These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.</p> <ul style="list-style-type: none"> <li>• &lt;1-65535&gt; – Optional. Configures a destination port number from 1 - 65535</li> <li>• &lt;WORD&gt; – Optional. Identifies the destination port by the service name provided. For example, the SSH service uses TCP port 22.</li> <li>• bgp – Optional. Configures the default BGP (Border Gateway Protocol) services port (179)</li> <li>• dns – Optional. Configures the default DNS (Domain Name System) services port (53)</li> <li>• ftp – Optional. Configures the default FTP (File Transfer Protocol) control services port (21)</li> <li>• ftp-data – Optional. Configures the default FTP data services port (20)</li> <li>• gopher – Optional. Configures the default gopher services port (70)</li> <li>• https – Optional. Configures the default HTTPS services port (443)</li> <li>• ldap – Optional. Configures the default LDAP (Lightweight Directory Access Protocol) services port (389)</li> </ul> |

- nntp – Optional. Configures the default Newsgroup (NNTP) services port (119)
- ntp – Optional. Configures the default NTP (Network Time Protocol) services port (123)
- POP3 – Optional. Configures the default POP3 (Post Office Protocol) services port (110)
- proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
- sip – Optional. Configures the default SIP (Session Initiation Protocol) services port (5060)
- smtp – Optional. Configures the default SMTP (Simple Mail Transfer Protocol) services port (25)
- sourceport [<1-65535>|<WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports.
  - <1-65535> – Specify the source port from 1 - 65535.
  - <WORD> – Specify the source port range, for example 1-10.
- ssh – Optional. Configures the default SSH services port (22)
- telnet – Optional. Configures the default Telnet services port (23)
- tftp – Optional. Configures the default TFTP (Trivial File Transfer Protocol) services port (69)
- www – Optional. Configures the default HTTP services port (80)

`alias number <NUMBER-ALIAS-NAME> <0-4294967295>`

`alias number <NUMBER-ALIAS-NAME> <0-4294967295>` Creates a new number alias or applies an existing number, identified by the <NUMBER-ALIAS-NAME> keyword

- <NUMBER-ALIAS-NAME> – Specify the number alias name.
  - <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created.

Number aliases map a name to a numeric value. For example, 'alias number \$NUMBER 100'.

- The number alias name is: \$NUMBER
- The value assigned is: 100

The value referenced by alias \$NUMBER, wherever used, is 100.

`alias string <STRING-ALIAS-NAME> <LINE>`

alias vlan $TestVLANAlias 1
--More--
rfs4000-229D58(config)#
```

In the following examples the global aliases '\$kerberos' and '\$TestVLANAlias' are associated with the RF Domain 'test' and overrides applied:

```
rfs4000-229D588(config-rf-domain-test)#alias network-service $kerberos proto tcp
749 750 80
rfs4000-229D58(config-rf-domain-test)#alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
 no country-code
 alias network-service $kerberos proto tcp 749 750 80
 alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#
nx9500-6C8809(config-rf-domain-test)#alias string $test example_company.com
nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
 no country-code
 alias string $test example_company.com
nx9500-6C8809(config-rf-domain-test)#
Example 1:
```

In the following examples, the network-group alias '\$test' is configured to include hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

```
rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to 192.168.4.20
```

Associate this network-group alias '\$test' to the RF Domain 'test' and override the 'host' element of the alias.

```
rfs4000-229D58(config-rf-domain-test)#alias network-group $test host 192.168.10.10
rfs4000-229D58(config-rf-domain-test)#alias network-group $test host 192.168.10.10
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
 no country-code
 alias network-service $kerberos proto tcp 749 750 80
 alias network-group $test host 192.168.10.10
 alias network-group $test network 192.168.2.0/24 192.168.3.0/24
 alias network-group $test address-range 192.168.4.10 to 192.168.4.20
 alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#
```

In the preceding example, the 'host' element of the network-group alias '\$test' has been overridden. But the 'network' and 'address-range' elements have been retained as is.

|--------------------------------------------------------------------------------------------------------|
| <b>no</b> Removes a network, network-group, network-service, VLAN, or string alias from this RF Domain |
|--------------------------------------------------------------------------------------------------------|

#### channel-list

Configures the channel list advertised by the AP radios. This command also enables dynamic update of a channel list.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
channel-list [2.4GHz|5GHz|dynamic]
channel-list dynamic
channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

## Parameters

```
channel-list dynamic
```

|         |                                            |
|---------|--------------------------------------------|
| dynamic | Enables dynamic update of the channel list |
|---------|--------------------------------------------|

```
channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

|                       |                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.4GHz <CHANNEL-LIST> | Configures the channel list advertised by radios operating in the 2.4 GHz band <ul style="list-style-type: none"><li>&lt;CHANNEL-LIST&gt; – Specify the list of channels separated by commas or hyphens.</li></ul> |
| 5GHz <CHANNEL-LIST>   | Configures the channel list advertised by radios operating in the 5.0 GHz mode <ul style="list-style-type: none"><li>&lt;CHANNEL-LIST&gt; – Specify the list of channels separated by commas or hyphens.</li></ul> |

## Examples

```
nx9500-6C8809(config-rf-domain-default)#channel-list 2.4GHz 1-10
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
nx9500-6C8809(config-rf-domain-default)#
```

## Related Commands

|----|--------------------------------------------------------------------------------------------------------------------------------------------------|
| no | Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list. |
|----|--------------------------------------------------------------------------------------------------------------------------------------------------|

## contact

Configures the network administrator's contact details. The network administrator is responsible for addressing problems impacting the network.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
contact <WORD>
```

## Parameters

```
contact <WORD>
```

|                |                                                   |
|----------------|---------------------------------------------------|
| contact <WORD> | Specify contact details, such as name and number. |
|----------------|---------------------------------------------------|

## Examples

```
nx9500-6C8809(config-rf-domain-default)#contact Bob+14082778691
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
contact Bob+14082778691
```

```
no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
nx9500-6C8809(config-rf-domain-default)#
```

#### Related Commands

|           |                                                     |
|-----------|-----------------------------------------------------|
| <b>no</b> | Removes the network administrator's contact details |
|-----------|-----------------------------------------------------|

### control-vlan

Configures the VLAN designated for traffic control in this RF Domain

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

#### Parameters

```
control-vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

|                                           |                                                                                                                                                                         |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| control-vlan [<1-4094> <VLAN-ALIAS-NAME>] | Specify the VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the control VLAN. If using a vlan-alias, ensure that the alias is existing and configured. |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-rf-domain-default)#control-vlan 1
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 no country-code
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
 control-vlan 1
nx9500-6C8809(config-rf-domain-default)#
```

#### Related Commands

|           |                                                                |
|-----------|----------------------------------------------------------------|
| <b>no</b> | Disables the VLAN designated for controlling RF Domain traffic |
|-----------|----------------------------------------------------------------|

### controller-managed

Configures the adopting controller (wireless controller, Access Point, or service platform) as this RF Domain's manager. In other words, the RF Domain is controller managed, and the managing controller is the device managing the RF Domain.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
controller-managed
```

## Parameters

None

## Examples

```
rfs4000-229D58(config-rf-domain-test)#controller-managed
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
 country-code in
controller-managed
 network-alias techPubs host 192.168.13.8
 network-alias techPubs address-range 192.168.13.10 to 192.168.13.15
 service-alias testing index 10 proto 9 destination-port range 21 21
rfs4000-229D58(config-rf-domain-test)#
```

## Related Commands

|                                                                                           |
|-------------------------------------------------------------------------------------------|
| <b>no</b> Removes the adopting controller or service platform as this RF Domain's manager |
|-------------------------------------------------------------------------------------------|

## country-code

Configures a RF Domain's country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
country-code <WORD>
```

## Parameters

```
country-code <WORD>
```

|              |                                                   |
|--------------|---------------------------------------------------|
| country-code | Configures the RF Domain's country of operation   |
| <WORD>       | Specify the two (2) letter ISO-3166 country code. |

## Examples

```
nx9500-6C8809nx9500-6C8809(config-rf-domain-default)#country-code ?
WORD The 2 letter ISO-3166 country code
ae United Arab Emirates
ag Antigua and Barbuda
ai Anguilla
al Albania
an Dutch Antilles
ar Argentina
at Austria
au Australia
ba Bosnia-Herzegovina
bb Barbados
bd Bangladesh
be Belgium
bf Burkina Faso
```

```

 contact Bob+14082778691
 country-code us
 channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
 control-vlan 1
nx9500-6C8809(config-rf-domain-default)#
```

#### Related Commands

|           |                                                                    |
|-----------|--------------------------------------------------------------------|
| <b>no</b> | Removes or resets this RF Domain's configured country of operation |
|-----------|--------------------------------------------------------------------|

#### geo-coordinates

Configures the longitude and latitude of the RF Domain in order to fix its exact geographical location on a map. Use this command to define the geographical area where a common set of device configurations are deployed and managed by this RF Domain policy.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

#### Parameters

```
geo-coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

|                                                               |                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| geo-coordinates<br><-90.0000-90.0000><br><-180.0000-180.0000> | Configures the geo-coordinates of this RF Domain <ul style="list-style-type: none"> <li>• &lt;-90.0000-90.0000&gt; - Specify the latitude from -90.0000 - 90.0000.</li> <li>• -180.0000-180.0000 - Specify the longitude from -180.0000 - 180.0000.</li> </ul> |

|-----------|---------------------------------------------------------------|
| <b>no</b> | Removes or resets this RF Domain's configured geo-coordinates |
|-----------|---------------------------------------------------------------|

#### layout

Configures the RF Domain's layout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
layout [area|description|floor|map-location] {(area/description/floor/map-location)}
layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|
map-location <URL> units [feet|meters]] {(area <AREA-NAME>/description <LINE>/
floor <FLOOR-NAME> {<1-4094>}/map-location <URL> units [feet|meters])}
```

#### Parameters

```
layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|
map-location <URL> units [feet|meters]] {(area <AREA-NAME>/description <LINE>/
floor <FLOOR-NAME> {<1-4094>}/map-location <URL> units [feet|meters])}
```

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|-----------------|----------------------------------------|
| <code>no</code> | Removes the RF Domain's layout details |
|-----------------|----------------------------------------|

#### location

Configures the RF Domain's physical location. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a common set of device configurations are deployed and managed by a RF Domain policy.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
location <WORD>
```

#### Parameters

```
location <WORD>
```

#### location-server

Configures the ExtremeLocation server's IP address or hostname on the selected RF Domain. When configured, the AP 7522, AP 7532, AP 7562, AP 8432 and AP 8533 model access points, within the RF Domain, extract and forward client-location related data to the specified ExtremeLocation server.

ExtremeLocation is a highly scalable indoor locationing platform that gathers location-related analytics, such as visitor trends, peak and off-peak times, dwell time, heat-maps, etc. to enable entrepreneurs deeper visibility at a venue. To enable the location tracking system, the ExtremeLocation server should be up and running and the RF Domain configuration should point to the ExtremeLocation server.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX

#### Syntax

```
location-server 1 ip <EL-SERVER-IP/HOSTNAME> {port <1-65535>}
```

#### Parameters

```
location-server 1 ip <IP/HOSTNAME> {port <1-65535>}
```

#### location-tenantid

Configures the ExtremeLocation Tenant’s account number.

ExtremeLocation Tenants, at the time of registration, are communicated (via, email) an account number uniquely identifying the Tenant. Configure this account number in the RF Domain context. When configured, RF Domain AP reports, pushed to the ExtremeLocation server, include the Tenant’s account number along with the reporting AP’s MAC address. Including the Tenant account number reinforces the Tenant’s identity.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
location-tenantid <WORD>
```

## Parameters

location-tenantid <WORD>

|                          |                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| location-tenantid <WORD> | Configures the ExtremeLocation Tenant's account number <ul style="list-style-type: none"><li>• &lt;WORD&gt; - Specify the account number.</li></ul> |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```

### override-smart-rf

Enables dynamic channel switching for Smart RF radios. This command allows you to configure an override list of channels that Smart RF can use for channel compensations on 2.4 GHz and 5.0 GHz radios.

When a radio fails or is faulty, a Smart RF policy provides automatic recovery by instructing neighboring access points to increase their transmit power to compensate for the coverage loss. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events and can ensure availability of adequate detector coverage.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
override-smartrf channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

### Parameters

```
override-smartrf channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

| <code>no</code> | Removes the override-smartrf list of channels configured for 2.4 GHz and 5.0 GHz radios |
|-----------------|-----------------------------------------------------------------------------------------|

### override-wlan

Configures RF Domain level overrides for a WLAN

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
override-wlan <WLAN-NAME> [shutdown|ssid|template|vlan-pool|wep128|wpa-wpa2-psk]
override-wlan <WLAN-NAME> [shutdown|ssid <SSID>|template <TEMPLATE-NAME>|vlan-pool
<1-4094> {limit <0-8192>}]
override-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]
override-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>]
```

#### Parameters

```
override-wlan <WLAN-NAME> [shutdown|ssid <SSID>|template <TEMPLATE-NAME>|vlan-pool
<1-4094> {limit <0-8192>}]
```

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WLAN-NAME>                         | Configures the WLAN name<br>If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| shutdown                            | Shuts down WLAN operation on all mapped radios                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ssid <SSID>                         | Configures a override SSID associated with this WLAN <ul style="list-style-type: none"> <li>• &lt;SSID&gt; – Specify the SSID (should not exceed 32 characters in length).</li> </ul> <p>Each WLAN provides associated wireless clients with a SSID. This has limitations, because it requires wireless clients to associate with different SSIDs to obtain QoS and security policies. However, a WiNG-managed RF Domain can have WLANs assigned and advertise a single SSID, and yet allow users to inherit different QoS or security policies.</p>                                                                                                                                                                                   |
| template <TEMPLATE-NAME>            | Configures a template name for this RF Domain <ul style="list-style-type: none"> <li>• &lt;TEMPLATE-NAME&gt; – Specify the template name (should not exceed 32 characters in length).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| vlan-pool <1-4094> {limit <0-8192>} | Configures the override VLANs available to this WLAN <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; – Specify the VLAN ID from 1 - 4094.</li> <li>• limit &lt;0-8192&gt; – Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0.</li> </ul> <p>Controllers and service platforms allow the mapping of a WLAN to more than one VLAN. Wireless clients associating with a WLAN are assigned VLANs, from the pool representative of the WLAN, in a way that ensures proper load balancing across VLANs. Clients are tracked per VLAN, and assigned to the least used/loaded VLAN. Client VLAN usage is tracked on a per-WLAN basis. The maximum allowed client limit is 8192 per VLAN.</p> |

```
override-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]
```

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <WLAN-NAME>                  | Configures the WLAN name<br>If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| wpa-wpa2-psk<br><PASSPHRASE> | Overrides a WLAN's existing WPA-WPA2 pre-shared key or passphrase at the RF Domain level. WPA2 is a newer 802.11i standard that provides wireless security that is stronger than WPA (Wi-Fi Protected Access) and WEP. <ul style="list-style-type: none"> <li>• &lt;PASSPHRASE&gt; - Specify a WPA-WPA2 key or passphrase. It is an alphanumeric string of 8 to 64 ASCII characters or 64 HEX characters as the primary string, which both the transmitting and receiving authenticators must share in this new override PSK. The alphanumeric string allows character spaces. The string is converted to a numeric value. This passphrase saves the you the necessity of entering the 256-bit key each time keys are generated.</li> </ul> |

```
override-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>]
```

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <WLAN-NAME>                       | Configures the WLAN name<br>If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.                                                                                                                                                                                                                                                                                                        |
| wep128                            | Overrides a WLAN's existing WEP128 keys at the RF Domain level (not the profile level). WEP128 uses a 104 bit key, which is concatenated with a 24-bit initialization vector (IV) to form the RC4 traffic key. WEP may be all a small-business user needs for the simple encryption of wireless data on the WLAN. However, networks that require more security are at risk from a WEP flaw. WEP is only recommended if there are client devices incapable of using higher forms of security. The existing 802.11 standard alone offers administrators no effective method to update keys. |
| key <1-4> hex [0 <WORD> 2 <WORD>] | Configures the WEP128 key. A total of four keys can be configured. <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Select the key index from 1- 4. <ul style="list-style-type: none"> <li>• hex - Configures a hexadecimal key <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify the WEP128/Keyguard key (should not exceed 26 hexadecimal characters in length).</li> </ul> </li> </ul> </li> </ul>                                                                                                                                                                 |
| transmit-key <1-4>                | Configures transmit WEP/Keyguard key settings <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Transmit the key identified by the key index specified here. Specify the index from 1 - 4.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                |

sensor-server

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems.

WIPS (*Wireless Intrusion Protection System*) protects the controller managed network, wireless clients and Access Point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgement of a threat.

In addition to dedicated AirDefense sensors, an access point radio can function as a sensor and upload information to a dedicated WIPS server (external to the controller). Unique WIPS server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

#### Parameters

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}
```

|                      |                                                                                                                                                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sensor-server <1-3>  | Configures the AirDefense sensor server parameters <ul style="list-style-type: none"> <li>• &lt;1-3&gt; - Select the server ID from 1 - 3. The server with the lowest defined ID is reached first. The default is 1.</li> </ul>                                                                  |
| ip <IP/HOSTNAME>     | Configures the (non DNS) IPv4 address of the sensor server <ul style="list-style-type: none"> <li>• &lt;IP/HOSTNAME&gt; - Specify the sensor server's IPv4 address or hostname.</li> </ul>                                                                                                       |
| port [443 <1-65535>] | Optional. Configures the sensor server port. The options are: <ul style="list-style-type: none"> <li>• 443 - Configures port 443, the default port used by the AirDefense server</li> <li>• &lt;1-6553&gt; - Allows you to select a WIPS/AirDefense sensor server port from 1 - 65535</li> </ul> |

#### Examples

```
nx9500-6C8809(config-rf-domain-default)#sensor-server 2 ip 172.16.10.3 port 443
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
contact Bob+14082778691
country-code us
```

```

sensor-server 2 ip 172.16.10.3
override-smarttrf channel-list 2.4GHz 1,2,3
override-wlan test vlan-pool 2 limit 20
layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
nx9500-6C8809(config-rf-domain-default)#

```

#### stats

Configures settings that define how RF Domain statistics are updated

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```

stats update-interval
stats update-interval [<5-300>|auto]

```

#### Parameters

```

stats update-interval [<5-300>|auto]

```

|-----------|-------------------------------|
| <b>no</b> | Resets stats related settings |
|-----------|-------------------------------|

#### timezone

Configures the RF Domain's geographic time zone. By default all WiNG devices are shipped with the time zone and time format set to UTC (Universal Time Coordinated) and 24-hour clock respectively. If the time zone is not reset, all devices within the RF Domain will display time relative to the UTC - Greenwich Time. Resetting the time zone is recommended, especially for RF Domains deployed across different geographical locations. The time zone can either be set on a specific device or on an RF

Domain. When configured as RF Domain setting, it applies to all devices within the domain. For more information on configuring the time zone on a device, see [timezone](#) on page 1282 (device config mode).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
timezone <TIMEZONE>
```

#### Parameters

```
timezone <TIMEZONE>
```

|                 |                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| time <TIMEZONE> | Specify the RF Domain's time zone. The configured time zone will apply to all devices within the selected RF Domain. |
|-----------------|----------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-rf-domain-default)#timezone America/Los_Angeles
nx9500-6C8809(config-rf-domain-default)#show context
rf-domain default
 contact Bob+14082778691
 timezone America/Los_Angeles
 stats update-interval 200
 country-code us
 sensor-server 2 ip 172.16.10.3
 override-smartrf channel-list 2.4GHz 1,2,3
 override-wlan test vlan-pool 2 limit 20
 layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
nx9500-6C8809(config-rf-domain-default)#
```

Use [TAB] to view the built-in timezones.

```
nx9500-6C8809(config-rf-domain-test)#timezone <TAB>
Africa/ Asia/ Atlantic/ Australia/ CET CST6CDT
EET EST5EDT Etc/ Europe/ MST7MDT Pacific/
PST8PDT US/ America/
nx9500-6C8809(config-rf-domain-test)#
```

Each of these time zones are further differentiated into sub time zones. For example, as shown in the following example:

```
nx9500-6C8809(config-rf-domain-test)#timezone Africa/
Africa/Cairo Africa/Casablanca Africa/Harare
Africa/Johannesburg Africa/Lagos Africa/Nairobi
nx9500-6C8809(config-rf-domain-test)#
```

#### tree-node

Configures the hierarchical (tree-node) structure under which this RF Domain is located

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
tree-node [campus|city|country|region] {(campus|city|country|region)}
```

### Parameters

```
tree-node [campus|city|country|region] {(campus|city|country|region)}
```

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tree-node | Configures the hierarchical tree structure defining the RF Domain's location. The tree node hierarchy can be configured in any order, but will always appear as: country > region > city > campus. Further, a higher node, such as country, cannot be defined under a lower node, such as region. An RF Domain can be placed under any one of the tree nodes. But, an RF Domain at the country level may have all four nodes defined. Whereas, an RF Domain restricted to a campus, cannot have the country, city, and region nodes. At least one of these four nodes must be defined. This feature is disabled by default. |
| campus    | Configures the campus name for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| city      | Configures the city for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| country   | Configures the country for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| region    | Configures the region for this RF Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Usage Guidelines

The following points need to be taken into consideration when creating the tree-node structure:

- Adding a *country* first is a good idea since region, city, and campus can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.
- A *city* and *campus* can be added in the tree structure as sub-nodes under a region. An RF Domain can be mapped anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.
- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.
- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.
- After creating the tree structure do a commit and save for the tree configuration to take effect and persist across reboots.

