Cancels scheduled trustpoint/certificate synchronization on a specified AP. Specify the AP's hostname or MAC address.
  - all – Cancels scheduled trustpoint/certificate synchronization on all APs
  - rf-domain [<DOMAIN-NAME>|all] – Cancels scheduled trustpoint/certificate synchronization on all APs in a specified RF Domain or in all RF Domains
    - <DOMAIN-NAME> – Cancels scheduled trustpoint/certificate synchronization on all APs within a specified RF Domain. Specify the RF Domain's name.
    - all – Cancels scheduled trustpoint/certificate synchronization on all RF Domains

```
file-sync load-file [trustpoint|wireless-bridge] <URL>
```

```
file-sync load-file [trustpoint|
wireless-bridge] <URL>
```

Loads the following files on to the staging controller:

- trustpoint – Loads the trustpoint, including CA certificate, server certificate and private key
- wireless-bridge – Loads the wireless-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.
- <URL> – Provide the trustpoint/certificate location using one of the following formats:

```
tftp://<hostname|IP>[:port]/path/file
```

```
ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
```

```
sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
```

```
http://<hostname|IP>[:port]/path/file
```

**Note:** Both IPv4 and IPv6 address types are supported.

```
cf:/path/file
```

```
usb<n>:/path/file
```

```
file-sync [trustpoint <TRUSTPOINT-NAME>|wireless-bridge] [<DEVICE-NAME>|
all|rf-domain [<DOMAIN-NAME>|all]] {from-controller} {reset-radio|upload-time <TIME>}
```

|                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

If no time is configured, the process is initiated as soon as the command is executed.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Example (User Exec Mode)

```
NOC-NX9500>file-sync wireless-bridge ap7161-11E6C4 upload-time 06/01/2018-12:30
```

| CONTROLLER        | STATUS  | MESSAGE                |
|-------------------|---------|------------------------|
| B4-C7-99-6C-88-09 | Success | Queued 1 APs to upload |

```
NOC-NX9500>
```

The following command uploads certificate to all access points:

```
NOC-NX9500>file-sync wireless-bridge all upload-time 06/01/2018-23:42
```

### Example (Privi Exec Mode)

```
rfs4000-6DB5D4#file-sync wireless-bridge ap7161-11E6C4 upload-time 06/01/2018-12:30
```

| CONTROLLER        | STATUS  | MESSAGE                |
|-------------------|---------|------------------------|
| B4-C7-99-6D-B5-D4 | Success | Queued 1 APs to upload |

```
rfs4000-6DB5D4#
```

The following command uploads certificate to all access points:

```
rfs4000-6DB5D4#file-sync wireless-bridge all upload-time 06/01/2018-23:42
```

## halt

Stops (halts) a device (Access Point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
halt force {on <DEVICE-NAME>}
```

### Parameters

```
halt force {on <DEVICE-NAME>}
```

|                                                                                                                                                                                                                                                                               |                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| halt                                                                                                                                                                                                                                                                          | Halts a device                                                                                                                               |
| force                                                                                                                                                                                                                                                                         | Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes, etc. |
| The following keywords are recursive and applicable to the 'force' parameter:                                                                                                                                                                                                 |                                                                                                                                              |
| <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; - Optional. Specifies the name of the device to be halted<ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Enter the name of the AP, wireless controller, or service platform.</li></ul></li></ul> |                                                                                                                                              |
| <b>Note:</b> If the device name is not specified, the logged device is halted.                                                                                                                                                                                                |                                                                                                                                              |

### Example

```
nx9500-6C8809#halt on rfs4000-229D58
nx9500-6C8809#
```

## join-cluster (user and privi exec modes)

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster. Note, a cluster can be only formed of devices of the same model type.

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

## Parameters

```
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

|                       |                                                                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| join-cluster          | Adds a access point wireless controller, or service platform to an existing cluster                                                                                                                  |
| <IP>                  | Specify the cluster member's IP address.                                                                                                                                                             |
| user <USERNAME>       | Specify a user account with super user privileges on the new cluster member                                                                                                                          |
| password <WORD>       | Specify password for the account specified in the user parameter                                                                                                                                     |
| level [1 2]           | Optional. Configures the routing level <ul style="list-style-type: none"><li>• 1 – Configures level 1 routing</li><li>• 2 – Configures level 2 routing</li></ul>                                     |
| mode [active standby] | Optional. Configures the cluster mode <ul style="list-style-type: none"><li>• active – Configures this cluster as active</li><li>• standby – Configures this cluster to be on standby mode</li></ul> |

## Usage Guidelines

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding a device to a cluster, execute the "write memory" command to ensure the configuration persists across reboots.

## Examples (User Exec Mode)

```
rfs4000-229D58>join-cluster 192.168.13.15 user admin password superuser level 1
mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes

### *l2tpv3 (user and privi exec modes)*

Establishes or brings down a *Layer 2 Tunnel Protocol Version 3* (L2TPV3) tunnel

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
l2tpv3 tunnel [<TUNNEL-NAME>|all]
l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

## Parameters

```
l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
```

|                         |                                                                                                                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l2tpv3 tunnel           | Establishes or brings down L2TPV3 tunnels                                                                                                                                                                       |

## Examples (User Exec Mode)

```
nx9500-6C8809>l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on nx9500-6C8809
```

### Example (Privi Exec Mode)

```
nx9500-6C8809#l2tpv3 tunnel TestTunnel session TestTunnelSession1 up on rfs4000-6DB5D4
```

#### Note

For more information on the L2TPV3 tunnel configuration mode and commands, see [L2TPV3-POLICY](#).

### logging (user and privi exec modes)

Modifies message logging settings

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
logging monitor {<0-7>/alerts/critical/debugging/emergencies/errors/informational/notifications/warnings}
```

### Parameters

```
logging monitor {<0-7>/alerts/critical/debugging/emergencies/errors/informational/notifications/warnings}
```

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>monitor Sets the terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.</p> <ul style="list-style-type: none"><li>• &lt;0-7&gt; - Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:</li><li>• alerts - Optional. Immediate action needed (severity=1)</li><li>• critical - Optional. Critical conditions (severity=2)</li><li>• debugging - Optional. Debugging messages (severity=7)</li><li>• emergencies - Optional. System is unusable (severity=0)</li><li>• errors - Optional. Error conditions (severity=3)</li><li>• informational - Optional. Informational messages (severity=6)</li><li>• notifications - Optional. Normal but significant conditions (severity=5)</li><li>• warnings - Optional. Warning conditions (severity=4)</li></ul> <p><b>Note:</b> Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device's configuration mode, execute the logging &gt; on command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.</p> |

*mint* (user and privi exec modes)

Uses MiNT protocol to perform a ping and trace route to a remote device

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
mint [ping|traceroute]
mint ping <MINT-ID> {(count <1-10000>/size <1-64000>/timeout <1-10>)}
mint traceroute <MINT-ID> {(destination-port <1-65535>/max-hops <1-255>/
source-port <1-65535>/timeout <1-255>)}
```

## Parameters

```
mint ping <MINT-ID> {(count <1-10000>/size <1-64000>/timeout <1-10>)}
```

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ping <MINT-ID>  | Sends a MiNT echo message to a specified destination <ul style="list-style-type: none"><li>&lt;MINT-ID&gt; - Specify the destination device's MiNT ID.</li></ul>                                  |
| count <1-10000> | Optional. Sets the number of ping packets sent to the specified MiNT destination <ul style="list-style-type: none"><li>&lt;1-60&gt; - Specify a value from 1 - 10000. The default is 3.</li></ul> |
| size <1-64000>  | Optional. Sets the MiNT payload size in bytes <ul style="list-style-type: none"><li>&lt;1-64000&gt; - Specify a value from 1 - 64000. The default is 64 bytes.</li></ul>                          |
| timeout <1-10>  | Optional. Sets a response time in seconds <ul style="list-style-type: none"><li>&lt;1-10&gt; - Specify a value from 1 sec - 10 sec. The default is 1 second.</li></ul>                            |

```
mint traceroute <MINT-ID> {(destination-port <1-65535>/max-hops <1-255>/
source-port <1-65535>/timeout <1-255>)}
```

|                            |                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traceroute <MINT-ID>       | Prints the route packets trace to a device <ul style="list-style-type: none"><li>&lt;MINT-ID&gt; - Specify the destination device's MiNT ID.</li></ul>                                                            |
| destination-port <1-65535> | Optional. Sets the <i>Equal-cost Multi-path</i> (ECMP) routing destination port <ul style="list-style-type: none"><li>&lt;1-65535&gt; - Specify a value from 1 - 65535. The default port is 45.</li></ul>         |
| max-hops <1-255>           | Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction <ul style="list-style-type: none"><li>&lt;1-255&gt; - Specify a value from 1 - 255. The default is 30.</li></ul> |
| source-port <1-65535>      | Optional. Sets the ECMP source port <ul style="list-style-type: none"><li>&lt;1-65535&gt; - Specify a value from 1 - 65535. The default port is 45.</li></ul>                                                     |
| timeout <1-255>            | Optional. Sets the minimum response time period in seconds <ul style="list-style-type: none"><li>&lt;1-65535&gt; - Specify a value from 1 sec - 255 sec. The default is 30 seconds.</li></ul>                     |

## Example (User Exec Mode)

```
NOC-NX9500>mint ping 4D.83.30.A4
MiNT ping 4D.83.30.A4 with 64 bytes of data.
Response from 4D.83.30.A4: id=16777216 time=0.262 ms
Response from 4D.83.30.A4: id=33554432 time=2.025 ms
Response from 4D.83.30.A4: id=50331648 time=0.256 ms

--- 4D.83.30.A4 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.256/0.848/2.025 ms
NOC-NX9500>
```

## Example (Privi Exec Mode)

```
rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
```

```
Response from 68.88.0D.A7: id=1 time=0.364 ms
Response from 68.88.0D.A7: id=2 time=0.333 ms
Response from 68.88.0D.A7: id=3 time=0.368 ms
```

```
--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
```

## *mkdir*

Creates a new directory in the file system

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
mkdir <DIR>
```

### Parameters

```
mkdir <DIR>
```

<DIR> Specify a directory name.

**Note:** A directory, specified by the <DIR> parameter, is created within the file system.

### Examples

```
rfs4000-229D58#dir
Directory of flash:/.
```

*more*

Displays files on the device's file system. This command navigates and displays specific files in the device's file system.

The more command also displays the startup configuration file.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
more <FILE>
```

### Parameters

```
more <FILE>
```

|                                                                                   |
|-----------------------------------------------------------------------------------|
| <FILE> Specify the file name and location. Provide the complete path to the file. |
|-----------------------------------------------------------------------------------|

### Examples

```
NOC-NX9500#more flash:/archived_logs/startup.1.log
Jan 23 09:51:23 2017: %KERN-6-INFO: PACE(22 - DEFRAG) : memory = 2064375.
Jan 23 09:51:23 2017: %KERN-6-INFO: PACE(22) : Enabled midstream protocol detection.
Jan 23 09:51:23 2017: %KERN-6-INFO: PACE(23) : Enabled rtp performance measurement.
Jan 23 09:51:23 2017: %KERN-6-INFO: PACE(23) : Enabled metadata dissectors.
Jan 23 09:51:23 2017: %KERN-6-INFO: PACE(23 - DEFRAG) : memory = 2064375.

NOC-NX9500#
```

*no (priv-exec-mode)*

Use the no command to revert to turn off an enabled feature or to revert a setting to default value.

The no commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
[adoption|captive-portal|cpe|crypto|debug|logging|page|raid|service|terminal|upgrade|virtual-machine|wireless]
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
```

### Note

The **no > adoption** command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

```
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-DOMAIN-NAME>}
no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}}|on <DEVICE-NAME>}
no logging monitor
no page
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service block-adopter-config-update
no service locator {on <DEVICE-NAME>}
no service snmp sysoid wing5
no service ssm trace pattern {<WORD>} {(on <DEVICE-NAME>)}
no service wireless [trace pattern {<WORD>} {(on <DEVICE-NAME>)}|unsanctioned ap air-terminate <BSSID>
{on <DOMAIN-NAME>}]
no terminal [length|width]
no upgrade <PATCH-NAME> {on <DEVICE-NAME>}
no wireless client [all|<MAC>]
no wireless client all {filter/on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

The following command is available only on the NX 95XX and NX 96XX series service platforms:

```
no cpe led cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
no raid locate
```

### Parameters

```
no <PARAMETERS>
```

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |
|-----------------|-----------------------------------------------------------|

### Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

### Examples

```
NOC-NX9500#no adoption on ?
DEVICE-OR-DOMAIN-NAME AP/Controller/RF-Domain name

NOC-NX9500#
NOC-NX9500#no page
NOC-NX9500#
NOC-NX9500#no upgrade ?
WORD Name of the patch to remove
```

NOC-NX9500#

on (user and privi exec modes)

Executes the following commands in the RF Domain context: *clrscr*, *do*, *end*, *exit*, *help*, *service*, and *show*

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

### Parameters

```
on rf-domain [<RF-DOMAIN-NAME>|all]
```

|                                     |                                                                                                                                                                                          |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| on rf-domain [<RF-DOMAIN-NAME> all] | Enters the RF Domain context based on the parameter specified                                                                                                                            |
|                                     | <ul style="list-style-type: none"><li>• &lt;RF-DOMAIN-NAME&gt; - Specify the RF Domain name. Enters the specified RF Domain context.</li><li>• all - Specifies all RF Domains.</li></ul> |

### Example (User Exec Mode)

```
nx9500-6C8809>on rf-domain TechPubs
nx9500-6C8809(TechPubs)>?
on RF-Domain Mode commands:

 clrscr Clears the display screen
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 service Service Commands
 show Show running system information

nx9500-6C8809(TechPubs)>
nx9500-6C8809(rf-domain-all)>?
on RF-Domain Mode commands:

 clrscr Clears the display screen
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 service Service Commands
 show Show running system information

nx9500-6C8809(rf-domain-all)>
```

### Example (Privi Exec Mode)

```
nx9500-6C8809#on rf-domain TechPubs
nx9500-6C8809(TechPubs)#
NOC-NX9500#on rf-domain default
NOC-NX9500(default)#?
on RF-Domain Mode commands:
```

```
 clrscr Clears the display screen
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 service Service Commands
 show Show running system information
```

```
NOC-NX9500(default)#
```

```
NOC-NX9500(default)#show sessions on RFS6K-SITE1-VLAN20
```

| INDEX | COOKIE | NAME  | START TIME          | FROM      | ROLE      |
|-------|--------|-------|---------------------|-----------|-----------|
| 1     | 10     | admin | 2018-01-02 04:31:41 | Console   | superuser |

| 3     | 4      | snmp2 | 2018-01-02 03:39:59 | 127.0.0.1 | superuser |

```
NOC-NX9500(default)#
```

#### *opendns (user and privi exec modes)*

Fetches the OpenDNS device\_id from the OpenDNS site. Use this command to fetch the OpenDNS device\_id. Once fetched, apply the device\_id to WLANs that are to be OpenDNS enabled.

OpenDNS is a free DNS service that enables swift Web navigation without frequent outages. It is a reliable DNS service that provides the following services: DNS query resolution, Web-filtering, protection against virus and malware attacks, performance enhancement, etc.

This command is part of a set of configurations that are required to integrate WiNG devices with OpenDNS. When integrated, DNS queries going out of the WiNG device (access point, controller, or service platform) are re-directed to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers that act as proxy DNS servers.

For more information on integrating WiNG devices with OpenDNS site, see [Example: Enabling OpenDNS Support](#) on page 194.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
opendns [APIToken|username]
opendns APIToken <OPENDNS-APITOKEN>
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

### Note

Note, as per the current implementation both of the above commands can be used to fetch the device\_id from the OpenDNS site.

## Parameters

```
opendns APIToken <OPENDNS-APITOKEN>
```

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| opendns                     | Fetches the device_id from the OpenDNS site using the OpenDNS API token                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| APIToken <OPENDNS-APITOKEN> | Configures the OpenDNS APIToken. This is the token provided you by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"><li>&lt;OPENDNS-APITOKEN&gt; - Provide the OpenDNS API token (should be a valid token).</li></ul> For every valid OpenDNS API token provided a device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see <a href="#">opendns</a> on page 586. |

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| opendns                 | Fetches the device_id from the OpenDNS site using the OpenDNS credentials                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| username <USERNAME>     | Configures the OpenDNS user name. This is your OpenDNS email ID provided by CISCO at the time of subscribing for their OpenDNS service. <ul style="list-style-type: none"><li>&lt;USERNAME&gt; - Provide the OpenDNS user name (should be a valid OpenDNS username).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| password <OPENDNS-PSWD> | Configures the password associated with the user name specified in the previous step. <ul style="list-style-type: none"><li>&lt;OPENDNS-PSWD&gt; - Provide the OpenDNS password (should be a valid OpenDNS password).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| label <LABEL>           | Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal. <ul style="list-style-type: none"><li>&lt;LABEL&gt; - Specify your network label.</li></ul> For every set of user name, password, and label passed only one unique device_id is returned. Apply this device_id to WLANs that are to be OpenDNS enabled. Once applied, DNS queries originating from associating clients are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. For information on configuring the device_id in the WLAN context, see <a href="#">opendns</a> on page 586. |

## Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

## Example

```
ap7161-E6D512>opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
```

```
device_id = 0014AADF8EDC6C59
ap7161-E6D512>
nx9600-7F3C7F>opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073 device_id =
001480fe36dcb245
nx9600-7F3C7F>
```

### Example: Enabling OpenDNS Support

The following example shows how to enable OpenDNS support:

- 1 Fetch the OpenDNS device\_id from the OpenDNS site.
  - a In the User/Privilege executable mode execute one of the following commands:

```
nx9500-6C8809#opendns APIToken <OPENDNS-APITOKEN>
nx9500-6C8809#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 001480fe36dcb245nx9500-6C8809#
```

OR

```
nx9500-6C8809#opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

#### Note

The *OpenDNS API token* and/or *user account credentials* are provided the OpenDNS service provider when subscribing for the OpenDNS service.

- b Apply the device\_id fetched in the step 1 to the WLAN.

```
nx9500-6C8809(config-wlan-opendns)#opendns device-id <OPENDNS-DEVICE-ID>
nx9500-6C8809(config-wlan-opendns)#opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 bridging-mode local
 encryption-type none
 authentication-type none
 opendns device-id 001480fe36dcb245
nx9500-6C8809(config-wlan-opendns)#
```

#### Note

Once applied, DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.

- 2 Configure a DHCP server policy, and set the DHCP pool's DNS server configuration to point to the OpenDNS servers.

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#dns-server 208.67.222.222
```

#### Note

You can configure any one of the following OpenDNS servers: 208.67.222.222 OR 208.67.222.220

```
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#show context
dhcp-pool opendnsPool
 dns-server 208.67.222.222
nx9500-6C8809(config-dhcp-policy-opendns-pool-opendnsPool)#
```

- 3 Apply the DHCP server policy configured in step 2 on the access point, controller, or service platform.

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#use dhcp-server-policy opendns
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context include-factory | include
use
 use profile default-nx9000
 use rf-domain TechPubs
```

```
use database-policy default
use nsight-policy noc
use dhcp-server-policy.opendns
use auto-provisioning-policy TechPubs
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

#### Note

When configured, DNS queries are forwarded by the access point, controller, or service platform to the specified OpenDNS resolver.

- 4 Configure an IP Access Control List with the following permit and deny rules:

```
nx9500-6C8809(config-ip-acl-OpenDNS)#permit udp any host 208.67.222.222 eq dns rule-
precedence 1 rule-description "allow dns queries only to OpenDNS"
nx9500-6C8809(config-ip-acl-OpenDNS)#deny udp any any eq dns rule-precedence 10 rule-
description "block all DNS queries"
nx9500-6C8809(config-ip-acl-OpenDNS)#permit ip any any rule-precedence 100 rule-
description "allow all other ip packets"
nx9500-6C8809(config-ip-acl-OpenDNS)#show context
ip access-list OpenDNS
permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow dns
queries only to OpenDNS"
deny udp any any eq dns rule-precedence 10 rule-description "block all dns queries"
permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
nx9500-6C8809(config-ip-acl-OpenDNS)#
```

#### Note

When configured and applied in the WLAN context, the IP ACL prevents wireless clients from adding their own DNS servers to bypass the Web filtering and network policies enforced by OpenDNS.

- 5 Apply the IP ACL configured in step 4 in the WLAN context.

```
nx9500-6C8809(config-wlan-opendns)#use ip-access-list out OpenDNS
nx9500-6C8809(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 vlan 1
 bridging-mode local
 encryption-type none
 authentication-type none
 use ip-access-list in OpenDNS
 use ip-access-list out OpenDNS
 opendns device-id 0014AADF8EDC6C59
nx9500-6C8809(config-wlan-opendns)#
```

#### Note

When applied to the WLAN, only the DNS queries directed to the OpenDNS server are forwarded. All other DNS queries are dropped.

*page (user and privi exec modes)*

Toggles a device's paging function. Enabling this option displays the CLI command output page by page, instead of running the entire output at once.

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

---

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

page

**Parameters**

None

**Examples (User Exec Mode)**

```
rfs4000-6DB5D4#page
rfs4000-6DB5D4#
```

**Example (Privi Exec Mode)**

```
nx9500-6C8809#page
nx9500-6C8809#
```

**Related Commands**

`no (user exec mode) on` Disables paging  
page 83

`no (priv-exec-mode) on` Disables paging  
page 189

*ping (user and privi exec modes)*

Sends ICMP (Internet Controller Message Protocol) echo messages to a user-specified location

**Note**

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

```
ping <IP/HOSTNAME> {count <1-10000>/dont-fragment {count/size}/size <1-64000>/
source [<IP>/pppoe/vlan <1-4094>/wwan]}
```

**Parameters**

```
ping <IP/HOSTNAME> {count <1-10000>/dont-fragment {count/size}/size <1-64000>/
source [<IP>/pppoe/vlan <1-4094>/wwan]}
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IP/HOSTNAME>                          | Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| count <1-10000>                        | Optional. Sets the pings to the specified destination <ul style="list-style-type: none"> <li>&lt;1-10000&gt; – Specify a value from 1 - 10000. The default is 5.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| dont-fragment {count size}             | Optional. Sets the don't fragment bit in the ping packet. Packets with the dont-fragment bit specified are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified MTU (maximum transmission unit) value, an error message is sent from the device trying to fragment it. <ul style="list-style-type: none"> <li>count &lt;1-10000&gt; – Optional. Sets the pings to the specified destination from 1 - 10000. The default is 5.</li> <li>size &lt;1-64000&gt; – Optional. Sets the ping payload size from 1 - 64000 bytes. The default is 100 bytes.</li> </ul> |
| size <1-64000>                         | Optional. Sets the ping payload size in bytes <ul style="list-style-type: none"> <li>&lt;1-64000&gt; – Specify the ping payload size from 1 - 64000. The default is 100 bytes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                           |
| source [<IP> pppoe vlan <1-4094> wwan] | Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination. <ul style="list-style-type: none"> <li>&lt;IP&gt; – Specifies the source IP address</li> <li>pppoe – Selects the PPP over Ethernet interface</li> <li>vlan &lt;1-4094&gt; – Selects the VLAN interface from 1 - 4094</li> <li>wwan – Selects the wireless WAN interface</li> </ul>                                                                                                                                                                                         |

### Examples (User Exec Mode)

```
NOC-NX9500>ping 10.234.160.13
PING 10.234.160.13 (10.234.160.13) 100(128) bytes of data.

5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 3997ms

rfs4000-229D58#

```

### ping6 (user and privi exec modes)

Sends ICMPv6 echo messages to a user-specified IPv6 address

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

### Parameters

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}
```

|                 |                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv6/HOSTNAME> | Specify the destination IPv6 address or hostname.                                                                                                                                                |
| <INTF-NAME>     | Specify the interface name for link local/broadcast address                                                                                                                                      |
| count <1-10000> | Optional. Sets the pings to the specified IPv6 destination <ul style="list-style-type: none"> <li>• &lt;1-10000&gt; - Specify a value from 1 - 10000. The default is 5.</li> </ul>               |
| size <1-64000>  | Optional. Sets the IPv6 ping payload size in bytes <ul style="list-style-type: none"> <li>• &lt;1-64000&gt; - Specify the ping payload size from 1 - 64000. The default is 100 bytes.</li> </ul> |

### Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the **ipv6 > address <IPv6-ADDRESS>** command. After configuring the IPv6 address, use the **ipv6 > enable** command to enable IPv6. For more information, see [ipv6](#) on page 1162 (profile config mode).

### Examples (User Exec Mode)

```

rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief

INTERFACE IPV6 MODE IPV6-ADDRESS/MASK TYPE STATUS PROTOCOL

vlan1 True fe80::223:68ff:fe88:da7/64 Link-Local UP up
vlan1 True 2001:10:10:10:10:10:10:1/64 Global-Permanent UP up
vlan2 False UNASSIGNED None UP up

```

```

rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#

rfs4000-880DA7#

```

### *pwd*

Displays the full path of the present working directory, similar to the UNIX `pwd` command

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
pwd
```

### Parameters

None

### Examples

```

rfs4000-229D58#pwd
flash:/
rfs4000-229D58#
rfs4000-229D58#dir
Directory of flash:/

```

```

### re-elect

Re-elects the tunnel controller (wireless controller or service platform)

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

#### Parameters

```
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| re-elect tunnel-controller | Re-elects the tunnel controller                                                                                                                                                                                                                                                                                                                                    |
| <WORD> {on <DEVICE-NAME>}  | Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches <WORD> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Re-elects the tunnel controller on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

#### Example

```

rfs4000-229D58#re-elect tunnel-controller
OK
rfs4000-229D58#

```

### reload

Halts a device or devices and performs a warm reboot

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
reload {<DEVICE-MAC-OR-HOSTNAME>|at|cancel|force|in|on|staggered}
reload {(<DEVICE-MAC-OR-HOSTNAME>)}
reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
reload {force} {(<DEVICE-MAC-OR-HOSTNAME> |on <DOMAIN-NAME> |staggered)}
reload {force} {on <DOMAIN-NAME> {staggered} |staggered {<DEVICE-MAC-OR-HOSTNAME> |
on <DOMAIN-NAME>}} {containing <WORD> |exclude-controllers |exclude-rf-domain-manager |
filter <DEVICE-TYPE>}
reload {in <1-999>} {list|on}
reload {in <1-999>} {list {<LINE>|all} |on <DEVICE-OR-DOMAIN-NAME>}
reload {in <1-999>} {on <DEVICE-OR-DOMAIN-NAME>}
reload {on <DOMAIN-NAME>} {containing <WORD> |exclude-controllers |
exclude-rf-domain-manager |filter <DEVICE-TYPE>}
reload {staggered} {(<DEVICE-MAC-OR-HOSTNAME>) |on <DOMAIN-NAME>} {containing <WORD> |
exclude-controllers |exclude-rf-domain-manager |filter <DEVICE-TYPE>}
```

## Parameters

```
reload {on <DEVICE-OR-DOMAIN-NAME>}
```

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reload <DEVICE-MAC-OR-HOSTNAME> | <p>Initiates device(s) reload and configures associated parameters</p> <p>The following keyword is recursive and allows you to specify multiple devices:</p> <ul style="list-style-type: none"><li>• &lt;DEVICE-MAC-OR-HOSTNAME&gt; – Optional. Reloads a specified device(s), identified by the &lt;DEVICE-MAC-OR-HOSTNAME&gt; keyword. Specify the device's hostname or MAC address.</li></ul> <p><b>Note:</b> If no device is specified, the system reloads the logged device.</p> |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reload at                  | <p>Initiates device(s) reload and configures associated parameters</p> <ul style="list-style-type: none"><li>• at – Optional. Schedules a reload at a specified time and day. Use the following keywords to specify the time and day: &lt;TIME&gt;, &lt;1-31&gt;, &lt;MONTH&gt;, and &lt;1993-2035&gt;.</li></ul>                                                                                                                                                                       |
| <TIME>                     | Specifies the time in the HH:MM:SS format                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <1-31>                     | Specifies the day of the month from 1 - 31                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <MONTH>                    | Specifies the month from Jan - Dec                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <1993-2035>                | Specifies the year from 1993 - 2035. It should be a valid 4 digit year.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| on <DEVICE-OR-DOMAIN-NAME> | <p>Optional. Performs reload at the scheduled time, on a specified device or all devices within a specified RF Domain</p> <ul style="list-style-type: none"><li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain. When a RF Domain name is provided, all devices within the specified RF Domain are reloaded at the scheduled time. If no device is specified, the reload is scheduled on the logged device.</li></ul> |

```
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
```

The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533, RFS 4000, NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000, and t5.</li> </ul> </li> </ul>                      |

### Example

```

nx9500-6C8809#reload at 12:30:00 10 Jan 2018 on rfs4000-6DB5D4
Reload scheduled at 2018-01-10 12:30:00 UTC ...
nx9500-6C8809#
nx9500-6C8809#reload cancel on rfs4000-6DB5D4
Scheduled reload cancelled.
nx9500-6C8809#

```

### rename

Renames a file in the devices’ file system

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
rename <OLD-FILE-NAME> <NEW-FILE-NAME>
```

### Parameters

```
rename <OLD-FILE-NAME> <NEW-FILE-NAME>
```

|                 |                             |
|-----------------|-----------------------------|
| <OLD-FILE-NAME> | Specify the file to rename. |
| <NEW-FILE-NAME> | Specify the new file name.  |

### Examples

```
rfs4000-229D58#dir
Directory of flash:/.
```

```

```

### *rmdir*

Deletes an existing directory from the file system (only empty directories can be removed)

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
rmdir <DIR>
```

### Parameters

```
rmdir <DIR>
```

```
rmdir <DIR> Specifies the directory name
```

**Note:** The directory, specified by the <DIR> parameter, is removed from the file system.

### Examples

```
rfs4000-229D58#dir
Directory of flash:/.
```

```

```

```
rfs4000-229D58#
```

*self*

Enters the logged device's configuration context

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

self

## Parameters

None

## Examples

```
nx9500-6C8809#self
Enter configuration commands, one per line. End with CNTL/Z.
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

*ssh (user and privi exec modes)*

Opens a SSH (Secure Shell) connection between two network devices

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

## Parameters

```
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

|                            |                                                                                |
|----------------------------|--------------------------------------------------------------------------------|
| <IP/HOSTNAME>              | Specify the remote system's IP address or hostname.                            |
| <USERNAME>                 | Specify the name of the user requesting SSH connection with the remote system. |
| <INF-NAME/ LINK-LOCAL-ADD> | Optional. Specify the interface's name or link local address.                  |

## Example (User Exec Mode)

```
NOC-NX9500>ssh 10.234.160.13 admin
admin@10.234.160.13's password:
ap8432-070235>>ssh 192.168.13.24 admin
admin@192.168.13.24's password:
rfs4000-6DB5D4>
```

## Example (Privi Exec Mode)

```
ap7532-DF9A4C#ssh 10.234.160.13 admin
admin@10.234.160.13's password:
ap8432-070235>
```

*t5 (privi exec mode)*

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device's file system
- write running configuration to the T5 device's memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on re-wiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

#### Note

For more information on other T5 CPE related commands, see [cpe \(privilege-exec-mode\)](#) on page 134.

#### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|
rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

#### Parameters

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|
rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| write memory        | Writes running configuration to an adopted T5 device's memory <ul style="list-style-type: none"> <li>memory - Writes running configuration to the T5 device's non-volatile (NV) memory.</li> </ul> |
| on <T5-DEVICE-NAME> | Optional. Executes these operation on a specified T5 device <ul style="list-style-type: none"> <li>&lt;T5-DEVICE-NAME&gt; - Specify the T5 device's hostname.</li> </ul>                           |

### Example

```
nx9500-6C8809#t5 write memory on t5-ED7C6C
Success
nx9500-6C8809#
```

*telnet (user and privi exec modes)*

Opens a Telnet session between two network devices

### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

### Parameters

```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

|               |                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IP/HOSTNAME> | Configures the destination remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system. <ul style="list-style-type: none"> <li>&lt;IP/HOSTNAME&gt; - Specify the remote system's IPv4 or IPv6 address or hostname.</li> </ul> |
| <TCP-PORT>    | Optional. Specify the <i>Transmission Control Protocol</i> (TCP) port number.                                                                                                                                                                                                                                  |
| <INTF-NAME>   | Optional. Specify the interface name for the link local address.                                                                                                                                                                                                                                               |

### Examples (User Exec Mode)

```
NOC-NX9500>telnet 10.234.160.11
telnet: cannot connect to remote host (10.234.160.11): Connection refused
NOC-NX9500>telnet 10.234.160.13
```

```
Entering character mode
Escape character is '^]'.

```

*terminal (user and privi exec modes)*

Sets the length and width of the CLI display window on a terminal

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
terminal [length|width] <0-512>
```

### Parameters

```
terminal [length|width] <0-512>
```

|                |                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| length <0-512> | Sets the number of lines displayed on a terminal window <ul style="list-style-type: none"><li>• &lt;0-512&gt; - Specify a value from 0 - 512.</li></ul>                    |
| width <0-512>  | Sets the width (the number of characters displayed) of the terminal window <ul style="list-style-type: none"><li>• &lt;0-512&gt; - Specify a value from 0 - 512.</li></ul> |

### Example (User Exec Mode)

```
ap8432-070235>show terminal
Terminal Type: xterm
Length: 24 Width: 80
ap8432-070235>
ap8432-070235>terminal length 80
ap8432-070235>terminal width 100
ap8432-070235>show terminal
Terminal Type: xterm
Length: 80 Width: 100
ap8432-070235>
```

### Example (Privi Exec Mode)

```
NOC-NX9500#show terminal
Terminal Type: xterm
```

```
Length: 24 Width: 80
NOC-NX9500#
NOC-NX9500#terminal length 30
NOC-NX9500#terminal width 100
NOC-NX9500#show terminal
Terminal Type: xterm
Length: 30 Width: 100
NOC-NX9500#
```

### Related Commands

```
no (user exec mode) on Resets the width or length of the terminal window
page 83
no (priv-exec-mode) on Resets the width or length of the terminal window
page 189
```

### *time-it (user and privi exec modes)*

Verifies the time taken by a particular command between request and response

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
time-it <COMMAND>
```

### Parameters

```
time-it <COMMAND>
```

```
time-it <COMMAND> Verifies the time taken by a particular command to execute and provide a result
```

- <COMMAND> – Specify the command.

### Examples

```
ap8432-070235>time-it enable
That took 0.00 seconds..
ap8432-070235#
```

### Example (Privi Exec Mode)

```
rfs4000-229D58#time-it config terminal
Enter configuration commands, one per line. End with CNTL/Z.
That took 0.00 seconds..
rfs4000-229D58(config)#
```

---

### *traceroute* (user-privi-exec-mode)

Traces the route to a defined destination

Use '--help' or '-h' to display a complete list of parameters for the traceroute command

---

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

---

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
traceroute <LINE>
```

#### Parameters

```
traceroute <LINE>
```

|                   |                                                              |
|-------------------|--------------------------------------------------------------|
| traceroute <LINE> | Traces the route to a destination IP address or hostname     |
|                   | • <LINE> - Specify the destination IPv4 address or hostname. |

#### Example (User Exec Mode)

```
NOC-NX9500>traceroute 10.234.160.13
traceroute to 10.234.160.13 (10.234.160.13), 30 hops max, 46 byte packets
 1 10.234.160.13 (10.234.160.13) 0.315 ms 0.159 ms 0.137 ms
NOC-NX9500>
```

#### Example (Privi Exec Mode)

```
NOC-NX9500#traceroute 10.234.160.11
traceroute to 10.234.160.11 (10.234.160.11), 30 hops max, 46 byte packets
 1 10.234.160.11 (10.234.160.11) 8.115 ms 0.410 ms 0.370 ms
NOC-NX9500#
```

### *traceroute6* (user-privi-exec-mode)

Traces the route to a specified IPv6 destination

---

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

---

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
traceroute6 <LINE>
```

## Parameters

```
traceroute6 <LINE>
```

|                    |                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traceroute6 <LINE> | Traces the route to a destination IPv6 address or hostname <ul style="list-style-type: none"><li>• &lt;LINE&gt; - Specify the destination IPv6 address or hostname.</li></ul> |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example (User Exec Mode)

```
rfs4000-6DB5D4>traceroute6 2001:10:10:10:10:10:10:1
traceroute to 2001:10:10:10:10:10:10:1 (2001:10:10:10:10:10:10:1) from
2001:10:10:10:10:10:10:2, 30 hops max, 16 byte packets
 1 2001:10:10:10:10:10:10:1 (2001:10:10:10:10:10:10:1) 6.054 ms 0.448 ms 0.555 ms
rfs4000-6DB5D4>
```

## Example (Privileged Exec Mode)

```
rfs4000-229D587#traceroute6 2001:10:10:10:10:10:10:2
traceroute to 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) from
2001:10:10:10:10:10:10:1, 30 hops max, 16 byte packets
 1 2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) 0.622 ms 0.497 ms 0.531 ms
rfs4000-229D587#
```

## upgrade

Upgrades a device's software image

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
upgrade [<FILE>|<URL>|dhcp-vendor-options]
upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>} {<DEVICE-NAME>}
upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>} {containing <SUB-STRING>|exclude-
controllers|
exclude-rf-domain-managers|filter <DEVICE-TYPE>}
```

## Parameters

```
upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}
```

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

```

**Note**

After upgrading, the device has to be reloaded to boot using the new image.

The following example shows an RFS 6000 being upgraded via the controller:

```

nx7500-7F3609#upgrade tftp://192.168.0.50/RFS6000-5.9.2.0-026D.img rfs6000-6DCBB3

```

| DEVICE         | STATUS  | MESSAGE |
|----------------|---------|---------|
| rfs6000-6DCBB3 | Success | None    |

```

nx7500-7F3609#

```

The following example shows the upgrade status:

```

nx7500-7F3609#show upgrade detail
Last Image Upgrade Status : Successful
Last Image Upgrade Time : 2018-01-11 10:31:12

Running from partition /dev/sda7
var2 is 2 percent full

## Related Commands

`no (priv-exec-mode) on` Removes a patch installed on a specified device  
page 189

### *upgrade-abort*

Aborts an ongoing software image upgrade

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

```
upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}
```

### *virtual-machine (user and privi exec modes)*

Installs, configures, and monitors the status of virtual machines (VMs)

#### Note

This command and its syntax is common to both the *User Executable* and *Privilege Executable* configuration modes.

## Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

## Syntax

```
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
virtual-machine install [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan]
virtual-machine restart [<VM-NAME>|hard|adsp|team-urc|team-rls|team-vowlan]
virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]
virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|
vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|
vnc [disable|enable]] [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

The following virtual-machine commands are supported only on the VX 9000 platform:

```
virtual-machine volume-group [add-drive|replace-drive|resize-drive|resize-volume-group]
virtual-machine volume-group [add-drive|replace-drive] <BLOCK-DEVICE-LABEL>
virtual-machine volume-group replace-drive <BLOCK-DEVICE-LABLE> <NEW-BLOCK-DEVICE-
LABEL>
virtual-machine volume-group resize-volume-group <BLOCK-DEVICE-LABEL>
```

## Parameters

```
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
```

|                              |                                                                                                                                                                                                                                                                                                                                                                                             |

|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>|
vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc
[disable|enable]]
[<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine  
set

Configures the VM settings

- autostart – Specifies whether to autostart the VM on system reboot
  - ignore – Enables autostart on each system reboot
  - start – Disables autostart
- memory – Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
- vcpus – Specifies the number of VCPUS for this VM
  - <1-4> – Specify the number of VCPUS from 1- 4.
- vif-count – Configures or resets the VM's VIFs
  - <0-2> – Specify the VIF number from 0 - 2.
- vif-mac – Configures the MAC address of the selected virtual network interface
  - <1-2> – Select the VIF
    - <1-8> – Specify the MAC index for the selected VIF
    - <MAC> – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the 'set' keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard I2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM's interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.

- vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the twelve ports for NX 95XX on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

- vnc – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - disable – Disables VNC port
  - enable – Enables VNC port

After configuring the VM settings, identify the VM to apply the settings.

- <VM-NAME> – Applies these settings to the VM identified by the <VM-NAME> keyword. Specify the VM name.
- adsp – Applies these settings to the ADSP VM
- team-urc – Applies these settings to the VM TEAM-URC
- team-rls – Applies these settings to the VM TEAM-RLS
- team-vowlan – Applies these settings to the VM TEAM-VoWLAN

```
virtual-machine start [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine start

Starts the VM, based on the parameters passed. Select one of the following options:

- <VM-NAME> - Starts the VM identified by the <VM-NAME> keyword. Specify the VM name.
- adsp - Starts the ADSP VM
- team-urc - Starts the VM TEAM-URC
- team-rls - Starts the VM TEAM-RLS
- team-vowlan - Starts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine stop [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine stop hard

Stops the VM, based on the parameters passed. Select one of the following options:

- <VM-NAME> - Stops the VM identified by the <VM-NAME> keyword. Specify the VM name.
- ADSP - Stops the ADSP VM
- team-urc - Stops the VM TEAM-URC
- team-rls - Stops the VM TEAM-RLS
- team-vowlan - Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas. Note: The option 'hard' forces the selected VM to shutdown.

**Note:** The option 'hard' forces the selected VM to shutdown.

```
virtual-machine uninstall [<VM-NAME>|adsp|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

virtual-machine uninstall

Uninstalls the specified VM

- <VM-NAME> - Uninstalls the VM identified by the <VM-NAME> keyword. Specify the VM name.
- ADSP - Uninstalls the ADSP VM
- team-urc - Uninstalls the VM TEAM-URC
- team-rls - Uninstalls the VM TEAM-RLS
- team-vowlan - Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> - Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> - Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

```
virtual-machine volume-group [add-drive|resize-drive] <BLOCK-DEVICE-LABEL>
```

## Examples

The following examples show the VM installation process:

### Insatllation media: USB

```
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/
win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

## Installation media: pre-installed disk image

```
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/
win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>
In the preceding example, the command is executed on the device identified by the <DEVICE-
NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the
install media as first boot device.
```

## Installation media: VM archive

```
<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3
In the preceding example, the default configuration attached with the VM archive overrides
any parameters specified.
```

## Exporting an installed VM:

```
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
In the preceding example, the command copies the VM archive on to the URL (VM should be in
stop state).
<DEVICE>>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
<DEVICE>>
VX 9000-DE6F97>virtual-machine add-drive sdb
VX 9000-DE6F97>show virtual-machine volume-group status

Logical Volume: lv1

STATUS : available
SIZE : 81.89 GiB
VOLUME GROUP : vg0
PHYSICAL VOLUMES :
 sda10 : 73.90 GiB
 sdc1 : 8.00 GiB
AVAILABLE DISKS :
 sdb : size: 8590MB

* indicates a drive that must be resized

VX 9000-DE6F97>
```

## *exit (privi exec mode)*

Ends the current CLI session and closes the session window

For more information, see [exit](#).

## Supported in the following platforms:

- Access Points — AP 6522, AP 6532, AP 6562, AP 7502, AP 7522, AP 7532, AP 7161, AP 81XX, AP 8232
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 7500, NX 9500, NX 9510

## Syntax

```
exit
```

## Parameters

None

## Examples

```
<exsw1>#exit
```

---

## raid

Enables *Redundant Array of Independent Disks* (RAID) management

RAID is a group of one or more independent, physical drives, referred to as an array or drive group. These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to “RAID degraded”. The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

- Verify the current array status
- Start and monitor array consistency checks
- Retrieve date and time of the last consistency check
- Shut down drives before physically removing them
- Install new drives
- Assign drives as hot spares
- Identify a degraded drive
- Deactivate an alarm (triggered when a drive is removed from the array)

### Supported in the following platforms:

- Service Platforms — NX 9500, NX 7500

---

#### Note

The NX 9500 service platform includes a single Intel MegaRAID controller, configured to provide a single virtual drive. This virtual drive is of the RAID-1 type, and has a maximum of two physical drives. In addition to these two drives, there are three hot spares, which are used in case of a primary drive failure.

---

#### Syntax

```
raid [check|install|locate|remove|silence|spare]
raid [check|silence]
raid [install|locate|remove|spare] drive <0-4>
```

#### Parameters

```
raid [check|silence]
```

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| check   | Starts a consistency check on the RAID array. Use the show > raid command to view consistency check status.<br>A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures.                                                                                                            |
| silence | Deactivates an alarm<br><b>Note:</b> When enabled, an audible alarm is triggered when a drive in the array fails. The silence command deactivates the alarm (sound).<br><b>Note:</b> To enable RAID alarm, in the device configuration mode, use the raid > alarm > enable command. A NX 9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see <a href="#">raid</a> on page 1284. |

**raid** [install|locate|remove|spare] drive <0-4>

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| install <0-4> | Includes a new drive, inserted in one of the available slots, in the array. Specify the drive number.<br><b>Note:</b> Drives 0 and 1 are the array drives. Drives 2, 3, and 4 are the hot spare drives. You can include the new drive in a degraded array, or enable it as a hot spare.<br><b>Note:</b> If the array is in a degraded state, the re-build process is triggered and the new drive is used to repair the degraded array. |
| locate <0-4>  | Enables LEDs to blink on a specified drive. Specify the drive number.<br><b>Note:</b> Blinking LEDs enable you correctly locate a drive.                                                                                                                                                                                                                                                                                               |
| remove <0-4>  | Removes (shuts down) a disk from the array, before it is physically removed from its slot. Specify the drive number containing the disk.<br><b>Note:</b> Use this command to also remove a hot spare.                                                                                                                                                                                                                                  |
| spare <0-4>   | Converts an unused drive into a hot spare. Specify the drive number.                                                                                                                                                                                                                                                                                                                                                                   |

### Example

```
nx9500-6C874D#raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added
nx9500-6C874D#
nx9500-6C8809#raid spare drive 1
Error: RAID operation failed, returned 2, output: Input Error: Drive 1 is member of array,
can't be a hotspare
/
nx9500-6C8809#
```

### watch

Repeats a specified CLI command at periodic intervals

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6532, AP 6562, AP 7502, AP 7522, AP 7532, AP 7161, AP 81XX, AP 8232
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 7500, NX 9500, NX 9510

#### Syntax

```
watch <1-3600> <LINE>
```

#### Parameters

```
watch <1-3600> <LINE>
```

---

|                |                                                                                         |
|----------------|-----------------------------------------------------------------------------------------|
| watch <1-3600> | Repeats a CLI command at a specified interval                                           |
| <1-3600>       | Select an interval from 1- 3600 seconds. Pressing CTRL-Z halts execution of the command |
| <LINE>         | Specify the CLI command name.                                                           |

**Examples**

```
<exsw1>#watch 1 show clock
<exsw1>#
```

# GLOBAL CONFIG MODE COMMANDS

## GLOBAL CONFIGURATION COMMANDS

---

This chapter summarizes the global-configuration commands in the CLI command structure.

The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the privileged EXEC mode:

```
<DEVICE>#configure terminal
<DEVICE> (config)#
```

### Note

The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

---

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a **commit write memory** command is issued.

```
<DEVICE>(config)#?
Global configuration commands:
 aaa-policy Configure a
 authentication/accounting/authorization
 policy
 aaa-tacacs-policy Configure an
 authentication/accounting/authorization
 TACACS policy

| auto-provisioning-policy           | Configure an auto-provisioning policy                                                      |
| bgp                                | BGP Configuration                                                                          |
| bonjour-gw-discovery-policy        | Bonjour Gateway discovery policy                                                           |
| bonjour-gw-forwarding-policy       | Bonjour Gateway forwarding policy                                                          |
| bonjour-gw-query-forwarding-policy | Bonjour Gateway Query forwarding policy                                                    |
| captive-portal                     | Configure a captive portal                                                                 |
| clear                              | Clear                                                                                      |
| client-identity                    | Client identity (DHCP Device Fingerprinting)                                               |
| client-identity-group              | Client identity group (DHCP Fingerprint Database)                                          |
| clone                              | Clone configuration object                                                                 |
| crypto-cmp-policy                  | CMP policy                                                                                 |
| customize                          | Customize the output of summary cli commands                                               |
| database-client-policy             | Configure database client policy                                                           |
| database-policy                    | Configure database policy                                                                  |
| device                             | Configuration on multiple devices                                                          |
| device-categorization              | Configure a device categorization object                                                   |
| dhcp-server-policy                 | DHCP server policy                                                                         |
| dhcpv6-server-policy               | DHCPv6 server related configuration                                                        |
| dns-whitelist                      | Configure a whitelist                                                                      |
| event-system-policy                | Configure a event system policy                                                            |
| ex3500                             | Ex3500 device                                                                              |
| ex3500-management-policy           | Configure a ex3500 management policy                                                       |
| ex3500-qos-class-map-policy        | Configure a ex3500 qos class-map policy                                                    |
| ex3500-qos-policy-map              | Configure a ex3500 qos policy-map                                                          |
| ex3524                             | EX3524 wireless controller                                                                 |
| ex3548                             | EX3548 wireless controller                                                                 |
| firewall-policy                    | Configure firewall policy                                                                  |
| global-association-list            | Configure a global association list                                                        |
| guest-management                   | Configure a guest management policy                                                        |
| help                               | Description of the interactive help system                                                 |
| host                               | Enter the configuration context of a device by specifying its hostname                     |
| igmp-snoop-policy                  | Create igmp snoop policy                                                                   |
| inline-password-encryption         | Store encryption key in the startup configuration file                                     |
| ip                                 | Internet Protocol (IP)                                                                     |
| ipv6                               | Internet Protocol version 6 (IPv6)                                                         |
| ipv6-router-advertisement-policy   | IPv6 Router Advertisement related configuration                                            |
| l2tpv3                             | L2tpv3 tunnel protocol                                                                     |
| mac                                | MAC configuration                                                                          |
| management-policy                  | Configure a management policy                                                              |
| meshpoint                          | Create a new MESHPOINT or enter MESHPOINT configuration context for one or more MESHPOINTS |
| meshpoint-qos-policy               | Configure a meshpoint quality-of-service policy                                            |
| mint-policy                        | Configure the global mint policy                                                           |
| nac-list                           | Configure a network access control list                                                    |
| no                                 | Negate a command or set its defaults                                                       |
| nsight-policy                      | Configure a Nsight policy                                                                  |
| nx45xx                             | NX45XX integrated services platform                                                        |
| nx5500                             | NX5500 wireless controller                                                                 |
| nx65xx                             | NX65XX integrated services platform                                                        |
| nx75xx                             | NX75XX wireless controller                                                                 |
| nx9000                             | NX9000 wireless controller                                                                 |

|                         |                                                                                  |
|-------------------------|----------------------------------------------------------------------------------|
| passpoint-policy        | Configure a passpoint policy                                                     |
| password-encryption     | Encrypt passwords in configuration                                               |
| profile                 | Profile related commands - if no parameters are given, all profiles are selected |
| radio-qos-policy        | Configure a radio quality-of-service policy                                      |
| radius-group            | Configure radius user group parameters                                           |
| radius-server-policy    | Create device onboard radius policy                                              |
| radius-user-pool-policy | Configure Radius User Pool                                                       |
| rename                  | Clone configuration object                                                       |
| replace                 | Replace configuration object                                                     |
| rf-domain               | Create a RF Domain or enter rf-domain context for one or more rf-domains         |
| rfs4000                 | RFS4000 wireless controller                                                      |
| rfs6000                 | RFS6000 wireless controller                                                      |
| rfs7000                 | RFS7000 wireless controller                                                      |
| roaming-assist-policy   | Configure a roaming-assist policy                                                |
| role-policy             | Role based firewall policy                                                       |
| route-map               | Dynamic routing route map Configuration                                          |
| routing-policy          | Policy Based Routing Configuration                                               |
| rtl-server-policy       | Configure a rtl server policy                                                    |
| schedule-policy         | Configure a schedule policy                                                      |
| self                    | Config context of the device currently logged into                               |
| sensor-policy           | Configure a sensor policy                                                        |
| smart-rf-policy         | Configure a Smart-RF policy                                                      |
| t5                      | T5 DSL switch                                                                    |
| url-filter              | Configure a url filter                                                           |
| url-list                | Configure a URL list                                                             |
| vx9000                  | VX9000 wireless controller                                                       |
| web-filter-policy       | Configure a web filter policy                                                    |
| wips-policy             | Configure a wips policy                                                          |
| wlan                    | Create a new WLAN or enter WLAN configuration context for one or more WLANs      |
| wlan-qos-policy         | Configure a wlan quality-of-service policy                                       |
| write                   | Write running configuration to memory or terminal                                |
| clrscr                  | Clears the display screen                                                        |
| commit                  | Commit all changes made in this session                                          |
| do                      | Run commands from Exec mode                                                      |
| end                     | End current mode and change to EXEC mode                                         |
| exit                    | End current mode and down to previous mode                                       |
| revert                  | Revert changes                                                                   |
| service                 | Service Commands                                                                 |
| show                    | Show running system information                                                  |

<DEVICE>(config)#

## global-config-commands

The following table summarizes the Global Configuration Mode commands:

**Table 6: Global Config Commands**

| Command                                              | Description                                                                                                                                                                                                                                  |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">aaa-policy</a> on page 235               | Creates a AAA policy and enters its configuration mode. This policy enables administrators to define access control within the network.                                                                                                      |
| <a href="#">aaa-tacacs-policy</a> on page 236        | Creates a AAA-TACACS policy and enters its configuration mode. This policy provides access control to network devices such as routers, network access servers, and other computing devices through centralized servers.                      |
| <a href="#">alias</a> on page 237                    | Configures network, VLAN, and service aliases                                                                                                                                                                                                |
| <a href="#">ap6522</a> on page 248                   | Adds an AP 6522 to the network                                                                                                                                                                                                               |
| <a href="#">ap6562</a> on page 248                   | Adds an AP 6562 to the network                                                                                                                                                                                                               |
| <a href="#">ap7161</a> on page 249                   | Adds an AP 7161 to the network                                                                                                                                                                                                               |
| <a href="#">ap7502</a> on page 250                   | Adds an AP 7502 to the network                                                                                                                                                                                                               |
| <a href="#">ap7522</a> on page 251                   | Adds an AP 7522 to the network                                                                                                                                                                                                               |
| <a href="#">ap7532</a> on page 251                   | Adds an AP 7532 to the network                                                                                                                                                                                                               |
| <a href="#">ap7562</a> on page 252                   | Adds an AP 7562 to the network                                                                                                                                                                                                               |
| <a href="#">ap7602</a> on page 253                   | Adds an AP 7602 to the network                                                                                                                                                                                                               |
| <a href="#">ap7612</a> on page 254                   | Adds an AP 7612 to the network                                                                                                                                                                                                               |
| <a href="#">ap7622</a> on page 254                   | Adds an AP 7622 to the network                                                                                                                                                                                                               |
| <a href="#">ap7632</a> on page 255                   | Adds an AP 7632 to the network                                                                                                                                                                                                               |
| <a href="#">ap7662</a> on page 256                   | Adds an AP 7662 to the network                                                                                                                                                                                                               |
| <a href="#">ap8163</a> on page 256                   | Adds an AP 8163 to the network                                                                                                                                                                                                               |
| <a href="#">ap8432</a> on page 257                   | Adds an AP 8432 to the network                                                                                                                                                                                                               |
| <a href="#">ap8533</a> on page 258                   | Adds an AP 8533 to the network                                                                                                                                                                                                               |
| <a href="#">application</a> on page 258              | Creates an application definition and enters its configuration mode. This command allows you to create a customized application detection definition.                                                                                        |
| <a href="#">application-policy</a> on page 267       | Creates an application group and enters its configuration mode                                                                                                                                                                               |
| <a href="#">application-group</a> on page 263        | Creates an application policy and enters its configuration mode. This policy defines the actions executed on recognized HTTP (e.g. Facebook), enterprise (e.g. Webex) and peer-to-peer (e.g. gaming) applications or application-categories. |
| <a href="#">association-acl-policy</a> on page 283   | Creates an association ACL policy and enters its configuration mode. This policy restricts access by specifying a client MAC address or range of addresses to either include or exclude from WLAN connectivity.                              |
| <a href="#">auto-provisioning-policy</a> on page 284 | Creates an auto provisioning policy and enters its configuration mode. This policy defines the process by which an access point discovers controllers and associates with it.                                                                |
| <a href="#">bgp</a> on page 285                      | Configures BGP (Border Gateway Protocol) settings                                                                                                                                                                                            |

**Table 6: Global Config Commands (continued)**

| Command                                                          | Description                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">bonjour-gw-discovery-policy</a> on page 287          | Creates a Bonjour GW Discovery policy and enters its configuration mode. This policy configures the VLANs on which Bonjour services are located.                                                                                                                 |
| <a href="#">bonjour-gw-forwarding-policy</a> on page 291         | Configures a Bonjour GW Forwarding policy and enters its configuration mode. This policy enables the discovery of services on VLANs not visible to the device running the Bonjour Gateway.                                                                       |
| <a href="#">bonjour-gw-query-forwarding-policy</a> on page 292   | Creates a Bonjour GW Query Forwarding policy and enters its configuration mode. This policy enables Bonjour query forwarding across multiple VLANs.                                                                                                              |
| <a href="#">captive-portal</a> on page 293                       | Creates a captive portal and enters its configuration mode                                                                                                                                                                                                       |
| <a href="#">clear</a> on page 335                                | Clears the event history                                                                                                                                                                                                                                         |
| <a href="#">client-identity</a> on page 336                      | Creates a client identity definition and enters its configuration mode. This feature enables client identification through DHCP device fingerprinting.                                                                                                           |
| <a href="#">client-identity-group</a> on page 343                | Creates a new client identity group and enters its configuration mode                                                                                                                                                                                            |
| <a href="#">clone</a> on page 347                                | Clones a specified configuration object                                                                                                                                                                                                                          |
| <a href="#">crypto-cmp-policy</a> on page 348                    | Creates a crypto CMP (Certificate Management Protocol) policy and enters its configuration mode. CMP is an Internet protocol designed to obtain and manage digital certificates in a PKI (Public Key Infrastructure) network.                                    |
| <a href="#">customize</a> on page 349                            | Customizes the CLI command summary output                                                                                                                                                                                                                        |
| <a href="#">database-client-policy global-config</a> on page 359 | Creates a database client policy and enters its configuration mode. The database client policy configures the IP address or hostname of the VX 9000 hosting the captive-portal/NSight database. Use this option when deploying a split NSight/EGuest deployment. |
| <a href="#">database-policy global config</a> on page 363        | Creates a database policy and enters its configuration mode. This policy enables the database, and also configures the database replica set.                                                                                                                     |
| <a href="#">device</a> on page 368                               | Specifies configuration on multiple devices                                                                                                                                                                                                                      |
| <a href="#">device-categorization</a> on page 369                | Creates a device categorization list and enters its configuration mode. The list categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.                   |
| <a href="#">dhcp-server-policy</a> on page 372                   | Creates a DHCP server policy and enters its configuration mode. This policy allows hosts on an IP network to request and be assigned IP addresses and discover information about the network.                                                                    |
| <a href="#">dhcpv6-server-policy</a> on page 373                 | Creates a DHCPv6 server policy and enters its configuration mode. This policy configures hosts with IPv6 addresses, IP prefixes and other configuration attributes required on an IPv6 network.                                                                  |
| <a href="#">dns-whitelist</a> on page 374                        | Creates a DNS whitelist and enters its configuration mode. A DNS whitelist is used with a captive portal to provide access services to requesting wireless clients.                                                                                              |

**Table 6: Global Config Commands (continued)**

| Command                                                      | Description                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">event-system-policy</a> on page 377              | Creates an Event system policy and enters its configuration mode. This policy enables administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform.   |
| <a href="#">ex3500</a> on page 391                           | Creates an EX3500 time range list and enters its configuration mode                                                                                                                                                                                                                         |
| <a href="#">ex3500-management-policy</a> on page 395         | Creates an EX3500 management policy and enters its configuration mode. This policy controls access to the EX3500 switch from management stations using SNMP.                                                                                                                                |
| <a href="#">ex3500-qos-class-map-policy</a> on page 411      | Creates an EX3500 QoS class map policy and enters its configuration mode. The QoS policy map assigns priority to mission critical EX3500 switch data traffic, prevent EX3500 switch bandwidth congestion, and prevent packet drops.                                                         |
| <a href="#">ex3500-qos-policy-map</a> on page 415            | Creates an EX3500 QoS policy map and enters its configuration mode. This policy defines rules that filter traffic exchanged between the EX3500 switch and its connected devices.                                                                                                            |
| <a href="#">ex3524</a> on page 425                           | Adds a EX3524 switch to the network                                                                                                                                                                                                                                                         |
| <a href="#">ex3548</a> on page 426                           | Adds a EX35XX switch to the network                                                                                                                                                                                                                                                         |
| <a href="#">firewall-policy</a> on page 427                  | Creates a firewall policy and enters its configuration mode. This policy configures safe guards against DoS (denial of service) attacks and packet storms. It also configures firewall parameters, such as logging, application layer gateway, TCP protocol checks, state flow checks, etc. |
| <a href="#">global-association-list</a> on page 428          | Configures a global list of client MAC addresses                                                                                                                                                                                                                                            |
| <a href="#">guest-management-policy</a> on page 431          | Creates a guest management policy and enters its configuration mode. This policy redirects guest users to a registration portal, upon association to a captive portal SSID (Service Set Identifier).                                                                                        |
| <a href="#">host</a> on page 440                             | Sets the system's network name                                                                                                                                                                                                                                                              |
| <a href="#">inline-password-encryption</a> on page 440       | Stores the encryption key in the startup configuration file                                                                                                                                                                                                                                 |
| <a href="#">iot-device-type-imagotag-policy</a> on page 441  | Creates an IoT Device-Type Imagotag policy and enters its configuration mode. This policy enables support for SES-imagotag's ESL tags on WiNG APs (with USB ports).                                                                                                                         |
| <a href="#">ip</a> on page 448                               | Creates a IP ACL (access control list) and/or a SNMP (Simple Network Management Protocol) ACL, and enters its configuration mode                                                                                                                                                            |
| <a href="#">ipv6</a> on page 450                             | Creates a IPv6 ACL and enters its configuration mode                                                                                                                                                                                                                                        |
| <a href="#">ipv6-router-advertisement-policy</a> on page 451 | Creates an IPv6 RA (router advertisement) policy and enters its configuration mode                                                                                                                                                                                                          |
| <a href="#">l2tpv3</a> on page 462                           | Configures L2TPv3 (Layer 2 Tunneling Protocol Version 3)tunnel policy and enters its configuration mode. This policy defines control and encapsulation protocols for tunneling layer 2 frames between two IP nodes.                                                                         |
| <a href="#">location-policy</a> on page 463                  | Configures a location policy and enters its configuration mode                                                                                                                                                                                                                              |

**Table 6: Global Config Commands (continued)**

| Command                                                        | Description                                                                                                                                                                                                 |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">mac</a> on page 467                                | Configures MAC access lists (goes to the MAC (Access Control List) mode)                                                                                                                                    |
| <a href="#">management-policy</a> on page 468                  | Creates a management policy and enters its configuration context. This policy configures services that run on a device, such as welcome messages, banners, etc.                                             |
| <a href="#">meshpoint</a> on page 469                          | Creates a meshpoint and enters its configuration mode                                                                                                                                                       |
| <a href="#">meshpoint-qos-policy</a> on page 470               | Creates a meshpoint QoS (quality of service) policy and enters its configuration mode                                                                                                                       |
| <a href="#">mint-policy</a> on page 471                        | Creates a MiNT security policy and enters its configuration mode                                                                                                                                            |
| <a href="#">nac-list</a> on page 472                           | Creates a network ACL and enters its configuration mode                                                                                                                                                     |
| <a href="#">no (global-config-mode)</a> on page 475            | Negates a command or sets its default                                                                                                                                                                       |
| <a href="#">nsight-policy (global-config-mode)</a> on page 479 | Creates an NSight policy and enters its configuration mode                                                                                                                                                  |
| <a href="#">passpoint-policy</a> on page 486                   | Creates a new passpoint policy and enters its configuration mode                                                                                                                                            |
| <a href="#">password-encryption</a> on page 487                | Enables password encryption                                                                                                                                                                                 |
| <a href="#">profile</a> on page 488                            | Creates a device profile and enters its configuration mode                                                                                                                                                  |
| <a href="#">radio-qos-policy</a> on page 492                   | Creates a radio qos policy and enters its configuration mode                                                                                                                                                |
| <a href="#">radius-group</a> on page 493                       | Creates a RADIUS group and enters its configuration mode                                                                                                                                                    |
| <a href="#">radius-server-policy</a> on page 494               | Creates a RADIUS server policy and enters its configuration mode                                                                                                                                            |
| <a href="#">radius-user-pool-policy</a> on page 495            | Creates a RADIUS user pool policy and enters its configuration mode                                                                                                                                         |
| <a href="#">rename</a> on page 496                             | Renames an existing TLO (top-level object)                                                                                                                                                                  |
| <a href="#">replace</a> on page 497                            | Selects an existing device by its MAC address or hostname and replaces it with a new device having a different MAC address                                                                                  |
| <a href="#">rf-domain</a> on page 499                          | Creates an RF Domain and enters its configuration mode                                                                                                                                                      |
| <a href="#">rfs4000</a> on page 527                            | Adds an RFS 4000 to the network                                                                                                                                                                             |
| <a href="#">roaming-assist-policy</a> on page 530              | Configures a roaming assist policy and enters its configuration mode. This policy enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc. |
| <a href="#">nx5500</a> on page 528                             | Adds an NX 5500 to the network                                                                                                                                                                              |
| <a href="#">nx75xx</a> on page 528                             | Adds an NX 7500 to the network                                                                                                                                                                              |
| <a href="#">nx9000</a> on page 529                             | Adds an NX 95XX or NX 96XX to the network                                                                                                                                                                   |
| <a href="#">role-policy</a> on page 531                        | Creates a role policy and enters its configuration mode                                                                                                                                                     |
| <a href="#">route-map</a> on page 532                          | Creates a dynamic BGP route map and enters its configuration mode                                                                                                                                           |
| <a href="#">routing-policy</a> on page 533                     | Creates a routing policy and enters its configuration mode                                                                                                                                                  |
| <a href="#">rtl-server-policy</a> on page 533                  | Creates an RTL server policy and enters its configuration mode. The RTL server policy provides the exact location (URL) at which the Euclid server can be reached.                                          |

**Table 6: Global Config Commands (continued)**

| Command                                       | Description                                                                                                                                  |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">schedule-policy</a> on page 536   | Creates a schedule policy and enters its configuration mode                                                                                  |
| <a href="#">self</a> on page 539              | Displays a logged device's configuration context                                                                                             |
| <a href="#">sensor-policy</a> on page 540     | Creates a sensor policy and enters its configuration mode                                                                                    |
| <a href="#">smart-rf-policy</a> on page 545   | Creates a Smart RF policy and enters its configuration mode                                                                                  |
| <a href="#">t5</a> on page 546                | Configures a t5 wireless controller. This command is applicable only on the RFS 4000, NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000 platforms. |
| <a href="#">web-filter-policy</a> on page 547 | Creates a Web Filtering policy and enters its configuration mode                                                                             |
| <a href="#">wips-policy</a> on page 553       | Creates a WIPS policy and enters its configuration mode                                                                                      |
| <a href="#">wlan</a> on page 554              | Creates a WLAN (Wireless Local Area Network) and enters its configuration mode                                                               |
| <a href="#">wlan-qos-policy</a> on page 622   | Creates a WLAN QoS policy and enters its configuration mode                                                                                  |
| <a href="#">url-filter</a> on page 623        | Creates an URL filter and enters its configuration mode. URL filtering is a licensed feature.                                                |
| <a href="#">url-list</a> on page 633          | Creates an URL list and enters its configuration mode.                                                                                       |
| <a href="#">vx9000</a> on page 636            | Configures a V-WLC (Virtual WLAN Controller) in a VM (virtual machine) environment                                                           |

**Note**

For more information on common commands (clrcsr, commit, help, revert, service, show, write, and exit), see [COMMON COMMANDS](#) on page 640.

**Note**

The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (\_) character.

*aaa-policy*

Configures an AAA (Authentication, Accounting, and Authorization) policy. Use an AAA policy to define access control within the network.

A controller, service platform, or access point can interoperate with external RADIUS and LDAP servers (AAA Servers) to provide an additional user database and authentication resource. Each WLAN can maintain its own unique AAA configuration. Up to six servers can be configured for providing AAA services.

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
aaa-policy <AAA-POLICY-NAME>
```

## Parameters

```
aaa-policy <AAA-POLICY-NAME>
```

|                   |                                                                           |
|-------------------|---------------------------------------------------------------------------|
| <AAA-POLICY-NAME> | Specify the AAA policy name. If the policy does not exist, it is created. |
|-------------------|---------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#aaa-policy test
nx9500-6C8809(config-aaa-policy-test)#?
AAA Policy Mode commands:
 accounting Configure accounting parameters
 attribute Configure RADIUS attributes in access and accounting
 requests
 authentication Configure authentication parameters
 health-check Configure server health-check parameters
 mac-address-format Configure the format in which the MAC address must be
 filled in the Radius-Request frames
 no Negate a command or set its defaults
 proxy-attribute Configure radius attribute behavior when proxying
 through controller or rf-domain-manager
 server-pooling-mode Configure the method of selecting a server from the
 pool of configured AAA servers
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-aaa-policy-test)#
```

## Related Commands

|    |                                |
|----|--------------------------------|
| no | Removes an existing AAA policy |
|----|--------------------------------|

### Note

For more information on the AAA policy commands, see [AAA-POLICY](#).

## *aaa-tacacs-policy*

Configures AAA TACACS+ (Terminal Access Controller Access-Control System) policy. TACACS+ is a protocol created by CISCO Systems which provides access control to network devices such as routers, network access servers and other networked computing devices through one or more centralized servers. TACACS provides separate authentication, authorization, and accounting services running on different servers.

TACACS controls user access to devices and network resources while providing separate accounting, authentication, and authorization services. Some of the services provided by TACACS are:

- Authorizing each command with the TACACS+ server before execution.
- Accounting each session's logon and log off events.
- Authenticating each user with the TACACS+ server before enabling access to network resources.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>
```

#### Parameters

```
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>
```

<AAA-TACACS-POLICY-NAME> Specify the AAA-TACACS policy name. If the policy does not exist, it is created.

#### Examples

```
nx9500-6C8809(config)#aaa-tacacs-policy testpolicy
nx9500-6C8809(config-aaa-tacacs-policy-testpolicy)#?
AAA TACACS Policy Mode commands:
 accounting Configure accounting parameters
 authentication Configure authentication parameters
 authorization Configure authorization parameters
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-aaa-tacacs-policy-testpolicy)#
```

#### Related Commands

**no** Removes an existing AAA TACACS policy

#### Note

For more information on the AAA-TACACS policy commands, see [AAA-TACACS-POLICY](#).

#### alias

Configures the following types of aliases: network, VLAN, host, string, network-service, etc.

Aliases are objects having a unique name and content that is determined by the alias type (for example, network, VLAN, network-service, etc.).

---

A typical, large enterprise network, consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a TLO (top-level-object). Global aliases are not mandatory, and can be defined at the domain-level, or profile, or device-level only. An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

The different aliases types supported are:

- **address-range alias** – Maps a user-friendly name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.20 through 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.
- **host alias** – Maps a user-friendly name to a specific host (identified by its IP address. For example, 192.168.10.23). A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location's local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.
- **network alias** – Maps a user-friendly name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location's network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.
- **network-group alias** – Maps a user-friendly name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.10-192.168.10.20.

A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created.

A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.

- **network-service alias** – Maps a user-friendly name to service protocols and ports. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per

---

network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.

Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.

- **number alias** – Maps a user-friendly name to a number
- **vlan alias** – Maps a user-friendly name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set at 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26, but utilizes the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.
- **string alias** – Maps a user-friendly name to a specific string (for example, RF Domain name). A string alias can be utilized at different deployments. For example, if the main domain at a remote location is called *loc1.domain.com* and at another deployment location it is called *loc2.domain.com*, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the *loc1.domain.com* domain and at the other with the *loc2.domain.com* domain.
- **encrypted-string alias** – Maps a user-friendly name to a string value. The string value of this alias is encrypted when "password-encryption" is enabled. Encrypted-string aliases can be used for string configuration parameters that are encrypted by the "password-encryption" feature.
- **hashed-string alias** – Maps a user-friendly name to a hashed-string value. Hashed-string aliases can be used for string configuration parameters that are hashed, such as passwords.

#### Note

When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

---

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP>
to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|

| <p>encrypted-string<br/>&lt;ENCRYPTED-STRING-ALIAS-NAME&gt;</p> | <p>Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. For more information, see <a href="#">snmp-server</a> on page 1537 (management policy config mode).</p> <ul style="list-style-type: none"> <li>• &lt;ENCRYPTED-STRING-ALIAS-NAME&gt; - Specify the encrypted-string alias name.</li> </ul> <p><b>Note:</b> Alias name should begin with '\$'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>[0]2] &lt;LINE&gt;</p>                                       | <p>Configures the value associated with the alias name specified in the previous step</p> <ul style="list-style-type: none"> <li>• [0]2] &lt;LINE&gt; - Configures the alias value</li> </ul> <p><b>Note:</b> If password-encryption is enabled, in the <b>show &gt; running-config</b> output, this clear text is displayed as an encrypted string, as shown below:</p> <pre> nx9500-6C8809(config)#show running-config !..... alias encrypted-string \$enString 2 fABMK2is7UToNiZE3MQXbgAAAxB0ZIysdqsEJwr6AH/Da// ! --More-- nx9500-6C8809 </pre> <p>In the above <b>show &gt; running-config</b> output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text. However, if password-encryption is disabled the clear text is displayed as is:</p> <pre> nx9500-6C8809(config)#show running-config !..... ! alias encrypted-string \$enString 0 test11223344 ! --More-- nx9500-6C8809 </pre> <p>For more information on enabling password-encryption, see <a href="#">password-encryption</a> on page 487.</p> |

alias hashed-string <HASHED-STRING-ALIAS-NAME> <LINE>

hashed-string <HASHED-STRING-ALIAS-NAME>

Creates an alias for a hashed string. Use this alias for configuration values that are hashed strings, such as passwords. For example, in the management-policy, use it to define the privilege mode password. For more information, see [privilege-mode-password](#) on page 1532.

- <HASHED-STRING-ALIAS-NAME> - Specify the hashed-string alias name.

**Note:** Alias name should begin with '\$'.

<LINE>

Configures the hashed-string value associated with this alias.

```
nx9500-6C8809(config)#show running-config
!
alias encrypted-string $WRITE 2
sBqVCDAoxs3oByF5PCSuFAAAAAd7HT2+EiT/1/BXm9c4SBDv
!
alias hashed-string $PriMode 1
faffdde27cb49ad634ea20df4f7c8ef2685894d10ffcb1b2efba054112ecfc75
0
--More--
nx9500-6C8809
```

In the above **show > running-config** output, the '!' displayed before the hashed-string alias value indicates that the displayed text is hashed and not clear text.

alias host <HOST-ALIAS-NAME> <HOST-IP>

host <HOST-ALIAS-NAME>

Creates a host alias, defining a single network host

- <HOST-ALIAS-NAME> - Specify the host alias name.

**Note:** Alias name should begin with '\$'.

<HOST-IP>

Associates the network host's IP address with this host alias. For example, 'alias host \$HOST 1.1.1.100'. In this example, the host alias name is: \$HOST and the host IP address it is mapped to is: 1.1.1.100.

- <HOST-IP> - Specify the network host's IP address.

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

network  
<NETWORK-ALIAS-NAME>

Creates a network alias, defining a single network address

- <NETWORK-ALIAS-NAME> - Specify the network alias name.

**Note:** Alias name should begin with '\$'.

<NETWORK-ADDRESS/MASK>

Associates a single network with this network alias. For example, 'alias network \$NET 1.1.1.0/24'. In this example, the network alias name is: \$NET and the network it is mapped to is: 1.1.1.0/24.

- <NETWORK-ADDRESS/MASK> - Specify the network's address and mask.

```
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP>
to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]
```

|                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.</p> <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; – Optional. Configures a destination port number from 1 - 65535</li> <li>• &lt;WORD&gt; – Optional. Identifies the destination port by the service name provided. For example, the SSH service uses TCP port 22.</li> <li>• bgp – Optional. Configures the default BGP (Border Gateway Protocol) services port (179)</li> <li>• dns – Optional. Configures the default DNS (Domain Name System) services port (53)</li> <li>• ftp – Optional. Configures the default FTP (File Transfer Protocol) control services port (21)</li> <li>• ftp-data – Optional. Configures the default FTP data services port (20)</li> <li>• gopher – Optional. Configures the default gopher services port (70)</li> <li>• https – Optional. Configures the default HTTPS services port (443)</li> <li>• ldap – Optional. Configures the default LDAP (Lightweight Directory Access Protocol) services port (389)</li> <li>• nntp – Optional. Configures the default Newsgroup (NNTP) services port (119)</li> </ul> |

- ntp – Optional. Configures the default NTP (Network Time Protocol) services port (123)
- POP3 – Optional. Configures the default POP3 (Post Office Protocol) services port (110)
- proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
- sip – Optional. Configures the default SIP (Session Initiation Protocol) services port (5060)
- smtp – Optional. Configures the default SMTP (Simple Mail Transfer Protocol) services port (25)
- sourceport [<1-65535>|<WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports.
- <1-65535> – Specify the source port from 1 - 65535.
- <WORD> – Specify the source port range, for example 1-10.
- ssh – Optional. Configures the default SSH services port (22)
- telnet – Optional. Configures the default Telnet services port (23)
- tftp – Optional. Configures the default TFTP (Trivial File Transfer Protocol) services port (69)
- www – Optional. Configures the default HTTP services port (80)

`alias number <NUMBER-ALIAS-NAME> <0-4294967295>`

`alias number <NUMBER-ALIAS-NAME>  
<0-4294967295>`

Creates a number alias identified by the <NUMBER-ALIAS-NAME> keyword. Number aliases map a name to a numeric value. For example, *'alias number \$NUMBER 100'*. In this example:

- The number alias name is: *\$NUMBER*
- The value assigned is: *100*

The value referenced by alias \$NUMBER, wherever used, is 100.

- <NUMBER-ALIAS-NAME> – Specify the number alias name.

**Note:** Alias name should begin with '\$'.

- <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created.

`alias string <STRING-ALIAS-NAME> <LINE>`

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Examples

```
rfs4000-229D58(config)#alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
rfs4000-229D58(config)#alias network $TestNetworkAlias 192.168.13.0/24
rfs4000-229D58(config)#alias host $TestHostAlias 192.168.13.100
rfs4000-229D58(config)#alias vlan $TestVLANAlias 1
rfs4000-229D58(config)#alias address-range $AddRangeAlias 192.168.13.2 to 192.168.13.10
rfs4000-229D58(config)#alias network-service $NetServAlias proto igmp
rfs4000-229D58(config)#show running-config | include alias
alias network-group $NetGrAlias address-range 192.168.13.7 to 192.168.13.9 192.168.13.20
to 192.168.13.25
alias network $NetworkAlias 192.168.13.0/24
alias host $HostAlias 192.168.13.10
alias address-range $AddRangeAlias 192.168.13.2 to 192.168.13.10
alias network-service $NetServAlias proto igmp
alias vlan $VlanAlias 1
rfs4000-229D58(config)#
nx9500-6C8809(config)#alias number $NUMBER 100
nx9500-6C8809(config)#show context include-factory | include alias
alias string $DOMAIN test.examplecompany.com
alias string $DOMAIN2 test.example_company.com
alias number $NUMBER 100
alias string $SN B4C7996C8809
nx9500-6C8809(config)#
```

The following examples show encrypted-string alias configuration:

```
nx9500-6C8809(config)#alias encrypted-string $WRITE 0 private
nx9500-6C8809(config)#alias encrypted-string $READ 0 public
nx9500-6C8809(config)#show context | include alias
alias vlan $BLR-01 1
alias string $IN-Blr-EcoSpace-Floor-4 IBEF4
alias encrypted-string $READ 0 public
```

```
alias encrypted-string $WRITE 0 private
nx9500-6C8809(config)#
```

The following example shows the encrypted-string aliases, configured in the previous example, used in the management-policy:

```
nx9500-6C8809(config-management-policy-default)#snmp-server community 0 $WRITE rw
nx9500-6C8809(config-management-policy-default)#snmp-server community 0 $READ ro

## ap6522

Adds an AP 6522 to the network. If a profile for the AP is not available, a new profile is created.

### Supported in the following platforms:

- Access Point — AP 6522
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ap6522 <MAC>
```

### Parameters

```
ap6522 <MAC>
```

|       |                                    |
|-------|------------------------------------|
| <MAC> | Specify the AP 6522's MAC address. |
|-------|------------------------------------|

### Examples

```
nx9500-6C8809(config)#ap6522 B4-C7-99-58-72-58
nx9500-6C8809(config-device-B4-C7-99-58-72-58)#show context

## ap6562

Adds an AP 6562 to the network. If a profile for the AP is not available, a new profile is created.

### Supported in the following platforms:

- Access Point — AP 6562
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ap6562 <MAC>
```

### Parameters

```
ap6562 <MAC>
```

<MAC> Specify the AP 6562's MAC address.

### Examples

```
nx9500-6C8809(config)#ap6562 00-23-68-31-16-59

### Related Commands

**no** Removes an AP 6562 from the network

## ap7161

Adds an AP 7161 series to the network. If a profile for the AP is not available, a new profile is created.

### Supported in the following platforms:

- Access Point — AP 7161
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ap71xx <MAC>
```

### Parameters

```
ap71xx <MAC>
```

<MAC> Specify the AP 7161's MAC address.

### Examples

```

### ap7502

Adds an AP 7502 to the network. If a profile for the AP is not available, a new profile is created.

### Supported in the following platforms:

- Access Point — AP 7502
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ap7502 <MAC>
```

### Parameters

```
ap7502 <MAC>
```

|       |                                    |
|-------|------------------------------------|
| <MAC> | Specify the AP 7502's MAC address. |
|-------|------------------------------------|

### Examples

```

rfs4000-6DB5D4(config)#ap7502 00-23-68-99-BF-A8

### *ap7522*

Adds an AP 7502 to the network. If a profile for the AP is not available, a new profile is created.

#### Supported in the following platforms:

- Access Point — AP 7522
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

`ap7522 <MAC>`

#### Parameters

`ap7522 <MAC>`

|                          |                                    |
|--------------------------|------------------------------------|
| <code>&lt;MAC&gt;</code> | Specify the AP 7522's MAC address. |
|--------------------------|------------------------------------|

#### Examples

```
NOC-NX9500(config)#ap7522 84-24-8D-83-30-A4

## application

Creates a new application definition and enters its configuration mode. Use this command to create a customized application detection definition.

### Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
application <APPLICATION-NAME>
```

### Parameters

```
application <APPLICATION-NAME>
```

|                                |                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| application <APPLICATION-NAME> | Creates a new application definition and enters its configuration mode                                                                                                              |
|                                | <ul style="list-style-type: none"> <li>&lt;APPLICATION-NAME&gt; – Specify a name of the new application definition. It is created if not already existing in the system.</li> </ul> |

### Examples

```

nx9500-6C8809(config)#application Bing
nx9500-6C8809(config-application-Bing)#?
Application Mode commands:
 app-category Set application category (default is custom)
 description Add application description
 https Secure HTTP
 no Negate a command or set its defaults
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system

### application-mode-commands

The following table summarizes Application definition configuration mode commands:

**Table 7: Application Config Mode Commands**

| Command                                            | Description                                                                                                                                                |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| app-category (application-config-mode) on page 259 | Configures the category for this application definition                                                                                                    |
| description (application-config-mode) on page 260  | Configures a description for this application definition                                                                                                   |
| https (application-config-mode) on page 261        | Configures the HTTPS common-name attribute value for this application category's server certificate. Applicable only to applications using HTTPS protocol. |
| use (application-config-mode) on page 261          | Associates a network-service alias or a URL list with this application definition. Applicable for applications using protocols other than HTTPS.           |
| no (application-config-mode) on page 262           | Removes or resets this application definition's configured settings                                                                                        |

app-category (application-config-mode)

Configures the category for this application definition

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
app-category <APP-CATEGORY-NAME>
```

#### Parameters

```
app-category <APP-CATEGORY-NAME>
```

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| app-category <APP-CATEGORY-NAME> | Select the category best suited for this application definition. There are twenty three categories. These are: business, conference, custom, database, filetransfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and Web.<br>The default setting is custom. Use this option to categorize your internal custom applications, so that they do not appear as unknown traffic. |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-application-Bing)#app-category [TAB]
business conference custom
database filetransfer gaming
generic im mail
mobile network\ management other
p2p remote_control sharehosting
social\ networking streaming tunnel
voip web
```

```
nx9500-6C8809(config-application-Bing)#
nx9500-6C8809(config-application-Bing)#app-category streaming
nx9500-6C8809(config-application-Bing)#show context
application Bing
 app-category streaming
nx9500-6C8809(config-application-Bing)#
```

#### Related Commands

|                                          |                                                 |
|------------------------------------------|-------------------------------------------------|
| no (application-config-mode) on page 262 | Resets application category to default (custom) |
|------------------------------------------|-------------------------------------------------|

description (application-config-mode)

Configures a description for this application definition

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
description <WORD>
```

#### Parameters

```
description <WORD>
```

|                    |                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <WORD> | Configures a description for this application <ul style="list-style-type: none"><li>• &lt;WORD&gt; - Specify a description not exceeding 80 characters in length. Enter the descriptive text within double quotes.</li></ul> |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-application-Bing)#description "Bing is Microsoft's Web search engine"
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's Web search engine"
 app-category streaming
nx9500-6C8809(config-application-Bing)#
```

## Related Commands

|                                                       |                                                          |
|-------------------------------------------------------|----------------------------------------------------------|
| <code>no (application-config-mode)</code> on page 262 | Removes this description configured for this application |
|-------------------------------------------------------|----------------------------------------------------------|

## https (application-config-mode)

Configures the HTTPS parameter type, attribute type, match criteria for the HTTPS server name and 64 character maximum server name attribute used in the HTTPS server message exchange

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

```
https server-cert common-name [contains|ends-with] <WORD>
```

## Parameters

```
https server-cert common-name [contains|ends-with] <WORD>
```

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| https server-cert                       | Configures the HTTPS parameter type as server certificate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| common-name [contains ends-with] <WORD> | Configures the HTTPS attribute match criteria as common name. This is the only option applicable when the HTTPS parameter type is set to server-cert. Use one of the following options to provide the common-name attribute value used as the match criteria: <ul style="list-style-type: none"><li>• contains - Filters applications having common-name attributes containing the string specified here</li><li>• ends-with - Filters applications ending with the string specified here<ul style="list-style-type: none"><li>• &lt;WORD&gt; - Specify the string to match (should not exceed 64 characters).</li></ul></li></ul> |

## Examples

```
nx9500-6C8809(config-application-Bing)#https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's web search engine"
 app-category streaming
 https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#
```

## Related Commands

|                                                       |                                                                                         |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>no (application-config-mode)</code> on page 262 | Removes the HTTPS common-name attribute value configured with this application category |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------|

## use (application-config-mode)

Associates a network-service alias or a URL list with this application definition

For applications using protocols other than HTTPS, use this command to define the protocols, ports, and/or URL host name to match.

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

#### Parameters

```
use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| use                                          | Configures this application definition to use a network-service alias or a URL list                                                                                                                                                                                                                                                                                                                                       |
| network-service <NETWORK-SERVICE-ALIAS-NAME> | Associates a network-service alias with this application definition <ul style="list-style-type: none"><li>• &lt;NETWORK-SERVICE-ALIAS-NAME&gt; - Specify the network-service alias name (should be existing and configured). The network-service alias should specify the protocols and ports to match.</li></ul>                                                                                                         |
| url-list <URL-LIST-NAME>                     | Associates a URL list with this application definition. URL lists are utilized for whitelisting and blacklisting Web application URLs from being launched and consuming bandwidth within the WiNG managed network. <ul style="list-style-type: none"><li>• &lt;URL-LIST-NAME&gt; - Specify the URL list name (should be existing and configured). The URL list should specify the HTTP URL host names to match.</li></ul> |

#### Examples

```
nx9500-6C8809(config-application-Bing)#use url-list Bing
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's web search engine"
 app-category streaming
 use url-list Bing
 https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#
```

#### Related Commands

|                                          |                                                                                               |
|------------------------------------------|-----------------------------------------------------------------------------------------------|
| no (application-config-mode) on page 262 | Removes the network-service alias or the URL list associated with this application definition |
|------------------------------------------|-----------------------------------------------------------------------------------------------|

no (application-config-mode)

Removes or resets this application definition's configured settings

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
no [app-category|description|https|use]
no [app-category|description]
no https server-cert common-name [contains|ends-with] <WORD>
no use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]
```

#### Parameters

```
no <PARAMETERS>
```

|                 |                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this application definition's configured settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------------------------------|

Example (User Exec Mode)

Example (Privi Exec Mode)

The following example displays the application definition 'Bing' parameters before the 'no' commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
 description "Bing is Microsoft's web search engine"
 app-category streaming
 use url-list Bing
 https server-cert common-name exact bing.com
nx9500-6C8809config-application-Bing)#
nx9500-6C8809(config-application-Bing)#no description
nx9500-6C8809(config-application-Bing)#no https server-cert common-name exact bing.com
```

The following example displays the application definition 'Bing' parameters after the 'no' commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
 app-category streaming

```

### *application-group*

An application group is a collection of system-provided and/or user-defined applications. It is a subset of the total number of supported applications. There are a total of 300 system-provided applications.

WiNG, nx9500-6C8809

#### **Supported in the following platforms:**

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
application-group <APPLICATION-GROUP-NAME>
```

#### **Parameters**

```
application-group <APPLICATION-GROUP-NAME>
```

|                                               |                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| application-group<br><APPLICATION-GROUP-NAME> | Creates an application group and enters its configuration mode <ul style="list-style-type: none"> <li>• &lt;APPLICATION-GROUP-NAME - Specify the application group name. If an application group with the specified name does not exist, it is created. The name should not exceed 32 characters in length.</li> </ul> |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### **Examples**

```
nx9500-6C8809(config)#application-group amazon
nx9500-6C8809(config-app-group-amazon)#?
Application Group Mode commands:
 application Add application to group
```

### Related Commands

`no (global-config-mode)` Removes an existing application group on page 475

### application-group-mode-commands

The following table summarizes the application group configuration mode commands:

**Table 8: Application Group Config Commands**

| Command                                                              | Description                                                                             |
|----------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>application (application-group-config-mode)</code> on page 264 | Adds an application to this application group                                           |
| <code>description (application-group-config-mode)</code> on page 265 | Configures a description for this application group                                     |
| <code>no (application-group-config-mode)</code> on page 266          | Removes this application group's configured parameters (application and/or description) |

#### application (application-group-config-mode)

Adds an application to this application group. You can add a system-provided or user-defined application.