### Examples

```
rfs4000-229D58(config-rf-domain-test)#tree-node campus EcoSpace City Bangalore
country India region South
rfs4000-229D58(config-rf-domain-test)#
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
country-code in
tree-node country India region South city Bangalore campus EcoSpace
rfs4000-229D58(config-rf-domain-test)#
```

use (rf-domain-config-mode)

Associates the following with an RF Domain: database policy, NSight policy, sensor policy, Smart RF policy, WIPS policy, RTL server policy, and Web filtering license.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
use [database-policy|license|nsight-policy|rtl-server-policy|sensor-policy|
smart-rf-policy|wips-policy]
use [database-policy <DATABASE-POLICY-NAME>|license <WEB-FILTERING-LICENSE>|
nsight-policy <NSIGHT-POLICY-NAME>|rtl-server-policy <RTL-SERVER-POLICY-NAME>|
sensor-policy <SENSOR-POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|
wips-policy <WIPS-POLICY-NAME>]
```

#### Parameters

```
use [database-policy <DATABASE-POLICY-NAME>|license <WEB-FILTERING-LICENSE>|
nsight-policy <NSIGHT-POLICY-NAME>|rtl-server-policy <RTL-SERVER-POLICY-NAME>|
sensor-policy <SENSOR-POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|
wips-policy <WIPS-POLICY-NAME>]
```

| smart-rf-policy<br><SMART-RF-POLICY-NAME> | <p>Associates a Smart RF policy with the selected RF Domain. When associated, the Smart RF policy provides automatic recovery from coverage loss (due to failed or faulty radio) by instructing neighboring access points to increase their transmit power. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events to ensure availability of adequate detector coverage.</p> <ul style="list-style-type: none"> <li>• &lt;SMART-RF-POLICY-NAME&gt; – Specify the Smart RF policy name (should be existing and configured).</li> </ul> |
| wips-policy <WIPS-POLICY-NAME>            | <p>Associates a WIPS policy with the selected RF Domain. A WIPS policy provides protection against wireless threats and acts as a key layer of security complementing wireless VPNs, encryption and authentication. A WIPS policy uses a dedicated sensor for actively detecting and locating rogue AP devices. After detection, WIPS uses mitigation techniques to block the devices by manual termination, air lockdown, or port suppression.</p> <ul style="list-style-type: none"> <li>• &lt;WIPS-POLICY-NAME&gt; – Specify the WIPS policy name (should be existing and configured).</li> </ul>                                                                     |

|----|------------------------------------------|
| no | Resets profiles used with this RF Domain |
|----|------------------------------------------|

### no (rf-domain-config-mode)

Negates a command or reverts configured settings to their default. When used in the RF Domain context, the no command removes the RF Domain settings, or reverts them to default values.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

nx9500-6C8809(config-rf-domain-default)#

```

#### *rfs4000*

Adds an RFS 4000 wireless controller to the network

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
rfs4000 <DEVICE-RFS4000-MAC>
```

## Parameters

rfs4000 <DEVICE-RFS4000-MAC>

|                     |                                     |
|---------------------|-------------------------------------|
| <DEVICE-RFS4000-MAC | Specify the RFS 4000's MAC address. |
|---------------------|-------------------------------------|

## Examples

```
nx9500-6C8809(config)#rfs4000 10-20-30-40-50-60
nx9500-6C8809(config-device-10-20-30-40-50-60)#
```

## Related Commands

|----|----------------------------------------------------------|
| no | Removes an RFS 4000 wireless controller from the network |
|----|----------------------------------------------------------|

### *nx5500*

Adds an integrated NX 5500 series service platform to the network. If a profile for this service platform is not available, a new profile is created.

#### **Supported in the following platforms:**

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

nx5500 <DEVICE-NX5500-MAC>

## Parameters

nx5500 <DEVICE-NX5500-MAC>

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <DEVICE-NX5500-MAC> | Specifies the MAC address of a NX 5500 series service platform. |
|---------------------|-----------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#nx5500 B4-C7-02-3C-FA-6E
nx9500-6C8809(config-device-B4-C7-02-3C-FA-6E)#
```

## Related Commands

|    |                                                            |
|----|------------------------------------------------------------|
| no | Removes a NX 5500 series service platform from the network |
|----|------------------------------------------------------------|

### *nx75xx*

Adds an integrated NX 75XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

#### **Supported in the following platforms:**

- Service Platforms — NX 7500, NX 9500, NX 9510

## Syntax

nx75xx <DEVICE-NX75XX-MAC>

## Parameters

`nx75xx <DEVICE-NX75XX-MAC>`

|                                        |                                                                  |
|----------------------------------------|------------------------------------------------------------------|
| <code>&lt;DEVICE-NX75XX-MAC&gt;</code> | Specifies the MAC address of the NX 75XX series service platform |
|----------------------------------------|------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#nx75xx B4-C9-81-6C-FA-7C
nx9500-6C8809(config-device-B4-C9-81-6C-FA-7C)#show context
nx75xx B4-C9-81-6C-FA-7C
 use profile default-nx75xx

|-----------------|-------------------------------------------------------------|

## *nx9000*

Adds an NX9XXX (NX95XX and NX96XX) series service platform to the network

### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

## Syntax

`nx9000 <DEVICE-NX9XXX-MAC>`

## Parameters

`nx9000 <DEVICE-NX9XXX-MAC>`

|                                        |                                                                |
|----------------------------------------|----------------------------------------------------------------|
| <code>&lt;DEVICE-NX9XXX-MAC&gt;</code> | Specifies the MAC address of a NX9XXX series service platform. |
|----------------------------------------|----------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#nx9000 B4-C7-89-7C-81-08
nx9500-6C8809(config-device-B4-C7-89-7C-81-08)#
```

## Related Commands

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| <code>no</code> | Removes a NX9XXX series service platform from the network |
|-----------------|-----------------------------------------------------------|

### *roaming-assist-policy*

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>
```

#### Parameters

```
roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>
```

|                              |                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------|
| <ROAMING-ASSIST-POLICY-NAME> | Specify the roaming-assist policy name. If the policy does not exist, it is created. |
|------------------------------|--------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#roaming-assist-policy test
nx9500-6C8809(config-roaming-assist-policy-test)#?
```

Roaming Assist Mode commands:

|                                  |                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------|
| <code>action</code>              | Configure action - action is death / log / assisted-roam                           |
| <code>aggressiveness</code>      | Configure the roaming aggressiveness for a wireless client                         |
| <code>detection-threshold</code> | Configure the detection threshold - when exceeded, client monitoring starts        |
| <code>disassoc-time</code>       | Configure the disassociation time - time after which a disassociation is sent      |
| <code>handoff-count</code>       | Configure the handoff count - number of times client can exceed handoff threshold  |
| <code>handoff-threshold</code>   | Configure the handoff threshold - when exceeds an action is taken.                 |
| <code>monitoring-interval</code> | Configure the monitoring interval - interval at which client monitoring occurs     |
| <code>no</code>                  | Negate a command or set its defaults                                               |
| <code>sampling-interval</code>   | Configure the sampling interval - interval at which client rssi values are checked |
| <code>clrscr</code>              | Clears the display screen                                                          |
| <code>commit</code>              | Commit all changes made in this session                                            |
| <code>end</code>                 | End current mode and change to EXEC mode                                           |
| <code>exit</code>                | End current mode and down to previous mode                                         |
| <code>help</code>                | Description of the interactive help system                                         |
| <code>revert</code>              | Revert changes                                                                     |

|-----------------|-------------------------------------------|
| <code>no</code> | Removes an existing roaming-assist-policy |
|-----------------|-------------------------------------------|

### Note

For more information on the Roaming Assist Policy commands, [ROAMING-ASSIST-POLICY](#).

## *role-policy*

Creates a role-based firewall policy and enters its configuration mode

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
role-policy <ROLE-POLICY-NAME>
```

### Parameters

```
role-policy <ROLE-POLICY-NAME>
```

|                                       |                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------|
| <code>&lt;ROLE-POLICY-NAME&gt;</code> | Specify the role policy name. If a policy with the specified name does not exist, it is created. |
|---------------------------------------|--------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#role-policy role1
nx9500-6C8809(config-role-policy-role1)#?
Role Policy Mode commands:
 default-role Configuration for Wireless Clients not matching any role
 ldap-deadperiod Ldap dead period interval
 ldap-query Set the ldap query mode
 ldap-server Add a ldap server
 ldap-timeout Ldap query timeout interval
 no Negate a command or set its defaults
 user-role Create a role

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-role-policy-role1)#
```

## Related Commands

`no` Removes an existing role policy

### Note

For more information on Role Policy commands, see [ROLE-POLICY](#).

## *route-map*

Creates a dynamic BGP (Border Gateway Protocol) route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

### Supported in the following platforms:

- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
route-map <ROUTE-MAP-NAME>
```

### Parameters

```
route-map <ROUTE-MAP-NAME>
```

`route-map <ROUTE-MAP-NAME>` Creates a new BGP route map and enters its configuration mode

### Examples

```
nx9500-6C8809(config)#route-map test
nx9500-6C8809(config-dr-route-map-test)#?
Route Map Mode commands:
deny Add a deny route map rule to deny set operations
no Negate a command or set its defaults
permit Add a permit route map rule to permit set operations

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

nx9500-6C8809(config-dr-route-map-test)#
```

## Related Commands

`no` Removes an existing dynamic BGP route map

### Note

For more information on BGP route maps, see [BORDER GATEWAY PROTOCOL](#) on page 1852.

## *routing-policy*

Creates a routing policy and enters its configuration mode

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
routing-policy <ROUTING-POLICY-NAME>
```

### Parameters

```
routing-policy <ROUTING-POLICY-NAME>
```

|                       |                                                                            |
|-----------------------|----------------------------------------------------------------------------|
| <ROUTING-POLICY-NAME> | Specify the role policy name. If the policy does not exist, it is created. |
|-----------------------|----------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#routing-policy test
nx9500-6C8809(config-routing-policy-test)#?
Routing Policy Mode commands:
 apply-to-local-packets Use Policy Based Routing for packets generated by
 the device
 logging Enable logging for this Route Map
 no Negate a command or set its defaults
 route-map Create a Route Map
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-routing-policy-test)#
```

### Related Commands

|----|------------------------------------|
| no | Removes an existing routing policy |
|----|------------------------------------|

#### Note

For more information on Routing Policy commands, see [ROUTING-POLICY](#).

## *rtl-server-policy*

Creates an RTL server policy and enters its configuration mode. When configured and applied on an access point (AP 7522, AP 7532, AP 8432, AP 8533), this policy enables the sending of RSSI feeds from

the access point to a server. The RTL server policy provides the exact location (URL) of the server. The RSSI feeds sent are as per the sensor-policy configured and applied on the access point. Therefore, ensure that a sensor-policy, with the rssi-interval-duration specified, is existing, configured, and applied on the access points.

To initiate RSSI feed posts to the Euclid locationing server, use the RTL server policy on the:

- AP's device/profile context, or
- AP's RF Domain context.

**Supported in the following platforms:**

- Access Points — AP 7522, AP 7532, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX, NX 96XX VX 9000

**Syntax**

```
rtl-server-policy <RTL-POLICY-NAME>
```

**Parameters**

```
rtl-server-policy <RTL-POLICY-NAME>
```

|                                      |                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;RTL-POLICY-NAME&gt;</code> | Specify the RTL server policy name. If an RTL server policy with the specified name does not exist, it is created. |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------|

```
nx9500-6C8809(config)#rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#?
RTL Server Policy Mode commands:
no Negate a command or set its defaults
url Configure the url to send the real time RSSI feed to

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-rtl-server-policy-test)#
```

|                                                                           |                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no</code>                                                           | Removes an existing RTL server policy                                                                                                                                                                                      |
| <code>use</code> on page 1232 (profile/device configuration mode command) | Documents the 'use' command in a device's profile or device configuration context. Use this option to associate this RTL server policy to an access point's profile or device.                                             |
| <code>use</code> (RF Domain configuration mode command)                   | Documents the 'use' command in the RF Domain configuration context. Use this option to associate this RTL server policy to an RF Domain. When associated, the policy is applied to all access points within the RF Domain. |

**rtl-server-policy-config-commands**

The following table summarizes the RTL server policy configuration mode commands:

**Table 27: RTL Server Policy Config Mode Commands**

| Command                      | Description                                |
|------------------------------|--------------------------------------------|
| <code>url</code> on page 535 | Configures the RTL server's URL            |
| <code>no</code> on page 535  | Removes the RTL server's URL configuration |

url

Configures the RTL server's exact location. This is the URL at which the server can be reached.

Supported in the following platforms:

- Access Points — AP 7522, AP 7532, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX, NX 96XX VX 9000

Syntax

`url <URL>`

Parameters

`url <URL>`

|                              |                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>url &lt;URL&gt;</code> | Configures the RTL server's URL <ul style="list-style-type: none"><li>• <code>&lt;URL&gt;</code> - Specify the URL.</li></ul> |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------|

Examples

```
nx9500-6C8809(config-rtl-server-policy-test)#url https://testrtlserver.com
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
 url https://testrtlserver.com
nx9500-6C8809(config-rtl-server-policy-test)#
```

Related Commands

|                             |                                         |
|-----------------------------|-----------------------------------------|
| <code>no</code> on page 535 | Removes the RTL server's configured URL |
|-----------------------------|-----------------------------------------|

no

Removes the locationing server's URL configuration

Supported in the following platforms:

- Access Points — AP 7522, AP 7532, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX, NX 96XX VX 9000

Syntax

`no <URL>`

Parameters

`no <URL>`

|                             |                              |
|-----------------------------|------------------------------|
| <code>no &lt;URL&gt;</code> | Removes the RTL server's URL |
|-----------------------------|------------------------------|

Examples

The following example displays the RTL server policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
 url https://testrtlserver.com
nx9500-6C8809(config-rtl-server-policy-test)#
nx9500-6C8809(config-rtl-server-policy-test)#no url
```

The following example displays the RTL server policy 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#
```

#### Related Commands

|                             |                                         |
|-----------------------------|-----------------------------------------|
| <code>no</code> on page 535 | Removes the RTL server's configured URL |
|-----------------------------|-----------------------------------------|

### *schedule-policy*

Creates a schedule policy and enters its configuration mode. A schedule policy strategically enforces application filter policy rules during administrator assigned intervals.

#### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
schedule-policy <SCHEDULE-POLICY-NAME>
```

#### Parameters

```
schedule-policy <SCHEDULE-POLICY-NAME>
```

|                                                           |                                                                                                                                    |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>schedule-policy &lt;SCHEDULE-POLICY-NAME&gt;</code> | Specify the Schedule policy name. If the policy does not exist, it is created. The name should not exceed 32 characters in length. |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#?
Schedule Policy Mode commands:
 description Schedule policy description
 no Negate a command or set its defaults
 time-rule Configure a time rule

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-schedule-policy-test)#
```

## Related Commands

|                 |                                     |
|-----------------|-------------------------------------|
| <code>no</code> | Removes an existing schedule policy |
|-----------------|-------------------------------------|

## schedule-policy-config-commands

The following table summarizes schedule-policy configuration mode commands:

**Table 28: Schedule Policy Config Mode Commands**

| Command                              | Description                                                                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>description</code> on page 537 | Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations |
| <code>time-rule</code> on page 537   | Configures a time rule specifying the days and optionally the start and end times                                                  |
| <code>no</code> on page 538          | Removes the selected schedule policy's settings                                                                                    |

### description

Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
description <WORD>
```

#### Parameters

```
description <WORD>
```

|                                       |                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>description &lt;WORD&gt;</code> | Configures this schedule policy's description <ul style="list-style-type: none"><li>• <code>&lt;WORD&gt;</code> - Enter a description not exceeding 80 characters in length. The description should uniquely identify the policy from other policies with similar configuration.</li></ul> |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config-schedule-policy-test)#description "Denies social networking sites on weekdays."
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
nx9500-6C8809(config-schedule-policy-test)#
```

### Related Commands

|                             |                                                        |
|-----------------------------|--------------------------------------------------------|
| <code>no</code> on page 538 | Removes or modifies this schedule policy's description |
|-----------------------------|--------------------------------------------------------|

### time-rule

Configures a time rule specifying the days and optionally the start and end times. When applied to an application-policy rule, the schedule policy defines the enforcement time of the rule. For more information, see [application-policy](#) on page 267.

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

### Parameters

```
time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

|                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time-rule                                                                                  | Configures a time rule in days and hours and minutes<br>A schedule policy can have more than one non-overlapping time-rules. The following time-rules, having overlapping time periods, are invalid: 'weekdays, start-time 9:30 am, end-time 11:30 pm' and 'all, start-time 12:00 am, end-time 12:00 pm'.                                                                                                                                                                                                                                                                                                                                  |
| days [sunday monday  tuesday  wednesday thursday friday  saturday all] weekends  weekdays] | Specifies the days on which the time rule is applicable <ul style="list-style-type: none"><li>• sunday – Applicable on Sundays only</li><li>• monday – Applicable on Mondays only</li><li>• tuesday – Applicable on Tuesdays only</li><li>• wednesday – Applicable on Wednesdays only</li><li>• thursday – Applicable on Thursdays only</li><li>• friday – Applicable on Fridays only</li><li>• saturday – Applicable on Saturdays only</li><li>• weekends – Applicable on weekends only</li><li>• weekdays – Applicable on weekdays only</li><li>• all – Applicable on all days</li></ul>                                                 |
| start-time <HH:MM> [end-time <HH:MM>]                                                      | After specifying the days of enforcement, specify the following: <ul style="list-style-type: none"><li>• start-time – Optional. Specifies the enforcement start time<ul style="list-style-type: none"><li>• &lt;HH:MM&gt; – Specify the start time in hours and minutes in the HH:MM format.</li></ul></li></ul> If no start time is specified, the time rule is enforced, on the specified days, at all time. <ul style="list-style-type: none"><li>• end-time – Specifies the enforcement end time<ul style="list-style-type: none"><li>• &lt;HH:MM&gt; – Specify the time in hours and minutes in the HH:MM format.</li></ul></li></ul> |

### Examples

```
nx9500-6C8809(config-schedule-policy-test)#time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
 time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#
```

### Related Commands

|                |                                                |
|----------------|------------------------------------------------|
| no on page 538 | Removes the time-rule from the schedule policy |
|----------------|------------------------------------------------|

no

Removes the selected schedule policy's settings

Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
no [description|time-rule]
no description
no time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|
all|weekends|weekdays]
```

#### Parameters

```
no <PARAMETERS>
```

|                 |                                                                       |
|-----------------|-----------------------------------------------------------------------|
| no <PARAMETERS> | Removes the schedule policy's settings based on the parameters passed |
|-----------------|-----------------------------------------------------------------------|

#### Examples

The following example displays the schedule policy 'test' settings before the 'no' commands have been executed:

```
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
 description "Denies social networking sites on weekdays."
 time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#
```

The following example displays the schedule policy 'test' settings after the 'no' commands have been executed:

```
nx9500-6C8809(config-schedule-policy-test)#no description
nx9500-6C8809(config-schedule-policy-test)#no time-rule days weekdays
nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#
```

#### *self*

Invokes the logged device's configuration context

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
self
```

#### Parameters

None

## Examples

```
nx9500-6C8809(config)#self
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

### *sensor-policy*

Creates a sensor policy and enters its configuration mode.

Access point radios, functioning as sensors, along with AirDefense WIPS servers protect networks from attacks and unauthorized access. These access point sensors scan legal channels and (based on a WIPS policy settings) identify events potential threats to the managed network. These events are reported to the AirDefense WIPS server, which determines the action taken.

In addition to WIPS support, sensor functionality has now been added for the Extreme Network's locationing system. The ExtremeLocation system for Wi-Fi locationing includes WiNG controllers, and access points functioning as sensors. Within the Locationing architecture, sensors scan for RSSI data on an administrator-defined interval and send to a dedicated ExtremeLocation Server resource, as opposed to an ADSP server. The ExtremeLocation Server collects the RSSI data from WiNG sensor devices, and calculates the location of Wi-Fi devices for ExtremeLocation administrators.

Use this command to configure a policy defining the mode of scanning, the channels to scan (in case scan-mode is set to custom-scan), and the RSSI interval. For the sensor policy to take effect, use the policy either in the access point's RF Domain context or in the access point's device context.

#### Note

If a dedicated sensor is utilized with WIPS for rogue detection, any sensor policy used is discarded and not utilized by the sensor. To avoid this situation, use ADSP channel settings exclusively to configure the sensor and not the WiNG interface.

### Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
sensor-policy <SENSOR-POLICY-NAME>
```

### Parameters

```
sensor-policy <SENSOR-POLICY-NAME>
```

|                      |                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <SENSOR-POLICY-NAME> | Specify the Sensor policy name. If a sensor policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length. No character spaces are permitted within the name. Define a name unique to the policy's channel and scan mode configuration to help differentiate it from other policies. |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#sensor-policy test
nx9500-6C8809(config-sensor-policy-test)#?
Sensor Policy Mode commands:
 custom-scan Channel configuration in Custom Scan channels
 no Negate a command or set its defaults
 rssi-interval-duration Configure the periodicity of sending RSSI info from
 sensor to server
 scan-mode Configure the Scan mode
```

```

clearscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

```

```
nx9500-6C8809(config-sensor-policy-test)#
```

## Related Commands

## sensor-policy-config-commands

The following table summarizes sensor-policy configuration mode commands:

**Table 29: Sensor Policy Config Mode Commands**

| Command                                        | Description                                                                                                                                            |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>custom-scan</code> on page 541           | Configures the channel scanning settings when the scan-mode is set to custom-scan                                                                      |
| <code>rss-interval-duration</code> on page 542 | Configures the interval at which dedicated sensors scan channels for RSSI assessments and send the collected data to a specified MPact server resource |
| <code>scan-mode</code> on page 543             | Configures the mode of scanning used by dedicated sensors (access point radios)                                                                        |
| <code>no</code> on page 544                    | Removes or reverts to default a sensor policy's settings                                                                                               |

### custom-scan

Configures the channel scanning settings when the scan-mode is set to custom-scan

#### Note

If the mode of scanning is set to Custom-Scan, use this command to configure the channels to be scanned. To set the mode of scanning to custom-scan, use the `scan-mode > Custom-Scan` command. For more information, see [scan-mode](#) on page 543.

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
custom-scan channel-frequency <CHANNEL-FREQUENCY> width
[20MHz | 40MHz-Bth | 40MHz-Lower | 40MHz-Upper | 80MHz] scan-weight <SCAN-WEIGHT>
```

#### Parameters

```
custom-scan channel-frequency <CHANNEL-FREQUENCY> width
[20MHz | 40MHz-Bth | 40MHz-Lower | 40MHz-Upper | 80MHz] scan-weight <SCAN-WEIGHT>
```

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| custom-scan                                                | Configures the custom-scan channel frequency, channel width, and scan weight                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| channel-frequency <CHANNEL-FREQUENCY>                      | Configures the channel frequency. A list of unique channels in the 2.4, 4.9, 5 and 6 GHz band can be collectively or individually enabled for customized channel scans and RSSI reporting. <ul style="list-style-type: none"> <li>• &lt;CHANNEL-FREQUENCY&gt; – Specify a single or multiple, ‘comma-separated’ channel frequencies.</li> </ul>                                                                                                                                                                                                                                         |
| width [20MHz  40MHz-Both  40MHz-Lower  40MHz-Upper  80MHz] | Configures the channel width. When custom channels are selected for RSSI scans, each selected channel can have its own width defined. Numerous channels have their width fixed at 20MHz, 802.11a radios support 20 and 40 MHz channel widths. <ul style="list-style-type: none"> <li>• 20MHz – Sets the channel width as 20 Mhz</li> <li>• 40Mhz-Both – Sets the channel width as 40Mhz-Both</li> <li>• 40Mhz-Lowe – Sets the channel width as 40Mhz-Lower</li> <li>• 40Mhz-Upper – Sets the channel width as 40Mhz-Upper</li> <li>• 80Mhz – Sets the channel width as 80Mhz</li> </ul> |
| scan-weight <SCAN-WEIGHT>                                  | Configures the scan-weight (scanning duration) for each of the selected channels. Each selected channel can have its weight prioritized in respect to the amount of time a scan is permitted within the defined RSSI scan interval. <ul style="list-style-type: none"> <li>• &lt;SCAN-WEIGHT&gt; – Specify the scan weightage given to each selected channel.</li> </ul>                                                                                                                                                                                                                |

### Examples

```

nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2412 width 20MHz
scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2417 width 20MHz
scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#

```

|----------------|-----------------------------------------------------------------------------------------------|
| no on page 544 | Removes channels from the channels-to-scan list in case of scan-mode being set to Custom-Scan |
|----------------|-----------------------------------------------------------------------------------------------|

### rssi-interval-duration

Configures the interval, in seconds, at which dedicated sensors scan channels for RSSI assessments and send the RSSI data obtained to a specified server resource

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
rssi-interval-duration <1-60>
```

#### Parameters

```
rssi-interval-duration <1-60>
```

## scan-mode

Configures the mode of scanning used by dedicated sensors (access point radios)

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```

scan-mode [Channel-Lock|Custom-Scan|Default-Scan]
scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>
scan-mode [Custom-Scan|Default-Scan]

```

### Parameters

```

scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>

```

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>scan-mode</code>                                          | Configures the mode of scanning used by the sensors to scan system-defined or user-defined channels for RSSI assessments. The options are: Channel-Lock, Custom-Scan, and Default-Scan.                                                                                                                                                                                                                                         |
| <code>Channel-Lock lock-frequency &lt;LOCK-FREQUENCY&gt;</code> | Configures the mode of scanning as Channel-Lock <ul style="list-style-type: none"> <li><code>lock-frequency &lt;LOCK-FREQUENCY&gt;</code> – Locks scanning for RSSI data to one specific channel identified by the <code>&lt;LOCK-FREQUENCY&gt;</code> parameter.</li> <li><code>&lt;LOCK-FREQUENCY&gt;</code> – Specify the channel frequency in MHz. When specified, the sensor scans only this specified channel.</li> </ul> |

```

scan-mode [Custom-Scan|Default-Scan]

```

|              |                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scan-mode    | Configures the mode of scanning used by the sensor. The options are: channel-lock, custom-scan, and default-scan.                                                                                                                                                                                                           |
| Custom-Scan  | Configures the mode of scanning as Custom-Scan<br>Select this option to restrict scanning to user-defined channels. If selecting this option, use the custom-scan > channel-frequency command to configure the channels scanned by the dedicated sensor. For more information, see <a href="#">custom-scan</a> on page 541. |
| Default-Scan | Configures the mode of scanning as Default-Scan. This is the default setting. By default the system has a fixed, built-in list of channels that are scanned. These channels are hard coded in a spread pattern of 1, 6, 11, 36, 40, 44, and 48. When selected, the dedicated sensor scans only these default channels.      |

### Examples

```

nx9500-6C8809(config-sensor-policy-test)#scan-mode Custom-Scan
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#

```

### Related Commands

|                                |                                                 |
|--------------------------------|-------------------------------------------------|
| <a href="#">no</a> on page 544 | Reverts the scan-mode to default (Default-Scan) |
|--------------------------------|-------------------------------------------------|

no

Removes or reverts to default a sensor policy's settings

Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```

no [custom-scan|rssi-interval-duration|scan-mode]
no custom-scan channel-frequency <CHANNEL-FREQUENCY-LIST>
no rssi-interval-duration
no scan-mode

```

### Parameters

no <PARAMETERS>

|                 |                                                                                       |
|-----------------|---------------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes or reverts to default a sensor policy settings based on the parameters passed |
|-----------------|---------------------------------------------------------------------------------------|

### Examples

The following example shows the sensor-policy 'test' settings before the 'no' commands are executed:

```

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Custom-Scan
 custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
 custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#