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
application <APPLICATION-NAME>
```

#### Parameters

```
application <APPLICATION-NAME>
```

application <APPLICATION-NAME>

Configures the application to be added to this application group

- <APPLICATION-NAME> - Provide the application name (should be available as an option in the system). A maximum of eight (8) applications can be added to a group.

**Note:** If the desired application is not available as an option, use the `application` command to add it.

## Examples

To view all applications available in the system, use [TAB], as shown in the following example:

```
nx9500-6C8809(config-app-group-test)#application [TAB]
Display all 300 possibilities? (y or n)
1-clickshare-com 1-upload-com
1-upload-to 10upload-com

--More--
nx9500-6C8809(config-app-group-test)#
```

Select the desired application from the list displayed, as shown in the following examples:

```
nx9500-6C8809(config-app-group-amazon)#application amazon [TAB]
amazon-prime-music amazon-prime-video amazon_cloud amazon_shop
nx9500-6C8809(config-app-group-amazon)#
nx9500-6C8809(config-app-group-amazon)#application amazon-prime-music
nx9500-6C8809(config-app-group-amazon)#application amazon-prime-video
nx9500-6C8809(config-app-group-amazon)#application amazon_cloud
nx9500-6C8809(config-app-group-amazon)#application amazon_shop
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
 application amazon-prime-music
 application amazon-prime-video
 application amazon_cloud
 application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

Note, the system returns an error message if the application entered is not listed, as shown in the following example:

```
nx9500-6C8809(config-app-group-test)#application bing
% Error: application 'bing' is not defined
nx9500-6C8809(config-app-group-test)#
```

## Related Commands

`no (application-group-config-mode)` on page 266

Removes a specified application from this application group

description (application-group-config-mode)

Configures a description for this application group

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

description <WORD>

## Parameters

description <WORD>

|                    |                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description <WORD> | Configures a description for this application group that uniquely differentiates it from other existing application groups <ul style="list-style-type: none"><li>• &lt;WORD&gt; - Provide a description not exceeding 80 characters in length.</li></ul> |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-app-group-amazon)#description "This application-group lists
all Amazon applications."
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
description "This application-group lists all Amazon applications."
application amazon-prime-music
application amazon-prime-video
application amazon_cloud
application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

## Related Commands

|                                                |                                                               |
|------------------------------------------------|---------------------------------------------------------------|
| no (application-group-config-mode) on page 266 | Removes the description configured for this application group |
|------------------------------------------------|---------------------------------------------------------------|

## no (application-group-config-mode)

Removes this application group's configured parameters (application and/or description)

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

```
no [application <APPLICATION-NAME>|description]
```

## Parameters

```
no [application <APPLICATION-NAME>|description]
```

|                 |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes an application associated with this group, and removes this group's description |
|-----------------|-----------------------------------------------------------------------------------------|

## Examples

The following example displays the application-group 'amazon' configuration before the execution of 'no' commands:

```
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
description "This application-group lists all Amazon applications."
application amazon-prime-music
application amazon-prime-video
application amazon_cloud
application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
nx9500-6C8809(config-app-group-amazon)#no application amazon_cloud
nx9500-6C8809(config-app-group-amazon)#no description
```

The following example displays the application-group 'amazon' configuration after the execution of 'no' commands:

```
nx9500-6C8809(config-app-group-amazon)#show context
application-group amazon
 application amazon-prime-music
 application amazon-prime-video
 application amazon_shop
nx9500-6C8809(config-app-group-amazon)#
```

### *application-policy*

When an application is recognized and classified by the WiNG application recognition engine, administrator defined actions can be applied to that specific application. An application policy defines the rules or actions executed on recognized applications (for example, Facebook) or application-categories (for example, social-networking). The following are the rules/actions that can be applied in an application policy:

- *Allow* - Allows packets for a specific application or application category
- *Deny* - Denies packets for a specific application or application category
- *Mark* - Marks packets with DSCP/8021p value for a specific application or application category
- *Rate-limit* - Rate limits packets from specific application types.

For each rule defined, a precedence is assigned to resolve conflicting rules for applications and categories. A *deny* rule is exclusive, as no other action can be combined with a deny. An *allow* rule is redundant with other actions, since the default action is allow. An allow rule is useful when wanting to deny packets for a category, but wanting to allow a few applications in the same category to proceed. In such a cases, add an allow rule for applications with a higher precedence then a deny rule for that category.

*Mark* actions mark packets for a recognized application and category with DSCP/8021p values used for QoS. Rate-limits create a rate-limiter applied to packets recognized for an application and category. Ingress and egress rates need to be specified for the rate-limiter, but both are not required. Mark and rate-limit are the only two actions that can be combined for an application and category. All other combinations are invalid.

Once created and configured, apply the application policy at the following levels within the network to enforce application assurance:

- RADIUS CoA usage - In the device/profile configuration mode, use the **application-policy > radius > <APPLICATION-POLICY-NAME>** command to apply the policy to every user successfully authenticated by the RADIUS server.
- User role - In the role-policy-user-role configuration mode, use the **use > application-policy <APPLICATION-POLICY-NAME>** command to apply the policy to all users assigned to the role.
- WLAN - In the WLAN configuration mode, use the **use > application-policy <APPLICATION-POLICY-NAME>** command to apply the policy to all users accessing the WLAN.
- Bridge VLAN - In the bridge VLAN configuration mode, use the **use > application-policy <APPLICATION-POLICY-NAME>** command to apply the policy for the traffic corresponding to the bridged VLAN.

#### **Supported in the following platforms:**

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

```
application-policy <APPLICATION-POLICY-NAME>
```

## Parameters

```
application-policy <APPLICATION-POLICY-NAME>
```

|                                                 |                                                                                                                                                                          |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| application-policy<br><APPLICATION-POLICY-NAME> | Specify the application policy name. If an application policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length. |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#application-policy TestAppliPolicy
nx9500-6C8809(config-app-policy-TestAppliPolicy)#?
Application Policy Mode commands:
 allow Allow packets
 deny Deny packets
 description Application policy description
 enforcement-time Configure policy enforcement based on time
 logging Application recognition logging
 mark Mark packets
 no Negate a command or set its defaults
 rate-limit Rate-limit packets

## application-policy-mode-commands

The following table summarizes Application policy configuration mode commands:

**Table 9: Application Policy Config Commands**

| Command                                                                  | Description                                                                                                                      |
|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">allow (application-policy-config-mode)</a> on page 269       | Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action appliedc |
| <a href="#">deny (application-policy-config-mode)</a> on page 272        | Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied     |
| <a href="#">description (application-policy-config-mode)</a> on page 274 | Configures a brief description for this application policy that enables you to differentiate it from other application policies  |

**Table 9: Application Policy Config Commands (continued)**

| Command                                                                    | Description                                                                                                                                                  |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>enforcement-time (application-policy-config-mode)</code> on page 275 | Configures an enforcement time period in days and hours for this application policy. The policy is enforced only during the specified time period.           |
| <code>logging (application-policy-config-mode)</code> on page 276          | Enables logging of application recognition hits made by the DPI engine. It also sets the logging level.                                                      |
| <code>mark (application-policy-config-mode)</code> on page 277             | Creates a mark rule and configures the match criteria based on which packets are filtered and marked with 802.1p priority value or DSCP code                 |
| <code>rate-limit (application-policy-config-mode)</code> on page 280       | Creates a rate-limit rule and configures the match criteria based on which incoming and outgoing packets are filtered and the configured rate limits applied |
| <code>no (application-policy-config-mode)</code> on page 282               | Removes or resets this application policy settings                                                                                                           |

### allow (application-policy-config-mode)

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

#### Parameters

```
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow                                  | Creates an allow rule and configures the match criteria. The options are app-category and application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| app-category [<APP-CATEGORY-NAME> all] | <p>Uses application category as the match criteria</p> <ul style="list-style-type: none"> <li>• &lt;APP-CATEGORY-NAME&gt; - Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system forwards the packet or else drops it.</li> <li>• all - The system forwards all packets irrespective of the application category.</li> </ul> |

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>application &lt;APPLICATION-NAME&gt;</p>  | <p>Uses application name as the match criteria</p> <ul style="list-style-type: none"> <li>• &lt;APPLICATION-NAME&gt; – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system forwards the packet.</li> </ul> <p><b>Note:</b> The WiNG system provides approximately 381 canned applications. In addition to these, the database also includes custom-made applications. These are application definitions created using the <a href="#">application</a> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p>schedule &lt;SCHEDULE-POLICY-NAME&gt;</p> | <p>Schedules an enforcement time for this allow rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> <li>• schedule &lt;SCHEDULE-POLICY-NAME&gt; – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy &gt; enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all').</li> <li>• &lt;SCHEDULE-POLICY-NAME&gt; – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</li> </ul> <p><b>Note:</b> In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see <a href="#">enforcement-time</a>.</p> |
| <p>precedence &lt;1-256&gt;</p>              | <p>Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</p> <p>Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>. The action required is: Allow youtube packets, and deny all other applications belonging to app-category streaming.</p> <p>The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p>                                                                                                                                                                                                                                                                                            |

## Examples

The following example shows how to view all built-in, system provided applications:

```
nx9500-6C8809(config-app-policy-test)#allow application [TAB]
Display all 300 possibilities? (y or n)
1-clickshare-com 1-upload-com
1-upload-to 10upload-com
123upload-pl 139pan-com
163pan-com 1clickshare-net
1fichier-com 1kxun
2channel 2gis
2shared-com 360mobile
4fastfile-com 4share-ws
Dota\ 2 EA\ Origin
--More--
nx9500-6C8809(config-app-policy-test)#
```

The following examples show two allow rules, allowing access to all packets belonging to the application category 'business' and the application 'Bing':

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bi [TAB]
Bing BitTorrent BitTorrent_encrypted
BitTorrent_plain BitTorrent_uTP BitTorrent_uTP_encrypted
nx9500-6C8809(config-app-policy-Bing)#
```

Note: Bing is not one of the WING built-in database applications. It is a customized application created using the application command.

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
nx9500-6C8809(config-app-policy-Bing)#allow app-category [TAB]
all antivirus\ update audio
business conference custom
database filetransfer gaming
generic im mail
mobile network\ management other
p2p remote_control social\ networking
standard streaming tunnel
video voip web
nx9500-6C8809(config-app-policy-Bing)#
nx9500-6C8809(config-app-policy-Bing)#allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 allow application Bing precedence 1
 allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#
```

The following example shows an application policy 'SocialNet' having an allow rule with an associated schedule policy named 'FaceBook':

```
nx9500-6C8809(config-app-policy-SocialNet)#allow application facebook schedule Facebook
precedence 1
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
 description "This application policy relates to Social Networking sites."
 allow application facebook schedule FaceBook precedence 1
nx9500-6C8809(config-app-policy-SocialNet)#
```

The schedule policy 'FaceBook' configuration is as follows. As per this policy, the above allow rule will apply to all FaceBook packets every Friday between 13:00 and 18:00 hours.

```
nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
 description "Allows FaceBook traffic on Fridays."
 time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#
```

|--------------------------------------------------------------|-----------------------------------------------------|
| <code>no (application-policy-config-mode)</code> on page 282 | Removes this allow rule from the application policy |
|--------------------------------------------------------------|-----------------------------------------------------|

### deny (application-policy-config-mode)

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

#### Parameters

```
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                   | Creates a deny rule and configures the match criteria. The options are app-category and application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| app-category [<APP-CATEGORY-NAME> all] | Uses application category as the match criteria <ul style="list-style-type: none"><li>• &lt;APP-CATEGORY-NAME&gt; - Specify the application category name. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system drops the packet.</li><li>• all - The system drops all packets irrespective of the application category.</li></ul> |

In addition to these, the database displays custom-made applications also. These are application definitions created using the application command.</p>                                                                                                                             |

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>schedule &lt;SCHEDULE-POLICY-NAME&gt;</p> | <p>Schedules an enforcement time for this deny rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> <li>• schedule &lt;SCHEDULE-POLICY-NAME&gt; - Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy &gt; enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all').</li> <li>• &lt;SCHEDULE-POLICY-NAME&gt; - Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</li> </ul> <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see <a href="#">enforcement-time</a>.</p> |
| <p>precedence &lt;1-256&gt;</p>              | <p>Assigns a precedence value for this deny rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule. Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>. The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Examples

The following example shows one deny rule, denying access to all packets belonging to the application category 'social\ networking':

```
nx9500-6C8809(config-app-policy-Bing)#deny app-category social\ networking precedence 3
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

The following example displays the schedule policy 'DenyS-N' settings. The time-rule defined in the policy is all weekdays from 9:30 AM to 11:30 PM.

```
nx9500-6C8809(config-schedule-policy-DenyS-N)#show context
schedule-policy DenyS-N
 description "Denies all social Networking sites on weekdays."
 time-rule days weekdays start-time 09:30 end-time 23:30
nx9500-6C8809(config-schedule-policy-DenyS-N)#
```

The following example displays the schedule policy 'FaceBook' settings. The time-rule defined in the policy is Friday from 1:00 PM to 6:00 PM.

```
nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
 description "Allows FaceBook traffic on Fridays."
 time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#
```

The following example shows an application policy 'SocialNet' defining an allow and deny rule. Both rules have different enforcement time, defined by their respective schedule policies (DenyS-N and FaceBook). As per these two schedule policy settings, this application policy:

- Denies all social\ networking sites on weekdays (barring Fridays between 1:00 PM to 6:00 PM) from 9:30 AM to 11:30 PM.
- On Fridays, between 1:00 PM to 6:00 PM, it:
  - Denies all social\ networking sites except Facebook.

```
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
 description "This application policy relates to Social Networking sites."
 allow application facebook schedule FaceBook precedence 1
 deny app-category "social networking" schedule DenyS-N precedence 2
nx9500-6C8809(config-app-policy-SocialNet)#
```

```

## Related Commands

`no (application-policy-config-mode)` Removes this application policy's description  
on page 282

### enforcement-time (application-policy-config-mode)

Configures an enforcement time period in days and hours for this application policy. The enforcement time is applicable only to those rules, within the application policy, that do not have a schedule policy associated. By default an application policy is enforced on all days.

#### Note

Schedule policies are a means of enforcing allow/deny/mark/rate-limit rules at different time periods. If no schedule policy is applied, all rules within an application policy are enforced at the time specified using this enforcement-time command. For more information on configuring a schedule policy, see [schedule-policy](#).

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

#### Parameters

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## logging (application-policy-config-mode)

Enables DPI application recognition logging. It also sets the logging level.

DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

```
logging [level|on]
logging on
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

## Parameters

```
logging on
```

|                         |                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------|
| <code>logging on</code> | Enables logging of application recognition hits made by the DPI engine. This option is disabled by default. |
|-------------------------|-------------------------------------------------------------------------------------------------------------|

```
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
notifications|warnings]
```

```
logging level [<0-7>|alerts| critical|
debugging| emergencies|errors|
informational| notifications| warnings]
```

Sets the logging level for application recognition hits made by the DPI engine. This option is disabled by default.

- <0-7> - Sets the message logging severity level on a scale of 0 - 7
- emergencies - Severity level 0: System is unusable
- alerts - Severity level 1: Requires immediate action
- critical - Severity level 2: Critical conditions
- errors - Severity level 3: Error conditions
- warnings - Severity level 4: Warning conditions
- notifications - Severity level 5: Normal but significant conditions (this is the default setting)
- informational - Severity level 6: Informational messages
- debugging - Severity level 7: Debugging messages

### Examples

```
nx9500-6C8809(config-app-policy-Bing)#logging level critical
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
 description "This application policy allows Bing search engine packets"
 enforcement-time days weekdays start-time 12:30 end-time 20:00
 allow application Bing precedence 1
 allow app-category business precedence 2
 deny app-category "social networking" precedence 3
 logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

### Related Commands

**no (application-policy-config-mode)** on page 282

Resets the logging level to default (notifications). And the no > logging > on command disables DPI logging.

## mark (application-policy-config-mode)

Creates a mark rule and configures the match criteria based on which packets are marked

Marks packets, matching a specified set of application categories or applications/protocols, with 802.1p priority level or DSCP ToS (type of service) code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

WiNG, nx9500-6C8809

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] [8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

### Parameters

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] [8021p <0-7>|dscp <0-63>] schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mark                                   | Creates a mark rule and configures the match criteria. When applied, the rule marks packets, matching the criteria configured here, with 802.1p priority value or DSCP code. The match criteria options are: app-category and application.                                                                                                                                                                                                                                                                                                                                                                                                          |
| app-category [<APP-CATEGORY-NAME> all] | <p>Uses application category as the match criteria</p> <ul style="list-style-type: none"> <li>• &lt;APP-CATEGORY-NAME&gt; – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system marks the packet.</li> <li>• all – The system marks all packets irrespective of the application category.</li> </ul> |
| application <APPLICATION-NAME>         | <p>Uses application name as the match criteria</p> <ul style="list-style-type: none"> <li>• &lt;APPLICATION-NAME&gt; – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system marks the packet.</li> </ul> <p>The WiNG database provides approximately 300 canned applications. In addition to these, the database includes custom-made applications. These are application definitions created using the <a href="#">application</a> command.</p>                                                                                                             |
| 8021p <0-7>                            | <p>Marks packets matching the specified criteria with 802.1p priority value</p> <ul style="list-style-type: none"> <li>• &lt;0-7&gt; – Specify a value from 0 - 7.</li> </ul> <p>The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet's MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.</p>                                                              |
| dscp <0-63>                            | <p>Marks packets matching the specified criteria with DSCP ToS code</p> <ul style="list-style-type: none"> <li>• &lt;0-63&gt; – Specify a value from 0 - 63.</li> </ul> <p>The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet's IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.</p>                                                                                                                                                                  |

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>schedule &lt;SCHEDULE-POLICY-NAME&gt;</p> | <p>Schedules an enforcement time for this mark rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> <li>• schedule &lt;SCHEDULE-POLICY-NAME&gt; – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy &gt; enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all').</li> <li>• &lt;SCHEDULE-POLICY-NAME&gt; – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</li> </ul> <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see <a href="#">enforcement-time</a>.</p> |
| <p>precedence &lt;1-256&gt;</p>              | <p>Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule. Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>. The action required is: Allow youtube packets and deny all other applications belonging to app-category streaming. The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p>                                                                                                                                                                                                                                                                                                       |

### Examples

```
nx9500-6C8809(config-app-policy-Bing)#mark app-category video dscp 9 precedence 4
nx9500-6C8809(config-app-policy-Bing)#mark application facetime dscp 10 precedence 5
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

### Related Commands

`no (application-policy-config-mode)` Removes this mark rule from the application policy on page 282

## rate-limit (application-policy-config-mode)

Creates a rate-limit rule and configures the match criteria

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

### Parameters

```
rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

| schedule <SCHEDULE-POLICY-NAME> | <p>Schedules an enforcement time for this rate-limit rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</p> <ul style="list-style-type: none"> <li>schedule &lt;SCHEDULE-POLICY-NAME&gt; – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced concurrently (defined by the application-policy &gt; enforcement-time command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy's enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as 'all').</li> <li>&lt;SCHEDULE-POLICY-NAME&gt; – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</li> </ul> <p>In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see <a href="#">enforcement-time</a>.</p> |
| precedence <1-256>              | <p>Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</p> <p>Let us consider application <i>youtube</i> belonging to app-category <i>streaming</i>. The action required is: Allow youtube packets and deny all other applications belonging to app-category streaming.</p> <p>The rules can be defined as:</p> <pre>#allow application youtube precedence 1 #deny app-category streaming precedence 2</pre> <p>The following configuration is incorrect:</p> <pre>#deny app-category streaming precedence 1 #allow application youtube precedence 2</pre> <p>Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.</p> <p>The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</p>                                                                                                                                                                                                                                                                                           |

### Examples

```
nx9500-6C8809(config-app-policy-Bing)#rate-limit application BGP ingress rate 100
max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
```

```

mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-
size 25 precedence 6
logging level critical
nx9500-6C8809(config-app-policy-Bing)#

```

#### Related Commands

|--------------------------------------------------|----------------------------------------------------------------------|
| <code>no (application-policy-config-mode)</code> | Removes this rate-limit rule from the application policy on page 282 |
|--------------------------------------------------|----------------------------------------------------------------------|

#### no (application-policy-config-mode)

Removes or resets this application policy's settings

Supported in the following platforms:

- Access Points — AP 7522, AP 7532
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```

no [allow|deny|description|enforcement-time|logging|mark|rate-limit]
no allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
precedence <1-256>
no deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] precedence
<1-256>
no description
no enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|
weekends|weekdays]
no logging [level|on]
no mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] precedence
<1-256>
no rate-limit [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
precedence <0-256>

```

#### Parameters

```
no <PARAMETERS>
```

|                                    |                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------|
| <code>no &lt;PARAMETERS&gt;</code> | Removes or resets this application policy settings based on the parameters passed |
|------------------------------------|-----------------------------------------------------------------------------------|

#### Examples

The following example shows the application policy 'Bing' settings before the 'no' commands are executed:

```

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-
size 25 precedence 6

```

```

logging level critical
nx9500-6C8809(config-app-policy-Bing)#
nx9500-6C8809(config-app-policy-Bing)#no allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#no deny app-category social\ networking precedence 3

```

The following example shows the application policy 'Bing' settings after the 'no' commands are executed:

```

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
logging level critical
nx9500-6C8809(config-app-policy-Bing)#

```

### *association-acl-policy*

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>
```

#### **Parameters**

```
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>
```

|                               |                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------|
| <ASSOCIATION-ACL-POLICY-NAME> | Specify the association ACL policy name. If the policy does not exist, it is created. |
|-------------------------------|---------------------------------------------------------------------------------------|

#### **Examples**

```

NOC-NX9500(config)#association-acl-policy test
NOC-NX9500(config-assoc-acl-test)#?
Association ACL Mode commands:
deny Specify MAC addresses to be denied
no Negate a command or set its defaults
permit Specify MAC addresses to be permitted

|-----------------|-------------------------------------|
| <code>no</code> | Removes this Association ACL Policy |
|-----------------|-------------------------------------|

### Note

For more information on the association-acl-policy, see [ASSOCIATION-ACL-POLICY](#).

## *auto-provisioning-policy*

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>
```

### Parameters

```
auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>
```

|                                 |                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------|
| <AUTO-PROVISIONING-POLICY-NAME> | Specify the auto provisioning policy name. If the policy does not exist, it is created. |
|---------------------------------|-----------------------------------------------------------------------------------------|

### Examples

```
NOC-NX9500(config)#auto-provisioning-policy test
NOC-NX9500(config-auto-provisioning-policy-test)#?
Auto-Provisioning Policy Mode commands:
 adopt Add rule for device adoption
 auto-create-rfd-template When RF Domain specified by the matching rule
 template does not exist create new RF Domain
 automatically
 default-adoption Adopt devices even when no matching rules are
 found. Assign default profile and default
 rf-domain
 deny Add rule to deny device adoption
 evaluate-always Set the flag to evaluate the policy everytime,
 regardless of previous adoption status
 no Negate a command or set its defaults
 redirect Add rule to redirect device adoption
 upgrade Add rule for device upgrade

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
```

## bgp

Configures BGP (Border Gateway Protocol) settings

BGP is an inter-ISP routing protocol which establishes routing between ISPs (Internet Service Providers). ISPs use BGP to exchange routing and reachability information between AS (Autonomous Systems) on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use IGP (Interior Gateway Protocol) and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed).

WiNG, nx9500-6C8809

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>
```

## Parameters

bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

|                               |                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as-path-list <LIST-NAME>      | Creates an AS path list and enters its configuration mode <ul style="list-style-type: none"><li>&lt;LIST-NAME&gt; - Provide the AS-PATH-LIST name.</li></ul>                 |
| community-list <LIST-NAME>    | Creates a community list and enters its configuration mode <ul style="list-style-type: none"><li>&lt;LIST-NAME&gt; - Provide the COMMUNITY-LIST name.</li></ul>              |
| extcommunity-list <LIST-NAME> | Creates an extended community list and enters its configuration mode <ul style="list-style-type: none"><li>&lt;LIST-NAME&gt; - Provide the EXTCOMMUNITY-LIST name.</li></ul> |
| ip-access-list <LIST-NAME>    | Creates a BGP IP access list and enters its configuration mode <ul style="list-style-type: none"><li>&lt;LIST-NAME&gt; - Provide the BGP IP-ACCESS-LIST name.</li></ul>      |
| ip-prefix-list <LIST-NAME>    | Creates a BGP IP prefix list and enters its configuration mode <ul style="list-style-type: none"><li>&lt;LIST-NAME&gt; - Provide the BGP IP-PREFIX-LIST name.</li></ul>      |

## Examples

```
nx9500-6C8809(config)#bgp ?
 as-path-list BGP AS path list Configuration
 community-list Add a community list entry
 extcommunity-list Add a extended community list entry (EXPERIMENTAL)
 ip-access-list Add an access list entry
 ip-prefix-list Build a prefix list
```

```
nx9500-6C8809(config)#
nx9500-6C8809(config)#bgp as-path-list AS-TEST-PATH
nx9500-6C8809(config-bgp-as-path-list-AS-TEST-PATH)#?
BGP AS Path List Mode commands:
 deny Specify packets to reject
 no Negate a command or set its defaults
 permit Specify packets to forward

## *bonjour-gw-discovery-policy*

Bonjour is Apple's zero-configuration networking (Zeroconf) implementation. Bonjour enables automatic IP address assignment, name to address resolution, and service discovery without having to configure a DHCP server, DNS server, and Directory server. When configured and applied on a WLAN, the Bonjour Gateway Discovery policy queries for and locates Bonjour devices (printers, computers, file-sharing servers, etc.) and services these computers provide over a local network. Bonjour works only within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

Use this command to configure a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access points, wireless controllers, or service platforms.

When configured and applied, this feature enables Bonjour services on local and tunneled VLANs.

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

### **Parameters**

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### bonjour-gw-discovery-policy-config-commands

The following table summarizes the Bonjour Gateway Discovery Policy configuration mode commands:

**Table 10: Bonjour GW Discovery Policy Config Commands**

| Command                                                                            | Description                                                                                                                                            |
|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">allow-service (bonjour-gw-discovery-policy-cogig-mode)</a> on page 288 | Configures the Bonjour Services that can be discovered on Local or Tunneled VLANs. It configures the local VLANs on which these services can be found. |
| <a href="#">no (bonjour-gw-discovery-policy-config-mode)</a> on page 290           | Removes or modifies the Bonjour Gateway Discovery policy settings                                                                                      |

#### allow-service (bonjour-gw-discovery-policy-cogig-mode)

Enables discovery of Bonjour devices and the services they provide on Local or Tunneled VLANs

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```

allow-service <BONJOUR-SERVICE-NAME> [local|tunneled]
allow-service <BONJOUR-SERVICE-NAME> local {instance-name contains <WORD>} ({service-vlans <WORD>})
allow-service <BONJOUR-SERVICE-NAME> tunneled {instance-name contains <WORD>}

```

#### Parameters

```

allow-service <BONJOUR-SERVICE-NAME> local {instance-name contains <WORD>} ({service-vlans <WORD>})

```

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| instance-name contains <WORD>        | <p>Optional. Adds a Bonjour Service instance name. If you have a large enterprise network, use this option to create different Bonjour Service instances for the different organizations or departments (VLANs) within your network. Creating instances allows you to advertise specific service instances for a specific set of VLANs, instead of advertising top-level Bonjour Services to various allocated VLAN(s).</p> <ul style="list-style-type: none"> <li>contains &lt;WORD&gt; – Specify the sub-string to match. You can either directly specify the string value to be used as a match criteria, or use a string alias (for example, \$BONJOUR-STRING) to identify the string to match. If using a string alias, ensure that it is existing and configured. For information on configuring aliases, see <a href="#">alias</a>.</li> </ul> |

### Examples

```

nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#allow-service Printer lo
cal instance-name contains $Bonjour_Service service-vlans 1,2
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
 allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#

```

Following example configures the string alias named \$Bonjour\_Service:

```

nx9500-6C8809(config)#alias string $Bonjour_Service admin
nx9500-6C8809(config)#commit
nx9500-6C8809(config)#show context include-factory | include alias string
alias string $Bonjour_Service admin
nx9500-6C8809(config)#

```

|----------------------------------------------------------------------------------------------------------------------|
| <p><b>no (global-config-mode)</b> Removes or modifies this Bonjour Gateway Discovery Policy settings on page 475</p> |
|----------------------------------------------------------------------------------------------------------------------|

no (bonjour-gw-discovery-policy-config-mode)

Removes or modifies the Bonjour Gateway Discovery policy settings

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
no allow-service <BONJOUR-SERVICE-NAME> [local|tunneled] {service-vlans <WORD>}
```

#### Parameters

```
no allow-service <BONJOUR-SERVICE-NAME> [local|tunneled] {service-vlans <WORD>}
```

|                 |                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| no <parameters> | Removes allow-service rules in the selected Bonjour GW Discovery policy, based on the parameters passed |
|-----------------|---------------------------------------------------------------------------------------------------------|

#### Examples

The following example shows the Bonjour GW Discovery policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
 allow-service Afp local
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
nx9500-6C8809(config-bonjour-gw-discovery-policy-test1)#no allow-service Afp local
```

The following example shows the Bonjour GW Discovery policy 'test' settings after the 'no' command was executed:

```
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#show context
bonjour-gw-discovery-policy test
 allow-service Printer local service-vlans 1-2 instance-name contains $Bonjour_Service
nx9500-6C8809(config-bonjour-gw-discovery-policy-test)#
```

#### *bonjour-gw-forwarding-policy*

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
bonjour-gw-forwarding-policy <POLICY-NAME>
```

#### **Parameters**

```
bonjour-gw-forwarding-policy <POLICY-NAME>
```

<POLICY-NAME> Specify the Bonjour GW Forwarding policy name. If the policy does not exist, it is created. To receive Bonjour service responses from specific VLANs, specify the VLAN IDs. In the Bonjour GW Forwarding policy configuration mode, provide a list of VLAN IDs from which Bonjour responses can be received (format: 10-20, 25, 30-35). And then specify the list of client VLANs that can access Bonjour services.

Execute the `bonjour-gw-discovery-policy` command to define the Bonjour services allowed on local and tunneled VLANs.

To associate a Bonjour GW Forwarding policy with a device or profile, in the profile/device configuration mode, execute the `use > bonjour-gw-forwarding-policy > <POLICY-NAME>` command. For more information, see [use](#) on page 1232.

## Examples

```

nx9500-6C8809(config)#bonjour-gw-forwarding-policy test
nx9500-6C8809(config-bonjour-gw-forwarding-policy-test)#?
(config-bonjour-gw-forwarding-policy) commands:
 forward-bonjour-response Forwards bonjour service response across vlans
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-bonjour-gw-forwarding-policy-test)#

```

## Related Commands

`no` Removes an existing Bonjour GW Forwarding policy

### *bonjour-gw-query-forwarding-policy*

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
bonjour-gw-query-forwarding-policy <POLICY-NAME>
```

#### Parameters

```
bonjour-gw-query-forwarding-policy <POLICY-NAME>
```

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;POLICY-NAME&gt;</code> | <p>Specify the Bonjour GW Query Forwarding policy name. If the policy does not exist, it is created.</p> <p>In the Bonjour GW Query Forwarding policy configuration mode, specify the 'from' and 'to' VLAN(s). ### *captive-portal*

Configures a captive portal policy and enters its configuration mode. Once created and configured, use the captive portal policy in the WLAN context, and in the device/profile contexts of the access point or controller hosting the captive portal server.

A captive portal provides secure access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the wireless network. Once logged into the captive portal, additional Acknowledgment, Agreement, Welcome, No Service, and Fail pages provides you options to customize the screen flow and user appearance.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a data center.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

`captive-portal <CAPTIVE-PORTAL-NAME>`

**Parameters**

`captive-portal <CAPTIVE-PORTAL-NAME>`

|                       |                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| <CAPTIVE-PORTAL-NAME> | Specify the captive portal name. If a captive portal with the specified name does not exist, it is created. |
|-----------------------|-------------------------------------------------------------------------------------------------------------|

**Examples**

```
nx9500-6C8809(config)#captive-portal test
nx9500-6C8809(config-captive-portal-test)#?
```

Captive Portal Mode commands:

|                                         |                                                                                                                                     |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <code>access-time</code>                | Allowed access time for the client. Used when there is no session time in radius response                                           |
| <code>access-type</code>                | Access type of this captive portal                                                                                                  |
| <code>accounting</code>                 | Configure how accounting records are created for this captive portal policy                                                         |
| <code>bypass</code>                     | Bypass captive portal                                                                                                               |
| <code>connection-mode</code>            | Connection mode for this captive portal                                                                                             |
| <code>custom-auth</code>                | Custom user information                                                                                                             |
| <code>data-limit</code>                 | Enforce data limit for clients                                                                                                      |
| <code>frictionless-onboarding</code>    | Register the client MAC address at ExtremeGuest on redirection                                                                      |
| <code>inactivity-timeout</code>         | Inactivity timeout in seconds. If a frame is not received from client for this amount of time, then current session will be removed |
| <code>ipv6</code>                       | Internet Protocol version 6 (IPv6)                                                                                                  |
| <code>localization</code>               | Configure the FQDN address to get the localization parameters for the client                                                        |
| <code>logout-fqdn</code>                | Configure the FQDN address to logout the session from client                                                                        |
| <code>no</code>                         | Negate a command or set its defaults                                                                                                |
| <code>oauth</code>                      | OAuth 2.0 authentication configuration                                                                                              |
| <code>php-helper</code>                 | Configure the captive portal to use a server for help with php                                                                      |
| <code>post-authentication-vlan</code>   | Configure post authentication vlan for captive portal users                                                                         |
| <code>radius-vlan-assignment</code>     | Enable radius vlan assignment for captive portal users                                                                              |
| <code>redirection</code>                | Configure connection redirection parameters                                                                                         |
| <code>report-loyalty-application</code> | Report customer loyalty application presence in clients                                                                             |
| <code>server</code>                     | Configure captive portal server parameters                                                                                          |
| <code>simultaneous-users</code>         | Particular username can only be used by a certain number of MAC addresses at a time                                                 |

### captive-portal-mode-commands

The following table summarizes captive portal configuration mode commands:

**Table 11: Captive-Portal-Mode Commands**

| Command                                          | Description                                                                                                                                                     |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>access-time</code>                         | Defines a client's access time. It is used when no session time is defined in the RADIUS response.                                                              |
| <code>access-type</code>                         | Configures a captive portal's access type                                                                                                                       |
| <code>accounting</code>                          | Enables a captive portal's accounting records                                                                                                                   |
| <code>bypass</code>                              | Enables bypassing of captive portal detection requests                                                                                                          |
| <code>connection-mode</code>                     | Configures a captive portal's connection mode                                                                                                                   |
| <code>custom-auth</code>                         | Configures custom user information                                                                                                                              |
| <code>data-limit</code>                          | Enforces data limit on captive portal clients                                                                                                                   |
| <code>frictionless-onboarding</code> on page 301 | Enables wireless clients, associated with guest WLANs, to self-register with the ExtremeGuest server.                                                           |
| <code>inactivity-timeout</code>                  | Defines an inactivity timeout in seconds                                                                                                                        |
| <code>ipv6</code> on page 304                    | Configures the IPv6 address of the internal captive portal server                                                                                               |
| <code>localization</code> on page 305            | Configures an FQDN address string that enables the client to receive localization parameters. This command also allows the configuration of a response message. |
| <code>logout-fqdn</code>                         | Clears the logout FQDN address                                                                                                                                  |

**Table 11: Captive-Portal-Mode Commands (continued)**

| Command                                             | Description                                                                                                                                                                             |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no</code>                                     | Reverts the selected captive portal's settings or resets settings to default                                                                                                            |
| <code>oauth</code> on page 307                      | Enables OAuth-based authentication support on the captive portal. When enabled, OAuth allows captive-portal users to sign in to guest WLANs using their Facebook or Google credentials. |
| <code>php-helper</code> on page 308                 | Configures a PHP helper to serve the captive portal's PHP splash pages to guest users using social-media to login to the captive portal.                                                |
| <code>post-authentication-vlan</code>               | Assigns a post authentication RADIUS VLAN for this captive portal's users                                                                                                               |
| <code>radius-vlan-assignment</code>                 | Assigns a RADIUS VLAN for this captive portal                                                                                                                                           |
| <code>redirection</code>                            | Enables redirection of client connections to specified destination ports                                                                                                                |
| <code>report-royalty-application</code> on page 312 | Enables detection of captive portal client's loyalty application presence and stores this information in the captive portal's user database                                             |
| <code>server</code>                                 | Configures the captive portal server settings                                                                                                                                           |
| <code>simultaneous-users</code>                     | Specifies a username used by a MAC address pool                                                                                                                                         |
| <code>terms-agreement</code>                        | Enforces the user to agree to terms and conditions (included in login page) for captive portal access                                                                                   |
| <code>use</code>                                    | Associates a AAA policy and a DNS whitelist with a captive portal                                                                                                                       |
| <code>webpage</code>                                | Configures captive portal Web page settings                                                                                                                                             |
| <code>webpage-auto-upload</code>                    | Enables automatic upload of advanced Web pages on a captive portal                                                                                                                      |
| <code>webpage-location</code>                       | Specifies the location of Web pages used for captive portal authentication                                                                                                              |
| <code>welcome-back</code> on page 326               | Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins                                                                    |

#### access-time

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
access-time <10-10080>
```

#### Parameters

```
access-time <10-10080>
```

|                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------|
| <p>&lt;30-10080&gt; Defines the access time allowed for a wireless client from 10 - 10080 minutes. The default is 1440 minutes.</p> |
|-------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-captive-portal-test)#access-time 35
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
nx9500-6C8809(config-captive-portal-test)#
```

## Related Commands

|    |                                                             |
|----|-------------------------------------------------------------|
| no | Reverts to the default permitted access time (1440 minutes) |
|----|-------------------------------------------------------------|

## access-type

Defines the captive portal's access type. The authentication scheme configured here is applied to wireless clients requesting captive portal guest access to the WiNG network.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
access-type [custom-auth-radius | logging | no-auth | radius | registration]
```

## Parameters

```
access-type [custom-auth-radius | logging | no-auth | radius | registration]
```

|                    |                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| custom-auth-radius | Specifies the custom user information used for authentication (RADIUS lookup of given information, such as name, e-mail address, telephone, etc.). When configured, accessing clients are required to provide a 1-32 character lookup data string used to authenticate their credentials.<br>When selecting this option, use the custom-auth command to configure the required user information.             |
| logging            | Enables logging of user access details.                                                                                                                                                                                                                                                                                                                                                                      |
| no-auth            | Defines no authentication required for a guest. Requesting clients are redirected to the captive portal Welcome page without authentication.                                                                                                                                                                                                                                                                 |
| radius             | Enables RADIUS authentication for wireless clients. A requesting client's user credentials require authentication before access to the captive portal is permitted. This is the default setting.                                                                                                                                                                                                             |
| registration       | Enables captive portal's clients to self register. When enabled, a requesting client's user credentials require authentication locally or through social media credential exchange and validation.<br>If enabled, use the <b>webpage &gt; internal &gt; registration &gt; field</b> command to customize the registration page. If not customized, the default, built-in registration Web page is displayed. |

## Examples

```
nx9500-6C8809(config-captive-portal-test)#access-type logging
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
nx9500-6C8809(config-captive-portal-test)#
```

## Related Commands

**no** Removes the captive portal access type or reverts to default (radius)

## accounting

Enables support for accounting messages for this captive portal

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted etc. Accounting enables tracking of captive portal services consumed by clients.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
accounting [radius|syslog]
accounting radius
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

### Parameters

accounting radius

**radius** Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.

```
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

|                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| syslog host <IP/HOSTNAME>                                      | Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default. <ul style="list-style-type: none"><li>• host &lt;IP/HOSTNAME&gt; - Specifies the destination where accounting messages are sent. Specify the destination's IP address or hostname.</li></ul> |
| port <1-65535>                                                 | Optional. Specifies the syslog server's listener port <ul style="list-style-type: none"><li>• &lt;1-65535&gt; - Specify the UDP port from 1- 65535. The default is 514.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| proxy-mode [none through-controller through-rf-domain-manager] | Optional. Specifies the mode of proxying the syslog server <ul style="list-style-type: none"><li>• none - Accounting messages are sent directly to the syslog server</li><li>• through-controller - Accounting messages are sent through the controller configuring the device</li><li>• through-rf-domain-manager - Accounting messages are sent through the local RF Domain manager</li></ul>                                                                                                                                                                                                                |

### Examples

```
nx9500-6C8809(config-captive-portal-test)#accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
```

```
access-type logging
access-time 35
accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
```

#### Related Commands

|-----------|-----------------------------------------------------|
| <b>no</b> | Disables accounting records for this captive portal |
|-----------|-----------------------------------------------------|

#### bypass

Enables bypassing of captive portal detection requests from wireless clients

Certain devices, such as Apple iOS devices send CNA (Captive Network Assistant) requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
bypass captive-portal-detection
```

#### Parameters

```
bypass captive-portal-detection
```

|                                 |                                            |
|---------------------------------|--------------------------------------------|
| bypass captive-portal-detection | Bypasses captive portal detection requests |
|---------------------------------|--------------------------------------------|

#### Examples

```
rfs4000-229D58(config-captive-portal-test)#bypass captive-portal-detection
rfs4000-229D58(config-captive-portal-test)#show context
aptive-portal test
bypass captive-portal-detection
rfs4000-229D58(config-captive-portal-test)#
```

#### Related Commands

|           |                                                         |
|-----------|---------------------------------------------------------|
| <b>no</b> | Disables bypassing of captive portal detection requests |
|-----------|---------------------------------------------------------|

#### connection-mode

Configures a captive portal's mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same URI (Uniform Resource Identifier), so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
connection-mode [http|https]
```

#### Parameters

```
connection-mode [http|https]
```

|                                                                                                                |                                                                        |
|----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| http                                                                                                           | Sets HTTP as the default connection mode. This is the default setting. |
| https                                                                                                          | Sets HTTPS as the default connection mode                              |
| <b>Note:</b> HTTPS is a more secure version of HTTP, and uses encryption while sending and receiving requests. |                                                                        |

#### Examples

```
nx9500-6C8809(config-captive-portal-test)#connection-mode https
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 connection-mode https
 accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
```

### custom-auth

Configures custom user information

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
custom-auth info <LINE>
```

#### Parameters

```
custom-auth info <LINE>
```

|             |                                                                                                                                                                                                                                                                                                     |

|-------------------------------------------------------------------------------|

#### data-limit

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
data-limit <1-102400> {action [log-and-disconnect|log-only]}
```

#### Parameters

```
data-limit <1-102400> {action [log-and-disconnect|log-only]}
```

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data-limit<br><1-102400>             | Sets a captive portal client's data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer. <ul style="list-style-type: none"><li>• &lt;1-102400&gt; – Specify a value from 1 - 102400 MB.</li></ul>                                                                                                                                                                                                                                                                                                |
| action [log-and-disconnect log-only] | Optional. Specifies the action taken when a client exceeds the configured data limit. The options are: <ul style="list-style-type: none"><li>• log-and-disconnect – When selected, an entry is added to the log file any time a captive portal client exceeds the data limit, and the client is disconnected.</li><li>• log-only – When selected, an entry is added to the log file any time a captive portal client exceeds the data limit. the client, however, remains connected to the captive portal. This is the default setting.</li></ul> |

#### Examples

```
rfs4000-229D58(config-captive-portal-test)#data-limit 200 action log-and-disconnect
rfs4000-229D58(config-captive-portal-test)#
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 data-limit 200 action log-and-disconnect
rfs4000-229D58(config-captive-portal-test)#
```

#### frictionless-onboarding

Enables wireless clients, associated with guest WLANs, to self-register with the ExtremeGuest server. In other words, this feature enables frictionless on-boarding of guest users to the ExtremeGuest server.

It also provides an integration API, as a means of on-boarding guest users through a loyalty application.

#### Note

To enable this feature, in the Guest WLAN (using this captive-portal), enable MAC authentication and set the registration mode to 'device'. For information on enabling frictionless-onboarding, see [Examples](#) on page 302.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`frictionless-onboarding`

#### Parameters

None

#### Examples

The following configurations are required to enable frictionless on-boarding of guest users to the ExtremeGuest server:

1 Create a captive-portal:

```
NX9500-EGuest(config)#captive-portal EGuest
NX9500-EGuest(config-captive-portal-EGuest)#
```

a Set the *access-type* as registration..

```
NX9500-WC-EGuest(config-captive-portal-EGuest)#access-type registration
```

This sets the guest user access and authentication mode to self-registration.

b Enable *frictionless-onboarding*.

```
NX9500-WC-EGuest(config-captive-portal-EGuest)#frictionless-onboarding
```

This enables auto-redirection of guest users to the ExtremeGuest server, where the user's MAC address is registered. Registered devices, on subsequent logins, are provided immediate access without interaction with Splash pages.

c Configure *Localization* URL..

```
NX9500-WC-EGuest(config-captive-portal-test)#localization fqdn local.guestaccess.com
```

When configured, the defined URL is triggered from a mobile application to derive location information from the wireless network so that an application can be localized to a particular store or region.

```
NX9500-WC-EGuest(config-captive-portal-Guest)#show context
captive-portal EGuest
 access-type registration
 webpage internal registration field city type text enable label "City" placeholder
 "Enter City"
 webpage internal registration field street type text enable label "Address"
 placeholder "123 Any Street"
 webpage internal registration field name type text enable label "Full Name"
 placeholder "Enter First Name, Last Name"
 webpage internal registration field zip type number enable label "Zip" placeholder
 "Zip"
 webpage internal registration field via-sms type checkbox enable title "SMS
 Preferred"
```

```

webpage internal registration field mobile type number enable label "Mobile"
placeholder "Mobile Number with Country code"
webpage internal registration field age-range type dropdown-menu enable label "Age
Range" title "Age Range"
webpage internal registration field email type e-address enable mandatory label
"Email" placeholder "you@domain.com"
webpage internal registration field via-email type checkbox enable title "Email
Preferred"
frictionless-onboarding
localization fqdn local.guestaccess.com
NX9500-WC-EGuest(config-captive-portal-Guest)#

```

**Note**

This is an example fqdn URI.

2 Create a WLAN with the following settings:

- a Set authentication-type as 'mac'.

```
NX9500-WC-EGuest(config-wlan-EGuest)#authentication-type mac
```

When configured, enables MAC authentication of guest users.

- b Enable device registration.

```
NX9500-WC-EGuest(config-wlan-EGuest)#registration device group-name test expiry-time
300
```

When enabled, guest users' device MAC addresses are registered in the database. Registered devices are provided immediate access on subsequent logins.

- c Set guest-registration as external.

```
NX9500-WC-EGuest(config-wlan-EGuest)#registration external follow-aaa
```

This enables forwarding of guest registration and authentication requests to an external authentication server resource, specified in an AAA policy.

Note, in this scenario, the external resource is the ExtremeGuest server.

Execute the command in the following step to specify the AAA Policy.

- d Apply an AAA Policy to the WLAN.

```
NX9500-WC-EGuest(config-wlan-EGuest)#use aaa-policy guest
```

When applied, registration and authentication requests are forwarded to the authentication server configured in the specified AAA Policy.

**Note**

In the AAA policy, ensure that the authentication server configuration points to the ExtremeGuest server.

- e Enable captive-portal enforcement.

```
NX9500-WC-EGuest(config-wlan-EGuest)#captive-portal-enforcement fall-back
```

When enabled, captive-portal validation is enforced on clients requesting access. Fall-back is an optional parameter that enforces captive-portal authentication only on failure of WLAN authentication.

- f Use the captive-portal configured in Step 1 in the WLAN..

```
NX9500-WC-EGuest(config-wlan-EGuest)#use captive-portal EGuest
```

```
NX9500-WC-EGuest(config-wlan-EGuest)#show context
```

```
wlan EGuest
```

```
ssid eguest
```

```

bridging-mode local
encryption-type none
authentication-type mac
use captive-portal EGuest
captive-portal-enforcement fall-back
registration device group-name test expiry-time 300
NX9500-WC-EGuest(config-wlan-EGuest)#

```

This is the captive-portal used with this WLAN for captive-portal validation of guest users.

#### inactivity-timeout

Defines an inactivity timeout in seconds. If a frame is not received from a client for the specified interval, the current session is terminated.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
inactivity-timeout <60-86400>
```

#### Parameters

```
inactivity-timeout <60-86400>
```

|                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>&lt;60-86400&gt; Defines the interval for which a captive portal session is kept alive without receiving a frame from the client. The session is automatically terminated once this interval is over.</p> <ul style="list-style-type: none"> <li>• &lt;60-86400&gt; – Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.</li> </ul> |

#### ipv6

Configures the internal captive portal server's (running on the centralized mode) IPv6 address. If using centralized server mode, use this option to define the controller, service platform, or access point resource's (hosting the captive portal) IPv6 address. For information on configuring the server mode, see [server](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ipv6 server host <IPv6>
```

#### Parameters

```
ipv6 server host <IPv6>
```

|                         |                                                                                                                                                                                             |

## localization

Configures an FQDN address string to get localization parameters for the client. Use this option to add a URL to trigger a one-time redirect on demand. The defined URL is triggered from a mobile application to derive location information from the wireless network so an application can be localized to a particular store or region.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
localization [fqdn <WORD>|response <WORD>]
```

#### Parameters

```
localization [fqdn <WORD>|response <WORD>]
```

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

```

### Related Commands

no

Removes the FQDN address string and response message configured on a captive portal for localization

## logout-fqdn

the Logout FQDN as the FQDN address to logout of the captive portal session from the client (for example, *logout.guest.com*).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
logout-fqdn <WORD>
```

### Parameters

```
logout-fqdn <WORD>
```

logout-fqdn <WORD> Configures the FQDN address used to logout

- <WORD> – Provide the FQDN address (for example, *logout.guestaccess.com*).

### Examples

```
rfs4000-229D58(config-captive-portal-test)#logout-fqdn logout.testuser.com
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 logout-fqdn logout.testuser.com
rfs4000-229D58(config-captive-portal-test)#
```

### Related Commands

no

Clears the logout FQDN address

## oauth

Enables OAuth-driven Google and/or Facebook authentication on captive portals that use internal Web pages.

To enable Google and Facebook captive-portal authentication:

- Enforce captive-portal authentication on the WLAN to which wireless-clients associate. For information, see [captive-portal-enforcement](#).
- Set captive-portal Web page location to internal. For more information, see [webpage-location](#).
- Register your captive-portal individually on Google/FaceBook APIs and generate a client-id and client-secret. The client-ids retrieved during registration are the IDs for the WiNG application running on the access point/controller. The WiNG application uses these client-ids to access the Google and Facebook Auth APIs, and authenticate the guest client on behalf of the user.

If enabling OAuth-driven Google and/or Facebook authentication on the captive portal, use this command to configure the Google/Facebook client-ids. Once enabled, the captive portal landing page, displayed on the client's browser, provides the Facebook and Google login buttons.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
oauth
oauth client-id [facebook|google] <WORD>
```

## Parameters

```
oauth
```

|       |                                                                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oauth | Execute this command without the associated keywords to enable OAuth on this captive-portal. If enabling OAuth, ensure the captive-portal Web page location is configured as advanced or external. |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
oauth client-id [facebook|google] <WORD>
```

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oauth client-id [facebook google] <WORD> | <p>Configures the client-ids retrieved from the Google and Facebook API manager portals during registration</p> <ul style="list-style-type: none"> <li>• facebook - Configures the Facebook API client-id (is a 15 digit entity)</li> <li>• google - Configures the Google API client-id (is a 12 digit number) <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Provide the Facebook/Google client-id.</li> </ul> </li> </ul> <p>If the captive-portal Web page location is advanced or external, and you are enabling OAuth support, you need not configure the client-id. In such a scenario, the client-id is configured through the EGuest server UI and not the WiNG CLI.</p> |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example (User Exec Mode)

```
nx7500-6DCD39(config-captive-portal-test2)#OAuth
nx7500-6DCD39(config-captive-portal-test2)#OAuth client-id Google
xxxxxxxxxxxxx.apps.googleusercontent.com Facebook yyyyyyyyyyyyyyyy
nx7500-6DCD39(config-captive-portal-test2)#show context
captive-portal test2
server host guest.social.com
oauth
oauth client-id Google xxxxxxxxxxxxxx.apps.googleusercontent.com Facebook yyyyyyyyyyyyyyyy

nx7500-6DCD39(config-captive-portal-test)#
```

In the above example,

- xxxxxxxxxxxxxx - Is the 12 digit numeric part of your Google client-id.
- yyyyyyyyyyyyyyyy - Is the 15 digit Facebook client-id

## Related Commands

|    |                                                                        |
|----|------------------------------------------------------------------------|
| no | Removes all OAuth client identities configured for this captive portal |
|----|------------------------------------------------------------------------|

## php-helper

Configures a PHP helper to serve the PHP splash pages to guest users logging in to the captive portal using social-media credentials. Configure a PHP helper only if the following criteria are fulfilled:

- OAuth-based authentication is enabled on the captive portal.
- The captive-portal server mode is "self".

- The access point, hosting the captive-portal server, has low memory space (for example, the AP 6522, and AP 7502 model access points).
- A hotspot server, hosting the captive-portal PHP splash pages, is up and running.

The WiNG software introduces HybridAuth support on captive portals. HybridAuth is an open-source, social-sign on PHP Library. In addition to Google and Facebook, it allows a variety of third-party social authentications, such as *LinkedIn*, *Twitter*, *Live*, *Yahoo*, *OpenID*, etc. However, HybridAuth uses space-consuming PHP splash pages that cannot be loaded on access points with low memory space. These access points can only serve the initial landing page, where guests clicking on a social login button are redirected by the php-helper to a PHP page hosted on the PHP-helper.

To create PHP splash pages, use the splash template configuration tool available on the EGuest (ExtremeGuest) dashboard. Upload the generated tar to both the hotspot server and the php helper. Note, the EGuest dashboard can be launched from the WiNG controller (NX 95XX/NX 96XX/VX 9000) enabled as the EGuest server.

For more information on enabling the EGuest server, see [eguest-server \(VX9000 only\)](#) on page 990.

For more information on configuring an EGuest captive portal, see [configuring ExtremeGuest captive portal](#) on page 332.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
php-helper [controller|domain-manager]
php-helper controller <IP/HOSTNAME> hosting-vlan-interface <0-4096>
php-helper domain-manager <IP/HOSTNAME>
```

#### Parameters

```
php-helper controller <IP/HOSTNAME> hosting-vlan-interface <0-4096>
```

|                                 |                                                                                                                                                                                                                           |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| controller <IP/HOSTNAME>        | Configures the controller adopting the captive-portal access point as the php-helper <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the adopting controller's IP address or host name.</li> </ul> |
| hosting-vlan-interface <0-4096> | Optional. Configures the VLAN on which the php-helper is reachable <ul style="list-style-type: none"> <li>• &lt;0-4096&gt; - Specify the VLAN hosting the php-helper from 0 - 4096.</li> </ul>                            |

```
php-helper domain-manager <IP/HOSTNAME>
```

|                              |                                                                                                                                                                                                                     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| php-helper                   | Configures the php-helper parameters                                                                                                                                                                                |
| domain-manager <IP/HOSTNAME> | Configures the captive-portal access point's RF Domain manager as the php-helper <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the RF Domain manager's IP address or host name.</li> </ul> |

#### Examples

To enable php-helper configure the following parameters in the captive-portal context:

```
ap6532-3163A4(config-captive-portal-php-helper)#oauth
ap6532-3163A4(config-captive-portal-php-helper)#php-helper controller nx9500-6C8809
ap6532-3163A4(config-captive-portal-php-helper)#server mode self
ap6532-3163A4(config-captive-portal-php-helper)#server host cpsocial.extreme.com
```

Note, when configuring the server, specify the server's hostname and not the IP address, because some social media do not allow IP address as a redirect URI.

```
ap6532-3163A4(config-captive-portal-php-helper)#show running-config captive-portal php-
helper
captive-portal php-helper
 server host cpsocial.extreme.com
 php-helper controller nx9500-6C8809
 oauth
 webpage internal registration field city type text enable label "City" placeholder "Enter
 City"
 webpage internal registration field street type text enable label "Address" placeholder
 "123 Any Street"
 webpage internal registration field name type text enable label "Full Name" placeholder
 --More--
ap6532-3163A4(config-captive-portal-php-helper)#
```

#### Related Commands

#### post-authentication-vlan

Configures the VLAN that is assigned to this captive portal's users upon successful authentication

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
post-authentication-vlan [<1-4096> | <VLAN-ALIAS>]
```

#### Parameters

```
post-authentication-vlan [<1-4096> | <VLAN-ALIAS>]
```

|                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>post-authentication-vlan [<b>&lt;1-4096&gt;</b>   <b>&lt;VLAN-ALIAS&gt;</b>]</code> | Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal's users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN. <ul style="list-style-type: none"><li>• <b>&lt;1-4096&gt;</b> – Specify the VLAN's number from 1 - 4096.</li><li>• <b>&lt;VLAN-ALIAS&gt;</b> – Specify the VLAN alias (should be existing and configured). VLAN alias names begin with a '\$'.</li></ul> |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58(config-captive-portal-test)#post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#
```

#### Related Commands

**no** Removes the post authentication RADIUS VLAN assigned to this captive portal's users

•

## radius-vlan-assignment

Enables assignment of a RADIUS VLAN for this captive portal

When enabled, if the RADIUS server as part of the authentication process returns a client's VLAN-ID in a RADIUS access-accept packet, then all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server's VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
radius-vlan-assignment
```

### Parameters

None

### Example

```
rfs4000-229D58(config-captive-portal-test)#radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 post-authentication-vlan 1
 radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#
```

### Related Commands

**no** Disables assignment of a RADIUS VLAN for this captive portal

## redirection

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
redirection ports <LIST-OF-PORTS>
```

### Parameters

```
redirection ports <LIST-OF-PORTS>
```

|                       |                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ports <LIST-OF-PORTS> | Configures destination ports considered for redirecting client connection<br>A maximum of 16 ports can be specified in a comma-separated list. Standard ports 80 and 443 are always considered for client connections regardless of what's entered by the administrator. |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Example

```
rfs4000-229D58(config-captive-portal-test)#redirection ports 1,2,3
rfs4000-229D58(config-captive-portal-test)#show context
captive-portal test
 redirection ports 1-3
rfs4000-229D58(config-captive-portal-test)#
```

#### Related Commands

|----|-------------------------------------------|
| no | Disables redirection of client connection |
|----|-------------------------------------------|

### report-royalty-application

Enables detection of captive portal client's usage of a selected (preferred) loyalty application

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
report-loyalty-application {custom-app <APPLICATION-NAME>}
```

#### Parameters

```
report-loyalty-application {custom-app <APPLICATION-NAME>}
```

## server

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the captive-portal server hosting the captive portal Web pages.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
server [host | mode]
server host <IP/HOSTNAME>
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]
```

### Parameters

```
server host <IP/HOSTNAME>
```

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host <IP/<br>HOSTNAME> | <p>Configures the internal captive portal server (wireless controller, access point, service platform)</p> <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; – Specify the IPv4/IPv6 address or hostname of the captive portal server.</li> </ul> <p>For centralized-controller mode, the server host should be a virtual hostname and not an IP address.</p> <p>If enabling OAuth (social-media login) on the captive portal, configure the server's hostname and not the IP address. This is because some social media do not allow IP address as redirect-uri. For more information, see <a href="#">oauth</a> and <a href="#">php-helper</a>.</p> |

|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode        | <p>Configures the captive portal server mode. This parameter identifies the device that will capture and redirect a wireless user's Web browser session to a landing page where the user has to provide login credentials in order to access the managed network. The WiNG captive portal implementation is very flexible and allows captive portal services to reside anywhere within the WiNG managed network. For example, the capture and redirection can be performed directly by the access points at the edge of the network, centrally on the controllers or service platforms managing the access points, or on dedicated wireless controller deployed within an isolated network.</p> |
| centralized | <p>Select this option if capture and redirection is provided by a designated wireless controller/service platform on the network defined using an IPv4/IPv6 address or hostname. This dedicated device can either be managing the dependent/independent access points or be a dedicated device deployed over the intermediate network.</p> <p>Ensure the IPv4 address or hostname of the WiNG wireless controller performing the capture and redirection is defined in the captive portal policy. And also, that the wireless controller is reachable via MINT.</p>                                                                                                                             |

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| centralized-controller {hosting-vlan-interface <0-4096>} | <p>Select this option if capture and redirection is on a cluster of wireless controller/service platforms managing dependent/independent access points when redundancy is required. The capture and redirection is provided by one of the controllers in the cluster that is operating as the designated forwarder for the tunneled VLAN. The cluster can be configured as active/active or active/standby as required.</p> <p>If using this option, ensure a non-resolvable virtual hostname is defined in the captive portal policy which is shared between the controllers in the cluster.</p> <ul style="list-style-type: none"> <li>hosting-vlan-interface – Optional. Configures the VLAN where the client can reach the captive-portal server. This option is available only for the centralized-controller mode. <ul style="list-style-type: none"> <li>&lt;0-4096&gt; – Specify the VLAN number (0 implies the controller is available on the client's VLAN).</li> </ul> </li> </ul> |
| self                                                     | <p>Select this option if capture and redirection is provided by the access point that is servicing the captive portal enabled Wireless LAN. This is the default setting.</p> <p>When enabled each remote access point servicing the captive portal enabled WLAN performs the captive portal capture and redirection internally. The WLAN users are mapped to a locally bridged VLAN for which each access point has a SVI defined. The SVI can either have a static or dynamic (DHCP) IPv4 address assigned. The capture, redirection, and presentation of the captive portal pages are performed using the SVI on each access point the wireless device is associated to.</p>                                                                                                                                                                                                                                                                                                                |

### Examples

```

nx9500-6C8809(config-captive-portal-test)#server host 172.16.10.9
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9

### simultaneous-users

Specifies the number of users (client MAC addresses) that can simultaneously log on to the captive portal. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
simultaneous-users <1-8192>
```

### Parameters

```
simultaneous-users <1-8192>
```

|                             |                                                                                                                                                                                                  |

| <b>no</b> | Resets or disables captive portal commands |
|-----------|--------------------------------------------|

## terms-agreement

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

When enabled, the system enforces a previously registered user to re-confirm the terms of agreement, on successive log ins, only if the interval between the last log out and the current log in exceeds the agreement-refresh timeout configured in the WLAN context. For more information on configuring the agreement-refresh timeout value, see [registration](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
terms-agreement
```

## Parameters

None

## Examples

```
nx9500-6C8809(config-captive-portal-test)#terms-agreement
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https

use (captive-portal-config-mode)

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

For more information on AAA policies, see [aaa-policy](#).

For more information on DNS whitelists, see [dns-whitelist](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]
```

#### Parameters

```
use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]
```

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aaa-policy <AAA-POLICY-NAME>       | Associates a AAA policy with this captive portal. AAA policies validate user credentials and provide captive portal access to the network. <ul style="list-style-type: none"><li>• &lt;AAA-POLICY-NAME&gt; - Specify the AAA policy name.</li></ul>                                                                                                                                                                                                           |
| dns-whitelist <DNS-WHITELIST-NAME> | Associates a DNS whitelist to use with this captive portal. A DNS whitelist defines a set of allowed destination IP addresses. DNS whitelists restrict captive portal access. <ul style="list-style-type: none"><li>• &lt;DNS-WHITELIST-NAME&gt; - Specify the DNS whitelist name.</li></ul> <p>To effectively host captive portal pages on an external Web server, the IP address of the destination Web server(s) should be added to the DNS whitelist.</p> |

#### Examples

```
nx9500-6C8809(config-captive-portal-test)#use aaa-policy test
nx9500-6C8809(config-captive-portal-test)#use dns-whitelist test
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9
 simultaneous-users 5
 terms-agreement
 use aaa-policy test
 use dns-whitelist test
nx9500-6C8809(config-captive-portal-test)#
```

- 

#### webpage

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the

Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. There are six (6) different pages.

- acknowledgment – This page displays details for the user to acknowledge.
- agreement – This page displays “Terms and Conditions” that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due unavailability of critical services.
- registration – This page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Parameters

```
webpage external [acknowledgment|agreement|fail|login {post}|no-service|
registration|welcome] <URL>
```

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| external       | Indicates Web pages being served are hosted on an external (to the captive portal) server resource                                         |
| acknowledgment | Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided. |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agreement    | <p>Indicates the page is displayed for “Terms &amp; Conditions”</p> <p>The agreement page provides conditions that must be agreed to before captive portal access is permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| fail         | <p>Indicates the page is displayed for login failure</p> <p>The fail page asserts authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| login {post} | <p>Indicates the page is displayed for getting user credentials. This page is displayed by default.</p> <ul style="list-style-type: none"> <li>• post – Optional. Redirects users to post externally when they during authentication</li> </ul> <p>The login page prompts the user for a username and password to access the captive portal and proceed to either the agreement page (if used) or the welcome page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no-service   | <p>Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are:</p> <ul style="list-style-type: none"> <li>• The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated</li> <li>• The external captive portal server is not reachable</li> <li>• The connectivity between the adopted AP and controller is lost</li> <li>• The external DHCP server is not reachable</li> </ul> <p>To provide this service, enable the following:</p> <ul style="list-style-type: none"> <li>• External captive portal server monitoring.</li> <li>• AAA server monitoring. This enables detection of RADIUS server failure.</li> <li>• External DHCP server monitoring.</li> <li>• AP to controller connectivity monitoring.</li> </ul> <p>For more information on enabling these critical resource monitoring, see <a href="#">service</a>.</p> |
| registration | <p>Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database.</p> <p>Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| login          | Indicates the page is displayed for entering user credentials                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| no-service     | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are: <ul style="list-style-type: none"> <li>• The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated</li> <li>• The external captive portal server is not reachable</li> <li>• The connectivity between the adopted AP and controller is lost</li> <li>• The external DHCP server is not reachable</li> </ul> To provide this service, enable the following: <ul style="list-style-type: none"> <li>• External captive portal server monitoring.</li> <li>• AAA server monitoring. This enables detection of RADIUS server failure.</li> <li>• External DHCP server monitoring.</li> <li>• AP to controller connectivity monitoring.</li> </ul> For more information on enabling these critical resource monitoring, see <a href="#">service</a> . |
| registration   | Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database<br>Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| welcome        | Indicates the page is displayed after a user has been successfully authenticated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| description    | Indicates the content is the description portion of each of the following internal Web pages: acknowledgment, agreement, fail, login, no-service, and welcome                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|           |                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| footer    | Indicates the content is the footer portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, registration, and welcome page. The footer portion contains the signature of the organization that hosts the captive portal.                                                                                      |
| header    | Indicates the content is the header portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The header portion contains the heading information for each of these pages.                                                                                                                    |
| title     | Indicates the content is the title of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The title for each of these pages is configured here.                                                                                                                                                    |
| <CONTENT> | The following keyword is common to all of the above internal Web page options: <ul style="list-style-type: none"> <li>• &lt;CONTENT&gt; – Specify the content displayed for each of the different components of the internal Web page. Enter up to 900 characters for the description and 256 characters each for header, footer, and title.</li> </ul> |

| internal     | Indicates the Web pages are hosted on an internal server resource                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| registration | <p>Allows you to customize the user registration page. Select this option if the captive-portal's access-type is set to registration. Use the field and type options to define the input fields (for example, age-range, city, email, etc.) and the field type (for example, text, checkbox, dropdown-menu, radio-button, etc.)</p> <p>Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.</p> <p>If the registration Web page is not customized, the built-in, default registration page is displayed to the client.</p> |

field [age-range| city|country|  
custom| disclaimer| dob|email|  
gender|member| mobile|name|  
optout| street|via-email|via-sms|  
zip]

Configures the captive portal's registration page fields  
Following are the available fields and the field type for each:

- age-range – Creates the age-range input field (enabled by default and included in the built-in registration page)
  - dropdown-menu – Configures the age-range field as a drop-down menu
  - radio-button – Configures the age-range field as a radio button menu
- city – Creates the postal address: city name input field (enabled by default and included in the built-in registration page)
  - text – Configures the city field as only alpha-numeric and special characters input field
- country – Creates the postal address: country name input field (disabled by default)
  - text – Configures the country field as only alpha-numeric and special characters input field
- custom <WORD> – Creates a customized field (as per your requirement). Use the 'custom' option to create a field not included in the built-in list.
  - <WORD> – Provide a name for the field. On the registration page, the field is displayed under the name specified here.
- disclaimer – Creates client's disclaimer-confirmation input field (disabled by default)
- checkbox – Configures the disclaimer field as a check box
- dob – Creates the client's date of birth (DoB) input field (disabled by default)
  - date – Configures the DoB field as only date-format input field
  - dropdown-menu – Configures the DoB field as a drop-down menu
  - text – Configures the DoB field as only alpha-numeric and special characters input field
- email – Creates the e-mail address input field (enabled by default and included in the built-in registration page)
  - e-address – Configures the e-mail field as only e-mail address format input field
- gender – Creates client's gender input field (disabled by default)
  - dropdown-menu – Configures the gender field as a drop-down menu
  - radio-button – Configures the gender field as a radio button menu
- member – Creates client's loyalty or captive-portal membership card number input field (disabled by default)
  - number – Configures the member field as only-numeric characters input field
  - text – Configures the member field as only alpha-numeric and special characters input field
- mobile – Creates the mobile number input field (enabled by default and included in the built-in registration page)
  - number – Configures the mobile field as only-numeric characters input field
  - text – Configures the mobile field as only alpha-numeric and special characters input field
- name – Creates the client name input field (enabled by default and included in the built-in registration page)
  - text – Configures the name field as only alpha-numeric and special characters input field

#### webpage-auto-upload

Enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as advanced. For more information, see [webpage-location](#).

If this feature is enabled, Access Points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the Access Points, the controller shall distribute the Web pages uploaded on it to the Access Points.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
webpage-auto-upload
```

#### Parameters

None

#### Examples

```
nx9500-6C8809(config-captive-portal-test)#webpage-auto-upload

|-------------------------------|-----------------------------------------------------------------------|
| <code>no</code>               | Disables automatic upload of advanced Web pages on a captive portal   |
| <code>webpage</code>          | Configures Web pages displayed when interacting with a captive portal |
| <code>webpage-location</code> | Specifies the location of the Web pages used for authentication       |

#### webpage-location

Specifies the location of the Web pages used for authentication. These pages can either be hosted on the system or on an external Web server.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`webpage-location [advanced|external|internal]`

#### Parameters

`webpage-location [advanced|external|internal]`

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>advanced</code> | Uses Web pages for login, welcome, failure, and terms created and stored on the controller. Select <code>advanced</code> to use a custom-developed directory full of Web page content that can be copied in and out of the controller, service platform, or access point.<br>If selecting <code>advanced</code> , enable the <code>webpage-auto-upload</code> option to automatically launch the advanced pages to requesting clients upon association. For more information, see <a href="#">webpage-auto-upload</a> . |
| <code>external</code> | Uses Web pages for login, welcome, failure, and terms located on an external server. Provide the URL for each of these pages.                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>internal</code> | Uses Web pages for login, welcome, and failure that are automatically generated                                                                                                                                                                                                                                                                                                                                                                                                                                         |

#### Examples

```
nx9500-6C8809(config-captive-portal-test)#webpage-location external
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
 server host 172.16.10.9
 simultaneous-users 5
 terms-agreement
 webpage-location external
 use aaa-policy test
nx9500-6C8809(config-captive-portal-test)#
```

#### Related Commands

|----------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <code>no</code>                  | Resets or disables captive portal Web page settings                                                                      |
| <code>webpage</code>             | Configures a captive portal's Web page (acknowledgment, agreement, login, welcome, fail, no-service, and terms) settings |
| <code>webpage-auto-upload</code> | Enables automatic upload of advanced Web pages on a captive portal                                                       |

#### welcome-back

Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins. When enabled, a registered captive-portal guest user, on subsequent logins, is served the Acknowledgement page only if:

- The `agreement-refresh` option is enabled for device-based (device and device-OTP) registration, and
- The interval between logout and login is lesser than the `agreement-refresh` timeout configured in the WLAN context. If this interval exceeds the `agreement-refresh` timeout, the user is served the

Agreement page. For more information on configuring the agreement-refresh timeout value, see [registration](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
welcome-back pass-through
```

### Parameters

```
welcome-back pass-through
```

|                           |                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| welcome-back pass-through | Enables display of the Acknowledgement page to an already registered user on subsequent captive-portal log-ins, provided the interval between logout and login is lesser than the agreement-refresh timeout <ul style="list-style-type: none"><li>• pass-through - Provides user direct Internet access, from the Welcome-back page, without any user action</li></ul> |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test

 webpage internal registration field city type text enable label "City" placeholder "Enter City"
 webpage internal registration field street type text enable label "Address" placeholder "123 Any Street"
 webpage internal registration field name type text enable label "Full Name" placeholder "Enter First Name, Last Name"
 webpage internal registration field zip type number enable label "Zip" placeholder "Zip"
 webpage internal registration field via-sms type checkbox enable title "SMS Preferred"
 webpage internal registration field mobile type number enable label "Mobile" placeholder "Mobile Number with Country code"
 webpage internal registration field age-range type dropdown-menu enable label "Age Range" title "Age Range"
 webpage internal registration field email type e-address enable mandatory label "Email" placeholder "you@domain.com"
 webpage internal registration field via-email type checkbox enable title "Email Preferred"nx9500-6C8809(config-captive-portal-test)#
```

### Related Commands

|    |                                                                                                                       |
|----|-----------------------------------------------------------------------------------------------------------------------|
| no | Disables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins |
|----|-----------------------------------------------------------------------------------------------------------------------|

no (captive-portal-config-mode)

The no command reverts the selected captive portal's settings or resets settings to default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```

## Parameters

```
no <PARAMETERS>
```

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets this captive portal's settings, based on the parameters passed. |
|-----------------|-----------------------------------------------------------------------------------|

## Example

The following example shows the captive portal 'test' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-type logging
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
```

```

accounting syslog host 172.16.10.13 port 1
nx9500-6C8809(config-captive-portal-test)#
nx9500-6C8809(config-captive-portal-test)#no accounting syslog
nx9500-6C8809(config-captive-portal-test)#no access-type
The following example shows the captive portal 'test' settings after the 'no' commands are
executed:
nx9500-6C8809(config-captive-portal-test)#show context
captive-portal test
 access-time 35
 custom-auth info bob bob@examplecompany.com
 connection-mode https
 inactivity-timeout 750
nx9500-6C8809(config-captive-portal-test)#

```

## configuring-device-registration-with-dynamic-vlan-assignment

This section provides the configurations required to enable device registration with dynamic VLAN assignment in a multi-vendor environment.

- 1 Create vendor-specific RADIUS user groups and assign an allowed VLAN to each group, as shown in the following examples:

```

nx9500-6C8809(config)#radius-group Apple
nx9500-6C8809(config-radius-group-Apple)#policy vlan 200
nx9500-6C8809(config)#radius-group Samsung
nx9500-6C8809(config-radius-group-Samsung)#policy vlan 100
nx9500-6C8809(config)#radius-group Devices
nx9500-6C8809(config-radius-group-Devices)#policy vlan 1

```

### Note

If necessary, configure the session-time for each of the above configured RADIUS group. This is the duration for which a RADIUS group client's session remains active after successful authentication. Upon expiration, the RADIUS session is terminated. Use the **policy > session-time > <5-144000>** command to specify the session-time.

- 2 Create a RADIUS user pool, add users to the pool, and assign the users to the vendor-specific user groups: as shown in the following examples:

```

nx9500-6C8809(config)#radius-user-pool-policy Vendor-Devices
nx9500-6C8809(config-radius-user-pool-Vendor-Devices)#user Samsung password 0 samsung
group Samsung
nx9500-6C8809(config-radius-user-pool-Vendor-Devices)#user test password 0 test123
group Apple

```

- 3 Create a RADIUS server policy, and associate the RADIUS groups and user pool created in steps 1 and 2 respectively, as shown in the following examples:

```

nx9500-6C8809(config)#radius-server-policy Guest-Radius
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-user-pool-policy
Vendor-Devices
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Samsung
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Sony
nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Apple

```

- 4 Create an AAA Policy, on the controller, and configure the authentication server as self, as shown in the following example:

```

nx9500-6C8809(config)#aaa-policy OnBoard-NX
nx9500-6C8809(config-aaa-policy-OnBoard-NX)#authentication server 1 onboard controller
nx9500-6C8809(config-aaa-policy-OnBoard-NX)#show context
aaa-policy OnBoard-NX
 authentication server 1 onboard self
nx9500-6C8809(config-aaa-policy-OnBoard-NX)#

```

- 5 Create a captive-portal, and point to the captive-portal's server, enable RADIUS VLAN assignment, and associate the AAA policy, as shown in the following examples:

```

nx9500-6C8809(config)#captive-portal DeviceRegistration
nx9500-6C8809(config-captive-portal-DeviceRegistration)#server host
captive.extremenoc.com
nx9500-6C8809(config-captive-portal-DeviceRegistration)#radius-vlan-assignment
nx9500-6C8809(config-captive-portal-DeviceRegistration)#use aaa-policy OnBoard-NX
nx9500-6C8809(config-captive-portal-DeviceRegistration)#access-type radius

```

- 6 Configure a WLAN and enable RADIUS VLAN assignment, as shown in the following examples:

```

nx9500-6C8809(config)#wlan CP-OnBoarding
nx9500-6C8809(config-wlan-CP-OnBoarding)#ssid CP-OnBoarding
nx9500-6C8809(config-wlan-CP-OnBoarding)#radius vlan-assignment
nx9500-6C8809(config-wlan-CP-OnBoarding)#use aaa-policy OnBoard-NX
nx9500-6C8809(config-wlan-CP-OnBoarding)#use captive-portal DeviceRegistration
nx9500-6C8809(config-wlan-CP-OnBoarding)#captive-portal-enforcement fall-back
nx9500-6C8809(config-wlan-CP-OnBoarding)#registration device group-name Devices expiry-
time 4320
nx9500-6C8809(config-wlan-CP-OnBoarding)#authentication-type mac

```

- 7 Create an access point profile, associate the RADIUS server policy, captive-portal policy to it, and also assign the WLAN to the AP radio, as shown in the following examples:

```

nx9500-6C8809(config-profile-SITE-10)#use radius-server-policy Guest-Radius
nx9500-6C8809(config-profile-SITE-10)#use captive-portal server DeviceRegistration
nx9500-6C8809(config-profile-SITE-10-if-radio2)#wlan CP-OnBoarding bss 1 primary
nx9500-6C8809(config-profile-SITE-10-if-gel1)#switchport mode trunk
nx9500-6C8809(config-profile-SITE-10-if-gel1)#switchport trunk native vlan 90
nx9500-6C8809(config-profile-SITE-10-if-gel1)#switchport trunk allowed vlan
1,90,1000-1002
nx9500-6C8809(config-profile-SITE-10-if-gel1)#no switchport trunk native tagged

```

- 8 Use the access point profile in the access point's device context.

| <a href="#">guest-registration</a> on page 750 (show commands) | Documents <b>show &gt; guest-registration</b> command and outputs. Use this command to view guest registration statistics once device-registration is enabled. |

#### configuring WeChat Wi-Fi hotspot support in WiNG captive portal

WeChat is a popular messaging app used in China with more than 500 million installations. WeChat's WiFi hotspot solution allows businesses to provide Internet access to their customers. The WiNG captive portal can be configured to incorporate the WeChat WiFi hotspot, so that WeChat users, on their first connect to a WiNG access point, can automatically authenticate with the WeChat server through an intermediate server.

This section provides an example that shows the configurations required to be made on the WiNG portal to enable WeChat Wi-Fi hotspot.

- 1 Create an AAA policy re-directing the WiNG captive portal user to WeChat's AAA server for authentication, as shown in the following example:

```
nx9500-6C8809(config)#aaa-policy cloud2
nx9500-6C8809(config-aaa-policy-cloud2)#authentication server 1 host
cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809(config-aaa-policy-cloud2)#show context
aaa-policy cloud2
authentication server 1 host cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809(config-aaa-policy-cloud2)#
```

#### Note

Synchroweb is an ISV (independent software vendor), whose third-party software is being used as the intermediate server. The AAA server and RADIUS accounting server configured in AAA policy must be as per the specification provided by the ISV.

- 2 Create a DNS whitelist, whitelisting WeChat's server name in order to initiate RADIUS authentication. The "qq.com" domain name is where WeChat server can be reached.

```
nx9500-6C8809(config)#dns-whitelist wxWL
nx9500-6C8809(config-dns-whitelist-wxWL)#permit cloud2.synchroweb.com
nx9500-6C8809(config-dns-whitelist-wxWL)#permit qq.com suffix
nx9500-6C8809(config-dns-whitelist-wxWL)#show context
dns-whitelist wxWL
permit qq.com suffix
permit cloud2.synchroweb.com
nx9500-6C8809(config-dns-whitelist-wxWL)#
```

- 3 Create a captive portal and associate the AAA policy and DNS whitelist created in steps 1 & 2, as shown in the following example:

```
nx9500-6C8809(config)#captive-portal wxCP
nx9500-6C8809(config-captive-portal-wxCP)#use aaa-policy cloud2
nx9500-6C8809(config-captive-portal-wxCP)#use dns-whitelist wxWL
```

- 4 Configure the following captive portal parameters:

```
nx9500-6C8809(config)#captive-portal wxCP
nx9500-6C8809(config-captive-portal-wxCP)#access-time 10
nx9500-6C8809(config-captive-portal-wxCP)#server host guest.extreme.com
nx9500-6C8809(config-captive-portal-wxCP)#webpage-location external
nx9500-6C8809(config-captive-portal-wxCP)#webpage external login http://
cloud2.synchroweb.com/wechat.nx/index.phpc=WING_TAG_CLIENT_MAC
nx9500-6C8809(config-captive-portal-wxCP)#show context
captive-portal wxCP
access-time 10
server host guest.extreme.com
webpage-location external
webpage external login http://cloud2.synchroweb.com/wechat.nx/
index.phpc=WING_TAG_CLIENT_MAC
use aaa-policy cloud2
use dns-whitelist wxWL
--More--
nx9500-6C8809(config-captive-portal-wxCP)#
```

#### Note

The login URL configured here must be as per the specifications provided by the ISV.

**Note**

The access-type remains unchanged (i.e. radius, which is the default setting). The access-time is set to a minimum value (10 minutes in this example) in order to avoid the default value of 24 hours being applied, in case the RADIUS response does not contain the session-timeout attribute.

- 5 Create a WLAN and associate the captive portal created in step 3:

```
nx9500-6C8809(config)#wlan wxOpen
nx9500-6C8809(config-wlan-wxOpen)#ssid wxOpen
nx9500-6C8809(config-wlan-wxOpen)#vlan 200
nx9500-6C8809(config-wlan-wxOpen)##use captive-portal wxCP
nx9500-6C8809(config-wlan-wxOpen)#captive-portal-enforcement
nx9500-6C8809(config-wlan-wxOpen)#show context
wlan wxOpen
ssid wxOpen
vlan 200
bridging-mode local
encryption-type none
authentication-type none
use captive-portal wxCP
captive-portal-enforcement
nx9500-6C8809(config-wlan-wxOpen)#
```

**Note**

The modes of authentication and encryption remain unchanged (i.e. none, which is the default setting for both parameters). Ensure captive-portal-enforcement is enabled on the WLAN.

Following are the related commands:

|                                            |                                                      |
|--------------------------------------------|------------------------------------------------------|

configuring ExtremeGuest captive portal

This section documents the basic configurations required to deploy an EGuest (ExtremeGuest) setup. A typical EGuest deployment consists of the EGuest server, EGuest captive-portal database, and NOC adopting the access points. The EGuest server and database can be hosted only on the VX 9000 platform.

In the following example, the EGuest server and database are hosted on the same device.

- 1 On the EGuest server/database host,
  - a enable the EGuest daemon. When enabled, the EGuest server is up and running.  
`EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#eguest-server`
  - b apply a database-policy to enable the EGuest database.  
`EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#use database-policy default`
  - c configure the NTP server. This is to ensure time synchronization across replica-set members (this is mandatory in replica-set deployments and should be configured either on the replica-set members' device or profile context).  
`EG-Server-DB(config-device-02-EE-1A-7E-AE-5B)#ntp server time.nist.govt`

## 2 On the NOC,

### a create an AAA policy with the following configurations:

- Configure the EGuest server (configured in Step 1) as the authentication and accounting RADIUS server.

```
NOC(config-aaa-policy-EguestAAA)#authentication server 1 host EG-Server secret 0
extreme123
```

```
NOC(config-aaa-policy-EguestAAA)#accounting server 1 host EG-Server secret 0
extreme123
```

- Configure the proxy-mode as 'through-controller'. When configured, all requests to the server are proxied through the NOC.

```
NOC(config-aaa-policy-EguestAAA)#authentication server 1 proxy-mode through-
controller
```

```
NOC(config-aaa-policy-EguestAAA)#accounting server 1 proxy-mode through-controller
```

```
NOC(config-aaa-policy-EguestAAA)#show context
```

```
aaa-policy EguestAAA
```

```
accounting server 1 host EG-OnBServer secret 0 extreme123
```

```
accounting server 1 proxy-mode through-controller
```

```
authentication server 1 host EG-Server secret 0 extreme123
```

```
authentication server 1 proxy-mode through-controller
```

```
NOC(config-aaa-policy-EguestAAA)#
```

### b Create a DNS whitelist. Note, DNS whitelist configuration is required only if enabling OAuth on the EGuest captive-portal. When created and used on the EGuest captive-portal, the DNS whitelist renders social plugin buttons on the client prior to successful captive portal authentication.

- Configure the following permit rules:

```
NOC(config-dns-whitelist-EguestDNS)#permit fbstatic-a.akamaihd.net
```

```
NOC(config-dns-whitelist-EguestDNS)#permit connect facebook.net
```

```
NOC(config-dns-whitelist-EguestDNS)#permit facebook.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit fbcdn.net suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit googleapis.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit google.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit googleusercontent.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit linkedin.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit static.licdn.com
```

```
NOC(config-dns-whitelist-EguestDNS)#permit twitter.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit twimg.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit instagramstatic-a.akamaihd.net
```

```
NOC(config-dns-whitelist-EguestDNS)#permit instagram.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit ssl.gstatic.com
```

```
NOC(config-dns-whitelist-EguestDNS)#permit extremenetworks.com suffix
```

```
NOC(config-dns-whitelist-EguestDNS)#permit local.extreme.com
```

### c Create a captive-portal with the following configurations:

- Specify the captive-portal server.

```
NOC(config-captive-portal-EguestCP)#server host guest.extreme.com
```

- Use the AAA policy created in Step 2 a.

```
NOC(config-captive-portal-EguestCP)#use aaa-policy EguestAAA
```

- Enable social-media authentication. This setting is optional.

```
NOC(config-captive-portal-EguestCP)#oauth
```

- Use the DNS whitelist created in Step 2 b. Note, the DNS whitelist is required only if enabling OAuth on the captive-portal.  
`NOC(config-captive-portal-EguestCP)#use dns-whitelist EguestDNS`
- Configure the captive portal's webpage location as advanced.

**Note**

Webpage-location should be 'advanced' if using pages created with EGuest splash templates.

```
NOC(config-captive-portal-EguestCP)#webpage-location advanced
```

d Create a WLAN policy with the following configurations:

- Enable MAC authentication.  
`NOC(config-wlan-EguestWLAN)#authentication-type mac`
- Use the AAA policy created in Step 2 a.  
`NOC(config-wlan-EguestWLAN)#use aaa-policy EguestAAA`

**Note**

When used, access points/controllers forward registration requests to the EGuest server specified in the AAA policy. However, ensure that the **registration > external > follow-aaa** option is configured on the WLAN. See below.