```

The scan-mode is reverted back to the default setting of 'Default-Scan', as show in the following output:

```
nx9500-6C8809(config-sensor-policy-test)#no scan-mode
nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2412
nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2417
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
 rssi-interval-duration 30
 scan-mode Default-Scan
nx9500-6C8809(config-sensor-policy-test)#
```

### smart-rf-policy

Configures a Smart RF policy and enters its configuration mode

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

#### Parameters

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

|                        |                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------|
| <SMART-RF-POLICY-NAME> | Specify the Smart RF policy name. If a policy with the specified name does not exist, it is created. |
|------------------------|------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config)#smart-rf-policy test
nx9500-6C8809(config-smart-rf-policy-test)#?
Smart RF Mode commands:
 area Specify channel list/ power for an area
 assignable-power Specify the assignable power during power-assignment
 avoidance-time Time to avoid a channel once dfs/adaptivity
 avoidance is necessary
 channel-list Select channel list for smart-rf
 channel-width Select channel width for smart-rf
 coverage-hole-recovery Recover from coverage hole
 enable Enable this smart-rf policy
 group-by Configure grouping parameters
 interference-recovery Recover issues due to excessive noise and
 interference
 neighbor-recovery Recover issues due to faulty neighbor radios
 no Negate a command or set its defaults
 sensitivity Configure smart-rf sensitivity (Modifies various
 other smart-rf configuration items)
 smart-ocs-monitoring Smart off channel scanning

```

```
show Show running system information
write Write running configuration to memory or term
```

```
nx9500-6C8809(config-smart-rf-policy-test)#
```

### Related Commands

|                 |                                     |
|-----------------|-------------------------------------|
| <code>no</code> | Removes an existing Smart RF policy |
|-----------------|-------------------------------------|

#### Note

For more information on Smart RF policy commands, see [SMART-RF-POLICY](#).

`t5`

Invokes the configuration mode of a t5 wireless controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices.

#### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
t5 <T5-DEVICE-MAC>
```

#### Parameters

```
t5 <T5-DEVICE-MAC>
```

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>t5 &lt;T5-DEVICE-MAC&gt;</code> | <p>Specify the t5 device's MAC address. The system enters the identified device's configuration mode.</p> <p>A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs (Customer Premises Equipments) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL (Digital Subscriber Line) as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.</p> <p>After logging on to the T5 device, use the 'cpe' keyword and configure the following mandatory settings:</p> <ul style="list-style-type: none"><li>• <code>vlan</code> - Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices.</li><li>• <code>start ip</code> - Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices.</li><li>• <code>end ip</code> - Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.</li></ul> |

### *web-filter-policy*

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, hierarchically managed (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable, etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see [url-filter](#) on page 623.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
web-filter-policy <WEB-FILTER-POLICY-NAME>
```

## Parameters

```
web-filter-policy <WEB-FILTER-POLICY-NAME>
```

|                          |                                                                                  |
|--------------------------|----------------------------------------------------------------------------------|
| <WEB-FILTER-POLICY-NAME> | Specify the Web filter policy name. If the policy does not exist, it is created. |
|--------------------------|----------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#web-filter-policy test
nx9500-6C8809(config-web-filter-policy-test)#?
Content Filter Mode commands:
 cache-max-recs Configure the maximum number of records in local cache
 cache-save-interval Configure the time a record is saved in local cache
 logging Select logging method
 no Negate a command or set its defaults
 server-host Configure URL classification server if it is not the
 adopted controller
 server-unreachable Permission to access website when classification server
 is unreachable (default is pass)
 uncategorized-url Permission to website when server fails to classify the
 URL request (default is pass)

## web-filter-config-commands

The following table summarizes Web Filter policy configuration mode commands:

**Table 30: Web Filter Config Mode Commands**

| Command                         | Description                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| cache-max-recs on page 549      | Configures the maximum number of records (URLs and Web pages) cached in the local database                                    |
| cache-save-interval on page 549 | Configures the maximum time period for which a record (URL and Web page classification entry) is cached in the local database |
| logging on page 550             | Configures the method used to log Web filtering events                                                                        |
| server-host on page 550         | Configures the URL classification server in case it is not the adopted controller                                             |

**Table 30: Web Filter Config Mode Commands (continued)**

| Command                                     | Description                                                                                   |
|---------------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>server-unreachable</code> on page 551 | Configures the action taken in case the classification server is unreachable                  |
| <code>uncategorized-url</code> on page 552  | Configures the action taken in case the classification server fails to classify a URL/Website |
| <code>no</code> on page 553                 | Reverts the selected Web Filter policy settings to default                                    |

### cache-max-recs

Configures the maximum number of records (URL and Web page classification entries) cached in the local database

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
cache-max-recs <1-1000000>
```

#### Parameters

```
cache-max-recs <1-1000000>
```

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>cache-max-recs &lt;1-1000000&gt;</code> | Specify the maximum number of records cached in the local database from 1 - 1000000.<br>When configuring this value take into consideration the type of device using the Web Filter policy. The value should approximately be as per the following information: <ul style="list-style-type: none"> <li>• NX95XX - &lt;1-1000000&gt; (default is 100000)</li> <li>• NX75XX - &lt;1-100000&gt; (default is 10000)</li> <li>• RFS Switches - &lt;1-10000&gt; (default is 1000)</li> <li>• Access Points - &lt;1-1500&gt; (default is 500)</li> </ul> |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-web-filter-policy-test)#cache-max-recs 9000
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
nx9500-6C8809(config-web-filter-policy-test)#
```

#### Related Commands

|                             |                                                                                                                                            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no</code> on page 553 | Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types. |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|

### cache-save-interval

Configures the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
cache-save-interval <1-86400>
```

#### Parameters

```
cache-save-interval <1-86400>
```

|                               |                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| cache-save-interval <1-86400> | Specify the maximum time period, in seconds, for which a record is cached in the local database from 1 - 86400 seconds. The default is 60 seconds. |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-web-filter-policy-test)#cache-save-interval 1000
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
nx9500-6C8809(config-web-filter-policy-test)#
```

#### Related Commands

|                       |                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>no</b> on page 553 | Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60) |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|

## logging

Configures the method used to log Web filtering events

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
logging [logfile|syslog]
```

#### Parameters

```
logging [logfile|syslog]
```

|                          |                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging [logfile syslog] | Selects the method used to log Web filtering events. The options are: <ul style="list-style-type: none"><li>• logfile - Logs to a file.</li><li>• syslog - Logs to the syslog server. This is the default setting.</li></ul> |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-web-filter-policy-test)#logging logfile
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 logging logfile
nx9500-6C8809(config-web-filter-policy-test)#
```

## server-host

Configures the URL classification server in case it is not the adopted controller

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]
```

#### Parameters

```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]
```

|                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server-host [host-name <SERVER-HOST-NAME> ip-address <SERVER-IPv4> mint-id <SERVER-MiNT-ID>] | Use one of the following options to identify the URL classification server: <ul style="list-style-type: none"><li>• host-name &lt;SERVER-HOST-NAME&gt; - Identifies the classification server by its hostname.</li><li>• ip-address &lt;SERVER-IPv4&gt; - Identifies the classification server by its IP address.</li><li>• mint-id &lt;SERVER-MiNT-ID&gt; - Identifies the classification server by its MiNT ID.</li></ul> |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```
nx9500-6C8809(config-web-filter-policy-test)#server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

#### Related Commands

|                                |                                                                                                       |
|--------------------------------|-------------------------------------------------------------------------------------------------------|
| <a href="#">no</a> on page 553 | Removes the URL classification server's configured details, such as hostname, ip-address, or MiNT ID. |
|--------------------------------|-------------------------------------------------------------------------------------------------------|

### server-unreachable

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user's request for a URL/Website is either blocked or passed.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
server-unreachable [block|pass]
```

#### Parameters

```
server-unreachable [block|pass]
```

|                                    |                                                                                                                                                                                                                                                                                                |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server-unreachable<br>[block pass] | Configures the action taken in case the classification server is unreachable. The options are: <ul style="list-style-type: none"> <li>• block - Denies access to the requested URL/Website</li> <li>• pass - Allows access to the requested URL/Website. This is the default value.</li> </ul> |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```

nx9500-6C8809(config-web-filter-policy-test)#server-unreachable block
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#

```

### Related Commands

|                |                                                                                             |
|----------------|---------------------------------------------------------------------------------------------|
| no on page 553 | Reverts the action taken in case the classification server is unreachable to default (pass) |
|----------------|---------------------------------------------------------------------------------------------|

## uncategorized-url

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured the an end user's request for a non-classified URL/Website is either blocked or passed.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
uncategorized-url [block|pass]
```

### Parameters

```
uncategorized-url [block|pass]
```

|                                |                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uncategorized-url [block pass] | Configures the action taken in case the classification server fails to classify a URL/Website. The options are: <ul style="list-style-type: none"> <li>• block - Denies access to the requested non-classified URL/Website</li> <li>• pass - Allows access to the requested non-classified URL/Website. This is the default value.</li> </ul> |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```

nx9500-6C8809(config-web-filter-policy-test)#uncategorized-url block
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 uncategorized-url block
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#

```

### Related Commands

no on page 553

no

Reverts the selected Web Filter policy settings to default, based on the parameters passed

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
no [cache-max-recs|cache-save-interval|server-host|server-unreachable|uncategorized-url]
```

Parameters

```
no <PARAMETERS>
```

|                 |                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | Reverts the selected Web Filter policy settings to default, based on the parameters passed. Specify the parameters to revert back to default value. |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

Examples

The following example shows the Web Filter policy 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-max-recs 9000
 cache-save-interval 1000
 uncategorized-url block
 server-unreachable block
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
nx9500-6C8809(config-web-filter-policy-test)#no cache-max-recs
nx9500-6C8809(config-web-filter-policy-test)#no server-unreachable
nx9500-6C8809(config-web-filter-policy-test)#no uncategorized-url
```

The following example shows the Web Filter policy 'test' settings after the 'no' command has been executed:

```
nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
 cache-save-interval 1000
 server-host ip-address 192.168.13.13
nx9500-6C8809(config-web-filter-policy-test)#
```

*wips-policy*

Configures a WIPS policy and enters its configuration mode

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
wips-policy <WIPS-POLICY-NAME>
```

## Parameters

```
wips-policy <WIPS-POLICY-NAME>
```

<WIPS-POLICY-NAME> Specify the WIPS policy name. If A policy with the specified name does not exist, it is created.

## Examples

```
nx9500-6C8809(config)#wips-policy test
nx9500-6C8809(config-wips-policy-test)#?
Wips Policy Mode commands:
 ap-detection Rogue AP detection
 enable Enable this wips policy
 event Configure an event
 history-throttle-duration Configure the duration for which event duplicates
 are not stored in history
 interference-event Specify events which will contribute to smart-rf
 wifi interference calculations
 no Negate a command or set its defaults
 signature Signature to configure
 use Set setting to use

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-wips-policy-test)#
```

## Related Commands

**no** Removes an existing WIPS policy

### Note

For more information on WIPS Policy commands, see [WIPS-POLICY](#).

## wlan

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN's settings.

A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or OFDM (Orthogonal Frequency Division Multiplexing) modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected Access Point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each Access Point. A WLAN can be advertised from a single Access Point radio or can span multiple Access Points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHz radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHz and 5.0 GHz radios at the branch site to provide complete coverage.

The maximum number of WLANs supported by different devices is as follows:

- RFS 4000 controllers support a maximum of 32 WLANs. An Access Point supports a maximum of 16 WLANs.
- NX9XXX series service platforms – 1000 WLANs
- Access Points – 16 WLANs

**Supported in the following platforms:**

- Access Points – AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers – RFS 4000
- Service Platforms – NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

```
wlan {<WLAN-NAME>|containing <WLAN-NAME>}
```

**Parameters**

```
wlan {<WLAN-NAME>|containing <WLAN-NAME>}
```

|                        |                                                                                                                                                                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wlan <WLAN-NAME>       | Configures a new WLAN <ul style="list-style-type: none"> <li>• &lt;WLAN-NAME&gt; - Optional. Specify the WLAN name.</li> </ul> <p><b>Note:</b> The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing etc.).The name cannot exceed 32 characters.</p> |
| containing <WLAN-NAME> | Optional. Configures an existing WLAN's settings <ul style="list-style-type: none"> <li>• &lt;WLAN-NAME&gt; – Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN. This option allows you to select and enter the configuration mode of one or more WLANs.</li> </ul>             |

**Examples**

```
nx9500-6C8809(config)#wlan wlan1
nx9500-6C8809(config-wlan-wlan1)#?
```

Wireless LAN Mode commands:

```
accounting
```

Configure how accounting records are created for this wlan

```
acl
```

Actions taken based on ACL

|                                       |                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------|
|                                       | configuration [ packet drop being one of them]                                     |
| answer-broadcast-probes               | Include this wlan when responding to probe requests that do not specify an SSID    |
| assoc-response                        | Association response threshold                                                     |
| association-list                      | Configure the association list for the wlan                                        |
| authentication-type                   | The authentication type of this WLAN                                               |
| bridging-mode                         | Configure how packets to/from this wlan are bridged                                |
| broadcast-dhcp                        | Configure broadcast DHCP packet handling                                           |
| broadcast-ssid                        | Advertise the SSID of the WLAN in beacons                                          |
| captive-portal-enforcement            | Enable captive-portal enforcement on the wlan                                      |
| client-access                         | Enable client-access (normal data operations) on this wlan                         |
| client-client-communication           | Allow switching of frames from one wireless client to another on this wlan         |
| client-load-balancing                 | Configure load balancing of clients on this wlan                                   |
| controller-assisted-mobility          | Enable controller assisted mobility to determine wireless clients' VLAN assignment |
| data-rates                            | Specify the 802.11 rates to be supported on this wlan                              |
| description                           | Configure a description of the usage of this wlan                                  |
| downstream-group-addressed-forwarding | Enable downstream group addressed forwarding of packets                            |
| dpi                                   | Deep-Packet-Inspection (Application Assurance)                                     |
| dynamic-vlan-assignment               | Dynamic VLAN assignment configuration                                              |
| eap-types                             | Configure client access based on eap-type used for authentication                  |
| encryption-type                       | Configure the encryption to use on this wlan                                       |
| enforce-dhcp                          | Drop packets from Wireless Clients with static IP address                          |
| fast-bss-transition                   | Configure support for 802.11r Fast BSS Transition                                  |
| http-analyze                          | Enable HTTP URL analysis on the wlan                                               |
| ip                                    | Internet Protocol (IP)                                                             |
| ipv6                                  | Internet Protocol version 6 (IPv6)                                                 |
| kerberos                              | Configure kerberos authentication parameters                                       |
| mac-authentication                    | Configure mac-authentication related parameters                                    |
| no                                    | Negate a command or set its defaults                                               |
| nsight                                | Nsight Server                                                                      |
| opendns                               | OpenDNS related config for this wlan                                               |
| protected-mgmt-frames                 | Protected Management Frames (IEEE 802.11w) related configuration                   |
| proxy-arp-mode                        | Configure handling of ARP requests with proxy-arp is enabled                       |
| proxy-nd-mode                         | Configure handling of IPv6 ND requests with proxy-nd is enabled                    |
| qos-map                               | Support the 802.11u QoS map element and frame                                      |
| radio-resource-measurement            | Configure support for 802.11k Radio Resource Measurement                           |

|                     |                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| radius              | Configure RADIUS related parameters                                                                                         |
| registration        | Enable dynamic registration of device (or) user                                                                             |
| relay-agent         | Configure dhcp relay agent info                                                                                             |
| shutdown            | Shutdown this wlan                                                                                                          |
| ssid                | Configure the Service Set Identifier for this WLAN                                                                          |
| t5-client-isolation | Isolate traffic among clients                                                                                               |
| t5-security         | Configure encryption and authentication                                                                                     |
| time-based-access   | Configure client access based on time                                                                                       |
| use                 | Set setting to use                                                                                                          |
| vlan                | Configure the vlan where traffic from this wlan is mapped                                                                   |
| vlan-pool-member    | Add a member vlan to the pool of vlans for the wlan (Note: configuration of a vlan-pool overrides the 'vlan' configuration) |
| wep128              | Configure WEP128 parameters                                                                                                 |
| wep64               | Configure WEP64 parameters                                                                                                  |
| wing-extensions     | Enable support for WiNG-Specific extensions to 802.11                                                                       |
| wireless-client     | Configure wireless-client specific parameters                                                                               |
| wpa-wpa2            | Modify tkip-ccmp (wpa/wpa2) related parameters                                                                              |
| clrscr              | Clears the display screen                                                                                                   |
| commit              | Commit all changes made in this session                                                                                     |
| do                  | Run commands from Exec mode                                                                                                 |
| end                 | End current mode and change to EXEC mode                                                                                    |
| exit                | End current mode and down to previous mode                                                                                  |
| help                | Description of the interactive help system                                                                                  |
| revert              | Revert changes                                                                                                              |
| service             | Service Commands                                                                                                            |
| show                | Show running system information                                                                                             |
| write               | Write running configuration to memory or terminal                                                                           |

```
nx9500-6C8809(config-wlan-wlan1)#
```

The following example shows how to use the 'containing' keyword to enter the configuration mode of an existing WLAN:

```
nx9500-6C8809(config)#wlan containing wlan1
nx9500-6C8809(config-wlan-{'containing': 'wlan1'})#
```

### Related Commands

|           |                                          |
|-----------|------------------------------------------|
| <b>no</b> | Removes an existing WLAN from the system |
|-----------|------------------------------------------|

### wlan-config-mode-commands

This section documents the WLAN configuration mode commands in detail.

Use the (config) instance to configure WLAN related parameters.

To navigate to this instance, use the following command:

```
<DEVICE> (config)#wlan <WLAN-NAME>
```

The following table lists the WLAN configuration mode commands:

Table: WLAN Config Mode Commands

| Command                                               | Description                                                                                                                                           |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">accounting</a>                            | Defines a WLAN's accounting settings                                                                                                                  |
| <a href="#">acl</a>                                   | Defines the actions based on an ACL rule configuration                                                                                                |
| <a href="#">answer-broadcast-probes</a>               | Allows a WLAN to respond to probes for broadcast ESS                                                                                                  |
| <a href="#">assoc-response</a> on page 562            | Configures a minimum RSSI (receive signal strength indication) value, below which the WLAN does not send a response to a client's association request |
| <a href="#">association-list</a>                      | Attaches an existing global association list to a WLAN                                                                                                |
| <a href="#">authentication-type</a>                   | Sets a WLAN's authentication type                                                                                                                     |
| <a href="#">bridging-mode</a>                         | Configures how packets are bridged to/from this WLAN                                                                                                  |
| <a href="#">broadcast-dhcp</a>                        | Configures broadcast DHCP packet handling                                                                                                             |
| <a href="#">broadcast-ssid</a>                        | Advertises a WLAN's SSID in beacons                                                                                                                   |
| <a href="#">captive-portal-enforcement</a>            | Configures a WLAN's captive portal enforcement                                                                                                        |
| <a href="#">client-access</a>                         | Enables WLAN client access (normal data operations)                                                                                                   |
| <a href="#">client-client-communication</a>           | Allows the switching of frames from one wireless client to another on a WLAN                                                                          |
| <a href="#">client-load-balancing</a>                 | Enables load balancing of WLAN clients                                                                                                                |
| <a href="#">controller-assisted-mobility</a>          | Enables controller assisted mobility to determine wireless clients' VLAN assignment                                                                   |
| <a href="#">data-rates</a>                            | Specifies the 802.11 rates supported on the WLAN                                                                                                      |
| <a href="#">description</a>                           | Sets a WLAN's description                                                                                                                             |
| <a href="#">downstream-group-addressed-forwarding</a> | Enables forwarding of downstream packets addressed to a group                                                                                         |
| <a href="#">dynamic-vlan-assignment</a>               | Configures dynamic VLAN assignment on this WLAN                                                                                                       |
| <a href="#">eap-types</a>                             | Configures client access based on eap-type used for authentication                                                                                    |
| <a href="#">encryption-type</a>                       | Sets a WLAN's encryption type                                                                                                                         |
| <a href="#">enforce-dhcp</a>                          | Drops packets from clients with a static IP address                                                                                                   |
| <a href="#">fast-bss-transition</a>                   | Configures support for 802.11r fast BSS transition on a WLAN                                                                                          |
| <a href="#">http-analyze</a>                          | Enables HTTP URL analysis on the WLAN                                                                                                                 |
| <a href="#">ip</a>                                    | Configures IP settings                                                                                                                                |
| <a href="#">kerberos</a>                              | Configures Kerberos authentication parameters                                                                                                         |
| <a href="#">mac-authentication</a>                    | Configures MAC authentication parameters                                                                                                              |
| <a href="#">no (wlan-config-mode)</a> on page 619     | Negates a command or reverts settings to their default                                                                                                |
| <a href="#">proxy-arp-mode</a> on page 588            | Enables the proxy ARP mode for ARP requests                                                                                                           |

| Command                                  | Description                                                                       |
|------------------------------------------|-----------------------------------------------------------------------------------|
| <code>radio-resource-measurement</code>  | Enables support for 802.11k radio resource measurement                            |
| <code>radius</code>                      | Configures RADIUS parameters                                                      |
| <code>relay-agent</code>                 | Enables support for DHCP relay agent information (option 82) feature on this WLAN |
| <code>shutdown</code>                    | Shuts down a WLAN                                                                 |
| <code>ssid</code>                        | Configures a WLAN's SSID                                                          |
| <code>time-based-access</code>           | Configures time-based client access                                               |
| <code>use</code>                         | Defines WLAN mode configuration settings                                          |
| <code>vlan</code>                        | Assigns a VLAN for the WLAN                                                       |
| <code>vlan-pool-member</code>            | Adds a member VLAN to the pool of VLANs for a WLAN                                |
| <code>wep128</code>                      | Configures WEP128 parameters                                                      |
| <code>wep64</code>                       | Configures WEP64 parameters                                                       |
| <code>wing-extensions</code> on page 613 | Enables support for WiNG specific extensions to 802.11                            |
| <code>wireless-client</code>             | Configures the transmit power for wireless clients transmission                   |
| <code>wpa-wpa2</code>                    | Modifies TKIP and CCMP (WPA/WPA2) related parameters                              |
| <code>service</code>                     | Invokes service commands applicable in the WLAN configuration mode                |

#### accounting (wlan-config-mode)

Defines the WLAN's accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to Access Point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the Access Point for periodic network and user permission administration.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
accounting [radius|syslog|wait-client-ip]
accounting [radius|wait-client-ip]
accounting syslog [host|mac-address-format]
accounting syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|
pair-hyphen|quad-dot] case [lower|upper]
```

## Parameters

```
accounting [radius|wait-client-ip]
```

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accounting radius         | Enables support for WLAN RADIUS accounting messages. This option is disabled by default. When enabled, the WLAN uses an external RADIUS resource for accounting. Use the <b>use &gt; aaa-policy &gt; &lt;AAA-POLICY-NAME&gt;</b> command to associate an appropriate AAA policy with this WLAN. This AAA policy should be existing and should define the accounting, authentication, and authorization parameters. |
| accounting wait-client-ip | Enables waiting for client's IP before commencing the accounting procedure                                                                                                                                                                                                                                                                                                                                         |

```
accounting syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
```

|                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                  |

## acl

Defines the actions taken based on an ACL rule configuration

Use the **use > ip-access-list <IP-ACCESS-LIST-NAME>** command to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a Firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules.

WLANs use firewalls like ACLs (Access Control Lists) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of ACEs (Access Control Entries). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based Firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
disassociate}
```

### Parameters

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
disassociate}
```

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl exceed-rate                            | Sets the actions taken based on an ACL rule configuration (for example, drop a packet) <ul style="list-style-type: none"> <li>• exceed-rate - Action is taken when the rate exceeds a specified value</li> </ul>                                                                                                                                                                                                                                                                      |
| wireless-client-denied-traffic <0-1000000> | Sets the action to deny traffic to the wireless client when the rate exceeds the specified value <ul style="list-style-type: none"> <li>• &lt;0-1000000&gt; - Specify a allowed rate threshold of disallowed traffic in packets/sec.</li> </ul> <p>If enabled, this option allows an associated client, exceeding the thresholds configured for storm traffic, to be either de-authenticated or blacklisted depending on the action selected. This option is disabled by default.</p> |
| blacklist <0-86400>                        | Optional. Sets the time period for which an offending wireless client is blacklisted. <ul style="list-style-type: none"> <li>• &lt;0-86400&gt; - Configures the blacklist duration from 0 - 86400 seconds. Offending clients are re-authenticated once the blacklist duration, configured here, is over.</li> </ul>                                                                                                                                                                   |
| disassociate                               | Optional. When enabled, disassociates a blacklisted wireless client.                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Examples

```
nx9500-6C8809(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic
20 disassociate
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
nx9500-6C8809(config-wlan-test)#
```

|----|---------------------------------------------------------------------------------------------------------------------------------------------|
| no | Removes the action (de-authenticate or blacklist) to be taken when an associated client exceeds the thresholds configured for storm traffic |
|----|---------------------------------------------------------------------------------------------------------------------------------------------|

### assoc-response

Configures the deny-threshold and rssi-threshold values. These threshold values are considered when responding to a client's association/authentication request.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]
```

#### Parameters

```
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]
```

|                           |                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| assoc-response            | Configures the association response thresholds                                                                                                                                                                                                                                                                                           |
| deny-threshold <1-12>     | Configures the number of times association/authentication request, from a client, is ignored if the RSSI is less than the configured RSSI threshold. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;1-12&gt; - Specify the deny-threshold from 1 - 12.</li> </ul>                                      |
| rssi-threshold <-100--40> | Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the client's association/authentication request is ignored. This option is disabled by default. rssi-threshold <ul style="list-style-type: none"> <li>• &lt;-100--40&gt; - Specify a value from -100 - -40 dBm.</li> </ul> |

#### Examples

```
nx9500-6C8809(config-wlan-test)#assoc-response rssi-threshold -60
nx9500-6C8809(config-wlan-test)#assoc-response deny-threshold 4
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 assoc-response rssi-threshold -60
 assoc-response deny-threshold 4
 registration user group-name guest expiry-time 2000 agreement-refresh 14400
nx9500-6C8809(config-wlan-test)#
```

#### answer-broadcast-probes

Allows the WLAN to respond to probe requests that do not specify an SSID. These probes are for broadcast ESS. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
answer-broadcast-probes
```

#### Parameters

None

## Examples

```
nx9500-6C8809(config-wlan-1)#answer-broadcast-probes
nx9500-6C8809(config-wlan-1)#
```

|-----------------|----------------------------------------------------------------------------------|
| <code>no</code> | Does not allow this WLAN to respond to probe requests that do not specify a SSID |
|-----------------|----------------------------------------------------------------------------------|

## association-list

Attaches an existing global association list with this WLAN. For more information on global association lists, see [global-association-list](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
association-list global <GLOBAL-ASSO-LIST-NAME>
```

## Parameters

```
association-list global <GLOBAL-ASSO-LIST-NAME>
```

|                                                                    |                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>association-list global &lt;GLOBAL-ASSO-LIST-NAME&gt;</code> | Attaches an existing global association list with this WLAN <ul style="list-style-type: none"><li>• <code>&lt;GLOBAL-ASSO-LIST-NAME&gt;</code> - Specify the global association list name (should be existing and configured).</li></ul> |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
rfs4000-1B3596(config-wlan-test)#association-list global my-clients
rfs4000-1B3596(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 association-list global my-clients
rfs4000-1B3596(config-wlan-test)#
```

## Related Commands

|                 |                                                                  |
|-----------------|------------------------------------------------------------------|
| <code>no</code> | Removes the global association list's association with this WLAN |
|-----------------|------------------------------------------------------------------|

## authentication-type

Sets the WLAN's authentication type

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]
```

## Parameters

`authentication-type [ eap | eap-mac | eap-psk | kerberos | mac | none ]`

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication-type | Configures a WLAN's authentication type<br>The authentication types are: EAP, EAP-MAC, EAP-PSK, Kerberos, MAC, and none.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| eap                 | Configures EAP authentication (802.1X)<br>EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs.<br>The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An Access Point passes EAP packets from the client to an authentication server on the wired side of the Access Point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client's identity.<br>If using EAP authentication ensure that a AAA policy is mapped to the WLAN. |
| eap-mac             | Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type).<br>EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| eap-psk             | Configures EAP authentication or pre-shared keys depending on client (This setting is only valid with TKIP (Temporal Key Integrity Protocol) or CCMP (Counter Mode with Cipher Block Chaining Message Authentication Code Protocol) encryption types).<br>When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and passcode during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP.<br>If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN.                                                                                                                                                                                                                                                                    |
| kerberos            | Configures Kerberos authentication (encryption will change to WEP128 if it's not already WEP128 or Keyguard)<br>Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.<br>Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses NTP (Network Time Protocol) for synchronizing the clocks of its KDC (Key Distribution Center ) server(s).                                                                                                                                                                                                                 |
| mac                 | Configures MAC authentication (RADIUS lookup of MAC address)<br>MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP.<br>MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, firewall policies and time and date restrictions.<br>MAC authentication can only identify devices, not users.<br>If using mac authentication ensure that an AAA policy is mapped to the WLAN.                                                                                                                                                                                      |
| none                | No authentication is used or the client uses pre-shared keys                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Examples

```
nx9500-6C8809(config-wlan-test)#authentication-type eap
nx9500-6C8809(config-wlan-test)#show context
wlan test
ssid test
```

```

bridging-mode tunnel
encryption-type none
authentication-type eap
accounting syslog host 172.16.10.4 port 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
nx9500-6C8809(config-wlan-test)#

```

|-----------|--------------------------------------------------------------------------------------|
| <b>no</b> | Resets the authentication mode used with this WLAN to default (none/pre-shared keys) |
|-----------|--------------------------------------------------------------------------------------|

### bridging-mode

Configures the mode used to bridge packets to and from a WLAN

Use this command to define which VLANs are bridged, and how local VLANs are bridged between the wired and wireless sides of the network.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
bridging-mode [local|tunnel]
```

#### Parameters

```
bridging-mode [local|tunnel]
```

|               |                                                                                        |
|---------------|----------------------------------------------------------------------------------------|
| bridging-mode | Configures bridging mode on this WLAN. The options are local and tunnel.               |
| local         | Bridges packets between WLAN and local ethernet ports. This is the default mode.       |
| tunnel        | Tunnels packets to other devices (typically a wireless controller or service platform) |

#### Examples

```

nx9500-6C8809(config-wlan-test)#bridging-mode local
nx9500-6C8809(config-wlan-test)#show context
wlan test
ssid test
bridging-mode local
encryption-type none
authentication-type eap
accounting syslog host 172.16.10.4 port 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
nx9500-6C8809(config-wlan-test)#

```

### broadcast-dhcp

Configures broadcast DHCP packet handling parameters

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
broadcast-dhcp validate-offer
```

### Parameters

```
broadcast-dhcp validate-offer
```

`validate-offer` Enables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air. This option is disabled by default.

### Examples

```
nx9500-6C8809(config-wlan-test)#broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#
```

### Related Commands

`no` Disables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air

## broadcast-ssid

Advertises the WLAN SSID in beacons. If a hacker tries to isolate and hack a SSID from a client, the SSID will display since the ESSID is in the beacon. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
broadcast-ssid
```

### Parameters

None

### Examples

```
nx9500-6C8809(config-wlan-1)#broadcast-ssid
nx9500-6C8809(config-wlan-1)#
```

### Related Commands

`no` Disables the broadcasting of the WLAN's SSID in beacons

## captive-portal-enforcement

Configures the captive portal enforcement on this WLAN. When enabled, provides successfully authenticated guests temporary and restricted access to the network. If enforcing captive-portal authentication, associate captive-portal policy with the WLAN. For more information, see [use](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`captive-portal-enforcement {fall-back}`

#### Parameters

`captive-portal-enforcement {fall-back}`

|                                         |                                                                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <code>captive-portal-enforcement</code> | Enables captive portal enforcement on a WLAN. This option is disabled by default.                                        |
| <code>fall-back</code>                  | Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only) |

#### Examples

```
nx9500-6C8809(config-wlan-test)#captive-portal-enforcement fall-back
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#
```

#### Related Commands

|                 |                                     |
|-----------------|-------------------------------------|
| <code>no</code> | Disables captive portal enforcement |
|-----------------|-------------------------------------|

### client-access

Enables WLAN client access (for normal data operations)

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`client-access`

#### Parameters

None

#### Examples

```
nx9500-6C8809(config-wlan-1)#client-access
nx9500-6C8809(config-wlan-1)#
```

### client-client-communication

Allows frame switching from one client to another on a WLAN

This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
client-client-communication
```

#### Parameters

None

#### Examples

```
nx9500-6C8809(config-wlan-1)#client-client-communication
nx9500-6C8809(config-wlan-1)#
```

#### Related Commands

|                 |                                                               |
|-----------------|---------------------------------------------------------------|
| <code>no</code> | Disables frame switching from one client to another on a WLAN |
|-----------------|---------------------------------------------------------------|

### client-load-balancing

Enforces client load balancing on a WLAN's access point radios. When enforced, probe and association requests are not responded to, forcing a client to associate with another access point radio.

This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
client-load-balancing {allow-single-band-clients|band-discovery-intvl|
capability-ageout-time|max-probe-req|probe-req-intvl}
client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|band-discovery-intvl
<0-10000>/capability-ageout-time <0-10000>}
client-load-balancing {max-probe-req|probe-req-intvl} [2.4ghz|5ghz] <0-10000>
```

#### Parameters

```
client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|band-discovery-intvl
<0-10000>/capability-ageout-time <0-10000>}
```

|                                            |                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-load-balancing                      | Configures client load balancing on a WLAN                                                                                                                                                                                                                                                                          |
| allow-single-band-clients<br>[2.4GHz 5GHz] | Optional. Allows single band clients to associate even during load balancing <ul style="list-style-type: none"><li>• 2.4GHz – Enables load balancing across 2.4 GHz channels</li><li>• 5GHz – Enables load balancing across 5.0 GHz channels</li></ul> This option is enabled by default for 2.4 and 5.0 GHz bands. |

|                                     |                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| band-discovery-intvl<br><0-10000>   | Optional. Configures time interval to discover a client's band capability before connection <ul style="list-style-type: none"> <li>&lt;0-10000&gt; - Specify a value from 0 - 10000 seconds. The default is 10 seconds.</li> </ul>                                                                                                                                      |
| capability-ageout-time<br><0-10000> | Optional. Configures a client's capability ageout interval. This is the time for which a client's capabilities are retained in the device's internal table. Once this time is exceeded the client's capabilities are aged out. <ul style="list-style-type: none"> <li>&lt;0-10000&gt; - Specify a value from 0 - 10000 seconds. The default is 3600 seconds.</li> </ul> |

`client-load-balancing {max-probe-req/probe-req-intvl} [2.4Ghz|5Ghz] <0-10000>`

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client-load-balancing                  | Configures WLAN client load balancing                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| max-probe-req [2.4GHz 5GHz] <0-10000>  | Optional. Configures the maximum client probe requests allowed for 2.4 GHz and 5.0 GHz bands <ul style="list-style-type: none"> <li>2.4GHz - Configures maximum client probe requests on 2.4 GHz radios</li> <li>5GHz - Configures maximum client probe requests on 5.0 GHz radios <ul style="list-style-type: none"> <li>&lt;0-10000&gt; - Specify a client probe request threshold from 0 - 10000. The default for both 2.4 and 5.0 GHz radios is 60.</li> </ul> </li> </ul> |
| probe-req-intvl 2.4GHz 5GHz] <0-10000> | Optional. Configures client probe request interval limits for device association <ul style="list-style-type: none"> <li>2.4GHz - Configures the client probe request interval on 2.4 GHz radios</li> <li>5GHz - Configures the client probe request interval on 5.0 GHz radios <ul style="list-style-type: none"> <li>&lt;0-10000&gt; - Specify a value from 0 - 10000. The default for both 2.4 and 5.0 GHz radios is 10 seconds.</li> </ul> </li> </ul>                      |

### Examples

```

nx9500-6C8809(config-wlan-test)#client-load-balancing band-discovery-intvl 2

|-----------------|----------------------------------------------------------------|
| <code>no</code> | Disables client load balancing on a WLAN's access point radios |
|-----------------|----------------------------------------------------------------|

### controller-assisted-mobility

Enables controller or service platform assisted mobility to determine a wireless client's VLAN assignment. When enabled, a controller or service platform's mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

`controller-assisted-mobility`

#### Parameters

None

#### Examples

```
rfs4000-229D58(config-wlan-test)#controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```

|-----------------|------------------------------------------------------------------------------------------------------------|
| <code>no</code> | Disables controller or service platform assisted mobility to determine a wireless client's VLAN assignment |
|-----------------|------------------------------------------------------------------------------------------------------------|

## data-rates

Specifies the 802.11 rates supported on a WLAN

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
data-rates [2.4GHz|5GHz]
data-rates 2.4GHz [b-only|bg|bgn|custom|default|g-only|gn]
data-rates 2.4GHz custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|
basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|
basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]
data-rates 5GHz [a-only|an|custom|default]
data-rates 5GHz custom [12|18|24|36|48|54|6|9|basic-1|basic-11|basic-12|
basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|
basic-mcs-1s|mcs-1s|mcs2s|mcs3s]
```

#### Parameters

`data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]`

|                         |                                                                     |
|-------------------------|---------------------------------------------------------------------|
| <code>data-rates</code> | Specifies the 802.11 rates supported when mapped to a 2.4 GHz radio |
| <code>b-only</code>     | Uses rates that support only 11b clients                            |
| <code>bg</code>         | Uses rates that support both 11b and 11g clients                    |
| <code>bgn</code>        | Uses rates that support 11b, 11g and 11n clients                    |
| <code>default</code>    | Uses the default rates configured for a 2.4 GHz radio               |

|        |                                               |
|--------|-----------------------------------------------|
| g-only | Uses rates that support operation in 11g only |
| gn     | Uses rates that support 11g and 11n clients   |

`data-rates 5GHz [a-only|an|default]`

|            |                                                                     |
|------------|---------------------------------------------------------------------|
| data-rates | Specifies the 802.11 rates supported when mapped to a 5.0 GHz radio |
| a-only     | Uses rates that support operation in 11a only                       |
| an         | Uses rates that support 11a and 11n clients                         |
| default    | Uses default rates configured for a 5.0 GHz                         |

`data-rates [2.4GHz|5GHz] custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|basic-mcs0-7|mcs0-15|mcs0-7|mcs8-15]`

|                          |                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data-rates [2.4GHz 5GHz] | Specifies the 802.11 rates supported when mapped to a 2.4 GHz or 5.0 GHz radio                                                                                                                                                                                                                                                                                   |
| custom                   | Configures a data rates list by specifying each rate individually. Use 'basic-' prefix before a rate to indicate it is used as a basic rate (For example, 'data-rates custom basic-1 basic-2 5.5 11').<br>The data-rates for 2.4 GHz and 5.0 GHz channels are the same with a few exceptions. The 2.4 GHz channel has a few extra data rates: 1, 11, 2, and 5.5. |

|                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## description

Configures a description for this WLAN

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
description <LINE>
```

### Parameters

```
description <LINE>
```

<LINE> Specify a description for this WLAN  
The WLAN's description should help differentiate it from others with similar configurations. The description should not exceed 64 characters.

### Examples

```
nx9500-6C8809(config-wlan-test)#description TestWLAN
nx9500-6C8809(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test
 bridging-mode local
 encryption-type none
 uthentication-type eap
 accounting syslog host 172.16.10.4 port 2
 data-rates 2.4GHz gn
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
nx9500-6C8809(config-wlan-test)#
```

### Related Commands

**no** Removes a WLAN's configured description

## downstream-group-addressed-forwarding

Enables forwarding of downstream broadcast/multicast (BC/MC) packets to a group on this WLAN. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
downstream-group-addressed-forwarding
```

### Parameters

None

## Examples

```
rfs4000-229D58(config-wlan-test)#downstream-group-addressed-forwarding
```

## Related Commands

| <code>no</code> | Disables forwarding of downstream BCMC packets to a group on this WLAN |
|-----------------|------------------------------------------------------------------------|

## dpi

Enables DPI on this WLAN. When enabled, all traffic is subjected to DPI for detection of applications, application categories, custom applications, and metadata extraction.

DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When enabled, DPI inspects packets of all flows to identify applications (such as, Netflix, Twitter, Facebook, etc.) and extract metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
dpi metadata [http|ssl|tcp-rtt|voice-video]
```

## Parameters

```
dpi metadata [http|ssl|tcp-rtt|voice-video]
```

|                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dpi metadata [http ssl tcp-rtt voice-video]</code> | <p>Enables extraction of the following metadata flows:</p> <ul style="list-style-type: none"><li>• <code>http</code> – Extracts HTTP flows. When enabled, administrators can track HTTP Websites accessed by both internal and guest clients and visualize HTTP data usage, hits, active time and total clients on the NSight application's dashboard. This setting is disabled by default.</li><li>• <code>ssl</code> – Extracts SSL flows. When enabled, administrators can track SSL Websites accessed by both internal and guest clients and visualize SSL data usage, hits, active time and total clients on the NSight application's dashboard. This setting is disabled by default</li><li>• <code>tcp-rtt</code> – Extracts RTT (Round Trip Time) information from TCP (Transmission Control Protocol) flows. However, this TCP-RTT metadata is viewable only on the NSight dashboard. Therefore, ensure the NSight server is up and NSight analytics data collection is enabled.</li><li>• <code>voice-video</code> – Extracts voice and video flows. When enabled, voice and video calls can be tracked by extracting parameters, such as packets transferred and lost, jitter, and application name. Most Enterprise VoIP applications like facetime, skype for business and VoIP terminals can be monitored for call quality and visualized on the NSight dashboard in manner similar to HTTP and SSL. Call quality and metrics can only be determined from calls established unencrypted. This setting is disabled by default.</li></ul> |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config-wlan-test)#dpi metadata http
nx9500-6C8809(config-wlan-test)#dpi metadata ssl
nx9500-6C8809(config-wlan-test)#dpi metadata voice-video
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 dpi metadata voice-video
 dpi metadata http
 dpi metadata ssl
nx9500-6C8809(config-wlan-test)#
```

|-----------------|---------------------------------------------------|
| <code>no</code> | Disables extraction of metadata flows on the WLAN |
|-----------------|---------------------------------------------------|

## dynamic-vlan-assignment

Enables dynamic VLAN assignment on this WLAN, and adds or removes VLANs for the selected WLAN. Configure this feature to allow an override to the WLAN configuration. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS Access-Accept packet, and this feature is enabled, all client traffic is forward on that VLAN. If disabled, the RADIUS server returns VLAN-ID is ignored and the WLAN's VLAN configuration is used. For more information, see [vlan](#). This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
dynamic-vlan-assignment allowed-vlan <VLAN-ID>
```

## Parameters

```
dynamic-vlan-assignment allowed-vlan <VLAN-ID>
```

|                                      |                                                                                                                                                                                                    |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dynamic-vlan-assignment allowed-vlan | Enables dynamic VLAN assignment and configures a list of VLAN IDs or VLAN alias allowed access to the WLAN                                                                                         |
| <VLAN-ID>                            | Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, \$guest. For example, 10-20, 25, 30-35, \$guest. For information on VLAN aliases, see <a href="#">alias</a> . |

## Examples

```
rfs4000-229D58(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#
```

### eap-types

Configures client access based on the EAP type used

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] {(aka|all|fast|peap|sim|tls|ttls)}
```

### Parameters

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] {(aka|all|fast|peap|sim|tls|ttls)}
```

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| eap-types                        | Configures a list of allowed or denied EAP types                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| [allow deny]                     | <ul style="list-style-type: none"><li>• allow – Configures a list of EAP types allowed for WLAN client authentication</li><li>• deny – Configures a list of EAP types not allowed for WLAN client authentication</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| [aka all fast peap sim tls ttls] | <p>The following EAP types are common to the 'allow' and 'deny' keywords:</p> <ul style="list-style-type: none"><li>• aka – Configures EAP AKA (Authentication and Key Agreement ) and EAP-AKA' (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses UMTS (Universal Mobile Telecommunications System) and USIM (Universal Subscriber Identity Module) for client authentication and key distribution.</li><li>• all – Allows or denies usage of all EAP types on the WLAN</li><li>• fast – Configures EAP FAST (Flexible Authentication via Secure Tunneling). EAP-FAST establishes a TLS (Transport Layer Security ) tunnel, to verify client credentials, using PAC (Protected Access Credentials).</li><li>• peap – Configures PEAP (Protected Extensible Authentication Protocol). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP.</li><li>• sim – Configures EAP SIM (Subscriber Identity Module). EAP-SIM uses GSMC (Global System for Mobile Communications) SIM for client authentication and key distribution.</li><li>• tls – Configures EAP TLS. EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server.</li><li>• ttls – Configures TTLS (Tunneled Transport Layer Security). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA-signed certificate.</li><li>• These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.</li></ul> |

### Examples

```
nx9500-6C8809(config-wlan-test)#eap-types allow fast sim tls
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 eap-types allow fast sim tls
nx9500-6C8809(config-wlan-test)#
```

|-----------------|--------------------------------------------------|
| <code>no</code> | Reverts to default setting - eap-types allow all |
|-----------------|--------------------------------------------------|

## encryption-type

Sets a WLAN's encryption type

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|wep128-keyguard|wep64]
```

## Parameters

```
encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|wep128-keyguard|wep64]
```

|                 |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| encryption-type | Configures the WLAN's data encryption parameters                                                                                                                    |
| ccmp            | Configures AES-CCM/CCMP (Advanced Encryption Standard Counter Mode CBC-MAC Protocol)                                                                                |
| keyguard        | Configures Keyguard MCM (Mobile Computing Mode)                                                                                                                     |
| tkip-ccmp       | Configures the TKIP and AES-CCM/CCMP encryption modes                                                                                                               |
| wep128          | Configures WEP with 128 bit keys                                                                                                                                    |
| wep128-keyguard | Configures WEP128 as well as Keyguard-MCM encryption modes                                                                                                          |
| wep64           | Configures WEP with 64 bit keys. A WEP64 configuration is insecure when two WLANs are mapped to the same VLAN, and one uses no encryption while the other uses WEP. |

## Examples

```
nx9500-6C8809(config-wlan-test)#encryption-type tkip-ccmp
nx9500-6C8809(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test
 bridging-mode local
encryption-type tkip-ccmp
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 data-rates 2.4GHz gn
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2

| <code>no</code> | Resets the WLAN's encryption type to default (none) |
|-----------------|-----------------------------------------------------|

## enforce-dhcp

Enables dropping of packets from clients with a static IP address. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

`enforce-dhcp`

Parameters

None

Examples

```
nx9500-6C8809(config-wlan-test)#enforce-dhcp
nx9500-6C8809(config-wlan-test)#show context
wlan test
 description TestWLAN
 ssid test

fast-bss-transition

Enables or disables support for 802.11r FT (Fast-BSS Transition) on the selected WLAN. This feature is disabled by default.

802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
fast-bss-transition {over-ds}
```

## Parameters

```
fast-bss-transition {over-ds}
```

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                        |

|----|-----------------------------------------------------------------|
| no | Disables support for 802.11r Fast-BSS Transition (FT) on a WLAN |
|----|-----------------------------------------------------------------|

## http-analyze

Enables HTTP URL analysis on the WLAN

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
http-analyze [filter|syslog]
http-analyze filter [images|post|query-string]
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
```

## Parameters

```
http-analyze filter [images|post|query-string]
```

|              |                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| filter       | Filters URLs, based on the parameters set, before forwarding them                                                           |
| images       | Filters out URLs referring to images (does not forward URL requesting images)                                               |
| post         | Filters out URLs requesting POST (does not forward POST requests). This option is disabled by default.                      |
| query-string | Removes query strings from URLs before forwarding them (forwards requests and no data). This option is disabled by default. |

```
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>}
{proxy-mode [none|through-controller|through-rf-domain-manager]}
```

|                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| syslog host <IP/<br>HOSTNAME>                                           | Forwards client and URL information to a syslog server <ul style="list-style-type: none"> <li>host &lt;IP/HOSTNAME&gt; – Specify the syslog server's IP address or hostname</li> </ul>                                                                                                                                                                                                          |
| port <1-65535>                                                          | Optional. Specifies the UDP port to connect to the syslog server from 1 - 65535                                                                                                                                                                                                                                                                                                                 |
| proxy-mode [none through-<br>controller  through-rf-<br>domain-manager] | Optional. Specifies if the request is to be proxied through another device <ul style="list-style-type: none"> <li>none – Requests are sent directly to syslog server from device</li> <li>through-controller – Proxies requests through the wireless controller configuring the device</li> <li>through-rf-domain-manager – Proxies the requests through the local RF Domain manager</li> </ul> |

### Examples

```
rfs4000-229D58(config-wlan-test)#http-analyze syslog host 192.168.13.10 port 21
proxy-mode through-controller
rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller
rfs4000-229D58(config-wlan-test)#
```

## ip (wlan-config-mode)

Configures IP settings

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
ip [arp|dhcp]
ip arp [header-mismatch-validation|trust]
ip dhcp trust
```