```
NOC(config-wlan-EguestWLAN)#registration external follow-aaa
```

**Note**

This enables the use of the Authentication and Accounting servers specified in the AAA policy applied on the WLAN.

- Use the captive-portal created in Step 2 c.  
`NOC(config-wlan-EguestWLAN)#use captive-portal EguestCP`
- Enable captive-portal enforcement with fall-back.  
`NOC(config-wlan-EguestWLAN)#captive-portal-enforcement fall-back`
- Configure the following guest registration parameters:  
`NOC(config-wlan-EguestWLAN)#registration device group-name Eguest expiry-time 4320 agreement-refresh 1440`

**Note**

This is the RADIUS group assigned to registered users post authentication.

```
NOC(config-wlan-EguestWLAN)#show context
wlan EguestWLAN
ssid _EXTREME-GUEST-NRF2017
vlan 1
bridging-mode local
encryption-type none
authentication-type mac
no answer-broadcast-probes
no client-client-communication
wireless-client hold-time 300
use aaa-policy EguestAAA
use captive-portal EguestCP
captive-portal-enforcement fall-back
registration device group-name Eguest expiry-time 4320 agreement-refresh 1440
registration external follow-aaa
```

```
mac-authentication cached-credentials
NOC(config-wlan-EgustWLAN)#
```

e In the NOC's self context, configure the EGuest server.

```
NOC(config-device-74-67-F7-5C-64-4A)#eguest-server host 1 EG-Server https
```

3 In the Access Point's device or profile context, use the captive-portal configured in Step 2 c.

```
Egust-AP(config-device-74-67-F7-5C-64-4A)#use captive-portal EgustCP
```

4 To view EGuest registration status and statistics, on the EGuest server, use the following commands:

```
EG-Server-DB#show eguest registration statistics
EG-Server-DB#show eguest registration status
```

5 To clear EGuest registration statistics, on the EGuest server, use the following command:

```
EG-Server-DB#clear eguest registration statistics
```

Following are the related commands:

|                                                         |                                                                                                                                                                                                                                           |

| <a href="#">eguest-server (VX9000 only)</a> on page 990 | Documents the eguest-server command. When used in the EGuest server's device/profile context, without the 'host' option, it enables the EGuest daemon. When used on the NOC along with the 'host' option, it points to the EGuest server. |
| <a href="#">eguest</a> on page 732 (show commands)      | Documents the <b>show &gt; eguest</b> command outputs                                                                                                                                                                                     |

## clear

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where executed.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
clear event-history
```

### Parameters

```
clear event-history
```

|               |                               |
|---------------|-------------------------------|
| event-history | Clears the event history file |
|---------------|-------------------------------|

### Examples

### *client-identity*

With an increase in *Bring Your Own Device* (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization's security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain.

Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client's device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation etc. This method accurately classifies a client's

TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP etc. This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

The `client-identity` command enables device fingerprinting. It creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network.

#### Note

The WING software provides a set of built-in device fingerprints that load by default and identify client device types. Use the `service > show > client-identity-defaults` command to view default client identity fingerprints.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
client-identity <CLIENT-IDENTITY-NAME>
```

#### Parameters

```
client-identity <CLIENT-IDENTITY-NAME>
```

|                                           |                                                                                                                                                                                                                                                             |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-identity<br><CLIENT-IDENTITY-NAME> | Creates a new client identity policy and enters its configuration mode <ul style="list-style-type: none"><li>• &lt;CLIENT-IDENTITY-NAME&gt; - Specify a client identity policy name. If the client identity policy does not exist, it is created.</li></ul> |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Usage Guidelines

The following points should be considered when configuring the client identity (device fingerprinting) feature:

- Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see [enforce-dhcp](#).
- Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints, it will be difficult to identify the device type.
- When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).

## Examples

```
rfs4000-229D58(config)#client-identity test
rfs4000-229D58(config-client-identity-test)#?
Client Identity Mode commands:
 dhcp Add a DHCP option based match criteria
 dhcp-match-message-type Specify DHCP message type to match
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-test)#
```

Use the `service > show > client-identity-defaults` command to view default, built-in, system-provided client identity fingerprints:

```
nx9500-6C8809#service show client-identity-defaults
client-identity Android-2-1
 dhcp 1 message-type request option 55 exact hexstring 0103061c21333a3b79
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.1
client-identity Android-2-2
 dhcp 1 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
client-identity Android-2-3
 dhcp 3 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
 dhcp 1 message-type request option-codes exact hexstring 353d32393c37
 dhcp 2 message-type request option-codes exact hexstring 353d3236393c37
 dhcp 10 message-type request option-codes exact hexstring 353d3236393c0c37
--More--
nx9500-6C8809#
```

## client-identity-mode-commands

The following table summarizes the client-identity configuration mode commands:

**Table 12: Client-Identity-Mode Commands**

| Command                              | Description                                                             |
|--------------------------------------|-------------------------------------------------------------------------|
| <code>dhcp</code>                    | Configures the DHCP option match criteria for device fingerprinting     |
| <code>dhcp-match-message-type</code> | Configures the DHCP message type for device fingerprinting              |
| <code>no</code>                      | Removes the DHCP option (used for client identification) configurations |

## dhcp

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device's OS (Operating System). Options and option values contained in a client's messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
[contains|exact|starts-with] [ascii|hexstring] <WORD>
```

### Parameters

```
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
[contains|exact|starts-with] [ascii|hexstring] <WORD>
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| hexstring<br><WORD>                    | <p>The following keywords are common to the 'contains', 'exact', and 'starts-with' parameters:</p> <ul style="list-style-type: none"> <li>• hexstring – Configures the DHCP option in the hexa-decimal format <ul style="list-style-type: none"> <li>• &lt;WORD&gt; – Specify the DHCP option hexstring value to match.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

#### Usage Guidelines

The following DHCP options are useful for identifying different device types:

- Option 55: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client's order of preference.
- Client configured list of DHCP options (all options parsed into a hex string).
- Option 60: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

#### Examples

```
rfs4000-229D58(config-client-identity-test)#dhcp 1 message-type request option
60 exact ascii MSFT\5.0
rfs4000-229D58(config-client-identity-test)#dhcp 2 message-type discover option
2 exact hexstring 012456c22c44
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#
```

|-----------|--------------------------------------------------|

#### dhcp-match-message-type

Configures the DHCP message type to match

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
dhcp-match-message-type [all|any|discover|request]
```

#### Parameters

```
dhcp-match-message-type [all|any|discover|request]
```

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dhcp-match-message-type [all any discover request] | <p>Specifies the DHCP message type to consider for matching</p> <ul style="list-style-type: none"> <li>• all – Matches all message types: discover and request. Indicates that the fingerprint is checked with both the DHCP request and the DHCP discover message.</li> <li>• any – Matches any message type: discover or request. Indicates that the fingerprint is checked with either the DHCP request or the DHCP discover message.</li> <li>• discover – Matches discover messages only. A match is made only if the discover message sent by the client matches the match criteria set in the client identity. Values configured for request messages are ignored.</li> <li>• request – Matches request messages only. A match is made only if the request message sent by the client matches the match criteria set in the client identity. Values configured for discover messages are ignored.</li> </ul> |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
rfs4000-229D58(config-client-identity-test)#dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
 dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#
```

|-----------------|----------------------------------------|
| <code>no</code> | Removes the DHCP message type to match |
|-----------------|----------------------------------------|

## no (client-identity-config-mode)

Removes the DHCP options match criteria configurations

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
no [dhcp <1-16>|dhcp-match-message-type]
```

## Parameters

```
no [dhcp <1-16>|dhcp-match-message-type]
```

|                                      |                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dhcp &lt;1-16&gt;</code>       | Removes the DHCP option match criteria rule identified by the <1-16> keyword <ul style="list-style-type: none"><li>• &lt;1-16&gt; - Specify the DHCP option match criteria rule index</li></ul> |
| <code>dhcp-match-message-type</code> | Removes the DHCP message type to match                                                                                                                                                          |

## Examples

The following example shows the client identity 'test' settings before the 'no' commands are executed:

```
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
 dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
 dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#
```

The following example shows the client identity 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58(config-client-identity-test)#no dhcp 2
rfs4000-229D58(config-client-identity-test)#no dhcp-match-message-type
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
 dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#
```

## *client-identity-group*

Configures a new client identity group

A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

Device fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

### **Parameters**

```
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

|                                                       |                                                                                                                                                                                                                                                |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-identity-group<br><CLIENT-IDENTITY-GROUP-NAME> | Creates a new client identity group and enters its configuration mode <ul style="list-style-type: none"><li>• &lt;CLIENT-IDENTITY-GROUP-NAME&gt; - Specify a client identity group name. If the group does not exist, it is created.</li></ul> |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### **Examples**

```
rfs4000-229D58(config)#client-identity-group test
rfs4000-229D58(config-client-identity-group-test)#
Client Identity group Mode commands:
 client-identity Client identity (DHCP Device Fingerprinting)
 load Load Client identity Fingerprints
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-group-test)#
```

## client-identity-group-mode-commands

The following table summarizes the client identity group configuration mode commands:

**Table 13: Client-Identity-Group-Mode Commands**

| Command                                  | Description                                                                                                              |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <code>client-identity</code> on page 344 | Associates an existing and configured client identity (device fingerprinting definition) with this client identity group |
| <code>load</code> on page 345            | Loads default (system-provided) client identity fingerprints                                                             |
| <code>no</code>                          | Removes the client identity associated with this client identity group                                                   |

## client-identity

Associates an existing and configured client identity (device fingerprinting definition) with this client identity group

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

## Parameters

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

|                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>client-identity</code><br><code>&lt;CLIENT-IDENTITY-NAME&gt;</code> | Associates a client identity with this group <ul style="list-style-type: none"><li>• <code>&lt;CLIENT-IDENTITY-NAME&gt;</code> – Specify a client identity name (should be existing and configured)</li></ul>                                                                                                                                                                                                                                     |
| <code>precedence</code><br><code>&lt;1-10000&gt;</code>                   | Determines the order in which client identity is used. <ul style="list-style-type: none"><li>• <code>&lt;1-10000&gt;</code> – Specify this client identity precedence from <code>&lt;1-10000&gt;</code>.</li></ul> <p>The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets priority over a client identity having precedence 20.</p> |

## Examples

The following example shows two client identities created and configured:

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.9.2.0-006D
!
!
```

```

version 2.5
!
!

 --More--
rfs4000-229D58(config)#

```

The following example associates client identity 'test' with the client identity group 'test':

```
rfs4000-229D58(config-client-identity-group-test)#client-identity test precedence 1
```

The following example shows the client identity group 'test' with two associated client identities having precedence 1 and 2:

```

rfs4000-229D58(config-client-identity-group-test)#client-identity TestClientIdentity
precedence 2
rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
 client-identity test precedence 1
 client-identity TestClientIdentity precedence 2
rfs4000-229D58(config-client-identity-group-test)#

```

#### Related Commands

|                                                                                 |
|---------------------------------------------------------------------------------|
| <b>no</b> Removes the client identity associated with the client identity group |
|---------------------------------------------------------------------------------|

#### load

Loads default (built-in, system-provided) client identity fingerprints. This option is enabled by default.

The WiNG software provides some built-in client identity fingerprints that are automatically loaded when the client identity group is applied to a device (either directly or through the profile).

WiNG, nx9500-6C8809, rfs4000-229D58, rfs4000-1B3596, rfs4000-229D58, nx9500-6C8809, nx9500-6C874D

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
load default-fingerprints
```

#### Parameters

```
load default-fingerprints
```

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|
| load default-fingerprints | Loads client identity default fingerprints. This option is enabled by default. |
|---------------------------|--------------------------------------------------------------------------------|

## Examples

The auto-load default fingerprints option is enabled by default, as shown in the following example:

```
nx9500-6C874D(config-client-identity-group-test)#show context
client-identity-group test
 load default-fingerprints
nx9500-6C874D(config-client-identity-group-test)#
```

In scenarios where only customized client identities are to be applied, use the **no > load > default-fingerprints** command to disable auto-loading of default device fingerprints.

```
nx9500-6C874D(config-client-identity-group-test)#no load default-fingerprints
nx9500-6C874D(config-client-identity-group-test)#show context
client-identity-group test
 no load default-fingerprints
nx9500-6C874D(config-client-identity-group-test)#
```

Use the **service > show > client-identity-defaults** command to view default client identity fingerprints:

```
nx9500-6C874D#service show client-identity-defaults
client-identity Android-2-1
 dhcp 1 message-type request option 55 exact hexstring 0103061c21333a3b79
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.1
client-identity Android-2-2
 dhcp 1 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
client-identity Android-2-3
 dhcp 3 message-type request option 55 exact hexstring 01792103061c333a3b
 dhcp 6 message-type request option 60 exact ascii dhcpcd\ 4.0.15
 dhcp 1 message-type request option-codes exact hexstring 353d32393c37
 dhcp 2 message-type request option-codes exact hexstring 353d3236393c37
 dhcp 10 message-type request option-codes exact hexstring 353d3236393c0c37
--More--
nx9500-6C874D#
```

## Related Commands

|----|--------------------------------------------------------------------|
| no | Disables automatic loading of default client identity fingerprints |
|----|--------------------------------------------------------------------|

no (client-identity-group-config-mode)

Removes the client identity associated with the client identity group

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
no [client-identity|load]
no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
no load default-fingerprints
```

## Parameters

```
no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

```
no client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

Disassociates a specified client identity from this client identity group

- <CLIENT-IDENTITY-NAME> – Specify the client identity name.
- precedence <1-10000> – Specify the above specified client identity's precedence value from <1-10000>.

The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.

```
no load default-fingerprints
```

```
no load default-fingerprints
```

Disables automatic loading of built-in, system-provided client identity fingerprints

### Examples

```
<exsw5>(config-client-identity-group-test)#show context
client-identity-group test
 client-identity test precedence 1
<exsw5>(config-client-identity-group-test)#
<exsw5>(config-client-identity-group-test)#no client-identity test
<exsw5>(config)#
```

### Related Commands

```
client-identity Associates an existing and configured client identity (device fingerprinting) with this client identity group
```

## clone

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
clone [TLO|device]
clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>
```

### Parameters

```
clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
```

|                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                               |

nx9500-6C874D(config)#

```

*crypto-cmp-policy*

Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

`crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

**Parameters**

`crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

```
crypto-cmp-policy <CRYPTO- Specify the crypto CMP policy name. If the policy does not exist, it is created.
CMP-POLICY-NAME>
```

## Examples

```
nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?
CMP Policy Mode commands:
 ca-server CMP CA Server configuration commands
 cert-key-size Set key size for certificate request
 cert-renewal-timeout Trigger a cert renewal request on timeout
 cross-cert-validate Validate cross-cert using factory-cert
 no Negate a command or set its defaults
 subjectAltName Configure subjectAltName value
 trustpoint Trustpoint for CMP
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-cmp-policy-CMP)#
```

## Related Commands

```
no Resets values or disables commands
```

### Note

For more information on the crypto CMP policy, see [CRYPTO-CMP-POLICY](#) on page 1831.

## customize

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Parameters

```
customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>
```

|                                   |                                                                                                                                                                                                                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hostname-column-width <1-64>      | Configures default width of the hostname column in all show commands <ul style="list-style-type: none"> <li>&lt;1-64&gt; - Sets the hostname column width from 1 - 64 characters</li> </ul>                      |
| cdp-lldp-info-column-width <1-64> | Configures the column width in the <b>show &gt; cdp/lldp &gt; [neighbor report]</b> command output <ul style="list-style-type: none"> <li>&lt;1-64&gt; - Sets the column width from 1 - 64 characters</li> </ul> |

```
customize show-adoption-status (adopted-by,ap-name <1-64>,cdp-lldp-info,
config-status,last-adoption,msgs,uptime,version)
```

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show-adoption-status | Configures the information displayed in the show > adoption > status command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time. The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime. Where ever available, you can optionally use the <1-64> parameter to set the column width. |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
customize show-wireless-client (ap-name <1-64>,auth,client-identity <1-32>,
bss,enc,hostname <1-64>,ip,last-active,location <1-64>,mac,radio-alias <3-67>,
radio-id,radio-type,role <1-32>,state,username <1-64>,vendor,vlan,wlan)
```

|                        |                                                                                                                                                                                                                                                                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show-wireless-client   | Customizes the <b>show &gt; wireless &gt; client</b> command output<br>The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN. VLAN, and State.                                                                                                                                                                       |
| ap-name <1-64>         | Includes the ap-name column, which displays the name of the AP with which this client associates <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the ap-name column width from 1 - 64 characters</li> </ul>                                                                                                               |
| auth                   | Includes the auth column, which displays the authorization protocol used by the wireless client                                                                                                                                                                                                                                        |
| client-identity <1-32> | Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see <a href="#">client-identity</a> . <ul style="list-style-type: none"> <li>• &lt;1-32&gt; – Sets the client-identity column width from 1 - 32 characters</li> </ul> |
| bss                    | Includes the BSS column, which displays the BSS ID the wireless client is associated with                                                                                                                                                                                                                                              |
| enc                    | Includes the enc column, which displays the encryption suite used by the wireless client                                                                                                                                                                                                                                               |
| hostname <1-64>        | Includes the hostname column, which displays the wireless client's hostname <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</li> </ul>                                                                                                                                   |
| ip                     | Includes the IP column, which displays the wireless client's current IP address                                                                                                                                                                                                                                                        |
| last-active            | Includes the last-active column, which displays the time of last activity seen from the wireless client                                                                                                                                                                                                                                |
| location <1-64>        | Includes the location column, which displays the location of the client's associated Access Points <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the location column width from 1 - 64 characters</li> </ul>                                                                                                            |
| mac                    | Includes the MAC column, which displays the wireless client's MAC address                                                                                                                                                                                                                                                              |
| radio-alias <3-67>     | Includes the radio-alias column, which displays the radio alias with the AP's hostname and radio interface number in the "HOSTNAME:RX" format <ul style="list-style-type: none"> <li>• &lt;3-67&gt; – Sets the radio-alias column width from 3 - 67 characters</li> </ul>                                                              |
| radio-id               | Includes the radio-id column, which displays the radio ID with the AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format                                                                                                                                                                                    |
| radio-type             | Includes the radio-type column, which displays the wireless client's radio type                                                                                                                                                                                                                                                        |
| role <1-32>            | Includes the role column, which displays the client's role <ul style="list-style-type: none"> <li>• &lt;1-32&gt; – Sets the role column width from 1 - 32 characters</li> </ul>                                                                                                                                                        |
| state                  | Includes the state column, which displays the wireless client's current availability state                                                                                                                                                                                                                                             |

|                 |                                                                                                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username <1-64> | Includes the username column, which displays the wireless client's username <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Specify the username column width from 1 - 64 characters.</li> </ul> |
| vendor          | Includes the vendor column, which displays the wireless client's vendor ID                                                                                                                               |
| vlan            | Includes the VLAN column, which displays the wireless client's assigned VLAN                                                                                                                             |
| wlan            | Includes the WLAN column, which displays the wireless client's assigned WLAN                                                                                                                             |

`customize show-wireless-client-stats (hostname <1-64>,mac,rx-bytes,rx-errors,rx-packets,rx-throughput,t-index,tx-bytes,tx-dropped,tx-packets,tx-throughput)`

|                            |                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show-wireless-client-stats | Customizes the <b>show &gt; wireless &gt; client</b> stats command output<br>The columns displayed by default are: MAC, Tx bytes, RX bytes, Tx pkts, Rx pkts, and Tx bps, RX bps, T-Index, and Dropped pkts. |
| hostname <1-64>            | Includes the hostname column, which displays the wireless client's hostname <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</li> </ul>         |
| mac                        | Includes the MAC column, which displays the wireless client's MAC address                                                                                                                                    |
| rx-bytes                   | Includes the rx-bytes column, which displays the total number of bytes received by the wireless client                                                                                                       |
| rx-errors                  | Includes the rx-error column, which displays the total number of errors received by the wireless client                                                                                                      |
| rx-packets                 | Includes the rx-packets column, which displays the total number of packets received by the wireless client                                                                                                   |
| rx-throughput              | Includes the rx-throughput column, which displays the receive throughput at the wireless client                                                                                                              |
| t-index                    | Includes the t-index column, which displays the traffic utilization index at the particular wireless client                                                                                                  |
| tx-bytes                   | Includes the tx-bytes column, which displays the total number of bytes transmitted by the wireless client                                                                                                    |
| tx-dropped                 | Includes the tx-dropped column, which displays the total number of dropped packets by the wireless client                                                                                                    |
| tx-packets                 | Includes the tx-packets column, which displays the total number of packets transmitted by the wireless client                                                                                                |
| tx-throughput              | Includes the tx-throughput column, which displays the transmission throughput at the wireless client                                                                                                         |

`customize show-wireless-client-stats-rf (average-retry-number,error-rate,noise,q-index,rx-rate,signal,snr,t-index,tx-rate)`

|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show-wireless-client-stats-rf | Customizes the <b>show &gt; wireless &gt; client</b> stats RF command output<br>The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), TX Rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%). |
| average-retry-number          | Includes the average-retry-number column, which displays the average number of retransmissions made per packet                                                                                                            |
| error-rate                    | Includes the error-rate column, which displays the rate of error for the wireless client                                                                                                                                  |
| hostname <1-64>               | Includes the hostname column, which displays the wireless client's hostname <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</li> </ul>                      |

|         |                                                                                                                            |
|---------|----------------------------------------------------------------------------------------------------------------------------|
| mac     | Includes the MAC column, which displays the wireless client's MAC address                                                  |
| noise   | Includes the noise column, which displays the noise (in dBm) as detected by the wireless client                            |
| q-index | Includes the q-index column, which displays the RF quality index<br><b>Note:</b> Higher values indicate better RF quality. |
| rx-rate | Includes the rx-rate column, which displays the receive rate at the particular wireless client                             |
| signal  | Includes the signal column, which displays the signal strength (in dBm) at the particular wireless client                  |
| snr     | Includes the snr column, which displays the <i>signal-to-noise</i> (SNR) ratio (in dB) at the particular wireless client   |
| t-index | Includes the t-index column, which displays the traffic utilization index at the particular wireless client                |
| tx-rate | Includes the tx-rate column, which displays the packet transmission rate at the particular wireless client                 |

```

| show-wireless-meshpoint | Customizes the <b>show &gt; wireless &gt; meshpoint</b> command output<br>The columns displayed by default are: Mesh, Hostname, Hops, Is-Root, Config-As-Root, Root-Hostname, Root-Bound-Time, Path-Metric, Next-Hop-Hostname, and Next-Hop-Use-Time.  |
| ap-mac                  | Includes the ap-mac column, which displays the AP's MAC address in the AA-BB-CC-DD-EE-FF format. Applicable only in case of non-wireless controller meshpoints                                                                                         |
| cfg-as-root             | Includes the cfg-as-root column, which displays the configured root state of the meshpoint                                                                                                                                                             |
| hops                    | Includes the hops column, which displays the number of hops to the root for this meshpoint                                                                                                                                                             |
| hostname <1-64>         | Includes the hostname column, which displays the AP's hostname. Applicable only in case of non-wireless controller meshpoints <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the hostname column width from 1 - 64 characters</li> </ul> |
| interface-ids           | Includes the interface-ids column, which displays the interface identifiers (interfaces used by this meshpoint)                                                                                                                                        |
| is-root                 | Includes the is-root column, which displays the current root state of the meshpoint                                                                                                                                                                    |
| mesh-name <1-64>        | Includes the mesh-name column, which displays the meshpoint's name <ul style="list-style-type: none"> <li>• &lt;1-64&gt; - Sets the mesh-name column width from 1 - 64 characters</li> </ul>                                                           |

|                          |                                                                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mpid                     | Includes the mpid column, which displays the meshpoint identifier in the AA-BB-CC-DD-EE-FF format                                                                                                                                                          |
| next-hop-hostname <1-64> | Includes the next-hop-hostname column, which displays the next-hop AP's name (the AP next in the path to the bound root) <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the next-hop-hostname column width from 1 - 64 characters</li> </ul> |
| next-hop-ifid            | Includes the next-hop-ifid column, which displays the next-hop interface identifier in the AA-BB-CC-DD-EE-FF format                                                                                                                                        |
| next-hop-use-time        | Includes the next-hop-use-time column, which displays the time since this meshpoint started using this next hop                                                                                                                                            |
| root-bound-time          | Includes the root-bound-time column, which displays the time since this meshpoint has been bound to the current root                                                                                                                                       |
| root-hostname <1-64>     | Includes the root-hostname column, which displays the root AP's hostname to which this meshpoint is bound <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the root-hostname column width from 1 - 64 characters</li> </ul>                    |
| root-mpid                | Includes the root-mpid column, which displays the bound root meshpoint identifier in the AA-BB-CC-DD-EE-FF format                                                                                                                                          |

customize show-wireless-meshpoint-neighbor-stats (ap-hostname <1-64>, neighbor-hostname <1-64>, neighbor-ifid, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

| show-wireless-meshpoint-neighbor-stats | Customizes the <b>show &gt; wireless &gt; meshpoint &gt; neighbor &gt; stats</b> command output<br>The columns displayed by default are: AP Hostname, Neighbor-IFID, TX bytes, RX bytes, Tx pkts, Rx pkts, Tx (bps), Rx (bps), T-Index (%), and Dropped pkts. |
| ap-name <1-64>                         | Includes the ap-name column, which displays name of the AP reporting a neighbor <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the ap-name column width from 1 - 64 characters</li> </ul>                                                       |
| neighbor-hostname <1-64>               | Includes the neighbor-hostname column, which displays the reported neighbor's hostname <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the neighbor-hostname column width from 1 - 64 characters</li> </ul>                                      |
| neighbor-ifid                          | Includes the neighbor-ifid column, which displays the neighbor's interface ID                                                                                                                                                                                 |
| rx-bytes                               | Includes the rx-bytes column, which displays the total bytes received                                                                                                                                                                                         |
| rx-errors                              | Includes the rx-error column, which displays the total bytes of error received                                                                                                                                                                                |
| rx-packets                             | Includes the rx-packets column, which displays the number of packets received                                                                                                                                                                                 |
| rx-throughput                          | Includes the rx-throughput column, which displays neighbor's received throughput                                                                                                                                                                              |
| t-index                                | Includes the t-index column, which displays the traffic utilization index at the neighbor end                                                                                                                                                                 |
| tx-bytes                               | Includes the tx-bytes column, which displays the total bytes transmitted                                                                                                                                                                                      |
| tx-dropped                             | Includes the tx-dropped column, which displays the total bytes dropped                                                                                                                                                                                        |
| tx-packets                             | Includes the tx-packets column, which displays the number of packets transmitted                                                                                                                                                                              |
| tx-throughput                          | Includes the tx-throughput column, which displays neighbor's transmitted throughput                                                                                                                                                                           |

| show-wireless-radio | Customizes the show wireless radio command output                                                                                                                                                               |
| adopt-to            | Includes the adopt-to column, which displays information about the wireless controller adopting this AP                                                                                                         |
| ap-name <1-64>      | Includes the ap-name column, which displays information about the AP this radio belongs <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the ap-name column width from 1 - 64 characters</li> </ul> |
| channel             | Includes the channel column, which displays information about the configured and current channel for this radio                                                                                                 |
| location <1-64>     | Includes the location column, which displays the location of the AP this radio belongs <ul style="list-style-type: none"> <li>• &lt;1-64&gt; – Sets the location column width from 1 - 64 characters</li> </ul> |
| num-clients         | Includes the num-clients column, which displays the number of clients associated with this radio                                                                                                                |
| power               | Includes the power column, which displays the radio's configured and current transmit power                                                                                                                     |

|                    |                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radio-alias <3-67> | Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" formate) <ul style="list-style-type: none"> <li>• &lt;3-67&gt; - Sets the radio-alias column width from 3 - 67 characters</li> </ul> |
| radio-id           | Includes the radio-id column, which displays the radio's ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format)                                                                                                                        |
| radio-mac          | Includes the radio-mac column, which displays the radio's base MAC address                                                                                                                                                                                                           |
| rf-mode            | Includes the rf-mode column, which displays the radio's operating mode. The radio mode can be 2.4 GHz, 5.0 GHz, or sensor.                                                                                                                                                           |
| state              | Includes the state column, which displays the radio's current operational state                                                                                                                                                                                                      |

|-----------------|-------------------------------------------------------|
| <b>no</b>       | Restores custom CLI settings to default               |
| <b>wireless</b> | Displays wireless configuration and other information |

### *database-client-policy global-config*

Creates a database-client-policy and enters its configuration mode. The database-client-policy configures the IP address or hostname of the database host, and is used on the NSight/EGuest server's device context. However, the database-client-policy is required only in a split deployment, where the server and database are hosted on separate boxes. In such a scenario, the database-client-policy enables the server to identify the database host.

If enforcing database authentication, configure the user-name and password required to access the database on the database-client-policy. For more information on enabling database authentication, see [database \(user and privi exec modes\)](#) on page 59 (user/privi executable mode).

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

## Syntax

```
database-client-policy <DATABASE-CLIENT-POLICY-NAME>
```

## Parameters

```
database-client-policy <DATABASE-CLIENT-POLICY-NAME>
```

|                                                             |                                                                                                                                                                                        |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-client-policy<br><DATABASE-CLIENT-POLICY-<br>NAME> | Specify the database-client-policy name. If the policy does not exist, it is created.<br>Once created and configured, use this policy in the NSight/EGuest server's device<br>context. |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
vx9000-34B78B(config)#database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#?
```

Database Client Policy Mode commands:

```
authentication Database authentication
database-server Add database server
no Negate a command or set its defaults

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

To setup a database/server environment, with the database and the server hosted n separate hosts:

- 1 On the database host, use the database policy. This brings up the database server.
- 2 On the NSight/EGuest server, create the database-client-policy, and configure the database host's IP address or hostname.

```
vx9000-34B78B(config)#database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#database-server
192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

- 3 Use this database-client-policy in the NSight/EGuest server's device configuration context. Once applied, the server posts details to the database specified in the policy.

```
vx9000-34B78B(config-device-00-0C-29-34-B7-8B)#use database-client-policy DBClientPolicy
vx9000-34B78B(config-device-00-0C-29-34-B7-8B)#show context include-factory | include
database-client-policy
use database-client-policy DBClientPolicy
vx9000-34B78B(config-device-00-0C-29-34-B7-8B)#
```

## Related Commands

|                                                              |                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no (global-config-mode)</code> on page 475             | Removes an existing database-client-policy                                                                                                                                                                                                                                                                                                         |
| <code>database-policy global config</code> on page 363       | Documents database policy configuration commands. If enforcing authenticated database access, use this command to enable authentication on the database and configure the username and password.                                                                                                                                                   |
| <code>nsight-policy (global-config-mode)</code> on page 479  | Documents NSight policy configuration commands. The NSight policy is a tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted database. |
| <code>use</code> on page 1232                                | Uses a database-client-policy in the VX 9000's device or profile context                                                                                                                                                                                                                                                                           |
| <code>database (user and privi exec modes)</code> on page 59 | Drops or repairs a database. Also provides database keyfile management capabilities. If enforcing authenticated access to the database, use this command to generate, export, import, and zeroize the keyfile.                                                                                                                                     |

## database-client-policy-commands

The following table summarizes database-client-policy configuration mode commands:

**Table 14: Database Client Policy Config Commands**

| Command                      | Description                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>authentication</code>  | Configures the captive-portal/NSight database users                                                                                             |
| <code>database-server</code> | Configures the database host's IP address or hostname. Use this command to configure the IP address or hostname of the VM hosting the database. |
| <code>no</code>              | Removes the database host's IP/hostname configuration                                                                                           |

### authentication

Configures the database's user account details (username and password)

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
authentication username <USER-NAME> password <PASSWORD>
```

#### Parameters

```
authentication username <USER-NAME> password <PASSWORD>
```

```
authentication
username <USER-
NAME> password
<PASSWORD>
```

Configures the username and password required to access the database. Note, username and password specified here should be the same as those already created on the database host. For more information on creating database users, see [service](#) on page 647 (common commands).

- username <USER-NAME> - Configures the user name
  - password <PASSWORD> - Configures the password for the username specified above.

However, ensure database authentication is enabled in the database-policy.

**Note:** For more information on database-policy, see [database-policy global config](#) on page 363.

**Note:** For more information on enabling database authentication, see [database \(user and privi exec modes\)](#) on page 59.

### Examples

```
vx9000-65672(config-database-client-policy-DBClientPolicy)# authentication username
extreme password 2 test@12345
vx9000-656725#show running-config database-client-policy replica-set
database-client-policy replica-set
 database-server 13.13.13.3
 database-server 14.14.14.2
 authentication username extreme password 2 q4cUyedmA4BFsn1kg/
xjCQAAAAlIMbdrXKblQbsyrwMGdVzv
vx9000-656725#
```

### Related Commands

|                    |                                                    |
|--------------------|----------------------------------------------------|
| <a href="#">no</a> | Removes an existing database username and password |
|--------------------|----------------------------------------------------|

### database-server

Configures the IPv4/IPv6 address or hostname of the VM hosting the database

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
database-server [<IP> | <HOSTNAME> | <IPv6>]
```

### Parameters

```
database-server [<IP> | <HOSTNAME> | <IPv6>]
```

|                                                |                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-server [ <IP>   <HOSTNAME>   <IPv6> ] | Identifies the database host using one of the following options: <ul style="list-style-type: none"><li>• &lt;IP&gt; - Specifies the host's IPv4 address</li><li>• &lt;HOSTNAME&gt; - Specifies the host's hostname</li><li>• &lt;IPv6&gt; - Specifies the host's IPv6 address.</li></ul> |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

### Related Commands

|    |                                                                                       |
|----|---------------------------------------------------------------------------------------|
| no | Removes the database server's (the VM hosting the database) IP/hostname configuration |
|----|---------------------------------------------------------------------------------------|

no (database-client-policy-config-mode)

Removes the database host's IP/hostname configuration. Also removes database user details.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
no [authentication|database-server]
no authentication username <USER-NAME>
no database-server [<IP>|<HOST-NAME>|<IPv6>]
```

#### Parameters

```
no [authentication|database-server]
```

|                 |                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes the database VM's IPv4/IPv6 address or hostname associated with this database client policy. Also removes database user details. |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
database-server 192.168.13.10
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#no database-server
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#show context
database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#
```

### *database-policy global config*

Creates a database-policy and enters its configuration mode. After creating the database-policy, use it on the database host. This enables the database. If deploying a database replica-set, use this command to define the replica set configurations.

To enforce database authentication, enable authentication on the database-policy, and configure the username and password required to access the database. Note, this command is part of a set of configurations that are required to enable authentication. For more information on the entire set of configurations, see [database](#) (user exec mode).

#### **Supported in the following platforms:**

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
database-policy <DATABASE-POLICY-NAME>
```

#### **Parameters**

```
database-policy <DATABASE-POLICY-NAME>
```

|                                        |                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------|
| database-policy <DATABASE-POLICY-NAME> | Specify the database policy name. If the policy does not exist, it is created. |
|----------------------------------------|--------------------------------------------------------------------------------|

## Examples

```
nx9500-6C874D(config)#database-policy test
nx9500-6C874D(config-database-policy-test)#?
Database Policy Mode commands:
 authentication Database authentication
 no Negate a command or set its defaults
 replica-set Replica Set
 shutdown Disable database server

 clrscr Clears the display screen

## database-policy-config-commands

The following table summarizes database-policy configuration mode commands:

**Table 15: Database Policy Config Commands**

| Command                                    | Description                                                                                              |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <a href="#">authentication</a> on page 364 | Enables database authentication and configures the username and password required to access the database |
| <a href="#">replica-set</a> on page 365    | Adds a member to a database replica set                                                                  |
| <a href="#">shutdown</a> on page 366       | Shuts down the database server                                                                           |
| <a href="#">no</a>                         | Removes a member from the database replica set                                                           |

### authentication

Enables database authentication. When enabled and applied on the database host, this policy enforces authenticated access to the database. This command also configures the username and password required to access the database.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
authentication
authentication username <USER-NAME> password <PASSWORD>
```

#### Parameters

```
authentication
```

|                |                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication | Enables database authentication on this database-policy. When executed without the associated keywords, the command enables authentication on the database host using the policy. Execute the command along with the username and password inputs to configure the user credentials required for access the database. |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
authentication username <USER-NAME> password <PASSWORD>
```

|                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication username <USER-NAME> password <PASSWORD> | <p>Configures the username and password required to access the database. Note, username and password specified here should be the same as those already created on the database host. For more information, see <a href="#">service</a> (common commands).</p> <ul style="list-style-type: none"> <li>username &lt;USER-NAME&gt; - Configures the database username</li> <li>password &lt;PASSWORD&gt; - Configures the password for the username specified above</li> </ul> <p>Users using these credentials are allowed database access. In case of a split NSight/EGuest deployment, ensure that the database-client-policy running on the NSight/EGuest server has the same user details configured. For information on creating database-client-policy, see <a href="#">database-client-policy</a>. For more information on enabling database authentication, see <a href="#">database</a> (user exec mode).</p> |

| no | Disables database authentication, and removes the username and password configuration. |
|----|----------------------------------------------------------------------------------------|

#### replica-set

Adds a member to a database replica set. A replica-set is a group of devices (replica-set members) running the database instances that maintain the same data set. Replica sets provide redundancy and high availability and are the basis for all production deployments. The replica set usually consists of: an arbiter, a primary member, and one or more secondary members. The primary member and the secondary member(s) maintain replicas of the data set.

Before deploying a replica set, ensure that each of the replica-set member:

- has the DB instances installed, and
- is able to communicate with every other member in the set.

After ensuring the above,

- Create a database policy (with identical replica-set configuration) on each of the member devices, and
- Use the database policy in the member device's configuration mode.

These member devices elect a primary member, which begins accepting client-write operations. Remaining devices in the replica-set, with the exception of the arbiter, are designated as secondary members.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}
```

#### Parameters

```
replica-set member [<IP>|<FQDN>] {arbiter|priority <0-255>}
```

|-----------|------------------------------------------------|
| <b>no</b> | Removes a member from the database replica set |
|-----------|------------------------------------------------|

#### shutdown

Shuts down the database server. The factory default is set as **no > shutdown**.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
shutdown
```

## Parameters

None

## Examples

```
nx9500-6C874D(config-database-policy-test)#shutdown
nx9500-6C874D(config-database-policy-test)#show context
database-policy test
 shutdown
nx9500-6C874D(config-database-policy-test)#
```

## Related Commands

|                 |                                         |
|-----------------|-----------------------------------------|
| <code>no</code> | Enables (brings-up) the database server |
|-----------------|-----------------------------------------|

no (database-policy-config-mode)

Removes or reverts the database policy settings to default values

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

## Syntax

```
no [authentication|replica-set|shutdown]
no authentication {username <USER-NAME>}
no replica-set member [<IP>|<FQDN>]
no shutdown
```

## Parameters

no <PARAMETERS>

|                 |                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes a member from the database replica set, or brings up a database server that is down. Also disables database authentication and removes user |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

The following example shows a three-member replica set:

```
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.14 arbiter
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

In the following example the arbiter is being removed, leaving the replica set with only two members:

```
nx9500-6C8809(config-database-policy-test)#no replica-set member 192.168.13.14
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#
```

Since a replica set must have at least three members, another member must be added to this replica set. This member may or may not be an arbiter.

```
nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.8 priority 3
nx9500-6C8809(config-database-policy-test)#show context
database-policy test
 replica-set member 192.168.13.12 priority 2
 replica-set member 192.168.13.16 priority 1
```

```

 replica-set member 192.168.13.8 priority 3
 nx9500-6C8809(config-database-policy-test)#

```

## device

Enables simultaneous configuration of multiple devices

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

device {containing/filter}
device {containing <STRING>} {filter type [ap6522/ap6562/ap71xx/ap7502/ap7522/ap7532/ap7562/ap7602/ap7612/ap7622/ap7632/ap7662/ap81xx/ap8432/ap8533/ex3524/ex3548/rfs4000/nx5500/nx75xx/nx9000/nx9600/t5/vx9000]}
device {filter type [ap6522/ap6562/ap71xx/ap7502/ap7522/ap7532/ap7562/ap7602/ap7612/ap7622/ap7632/ap7662/ap81xx/ap8432/ap8533/ex3524/ex3548/rfs4000/nx5500/nx75xx/nx9000/nx9600/t5/vx9000]}

```

### Parameters

```

device {containing <STRING>} {filter type [ap6522/ap6562/ap71xx/ap7502/ap7522/ap7532/ap7562/ap7602/ap7612/ap7622/ap7632/ap7662/ap81xx/ap8432/ap8533/ex3524/ex3548/rfs4000/nx5500/nx75xx/nx9000/nx9600/t5/vx9000]}

```

|                           |                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device                    | Enters a device's configuration mode. Use this command to simultaneously configure devices having similar configuration.                                                                                                                                                                                                                                |
| containing <STRING>       | Optional. Configures the string to search for in the device's hostname. All devices having hostnames containing the string specified here are filtered, and can be configured simultaneously. <ul style="list-style-type: none"> <li>• &lt;STRING&gt; - Specify the string to search for in the device's hostname.</li> </ul>                           |
| filter type <DEVICE-TYPE> | Optional. Filters out a specific device type. After specifying the hostname string, select the device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533 EX3524, EX3548, RFS 4000, NX 5500, NX 7510, NX 95XX, NX 96XX, t5 and VX 9000(V-WLC). |

```

device {filter type [ap6522/ap6562/ap71xx/ap7502/ap7522/ap7532/ap7562/ap7602/ap7612/ap7622/ap7632/ap7662/ap81xx/ap8432/ap8533/ex3524/ex3548/rfs4000/nx5500/nx75xx/nx9000/nx9600/t5/vx9000]}

```

|                           |                                                                                                                                                                                                                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device                    | Configures a basic device profile                                                                                                                                                                                                                                                         |
| filter type <DEVICE-TYPE> | Optional. Filters out a specific device type. The options are: AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533 EX3524, EX3548, RFS 4000, NX 5500, NX 7510, NX 95XX, NX 96XX, t5 and VX 9000(V-WLC). |

### Examples

```

nx9500-6C874D(config)#device filter type ap7532
nx9500-6C874D(config-device-{'type': 'ap7532'})#

```

## Related Commands

|-----------------|-------------------------------------------|
| <code>no</code> | Removes multiple devices from the network |
|-----------------|-------------------------------------------|

### *device-categorization*

Configures a device categorization list, which categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.