### Parameters

```
ip arp [header-mismatch-validation|trust]
```

|                                |                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| ip arp                         | Configures the IP settings for ARP packets                                                                  |
| header-mismatch-<br>validation | Verifies mismatch of source MAC address in the ARP and Ethernet headers. This option is enabled by default. |
| trust                          | Sets ARP responses as trusted for a WLAN/range. This option is disabled by default.                         |

```
ip dhcp trust
```

|         |                                                                                      |
|---------|--------------------------------------------------------------------------------------|
| ip dhcp | Configures the IP settings for DHCP packets                                          |
| trust   | Sets DHCP responses as trusted for a WLAN/range. This option is disabled by default. |

Examples

```

nx9500-6C8809(config-wlan-test)#ip dhcp trust
<exsw1>(config-wlan-test)#show context
wlan test
 description TestWLAN

|----|--------------------------------------------------------------------------------------------------------------------------------------------|

ipv6

Sets the DHCPv6 and ICMPv6 ND (neighbor discovery) components for this WLAN

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```

ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|ranguard|trust]

```

Parameters

```

ipv6 dhcpv6 trust

```

|                   |                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 dhcpv6 trust | Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default. |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```

ipv6 nd [header-mismatch-validation|ranguard|trust]

```

|                            |                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 nd                    | Sets the IPv6 ND settings for this WLAN                                                                                                        |
| header-mismatch-validation | Checks for mismatch of source MAC address in the ICMPv6 ND message and Ethernet header (link layer option). This option is enabled by default. |

|         |                                                                                                                                                                              |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| raguard | Allows redirection of router advertisements (RAs) and ICMPv6 packets originating on this WLAN. This option is disabled by default.                                           |
| trust   | Enables trust state for ND requests received on this WLAN. When enabled, all ND requests on an IPv6 firewall, on this WLAN, are trusted. This option is disabled by default. |

### Examples

```

nx9500-6C8809(config-wlan-test)#ipv6 dhcpv6 trust
nx9500-6C8809(config-wlan-test)#ipv6 nd trust
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 ipv6 dhcpv6 trust
 ipv6 nd trust
nx9500-6C8809(config-wlan-test)#

```

|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no | Resets IPv6 ND or DHCPv6 trust parameters to default. ND request trust is disabled, ND header mismatch verification is enabled, ND RA and ICMPv6 redirection is disabled, or DHCPv6 trust is disabled. |
|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## kerberos

Configures Kerberos authentication parameters on a WLAN

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses NTP for synchronizing the clocks of its KDC server(s).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>

```

### Parameters

```

kerberos password [0 <LINE>|2 <LINE>|<LINE>]

```

|          |                                                                                                                                                                                                                                                                                                                                        |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kerberos | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server.                                                                                                                                                                                                                             |
| password | Configures a Kerberos KDC server password. The password should not exceed 127 characters. The password options are: <ul style="list-style-type: none"> <li>• 0 &lt;LINE&gt; – Configures a clear text password</li> <li>• 2 &lt;LINE&gt; – Configures an encrypted password</li> <li>• &lt;LINE&gt; – Specify the password.</li> </ul> |

kerberos realm <REALM>

|               |                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------|
| kerberos      | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server. |
| realm <REALM> | Configures a Kerberos KDC server realm. The REALM should not exceed 127 characters.                        |

kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}

|                            |                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kerberos                   | Configures a WLAN's Kerberos authentication parameters<br>The parameters are: password, realm, and server.                                                                                                                                  |

### mac-authentication

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
mac-authentication [cached-credentials|enforce-always]
```

#### Parameters

```
mac-authentication [cached-credentials|enforce-always]
```

|                    |                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-authentication | Enables MAC authentication on this WLAN and configures related parameters                                                                                                                                                                                              |
| cached-credentials | Uses cached credentials to skip RADIUS lookups. This option is disabled by default.                                                                                                                                                                                    |
| enforce-always     | Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default. |

#### Examples

```

rfs4000-229D58(config-wlan-test)#mac-authentication cached-credentials
rfs4000-229D58(config-wlan-test)#

```

### nsight

Enables retention of client-history

A typical NSight-server enabled, guest access environment may be visited by thousands of unique clients on a daily basis. Some of these guest clients are not regular visitors, accessing the network infrequently. However, by default, historical data of all guest clients, irrespective of their network access frequency, is retained by the NSight server for up to 180 days. This results in the database containing thousands if not millions of unique MAC addresses of infrequent guest clients. To address this potential problem it is recommended to disable client-history retention on a guest WLAN, and use the nsight-

policy context to configure a separate timer (8 hours by default) specifying the guest client data lifespan in the database.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
nsight client-history
```

#### Parameters

```
nsight client-history
```

|                       |                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------|
| nsight client-history | Enables retention of client-history in the database. This option is enabled by default. |
|-----------------------|-----------------------------------------------------------------------------------------|

#### Examples

On a WLAN, the client-history option is enabled by default. When enabled, all client history (including guest-clients) is retained in the NSight server database for 180 days.

To disable this option, execute the **no > nsight > client-history** command. When disabled, guest client history is retained only for 8 hours, which is the default setting defined by the NSight policy applied on the access point (through which the guest client accesses the WLAN) or the access point's RF Domain. However, the default historical data retention duration for regular clients and devices (access point and controllers) remains unchanged (180 days) as per the NSight policy settings.

```
nx9500-6C8809(config-wlan-test3)#no nsight client-history
nx9500-6C8809(config-wlan-test3)#show context
wlan test3
 ssid test3
 bridging-mode local
 encryption-type none
 authentication-type none
 no nsight client-history
nx9500-6C8809(config-wlan-test3)#
```

Use the NSight policy context to define separate client-history retention time for regular clients, devices, and guest clients. For more information, see

#### opendns

Configures the pre-fetched OpenDNS device\_id. Once configured, all DNS queries originating from wireless clients associating with the WLAN are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet. The device ID is a sixteen (16) character hex string representing a 64 bit unsigned integer and is fetched from the OpenDNS site.

This command is part of a series of configurations that are required to integrate WiNG access points, wireless controllers, and service platforms with OpenDNS. When all the parameters have been configured, DNS queries from wireless clients, associating with the WLAN, are redirected to OpenDNS

(208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement. For more information on the entire configuration, see [opendns](#) (privi exec mode).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
opendns device-id <DEVICE-ID>
```

#### Parameters

```
opendns device-id <DEVICE-ID>
```

|                                                |                                                                                                                                                               |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>opendns device-id &lt;DEVICE-ID&gt;</pre> | Configures the device ID to embed in DNS queries sent to OpenDNS <ul style="list-style-type: none"><li>• &lt;DEVICE-ID&gt; - Specify the device ID.</li></ul> |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

The following command fetches the device\_id from the OpenDNS site.

```
ap7161-E6D512#opendns ApiToken 9110B39543DEB2ECA1F473AE03E8899C00019073
device_id = 0014AADF8EDC6C59
ap7161-E6D512#
```

Use this device\_id in the WLAN configuration context.

```
ap7161-E6D512(config)#wlan opendns
ap7161-E6D512(config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap7161-E6D512(config-wlan-opendns)#commit
ap7161-E6D512(config-wlan-opendns)#show context
wlan opendns
 ssid opendns
 vlan 1
 bridging-mode local
 encryption-type none
 authentication-type none
 opendns device-id 0014AADF8EDC6C59
ap7161-E6D512(config-wlan-opendns)#
```

#### protected-mgmt-frames

Configures the WLAN's frame protection mode and SA (security association) query parameters

802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The 'robust management frames' are action, disassociation, and de-authentication frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. PMF (Protected management frames) protocol only applies to robust management frames after establishment of RSNA PTK. Robust management frame protection is achieved by using CCMP for unicast management frames, broadcast/multicast integrity protocol for

broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]
```

#### Parameters

```
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]
```

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protected-mgmt-frames                             | Enables and configures WLAN's frame protection mode and SA query parameters. Use this command to specify whether management frames are continually or optionally protected. Frame protection mode is disabled by default.                                                                                                                                                                                                              |
| mandatory                                         | Enforces protected management frames (PMF) on this WLAN (management frames are continually optionally protected)                                                                                                                                                                                                                                                                                                                       |
| optional                                          | Provides PMF only for those clients that support PMF (management frames are optionally protected)                                                                                                                                                                                                                                                                                                                                      |
| sa-query [attempts <1-10> <br>timeout <100-1000>] | Configures the following SA parameters: <ul style="list-style-type: none"><li>• attempts &lt;1-10&gt; - Configures the number of SA query attempts from 1 - 10. The default is 5.</li><li>• timeout &lt;100-1000&gt; - Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds.</li></ul> |

#### Examples

```
nx9500-6C8809(config-wlan-test)#protected-mgmt-frames mandatory
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel

|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no | Disables enforcement of protected management frames on this WLAN. And reverts protected management frames sa-query timeout and attempts to 201 milliseconds and 5 respectively. |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### proxy-arp-mode

Enables proxy ARP mode for handling ARP requests

Proxy ARP is the technique used to answer ARP requests intended for another system. By faking its identity, the access point accepts responsibility for routing packets to the actual destination.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
proxy-arp-mode [dynamic|strict]
```

#### Parameters

```
proxy-arp-mode [dynamic|strict]
```

|                |                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------|
| proxy-arp-mode | Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict. |
| dynamic        | Forwards ARP requests to the wireless side (for which a response could not be proxied)          |
| strict         | Does not forward ARP requests to the wireless side                                              |

#### Examples

```
nx9500-6C8809(config-wlan-test)#proxy-arp-mode strict
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none

### proxy-nd-mode

Configures the proxy ND mode for this WLAN member clients as either strict or dynamic

ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can be done either dynamically (requiring exchanges of identity and authorization information) or statically when the network topology is defined.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
proxy-nd-mode [dynamic|strict]
```

#### Parameters

```
proxy-nd-mode [dynamic|strict]
```

|                                |                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| proxy-nd-mode [dynamic strict] | Configures the proxy ND mode for this WLAN member clients. The options are: dynamic and strict <ul style="list-style-type: none"> <li>• dynamic - Forwards ND request to wireless for which a response could not be proxied. This is the default value.</li> <li>• strict - Does not forward ND requests to the wireless side</li> </ul> |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config-wlan-test)#proxy-nd-mode strict

## qos-map

Enables support for 802.11u QoS map element and frames

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

qos-map

### Parameters

None

### Examples

```
nx9500-6C8809(config-wlan-test)#qos-map
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none

## radio-resource-measurement

Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN

802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and under utilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to an under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it's an efficient use of the network's resources. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```

#### Parameters

```
radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```

|                            |                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radio-resource-measurement | Enables support for 802.11k radio resource measurement capabilities                                                                                                                                          |
| channel-report             | Optional. Includes the channel-report element in beacons and probe responses                                                                                                                                 |
| neighbor-report {hybrid}   | Optional. Enables responding to neighbor-report requests <ul style="list-style-type: none"><li>• hybrid - Optional. Uses the hybrid model of smart-rf neighbors and roaming frequency to neighbors</li></ul> |

#### Examples

radius

Configures RADIUS related parameters

Supported in the following platforms:

- Access Points — AP 6522, AP 6532, AP 6562, AP 7502, AP 7522, AP 7532, AP 7161, AP 81XX, AP 8232
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 7500, NX 9500, NX 9510

#### Syntax

```
radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]
radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|
 vlan-assignment]
```

## Parameters

`radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]`

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dynamic-authorization     | Enables support for disconnect and change of authorization messages (RFC5176). When enabled, this option extends the RADIUS protocol to support unsolicited messages from the RADIUS server. These messages allow administrators to issue CoA (change of authorization) messages, which affect session authorization, or DM (disconnect messages) that terminate a session immediately. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                            |
| nas-identifier <NAS-ID>   | Configures the NAS (network access server) identifier attribute, a value that identifies the access point or controller where the RADIUS messages originate. The value specified here is included in the RADIUS NAS-Identifier field for WLAN authentication and accounting packets. <ul style="list-style-type: none"><li>• &lt;NAS-ID&gt; - Specify the NAS identifier attribute (should not exceed 256 characters in length).</li></ul>                                                                                                                                                                                                                                                                                                                                                                             |
| nas-port-id <NAS-PORT-ID> | Configures the WLAN NAS port ID sent to the RADIUS server. The NAS port identifier should not exceed 256 characters. <ul style="list-style-type: none"><li>• &lt;NAS-PORT-ID&gt; - Specify the NAS port ID attribute (should not exceed 256 characters in length).</li></ul> <p>The profile database on the RADIUS server consists of user profiles for each connected NAS port. Each profile is matched to a username representing a physical port. When authorizing users, it queries the user profile database using a username representative of the physical NAS port making the connection. Set the numeric port value from 0 - 4294967295.</p>                                                                                                                                                                  |
| vlan-assignment           | Configures the VLAN assignment of a WLAN. RADIUS VLAN assignment is disabled by default. When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the <code>vlan/vlan-pool-member</code> options (in the WLAN config mode) is used. <p>If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration.</p> |

## Examples

```
nx9500-6C8809(config-wlan-test)#radius vlan-assignment
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 --More--
nx9500-6C8809(config-wlan-test)#
```

## Related Commands

|                 |                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>no</code> | Disables support for disconnect and change of authorization messages. Disables the use of VLAN information received in RADIUS server responses, instead uses the VLAN provided in the WLAN configuration. Removes the NAS identifier and NAS port identifiers configured. |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

registration

Configures settings enabling dynamic registration and validation of devices by their MAC addresses. When configured, this option registers a device's MAC address, and allows direct access to a previously registered device.

This command also configures the external guest registration and validation server details. If using an external server to perform guest registration, authentication and accounting, use this command to configure the external server's IP address/hostname. When configured, access points and controllers forward guest registration requests to the specified registration server. In case of EGuest deployment, this external resource should point to the EGuest registration server.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
registration [device|device-OTP|external|user]
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {agreement-refresh
<0-144000>|
expiry-time <1-43800>}
registration external [follow-aaa|host]
registration external follow-aaa {send-mode [http|https|udp]}
registration external host <IP/HOSTNAME> {proxy-mode |send-mode}
registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
through-rf-domain-manager|through-centralized-controller]|send-mode [https|https|udp]}
```

#### Parameters

```
registration external follow-aaa {send-mode [http|https|udp]}
```

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| registration                | Enables dynamic guest-user registration and validation. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| external                    | Specifies that the guest registration is handled by an external resource. Access points/controllers send registration requests to the external registration server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| follow-aaa                  | Uses an AAA policy to point to the guest registration, authentication, and accounting server. When used, guest registration is handled by the RADIUS server specified in the AAA policy used in the WLAN context.<br>In case of EGuest deployment, the RADIUS authentication and accounting server configuration in the AAA policy should point to the EGuest server. The use of 'follow-aaa' option is recommended in EGuest replica-set deployments.<br>For more information on enabling the EGuest server, see <a href="#">eguest-server (VX9000 only)</a> on page 990 (profile config mode).<br>For more information on configuring an EGuest deployment, see <a href="#">configuring ExtremeGuest captive-portal</a> . |
| send-mode [https https udp] | Optional. Specifies the protocol used to forward registration requests to the external AAA policy servers. The options are: <ul style="list-style-type: none"> <li>• HTTPS – Sends registration requests as HTTPS packet</li> <li>• HTTP – Sends registration requests as HTTP packet</li> <li>• UDP – Sends registration requests as UDP packet, using the UDP port 12322. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                         |

```
registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
through-rf-domain-manager|through-centralized-controller]|send-mode [https|https|udp]}
```

|                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| registration              | Configures dynamic guest registration and validation parameters. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| [device device-OTP  user] | <p>Configures the mode used to register guest users of this WLAN. Options include device, external, user, and device-OTP</p> <ul style="list-style-type: none"> <li>• device-OTP – Registers a device by its MAC address. During registration, the user, using the registered device, has to provide the e-mail address, mobile number, or member id, and the OTP (one-time-passcode) sent to the registered e-mail id or mobile number to complete registration. On subsequent logins, the user has to enter the OTP. If the MAC address of the device attempting login and the OTP combination matches, the user is allowed access. If using this option, set the WLAN authentication type as MAC authentication.</li> <li>• device – Registers a device by its MAC address. On subsequent logins, already registered MAC addresses are allowed access. If using this option, set the WLAN authentication type as <i>MAC authentication</i>.</li> <li>• user – Registers guest users using one of the following options: e-mail address, mobile-number, or member-id.</li> </ul> <p>If using any one of the above modes of registration, specify the RADIUS group to which the registered device or user is to be assigned post authentication.</p> |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group-name <RAD-GROUP-NAME>  | Configures the RADIUS group name to which registered users are associated. When left blank, users are not associated with a RADIUS group. <ul style="list-style-type: none"> <li>&lt;RAD-GROUP-NAME&gt; – Specify the RADIUS group name (should not exceed 64 characters).</li> </ul>                                                                                                                                                                                                |
| expiry-time <1-43800>        | Optional. Configures the amount of time, in hours, before registered addresses expire and must be re-entered <ul style="list-style-type: none"> <li>&lt;1-43800&gt; – Specify a value from 1 - 43800 hrs. The default is 1500 hrs.</li> </ul>                                                                                                                                                                                                                                        |
| agreement-refresh <0-144000> | Optional. Sets the time, in minutes, after which an inactive user has to refresh the WLAN's terms of agreement. For example, if the agreement refresh period is set to 1440 minutes, a user, who has been inactive for more than 1440 minutes (1 day) is served the agreement page, and is allowed access only after refreshing the terms of agreement. <ul style="list-style-type: none"> <li>&lt;0-100&gt; – Specify a value from 0 - 144000. The default is 0 minutes.</li> </ul> |

### Examples

```

nx9500-6C8809(config-wlan-test)#registration user group-name guest agreement-ref
resh 14400 expiry-time 2000
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 registration user group-name guest expiry-time 2000 agreement-refresh 14400
nx9500-6C8809(config-wlan-test)#

```

|----|-----------------------------------------------------------------------------------------------------------------------------------------------|
| no | Disables dynamic user registration and removes associated configurations. Also disables forwarding of user information to an external device. |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------|

## relay-agent

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

### Parameters

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relay-agent   | Enables support for the following DHCP and DHCPv6 options: option 82 and LDRA (Lightweight DHCPv6 Relay Agent) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server. This information provides the following: <ul style="list-style-type: none"> <li>• circuit ID suboption – Provides the SNMP port interface index</li> <li>• remote ID – Provides the controller’s MAC address</li> </ul> |
| dhcp-option82 | Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                               |
| dhcpv6-ldra   | Enables the DHCPv6 relay agent. The LDRA feature allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                          |

### Examples

### service (wlan-config-context)

Invokes service commands applicable in the WLAN configuration mode

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
service [allow-ht-only|allow-open-passpoint|client-load-balancing|cred-cache|eap-mac-mode|
eap-mac-multicopy|eap-mac-multikeys|eap-throttle|enforce-pmkid-validation|key-index|
monitor|
radio-crypto|reauthentication|session-timeout|tx-death-on-roam-detection|unresponsive-
```

```

client|
wpa-wpa2|show]

This option is enabled by default.</li> <li>clear-on-disconnect – Clears cached client credentials after the client has disconnected from the network. This option is disabled by default.</li> </ul>                                                                                                                                                                                                                                                                                                 |
| eap-mac-multicopy                                      | Enables sending of multiple copies of broadcast and unicast messages. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| eap-mac-multikeys                                      | Enables configuration of different key indices for MAC authentication. This option is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| enforce-pmkid-validation                               | <p>Validates the Predictive real-time PMKID (pairwise master key identifier) contained in a client's association request against the one present in the wpa-wpa2 handshake. This option is enabled by default.</p> <p>This functionality is based on the PKC (Proactive Key Caching) extension of the 802.11i EEEE standard. Whenever a wireless client successfully authenticates with a AP it receives a PMK (pairwise master key). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP.</p> |
| radio-crypto                                           | Uses radio hardware for encryption and decryption. This is applicable only for devices using CCMP (Counter Cipher Mode with Block Chaining Message Authentication Code Protocol) encryption mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| reauthentication seamless                              | Enables seamless EAP client reauthentication without disconnecting client after the session has timed out. This option is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| session-timeout mac                                    | Enables reauthentication of MAC authenticated clients without disconnecting client after the session has timed out. This option is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tx-deauth-on-roam-detection | Transmits a de-authentication on the air while disassociating a client because its roam is detected on the wired side. This option is disabled by default. |
| show cli                    | Displays the CLI tree of the current mode. When used in the WLAN mode, this command displays the WLAN CLI structure.                                       |

`service eap-mac-mode [mac-always|normal]`

|              |                                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eap-mac-mode | Configures the EAP and/or MAC authentication mode used with this WLAN. This option is enabled by default.                                                                                                                                                                |
| mac-always   | Enables both EAP and MAC authentication. MAC authentication is performed first, followed by EAP authentication. Clients are granted access based on the EAP authentication result. If a client does not have EAP, the MAC authentication result is used to grant access. |
| normal       | Grants client access if the client clears either EAP or MAC authentication. This is the default setting.                                                                                                                                                                 |

`service eap-throttle <0-254>`

|                      |                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eap-throttle <0-254> | Enables EAP request throttling. Use this command to specify the maximum number of parallel EAP sessions allowed on this WLAN. Once this specified value is exceeded, all incoming EAP session requests are throttled. This option is enabled by default. <ul style="list-style-type: none"> <li>• &lt;0-254&gt; - Specify a value from 0 - 254. This default value is 0.</li> </ul> |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

`service key-index eap-wep-unicast <1-4>`

|                                 |                                                                                                                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key-index eap-wep-unicast <1-4> | Configures an index with each key during EAP authentication with WEP. This option is enabled by default. <ul style="list-style-type: none"> <li>• &lt;1-4&gt; - Select a index from 1 - 4. The default value is 1.</li> </ul> |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

`service wpa-wpa2 exclude-ccmp`

|                       |                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wpa-wpa2 exclude-ccmp | Configures exclusion of CCMP requests when the authentication mode is set to tkip-ccmp. When enabled, it provides compatibility for client devices not compliant with tkip-ccmp. This option is disabled by default. |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

`service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]`

|            |                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| monitor    | Enables critical resource monitoring. In a WLAN, service monitoring enables regular monitoring of external AAA servers, captive portal servers, access point adoption, DHCP and DNS servers. When enabled, it allows administrators to notify users of a service's availability and make resource substitutions in case of unavailability of a service. |
| aaa-server | Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource's AAA activity and ensures its adoption and availability. This feature is disabled by default.                                                                                                                                                 |

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adoption<br>vlan<br><1-4094>              | <p>Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default.</p> <ul style="list-style-type: none"> <li>VLAN &lt;1-4094&gt; - Specify the VLAN on which clients are placed when the connectivity between the AAP and the controller is lost.</li> </ul> <p>Configure a DHCP pool and gateway for the failover VLAN. Ensure the DHCP server is running on the AP. Also ensure that the DHCP pool is configured to have less lease time.</p> <p>When this feature is enabled on a WLAN, it allows adopted APs to monitor their connectivity with the controller. If and when this connectivity is lost, all new clients are placed in the configured adoption failover VLAN. They are served an IP by the DHCP server running on the AP. In this situation if a client tries to access a Web URL, the AP redirects the client to a page stating that the service is down.</p> <p>When the AAP's link to the switch is restored, clients are placed back in the WLAN's configured VLAN, and are served an IP from the corresponding configured DHCP server (external or on the AP/controller).</p> |
| captive-<br>portal<br>external-<br>server | <p>Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.</p> <p>When enabled, this feature enables APs to display, to an externally located captive portal's user, the no-service page when the captive portal's server is not reachable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

```
service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>
```

|         |                                                                                                                                                                                                                                                                           |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| monitor | Enables DHCP and/or DNS server monitoring on this WLAN.                                                                                                                                                                                                                   |
| dhcp    | Enables monitoring of a specified DHCP server. When the connection to the DHCP server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.<br>Use the <i>crm</i> keyword to specify the DHCP server to monitor. |
| dns     | Enables monitoring of a specified DNS server. When the connection to the DNS server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.<br>Use the <i>crm</i> keyword to specify the DNS server to monitor.    |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Examples

```
rfs4000-229D58(config-wlan-test)#service allow-ht-only
rfs4000-229D58(config-wlan-test)#service monitor aaa-server
rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test
 vlan 1
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 service monitor aaa-server
 service allow-ht-only
 controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```

### Related Commands

no

Removes or reverts to default WLAN settings configured using the 'service' command

## shutdown

Shuts down a WLAN

The auto shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administrated. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN's availability is automated.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
shutdown {on-critical-resource <CR-NAME>/on-meshpoint-loss/on-primary-port-link-loss/on-unadoption}
```

### Parameters

```
shutdown {on-critical-resource <CR-NAME>/on-meshpoint-loss/on-primary-port-link-loss/on-unadoption}
```

|                                |                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shutdown                       | Auto shuts down the WLAN when specified events occur. Disabled by default.                                                                                                                                                                    |
| on-critical-resource <CR-NAME> | Optional. Auto shuts down the WLAN when critical resource failure occurs. Disabled by default. <ul style="list-style-type: none"><li>• &lt;CR-NAME&gt; - Specifies the name of the critical resource being monitored for this WLAN.</li></ul> |
| on-meshpoint-loss              | Optional. Auto shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.                                                                                                                                  |
| on-primary-port-link-loss      | Optional. Auto shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.                                                                                                                        |
| on-unadoption                  | Optional. Auto shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.                                                                                                                                             |

### Usage Guidelines

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.

### Examples

```
nx9500-6C8809(config-wlan-test)#shutdown on-unadoption
<exsw1>(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
```

```

protected-mgmt-frames mandatory
radius vlan-assignment
wing-extensions wmm-load-information
client-load-balancing probe-req-intvl 5ghz 5
client-load-balancing band-discovery-intvl 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
proxy-arp-mode strict
broadcast-dhcp validate-offer
shutdown on-unadoption
http-analyze controller
nx9500-6C8809(config-wlan-test)#

```

#### Related Commands

|           |                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>no</b> | Disables auto shut down WLAN. Use the optional keywords provided to disable auto shut down of the WLAN upon critical resource failure, when meshpoint links fail, when the primary Ethernet port (e1/up1) loses link, or when the WLAN gets unadopted. |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### ssid

Configures a WLAN's SSID

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
ssid <SSID>
```

#### Parameters

```
ssid <SSID>
```

|                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------|
| <SSID> Specify the WLAN's SSID. The WLAN SSID is case sensitive and alphanumeric. It's length should not exceed 32 characters. |
|--------------------------------------------------------------------------------------------------------------------------------|

#### Examples

```

nx9500-6C8809(config-wlan-test)#ssid testWLAN1
nx9500-6C8809(config-wlan-test)#show context
wlan test
ssid testWLAN1
bridging-mode local
encryption-type none
authentication-type none
protected-mgmt-frames mandatory
radius vlan-assignment
wing-extensions wmm-load-information
client-load-balancing probe-req-intvl 5ghz 5
client-load-balancing band-discovery-intvl 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
proxy-arp-mode strict
broadcast-dhcp validate-offer
shutdown on-unadoption
http-analyze controller
nx9500-6C8809(config-wlan-test)#

```

## t5-client-isolation

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by a T5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

### Note

This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:

- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

`t5-client-isolation`

### Parameters

None

### Examples

```
nx9500-6C8809(config-wlan-test)#t5-client-isolation
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 t5-client-isolation
nx9500-6C8809(config-wlan-test)#
```

## t5-security

Configures T5 PowerBroadband security settings

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

### Note

This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:

- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
t5-security [static-wep|wpa-enterprise|wpa-personal]
t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]
t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp]
version [mixed|wpa|wpa2]
```

### Parameters

```
t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]
```

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t5-security static-wep         | Configures the T5 WLAN security type as static-wep                                                                                                                                                                                                                                                                                                                                                                                                                          |
| encryption-type [wep128 wep64] | Applies one of the following encryption algorithms to the T5 support WLAN configuration: WEP64 or WEP128                                                                                                                                                                                                                                                                                                                                                                    |
| hex <STRING>                   | Configures the hex password (used to derive the security key) <ul style="list-style-type: none"> <li>• &lt;STRING&gt; - Specify the hex password (should not exceed the 10 - 26 characters).</li> </ul>                                                                                                                                                                                                                                                                     |
| passphrase <STRING>            | Configures the passphrase shared by both transmitting and receiving authenticators <ul style="list-style-type: none"> <li>• &lt;STRING&gt; - Specify the passphrase. It could either be an alphanumeric string of 8 to 63 ASCII characters or 64 HEX characters. The alphanumeric string allows character spaces. This string is converted to a numeric value. Configuring a passphrase saves you the need to create a 256-bit key each time keys are generated.</li> </ul> |

```

## time-based-access

Configures time-based client access to the network resources. Use this feature to assign fixed days and time of WLAN access for wireless clients.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

### Parameters

```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| day <option>       | Specifies the day or days on which the client can access the WLAN <ul style="list-style-type: none"><li>• sunday – Allows access on Sundays only</li><li>• monday – Allows access on Mondays only</li><li>• Tuesdays – Allows access on Tuesdays only</li><li>• wednesday – Allows access on Wednesdays only</li><li>• thursday – Allows access on Thursdays only</li><li>• friday – Allows access on Fridays only</li><li>• saturday – Allows access on Saturdays only</li><li>• weekends – Allows access on weekends only</li><li>• weekdays – Allows access on weekdays only</li><li>• all – Allows access on all days</li></ul> |
| start <START-TIME> | Optional. Specifies the access start time in hours and minutes (HH:MM)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| end <END-TIME>     | Specifies the access end time in hours and minutes (HH:MM)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Examples

```
nx9500-6C8809(config-wlan-test)#time-based-access days weekdays start 10:00 end 16:30
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 time-based-access days weekdays start 10:00 end 16:30
 --More--
nx9500-6C8809(config-wlan-test)#
```

## use (wlan-config-mode)

This command associates an existing captive portal and other policies with a WLAN.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
use [aaa-policy|application-policy|association-acl-policy|bonjour-gw-discovery-policy|
captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|roaming-
assist-policy|
url-filter|wlan-qos-policy]
use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|
association-acl-policy <ASSOCIATION-POLICY-NAME>|bonjour-gw-discovery-policy <POLICY-NAME>|
captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy <PASSPOINT-POLICY-NAME>|
roaming-assist-policy <POLICY-NAME>|url-filter <URL-FILTER-NAME>|wlan-qos-policy <WLAN-QOS-
POLICY-NAME>]
use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>
```

### Parameters

```
use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|
association-acl-policy <ASSOCIATION-POLICY-NAME>|bonjour-gw-discovery-policy <POLICY-NAME>|
captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy <PASSPOINT-POLICY-NAME>|
roaming-assist-policy <POLICY-NAME>|url-filter <URL-FILTER-NAME>|wlan-qos-policy <WLAN-QoS-
POLICY-NAME>]
```

### Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of ACEs (Access Control Entries). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE's conditions, it is either forwarded, dropped, or marked depending on the

action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

#### Examples

```
nx9500-6C8809(config-wlan-test)#use aaa-policy test
<exsw1>(config-wlan-test)#use association-acl-policy test
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local
 encryption-type none
 authentication-type none

| no | Removes the following policies associated with a WLAN: aaa-policy, application-policy, association-acl-policy, bonjour-gw-discovery-policy, captive-portal, ip-access-list, ipv6-access-list, mac-access-list, passpoint-policy, roaming-assist-policy, url-filter, or wlan-qos-policy. |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

vlan

Sets the VLAN where traffic from this WLAN is mapped

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

### Parameters

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

|                   |                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-4094>          | Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased.<br>Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool.                                                                                    |
| <VLAN-ALIAS-NAME> | Assigns a VLAN alias to the WLAN. The VLAN alias should be pre-existing and configured. A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see <a href="#">alias</a> . |

### Examples

```
nx9500-6C8809(config-wlan-test)#vlan 4
nx9500-6C8809(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 vlan 4
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
 time-based-access days weekdays start 10:00 end 16:30
 wing-extensions wmm-load-information
 client-load-balancing probe-req-intvl 5ghz 5
 client-load-balancing band-discovery-intvl 2
 use aaa-policy test
 use association-acl-policy test
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 shutdown on-unadoption
 http-analyze controller
nx9500-6C8809(config-wlan-test)#
```

|-----------|---------------------------------------|
| <b>no</b> | Removes a WLAN's default VLAN mapping |
|-----------|---------------------------------------|

### vlan-pool-member

Adds a member VLAN to a WLAN's VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

#### Note

Configuration of a VLAN pool overrides the 'vlan' configuration.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
vlan-pool-member <WORD> {limit <0-8192>}
```

#### Parameters

```
vlan-pool-member <WORD> {limit <0-8192>}
```

|                  |                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan-pool-member | Adds a member VLAN to a WLAN's VLAN pool<br>Since users belonging to separate VLANs can share the same WLAN, it is not necessary to create a new WLAN for every VLAN in the network.                                         |
| <WORD>           | Define the VLANs available to this WLAN. It is either a single index, or a list of VLAN IDs (for example, 1,3,7), or a range (for example, 1-10)                                                                             |
| limit <0-8192>   | Optional. Is ignored if the number of clients are limited and well within the limits of the DHCP pool on the VLAN <ul style="list-style-type: none"> <li>• &lt;0-8192&gt; - Specifies the number of users allowed</li> </ul> |

#### Examples

```
nx9500-6C8809(config-wlan-test)#vlan-pool-member 1-10 limit 1
nx9500-6C8809(config-wlan-test)#show context
wlan test

#### wep128

Configures WEP128 parameters

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
wep128 [key|keys-from-passkey|transmit-key]
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep128 keys-from-passkey <WORD>
wep128 transmit-key <1-4>
```

### Parameters

```
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
```

|                                  |                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wep128                           | Configures WEP128 parameters. The parameters are: key, key-from-passkey, and transmit-key.                                                                                                                                                                                                                                                            |
| key <1-4>                        | Use to configure the key number <ul style="list-style-type: none"> <li>• &lt;1-4&gt; – Specify the key number from 1 - 4.</li> </ul>                                                                                                                                                                                                                  |
| ascii [0 <WORD> 2 <WORD> <WORD>] | Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128) <ul style="list-style-type: none"> <li>• 0 &lt;WORD&gt; – Configures a clear text key</li> <li>• 2 &lt;WORD&gt; – Configures an encrypted key</li> <li>• &lt;WORD&gt; – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters</li> </ul>        |
| hex [0 <WORD> 2 <WORD> <WORD>]   | Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128) <ul style="list-style-type: none"> <li>• 0 &lt;WORD&gt; – Configures a clear text key</li> <li>• 2 &lt;WORD&gt; – Configures an encrypted key</li> <li>• &lt;WORD&gt; – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters</li> </ul> |

```
wep128 keys-from-passkey <WORD>
```

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| keys-from-passkey <WORD> | Specifies a pass key. The pass key can be any alphanumeric string. Controllers, service platforms, Access Points and their connected clients use the algorithm to convert an ASCII string to the same hexadecimal number. Clients without adapters need to use WEP keys manually configured as hexadecimal numbers. <ul style="list-style-type: none"> <li>• &lt;WORD&gt; – Specify a pass key from 4 - 32 characters.</li> </ul> |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
wep128 transmit-key <1-4>
```

|                    |                                                                                                                                                                                                      |

| transmit-key <1-4> | Configures the key index used for transmission from an AP to a wireless client or service platform <ul style="list-style-type: none"> <li>• &lt;1-4&gt; – Specify a key index from 1 - 4.</li> </ul> |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
NOC-NX9500(config-wlan-test)#wep128 key 1 ascii 123456789abcd
NOC-NX9500(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type none
 wep128 key 1 hex 0 31323334353637383961626364
NOC-NX9500(config-wlan-test)#
```

### Related Commands

no

Resets the WEP128 parameters to factory-default values.

## wep64

Configures WEP64 parameters

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
wep64 [key|keys-from-passkey|transmit-key]
wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep64 keys-from-passkey <WORD>
wep64 transmit-key <1-4>
```

### Parameters

```
wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
```

## wing-extensions

Enables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards that potentially increase client roaming reliability and handshake speed

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
wing-extensions [ap-attributes-information {include-hostname}|
coverage-hole-detection {11k-clients/offset <5-20>/threshold <-80--60>}|
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}|
smart-scan|wing-load-information|wmm-load-information]
```

## Parameters

```
wing-extensions [ap-attributes-information {include-hostname}|
coverage-hole-detection {11k-clients/offset <5-20>/threshold <-80--60>}|
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}|
smart-scan|wing-load-information|wmm-load-information]
```

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Inclusion of AP attributes IE allows Extreme Networks terminals to:</p> <ul style="list-style-type: none"><li>• - Recognize Extreme APs</li><li>• - Determine if the AP supports PAN BU features, irrespective of whether these features are enabled or not.</li></ul> <p>AP attributes IE is not added to beacons and probe responses by default.</p> |

|                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>verage-hole-detection {11k-clients  offset &lt;5-20&gt;  threshold &lt;-80--60&gt;}</p> | <p>Enables CHD (coverage hole detection) and configures CHD parameters. When enabled, allows clients (MUs) to inform an access point when it experiences a coverage hole. A coverage hole is an area of poor wireless coverage not supported by a WiNG managed access point radio. Enable radio resource measurement prior to enabling CHD. For enabling radio resource measurement, see <a href="#">radio-resource-measurement</a>. CHD is disabled by default.</p> <p>After enabling CHD, optionally configure the following parameters:</p> <ul style="list-style-type: none"> <li>• 11k-clients - Optional. Provides coverage hole detection to 802.11k-only-capable clients. This is a reduced set of coverage hole detection capabilities (standard 11k messages and behaviors). This option is disabled by default.</li> <li>• offset &lt;5-20&gt; - Optional. Configures the offset added to the threshold to obtain the access point's signal strength (as seen by the client) considered adequate. <ul style="list-style-type: none"> <li>• &lt;5-20&gt; - Specify the offset value from 5 - 20. The default is 5.</li> </ul> </li> <li>• threshold - Optional. Configures the access point's signal strength threshold. When Radio Resource Measurement and CVG Hole are enabled, specify a threshold for the AP's signal strength (as seen by the client) below which a coverage hole incident is reported by the client. <ul style="list-style-type: none"> <li>• &lt;-80--60&gt; - Specify the threshold from -80 - -60 dBm. The default is -70 dBm.</li> </ul> </li> </ul> |
| <p>ft-over-ds-aggregate</p>                                                                | <p>Enables FT (fast-transition) aggregation of action frames. When enabled, increases roaming speed by eliminating separate key exchange handshake frames with potential roam candidates. Enable fast transition to complete an initial FT over DS (distribution system) handshake with multiple roam candidates (up to 6) at once, eliminating the need to send separate FT over DS handshakes to each roam candidate. This option is disabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## wireless-client

Configures the transmit power indicated to clients

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|
max-firewall-sessions|reauthentication|roam-notification|tx-power|t5-inactivity-timeout|
vlan-cache-out]
wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]
wireless-client roam-notification [after-association|after-data-ready|auto]

```

### Parameters

```

wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]

```

|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless-client                  | Configures the transmit power indicated to wireless clients for transmission                                                                                                                                                                                                |
| count-per-radio <0-256>          | Configures the maximum number of clients allowed on this WLAN per radio <ul style="list-style-type: none"> <li>• &lt;0-256&gt; – Specify a value from 0 - 256.</li> </ul>                                                                                                   |
| cred-cache-ageout <60-86400>     | Configures the timeout period for which client credentials are cached across associations <ul style="list-style-type: none"> <li>• &lt;60-86400&gt; – Specify a value from 60 - 86400 seconds.</li> </ul>                                                                   |
| hold-time <1-86400>              | Configures the time period for which wireless client state information is cached post roaming <ul style="list-style-type: none"> <li>• &lt;1-86400&gt; – Specify a value from 1 - 86400 seconds.</li> </ul>                                                                 |
| inactivity-timeout <60-86400>    | Configures an inactivity timeout period in seconds. If a frame is not received from a wireless client for this period of time, the client is disassociated. <ul style="list-style-type: none"> <li>• &lt;60-86400&gt; – Specify a value from 60 - 86400 seconds.</li> </ul> |
| max-firewall-sessions <10-10000> | Configures the maximum firewall sessions allowed per client on a WLAN <ul style="list-style-type: none"> <li>• &lt;10-10000&gt; – Specify the maximum number of firewall sessions allowed from 10 - 10000.</li> </ul>                                                       |

|                                     |                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reauthentication<br><30-86400>      | Configures periodic reauthentication of associated clients <ul style="list-style-type: none"> <li>&lt;30-86400&gt; - Specify the client reauthentication interval from 30 - 86400 seconds.</li> </ul>                                                                                                                                              |
| t5-inactivity-timeout<br><60-86400> | Configures and inactivity timeout, in seconds, for T5 devices. When configured, the T5 device is disassociated if the time lapsed after the last frame received from it exceeds the value specified here. <ul style="list-style-type: none"> <li>&lt;60-86400&gt; - Specify a value from 60 - 86400 seconds. The default is 60 seconds.</li> </ul> |
| tx-power <0-20>                     | Configures the transmit power indicated to clients <ul style="list-style-type: none"> <li>&lt;0-20&gt; - Specify a value from 0 - 20 dBm.</li> </ul>                                                                                                                                                                                               |
| vlan-cache-ageout<br><60-86400>     | Configures the timeout period for which client VLAN information is cached across associations. <ul style="list-style-type: none"> <li>&lt;60-86400&gt; - Specify a value from 60 - 86400 seconds.</li> </ul>                                                                                                                                       |

wireless-client roam-notification [after-association|after-data-ready|auto]

|                   |                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| wireless-client   | Configures the transmit power indicated to wireless clients for transmission                                        |
| roam-notification | Configures when a roam notification is transmitted                                                                  |
| after-association | Transmits a roam notification after a client has associated                                                         |
| after-data-ready  | Transmits a roam notification after a client is data-ready (after completion of authentication, handshakes etc.)    |
| auto              | Transmits a roam notification upon client association (if the client is known to have authenticated to the network) |

### wpa-wpa2

Modifies TKIP-CCMP (WPA/WPA2) related parameters

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
wpa-wpa2 [exclude-wpa2-tkip|handshake|key-rotation|opp-pmk-caching|pmk-caching|
preauthentication|server-only-authentication|psk|tkip-countermeasures|use-sha256-akm]
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|
server-only-authentication|use-sha256-akm]
wpa-wpa2 handshake [attempts|init-wait|priority|timeout]
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]]
timeout <10-5000> {10-5000}]
wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>
wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]
wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

#### Parameters

```
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|
server-only-authentication|use-sha256-akm]
```

|                   |                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| wpa-wpa2          | Modifies TKIP-CCMP (WPA/WPA2) related parameters                                                                                               |
| exclude-wpa2-tkip | Excludes the WPA2 (Wi-Fi Protected Access II) version of TKIP. It supports the WPA version of TKIP only. This option is disabled by default.   |
| opp-pmk-caching   | Uses opportunistic key caching (same PMK (Pairwise Master Key) across APs for fast roaming with EAP.802.1x. This option is enabled by default. |
| pmk-caching       | Uses cached pair-wise master keys (fast roaming with eap/802.1x). This option is enabled by default.                                           |
| preauthentication | Uses pre-authentication mode (WPA2 fast roaming)                                                                                               |
| use-sha256-akm    | Uses sha256 authentication key management suite                                                                                                |

```
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]]
timeout <10-5000> {10-5000}]
```

|           |                                                  |
|-----------|--------------------------------------------------|
| wpa-wpa2  | Modifies TKIP-CCMP (WPA/WPA2) related parameters |
| handshake | Configures WPA/WPA2 handshake parameters         |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attempts <1-5>                 | Configures the total number of times a message is transmitted towards a non-responsive client <ul style="list-style-type: none"> <li>• &lt;1-5&gt; – Specify a value from 1 - 5. The default is 2.</li> </ul>                                                                                                                                                                                                       |
| init-wait<br><5-1000000>       | Configures a minimum wait-time period, in microseconds, before the first handshake message is transmitted from the AP. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;5-1000000&gt; – Specify a value from 5 - 1000000 microseconds.</li> </ul>                                                                                                                                   |
| priority [high normal]         | Configures the relative priority of handshake messages compared to other data traffic <ul style="list-style-type: none"> <li>• high – Treats handshake messages as high priority packets on a radio. This is the default setting.</li> <li>• normal – Treats handshake messages as normal priority packets on a radio</li> </ul>                                                                                    |
| timeout <10-5000><br><10-5000> | Configures the timeout period, in milliseconds, for a handshake message to retire. Once this period is exceeded, the handshake message is retired. <ul style="list-style-type: none"> <li>• &lt;10-5000&gt; – Specify a value from 10 - 5000 milliseconds. The default is 500 milliseconds.</li> <li>• &lt;10-5000&gt; – Optional. Configures a different timeout between the second and third attempts'</li> </ul> |

wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>

### Related Commands

|    |                                                                       |
|----|-----------------------------------------------------------------------|
| no | Removes or reverts to default TKIP-CCMP (WPA/WPA2) related parameters |
|----|-----------------------------------------------------------------------|

### no (wlan-config-mode)

Negates WLAN mode commands and reverts values to their default

Supported in the following platforms:

- Access Points — AP 6522, AP 6532, AP 6562, AP 7502, AP 7522, AP 7532, AP 7161, AP 81XX, AP 8232
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 7500, NX 9500, NX 9510

### Syntax

```
no <PARAMETERS>
```

### Parameters

None

### Usage Guidelines

The *no* command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

### Examples

|                                                    |                                                                                        |
|----------------------------------------------------|----------------------------------------------------------------------------------------|
| <code>nx9500-6C8809(config-wlan-test)#no ?</code>  |                                                                                        |
| <code>accounting</code>                            | Configure how accounting records are created for this wlan                             |
| <code>acl</code>                                   | Actions taken based on ACL configuration [ packet drop being one of them]              |
| <code>answer-broadcast-probes</code>               | Do not Include this wlan when responding to probe requests that do not specify an SSID |
| <code>assoc-response</code>                        | Association response threshold                                                         |
| <code>association-list</code>                      | Configure the association list for the wlan                                            |
| <code>authentication-type</code>                   | Reset the authentication to use on this wlan to default (none/Pre-shared keys)         |
| <code>broadcast-dhcp</code>                        | Configure broadcast DHCP packet handling                                               |
| <code>broadcast-ssid</code>                        | Do not advertise the SSID of the WLAN in beacons                                       |
| <code>captive-portal-enforcement</code>            | Configure how captive-portal is enforced on the wlan                                   |
| <code>client-access</code>                         | Disallow client access on this wlan (no data operations)                               |
| <code>client-client-communication</code>           | Disallow switching of frames from one wireless client to another on this wlan          |
| <code>client-load-balancing</code>                 | Disable load-balancing of clients on this wlan                                         |
| <code>controller-assisted-mobility</code>          | Disable configure assisted mobility                                                    |
| <code>data-rates</code>                            | Reset data rate configuration to default                                               |
| <code>description</code>                           | Reset the description of the wlan                                                      |
| <code>downstream-group-addressed-forwarding</code> | Disable downstream group addressed forwarding of packets                               |
| <code>dpi</code>                                   | Deep-Packet-Inspection (Application Assurance)                                         |
| <code>dynamic-vlan-assignment</code>               | Dynamic VLAN assignment configuration                                                  |
| <code>eap-types</code>                             | Allow all EAP types on this wlan                                                       |
| <code>encryption-type</code>                       | Reset the encryption to use on this wlan to default (none)                             |
| <code>enforce-dhcp</code>                          | Drop packets from Wireless Clients with static IP address                              |
| <code>fast-bss-transition</code>                   | Disable support for 802.11r Fast BSS Transition                                        |
| <code>http-analyze</code>                          | Enable HTTP URL analysis on the wlan                                                   |
| <code>ip</code>                                    | Internet Protocol (IP)                                                                 |
| <code>ipv6</code>                                  | Internet Protocol version 6 (IPv6)                                                     |
| <code>kerberos</code>                              | Configure kerberos authentication parameters                                           |
| <code>mac-authentication</code>                    | Configure mac-authentication related parameters                                        |
| <code>nsight</code>                                | Nsight Server                                                                          |
| <code>opendns</code>                               | OpenDNS related config for this wlan                                                   |
| <code>protected-mgmt-frames</code>                 | Disable support for Protected Management Frames (IEEE 802.11w)                         |
| <code>proxy-arp-mode</code>                        | Configure handling of ARP requests with proxy-arp is enabled                           |
| <code>proxy-nd-mode</code>                         | Configure handling of IPv6 ND requests with proxy-nd is enabled                        |
| <code>qos-map</code>                               | Disable the 802.11u QoS map element                                                    |

|                            |                                                                     |
|----------------------------|---------------------------------------------------------------------|
| radio-resource-measurement | and frame<br>Disable support for 802.11k Radio Resource Measurement |
| radius                     | Configure RADIUS related parameters                                 |

```

### *wlan-qos-policy*

Configures a WLAN QoS policy and enters its configuration mode

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

#### **Parameters**

```
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

|                        |                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------|
| <WLAN-QOS-POLICY-NAME> | Specify the WLAN QoS policy name. If a policy with the specified name does not exist, it is created. |
|------------------------|------------------------------------------------------------------------------------------------------|

#### **Examples**