Proper classification and categorization of devices (Access Points, clients etc.) helps suppress unnecessary unauthorized Access Point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

Authorized Access Points and clients are generally known to you and conform with your organization's security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or Access Point's radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>
```

### Parameters

```
device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>
```

|                                   |                                                                                                          |
|-----------------------------------|----------------------------------------------------------------------------------------------------------|
| <DEVICE-CATEGORIZATION-LIST-NAME> | Specify the device categorization list name. If a list with the same name does not exist, it is created. |
|-----------------------------------|----------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#device-categorization rfs4000
nx9500-6C8809(config-device-categorization-rfs4000)#?

### device-categorization-mode-commands

The following table summarizes device categorization configuration mode commands:

**Table 16: Device-Categorization Config Mode Commands**

| Command     | Description                                          |
|-------------|------------------------------------------------------|
| mark-device | Adds a device to the device categorization list      |
| no          | Removes a device from the device categorization list |

#### mark-device

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```

mark-device <1-1000> [sanctioned|neighboring] [ap|client]
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>/ssid <SSID> {mac <MAC>}}
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}

```

#### Parameters

```

mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>/ssid <SSID> {mac <MAC>}}

```

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000>                   | Configures the device categorization entry index number                                                                                                                                                                                                                                                                                                                                                                                                             |
| sanctioned                 | Marks a device as sanctioned. A sanctioned device is authorized to use network resources.                                                                                                                                                                                                                                                                                                                                                                           |
| neighboring                | Marks a device as neighboring. A neighboring device is a neighbor in the same network as this device.                                                                                                                                                                                                                                                                                                                                                               |
| ap {mac <MAC> ssid <SSID>} | <p>Marks a specified AP as sanctioned or neighboring based on its MAC address or the SSID it is beaconing</p> <ul style="list-style-type: none"> <li>• mac &lt;MAC&gt; – Optional. Specify the AP's MAC address</li> <li>• ssid &lt;SSID&gt; – Optional. Specify the SSID the AP is beaconing. After specifying the SSID, you can optionally specify MAC address of the radio.</li> </ul> <p>All APs are marked if no specific MAC address or SSID is provided.</p> |

```

mark-device [sanctioned|neighboring] client {mac <MAC>}

```

|                    |                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000>           | Configures the device categorization entry index number                                                                                                                                                          |
| sanctioned         | Marks the wireless client as sanctioned. A sanctioned device is authorized to use network resources.                                                                                                             |
| neighboring        | Marks the wireless client as neighboring. A neighboring device is a neighbor in the same network as this device.                                                                                                 |
| client {mac <MAC>} | Marks a specified wireless client as sanctioned or neighboring based on its MAC address <ul style="list-style-type: none"> <li>mac &lt;MAC&gt; - Optional. Specify the wireless client's MAC address.</li> </ul> |

#### Examples

```

nx9500-6C8809(config-device-categorization-rfs4000)#mark-device 1 sanctioned ap
 mac 11-22-33-44-55-66
nx9500-6C8809(config-device-categorization-rfs4000)#show context
device-categorization rfs4000
 mark-device 1 sanctioned ap mac 11-22-33-44-55-66
nx9500-6C8809(config-device-categorization-rfs4000)#

```

#### Related Commands

|----|------------------------------------------------------|
| no | Removes an entry from the device categorization list |
|----|------------------------------------------------------|

no (device-categorization-config-mode)

Removes a device from the device categorization list

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```

no mark-device <1-1000> [neighboring|sanctioned] [ap|client]
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>/ssid <SSID> {mac <MAC>}}

```

#### Parameters

no <PARAMETERS>

|                 |                                                                                          |
|-----------------|------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes a mark device (AP or wireless client) entry from this device categorization list |
|-----------------|------------------------------------------------------------------------------------------|

#### Examples

The following example shows the device categorization list 'rfs7000' settings before the 'no' command is executed:

```

nx9500-6C8809(config-device-categorization-rfs4000)#show context
device-categorization rfs4000
 mark-device 1 sanctioned ap mac 11-22-33-44-55-66
nx9500-6C8809(config-device-categorization-rfs4000)#
nx9500-6C8809(config-device-categorization-rfs4000)#no mark-device 1 sanctioned ap mac
11-22-33-44-55-66

```

The following example shows the device categorization list 'rfs7000' settings after the 'no' command is executed:

```
nx9500-6C8809(config-device-categorization-rfs4000)#show context
device-categorization rfs4000
nx9500-6C8809(config-device-categorization-rfs4000)#
```

### *dhcp-server-policy*

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
dhcp-server-policy <DHCP-SERVER-POLICY-NAME>
```

#### **Parameters**

```
dhcp-server-policy <DHCP-SERVER-POLICY-NAME>
```

<DHCP-POLICY-NAME> Specify the DHCP server policy name. If the policy does not exist, it is created.

#### **Examples**

```
nx9500-6C8809(config)#dhcp-server-policy test
nx9500-6C8809(config-dhcp-policy-test)#?
DHCP policy Mode commands:
 bootp BOOTP specific configuration
 dhcp-class Configure DHCP class (for address allocation using DHCP
 user-class options)
 dhcp-pool Configure DHCP server address pool
 dhcp-server Activating dhcp server based on criteria
 no Negate a command or set its defaults
 option Define DHCP server option
 ping Specify ping parameters used by DHCP Server

 clrscr Clears the display screen

| <code>no</code> | Removes an existing DHCP server policy |
|-----------------|----------------------------------------|

### Note

For more information on DHCP policy, see [DHCP-SERVER-POLICY](#).

## *dhcpv6-server-policy*

Creates a DHCPv6 server policy and enters its configuration mode

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>
```

### Parameters

```
dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>
```

|                             |                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------|
| <DHCPv6-SERVER-POLICY-NAME> | Specify the DHCPv6 server policy name. If the policy does not exist, it is created. |
|-----------------------------|-------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#dhcpv6-server-policy test
nx9500-6C8809(config-dhcpv6-server-policy-test)#?
DHCPv6 server policy Mode commands:
 dhcpv6-pool Configure DHCPV6 server address pool
 no Negate a command or set its defaults
 option Define DHCPv6 server option
 restrict-vendor-options Restrict vendor specific options to be sent in
 server reply
 server-preference Server preference value sent in the reply, by the
 server to client

 clrscr Clears the display screen

### *dns-whitelist*

Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
dns-whitelist <DNS-WHITELIST-NAME>
```

#### Parameters

```
dns-whitelist <DNS-WHITELIST-NAME>
```

|                                         |                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------|
| <code>&lt;DNS-WHITELIST-NAME&gt;</code> | Specify the DNS whitelist name. If the whitelist does not exist, it is created. |
|-----------------------------------------|---------------------------------------------------------------------------------|

#### Examples

```

nx9500-6C8809(config)#dns-whitelist test
nx9500-6C8809(config-dns-whitelist-test)#?
DNS Whitelist Mode commands:
 no Negate a command or set its defaults
 permit Match a host

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode

### dns-whitelist-mode-commands

The following table summarizes DNS Whitelist configuration mode commands:

**Table 17: DNS-Whitelist Config Mode Commands**

| Command                                                 | Description                                                                          |
|---------------------------------------------------------|--------------------------------------------------------------------------------------|
| <code>permit</code> on page 375                         | Permits a host, existing on a DNS whitelist, access to the network or captive portal |
| <code>no (dns-whitelist-config-mode)</code> on page 376 | Negates a command or reverts to default                                              |

### permit

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

### Parameters

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

|                          |                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv4/IPv6/<br>HOSTNAME> | Adds a device to the DNS whitelist <ul style="list-style-type: none"><li>• &lt;IPv4/IPv6/HOSTNAME&gt; - Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist.</li></ul> <p><b>Note:</b> A maximum of 256 entries can be made.</p> |
| suffix                   | Optional. Matches any hostname including the specified name as suffix                                                                                                                                                                                                                               |

### Examples

```
nx9500-6C8809(config-dns-whitelist-test)#permit example_company.com suffix
nx9500-6C8809(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
nx9500-6C8809(config-dns-whitelist-test)#
```

### Related Commands

|-----------------|-------------------------------|
| <code>no</code> | Removes a DNS whitelist entry |
|-----------------|-------------------------------|

no (dns-whitelist-config-mode)

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
no permit <IPv4/IPv6/HOSTNAME>
```

#### Parameters

```
no permit <IPv4/IPv6/HOSTNAME>
```

|                      |                                                                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv4/IPv6/HOSTNAME> | Removes a device from the DNS whitelist (identifies the device by its IP address or hostname) <ul style="list-style-type: none"><li>• &lt;IPv4/IPv6/HOSTNAME&gt; - Specify the device's IPv4/IPv6 address or hostname.</li></ul> |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
nx9500-6C8809(config-dns-whitelist-test)#
nx9500-6C8809(config-dns-whitelist-test)#no permit example_company.com
nx9500-6C8809(config-dns-whitelist-test)#show context
dns-whitelist test
nx9500-6C8809(config-dns-whitelist-test)#
```

*end*

Ends and exits the current mode and moves to the PRIV EXEC mode

The prompt changes to the PRIV EXEC mode.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
end
```

#### Parameters

None

#### Examples

```
rfs4000-229D58(config)#end
rfs4000-229D58#
```

## event-system-policy

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administrated in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the **show > event-system-policy** command.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
event-system-policy <EVENT-SYSTEM-POLICY-NAME>
```

### Parameters

```
event-system-policy <EVENT-SYSTEM-POLICY-NAME>
```

|                                                                                                               |
|---------------------------------------------------------------------------------------------------------------|
| <EVENT-SYSTEM-POLICY-NAME> Specify the event system policy name. If the policy does not exist, it is created. |
|---------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#event-system-policy event-testpolicy
nx9500-6C8809(config-event-system-policy-event-testpolicy)#?
Event System Policy Mode commands:
 event Configure an event
 no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-event-system-policy-event-testpolicy)#
```

### Related Commands

|                                                   |
|---------------------------------------------------|
| <b>no</b> Removes an existing event system policy |
|---------------------------------------------------|

## event-system-policy-mode-commands

The following table summarizes event system policy configuration mode commands:

Table: Event-System-Policy Config Mode Commands

| Command | Description                             |
|---------|-----------------------------------------|
| event   | Configures an event                     |
| no      | Negates a command or reverts to default |

event

Configures an event and sets the action performed when the event happens

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]
```

The even types are:

```
nx9500-6C8809(config-event-system-policy-testpolicy)#event ?

operation-failed
 event database operation-failed syslog default snmp default forward-to-switch default
email default
nx9500-6C8809(config-event-system-policy-test)#
```

### Related Commands

|    |                                     |
|----|-------------------------------------|
| no | Resets or disables event monitoring |
|----|-------------------------------------|

no (event-system-policy-config-mode)

Negates an event monitoring configuration

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
no event <EVENT-TYPE> <EVENT-NAME> [email|forward-to-switch|snmp|syslog] [default|on|off]
```

### Parameters

no <PARAMETERS>

|                 |                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes event monitoring and message forwarding activity based on the parameters passed<br>The system stops network monitoring for the occurrence of the specified event and no notification is sent if the event occurs. |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
rfs4000-229D58(config-event-system-policy-TestPolicy)#event ap adopted syslog default
rfs4000-229D58(config-event-system-policy-TestPolicy)#no event ap adopted syslog
```

## ex3500

Creates an EX3500 time range list and enters its configuration mode

An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP (Small Form-factor Pluggable) transceiver slots for fiber connectivity. The EX3500 series switch can adopt to a WiNG NOC controller and be managed by it. The EX3500 time range values configured here are used in EX3500 MAC ACL firewall rules that filter an EX3500's incoming and outgoing traffic. For more information on creating EX3500 MAC ACL rules, see [ex3500 \(mac-acl-config-commands\)](#) on page 1394 and [access-group](#) on page 1299.

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

### Syntax

```
ex3500 time-range <TIME-RANGE-NAME>
```

### Parameters

```
ex3500 time-range <TIME-RANGE-NAME>
```

|                                     |                                                                                                                                                                       |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 time-range <TIME-RANGE-NAME> | Configures EX3500 time range list and enters its configuration mode                                                                                                   |
|                                     | <ul style="list-style-type: none"><li>• &lt;TIME-RANGE-NAME&gt; - Enter a name for this EX3500 time range. If the time range does not exist, it is created.</li></ul> |

### Examples

```
nx9500-6C8809(config)#ex3500 time-range EX3500_TimeRange_02
nx9500-6C8809(config-ex3500-time-range-EX3500_TimeRange_02)#?
EX3500 Time Range Configuration commands:
 absolute Absolute time and date
 no Negate a command or set its defaults

## ex3500-time-range-config-commands

**Table 18: EX3500 Time Range Config Commands**

| Command                                                     | Description                                                            |
|-------------------------------------------------------------|------------------------------------------------------------------------|
| <code>absolute</code> on page 392                           | Configures an absolute time range rule for this EX3500 time range list |
| <code>periodic</code> on page 393                           | Configures a periodic time range rule for this EX3500 time range list  |
| <code>no (ex3500-time-range-config-mode)</code> on page 395 | Removes this EX3500 time range list settings                           |

### absolute

Configures an absolute time range rule for this EX3500 time range list

Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31> <MONTH> <2013-2037>}
```

#### Parameters

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31> <MONTH> <2013-2037>}
```

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|----|-----------------------------------------------------------------------|

#### periodic

Configures a periodic time range rule for this EX3500 time range list

Periodic time ranges are configured to recur based on periodicity such as daily, weekly, weekends, weekdays, and on specific week days, such as on every successive Sunday.

Supported in the following platforms:

- Service Platforms – NX 95XX, NX 7510

#### Syntax

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend]
<0-23> <0-59> to [<023> <0-59>|daily|friday|monday|saturday|sunday|thursday|tuesday|
wednesday|
weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

#### Parameters

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend]
<0-23> <0-59> to [<023> <0-59>|daily|friday|monday|saturday|sunday|thursday|tuesday|
wednesday|
weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#
```

## ex3500-management-policy

Creates an EX3500 management policy and enters its configuration mode. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

The EX3500 management policy is either applied:

- Individually on an adopted EX3500 series switch (in the device configuration mode), or
- To an EX3524 and EX35XX profile, which is then applied to an adopted EX3500 series switch.

EX3500 devices (EX3524 and EX35XX) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000

Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX 9500 and NX 7500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

WiNG can partially manage an EX3500 without using DHCP option 193, provided the EX3500 is directly configured to specify the IPv4 addresses of potential WiNG adopters. To identify the potential WiNG adopter, in the EX3500's device configuration mode specify the adopter's IPv4 address using the **controller > host > <IP-ADDRESS>** command. WiNG service platforms leave the proprietary operating system running the EX3500 switches unmodified, and partially manage them utilizing standardized WiNG interfaces. WiNG service platforms use a translation layer to communicate with the EX3500.

#### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
ex3500-management-policy <POLICY-NAME>
```

#### Parameters

```
ex3500-management-policy <POLICY-NAME>
```

|               |                                                                                         |
|---------------|-----------------------------------------------------------------------------------------|
| <POLICY-NAME> | Specify the EX3500 management policy name. If the policy does not exist, it is created. |
|---------------|-----------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#ex3500-management-policy test
nx9500-6C8809(config-ex3500-management-policy-test)#?
EX3500_Management Mode commands:
 enable Modifies enable password parameters
 http Hyper Text Terminal Protocol (HTTP)
 memory Memory utilization
 no Negate a command or set its defaults
 process-cpu Process-cpu utilization
 snmp-server Enable SNMP server configuration
 ssh Secure Shell server connections
 username Login TACACS server port

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal
```

```
nx9500-6c8809(config-ex3500-management-policy-test)#
```

## ex3500-management-policy-config-commands

**Table 19: EX3500 Management Policy Config Commands**

| Command                  | Description                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>enable</code>      | Configures an executive password for this EX3500 management policy                                                                                                        |
| <code>http</code>        | Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch                                                                               |
| <code>memory</code>      | Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values                                                                            |
| <code>process-cpu</code> | Configures the EX3500's CPU (processor) utilization rising (upper) and falling (lower) threshold values                                                                   |
| <code>snmp-server</code> | Configures SNMP server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP. |
| <code>ssh</code>         | Configures the SSH server settings used to authenticate SSH connection to a EX3500 switch                                                                                 |
| <code>username</code>    | Configures a EX3500 switch user settings                                                                                                                                  |
| <code>no</code>          | Removes or reverts this EX3500 management policy settings                                                                                                                 |

### enable

Configures an executive password for this EX3500 management policy

Each EX3500 management policy can have a unique executive password with its own privilege level assigned. Utilize these passwords as specific EX3500 management sessions require priority over others.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
enable password [0|7|level]
enable password [0|7] <PASSWORD>
enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]
```

#### Parameters

```
enable password [0|7] <PASSWORD>
```

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable password [0 7]<br><PASSWORD> | <p>Creates a new executive password for this EX3500 management policy. The password could be in clear text or encrypted</p> <ul style="list-style-type: none"> <li>• 0 - Configures a clear text password using ASCII characters (should be 1 - 32 characters long)</li> <li>• 7 - Configures an encrypted password using HEX characters (should be 32 characters long)</li> <li>• &lt;PASSWORD&gt; - Specify the password.</li> </ul> |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable password level <0-15> | <p>Creates a new executive password for this EX3500 management policy and sets its privilege level</p> <ul style="list-style-type: none"> <li>• &lt;0-15&gt; - Specify the privilege level for this executive password from 0 - 15. Lower values have higher priority, to slot and prioritize executive passwords and EX3500 management sessions.</li> </ul>                                                           |
| [0 7] <PASSWORD>             | <p>After setting the privilege level, configure the password, which could be in clear text or encrypted</p> <ul style="list-style-type: none"> <li>• 0 - Configures a clear text password using ASCII characters (should be 1 - 32 characters long)</li> <li>• 7 - Configures an encrypted password using HEX characters (should be 32 characters long)</li> <li>• &lt;PASSWORD&gt; - Specify the password.</li> </ul> |

### Examples

```

nx9500-6C8809(config-ex3500-management-policy-test)#enable password level 3 7
12345678901020304050607080929291
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809(config-ex3500-management-policy-test)#

```

### Related Commands

|    |                                                                 |
|----|-----------------------------------------------------------------|
| no | Removes a executive password from this EX3500 management policy |
|----|-----------------------------------------------------------------|

### http

Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the memory utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

### Syntax

```
memory [falling-threshold|rising-threshold] <1-100>
```

### Parameters

|                              |                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| memory                       | Configures the EX3500's memory utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.                                                           |
| falling-threshold<br><1-100> | Configures the falling threshold for the EX3500 memory utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the falling threshold as a percentage from 1 - 100. The default is 70%.</li> </ul> |
| rising-threshold<br><1-100>  | Configures the rising threshold for the EX3500's memory utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the rising threshold as a percentage from 1 - 100. The default is 90%.</li> </ul> |

#### Examples

```

nx9500-6C8809(config-ex3500-management-policy-test)#http secure-server
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 http secure-server
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809(config-ex3500-management-policy-test)#

```

#### Related Commands

|----|-----------------------------------------------------------------------------|
| no | Reverts to default HTTP server settings (HTTP server enabled, HTTP port 80) |
|----|-----------------------------------------------------------------------------|

#### memory

Configures the EX3500's memory utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the memory utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
memory [falling-threshold|rising-threshold] <1-100>
```

#### Parameters

```
memory [falling-threshold|rising-threshold] <1-100>
```

|                           |                                                                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| memory                    | Configures the EX3500's memory utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.                                                           |
| falling-threshold <1-100> | Configures the falling threshold for the EX3500 memory utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the falling threshold as a percentage from 1 - 100. The default is 70%.</li> </ul> |
| rising-threshold <1-100>  | Configures the rising threshold for the EX3500's memory utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the rising threshold as a percentage from 1 - 100. The default is 90%.</li> </ul> |

#### Examples

```

nx9500-6C8809(config-ex3500-management-policy-test)#memory falling-threshold 50
nx9500-6C8809(config-ex3500-management-policy-test)#memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test

```

```

http secure-server
enable password level 3 7 12345678901020304050607080929291
snmp-server notify-filter 1 remote 127.0.0.1
memory falling-threshold 50
memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#

```

#### Related Commands

|           |                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------|
| <b>no</b> | Reverts the memory utilization's falling-threshold and/or rising threshold to 70% and 90% respectively |

#### process-cpu

Configures the EX3500's CPU (processor) utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the CPU utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500's processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

#### Parameters

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

|                           |                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| process-cpu               | Configures the EX3500's CPU utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.                                                             |
| falling-threshold <1-100> | Configures the falling threshold for the EX3500's CPU utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the falling threshold as a percentage from 1 - 100. The default is 70%.</li> </ul> |
| rising-threshold <1-100>  | Configures the rising threshold for the EX3500's CPU utilization <ul style="list-style-type: none"> <li>• &lt;1-100&gt; - Specify the rising threshold as a percentage from 1 - 100. The default is 90%.</li> </ul>   |

#### Example (User Exec Mode)

```

nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu falling-threshold 60
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
 http secure-server
 enable password level 3 7 12345678901020304050607080929291
 snmp-server notify-filter 1 remote 127.0.0.1
 memory falling-threshold 50
 memory rising-threshold 95
 process-cpu falling-threshold 60
 process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#

```

#### Related Commands

no

Reverts the CPU utilization's falling-threshold and/or rising threshold to 70% and 90% respectively

## snmp-server

Configures SNMP (Simple Network Management Protocol) server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

SNMP is an application layer protocol that facilitates the exchange of management information between the management stations and a managed EX3500 switch. SNMP-enabled devices listen on port 162 (by default) for SNMP packets from the management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string is used to gather statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system's performance and other parameters.

Supported in the following platforms:

- Service Platforms – NX 95XX, NX 7510

### Syntax

```
snmp-server {community|contact|enable|engine-id|group|host|location|notify-filter|
user|view}
snmp-server {community <STRING> {ro|rw}}
snmp-server {contact <NAME>}
snmp-server {enable traps {authentication|link-up-down}}
snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}
snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|read <WORD>|
write <WORD>}}
snmp-server {host <IP> [<STRING>|inform]}
snmp-server {host <IP> <STRING> version [v1|v2c|v3 [auth|noauth|priv]]
{udp-port <1-65535>}}
snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>]
<STRING> version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}}
snmp-server {location <WORD>}
snmp-server {notify-filter <WORD> remote <IP>}
snmp-server {user <USER-NAME> <GROUP-NAME> [remote-host|v1|v2c|v3]}
snmp-server {user <USER-NAME> <GROUP-NAME> remote-host <IP> v3 [auth|encrypted auth]
[md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|des56] <WORD>}}
snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}
snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}
```

### Parameters

```
snmp-server {community <STRING> {ro|rw}}
```

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

ssh

Configures the SSH server settings used to authenticate SSH connection to a EX3500 switch

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling unused and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

#### Parameters

```
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

|----|----------------------------------------------------|
| no | Disables SSH management access to an EX3500 switch |
|----|----------------------------------------------------|

username

Configures a EX3500 switch user settings

The EX3500 switch user details are stored in a local database on the NX 95XX, NX 7510, or WiNG VM. You can configure multiple users, each having a unique name, access level, and password.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

#### Parameters

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

### *ex3500-qos-class-map-policy*

Creates a EX3500 QoS (Quality of Service) class map policy and enters its configuration mode

A QoS class map policy contains a set of DiffServ (Differentiated Services) classification criteria that are used to classify incoming traffic into different category and provide differentiated service based on this classification. Each policy defines a set match criteria rules that use objects, such as access lists, IP precedence or DSCP values, and VLANs. When configured and applied, the policy classifies traffic based on layer 2, layer 3, or layer 4 information contained in each incoming packet.

#### **Supported in the following platforms:**

- Service Platforms — NX 95XX, NX 7510

#### **Syntax**

```
ex3500-qos-class-map-policy <POLICY-NAME>
```

#### **Parameters**

```
ex3500-qos-class-map-policy <POLICY-NAME>
```

|                            |                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------|
| <b>&lt;POLICY-NAME&gt;</b> | Specify the EX3500 QoS class map policy name. If the policy does not exist, it is created. |
|----------------------------|--------------------------------------------------------------------------------------------|

#### **Examples**

```

nx9500-6C8809(config)#ex3500-qos-class-map-policy dscp
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#?
EX3500_Qos_class_map Mode commands:
 description Class-map description
 match Defines the match criteria to classify traffic
 no Negate a command or set its defaults
 rename Redefines the name of class-map

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode

### match

Configures match criteria rules used to classify traffic

Access lists, IP precedence, DSCP values, or VLANs are commonly used to classify traffic. Access lists select traffic based on layer 2, layer 3, or layer 4 information contained in each packet.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

### Syntax

```
match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl]
<ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

### Parameters

```
match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl]
<ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

|                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| ip [dscp <0-63>] precedence <0-7>]                                              | <p>Configures the IPv4 DSCP value to match and/or the IP precedence value to match.</p> <ul style="list-style-type: none"> <li>• &lt;0-63&gt; - Specify the DSCP value from 0 - 63. Use this option to specify the ToS (type of service) field values included in the IP header. The ToS field exists between the header length and the total length fields. The DSCP constitutes the first 6 bits of the ToS field.</li> <li>• precedence &lt;0-7&gt; - Configures the IP precedence to match. Following are the 8 traffic classes based on the IP precedence values: <ul style="list-style-type: none"> <li>• 000 (0) - Routine</li> <li>• 001 (1) - Priority</li> <li>• 010 (2) - Immediate</li> <li>• 011 (3) - Flash</li> <li>• 100 (4) - Flash Override</li> <li>• 101 (5) - Critical</li> <li>• 110 (6) - Internetwork Control</li> <li>• 111 (7) - Network Control</li> </ul> </li> </ul> |

|                  |                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 dscp <0-63> | Configures the IPv6 DSCP value to match <ul style="list-style-type: none"> <li>• &lt;0-63&gt; - Specify the DSCP value from 0 - 63.</li> </ul> |
| vlan <1-4094>    | Configures the VLAN to match <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; - Specify the VLAN ID.</li> </ul>                         |

Usage Guidelines

When configuring match entries, take into consideration the following points:

- Deny rules included in an ACL (associated with a EX3500 QoS class map policy) are ignored whenever an incoming packet matches the ACL.
- A class map policy cannot include both IP ACL or IP precedence rule and a VLAN rule.
- A class map policy containing a MAC ACL or VLAN rule cannot include either an IP ACL or a IP precedence rule.
- A class map policy can include a maximum of 16 match entries.

Examples

```

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
 match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
nx9500-6C8809(config-ex3500-qos-class-map-policy-test2)#match ip precedence 1

```

rename

Renames an existing EX3500 QoS class map policy

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

Syntax

```
rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>
```

Parameters

```
rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>
```

|                                                                                  |                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME> | Renames an existing EX3500 QoS class map <ul style="list-style-type: none"> <li>• &lt;EX3500-QOS-CLASS-MAP-POLICY-NAME&gt; - Enter the EX3500 QoS class map's current name.</li> <li>• &lt;NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME&gt; - Enter the new name.</li> </ul> |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Examples

```

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp test test2
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename test2 IP_Precedence
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp IP_Precedence test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#

```

no

description

Removes this EX3500 QoS class map policy's description and match criteria

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

Syntax

```
no [description|match]
no description
no match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl]
<ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

Parameters

```
no <PARAMETERS>
```

|                 |                                                                                   |
|-----------------|-----------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes the EX3500 QoS class map policy's settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------------|

Examples

The following example shows the EX3500 QoS class map policy 'test' settings before the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
 description "Matches packets marked for DSCP service 3"
 match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no description
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no match ip dscp
```

The following example shows the EX3500 QoS class map policy 'test' settings after the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

### *ex3500-qos-policy-map*

Creates an EX3500 policy map and enters its configuration mode

An EX3500 policy map contains one or more EX3500 QoS class maps traffic classifications (existing and configured) and can be attached to multiple interfaces. Creates an EX3500 policy map, and then use the class parameter to configure policies for traffic that matches the criteria defined in the EX3500 QoS class map policy. For more information, see [match](#).

**Supported in the following platforms:**

- Service Platforms — NX 95XX, NX 7510

**Syntax**

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

**Parameters**

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

```
<EX3500-QOS-POLICY-MAP-NAME> Specify the EX3500 policy map's name
```

### Examples

```
nx9500-6C8809(config)#ex3500-qos-policy-map testPolicyMap
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#?
EX3500_Qos_policy_map Mode commands:

## ex3500-qos-policy-map config commands

The following table summarizes EX3500 QoS policy map configuration mode commands:

**Table 21: EX3500 QoS Policy Map Config Commands**

| Command                              | Description                                                                                                                                               |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>class</code> on page 416       | Creates a policy map class and enters its configuration mode                                                                                              |
| <code>description</code> on page 424 | Configures this EX3500 QoS policy map's description                                                                                                       |
| <code>no</code> on page 425          | Removes this EX3500 QoS policy map's settings. Use this keyword to remove or modify the description and to remove the QoS traffic classification created. |

### class

Creates a policy map class and enters its configuration mode. The policy map class is a traffic classification upon which a policy can act.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

#### Parameters

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

|                                          |                                                                                    |
|------------------------------------------|------------------------------------------------------------------------------------|
| class <EX3500-QoS-CLASS-MAP-POLICY-NAME> | Specify the EX3500 QoS class map policy's name (should be existing and configured) |
|------------------------------------------|------------------------------------------------------------------------------------|

### Examples

```

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#class dscp
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#?
commands:
 no Negate a command or set its defaults
 police Defines a policer for classified traffic
 set Classify IP traffic

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#

```

| <b>no</b> on page 424(ex3500 qos policy map mode) | Removes this traffic classification's settings                                      |

### police

Configures an enforcer for classified traffic

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```

police [flow|srtcm-color-aware|srtcm-color-blind|trtcm-color-aware|trtcm-color-blind]
police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]
police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000>
<0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|
drop]
police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000>
<0-16000000>
conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

```

#### Parameters

```

police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]

```

| [srtcm-color-aware  srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000> | <p>Configures an enforcer for classified traffic based on single rate three color meter (srTCM) mode. The srTCM as defined in RFC 2697 meters a traffic stream and processes its packets according to three traffic parameters – CIR, BC, and BE (Excess Burst Size).</p> <ul style="list-style-type: none"> <li>• srtcm-color-blind - Single rate three color meter in color-blind mode</li> <li>• srtcm-color-aware - Single rate three color meter in color-aware mode</li> </ul> <p>The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.</p> <ul style="list-style-type: none"> <li>• &lt;0-1000000&gt; – Configures the CIR from 0 -1000000 kilobits per second. <ul style="list-style-type: none"> <li>• &lt;0-16000000&gt; – Configures the BC from 0 - 1600000 bytes.</li> <li>• &lt;0-16000000&gt; – Configures the BE from 0 - 1600000 bytes.</li> </ul> </li> </ul> <p>The behavior of the meter is specified in terms of its mode and two token buckets, C and E, which both share the common rate CIR. The maximum size of the token bucket C is BC and the maximum size of the token bucket E is BE. The token buckets C and E are initially full, that is, the token count <math>T_c(0) = BC</math> and the token count <math>T_e(0) = BE</math>. Thereafter, the token counts <math>T_c</math> and <math>T_e</math> are updated CIR times per second as follows:</p> <ul style="list-style-type: none"> <li>• If <math>T_c</math> is less than BC, <math>T_c</math> is incremented by one, else</li> <li>• If <math>T_e</math> is less than BE, <math>T_e</math> is incremented by one, else</li> <li>• neither <math>T_c</math> nor <math>T_e</math> is incremented.</li> </ul> <p>When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-blind mode:</p> <ul style="list-style-type: none"> <li>• If <math>T_c(t)-B &gt; 0</math>, the packet is green and <math>T_c</math> is decremented by B down to the minimum value of 0, else</li> <li>• if <math>T_e(t)-B &gt; 0</math>, the packets is yellow and <math>T_e</math> is decremented by B down to the minimum value of 0,</li> <li>• else the packet is red and neither <math>T_c</math> nor <math>T_e</math> is decremented.</li> </ul> <p>When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-aware mode:</p> <ul style="list-style-type: none"> <li>• If the packet has been pre-colored as green and <math>T_c(t)-B &gt; 0</math>, the packet is green and <math>T_c</math> is decremented by B down to the minimum value of 0, else</li> <li>• If the packet has been pre-colored as yellow or green and if</li> <li>• <math>T_e(t)-B &gt; 0</math>, the packets is yellow and <math>T_e</math> is decremented by B down to the minimum value of 0, else the packet is red and neither <math>T_c</math> nor <math>T_e</math> is decremented.</li> </ul> <p>The metering policy guarantees a deterministic behavior where the volume of green packets is never smaller than what has been determined by the CIR and BC, that is, tokens of a given color are always spent on packets of that color. Refer to RFC 2697 for more information on other aspects of srTCM.</p> |

| [trtcm-color-aware] trtcm-color-blind <0-1000000> <0-16000000> <0-1000000> <0-16000000> | <p>Configures an enforcer for classified traffic based on a two rate three color meter (trTCM) mode. The trTCM as defined in RFC 2698 meters a traffic stream and processes its packets based on two rates – CIR and PIR (Peak Information Rate), and their associated burst sizes - BC and BP (Peak Burst Size).</p> <ul style="list-style-type: none"> <li>• trtcm-color-blind - Two rate three color meter in color-blind mode</li> <li>• trtcm-color-aware - Two rate three color meter in color-aware mode <ul style="list-style-type: none"> <li>• &lt;0-1000000&gt; - Configures the CIR from 0 - 1000000 kilobits per second</li> <li>• &lt;0-16000000&gt; - Configures the BC from 0 - 16000000 bytes.</li> <li>• &lt;0-1000000&gt; - Configures the PIR from 0 - 1000000 kilobits per second</li> <li>• &lt;0-16000000&gt; - Configures the BP from 0 - 16000000 bytes</li> </ul> </li> </ul> <p>The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.</p> <p>The behavior of the meter is specified in terms of its mode and two token buckets, P and C, which are based on the rates PIR and CIR, respectively. The maximum size of the token bucket P is BP and the maximum size of the token bucket C is BC. The token buckets P and C are initially (at time 0) full, that is, the token count <math>T_p(0) = BP</math> and the token count <math>T_c(0) = BC</math>. Thereafter, the token count <math>T_p</math> is incremented by one PIR times per second up to BP and the token count <math>T_c</math> is incremented by one CIR times per second up to BC.</p> <p>When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-blind mode:</p> <ul style="list-style-type: none"> <li>• If <math>T_p(t) - B &lt; 0</math>, the packet is red, else</li> <li>• if <math>T_c(t) - B &lt; 0</math>, the packet is yellow and <math>T_p</math> is decremented by B, else</li> <li>• The packet is green and both <math>T_p</math> and <math>T_c</math> are decremented by B.</li> </ul> <p>When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-aware mode:</p> <ul style="list-style-type: none"> <li>• If the packet has been pre-colored as red or if <math>T_p(t) - B &lt; 0</math>, the packet is red, else</li> <li>• if the packet has been pre-colored as yellow or if <math>T_c(t) - B &lt; 0</math>, the packet is yellow and <math>T_p</math> is decremented by B, else</li> <li>• the packet is green and both <math>T_p</math> and <math>T_c</math> are decremented by B.</li> </ul> <p>The trTCM can be used to mark a IP packet stream in a service, where different, decreasing levels of assurances (either absolute or relative) are given to packets which are green, yellow, or red. Refer to RFC 2698 for more information on other aspects of trTCM.</p> |
| conform-action transmit                                                                 | <p>Configures the action applied when packet rates fall within the specified CIR and BP limits</p> <ul style="list-style-type: none"> <li>• transmit - Transmits packets falling within the specified CIR and BC limits</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Usage Guidelines

When configuring the traffic class enforcer parameters, consider the following factors:

- You can configure up to 200 enforcers/policers (i.e., class maps) for ingress ports.
- The committed-rate cannot exceed the configured interface speed, and the committed-burst cannot exceed 16 Mbytes.

### Examples

The following example uses the **police > trtcm-color-blind** command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#police
 trtcm-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0 violate-
action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
 class dscp
 police trtcm-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0
violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#
```

### set

Sets CoS value, PHB value, and IP DSCP value in matching packets

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

#### Syntax

```
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

#### Parameters

```
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| set            | Sets the match criteria used to identify and classify traffic into different classes. The match criteria options are: CoS, IP DSCP, and PHB values.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| cos <0-7>      | Configures the CoS value for a matching packet (as specified by the match command) in the packet's VLAN tag <ul style="list-style-type: none"> <li>• &lt;0-7&gt; – Specify a value from 0 - 7. The CoS is modified to the value specified here.</li> </ul>                                                                                                                                                                                                                                                                                                                      |
| ip dscp <0-63> | Modifies the IP DSCP value in a matching packet (as specified by the match command) <ul style="list-style-type: none"> <li>• &lt;0-63&gt; – Specify a value from 0 - 63. The DSCP value is modified to the value specified here.</li> </ul>                                                                                                                                                                                                                                                                                                                                     |
| phb <0-7>      | Configures a PHB value for a matching packets <ul style="list-style-type: none"> <li>• &lt;0-7&gt; – Specify a value from 0 - 7.</li> </ul> <p>The PHB label is composed of five bits, three bits for per-hop behavior, and two bits for the color scheme used to control queue congestion. A packet is marked green, yellow, or red as per the following:</p> <ul style="list-style-type: none"> <li>• green if it does not exceed the CIR and BC limits</li> <li>• yellow if it exceeds the CIR and BC limits, but not the BE limit, and</li> <li>• red otherwise.</li> </ul> |

## Examples

The following example uses the **set > phb** command to classify the service that incoming packets will receive, and then uses the **police > trtcm-color-blind** command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000 bytes, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#set phb 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)# police
trtcm-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-action 0 violate-
action drop
nx9500-6C8809nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-
test2)#show
context
class test2
set phb 3
police trtcm-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0
violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#

```

The following example uses the **set > ip dscp** command to classify the service that incoming packets will receive, and then uses the **police > flow** command to limit the average bandwidth to 100,000 Kbps, the burst rate to 4000 bytes, and configure the response to drop any violating packets:

```

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#set ip dscp 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)# police flow
100000 4000
conform-action transmit violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
class dscp
set ip dscp 3
police flow 100000 4000 conform-action transmit violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#

```

## Related Commands

```

description

Configures this EX3500 QoS policy map's description

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

Syntax

```
description <LINE>
```

Parameters

description <LINE>

description <LINE>

Configures this EX3500 QoS policy map's description

- <LINE> - Enter a description that allows to you differentiate it from other policies with similar configuration (should not exceed 64 characters)

Examples

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#description "This is a test EX3500 QoS
Policy Map"
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
 description "This is a test EX3500 QoS Policy Map"
 class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
```

Related Commands

no

Removes this EX3500 QoS policy map's description

no

Removes this EX3500 QoS policy map's settings. Use this keyword to remove the description and to remove the QoS traffic classification created.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 7510

Syntax

```
no [class <EX3500-QoS-POLICY-MAP-NAME>|description]
```

Parameters

```
no <PARAMETERS>
```

|                 |                                                                              |
|-----------------|------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes this EX3500 QoS policy map's settings based on the parameters passed |
|-----------------|------------------------------------------------------------------------------|

Examples

The following example shows the EX3500 QoS policy map 'test' settings before the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
 description "This is a test EX3500 QoS Policy Map"
 class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
nx9500-6C8809(config-ex3500-qos-policy-map-test)#no description
nx9500-6C8809(config-ex3500-qos-policy-map-test)#no class test
```

The following example shows the EX3500 QoS policy map 'test' settings after the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
```

### ex3524

Adds a EX3524 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

To enable layer 3 adoption of the logged EX3524 switch to a NOC controller, navigate to the EX3524 switch's device configuration mode and execute the following command: controller > host > <IP/HOSTNAME>.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

The NX 95XX and NX 7510 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating

system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

**Supported in the following platforms:**

- Service Platforms – NX 95XX, NX 7510

**Syntax**

```
ex3524 <DEVICE-EX3524-MAC>
```

**Parameters**

```
ex3524 <DEVICE-EX3524-MAC>
```

|                     |                                              |
|---------------------|----------------------------------------------|
| <DEVICE-EX3524-MAC> | Specifies the MAC address of a EX3524 switch |
|---------------------|----------------------------------------------|

**Examples**

```
nx9500-6C8809(config)#ex3524 A1-C4-33-6D-66-07
nx9500-6C8809(config-device-A1-C4-33-6D-66-07)#?
EX35xx Device Mode commands:
 hostname Set system's network name
 interface Select an interface to configure
 ip Internet Protocol (IP)
 no Negate a command or set its defaults
 power EX3500 Power over Ethernet Command
 remove-override Remove configuration item override from the device (so
 profile value takes effect)
 upgrade Configures upgrade option for ex3500 system
 use Set setting to use

|----|------------------------------------------|

**ex3548**

Adds a EX3548 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

**Supported in the following platforms:**

- Service Platforms – NX 95XX, NX 7510

## Syntax

```
ex3548 <DEVICE-EX3548-MAC>
```

## Parameters

```
ex3548 <DEVICE-EX3548-MAC>
```

|                     |                                              |
|---------------------|----------------------------------------------|
| <DEVICE-EX3548-MAC> | Specifies the MAC address of a EX3548 switch |
|---------------------|----------------------------------------------|

## Examples

### *firewall-policy*

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
firewall-policy <FIREWALL-POLICY-NAME>
```

## Parameters

```
firewall-policy <FIREWALL-POLICY-NAME>
```

|                        |                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------|
| <FIREWALL-POLICY-NAME> | Specify the firewall policy name. If a firewall policy, with the specified name, does not exist, it is created. |
|------------------------|-----------------------------------------------------------------------------------------------------------------|

### Examples

```

nx9500-6C8809(config)#firewall-policy test
nx9500-6C8809(config-fw-policy-test)#?
Firewall policy Mode commands:
 acl-logging Log on flow creating traffic
 alg Enable ALG
 clamp Clamp value
 dhcp-offer-convert Enable conversion of broadcast dhcp offers to
 unicast
 dns-snoop DNS Snooping
 firewall Wireless firewall
 flow Firewall flow
 ip Internet Protocol (IP)
 ip-mac Action based on ip-mac table
 ipv6 Internet Protocol version 6 (IPv6)
 ipv6-mac Action based on ipv6-mac table
 logging Firewall enhanced logging
 no Negate a command or set its defaults
 proxy-arp Enable generation of ARP responses on behalf
 of another device
 proxy-nd Enable generation of ND responses (for IPv6)
 on behalf of another device
 stateful-packet-inspection-l2 Enable stateful packet inspection in layer2
 firewall
 storm-control Storm-control
 virtual-defragmentation Enable virtual defragmentation for IPv4
 packets (recommended for proper functioning
 of firewall)

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or
 terminal

```

```
nx9500-6C8809(config-fw-policy-test)#
```

### Related Commands

|           |                                     |
|-----------|-------------------------------------|
| <b>no</b> | Removes an existing firewall policy |
|-----------|-------------------------------------|

#### Note

For more information on Firewall policy, see [FIREWALL-POLICY](#) on page 1483

### *global-association-list*

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an Association ACL (Access Control List). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client's MAC address, the global association ACL is checked. Once authenticated, the client's credentials are cached on the Access Point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
global-association-list <GLOBAL-ASSOC-LIST-NAME>
```

### Parameters

```
global-association-list <GLOBAL-ASSOC-LIST-NAME>
```

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <GLOBAL-ASSOC-LIST-NAME> | Specify the global association list name. If a list with the same name does not exist, it is created. Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see <a href="#">use</a> on page 1232. The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see <a href="#">association-list</a> . |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
rfs4000-229D58(config)#global-association-list my-clients
rfs4000-229D58(config-global-assoc-list-my-clients)#
Global Association List Mode commands:
 default-action Configure the default action when the client MAC does not
 match any rule
 deny Specify MAC addresses to be denied
 no Negate a command or set its defaults
 permit Specify MAC addresses to be permitted

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

rfs4000-229D58(config-global-assoc-list-my-clients)#
```

To enable global-association-list controlled client association, execute the following commands:

- 1 Create a global association list, and configure it as shown in the following examples:
 

```
rfs4000-880DA7(config)#global-association-list vtt-list
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 01-22-33-44-55-66 description
sample
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 40-B8-9A-39-F1-27 description
acer
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 42-B8-9A-39-F1-27 description
ami
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit 6C-40-08-B2-80-6C description
mac
rfs4000-880DA7(config-global-assoc-list-vtt-list)#permit E0-98-61-34-11-47 description
my_mobile
rfs4000-880DA7(config-global-assoc-list-vtt-list)#show context
global-association-list vtt-list
default-action deny
permit 01-22-33-44-55-66 description sample
permit 40-B8-9A-39-F1-27 description acer
permit 42-B8-9A-39-F1-27 description ami
permit 6C-40-08-B2-80-6C description mac
permit E0-98-61-34-11-47 description my_mobile
rfs4000-880DA7(config-global-assoc-list-vtt-list)#
```
- 2 Attach this global association list to the profile or device context of the access point or controller, as shown in the following examples:

On the access point's profile context:

#### Note

Ensure that the global association list is associated with the profile being applied on the access point.

```
rfs4000-880DA7(config-profile-testAP6522)#use global-association-list server
vtt-list
rfs4000-880DA7(config-profile-testAP6522)#show context include-factory | include g
lobal-association-list
service global-association-list blacklist-interval 60
use global-association-list server vtt-list
rfs4000-880DA7(config-profile-testAP6522)#
```

On the access point's device context:

```
ap6522(config-device-B4-C7-99-EA-DF-2C)#use global-association-list server vtt-list
ap6522(config-device-B4-C7-99-EA-DF-2C)#show context include-factory | in
clude global-association-list
use global-association-list server vtt-list
ap6522(config-device-B4-C7-99-EA-DF-2C)#
```

On the controller's device context:

```
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#use global-association-list server vtt-
list
rfs4000-880DA7(config-device-00-23-68-88-0D-A7)#show context include-factory | in
clude global-association-list
use global-association-list server vtt-list
ap6522(config-device-B4-C7-99-EA-DF-2C)#
```

- 3 Attach this global association list with the WLAN, as shown in the following example:

```
rfs4000-880DA7(config-wlan-GLAssList)#association-list global vtt-list
rfs4000-880DA7(config-wlan-GLAssList)#show context include-factory | include
association-list
association-list global vtt-list
rfs4000-880DA7(config-wlan-GLAssList)#
```

## guest-management-policy

Configures a guest management policy that redirects guest users to a registration portal upon association to a captive portal. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) where previously, not-registered guest users can register. The internally hosted captive portal registration page can be customized based on business requirements.

Use the guest management policy commands to configure parameters, such as E-mail host and SMS gateway along with the credentials required for sending pass code to guest via e-mail and SMS. You can configure up to 32 different guest management policies. Each guest management policy allows you to configure the SMS gateway, SMS message body, E-mail SMTP server, E-mail subject contents, and E-mail message body. Although, at any point-in-time, multiple guest management policies may exist, only one guest management policy can be active per device.