```
nx9500-6C8809(config)#wlan-qos-policy test
nx9500-6C8809(config-wlan-qos-test)#?
WLAN QoS Mode commands:
 accelerated-multicast Configure accelerated multicast streams address and
 forwarding QoS classification
 classification Select how traffic on this WLAN must be classified
 (relative prioritization on the radio)
 multicast-mask Egress multicast mask (frames that match bypass the
 PSPqueue. This permits intercom mode operation
 without delay even in the presence of PSP clients)
 no Negate a command or set its defaults
 qos Quality of service
 rate-limit Configure traffic rate-limiting parameters on a
 per-wlan/per-client basis
 svp-prioritization Enable spectralink voice protocol support on this
 wlan
 voice-prioritization Prioritize voice client over other client (for
 non-WMM clients)
 wmm Configure 802.11e/Wireless MultiMedia parameters

 clrscr Clears the display screen
 commit Commit all changes made in this session
```

```

do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

```

```
nx9500-6C8809(config-wlan-qos-test)#
```

## Related Commands

|           |                              |
|-----------|------------------------------|
| <b>no</b> | Removes an existing WLAN QoS |
|-----------|------------------------------|

### Note

For more information on WLAN QoS policy commands, see [WLAN-QoS-POLICY](#).

## *url-filter*

Creates a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user's request (in the form of a HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user's application (browser/email reader), the network's gateway, at the ISP's (Internet service provider) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration, these 12 category-types have been grouped into five (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see [web-filter-policy](#).

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter's blacklist these three sites are banned. Where as,

when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see [url-list](#).

**Note**

URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see [license](#) on page 1267 (device config mode).

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

`url-filter <URL-FILTER-NAME>`

**Parameters**

`url-filter <URL-FILTER-NAME>`

|                                      |                                                                                                                                                             |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;URL-FILTER-NAME&gt;</code> | Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If a filter with the specified name does not exist, it is created. |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Usage Guidelines**

| SI No. | Category Type           | Category                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### url-filter-config-commands

The following table summarizes URL filter configuration mode commands:

**Table 31: URL Filter Config Mode Commands**

| Command                            | Description                                                                                                                                        |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>blacklist</code> on page 626 | Creates a blacklist rule defining a list of banned Websites and URLs                                                                               |
| <code>blockpage</code> on page 628 | Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed |

**Table 31: URL Filter Config Mode Commands (continued)**

| Command                                 | Description                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------|
| <a href="#">description</a> on page 629 | Configures an appropriate description for this URL filter                                |
| <a href="#">whitelist</a> on page 630   | Creates a whitelist rule defining a list of Websites and URLs allowed access by clients. |
| <a href="#">no</a> on page 632          | Removes this URL filter's configured parameters                                          |

## blacklist

Creates a blacklist rule. A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides five (5) levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see [url-filter](#).

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
blacklist [category-type|level|url-list]
blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
blacklist level [basic|high|low|medium|medium-high] precedence <1-500>
{description <LINE>}
blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

### Parameters

```
blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-
sharing|
software-updates] precedence <1-500> {description <LINE>}
```

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blacklist category-type<br><SELECT-CATEGORY-TYPE> | <p>Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.</p> <p>Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates</p> <p>Select 'all' to blacklist all category-types.</p> <p>Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories:</p> <ul style="list-style-type: none"> <li>• alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.</li> </ul> <p>The system blocks all categories (URLs falling within their limits) within the selected category-type.</p> |
| precedence <1-500>                                | Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| description <LINE>                                | Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

```
blacklist level [basic|high|low|medium|medium-high] precedence <1-500> {description <LINE>}
```

|                                                     |                                                                                                                                                                                                    |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blacklist level [basic high low medium medium-high] | Configures the Web filtering level as basic, high, low, medium, or medium-high. Each of these filter-levels are pre-configured to use a set of category types and this mapping cannot be modified. |
| precedence <1-500>                                  | Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                  |
| description <LINE>                                  | Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.                                 |

```
blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blacklist url-list <URL-LIST-NAME> | <p>Associates a URL list with this URL filter. When associated with a blacklist rule, all URLs listed in the specified URL list are blacklisted.</p> <p>URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see <a href="#">url-list</a>.</p> <ul style="list-style-type: none"> <li>• &lt;URL-LIST-NAME&gt; – Enter URL list name (should be existing and configured)</li> </ul> |
| precedence <1-500>                 | Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                                                                                                                                                                                                                                                                                                                                                                                       |
| description <LINE>                 | Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                      |

## blockpage

Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
blockpage [external|internal|path]
blockpage path [external|internal]
blockpage external url <URL>
blockpage internal [content|footer|header|main-logo|org-name|org-signature|
small-logo|title] <LINE/IMAGE-URL>
```

## Parameters

```
blockpage path [external|internal]
```

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>blockpage path [external internal]</code> | Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal <ul style="list-style-type: none"><li>• external – Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the <b>blockpage &gt; external &gt; url &lt;URL&gt;</b> command to provide the path to the external Web server hosting the page.</li><li>• internal – Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the <b>blockpage &gt; internal &gt; &lt;SELECT-PAGE-TYPE&gt; &gt; &lt;LINE/IMAGE-URL&gt;</b> command to define the page configuration.</li></ul> |

## whitelist

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
whitelist [category-type|url-list]
whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
```

## Parameters

```
whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
```

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| whitelist category-type <SELECT-CATEGORY-TYPE> | <p>Selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.</p> <p>Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates.</p> <p>Select 'all' to whitelist all category-types.</p> <p>Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories:</p> <ul style="list-style-type: none"> <li>• alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.</li> </ul> <p>The system allows all categories (URLs falling within their limits) within the selected category-type.</p> |
| precedence <1-500>                             | Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| description <LINE>                             | Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| whitelist url-list <URL-LIST-NAME> | <p>Associates a URL list with this URL filter. When associated with a whitelist rule, all URLs listed in the specified URL list are allowed access.</p> <p>URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see <a href="#">url-list</a>.</p> <ul style="list-style-type: none"> <li>• &lt;URL-LIST-NAME&gt; - Enter URL list name (should be existing and configured)</li> </ul> |
| precedence <1-500>                 | Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.                                                                                                                                                                                                                                                                                                                                                                                          |
| description <LINE>                 | Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                         |

## Examples

```
nx9500-6C8809(config-url-filter-test)#whitelist category-type communication category chat
precedence 7
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
description "Blacklists sites inappropriate for children and are security risks."
blacklist level medium-high precedence 10
whitelist category-type communication category chat precedence 7
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
```

```
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
nx9500-6C8809(config-url-filter-test)#
```

|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no on page 632 | Removes a whitelist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed from the URL filter. |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

no

Use the no command to remove this URL filter's configured parameters

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
no [blacklist|blockpage|description|whitelist]
no blacklist [category-type|level|url-list]
no blacklist [category-type <SELECT-CATEGORY-TYPE>|level <SELECT-LEVEL>|
url-list <URL-LIST-NAME>] precedence <1-500>
no blockpage [external|internal [content|footer|header|main-logo|org-name|
org-signature|small-logo|title]|path]
no description
no whitelist [category-type|url-list]
no whitelist [category-type <SELECT-CATEGORY-TYPE>|url-list <URL-LIST-NAME>]
precedence <1-500>
```

## Parameters

```
no <PARAMETERS>
```

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| no <PARAMETERS> | Removes this URL filter's configured parameters based on the values passed here |
|-----------------|---------------------------------------------------------------------------------|

## Examples

The following example displays the URL filter 'test' settings before the 'no' is executed:

```
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 description "Blacklists sites inappropriate for children and are security risks."
 blacklist level medium-high precedence 10
 whitelist category-type communication category chat precedence 7
 blacklist category-type security-risk category botnets precedence 3
 blacklist category-type adult-content category alcohol-tobacco precedence 1
 blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
nx9500-6C8809(config-url-filter-test)#
nx9500-6C8809(config-url-filter-test)#no description
nx9500-6C8809(config-url-filter-test)#no blacklist category-type adult-content
category alcohol-tobacco precedence 1
nx9500-6C8809(config-url-filter-test)#no whitelist category-type communication
category chat precedence 7
```

The following example displays the URL filter 'test' settings after the 'no' is executed:

```
nx9500-6C8809(config-url-filter-test)#show context
url-filter test
 blacklist level medium-high precedence 10
 blacklist category-type security-risk category botnets precedence 3
 blockpage internal content "The requested Web page is blocked and cannot be displayed for
viewing"
nx9500-6C8809(config-url-filter-test)#
```

### *url-list*

Creates a URL list and enters its configuration mode. URL lists are a means of categorizing URLs on the basis of various criteria, such as frequently used, not-permitted, etc. It is used in URL filters to identify whitelisted/blacklisted URLs. Web requests are blocked or approved based on URL filter whitelist/blacklist rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
url-list <URL-LIST-NAME>
```

#### **Parameters**

```
url-list <URL-LIST-NAME>
```

<URL-LIST-NAME> • Specify the URL list name. The URL list is created if another list with the same name does not exist.

#### **Examples**

```
nx9500-6C8809(config)#url-list URLlist1
nx9500-6C8809(config-url-list-URLlist1)#?
URL List Mode commands:
 description Description of the category
 no Negate a command or set its defaults
 url Add a URL entry

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

nx9500-6C8809(config-url-list-URLlist1)#
nx9500-6C8809(config-url-list-URLlist1)#url http://www.example_company.com depth 10
nx9500-6C8809(config-url-list-test)#show context
url-list test
```

```
url http://www.example_company.com depth 10
nx9500-6C8809(config-url-list-URLlist1)#
```

### Related Commands

### url-list-config-commands

The following table summarizes URL list configuration mode commands:

**Table 32: URL List Config Mode Commands**

| Command                 | Description                                                           |
|-------------------------|-----------------------------------------------------------------------|
| url on page 634         | Adds URL entries to this URL list                                     |
| description on page 634 | Creates a blacklist rule defining a list of banned Web sites and URLs |
| no on page 635          | Removes this URL list's settings                                      |

### description

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
description <LINE>
```

### Parameters

```
description <LINE>
```

|                    |                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------|
| description <LINE> | Provide a unique description for this URL list (should not exceed 500 characters in length). |
|--------------------|----------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config-url-list-test)#description ""This URL list contains social media
URLs.""
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs."
nx9500-6C8809(config-url-list-test)#
```

### Related Commands

|                |                                     |
|----------------|-------------------------------------|
| no on page 635 | Removes this URL list's description |
|----------------|-------------------------------------|

### url

Adds URL entries to this URL list

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
url <WORD> {depth <1-10>}
```

Parameters

```
url <WORD> {depth <1-10>}
```

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url <WORD> {depth <1-10>} | Adds a URL entry <ul style="list-style-type: none"><li>• &lt;WORD&gt; - Specify the URL to add.</li><li>• depth - Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache.<ul style="list-style-type: none"><li>&lt;1-10&gt; - Specify the depth from 1 - 10.</li></ul></li></ul> |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Examples

```
nx9500-6C8809(config-url-list-test)#url http://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs."
 url https://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#
```

Related Commands

|----------------|----------------------------------------|
| no on page 635 | Removes a URL entry from this URL list |
|----------------|----------------------------------------|

no

Removes this URL list's settings

Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

Syntax

```
no [description|url]
no description
no url <WORD>
```

Parameters

```
no <PARAMETERS>
```

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| no <PARAMETERS> | Removes this URL's settings based on the parameters passed |
|-----------------|------------------------------------------------------------|

Examples

The following example displays the URL list 'test' settings before the 'no' command is executed:

```
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social media URLs."
 url https://www.facebook.com depth 5
nx9500-6C8809(config-url-list-test)#
nx9500-6C8809(config-url-list-test)#no url www.facebook.com
```

The following example displays the URL list 'test' settings after the 'no' command is executed:

```
nx9500-6C8809(config-url-list-test)#show context
url-list test
 description "This URL list contains social communication URLs"
nx9500-6C8809(config-url-list-test)#
```

## vx9000

Configures a Virtual WLAN Controller (V-WLC) in a VM (virtual machine) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.
- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

### Supported in the following platforms:

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### Syntax

```
vx9000 <MAC>
```

### Parameters

```
vx9000 <MAC>
```

|              |                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| vx9000 <MAC> | Configures a V-WLC and enters its configuration mode. The V-WLC configuration is the same as that of a normal controller. |
|--------------|---------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809(config)#vx9000 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?
Device Mode commands:
 adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning
```

|                           |                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------|
|                           | policy when adopted by another controller                                                                          |
| adoption                  | Adoption configuration                                                                                             |
| adoption-site             | Set system's adoption site                                                                                         |
| adoption-mode             | Configure the adoption mode for the access-points in this RF-Domain                                                |
| alias                     | Alias                                                                                                              |
| application-policy        | Application Policy configuration                                                                                   |
| area                      | Set name of area where the system is located                                                                       |
| arp                       | Address Resolution Protocol (ARP)                                                                                  |
| auto-learn                | Auto learning                                                                                                      |
| autogen-uniqueid          | Autogenerate a unique id                                                                                           |
| autoinstall               | Autoinstall settings                                                                                               |
| bluetooth-detection       | Detect Bluetooth devices using the Bluetooth USB module - there will be interference on 2.4 Ghz radio in wlan mode |
| bridge                    | Ethernet bridge                                                                                                    |
| captive-portal            | Captive portal                                                                                                     |
| cdp                       | Cisco Discovery Protocol                                                                                           |
| channel-list              | Configure channel list to be advertised to wireless clients                                                        |
| cluster                   | Cluster configuration                                                                                              |
| configuration-persistence | Enable persistence of configuration across reloads (startup configfile)                                            |
| contact                   | Configure the contact                                                                                              |
| controller                | WLAN controller configuration                                                                                      |
| country-code              | Configure the country of operation                                                                                 |
| critical-resource         | Critical Resource                                                                                                  |
| crypto                    | Encryption related commands                                                                                        |
| database                  | Database command                                                                                                   |
| device-upgrade            | Device firmware upgrade                                                                                            |
| dot1x                     | 802.1X                                                                                                             |
| dpi                       | Enable Deep-Packet-Inspection (Application Assurance)                                                              |
| dscp-mapping              | Configure IP DSCP to 802.1p priority mapping for untagged frames                                                   |
| email-notification        | Email notification configuration                                                                                   |
| enforce-version           | Check the firmware versions of devices before interoperating                                                       |
| environmental-sensor      | Environmental Sensors Configuration                                                                                |
| events                    | System event messages                                                                                              |
| export                    | Export a file                                                                                                      |
| file-sync                 | File sync between controller and adoptees                                                                          |
| floor                     | Set the floor within a area where the system is located                                                            |
| geo-coordinates           | Configure geo coordinates for this device                                                                          |
| gre                       | GRE protocol                                                                                                       |
| hostname                  | Set system's network name                                                                                          |
| http-analyze              | Specify HTTP-Analysis configuration                                                                                |
| interface                 | Select an interface to configure                                                                                   |
| ip                        | Internet Protocol (IP)                                                                                             |
| ipv6                      | Internet Protocol version 6 (IPv6)                                                                                 |
| l2tpv3                    | L2tpv3 protocol                                                                                                    |
| l3e-lite-table            | L3e lite Table                                                                                                     |
| layout-coordinates        | Configure layout coordinates for this device                                                                       |
| led                       | Turn LEDs on/off on the device                                                                                     |
| led-timeout               | Configure the time for the led to                                                                                  |

|                                    |                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------|
|                                    | turn off after the last radio state change                                          |
| legacy-auto-downgrade              | Enable device firmware to auto downgrade when other legacy devices are detected     |
| legacy-auto-update                 | Auto upgrade of legacy devices                                                      |
| license                            | License management command                                                          |
| lldp                               | Link Layer Discovery Protocol                                                       |
| load-balancing                     | Configure load balancing parameter                                                  |
| location                           | Configure the location                                                              |
| logging                            | Modify message logging facilities                                                   |
| mac-address-table                  | MAC Address Table                                                                   |
| mac-auth                           | 802.1X                                                                              |
| mac-name                           | Configure MAC address to name mappings                                              |
| management-server                  | Configure management server address                                                 |
| memory-profile                     | Memory profile to be used on the device                                             |
| meshpoint-device                   | Configure meshpoint device parameters                                               |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                             |
| min-misconfiguration-recovery-time | Check controller connectivity after configuration is received                       |
| mint                               | MiNT protocol                                                                       |
| mirror                             | Mirroring                                                                           |
| misconfiguration-recovery-time     | Check controller connectivity after configuration is received                       |
| mpact-server                       | MPACT server configuration                                                          |
| neighbor-inactivity-timeout        | Configure neighbor inactivity timeout                                               |
| neighbor-info-interval             | Configure neighbor information exchange interval                                    |
| no                                 | Negate a command or set its defaults                                                |
| noc                                | Configure the noc related setting                                                   |
| nsight                             | NSight                                                                              |
| ntp                                | Ntp server WORD                                                                     |
| offline-duration                   | Set duration for which a device remains unadopted before it generates offline event |
| override                           | Override a command                                                                  |
| override-wlan                      | Configure RF Domain level overrides for wlan                                        |
| power-config                       | Configure power mode                                                                |
| preferred-controller-group         | Controller group this system will prefer for adoption                               |
| preferred-tunnel-controller        | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic  |
| radius                             | Configure device-level radius authentication parameters                             |
| raid                               | RAID                                                                                |
| remove-override                    | Remove configuration item override from the device (so profile value takes effect)  |
| rf-domain-manager                  | RF Domain Manager                                                                   |
| router                             | Dynamic routing                                                                     |
| rsa-key                            | Assign a RSA key to a service                                                       |
| sensor-server                      | AirDefense sensor server configuration                                              |
| slot                               | PCI expansion Slot                                                                  |
| spanning-tree                      | Spanning tree                                                                       |
| timezone                           | Configure the timezone                                                              |

|                       |                                                                               |
|-----------------------|-------------------------------------------------------------------------------|
| traffic-class-mapping | Configure IPv6 traffic class to 802.1p priority mapping for untagged frames   |
| trustpoint            | Assign a trustpoint to a service                                              |

# COMMON COMMANDS

## COMMON COMMANDS

---

This chapter describes the CLI commands common to the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes.

The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

### common-commands

The following table summarizes the commands common to the User Exec, Priv Exec, Global Config modes, and all other configuration contexts:

*Table: Common Commands*

| Command              | Description                                                                           |
|----------------------|---------------------------------------------------------------------------------------|
| <code>clrscr</code>  | Clears the display screen                                                             |
| <code>commit</code>  | Commits (saves) changes made in the current session                                   |
| <code>exit</code>    | Ends and exits the current mode and moves to the PRIV EXEC mode                       |
| <code>help</code>    | Displays the interactive help system                                                  |
| <code>no</code>      | Negates a command or reverts values to their default settings                         |
| <code>revert</code>  | Reverts changes to their last saved configuration                                     |
| <code>service</code> | Invokes service commands to troubleshoot or debug (config-if) instance configurations |
| <code>show</code>    | Displays running system information                                                   |
| <code>write</code>   | Writes the system's running configuration to memory or terminal                       |

#### *clrscr*

Clears the screen and refreshes the prompt, irrespective of the mode

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
clrscr
```

## Parameters

None

## Examples

The following example shows the terminal window or screen before the `clrscr` command is executed:

```
rfs4000-229D58#device-upgrade ?
 DEVICE-NAME Name/MAC address of device
 all Upgrade all devices
 ap650 Upgrade AP650 Device
 ap6522 Upgrade AP6522 Device
 ap6532 Upgrade AP6532 Device
 ap6562 Upgrade AP6562 Device
 ap71xx Upgrade AP7161 Device
 ap7502 Upgrade AP7502 Device
 ap7522 Upgrade AP7522 Device
 ap7532 Upgrade AP7532 Device
 ap7562 Upgrade AP7562 Device
 ap81xx Upgrade AP8163 Device
 ap8432 Upgrade AP8432 Device
 ap8533 Upgrade AP8533 Device
 cancel-upgrade Cancel upgrading the device
 load-image Load the device images to controller for device-upgrades
 rf-domain Upgrade all devices belonging to an RF Domain
 rfs4000 Upgrade RFS4010 Device
```

```
rfs4000-229D58#
```

The terminal window or screen after the `clrscr` command is executed:

```
rfs4000-229D58#
```

## *commit*

Commits changes made in the active session. Use the `commit` command to save and invoke settings entered during the current transaction.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
commit {write}{memory}
```

## Parameters

```
commit {write}{memory}
```

|        |                                                                                         |
|--------|-----------------------------------------------------------------------------------------|
| write  | Optional. Commits changes made in the current session                                   |
| memory | Optional. Writes to memory. This option ensures current changes persist across reboots. |

## Examples

```
nx9500-6C8809#commit write memory
[OK]
nx9500-6C8809#
```

## exit

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from *(config)#* to *#*. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system will prompt you to either do a commit or a revert before terminating the session.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
exit
```

### Parameters

None

### Examples

```
nx9500-6C8809(config)#exit
nx9500-6C8809#
```

## help

Describes the interactive help system

Use this command to access the advanced help feature. Use "?" anytime at the command prompt to access the help topic

Two kinds of help are provided:

- Full help is available when ready to enter a command argument
- Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example 'show ve?').

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
help {search/show}
help {search <WORD>} {detailed/only-show/skip-no/skip-show}
```

### Parameters

```
help {search <WORD>} {detailed/only-show/skip-no/skip-show}
```

|               |                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| search <WORD> | Optional. Searches for CLI commands related to a specific target term <ul style="list-style-type: none"> <li>• &lt;WORD&gt; - Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.</li> </ul> |
| detailed      | Optional. Searches and displays help strings in addition to mode and commands                                                                                                                                                                                                                                                                                                                   |
| only-show     | Optional. Displays only "show" commands. Does not display configuration commands.                                                                                                                                                                                                                                                                                                               |
| skip-no       | Optional. Displays only configuration commands. Does not display "no" commands                                                                                                                                                                                                                                                                                                                  |
| skip-show     | Optional. Displays only configuration commands. Does not display "show" commands                                                                                                                                                                                                                                                                                                                |

```

*no*

Negates a command or sets its default. Though the `no` command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
no <PARAMETER>
```

## Parameters

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no <PARAMETERS> | The no command is common across all configuration modes and sub modes. It resets or reverts settings based on the mode in which executed. For example, when executed in the AAA policy configuration mode, it allows you to reset or revert a specific AAA policy settings. Similarly, when executed in the global configuration mode, it only resets or reverts settings configured in the global configuration mode. |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Global Config mode: No command options

| ipv6-router-advertisement-policy | IPv6 Router Advertisement related configuration                       |
| l2tpv3                           | Negate a command or set its defaults                                  |
| mac                              | MAC configuration                                                     |
| management-policy                | Delete a management policy                                            |
| meshpoint                        | Delete a meshpoint object                                             |
| meshpoint-qos-policy             | Delete a mesh point QoS configuration policy                          |
| nac-list                         | Delete an network access control list                                 |
| nsight-policy                    | Delete a nsight policy                                                |
| passpoint-policy                 | Delete a passpoint configuration policy                               |
| password-encryption              | Disable password encryption in configuration                          |
| profile                          | Delete a profile and all its associated configuration                 |
| radio-qos-policy                 | Delete a radio QoS configuration policy                               |
| radius-group                     | Local radius server group configuration                               |
| radius-server-policy             | Remove device onboard radius policy                                   |
| radius-user-pool-policy          | Configure Radius User Pool                                            |
| rf-domain                        | Delete one or more RF-domains and all their associated configurations |
| roaming-assist-policy            | Delete a roaming-assist policy                                        |
| role-policy                      | Role based firewall policy                                            |
| routing-policy                   | Policy Based Routing Configuratio                                     |
| rtl-server-policy                | Delete a rtl server policy                                            |
| schedule-policy                  | Delete a schedule policy                                              |
| sensor-policy                    | Delete a sensor policy                                                |
| smart-rf-policy                  | Delete a smart-rf-policy                                              |
| url-filter                       | Delete a url filter                                                   |
| url-list                         | Delete a URL list                                                     |
| web-filter-policy                | Delete a web filter policy                                            |
| wips-policy                      | Delete a wips policy                                                  |
| wlan                             | Delete a wlan object                                                  |
| wlan-qos-policy                  | Delete a wireless lan QoS configuration policy                        |
| service                          | Service Commands                                                      |

### revert

Reverts changes made, in the current session, to their last saved configuration

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
revert
```

#### Parameters

None

#### Examples

```

nx9500-6C8809revert
nx9500-6C8809

```

### service

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The *User Exec mode* and *Priv Exec mode* commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode's CLI tree.

This topic is organized into the following sections:

- [Syntax \(User Exec Mode\)](#)
- [Parameters \(User Exec Mode\)](#)
- [Syntax \(Priv Exec Mode\)](#)
- [Parameters \(Priv Exec Mode\)](#)

- 
- [Syntax - NX9XXX-Specific \(Privi Exec Mode\)](#)
  - [Parameters - NX9XXX-Specific \(Privi Exec Mode\)](#)
  - [Syntax \(Global Config Mode\)](#)
  - [Parameters \(Global Config Mode\)](#)
  - [Examples](#)

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax (User Exec Mode)**

## Parameters (User Exec Mode)

### Service Commands - Intro