Guest registration is supported only on the NX 95XX and NX 7510 series service platforms. However, the number of user identity entries supported on each varies. It is 2 million and 1 million user-identity entries for the NX 95XX and NX 7510 model service platforms respectively.

### Supported in the following platforms:

- Service Platforms – NX 7510, NX 95XX

### Syntax

```
guest-management <POLICY-NAME>
```

### Parameters

```
guest-management <POLICY-NAME>
```

|               |                                                                                        |
|---------------|----------------------------------------------------------------------------------------|
| <POLICY-NAME> | Specify the guest management policy name. If the policy does not exist, it is created. |
|---------------|----------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#guest-management guest
nx9500-6C8809(config-guest-management-guest)#?
Guest Management Mode commands:
 email Email guest-notification configuration
 guest-database-backup Configure guest-database-backup parameters
 guest-database-export Configure guest-database-export parameters
 no Negate a command or set its defaults
 sms SMS guest-notification configuration
 sms-over-smtp Sms-over-smtp configuration to email sms gateway
 address

### guest-management-policy config commands

The following table summarizes guest management policy configuration mode commands:

**Table 22: Guest Management Policy Config Commands**

| Command                                        | Description                                                                                                                                                                                                                                             |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>email</code> on page 432                 | Configures guest user e-mail notification settings                                                                                                                                                                                                      |
| <code>guest-database-backup</code> on page 434 | Enables periodic backup of the captive portal's guest registration user database                                                                                                                                                                        |
| <code>guest-database-export</code> on page 435 | Schedules an export of the Guest Management User database to a specified external server                                                                                                                                                                |
| <code>sms</code> on page 436                   | Configures guest user SMS notification settings                                                                                                                                                                                                         |
| <code>sms-over-smtp</code> on page 437         | Configures an e-mail host server along with sender credentials and the recipient's gateway e-mail address to which the message is e-mailed. The gateway server converts the e-mail into SMS and forwards the message to the guest user's mobile device. |
| <code>no</code> on page 439                    | Removes this guest management policy settings                                                                                                                                                                                                           |

#### email

Configures guest user e-mail notification settings. When configured, guest users can register themselves with their e-mail credentials as a primary key for authentication. The captive portal system provides the pass code for their registration. Guest users need to use their registered e-mail, mobile, or member ID and the received pass code for subsequent logins to the captive portal.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

#### Syntax

```
email [host|message|subject]
email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>
email message <LINE>
email subject <LINE>
```

#### Parameters

```
email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security
[none|ssl|starttls] username <USER-NAME> password <PASSWORD>
```

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## guest-database-backup

Enables periodic backup of a captive portal's guest registration user database. This option is enabled by default.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

### Syntax

```
guest-database-backup enable {<TIME>}
```

### Parameters

```
guest-database-backup enable {<TIME>}
```

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| guest-database-backup enable {<TIME>} | Enables periodic backup of a captive portal's guest registration user database. This command also allows you to configure the time at which the system starts backing up the database. The default backup-start time is '00:00' (midnight every day). <ul style="list-style-type: none"> <li>• &lt;TIME&gt; - Optional. Resets the periodic database backup-start time to a user-defined value in the HH;MM format. When specified, the system starts periodic backup of the database, every day, at the specified time.</li> </ul> |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-guest-management-test)#guest-database-backup enable 12:30
nx9500-6C8809(config-guest-management-test)#show context
guest-management test
 guest-database-backup enable 12:30
nx9500-6C8809(config-guest-management-test)#
```

## guest-database-export

Schedules an export of the Guest Management user database to a specified external server. This option is enabled by default.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

## Syntax

```
guest-database-export <TIME> frequency <1-168> url-directory <URL>
{(format [csv/json]/last-visit-within <1-168>)}
```

## Parameters

```
guest-database-export <TIME> frequency <1-168> url-directory <URL>
{(format [csv/json]/last-visit-within <1-168>)}
```

|                              |                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| guest-database-export <TIME> | Schedules an export of the Guest Management User collection to an external server <ul style="list-style-type: none"><li>• &lt;TIME&gt; - Configures the start time of the export operation in the HH:MM format</li></ul>                                                                                                                                          |
| frequency <1-168>            | Configures the user collection export frequency in hours <ul style="list-style-type: none"><li>• &lt;1-168&gt; - Configures the frequency from 1 - 168 hours. If the frequency is set at 3 hours, the user database is exported once in every 3 hours. The default is 4 hours.</li></ul>                                                                          |
| url-directory <URL>          | Configures external server's URL and directory to where the collection is exported <ul style="list-style-type: none"><li>• &lt;URL&gt; - Specify the external server's URL</li></ul>                                                                                                                                                                              |
| format [csv/json]            | Optional. Configures the file format <ul style="list-style-type: none"><li>• csv - Exports collection to the specified location in CSV format. This is the default setting.</li><li>• json - Exports collection to the specified location in JSON format</li></ul>                                                                                                |
| last-visit-within <1-168>    | Configures a filters guest users who have last visited within a specified period of time <ul style="list-style-type: none"><li>• &lt;1-168&gt; - Specify a time period from 1 - 168 hours. If for example, the last-visit-within value is set at 2 hours, then only the last two hours guest user collections will be exported. The default is 4 hours.</li></ul> |

## Examples

```
nx9500-6C8809(config-guest-management-gml)#guest-database-export 10:30 frequency 6 url-
directory ftp://admin:xxxxxx@192.168.13.10/dbe_dir format json last-visit-within 168
nx9500-6C8809(config-guest-management-test)#show context
guest-management test
 guest-database-export 12:30 frequency 20 url-directory ftp://admin:xxxxxx@192.168.13.10/
 dbe_dir format json last-visit-within 168
nx9500-6C8809(config-guest-management-test)#
```

## Related Commands

no

Reverts the guest database export parameters to default

sms

Configures guest user SMS notification settings

When configured, guest users can register themselves with their e-mail or mobile device ID as the primary key for authentication. The captive portal provides the pass code for registration. Guest users use their registered e-mail or mobile device ID and the received pass code for subsequent logins to the captive portal.

#### Note

When using SMS, ensure that the WLAN's mode of authentication is set to none and the mode of registration is set to user. In other words, captive portal authentication must always enforce guest registration.

SMS is similar to MAC address-based self registration, but in addition the captive portal sends an SMS message, containing an access code, to the user's mobile phone number provided at the time of registration. The captive portal verifies the code, returns the Welcome page and provides access. This allows the administrator to verify the phone number provided and can be traced back to a specific individual should the need arise.

The default gateway used with SMS is Clickatell. A pass code can be sent with SMS to the guest user directly using Clickatell, or the pass code can be sent via e-mail to the SMS Clickatell gateway server, and Clickatell sends the pass code SMS to the guest user.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

#### Syntax

```
sms [host|message] sms host clickatell username <USER-NAME> password <PASSWORD>
api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}
sms message <LINE>
```

#### Parameters

```
sms host clickatell username <USER-NAME> password <PASSWORD>
api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}
```

| no | Removes the SMS settings used to send SMS to the guest user |
|----|-------------------------------------------------------------|

### sms-over-smtp

Configures an e-mail host server (for example: smtp.gmail.com) along with sender related credentials and the recipient gateway e-mail address to which the message is E-mailed. The gateway server converts the e-mail into SMS and sends the message to the guest user’s mobile device.

When sending an e-mail, the e-mail client interacts with a SMTP server to handle the content transmission. The SMTP server on the host may have conversations with other SMTP servers to deliver the e-mail.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

## Syntax

```
sms-over-smtp [host | message | subject]
sms-over-smtp host [<IP/HOSTNAME> | <HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none | ssl | starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>
sms-over-smtp message <LINE>
sms-over-smtp subject <LINE>
```

## Parameters

```
sms-over-smtp host [<IP/HOSTNAME> | <HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security
[none | ssl | starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>
```

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| sms-over-smtp                              | Configures guest user SMS over SMTP notification settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| host [ <IP/HOSTNAME>   <HOST-ALIAS-NAME> ] | Configures the SMS gateway server resource's IPv4 address or hostname used for guest management SMS over SMTP traffic, guest user credential validation and pass code reception. Optionally you can use an existing host alias to identify the SMS gateway server resource. <ul style="list-style-type: none"><li>• &lt;IP/HOSTNAME&gt; - Specify the SMTP gateway server resource's IP address or hostname.</li><li>• &lt;HOST-ALIAS-NAME&gt; - Specify the host alias name (should existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.</li></ul> |
| sender <EMAIL-ADDRESS>                     | Configures the sender's e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials using SMTP. <ul style="list-style-type: none"><li>• &lt;EMAIL-ADDRESS&gt; - Specify the e-mail address (should not exceed 64 characters).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| security [none   ssl   starttls]           | Configures the encryption protocol used by the SMTP server when communicating the pass code <ul style="list-style-type: none"><li>• none - No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.</li><li>• SSL - Uses SSL encryption. This is the default setting.<ul style="list-style-type: none"><li>• STARTTLS - Uses STARTTLS encryption</li></ul></li></ul>                                                                                                                                                                                                                                                                                                                                      |
| username <USER-NAME>                       | Configures a username unique to this SMTP guest management configuration. After configuring the username, specify the associated password. Ensure that the correct password is provided to receive the pass code required for registering guest user credentials with SMTP. <ul style="list-style-type: none"><li>• &lt;USER-NAME&gt; - Specify the username (should not exceed 64 characters).</li></ul>                                                                                                                                                                                                                                                                                                                                                                      |
| password <PASSWORD>                        | Configures the password associated with the specified SMTP user name <ul style="list-style-type: none"><li>• &lt;PASSWORD&gt; - Specify the password (should not exceed 64 characters).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|-----------|-----------------------------------------------------------------------|
| <b>no</b> | Removes the SMS over SMTP settings used to send SMS to the guest user |
|-----------|-----------------------------------------------------------------------|

no

Removes this guest management policy settings

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

### Syntax

```
no [email | guest-database-backup | guest-database-export | sms | sms-over-smtp]
no email [host | message | subject]
no guest-database-backup enable
no guest-database-export
no gmd report-generation enable
no sms [host | message]
no sms-over-smtp [host | message | subject]
```

## Parameters

no <PARAMETERS>

|                 |                                                                              |

NOC-NX9500 RFS6K-SITE1-VLAN20
RFS6K-SITE2-VLAN192 default/RFS6K-SITE2-VLAN192
NOC-NX9500(config)#host ap7522-8330A4
NOC-NX9500(config-device-84-24-8D-83-30-A4)#
```

## inline-password-encryption

Stores the encryption key in the startup configuration file

By default, the encryption key is not stored in the startup-config file. Use the inline-password-encryption command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
inline-password-encryption
```

### Parameters

None

### Usage Guidelines

When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

### Examples

The following command uses the specified password for encryption key and stores it outside of startup-config:

```
nx9500-6C8809(config)#password-encryption secret 2 12345678
nx9500-6C8809(config)#commit write memory
```

The following command moves the same password to the startup-config and encrypts it with the master key:

```
nx9500-6C8809(config)#inline-password-encryption
```

### *iot-device-type-imagotag-policy*

Creates an IoT Device-Type ImagoTag policy and enters its configuration mode. Use this option to enable support for SES-imagotag's ESL (Electronic Shelf Label) tags on WiNG APs with USB interfaces.

ESL tags are small, battery-powered devices used by retail businesses to display information, such as product code, pricing, etc. These tags are activated, configured, and managed through an SES-ImagoTag provided server. The tags and server communicate through an ESL communicator (a USB dongle), connected to the USB port on the WiNG AP. This communication is over the 2.4 GHz band using a proprietary RF protocol. The ESL communicator acts as a bridge between the tags and the server, using WiNG AP as an infrastructure device.

This policy, when applied on an AP, enables the AP recognize the ESL communicator, and facilitate communication between communicator and tags.

The policy can be applied to the AP's self (in case of stand alone AP), or pushed to the AP through the adopting controller. In the latter case, apply the policy on the AP's profile.

### Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Note

The policy is applicable only on the AP 8432 model access point, which supports the USB interface.

### Syntax

```
iot-device-type-imagotag-policy <POLICY-NAME>
```

### Parameters

```
iot-device-type-imagotag-policy <POLICY-NAME>
```

|                                               |                                                                                                                                 |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| iot-device-type-imagotag-policy <POLICY-NAME> | Specify an IoT Device Type ImagoTag policy name. If another policy by the specified name does not exist, the policy is created. |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|

### Example

```
nx9500-6C8809(config)#iot-device-type-imagotag-policy ImagoTagPolicy
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#?
Iot ImagoTag Policy Mode commands:
 channel Auto channel selection
 enable Enable ESL communicator
 fcc-mode Enable fcc compatibility mode on ESL communicator
 no Negate a command or set its defaults
 output-power Maximum output power
 payload-size Configure payload size
 ssl Enable ssl on ESL communicator
 window-size Configure window size

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

### iot-device-type-imagotag-policy config commands

The following table summarizes IoT Device-Type ImagoTag policy configuration mode commands:

**Table 23: IoT-Device-Type Imagotag Policy**

| Command                                  | Description                                                                                                    |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">channel</a> on page 443      | Configures the channel assigned for ESL communicator to tag communication in the 2.4 GHz band                  |
| <a href="#">enable</a> on page 443       | Enables the ESL communicator                                                                                   |
| <a href="#">fcc-mode</a> on page 444     | Enables the FCC compatibility mode on the ESL communicator                                                     |
| <a href="#">output-power</a> on page 444 | Configures the maximum output power for the ESL communicator                                                   |
| <a href="#">payload-size</a> on page 445 | Configures the maximum payload size in packets exchanged between ESL communicator and tags                     |
| <a href="#">ssl</a> on page 447          | Enables SSL (Secure Socket Layer) encryption mode of communication between the AP and the SES-imagotag server. |
| <a href="#">window-size</a> on page 446  | Configures the transmission window size for messages exchanged between ESL communicator and tags.              |
| <a href="#">no</a> on page 447           | Reverts this IoT Device-Type Imagotag policy settings to default values                                        |

## channel

Manually configures the channel assigned for ESL communicator to tag communication in the 2.4 GHz band. Or, enables ACS (Auto-Channel Selection) mode.

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
channel [<0-10>|acs]
```

### Parameters

```
channel [<0-10>|acs]
```

|                      |                                                                                                                                                                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channel [<0-10> acs] | <p>Configures the 2.4 GHz frequency channel, using one of the following options:</p> <ul style="list-style-type: none"> <li>• &lt;0-10&gt; – Manually configures the channel from 0 - 10.</li> <li>• acs – Enables ACS channel selection mode. This is the default setting.</li> </ul> |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
iot-device-type-imagotag-policy ImagoTagPolicy
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

### Related Commands

|                                |                                           |
|--------------------------------|-------------------------------------------|
| <a href="#">no</a> on page 447 | Reverts the channel selection mode to ACS |
|--------------------------------|-------------------------------------------|

## enable

Enables the ESL communicator

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

`enable`

Parameters

None

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#enable
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

|                             |                               |
|-----------------------------|-------------------------------|
| <code>no</code> on page 447 | Disables the ESL communicator |
|-----------------------------|-------------------------------|

## fcc-mode

Enables the FCC (Federal Communications Commission) compatibility mode on the ESL communicator. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

`fcc-mode`

Parameters

None

Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#fcc-mode
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 fcc-mode
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

Related Commands

|                             |                                 |
|-----------------------------|---------------------------------|
| <code>no</code> on page 447 | Disables FCC compatibility mode |
|-----------------------------|---------------------------------|

## output-power

Configures the maximum output power for the ESL communicator.

Supported in the following platforms:

- Access Points — AP 8432

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`output-power [Level-A|Level-B|Level-C|Level-D|Level-E|Level-F|Level-G|Level-H]`

#### Parameters

`output-power [Level-A|Level-B|Level-C|Level-D|Level-E|Level-F|Level-G|Level-H]`

|                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>output-power [Level-A Level-B Level-C Level-D Level-E Level-F Level-G Level-H]</code> | <p>Configure the ESL communicator's output power in dBm. The options are:</p> <ul style="list-style-type: none"> <li>• Level-A - 1 dBm. This is the default setting.</li> <li>• Level-B - -4 dBm</li> <li>• Level-C - -6 dBm</li> <li>• Level-D - -12 dBm</li> <li>• Level-E - 0 dBm</li> <li>• Level-F - -2 dBm</li> <li>• Level-G - -8 dBm</li> <li>• Level-H - -10 dBm</li> </ul> <p><b>Note:</b> SES-Imagotags recommends NOT to change the default setting, which is in conformance to various country/region specific RF regulations.</p> |
|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```

nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#output-power Level-B
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 output-power Level-B
 fcc-enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#

```

#### Related Commands

|                             |                                                                  |
|-----------------------------|------------------------------------------------------------------|
| <code>no</code> on page 447 | Reverts the ESL communicator's output-power to default (Level-A) |
|-----------------------------|------------------------------------------------------------------|

### payload-size

Configures the maximum size of the payload in packets exchanged between ESL communicator and tags

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`payload-size <1-32>`

#### Parameters

`payload-size <1-32>`

payload-size <1-32>

Configures the packet's payload size

- <1-32> – Specify the value from 1 - 32 bytes. The default setting is 32 bytes.

**Note:** SES-Imagotags recommends NOT to change the default setting.

#### Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#payload-size 25
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 output-power Level-B
 payload-size 25
 fcc-enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

#### Related Commands

**no** on page 447

Reverts the payload size to default (32 bytes)

#### window-size

Configures the transmission window size for messages exchanged between ESL communicator and tags

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

window-size <1-14>

#### Parameters

window-size <1-14>

window-size <1-14>

Configures the window size

- <1-14> – Specify a value from 1 - 14 bytes. The default value is 14 bytes.

**Note:** SES-Imagotags recommends NOT to change the default setting.

#### Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#window-size 12
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 output-power Level-B
 window-size 12
 payload-size 25
 port 200
 ssl-enable
 fcc-enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

## Related Commands

|                |                                      |
|----------------|--------------------------------------|
| no on page 447 | Reverts the window-size to 14 bytes. |
|----------------|--------------------------------------|

## ssl

Enables secure, encrypted communication over the SSL (Secure Socket Layer) between the AP and SES-imagotag server. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

ssl

## Parameters

None

## Examples

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#ssl
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 output-power Level-B
 payload-size 25
 port 200
 ssl
 fcc-enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

## Related Commands

|                |                                               |
|----------------|-----------------------------------------------|
| no on page 447 | Disables SSL encryption mode of communication |
|----------------|-----------------------------------------------|

## no

Reverts this IoT Device-Type Imagotag policy settings to default values

Supported in the following platforms:

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

no [channel|enable|fcc-mode|output-power|payload-size|port|ssl|window-size]

## Parameters

no <PARAMETERS>

|                 |                                                                        |
|-----------------|------------------------------------------------------------------------|
| no <PARAMETERS> | Reverts this IoT Device-Type Imagotag policy settings to default value |
|-----------------|------------------------------------------------------------------------|

## Examples

The following example shows the ImagoTag policy settings before the `no` commands are executed.

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 output-power Level-B
 window-size 12
 payload-size 25
 ssl-enable
 fcc-enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#no payload-size
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#no window-size
```

The following example shows the ImagoTag policy settings after the 'no' commands are executed.

```
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#show context
 iot-device-type-imagotag-policy ImagoTagPolicy
 enable
 output-power Level-B
 ssl-enable
 fcc-enable
 channel 9
nx9500-6C8809(config-iot-device-type-imagotag-policy-ImagoTagPolicy)#
```

*ip*

Creates an ACL (access control list) and enters its configuration modeS

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ip [access-list|ex3500-ext-access-list|ex3500-std-access-list|snmp-access-list]
ip ex3500-ext-access-list <EX3500-EXT-ACL-NAME>
ip ex3500-std-access-list <EX3500-STD-ACL-NAME>
ip access-list <IP-ACL-NAME>
ip snmp-access-list <IP-SNMP-ACL-NAME>
```

#### Parameters

```
ip access-list <IP-ACL-NAME>
```

|                           |                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------|
| access-list <IP-ACL-NAME> | Creates an IP ACL and enters its configuration mode                                       |
|                           | • <IP-ACL-NAME> - Specify the ACL name. If the access list does not exist, it is created. |

```
ip ex3500-ext-access-list <EX3500-EXT-ACL-NAME>
```

## ipv6

Creates an IPv6 ACL and enters its configuration mode

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ipv6 access-list <IPv6-ACL-NAME>
```

### Parameters

```
ipv6 access-list <IPv6-ACL-NAME>
```

|                                                |                                                                                                                                                                                                                                        |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>access-list &lt;IPv6-ACL-NAME&gt;</code> | Configures an IPv6 access list and enters its configuration mode <ul style="list-style-type: none"> <li>• <code>&lt;IPv6-ACL-NAME&gt;</code> - Specify the IPv6 ACL name. If the access list does not exist, it is created.</li> </ul> |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```

rfs4000-229D58(config)#ipv6 access-list IPv6ACLTest
rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#?
IPv6 Access Control Mode commands:
 deny Specify packets to reject
 no Negate a command or set its defaults
 permit Specify packets to forward

 clrscr Clears the display screen

### *ipv6-router-advertisement-policy*

Creates an IPv6 RA policy and enters its configuration mode

An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message, which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ipv6-router-advertisement-policy <POLICY-NAME>
```

#### Parameters

```
ipv6-router-advertisement-policy <POLICY-NAME>
```

|               |                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------|
| <POLICY-NAME> | Specify an IPv6 RA policy name. If a policy with the specified name does not exist, it is created. |
|---------------|----------------------------------------------------------------------------------------------------|

## ipv6-router-advertisement-policy config commands

**Table 24: IPv6 Router Advertisement Policy Config Commands**

| Command                                                  | Description                                                                                                                             |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <code>advertise</code> on page 452                       | Enables advertisement of IPv6 MTU (maximum transmission unit) and hop-count value in RAs                                                |
| <code>assist-neighbor-discovery</code> on page 453       | Enables advertisement of the source link layer address in RAs                                                                           |
| <code>check-ra-consistency</code> on page 453            | Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link |
| <code>dns-server</code> on page 454                      | Configures the DNS server's IPv6 address and lifetime advertised in RAs                                                                 |
| <code>domain-name</code> on page 454                     | Configures the Domain name search label advertised in RAs                                                                               |
| <code>managed-config-flag</code> on page 455             | Sets the managed address configuration flag in RAs                                                                                      |
| <code>nd-reachable-time</code> on page 456               | Enables advertisement of neighbor reachable time in RAs                                                                                 |
| <code>ns-interval</code> on page 457                     | Configures the interval between two successive retransmitted NS (neighbor solicitation) messages                                        |
| <code>other-config-flag</code> on page 457               | Sets the other-configuration flag in RAs                                                                                                |
| <code>ra</code> on page 458                              | Configures RA related parameters, such as the interval between two unsolicited successive RAs                                           |
| <code>router-lifetime</code> on page 459                 | Configures the default router's lifetime, in seconds, advertised in RAs                                                                 |
| <code>router-preference</code> on page 459               | Configures the router preference field value advertised in RAs                                                                          |
| <code>unicast-solicited-advertisement</code> on page 460 | Enables unicasting of solicited RAs                                                                                                     |
| <code>no</code> on page 461                              | Removes or reverts router advertisement policy settings                                                                                 |

### advertise

Enables advertisement of IPv6 MTU and hop-count value in RAs

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
advertise [hop-limit|mtu]
```

### Parameters

```
advertise [hop-limit|mtu]
```

|                                        |                                                                                                            |
|----------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>advertise [hop-limit mtu]</code> | Enables advertisement of IPv6 MTU and hop-count value in RAs. Both these features are disabled by default. |
|----------------------------------------|------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#advertise hop-limit
nx9500-6C8809(config-ipv6-radv-policy-test)#advertise mtu
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 advertise mtu
 advertise hop-limit
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

## Related Commands

|                             |                                                               |
|-----------------------------|---------------------------------------------------------------|
| <code>no</code> on page 461 | Disables advertisement of IPv6 MTU and hop-count value in RAs |
|-----------------------------|---------------------------------------------------------------|

## assist-neighbor-discovery

Enables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
assist-neighbor-discovery
```

## Parameters

None

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#assist-neighbor-discovery
```

## Related Commands

|                             |                                                                    |
|-----------------------------|--------------------------------------------------------------------|
| <code>no</code> on page 461 | Disables the advertisement of the source link layer address in RAs |
|-----------------------------|--------------------------------------------------------------------|

## check-ra-consistency

Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
check-ra-consistency
```

## Parameters

None

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#check-ra-consistency
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
```

```

advertise mtu
advertise hop-limit
check-ra-consistency
nx9500-6C8809(config-ipv6-radv-policy-test)#

```

## dns-server

Configures the DNS server's IPv6 address and lifetime. The configured values are advertised in RAs.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}
```

#### Parameters

```
dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}
```

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## domain-name

Configures the Domain name search label advertised in RAs

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}
```

#### Parameters

```
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}
```

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### managed-config-flag

Sets the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

managed-config-flag

## Parameters

None

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#managed-config-flag
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
managed-config-flag
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

|----------------|------------------------------------------------------------------|

## nd-reachable-time

Enables advertisement of ND (neighbor discovery) reachable time in RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

nd-reachable-time [<5000-3600000>|global]

## Parameters

nd-reachable-time [<5000-3600000>|global]

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nd-reachable-time<br>[<5000-3600000> global] | Configures the interval, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation from the neighbor. Therefore, a neighbor is reachable, after being discovered, for a period specified here. This value is advertised in RAs. Use one of the following options: <ul style="list-style-type: none"><li>• &lt;5000-3600000&gt; - Configures an interface-specific value. Specify a value from 5000 - 3600000 milliseconds. The default is 5000 milliseconds.</li><li>• global - Advertises the neighbor reachable time configured for the system. This is the value configured at the device configuration mode. For more information, see <a href="#">use</a> on page 1232 (profile config mode).</li></ul> |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#nd-reachable-time 6000
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 managed-config-flag
 nd-reachable-time 6000
 advertise mtu
```

```
advertise hop-limit
check-ra-consistency

#### ns-interval

Configures the NS (neighbor solicitation) retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ns-interval [<1000-3600000>|global]
```

#### Parameters

```
ns-interval [<1000-3600000>|global]
```

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ns-interval [<1000-3600000> global] | Configures the NS interval advertised in RAs. #### other-config-flag

Sets the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`other-config-flag`

#### Parameters

None

#### Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#other-config-flag
```

#### Related Commands

|                             |                                                 |

ra

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ra [interval <3-1800>|suppress]
```

#### Parameters

```
ra [interval <3-1800>|suppress]
```

|                   |                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval <3-1800> | Configures the interval, in seconds, between two unsolicited successive RAs <ul style="list-style-type: none"><li>• &lt;3-1800&gt; - Specify a value from 3 - 1800 seconds. The default is 300 seconds.</li></ul> <p><b>Note:</b> The router-lifetime should be at least three times the specified router interval.</p> |
| suppress          | Enables the suppression of RAs. When enabled, the transmission of RAs in IPv6 packets is suppressed. This option is disabled by default. The <b>no &gt; ra &gt; suppress</b> command enables the sending of RAs.                                                                                                        |

#### Examples

### router-lifetime

Configures the default router's lifetime, in seconds, advertised in RAs

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
router-lifetime <0-9000>
```

#### Parameters

```
router-lifetime <0-9000>
```

|                                             |                                                                                                                                                                                                                                                                                             |

### router-preference

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
router-preference [high|medium|low]
```

#### Parameters

```
router-preference [high|medium|low]
```

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| router-preference [high medium low] | <p>Sets this router's preference over other routers, in the link, to be the default router. The options are high, low, and medium. The default value is medium. The following points should be taken into consideration when configuring router preference:</p> <ul style="list-style-type: none"><li>• For a router to be selected as a default router, the router's lifetime should not be equal to "0".</li><li>• To enable default router selection, using router information contained in RAs, configure default router selection on that interface.</li></ul> |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#router-preference high
nx9500-6C8809-6C8809(config-ipv6-radv-policy-test)#show context

#### unicast-solicited-advertisement

Enables unicasting of solicited RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
unicast-solicited-advertisement
```

#### Parameters

None

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#unicast-solicited-advertisement
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 ra suppress
 ra interval 200
 unicast-solicited-advertisement
 managed-config-flag
 nd-reachable-time global
 router-lifetime 2000
 advertise mtu
 advertise hop-limit
 router-preference high
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#
```

## Related Commands

|                             |                                      |
|-----------------------------|--------------------------------------|
| <code>no</code> on page 461 | Disables unicasting of solicited RAs |
|-----------------------------|--------------------------------------|

no

Removes or reverts router advertisement policy settings. Use the no command to remove or revert the interface-specific parameters that are advertised by link router.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
no [advertise [hop-limit|mtu]|assist-neighbor-discovery|check-ra-consistency|
dns-server <IPv6>|domain-name <WORD>|managed-config-flag|nd-reachable-time|ns-interval|
other-config-flag|ra [interval|suppress]|router-lifetime|unicast-solicited-advertisement]
```

## Parameters

```
no <PARAMETERS>
```

|                                    |                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>no &lt;PARAMETERS&gt;</code> | Removes or reverts this IPv6 router advertisement policy's settings based on the parameters passed |
|------------------------------------|----------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
 managed-config-flag
 nd-reachable-time global
 advertise mtu
 advertise hop-limit

 domain-name TechPubs lifetime infinite
nx9500-6C8809(config-ipv6-radv-policy-test)#

```

## *l2tpv3*

Configures a L2TPV3 (Layer 2 Tunnel Protocol Version 3) tunnel policy, used to create one or more L2TPV3 tunnels.

The L2TPV3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPV3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPV3 tunnels can be created between any vendor devices supporting L2TPV3 protocol.

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

### **Parameters**

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

|                                       |                                                                                                                                                                                                                                        |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l2tpv3 policy<br><L2TPV3-POLICY-NAME> | Configures an L2TPV3 tunnel policy <ul style="list-style-type: none"> <li>• &lt;L2TPV3-POLICY-NAME&gt; - Specify a policy name. The policy is created if it does not exist. To modify an existing L2TPV3, specify its name.</li> </ul> |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### **Examples**

```

nx9500-6C8809(config)#l2tpv3 policy L2TPV3Policy1
nx9500-6C8809(config-l2tpv3-policy-L2TPV3Policy1)#?

```

L2tpv3 Policy Mode commands:

```

cookie-size Size of the cookie field present in each l2tpv3 data
 message
failover-delay Time interval for re-establishing the tunnel after
 the failover (RF-Domain
 manager/VRRP-master/Cluster-master failover)
force-l2-path-recovery Enables force learning of servers, gateways etc.,
 behind the l2tpv3 tunnel when the tunnel is
 established
hello-interval Configure the time interval (in seconds) between
 l2tpv3 Hello keep-alive messages exchanged in l2tpv3
 control connection
no Negate a command or set its defaults
reconnect-attempts Maximum number of attempts to reestablish the

```

```

tunnel.
reconnect-interval Time interval between the successive attempts to
reestablish the l2tpv3 tunnel
retry-attempts Configure the maximum number of retransmissions for
signaling message
retry-interval Time interval (in seconds) before the initiating a
retransmission of any l2tpv3 signaling message
rx-window-size Number of signaling messages that can be received
without sending the acknowledgement
tx-window-size Number of signaling messages that can be sent
without receiving the acknowledgement

|--------------------------|------------------------------------------|
| <code>no</code>          | Removes an existing L2TPV3 tunnel policy |
| <code>mint-policy</code> | Configures the global MiNT policy        |

#### Note

For more information on the L2TPV3 tunnel configuration mode and commands, see [L2TPV3-POLICY](#).

### *location-policy*

Creates a Location policy and enters its configuration mode. Use this command to configure a policy that provides the ExtremeLocation server hostname, and the ExtremeLocation Tenant's API key needed to authenticate and authorize with the server. Apply this Location policy on the WiNG devices (site controller, virtual controllers, and standalone APs). When applied, these devices push/export site hierarchy to the ExtremeLocation server. The site hierarchy includes site details along with details of APs deployed within the site.

#### Note

Once created and configured, apply this Location policy on the WiNG controller's self, to enable Tenant site hierarchy reporting by the controller to the ExtremeLocation server.

#### Note

The ExtremeLocation sensor capabilities are supported only on AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP8432, AP8533 model access points.

### Supported in the following platforms:

- Access Points — AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
location-policy <LOCATION-POLICY-NAME>
```

## Parameters

```
location-policy <LOCATION-POLICY-NAME>
```

|                                        |                                                                                                      |
|----------------------------------------|------------------------------------------------------------------------------------------------------|
| location-policy <LOCATION-POLICY-NAME> | Specify the Location Policy name. If a policy with the specified name does not exist, it is created. |
|----------------------------------------|------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#eloc-policy testLocPolicy
nx9500-6C8809(config-eloc-policy-testLocPolicy)#?
Eloc Policy Mode commands:
 enable Enable this eloc policy
 location-key API key used for location service
 no Negate a command or set its defaults
 server-host ExtremeLocation server configuration

## location-policy-config-mode commands

The following table summarizes the Location Policy configuration commands:

**Table 25: Location Policy Config Mode Commands**

| Command                                  | Description                                                                                                                               |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">enable</a> on page 464       | Enables the location policy                                                                                                               |
| <a href="#">location-key</a> on page 465 | Configures the ExtremeLocation Tenant's API key. This key is used by the WiNG controller to authenticate with the ExtremeLocation server. |
| <a href="#">server-host</a> on page 466  | Configures the ExtremeLocation server's hostname                                                                                          |
| <a href="#">no</a> on page 466           | Removes Location policy settings or reverts them to default values                                                                        |

enable

Enables this Location policy

Supported in the following platforms:

- Access Points — AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`enable`

#### Parameters

None

#### Examples

```
nx9500-6C8809(config-location-policy-ELocPolicy)#enable
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

#### Related Commands

|                             |                               |
|-----------------------------|-------------------------------|
| <code>no</code> on page 466 | Disables this Location policy |
|-----------------------------|-------------------------------|

### location-key

Configures the ExtremeLocation Tenant's API key. The WiNG controller uses this key to authenticate with the ExtremeLocation server, and stage the Tenant's site hierarchy (includes site details and details of AP deployed within the site).

Supported in the following platforms:

- Access Points — AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`location-key <API-KEY>`

#### Parameters

`location-key <API-KEY>`

|                                           |                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>location-key &lt;API-KEY&gt;</code> | <p>Enter the 64-bit key that the WiNG controller uses to authenticate with the ExtremeLocation server.</p> <ul style="list-style-type: none"> <li>• <code>&lt;API-KEY&gt;</code> - Enter the key.</li> </ul> <p><b>Note:</b> To generate API-Key, log into your ExtremeLocation Tenant account and use the ExtremeLocation UI. Enter that key here in the Location Policy.</p> |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-location-policy-ELocPolicy)#location-key dGVzdEAXmJmONQo
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
 location-key dGVzdEAXmJmONQo
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

|-----------------------------|-------------------------------------------------------|
| <code>no</code> on page 466 | Removes the Tenant's API-Key from the Location policy |
|-----------------------------|-------------------------------------------------------|

## server-host

Configures the ExtremeLocation server's hostname. When configured, the WING controller stages the Tenant's site hierarchy information to the specified server.

Supported in the following platforms:

- Access Points — AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
server-host 1 ip <HOSTNAME> {port <1-65535>}
```

### Parameters

```
server-host 1 ip <HOSTNAME> {port <1-65535>}
```

|                                |                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server-host 1 ip<br><HOSTNAME> | Identifies the ExtremeLocation server by its hostname <ul style="list-style-type: none"><li>• &lt;HOSTNAME&gt; - Enter ExtremeLocation server's hostname.</li></ul> <p><b>Note:</b> Enter the server's hostname and not the IP address, as the IP address is likely to change periodically in order to balance load across multiple Location server instances.</p> |
| {port <1-65535>}               | optional. Configures the port on which the ExtremeLocation server is reachable <ul style="list-style-type: none"><li>• &lt;1-63335&gt; - Selects a port from 1 - 65535 for the ExtremeLocation server.</li></ul> <p><b>Note:</b> By default the ExtremeLocation server is reachable on port 443.</p>                                                               |

### Examples

```
nx9500-6C8809(config-location-policy-ELocPolicy)#server-host 1 ip xyz.com
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
 server-host 1 ip xyz.com port 443
 location-key dGVzdEAxMjM0NQo
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

### Related Commands

|                |                                                           |
|----------------|-----------------------------------------------------------|
| no on page 466 | Removes ExtremeLocation server's hostname from the policy |
|----------------|-----------------------------------------------------------|

## no

Removes this Location Policy settings or reverts them to default values

Supported in the following platforms:

- Access Points — AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
no [enable|location-key|server-host]
```

### Parameters

```
no <PARAMETERS>
```

```
no <PARAMETERS>
```

Removes this Location Policy settings or reverts to default values, based on the parameters passed

## Examples

The following example shows the 'ELocPolicy' policy settings before the 'no' commands were executed:

```
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
 enable
 server-host 1 ip xyz.com port 443
 location-key dGVzdEAxMjM0NzQ=
nx9500-6C8809(config-location-policy-ELocPolicy)#
nx9500-6C8809(config-location-policy-ELocPolicy)#no server-host 1
nx9500-6C8809(config-location-policy-ELocPolicy)#no enable
nx9500-6C8809(config-location-policy-ELocPolicy)#no location-key
```

The following example shows the 'ELocPolicy' policy settings after the 'no' commands were executed:

```
nx9500-6C8809(config-location-policy-ELocPolicy)#show context
location-policy ELocPolicy
nx9500-6C8809(config-location-policy-ELocPolicy)#
```

## mac

Configures a MAC ACL

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
mac access-list <MAC-ACL-NAME>
```

### Parameters

```
mac access-list <MAC-ACL-NAME>
```

```
access-list <IP-ACL-NAME>
```

Configures a MAC access control list

- <MAC-ACL-NAME> – Specify the ACL name. If a MAC ACL with the specified name does not exist, it is created.

### Examples

```
nx9500-6C8809(config)#mac access-list test
nx9500-6C8809(config-mac-acl-test)#?
MAC Extended ACL Configuration commands:
 deny Specify packets to reject
 disable Disable rule if not needed
 ex3500 Ex3500 device
 insert Insert this rule (instead of overwriting a existing rule)
 no Negate a command or set its defaults
```

```

permit Specify packets to forward

| <code>no</code> | Removes an existing MAC access control list |
|-----------------|---------------------------------------------|

### Note

For more information on Access Control Lists, see.

## *management-policy*

Configures a management policy. Management policies include services that run on a device, welcome messages, banners, etc.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
management-policy <MANAGEMENT-POLICY-NAME>
```

### Parameters

```
management-policy <MANAGEMENT-POLICY-NAME>
```

|                                             |                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------|
| <code>&lt;MANAGEMENT-POLICY-NAME&gt;</code> | Specify the management policy name. If the policy does not exist, it is created. |
|---------------------------------------------|----------------------------------------------------------------------------------|

### Examples

```

nx9500-6C8809(config)#management-policy test
nx9500-6C8809(config-management-policy-test)#?
Management Mode commands:
 aaa-login Set authentication for logins
 allowed-locations Add allowed locations
 banner Define a login banner
 ftp Enable FTP server
 http Hyper Text Terminal Protocol (HTTP)
 https Secure HTTP
 idle-session-timeout Configure idle timeout for a configuration session
 (GUI or CLI)
 ipv6 IPv6 management access restriction

```

|                         |                                                         |
|-------------------------|---------------------------------------------------------|
| no                      | Negate a command or set its defaults                    |
| passwd-retry            | Lockout user if too many consecutive login failures     |
| privilege-mode-password | Set the password for entering CLI privilege mode        |
| rest-server             | Enable rest server for device on-boarding functionality |
| restrict-access         | Restrict management access to the device                |
| snmp-server             | SNMP                                                    |

#### Note

For more information on Management policy configuration, see [MANAGEMENT-POLICY](#).

### *meshpoint*

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

#### Parameters

```
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <MESHPOINT-NAME>  | Specify the meshpoint name. If the meshpoint does not exist, it is created. |
| containing <WORD> | Selects existing meshpoints containing the sub-string <WORD> in their names |

## Examples

```
nx9500-6C8809(config)#meshpoint testMeshpoint
nx9500-6C8809(config-meshpoint-testMeshpoint)#?
Mesh Point Mode commands:
 allowed-vlans Set the allowed VLANs
 beacon-format The beacon format of this meshpoint
 control-vlan VLAN for meshpoint control traffic
 data-rates Specify the 802.11 rates to be supported on this meshpoint
 description Configure a description of the usage of this meshpoint
 force Force suboptimal paths
 meshid Configure the Service Set Identifier for this meshpoint
 neighbor Configure neighbor specific parameters
 no Negate a command or set its defaults
 root Set this meshpoint as root
 security-mode The security mode of this meshpoint
 shutdown Shutdown this meshpoint
 use Set setting to use
 wpa2 Modify ccmp wpa2 related parameters

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-meshpoint-testMeshpoint)#

### Note

For more information on Meshpoint configuration, see [MESHPOINT](#).

## *meshpoint-qos-policy*

Configures a set of parameters that defines the meshpoint QoS policy

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>
```

### Parameters

```
meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>
```

|                             |                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| <MESHPOINT-QOS-POLICY-NAME> | Specify the meshpoint QoS policy name. If a policy with the specified name does not exist, it is created. |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#meshpoint-qos-policy test
nx9500-6C8809(config-meshpoint-qos-test)#?
Mesh Point QoS Mode commands:
 accelerated-multicast Configure accelerated multicast streams address and
 forwarding QoS classification
 no Negate a command or set its defaults
 rate-limit Configure traffic rate-limiting parameters on a
 per-meshpoint/per-neighbor basis

 clrscr Clears the display screen

### *mint-policy*

Configures the global MiNT policy

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
mint-policy global-default
```

#### Parameters

```
mint-policy global-default
```

|                |                                           |
|----------------|-------------------------------------------|
| global-default | Configures the global default MiNT policy |
|----------------|-------------------------------------------|

## Examples

```
nx9500-6C8809(config)#mint-policy global-default
nx9500-6C8809(config-mint-policy-global-default)#?
Mint Policy Mode commands:
 level Mint routing level
 lsp LSP
 mtu Configure the global Mint MTU
 no Negate a command or set its defaults
 router Mint router
 udp Configure mint UDP/IP encapsulation

 clrscr Clears the display screen
 commit Commit all changes made in this session

nx9500-6C8809(config-mint-policy-global-default)#
```

### Note

For more information on MiNT policy configuration, see [MINT-POLICY](#) on page 1513.

## *nac-list*

Configures a NAC (Network Access Control) list that manages access to the network

A NAC list configures a list of devices that can access a network based on their MAC addresses.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
nac-list <NAC-LIST-NAME>
```

### Parameters

```
nac-list <NAC-LIST-NAME>
```

|                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------|
| <NAC-LIST-NAME> Specify the NAC list name. If a NAC list with the specified name does not exist, it is created. |
|-----------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#nac-list test
nx9500-6C8809(config-nac-list-test)#?
NAC List Mode commands:
 exclude Specify MAC addresses to be excluded from the NAC enforcement list
 include Specify MAC addresses to be included in the NAC enforcement list
 no Negate a command or set its defaults
```

```

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode

| <code>no</code> | Removes an existing NAC list |
|-----------------|------------------------------|

### nac-list-mode-commands

The following table summarizes NAC list configuration mode commands:

Table: NAC-List Config Mode Commands

| Command              | Description                                                        |
|----------------------|--------------------------------------------------------------------|
| <code>exclude</code> | Specifies the MAC addresses excluded from the NAC enforcement list |
| <code>include</code> | Specifies the MAC addresses included in the NAC enforcement list   |
| <code>no</code>      | Cancels an exclude or include NAC list rule                        |

#### exclude

Specifies the MAC addresses excluded from the NAC enforcement list

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

#### Parameters

```
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

|                        |                                                                                                                                                                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <START-MAC>            | Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list <ul style="list-style-type: none"> <li>&lt;START-MAC&gt; – Specify the first MAC address in the range.</li> </ul> <p><b>Note:</b> Use this parameter to specify a single MAC address.</p> |
| <END-MAC>              | Specifies the last MAC address in the range (optional if a single MAC is added to the list) <ul style="list-style-type: none"> <li>&lt;END-MAC&gt; – Specify the last MAC address in the range.</li> </ul>                                                                                    |
| precedence<br><1-1000> | Sets the rule precedence. Exclude entries are checked in the order of their rule precedence. <ul style="list-style-type: none"> <li>&lt;1-1000&gt; – Specify a value from 1 - 1000.</li> </ul>                                                                                                |

### Examples

```

nx9500-6C8809(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
nx9500-6C8809(config-nac-list-test)#

```

### Related Commands

|           |                                            |
|-----------|--------------------------------------------|
| <b>no</b> | Removes an exclude rule from this NAC list |
|-----------|--------------------------------------------|

### include

Specifies the MAC addresses included in the NAC enforcement list

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

### Parameters

```
include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

|                        |                                                                                                                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <START-MAC>            | Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list <ul style="list-style-type: none"> <li>&lt;START-MAC&gt; – Specify the first MAC address in the range.</li> </ul> <p><b>Note:</b> Use this parameter to specify a single MAC address.</p> |
| <END-MAC>              | Specifies the last MAC address in the range (optional if a single MAC is added to the list) <ul style="list-style-type: none"> <li>&lt;END-MAC&gt; – Specify the last MAC address in the range.</li> </ul>                                                                                  |
| precedence<br><1-1000> | Sets the rule precedence. Include entries are checked in the order of their rule precedence. <ul style="list-style-type: none"> <li>&lt;1-1000&gt; – Specify a value from 1 - 1000.</li> </ul>                                                                                              |

### Examples

```

nx9500-6C8809(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#show context
nac-list test

```

```
exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#
```

#### Related Commands

|    |                                            |
|----|--------------------------------------------|
| no | Removes an include rule from this NAC list |
|----|--------------------------------------------|

#### no (nac-config-mode)

Cancels an exclude or include NAC list rule

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
no [exclude|include]
no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

#### Parameters

```
no <PARAMETERS>
```

|                 |                                                                            |
|-----------------|----------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts this NAC list's settings based on the parameters passed |
|-----------------|----------------------------------------------------------------------------|

#### Examples

The following example shows the NAC list 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#
nx9500-6C8809(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1
```

The following example shows the NAC list 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-nac-list-test)#show context
nac-list test
 include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
nx9500-6C8809(config-nac-list-test)#
```

#### no (global-config-mode)

Negates a command, or reverts configured settings to their default

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

no service set [command-history|reboot-history|upgrade-history] {on <DEVICE-NAME>}
```

The following 'no' commands are specific to the NX 9500 and NX 9600 platforms:

```
no t5 <T5-DEVICE-MAC>
no bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>
```

The following 'no' commands are specific to the NX 9500 and NX 9600 platforms:

```
no route-map <ROUTE-MAP-NAME>
```

The following 'no' commands are specific to the AP 6522, AP 6532, AP 7161, AP 7502, AP 7522, AP 7532, and RFS 4000 platforms:

```
no url-filter <URL-FILTER-NAME>
no url-list <URL-LIST-NAME>
no web-filter-name <WEB-FILTER-NAME>
```

The following 'no' command is specific to the VX 9000 virtual machine platform:

```
no database-client-policy <POLICY-NAME>
```

## Parameters

```
no <PARAMETERS>
```

|                 |                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or resets settings, configurable in the global configuration mode, based on the parameters passed |
|-----------------|-----------------------------------------------------------------------------------------------------------|

## Examples

```
<DEVICE>(config)#no ?
aaa-policy Delete a aaa policy
aaa-tacacs-policy Delete a aaa tacacs policy
alias Alias
ap621 Delete an AP621 access point
ap622 Delete an AP622 access point
ap650 Delete an AP650 access point
ap6511 Delete an AP6511 access point
ap6521 Delete an AP6521 access point
ap6522 Delete an AP6522 access point
ap6532 Delete an AP6532 access point
ap6562 Delete an AP6562 access point
ap71xx Delete an AP71XX access point
ap7502 Delete an AP7502 access point
ap7522 Delete an AP7522 access point
ap7532 Delete an AP7532 access point
ap7562 Delete an AP7562 access point
ap7602 Delete an AP7602 access point
ap7612 Delete an AP7612 access point
ap7622 Delete an AP7622 access point
ap7632 Delete an AP7632 access point
ap7662 Delete an AP7662 access point
ap81xx Delete an AP81XX access point
ap82xx Delete an AP82XX access point
ap8432 Delete an AP8432 access point
ap8533 Delete an AP8533 access point
application Delete an application
application-group Delete an application-group
application-policy Delete an application policy
association-acl-policy Delete an association-acl policy
auto-provisioning-policy Delete an auto-provisioning policy
bgp BGP Configuration
bonjour-gw-discovery-policy Disable Bonjour Gateway discovery policy
bonjour-gw-forwarding-policy Disable Bonjour Gateway Forwarding policy
```

|                                    |                                                                       |
|------------------------------------|-----------------------------------------------------------------------|
| bonjour-gw-query-forwarding-policy | Disable Bonjour Gateway Query Forwarding policy                       |
| captive-portal                     | Delete a captive portal                                               |
| client-identity                    | Client identity (DHCP Device Fingerprinting)                          |
| client-identity-group              | Client identity group (DHCP Fingerprint Database)                     |
| crypto-cmp-policy                  | CMP policy                                                            |
| customize                          | Restore the custom cli commands to default                            |
| database-client-policy             | Configure database policy                                             |
| database-policy                    | Configure database policy                                             |
| device                             | Delete multiple devices                                               |
| device-categorization              | Delete device categorization object                                   |
| dhcp-server-policy                 | DHCP server policy                                                    |
| dhcpv6-server-policy               | DHCPv6 server related configuration                                   |
| dns-whitelist                      | Delete a whitelist object                                             |
| event-system-policy                | Delete a event system policy                                          |
| ex3500                             | Ex3500 device                                                         |
| ex3500-management-policy           | Delete a ex3500 management policy                                     |
| ex3500-qos-class-map-policy        | Delete a ex3500 qos class-map policy                                  |
| ex3500-qos-policy-map              | Delete a ex3500 qos policy-map                                        |
| ex3524                             | Delete an EX3524 wireless controller                                  |
| ex3548                             | Delete an EX3548 wireless controller                                  |
| firewall-policy                    | Configure firewall policy                                             |
| global-association-list            | Delete a global association list                                      |
| guest-management                   | Delete a guest management policy                                      |
| igmp-snoop-policy                  | Remove device onboard igmp snoop policy                               |
| inline-password-encryption         | Disable storing encryption key in the startup configuration file      |
| iot-device-type-imagotag-policy    | Delete a iot imagotag policy                                          |
| ip                                 | Internet Protocol (IP)                                                |
| ipv6                               | Internet Protocol version 6 (IPv6)                                    |
| ipv6-router-advertisement-policy   | IPv6 Router Advertisement related configuration                       |
| l2tpv3                             | Negate a command or set its defaults                                  |
| location-policy                    | Delete a ExtremeLocation policy                                       |
| mac                                | MAC configuration                                                     |
| management-policy                  | Delete a management policy                                            |
| meshpoint                          | Delete a meshpoint object                                             |

| rtl-server-policy     | Delete a rtl server policy                     |
| schedule-policy       | Delete a schedule policy                       |
| sensor-policy         | Delete a sensor policy                         |
| smart-rf-policy       | Delete a smart-rf-policy                       |
| t5                    | Delete an T5 DSL switch                        |
| url-filter            | Delete a url filter                            |
| url-list              | Delete a URL list                              |
| vx9000                | Delete an VX9000 wireless controller           |
| web-filter-policy     | Delete a web filter policy                     |
| wips-policy           | Delete a wips policy                           |
| wlan                  | Delete a wlan object                           |
| wlan-qos-policy       | Delete a wireless lan QoS configuration policy |
| service               | Service Commands                               |

<DEVICE>(config)#

### *nsight-policy (global-config-mode)*

Creates an NSight policy and enters its configuration mode

The NSight policy is an advance management, analytics, reporting, and troubleshooting tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted database. This large, complex data is collated and presented on an NSight Dashboard that can be launched from the NSight-enabled NOC. For large networks, enabling NSight removes the inadequacies of the existing data collection, presentation, and analytics framework. It simplifies network monitoring, troubleshooting, and reporting.

#### **Note**

NSight is a licensed feature, and can be enabled only on the application of an NSight license in the NSight server's self mode.

The NSight features include:

- Network statistic and event visualization - Simplified and unified network views based on defined user roles
- Custom dashboards - Live network health information in real-time to optimally assist network administrators
- Live troubleshooting tools - Packet capture, wireless debug logs, TCP/IP ping and traceroute
- Interactive floor maps with timeline views - Visualize and identify potential issues and problems areas
- Real-time trend analysis - Simplify network growth planning
- Exceptionally responsive interface - Any information the admin needs is three, or less, clicks away

The WiNG NSight implementation consists of the following components:

- An NSight server
- A database. This database consists of AP statistics gathered by RF Domain managers.
- An NSight UI portal

- An NSight client hosted on the RF Domain manager, which periodically gathers statistics from APs and forwards to the NSight server.
- Event history – Event details for all APs adopted by the NOC. These are events received by the Cfgd every 30 seconds and sent to the MART server. Each event consists of the RF Domain name, wireless client MAC if applicable, AP MAC, event mnemonic, event timestamp, and the event string itself.

#### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
nsight-policy <NSIGHT-POLICY-NAME>
```

#### Parameters

```
nsight-policy <NSIGHT-POLICY-NAME>
```

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| <NSIGHT-POLICY-NAME> | Specify the NSight policy name. If the policy does not exist, it is created. |
|----------------------|------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#nsight-policy test
nx9500-6C8809(config-nsight-policy-test)#?
Nsight Policy Mode commands:
 enable Enable this Nsight policy
 event-history-size Size of the event history collection
 history-ttl Time to live for historical data
 mandatory Configure mandatory app stats reporting
 no Negate a command or set its defaults
 nsight-server Enable Nsight server functionality
 server Configure Nsight server

 clrscr Clears the display screen
 commit Commit all changes made in this session
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-nsight-policy-test)#
```

#### Related Commands

#### nsight-policy config commands

The following table summarizes NSight policy configuration mode commands:

**Table 26: NSight-Policy Config Mode Commands**

| Command                                     | Description                                                                                                            |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>enable</code> on page 481             | Enables this NSight policy                                                                                             |
| <code>event-history-size</code> on page 481 | Converts and sizes the NSight event history collection to a capped collection                                          |
| <code>history-ttl</code> on page 482        | Configures the TTL, in days, for historical data related to clients and devices                                        |
| <code>mandatory</code> on page 482          | Enables mandatory AVC (Application Visibility and Control) statistics reporting                                        |
| <code>nsight-server</code> on page 484      | Enables NSight server functionality and configures the SMTP report delivery settings                                   |
| <code>server</code> on page 485             | Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host. |
| <code>no</code> on page 485                 | Removes this NSight policy settings                                                                                    |

### enable

Enables this NSight policy. The default setting is enabled.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

`enable`

#### Parameters

`enable`

#### Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#enable
```

#### Related Commands

|                             |                             |
|-----------------------------|-----------------------------|
| <code>no</code> on page 485 | Disables this NSight policy |
|-----------------------------|-----------------------------|

### event-history-size

Converts and sizes the NSight event history collection to a capped collection. The conversion occurs when upgrading. Use this command to define the NSight event history collection's size and prevent its unbounded growth. Note, resizing the collection results in the collection contents being dropped.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

`event-history-size [high|low|medium]`

#### Parameters

`event-history-size [high|low|medium]`

|                                                   |                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>event-history-size [high low medium]</code> | Defines the size of the NSight event history collection. The options are: <ul style="list-style-type: none"> <li>• high - Sets the size at approximately 10 M events</li> <li>• low - Sets the size at approximately 500 K events. This is the default setting.</li> <li>• medium - Sets the size at approximately 5 M events</li> </ul> |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-nsight-policy-test)#event-history-size medium
nx9500-6C8809(config-nsight-policy-test)#show context
nsight-policy test
 event-history-size medium
nx9500-6C8809(config-nsight-policy-test)#
```

## Related Commands

|                |                                                                   |
|----------------|-------------------------------------------------------------------|
| no on page 485 | Reverts the NSight event history collection size to default (5 M) |
|----------------|-------------------------------------------------------------------|

## history-ttl

Configures the TTL (time-to-live), in days, for historical data related to clients, devices, and guest users. This is the duration for which clients, devices, or guest user related data is retained in the NSight database.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

## Syntax

```
history-ttl [clients|devices|guest-clients]
history-ttl [clients|devices] <1-3650>
history-ttl guest-clients <8-48>
```

## Parameters

```
history-ttl [clients|devices] <1-3650>
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| history-ttl [clients devices] <1-3650> | <p>Configures the TTL for historical data related to clients and devices</p> <ul style="list-style-type: none"><li>• clients - Configures the TTL for wireless clients related historical data</li><li>• devices - Configures the TTL for devices (adopted access points or site controllers) related historical data</li></ul> <p>The following is common to both the 'clients' and 'devices' keywords:</p> <ul style="list-style-type: none"><li>• &lt;1-3650&gt; - Specify a value from 1 - 3650 days. The default for both (clients and devices) is 180 days.</li></ul> |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
history-ttl guest-clients <8-48>
```

|                                  |                                                                                                                                                                                                                                                                                                |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| history-ttl guest-clients <8-48> | <p>Configures the TTL for historical data related to clients and devices</p> <ul style="list-style-type: none"><li>• guest-clients - Configures the TTL for guest-client related historical data</li><li>• &lt;8-48&gt; - Specify a value from 8 - 48 hours. The default is 8 hours.</li></ul> |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-nsight-policy-test)#history-ttl clients 250
nx9500-6C8809(config-nsight-policy-test)#show context
nsight-policy test
 history-ttl clients 250
nx9500-6C8809(config-nsight-policy-test)#
```

## Related Commands

|                |                                                                          |
|----------------|--------------------------------------------------------------------------|
| no on page 485 | Reverts the NSight clients or devices TTL duration to default (180 days) |
|----------------|--------------------------------------------------------------------------|

## mandatory

Configures mandatory AVC statistics reporting for a specified application group. When configured, the RF Domain manager reports usage stats for applications, in the specified group, to the NSight server. By default, only the top-ten applications by usage are reported to the NSight server. This option allows you to configure mandatory stats reporting for applications that are not in the top-ten list.

To enable mandatory statistics reporting for an application or set of applications, create an application group, add the desired application(s), and enable mandatory stats reporting for the group. Once enabled, the specified application(s) usage stats is always reported.

At any given time, only ten (10) applications can be reported to the NSight server. These are the top-ten applications, by usage, identified by the system. However, if mandatory application stats reporting is enabled, applications, within the specified application group, have to be included in the report. This is done by dropping some of the top-ten applications. For example, if mandatory application reporting is enabled for five (5) applications, the report will contain these 5 applications, plus first 5 of the top-ten applications identified by the system, totaling the number to ten.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

#### Syntax

```
mandatory app stats app-group <APPLICATION-GROUP-NAME>
```

#### Parameters

```
mandatory app stats app-group <APPLICATION-GROUP-NAME>
```

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mandatory app stats                | Enables mandatory AVC statistics reporting for a specified application group                                                                                                                                                                                                                                                                                                                                             |
| app-group <APPLICATION-GROUP-NAME> | Specifies the application group for which statistics reporting is to be made mandatory. When configured, usage statistics, for the specified application group, is always reported to the NSight server. <ul style="list-style-type: none"> <li>• &lt;APPLICATION-GROUP-NAME&gt; - Specify the application group name.</li> </ul> <p><b>Note:</b> An application group can have a maximum of eight (8) applications.</p> |

#### Examples

```
nx9500-6C8809(config-nsight-policy-test)#mandatory app stats app-group socialnetworking
nx9500-6C8809(config-nsight-policy-test)#show context
nsight-policy test
server host 1.2.3.4 https
```

```
nx9500-6C8809(config-nsight-policy-test)#
```

Following is the "socialnetworking" application-group configuration. It contains three applications, which will be always reported to the NSight server even if they are not in the top-ten applications by usage list.

```
nx9500-6C8809(config-app-group-socialnetworking)#show context
application-group socialnetworking
 application facetime
 application Facebook_chat
 application "Google Hangouts_audio"
nx9500-6C8809(config-app-group-socialnetworking)#
```

## nsight-server

Enables NSight server functionality and configures the SMTP report delivery settings.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
nsight-server {smtp-report-delivery/standalone}
nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD>
[port <1-65535>|security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]]}
nsight-server {standalone}
```

### Parameters

```
nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD>
[port <1-65535>|security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]]}
```

|                                               |                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight-server                                 | Enables NSight server functionality on the host using this NSight policy                                                                                                                                                                                                                                                                                              |
| smtp-report-delivery host <WORD>              | Optional. Configures SMTP report delivery settings <ul style="list-style-type: none"><li>• host &lt;WORD&gt; - Configures the SMTP server host<ul style="list-style-type: none"><li>• &lt;WORD&gt; - Specify the SMTP server host's IP address or hostname.</li></ul></li></ul>                                                                                       |
| sender <EMAIL-ADD>                            | Optional. Configures the SMTP sender's e-mail address <ul style="list-style-type: none"><li>• &lt;EMAIL-ADD&gt; - Specify the sender's e-mail address.</li></ul>                                                                                                                                                                                                      |
| port <1-65535>                                | Optional. Configures the SMTP server port <ul style="list-style-type: none"><li>• &lt;1-65535&gt; - Specify the port from 1 - 65535.</li></ul>                                                                                                                                                                                                                        |
| security [none ssl starttls]                  | Optional. Configures the encryption protocol used by the SMTP server. The options are: <ul style="list-style-type: none"><li>• none - Uses no encryption</li><li>• ssl - Uses SSL encryption</li><li>• starttls - Uses STARTTLS encryption</li></ul>                                                                                                                  |
| username <USER-NAME><br>password [0 2 <WORD>] | Optional. Configures the SMTP username <ul style="list-style-type: none"><li>• &lt;USER-NAME&gt; Specify the user name<ul style="list-style-type: none"><li>• password [0 2 &lt;WORD&gt;] - Configures the password associated with the above configured user<ul style="list-style-type: none"><li>• &lt;WORD&gt; - Enter the password.</li></ul></li></ul></li></ul> |

```
nsight-server {standalone}
```

|               |                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight-server | Enables NSight server functionality on the host using this NSight policy                                                                                                     |
| standalone    | Optional. Configures NSight server as standalone. Use this option in the split NSight deployment scenario where the NSight server and database are hosted on separate hosts. |

### Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
```

### Related Commands

no on page 485

Disables NSight server functionality on this NSight policy

## server

Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host.

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}
```

### Parameters

```
server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}
```

```
server host [<IP>|
<HOSTNAME>|<X:X::X:X>]
```

Configures the NSight server host's address. Use one of the following options to identify the NSight server host:

- <IP> - Configures the NSight server's IPv4 address
- <HOSTNAME> - Configures the NSight server's hostname
- <X:X::X:X> - Configures the NSight server's IPv6 address

```
{http|https}
```

Optional. Configures the protocol used to communicate with the NSight server

- http - Optional. Uses HTTP to communicate
- https - Optional. Uses HTTPS to communicate (this is the default setting)

### Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#server host 172.22.0.153 http
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 server host 172.22.0.153 http
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
```

### Related Commands

no on page 485

Removes NSight server host settings from this NSight policy

## no

Removes NSight policy settings or reverts them to default values

Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
no [enable|event-history-size|history-ttl [clients|devices|guest-clients] |
mandatory app stats app-group <APPLICATION-GROUP-NAME> |
nsight-server {smtp-report-delivery}|server host [<IP>|<HOSTNAME>|<X:X::X:X>]]
```

### Parameters

```
no <PARAMETERS>
```

```
no <PARAMETERS>
```

Removes NSight policy settings based on the parameters passed

### Examples

The following example shows the NSight policy 'test2' settings before the 'no' command is executed:

```
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
 server host 172.22.0.153 http
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
nx9510-6C8A5C(config-nsight-policy-test2)#no server host 172.22.0.153
```

The following example shows the NSight policy 'test2' settings after the 'no' command is executed:

```
nx9500-6C8809(config-nsight-policy-test2)#show context
nsight-policy test2
 nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
```

### *passpoint-policy*

Creates a new passpoint policy and enters its configuration mode

The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
passpoint-policy <POLICY-NAME>
```

#### **Parameters**

```
passpoint-policy <POLICY-NAME>
```

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| passpoint-policy <POLICY-NAME> | Specify the passpoint policy name. If a passpoint policy with the specified name does not exist, it is created. |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|

#### **Examples**

```
nx9500-6C8809(config)#passpoint-policy test
nx9500-6C8809(config-passpoint-policy-test)#?
```

Passpoint Policy Mode commands:

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| 3gpp                  | Configure a 3gpp plmn (public land mobile network) id |
| access-network-type   | Set the access network type for the passpoint         |
| connection-capability | Configure the connection capability for the passpoint |
| domain-name           | Add a domain-name for the passpoint                   |
| hessid                | Set a homogeneous ESSID value for the passpoint       |
| internet              | Advertise the passpoint having internet access        |
| ip-address-type       | Configure the advertised ip-address-type              |
| nai-realm             | Configure a NAI realm for the passpoint               |
| net-auth-type         | Add a network authentication type to the passpoint    |

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| no              | Negate a command or set its defaults                       |
| operator        | Add configuration related to the operator of the passpoint |
| osu             | Online signup                                              |
| roam-consortium | Add a roam consortium for the passpoint                    |
| venue           | Set the venue parameters of the passpoint                  |
| wan-metrics     | Set the wan-metrics of the passpoint                       |
|                 |                                                            |
| clrscr          | Clears the display screen                                  |
| commit          | Commit all changes made in this session                    |
| do              | Run commands from Exec mode                                |
| end             | End current mode and change to EXEC mode                   |
| exit            | End current mode and down to previous mode                 |
| help            | Description of the interactive help system                 |
| revert          | Revert changes                                             |
| service         | Service Commands                                           |
| show            | Show running system information                            |
| write           | Write running configuration to memory or terminal          |

```
nx9500-6C8809(config-passpoint-policy-test)#
```

### Related Commands

|                 |                                           |
|-----------------|-------------------------------------------|
| <code>no</code> | Removes an existing roam passpoint policy |
|-----------------|-------------------------------------------|

#### Note

For more information on Passpoint policy, see [PASSPOINT-POLICY](#)

### *password-encryption*

Enables password encryption and configures the passphrase used to encrypt passwords. When enabled, passwords configured within the system are not displayed as clear text.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
password-encryption secret 2 <LINE>
```

#### Parameters

```
password-encryption secret 2 <LINE>
```

|                 |                                                                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| secret 2 <LINE> | Encrypts passwords with a secret phrase <ul style="list-style-type: none"> <li>• 2 - Specifies the encryption type as either SHA256-AES256</li> <li>• &lt;LINE&gt; - Specify the encryption passphrase.</li> </ul> |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#password-encryption secret 2 test@123
```

To confirm if password encryption is enabled, execute the following command:

```
nx9500-6C8809(config)#show password-encryption status
Password encryption is enabled
nx9500-6C8809(config)#
```

The following example shows the privilege-mode-password as encrypted text. Note, the digit '1' preceding the password implies that displayed text is the encrypted password and not clear text.

```
nx9500-6C8809(config-management-policy-test)#show context include-factory |
include privilege-mode-password
 privilege-mode-password 1 bc28e4d82bb11fa75a3c56346441d48f50f19c47184e2575a59a6a5d18e63925
nx9500-6C8809(config-management-policy-test)#
```

## Related Commands

|    |                              |
|----|------------------------------|
| no | Disables password encryption |
|----|------------------------------|

## profile

Configures profile related commands. If no parameters are given, all profiles are selected.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

| events                             | System event messages                                                           |
| export                             | Export a file                                                                   |
| file-sync                          | File sync between controller and adoptees                                       |
| floor                              | Set the floor within a area where the system is located                         |
| gre                                | GRE protocol                                                                    |
| http-analyze                       | Specify HTTP-Analysis configuration                                             |
| interface                          | Select an interface to configure                                                |
| ip                                 | Internet Protocol (IP)                                                          |
| ipv6                               | Internet Protocol version 6 (IPv6)                                              |
| l2tpv3                             | L2tpv3 protocol                                                                 |
| l3e-lite-table                     | L3e lite Table                                                                  |
| led                                | Turn LEDs on/off on the device                                                  |
| led-timeout                        | Configure the time for the led to turn off after the last radio state change    |
| legacy-auto-downgrade              | Enable device firmware to auto downgrade when other legacy devices are detected |
| legacy-auto-update                 | Auto upgrade of legacy devices                                                  |
| lldp                               | Link Layer Discovery Protocol                                                   |
| load-balancing                     | Configure load balancing parameter                                              |
| logging                            | Modify message logging facilities                                               |
| mac-address-table                  | MAC Address Table                                                               |
| mac-auth                           | 802.1X                                                                          |
| management-server                  | Configure management server address                                             |
| memory-profile                     | Memory profile to be used on the device                                         |
| meshpoint-device                   | Configure meshpoint device parameters                                           |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                         |
| min-misconfiguration-recovery-time | Time interval to check controller connectivity after configuration is received  |

|                                |                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------|
| mint                           | MiNT protocol                                                                       |
| misconfiguration-recovery-time | Check controller connectivity after configuration is received                       |
| neighbor-inactivity-timeout    | Configure neighbor inactivity timeout                                               |
| neighbor-info-interval         | Configure neighbor information exchange interval                                    |
| no                             | Negate a command or set its defaults                                                |
| noc                            | Configure the noc related setting                                                   |
| nsight                         | NSight                                                                              |
| ntp                            | Ntp server WORD                                                                     |
| offline-duration               | Set duration for which a device remains unadopted before it generates offline event |
| otls                           | Omnitrail Location Server                                                           |
| power-config                   | Configure power mode                                                                |
| preferred-controller-group     | Controller group this system will prefer for adoption                               |
| preferred-tunnel-controller    | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic  |
| radius                         | Configure device-level radius authentication parameters                             |
| raid                           | RAID                                                                                |
| remote-debug                   | Configure remote debug parameters                                                   |
| remove-override                | Remove configuration item override from the device (so profile value takes effect)  |
| rf-domain-manager              | RF Domain Manager                                                                   |
| router                         | Dynamic routing                                                                     |
| slot                           | PCI expansion Slot                                                                  |
| spanning-tree                  | Spanning tree                                                                       |
| traffic-class-mapping          | Configure IPv6 traffic class to 802.1p priority mapping for untagged frames         |
| traffic-shape                  | Traffic shaping                                                                     |
| trustpoint                     | Assign a trustpoint to a service                                                    |
| tunnel-controller              | Tunnel Controller group this controller belongs to                                  |
| use                            | Set setting to use                                                                  |
| vrrp                           | VRRP configuration                                                                  |
| vrrp-state-check               | Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP       |
| wep-shared-key-auth            | Enable support for 802.11 WEP shared key authentication                             |
| zone                           | Configure Zone name                                                                 |
| clrscr                         | Clears the display screen                                                           |
| commit                         | Commit all changes made in this session                                             |
| do                             | Run commands from Exec mode                                                         |
| end                            | End current mode and change to EXEC mode                                            |
| exit                           | End current mode and down to previous mode                                          |
| help                           | Description of the interactive help system                                          |
| revert                         | Revert changes                                                                      |
| service                        | Service Commands                                                                    |
| show                           | Show running system information                                                     |
| write                          | Write running configuration to memory or terminal                                   |

```
<DEVICE>(config-profile-test-NX9500)#
```

## Related Commands

|                 |                                                     |
|-----------------|-----------------------------------------------------|
| <code>no</code> | Removes a profile and its associated configurations |
|-----------------|-----------------------------------------------------|

### Note

For more information on profiles and how to configure profiles, see [PROFILES](#) on page 857.

## *radio-qos-policy*

Configures a radio QoS policy

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

### Parameters

```
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

|                                            |                                                                                                       |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <code>&lt;RADIO-QOS-POLICY-NAME&gt;</code> | Specify the radio QoS policy name. If a policy with the specified name does not exist, it is created. |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#radio-qos-policy test
nx9500-6C8809(config-radio-qos-test)#?
Radio QoS Mode commands:
 accelerated-multicast Configure multicast streams for acceleration
 admission-control Configure admission-control on this radio for one or
 more access categories
 no Negate a command or set its defaults
 smart-aggregation Configure smart aggregation parameters
 wmm Configure 802.11e/Wireless MultiMedia parameters

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-radio-qos-test)#
<exsw1>(config-radio-qos-test)#
```

## Related Commands

|                 |                                      |
|-----------------|--------------------------------------|
| <code>no</code> | Removes an existing Radio QoS policy |
|-----------------|--------------------------------------|

### Note

For more information on radio qos policy, see [RADIO-QOS-POLICY](#).

## *radius-group*

Configures RADIUS user group and enters its configuration mode

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
radius-group <RADIUS-GROUP-NAME>
```

### Parameters

```
radius-group <RADIUS-GROUP-NAME>
```

|                     |                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <RADIUS-GROUP-NAME> | Specify a RADIUS user group name. The name should not exceed 64 characters. If a RADIUS user group with the specified name does not exist, it is created. |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#radius-group testRadiusGr
nx9500-6C8809(config-radius-group-testRadiusGr)#?
Radius user group configuration commands:
 guest Make this group a Guest group
 no Negate a command or set its defaults
 policy Radius group access policy configuration
 rate-limit Set rate limit for group

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-radius-group-testRadiusGr)#
```

## Related Commands

|                 |                                  |
|-----------------|----------------------------------|
| <code>no</code> | Removes an existing RADIUS group |
|-----------------|----------------------------------|

### Note

For more information on RADIUS user group commands, see [RADIUS-POLICY](#).

## *radius-server-policy*

Creates an onboard device RADIUS server policy and enters its configuration mode

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
radius-server-policy <RADIUS-SERVER-POLICY-NAME>
```

### Parameters

```
radius-server-policy <RADIUS-SERVER-POLICY-NAME>
```

|                             |                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| <RADIUS-SERVER-POLICY-NAME> | Specify the RADIUS server policy name. If a policy with the specified name does not exist, it is created. |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#radius-server-policy testRadiusServerPolicy
nx9500-6C8809(config-radius-server-policy-testRadiusServerPolicy)#?
Radius Configuration commands:
 authentication Radius authentication
 bypass Bypass Certificate Revocation List(CRL) check
 chase-referral Enable chasing referrals from LDAP server
 crl-check Enable Certificate Revocation List(CRL) check
 ldap-agent LDAP Agent configuration parameters
 ldap-group-verification Enable LDAP Group Verification setting
 ldap-server LDAP server parameters
 local RADIUS local realm
 nas RADIUS client
 no Negate a command or set its defaults
 proxy RADIUS proxy server
 session-resumption Enable session resumption/fast reauthentication by
 using cached attributes
 termination Enable Eap termination for proxy requests
 use Set setting to use

 clrscr Clears the display screen

 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
```

```
write Write running configuration to memory or terminal
nx9500-6C8809(config-radius-server-policy-testRadiusServerPolicy)#
```

### Related Commands

|    |                                          |
|----|------------------------------------------|
| no | Removes an existing RADIUS server policy |
|----|------------------------------------------|

#### Note

For more information on RADIUS server policy commands, see [RADIUS-POLICY](#).

### *radius-user-pool-policy*

Configures a RADIUS user pool policy and enters its configuration mode

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
radius-user-pool-policy <RADIUS-USER-POOL-NAME>
```

#### Parameters

```
radius-user-pool-policy <RADIUS-USER-POOL-NAME>
```

|                                |                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| <RADIUS-USER-POOL-POLICY-NAME> | Specify the RADIUS user pool policy name. If a policy with the specified name does not exist, it is created. |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#radius-user-pool-policy testRadiusUserPool
nx9500-6C8809(config-radius-user-pool-testRadiusUserPool)#?

## Related Commands

`no` Removes an existing RADIUS user pool policy

### Note

For more information on RADIUS user group commands, see [RADIUS-POLICY](#).

## rename

Renames and existing TLO

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
rename tlo <TLO-NAME> <NEW-TLO-NAME>
```

### Parameters

```
rename tlo <TLO-NAME> <NEW-TLO-NAME>
```

|                                      |                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rename tlo <TLO-NAME> <NEW-TLO-NAME> | Renames an existing TLO object                                                                                                                                                                          |
|                                      | <ul style="list-style-type: none"><li>• &lt;TLO-NAME&gt; - Specify the TLO's name. This is the TLO that is to be renamed.</li><li>• &lt;NEW-TLO-NAME&gt; - Specify the new name for this TLO.</li></ul> |

### Examples

The following example shows the top level objects available for renaming:

### Note

Enter rename and press **Tab** to list top level objects available for renaming.

```
nx9500-6C8809(config)#rename [TAB]
aaa_policy aaa_tacacs_policy
address_range_alias aif_policy
app_policy application
assoc_acl auto_provisioning_policy
bgp_as_path_list bgp_community_list
bgp_extcommunity_list bgp_ip_access_list
bgp_ip_prefix_list bonjour_gw_discovery_policy
bonjour_gw_forwarding_policy bonjour_gw_query_forwarding_policy
bridging_policy captive_portal
centro_policy client_identity
client_identity_group content_cache_policy
content_filter_policy crypto_cmp_policy
database_client_policy database_policy
device_categorization dhcp_server_policy
dhcpv6_server_policy dns_whitelist
dr_route_map encrypted_string_alias
event_system_policy ex3500_ext_ip_acl
ex3500_management_policy ex3500_qos_class_map_policy
```

```

ex3500_qos_policy_map ex3500_std_ip_acl
ex3500_time_range firewall_policy
global_assoc_list guest_management
hashed_string_alias host_alias
ip_acl ip_snmp_acl
--More--
nx9500-6C8809(config)#

```

The following examples first clones the existing IP access list BROADCAST-MULTICAST-CONTROL, and then renames the cloned IP access list:

```

nx9500-6C8809(config)#show context include-factory | include ip access-list
ip access-list BROADCAST-MULTICAST-CONTROL
nx9500-6C8809(config)#
nx9500-6C8809(config)#clone ip_acl BROADCAST-MULTICAST-CONTROL Test_IP_CLONED

ip access-list Test_IP_CLONED
nx9500-6C8809(config)#
nx9500-6C8809(config)#rename Test_IP_CLONED NEW_IP_CLONED
nx9500-6C8809(config)#commit
nx9500-6C8809(config)#show context include-factory | include ip access-list
ip access-list BROADCAST-MULTICAST-CONTROL
ip access-list NEW_IP_CLONED
nx9500-6C8809(config)#

```

## Related Commands

|              |                                                |
|--------------|------------------------------------------------|
| <b>clone</b> | Creates a replica of an existing TLO or device |
|--------------|------------------------------------------------|

## replace

Selects an existing device by its MAC address or hostname and replaces it with a new device having a different MAC address. Internally, a new device is created with the new MAC address. The old device's configuration is copied to the new device, and then removed from the controller's configuration (i.e., the old device's configuration is no longer staged on the controller).

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
replace device [<MAC-ADDRESS>|<HOSTNAME>] <NEW-MAC-ADDRESS>
```

### Parameters

```
replace device [<MAC-ADDRESS>|<HOSTNAME>] <NEW-MAC-ADDRESS>
```

|                                |                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replace-device                 | Replaces an existing device with a new device, such that the old device's configuration is copied on to the new device                                                                                                                                                                                                                                   |
| [<MAC-ADDRESS>]<br><HOSTNAME>] | Identifies the device to replace by its MAC address or hostname <ul style="list-style-type: none"> <li>• &lt;MAC-ADDRESS&gt; - Identifies the device to replace by its MAC address. Specify the device's existing MAC address.</li> <li>• &lt;HOSTNAME&gt; - Identifies the device to replace by its hostname. Specify the device's hostname.</li> </ul> |
| <NEW-MAC-ADDRESS>              | Specifies the new device's MAC address. Both the new and old devices should of the same model type.                                                                                                                                                                                                                                                      |

## Examples

```
rfs4000-882A17(config)#replace device ap7131-4BF364 ?
 AA-BB-CC-DD-EE-FF New device MAC address
rfs4000-882A17(config)#replace device ap7131-4BF364 00-15-0F-BB-98-30
```

The following example shows an existing AP7502 (MAC: DD-AA-BB-88-12-43) configuration staged on a VX9000 controller:

```
VX9000-NOC-DE9D(config-device-DD-AA-BB-88-12-43)#show context
ap7502 DD-AA-BB-88-12-43
 use profile default-ap7502
 use rf-domain default
 hostname ap7502-881243
 interface radiol
 wlan theMOZART bss 1 primary
 interface radio2
 wlan theMOZART bss 1 primary
 interface gel
 switchport mode access
 switchport access vlan 1
 controller host 12.12.12.2
VX9000-NOC-DE9D(config-device-DD-AA-BB-88-12-43)#
```

The following example shows AP7502 (MAC: DD-AA-BB-88-12-43) replaced by another AP7502 having MAC address 11-22-33-44-55-66:

Note that the new AP7502 device has the same configuration as the old AP7502 device. The HOSTNAME remains the same. Consequently, objects that refer to this particular hostname need not be updated. For example, an hostname alias identifying this particular device, and TLOs using this alias, such as IP/MAC ACLs, remain unchanged.

```
VX9000-NOC-DE9D(config)#replace device DD-AA-BB-88-12-43 11-22-33-44-55-66
VX9000-NOC-DE9D(config)#ap7502 11-22-33-44-55-66
VX9000-NOC-DE9D(config-device-11-22-33-44-55-66)#show context
ap7502 11-22-33-44-55-66
 use profile default-ap7502
 use rf-domain default
 hostname ap7502-881243
 interface radiol
 wlan theMOZART bss 1 primary
 interface radio2
 wlan theMOZART bss 1 primary
 interface gel
 switchport mode access
 switchport access vlan 1
 controller host 12.12.12.2
VX9000-NOC-DE9D(config-device-11-22-33-44-55-66)#
```

---

## *rf-domain*

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller. RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller's configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.
- Single-site deployment - The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.
- Multi-site deployment - A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.
- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.
- Manually assigned - Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.
- Automatically assigned - Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point's model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see [AUTO-PROVISIONING-POLICY](#).

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within in a site.
- Assign unique regional or regulatory configurations to devices deployed in different states or countries.
- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
rf-domain {<RF-DOMAIN-NAME>/containing <RF-DOMAIN-NAME>}
```

## Parameters

```
rf-domain {<RF-DOMAIN-NAME>/containing <RF-DOMAIN-NAME>}
```

|                             |                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rf-domain                   | Creates a new RF Domain or enters its configuration context                                                                                                                                                                 |
| <RF-DOMAIN-NAME>            | Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.                                                                  |
| containing <RF-DOMAIN-NAME> | Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name <ul style="list-style-type: none"> <li>• &lt;RF-DOMAIN-NAME&gt; - Specify a sub-string of the RF Domain name.</li> </ul> |

## Examples

```
nx9500-6C8809(config)#rf-domain ecospace
nx9500-6C8809(config-rf-domain-ecospace)#?
RF Domain Mode commands:
 alias Alias
 channel-list Configure channel list to be advertised to wireless
 clients
 contact Configure the contact
 control-vlan VLAN for control traffic on this RF Domain
 controller-managed RF Domain manager for this domain will be an adopting
 controller
 country-code Configure the country of operation
 geo-coordinates Configure geo coordinates for this device
 layout Configure layout
 location Configure the location
 location-server Configuration ExtremeLocation server
 location-tenantid Set ExtremeLocation tenant id
 mac-name Configure MAC address to name mappings
 no Negate a command or set its defaults
 nsight-sensor Enable sensor for Nsight
 override-smarttrf Configured RF Domain level overrides for smart-rf
 override-wlan Configure RF Domain level overrides for wlan
 sensor-server AirDefense sensor server configuration
 stats Configure the stats related setting
 timezone Configure the timezone
 tree-node Configure tree node under which this rf-domain appears
 use Set setting to use

## Related Commands

| Command         | Description                                                  |
|-----------------|--------------------------------------------------------------|
| <code>no</code> | Removes an existing RF Domain. Specify the RF Domain's name. |

## rf-domain-mode-commands

The following table lists the RF Domain configuration mode commands:

Table: RF-Domain Config Mode Commands

| Command                                    | Description                                                                                                                                            |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>alias</code>                         | Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed -string, etc. at the RF Domain level |
| <code>channel-list</code>                  | Configures the channel list advertised by radios                                                                                                       |
| <code>contact</code>                       | Configures network administrator's contact information (needed in case of any problems impacting the RF Domain)                                        |
| <code>control-vlan</code>                  | Configures VLAN for traffic control on a RF Domain                                                                                                     |
| <code>controller-managed</code>            | Configures the adopting controller or service platform as this RF Domain's manager                                                                     |
| <code>country-code</code>                  | Configures the country of operation                                                                                                                    |
| <code>geo-coordinates</code> on page 513   | Configures the longitude and latitude of the RF Domain in order to fix its exact geographical location on a map                                        |
| <code>layout</code>                        | Configures layout information                                                                                                                          |
| <code>location</code>                      | Configures the physical location of an RF Domain                                                                                                       |
| <code>location-server</code> on page 515   | Configures an ExtremeLocation server on the selected RF Domain. This command is supported only on the NX 95XX series service platforms.                |
| <code>location-tenantid</code> on page 516 | Configures the ExtremeLocation Tenant's account number                                                                                                 |
| <code>mac-name</code>                      | Maps MAC addresses to names                                                                                                                            |
| <code>no</code>                            | Negates a command or reverts configured settings to their default                                                                                      |
| <code>override-smart-rf</code>             | Configures RF Domain level overrides for Smart RF                                                                                                      |
| <code>override-wlan</code>                 | Configures RF Domain level overrides for a WLAN                                                                                                        |
| <code>sensor-server</code>                 | Configures an AirDefense sensor server on this RF Domain                                                                                               |
| <code>stats</code>                         | Configures stats related settings on this RF Domain. These settings define how RF Domain statistics are updated.                                       |
| <code>timezone</code>                      | Configures a RF Domain's geographic time zone                                                                                                          |
| <code>tree-node</code>                     | Configures the hierarchical (tree-node) structure under which this RF Domain appears                                                                   |
| <code>use</code>                           | Enables the use of a specified Smart RF and/or WIPS policy with this RF Domain                                                                         |

alias

Configures network, VLAN, host, string, network-service, etc. aliases at the RF Domain level

For information on aliases, see [alias](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
alias hashed-string <HASHED-STRING-ALIAS-NAME> 1 <LINE>
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to
<ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}]
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|
gre|igmp|igmp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|
ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|
igmp|igmp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

### Parameters

```
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
```

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address-range<br><ADDRESS-RANGE-ALIAS-NAME> | Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses. <ul style="list-style-type: none"><li>• &lt;ADDRESS-RANGE-ALIAS-NAME&gt; - Specify the address range alias name.</li></ul> <p><b>Note:</b> Alias name should begin with '\$'.</p>                                                                                                                                                   |
| <STARTING-IP> to<br><ENDING-IP>             | Associates a range of IP addresses with this address range alias <ul style="list-style-type: none"><li>• &lt;STARTING-IP&gt; - Specify the first IP address in the range.</li><li>• to &lt;ENDING-IP&gt; - Specify the last IP address in the range.</li></ul> <p><b>Note:</b> Aliases defined at any given level can be overridden at the next lower level. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.</p> |

```
alias encrypted-string <ENCRYPTED-STRING-ALIAS-NAME> [0|2] <LINE>
```

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>encrypted-string &lt;ENCRYPTED-STRING-ALIAS-NAME&gt;</pre> | <p>Creates an alias for an encrypted string. Use this alias for string configuration values that are encrypted when "password-encryption" is enabled. For example, in the management-policy, use it to define the SNMP community string. For more information, see <a href="#">snmp-server</a>.</p> <ul style="list-style-type: none"> <li>• &lt;ENCRYPTED-STRING-ALIAS-NAME&gt; - Specify the encrypted-string alias name.</li> </ul> <p><b>Note:</b> Alias name should begin with '\$'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <pre>[0/2] &lt;LINE&gt;</pre>                                   | <p>Configures the value associated with the alias name specified in the previous step</p> <ul style="list-style-type: none"> <li>• [0/2] &lt;LINE&gt; - Configures the alias value</li> </ul> <p>Note, if password-encryption is enabled, in the <b>show &gt; running-config</b> output, this clear text is displayed as an encrypted string, as shown below:</p> <pre>nx9500-6C8809(config)#show running-config !..... alias encrypted-string \$enString 2 fABMK2is7UToNiZE3MQXbgAAA AxBOZIysdqsEJwr6AH/Da// ! --More-- nx9500-6C8809</pre> <p>In the above output, the '2' displayed before the encrypted-string alias value indicates that the displayed text is encrypted and not a clear text. However, if password-encryption is disabled the clear text is displayed as is:</p> <pre>nx9500-6C8809(config)#show running-config !..... alias encrypted-string \$enString 0 test11223344 ! --More-- nx9500-6C8809</pre> <p>For more information on enabling password-encryption, see <a href="#">password-encryption</a>.</p> |