```
service [block-adopter-config-update|request-full-config-from-adopter]
```

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| block-adopter-config-update      | Blocks the configuration updates pushed from the NOC (Network Operations Center) server to adopted devices                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| request-full-config-from-adopter | Configures a request for full configuration updates from the adopter device<br>In an HM (hierarchically managed) network devices are deployed in two levels. The first level consists of the NOC controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (Access Points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'. |

```
service clear adoption history {on <DEVICE-NAME>}
```

|                        |                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear adoption history | Clears adoption history on this device and its adopted Access Points                                                                                                                                |
| on <DEVICE-NAME>       | Optional. Clears adoption history on a specified device <ul style="list-style-type: none"><li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

```
service clear device-upgrade history {on <DOMAIN-NAME>}
```

|                              |                                                                                                                                                                          |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear device-upgrade history | Clears device upgrade history                                                                                                                                            |
| on <DOMAIN-NAME>             | Optional. Clears all firmware upgrade history on a specified RF Domain <ul style="list-style-type: none"><li>&lt;DOMAIN-NAME&gt; - Specify the RF Domain name.</li></ul> |

```
service clear diag pkts
```

|                 |                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear diag pkts | Clears the looped packets queue logged by the dataplane. The dataplane logs up to 16 looped packets at a time in a separate queue, which has to be manually cleared to make space for new packet logging.<br>For more information on viewing logged looped packet information execute the <b>service &gt; show &gt; diag &gt; pkts</b> command. |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
service clear dpi [all|app|app-category] stats {on <DEVICE-OR-DOMAIN-NAME>}
```

|                              |                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear dpi                    | Clears DPI (Deep Packet Inspection) statistics<br>When enabled, DPI allows application and/or application category recognition. The DPI statistics are maintained by the system for every hit registered by the DPI engine.                                                                                                            |
| [all app app-category] stats | Use the following filter options to clear all or specific DPI statistics: <ul style="list-style-type: none"> <li>• all – Clears all DPI related (application and app-category) statistics</li> <li>• app – Clears only application related statistics</li> <li>• app-category – Clears only app-category related statistics</li> </ul> |
| on <DEVICE-OR-DOMAIN-NAME>   | Optional. Clears DPI statistics based on the parameters passed on a specified device or RF Domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the access point, controller, service platform, or RF Domain.</li> </ul>                                                                |

```

| offline-for days <0-999><br>{time <HH:MM:SS>} | Removes offline devices from the EGuest server database. Offline devices are devices that have not been reporting to the EGuest server for a specified number of days. Use this option to configure that threshold value. Devices that have not reported to the EGuest server for the number of days specified here are considered to be offline and removed. <ul style="list-style-type: none"> <li>• days &lt;0-999&gt; – Specify the threshold, in days, from 0 - 999.</li> <li>• time &lt;HH:MM:SS&gt; – Option. In addition to the number of days, you can also specify the time in hours, minutes, and seconds. If specified, a device is removed if it has not reported to the server for the specified number of days and time.</li> </ul> |

```
service eguest restore factory-default
```

|                         |                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eguest                  | Enables EGuest server data maintenance                                                                                                                                                                                                                                         |
| restore factory-default | Reinitializes the EGuest server to factory-default settings. Use this option to stop the EGuest server and database.<br><br><b>Note:</b> Extreme caution is recommended, as this command deletes data related to EGuest server and database. Debug log files are also deleted. |

```
service clear file-sync history {on <DOMAIN-NAME>}
```

|                         |                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear file-sync history | Clears client-bridge certificate synchronization statistics<br>When an AP 6522/AP 6562 access point is configured as a client bridge, the EAP-TLS X.509 (PKCS#12) certificate is synchronized between the staging-controller and adoptee AP 6522/AP 6562 client-bridge access points. This command allows you to clear client-bridge certificate synchronization statistics. |
| on <DOMAIN-NAME>        | Optional. Clears file synchronization history on all devices within a specified RF Domain <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</li> </ul>                                                                                                                                                                              |

|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force-send-config          | Forces pushes configuration to device(s)                                                                                                                                                                                                                                  |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Pushes configuration to a specified device or all devices in a specified RF Domain <ul style="list-style-type: none"> <li>&lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

`service force-update-vm-stats {on <DEVICE-NAME>}`

|                       |                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force-update-vm-stats | Forcefully pushes VM statistics on to the NOC                                                                                                                |
| on <DEVICE-NAME>      | Optional. Executes the command on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; – Specify the name of the device.</li> </ul> |

`service guest-registration backup [delete|restore]`

```
service guest-registration
backup [delete|restore]
```

Deletes or restores all guest registration backup snapshots based on the parameter passed

- delete – Deletes all guest registration backup snapshots
- restores – Restores all guest registration backup snapshots

**Note:** To view the status of the restore process, use the **service > show > guest-registration > restore-status** command.

```
service guest-registration delete [all|email <EMAIL-ADD>|group <RAD-GROUP-NAME>|
mac <MAC>|mobile <MOBILE-NUMBER>|name <CLIENT-FULL-NAME>|non-social|
offline-for days <1-999>|wlan <WLAN-NAME>|otp-incomplete-for days <1-999>|
social [facebook|google]]
```

```
service guest-registration
delete
```

Deletes a specified user or all user records from the guest-registration database  
To delete a specific user, use one of the following options as an identification parameter: email, group, mac, mobile number, name, offline-for, wlan, otp-incomplete-for, or social.

```
[all|email <EMAIL-ADD>|group <RAD-GROUP-NAME>|mac <MAC>|mobile <MOBILE-NUMBER>|name <CLIENT-FULL-NAME>]|non-social|
offline-for days <1-999>|wlan <WLAN-NAME>|otp-incomplete-for days <1-999>|
social [facebook|google]
```

Following are the user filtering options: The user identified by one of the following parameters is deleted from the guest-registration database.

- email <EMAIL-ADD> – Identifies user by the e-mail address
  - <EMAIL-ADD> – Provide the user’s e-mail address.
- mac <MAC> – Identifies user by the MAC address
  - <MAC> – Provide the user’s MAC address.
- group <RAD-GROUP-NAME> – Identifies users by their RADIUS group association
  - <RAD-GROUP-NAME> – Specify the RADIUS group name.
- mobile <MOBILE-NUMBER> – Identifies user by the registered mobile number
  - <MOBILE-NUMBER> – Provide the user’s mobile number.
- name <CLIENT-FULL-NAME> – Identifies user by the registered full name
  - <CLIENT-FULL-NAME> – Provide the user’s full name.
- non-social – Identifies users that have not registered through social authentication
- offline-for days <1-999> – Filters users who have not accessed the network for a specified number of days
  - days <1-999> – Specify the number of days from 1 - 999.
- wlan <WLAN-NAME> – Identifies users accessing a specified WLAN
  - <WLAN-NAME> – Specify the WLAN name.
- otp-incomplete-for days <1-999> – Identifies records of users that have not used their OTP (one-time-password) to complete registration within a specified number of days
  - days <1-999> – Specify the number of days from 1 - 999.
- social [facebook|google] – Identifies users using either Facebook or Google credentials to access the network
  - facebook – Identifies users using Facebook authentication
  - google – Identifies users using Google authentication

```
service guest-registration export format [csv|json] <DEST-URL> {(rfdomain <DOMAIN-NAME>|
time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]|wlan <WLAN-NAME>)}
```

|                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| show diag [fds pkts] | Displays diagnostic statistics, such as LED status, fan speed, sensor temperature, open file descriptors, looped packets, etc.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| fds                  | Displays the number of fds (file descriptors) opened by key processes, such as the CFGD. When executed, the command displays only the file name and FD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| pkts                 | <p>Displays details of looped packets captured by the dataplane and pushed to a separate queue. These queued packets are written to a log file (named loop_pkt_info.log) available at the /var2/log/ directory. Use the <b>service &gt; start-shell</b> command and enter the path 'cat /var2/log/' to view if the loop_pkt_info.log file exists. However, looped packet logging has to be enabled in the profile/device context. For more information, see <a href="#">diag</a> on page 983 (profile config mode).</p> <p>The dataplane can log up to 16 looped packets at a time. Once the queue is full, no new loop packet is logged until the existing queue is cleared. To clear the logged looped packet queue execute the <b>service &gt; clear &gt; diag &gt; pkts</b> command.</p> <p>Following are the loop codes and the corresponding loop reasons:</p> <ul style="list-style-type: none"> <li>• (5) - "pkt looping in dataplane"</li> <li>• (51) - "loop in packet path"</li> <li>• (367) - "wispe encapsulation loop"</li> <li>• (432) - "mcx loop prevention"</li> <li>• (532) - "Port loop detected"</li> <li>• (536) - "packet loop detected by wireless bridge"</li> <li>• (41) - "IPv4 TTL exceeded"</li> <li>• (493) - "IPv6 TTL exceeded"</li> <li>• (540) - "mint TTL exceeded"</li> </ul> |

```
service show diag [led-status|psu|stats] {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                                                                           |

service show [fib|fib6] {table-id <0-255>}
```

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show             | Displays running system statistics based on the parameters passed                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| fib              | Displays entries in the FIB (Forwarding Information Base)                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| fib6             | Displays FIB IPv6 static routing entries<br>The WiNG software allows the IPv6 FIB to maintain only IPv6 static and interface routes. FIB is a collection of routing entries. A route entry consists of IPv6 network (which can also be a host) address, the prefix length for the network (for IPv6 routes this is between 0 - 128), and the next hop's (gateway) IPv6 address. Since a destination can be reached through multiple next hops, you can configure multiple routes to the same destination with multiple next hops. |
| table-id <0-255> | Optional. Displays FIB information maintained by the system based on the table ID<br>• <0-255> - Specify the table ID from 0 - 255.                                                                                                                                                                                                                                                                                                                                                                                               |

```
service show mint [adopted-devices {on <DEVICE-NAME>}|ports]
```

|                                  |                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show                             | Displays running system statistics based on the parameters passed                                                                                                                                                                                                                                           |
| mint                             | Displays MiNT protocol details                                                                                                                                                                                                                                                                              |
| adopted-devices on <DEVICE-NAME> | Displays adopted devices status in dpd2<br>on <DEVICE-NAME> - Optional. Displays MiNT protocol details for a specified device. If no device is specified, the system displays information for the logged device.<br>• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |
| ports                            | Displays MiNT ports used by various services and features                                                                                                                                                                                                                                                   |

```
service show pm {history} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show             | Displays running system statistics based on the parameters passed                                                                                                                                                                              |
| pm               | Displays the PM (Process Monitor) controlled process details                                                                                                                                                                                   |
| history          | Optional. Displays process change history (the time at which the change was implemented, and the events that triggered the change)                                                                                                             |
| on <DEVICE-NAME> | Optional. Displays process change history for a specified device. If no device is specified, the system displays information for the logged device.<br>• <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform. |

```
service show rf-domain-manager [diag|info] {<MAC/HOSTNAME>}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

|                            |                                                                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show                       | Displays running system statistics based on the parameters passed                                                                                                                                                                                                                                                      |
| rf-domain-manager          | Displays RF Domain manager information                                                                                                                                                                                                                                                                                 |
| diag                       | Displays RF Domain manager related diagnostics statistics                                                                                                                                                                                                                                                              |
| info                       | Displays RF Domain manager related information                                                                                                                                                                                                                                                                         |
| <MAC/HOSTNAME>             | The following keyword is common to the 'diag' and 'info' parameters:<br>Optional. Specify the MAC address or hostname of the RF Domain manager.                                                                                                                                                                        |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is common to the 'diag' and 'info' parameters:<br>Optional. Displays diagnostics statistics on a specified device or domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

`service show sites`

|       |                                                                   |
|-------|-------------------------------------------------------------------|
| show  | Displays running system statistics based on the parameters passed |
| sites | Displays NOC sites related information                            |

`service show virtual-machine-history { (on <DEVICE-NAME> ) }`

|                              |                                                                                                                                                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show virtual-machine-history | Displays virtual machine history based on the parameters passed<br>This command is applicable only to the NX 95XX and NX 96XX series service platforms. It is also available on the Privilege Executable Mode of these devices.                                         |
| on <DEVICE-NAME>             | Optional. Displays virtual machine history on a specified device. If no device is specified, the system displays information for the logged device. <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the service platform.</li> </ul> |

`service show wireless [aaa-stats|adaptivity-status|credential-cache|dns-cache|radar-status|vlan-usage] {on <DEVICE-NAME> }`

|                   |                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show              | Displays running system statistics based on the parameters passed                                                                                                                                          |
| wireless          | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN assignment, etc.)                                                                                                                |
| aaa-stats         | Displays AAA policy statistics                                                                                                                                                                             |
| adaptivity-status | Displays the current list of channels (with interference levels exceeding the configured threshold resulting in adaptivity kicking in) and time when adaptivity kicked in on a device                      |
| credential-cache  | Displays clients cached credentials statistics (VLAN, keys, etc.)                                                                                                                                          |
| dns-cache         | Displays cache of resolved names of servers related to wireless networking                                                                                                                                 |
| radar-status      | Displays radar discovery status. This option displays following information: <ul style="list-style-type: none"> <li>• If a radar has been discovered by the AP</li> <li>• The time of discovery</li> </ul> |

|                  |                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan-usage       | Displays VLAN statistics across WLANs                                                                                                                                                                                                                                                                                                                                                        |
| on <DEVICE-NAME> | The following keywords are common to all of the above: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; – Optional. Displays running system statistics on a specified device. If no device is specified, the system displays information for the logged device.</li> <li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
service show wireless [config-internal|log-internal|neighbors]
```

|                 |                                                                                        |
|-----------------|----------------------------------------------------------------------------------------|
| show            | Displays running system statistics based on the parameters passed                      |
| wireless        | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.) |
| config-internal | Displays internal configuration parameters                                             |
| log-internal    | Displays recent internal wireless debug logs (info and above severity)                 |
| neighbors       | Displays neighboring device statistics for roaming and flow migration                  |

```
service show wireless [client|meshpoint neighbor] proc [info|stats] {<MAC>}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show                       | Displays running system statistics based on the parameters passed                                                                                                                                                                                                                                                                                                                               |
| wireless                   | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)                                                                                                                                                                                                                                                                                                          |
| client                     | Displays WLAN client statistics                                                                                                                                                                                                                                                                                                                                                                 |
| meshpoint neighbor         | Displays meshpoint related proc entries                                                                                                                                                                                                                                                                                                                                                         |
| proc                       | The following keyword is common to client and meshpoint neighbor parameters: <ul style="list-style-type: none"> <li>proc – Displays dataplane proc entries based on the parameter selected</li> </ul> <p><b>Note:</b> These proc entries provide statistics on each wireless client on the WLAN.</p> <p><b>Note:</b> For the meshpoint parameter, it displays proc entries about neighbors.</p> |
| info                       | This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain.                                                                                                                                                                                                                                   |
| stats                      | This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain.                                                                                                                                                                                                                                   |
| <MAC>                      | Displays information for a specified device (wireless client or neighbor) or RF Domain.                                                                                                                                                                                                                                                                                                         |
| on <DEVICE-OR-DOMAIN-NAME> | This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain. <ul style="list-style-type: none"> <li>&lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul>                                                                |

```
service show wireless radio-internal [radio1|radio2] <LINE>
```

|          |                                                                                        |
|----------|----------------------------------------------------------------------------------------|
| show     | Displays running system statistics based on the parameters passed                      |
| wireless | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.) |

|                                |                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| radio-internal [radio1 radio2] | Displays radio internal debug logs. Select the radio from the following options: <ul style="list-style-type: none"> <li>radio1 – Selects radio 1</li> <li>radio2 – Selects radio 2.</li> </ul> |
| <LINE>                         | Specify the radio internal debug command to enable.                                                                                                                                            |

```
service show wireless reference [channels|frame|handshake|mcs-rates|reason-codes|
status-codes]
```

|              |                                                                                        |
|--------------|----------------------------------------------------------------------------------------|
| show         | Displays running system statistics based on the parameters passed                      |
| wireless     | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.) |
| reference    | Displays look up reference information related to standards, protocols, etc.           |
| channels     | Displays 802.11 channels information                                                   |
| frame        | Displays 802.11 frame structure                                                        |
| handshake    | Displays a flow diagram of 802.11 handshakes                                           |
| mcs-rates    | Displays MCS rate information                                                          |
| reason-codes | Displays 802.11 reason codes (for deauthentication, disassociation, etc.)              |
| status-codes | Displays 802.11 status codes (for association response)                                |

```
service show wireless stats-client diag {<MAC/HOSTNAME>}
{(on <DEVICE-OR-DOMAIN-NAME>) }
```

|                            |                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show                       | Displays running system statistics based on the parameters passed                                                                                                                                                                                     |
| wireless                   | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)                                                                                                                                                                 |
| stats-client               | Displays managed AP statistics                                                                                                                                                                                                                        |
| <MAC/HOSTNAME>             | Optional. Specify the MAC address or hostname of the AP.                                                                                                                                                                                              |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays statistics on a specified AP, or all APs on a specified domain. <ul style="list-style-type: none"> <li>&lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

```
service smart-rf clear-config {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}
```

|                  |                                                                                                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smart-rf         | Enables Smart RF management                                                                                                                                                              |
| clear-config     | Clears WLAN Smart RF configuration on a specified device or on all devices                                                                                                               |
| <MAC>            | Optional. Clears WLAN Smart RF configuration on a device identified by its MAC address. Specify the device's MAC address in the AA-BB-CC-DD-EE-FF format.                                |
| <DEVICE-NAME>    | Optional. Clears WLAN Smart RF configuration on a device identified by its hostname. Specify the device's hostname.                                                                      |
| on <DOMAIN-NAME> | Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain <ul style="list-style-type: none"> <li>&lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</li> </ul> |

```
service smart-rf [clear-history|clear-interfering-aps|save-config] {on <DOMAIN-NAME>}
```

|                       |                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smart-rf              | Enables Smart RF management                                                                                                                                                                |
| clear-history         | Clears WLAN Smart RF history on all devices                                                                                                                                                |
| clear-interfering-aps | Clears Smart-RF interfering APs                                                                                                                                                            |
| save-config           | Saves the Smart RF configuration on all devices, and also saves the history on the RF Domain Manager                                                                                       |
| on <DOMAIN-NAME>      | Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</li> </ul> |

```

|                                        |                                                                                                                                                            |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless client trigger-bss-transition | Enables the quiet-element information in beacons sent to wireless clients                                                                                  |
| start                                  | Enables the quiet-element information in beacons sent to wireless clients. This is the start of the time period when wireless clients are to remain quiet. |
| stop                                   | Disables the quiet-element information in beacons sent to wireless clients. Once disabled, this information is no longer included in beacons.              |

```
service wireless client trigger-bss-transition mac <MAC> {timeout <0-65535>
{url <URL>} {on <DEVICE-OR-DOMAIN-NAME>}}
```

|                                        |                                                                                                                                                                                                                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless client trigger-bss-transition | Sends a 80211v-Wireless Network Management BSS transition request to a client                                                                                                                                                                                                          |
| <MAC>                                  | Specifies the wireless client's MAC address                                                                                                                                                                                                                                            |
| timeout <0-65535>                      | Specifies the time remaining, for this client, before BSS transition is initiated. In other words on completion of the specified time period, BSS transition is triggered. <ul style="list-style-type: none"> <li>• &lt;0-65535&gt; - Specify a time from 0 -65535 seconds.</li> </ul> |
| url <URL>                              | Specifies session termination URL                                                                                                                                                                                                                                                      |
| on <DEVICE-OR-DOMAIN-NAME>             | Optional. Sends request on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR_DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul>                                                                     |

|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless client trigger-wnm                      | Sends a WNM notification (action frame) to a wireless client                                                                                                                                                                            |
| mac <MAC>                                        | Specifies the wireless client's MAC address                                                                                                                                                                                             |
| type [deauth-imminent  subscription-remediation] | Configures the WNM notification type <ul style="list-style-type: none"> <li>• deauth-imminent - Sends a de-authentication imminent frame</li> <li>• subscription-remediation - Sends a subscription remediation needed frame</li> </ul> |
| uri <WORD>                                       | Optional. Specifies the unique resource identifier (URI)                                                                                                                                                                                |

```
service wireless dump-core-snapshot
```

|                             |                                                   |
|-----------------------------|---------------------------------------------------|
| wireless dump-core-snapshot | Triggers a debug core dump of the wireless module |
|-----------------------------|---------------------------------------------------|

```
service wireless meshpoint zl <MESHPOINT-NAME> [on <DEVICE-NAME>] {<ARGS>/
timeout <1-65535>}
```

|                               |                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service wireless meshpoint zl | Triggers a zonal level debug of a specified meshpoint's modules                                                                                                                                                                                                                     |
| <MESHPOINT-NAME>              | Specify the meshpoint name                                                                                                                                                                                                                                                          |
| on <DEVICE-NAME>              | Triggers zonal level debug of a specified meshpoint's modules on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the device (AP, wireless controller, or service platform)</li> </ul>                                           |
| <ARGS>                        | Optional. Specifies the zonal arguments. These zonal arguments represent the meshpoint modules identified by the zonal and subzonal arguments passed here. Also specify the debug level from 0 -7. Please see the Examples section, at the end of this topic, for more information. |
| timeout <1-65535>             | Optional. Specifies a timeout value from 1 - 65535 seconds. When specified, meshpoint logs are debugged for the time specified here.                                                                                                                                                |

```
service wireless qos delete-tspec <MAC> tid <0-7>
```

|                           |                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| wireless qos delete-tspec | Sends a delete TSPEC request to a wireless client                                                                               |
| <MAC>                     | Specify the MAC address of the wireless client.                                                                                 |
| tid <0-7>                 | Deletes the TID (Traffic Identifier) <ul style="list-style-type: none"> <li>&lt;0-7&gt; - Select the TID from 0 - 7.</li> </ul> |

```
service wireless trace pattern <WORD> {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless trace   | Displays the wireless module trace based on parameters passed                                                                                                                                                    |
| pattern <WORD>   | Configures the pattern to match <ul style="list-style-type: none"> <li>&lt;WORD&gt; - Specify the pattern to match.</li> </ul>                                                                                   |
| on <DEVICE-NAME> | Optional. Displays the wireless module trace on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
service wireless unsanctioned ap air-terminate <MAC> {on <DOMAIN-NAME>}
```

|                                        |                                                                                                                                                                  |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless unsanctioned ap air-terminate | Enables unsanctioned access points termination                                                                                                                   |
| <MAC>                                  | Configures the unsanctioned access points' BSSID (MAC address)                                                                                                   |
| on <DOMAIN-NAME>                       | Optional. Specifies the RD Domain of the access point <ul style="list-style-type: none"> <li>&lt;DOMAIN-NAME&gt; - Specify the name of the RF Domain.</li> </ul> |

```
service wireless wips clear-client-blacklist [all|mac <MAC>]
```

|                                        |                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless wips                          | Enables management of WIPS parameters                                                                                                                                                                                                                                                                                                            |
| clear-client-blacklist [all mac <MAC>] | Removes a specified client or all clients from the blacklist <ul style="list-style-type: none"> <li>all - Removes all clients from the blacklist</li> <li>mac &lt;MAC&gt; - Removes a specified client from the blacklist <ul style="list-style-type: none"> <li>&lt;MAC&gt; - Specify the wireless client's MAC address.</li> </ul> </li> </ul> |

```
service wireless wips clear-event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

|                            |                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wireless wips              | Enables management of WIPS parameters                                                                                                                                                                                      |
| clear-event-history        | Clears event history                                                                                                                                                                                                       |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Clears event history on a device or RF Domain <ul style="list-style-type: none"> <li>&lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

## Syntax (Privilege Exec Mode)

### Service Commands - Intro

#### Note

The "service" command of the Priv Exec Mode is the same as the service command in the User Exec Mode. There are a few modifications that have been documented in this section. For the syntax and parameters of the other commands refer to the [Syntax \(User Exec Mode\)](#) and [Parameters \(User Exec Mode\)](#) sections of this chapter.

```
service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|
database|delete|delete-offline-aps|force-send-config|force-update-vm-stats|
guest-registration|load-balancing|locator|mint|pktcap|pm|radio|radius|
request-full-config-from-adopter|restore|set|show|signal|smart-rf|snmp|ssm|
start-shell|syslog|trace|wireless]
service clear crash-info {on <DEVICE-NAME>}

|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database    | Performs database related actions<br><br><b>Note:</b> This command is supported only on the NX 95XX, NX 96XX, and VX 9000 platforms.                                                                                                                                                                                                                                                                                                                                                                                   |
| replica-set | Adds members to the database replica set. A replica set is a group of devices running the database instances that maintain the same data set. Replica sets provide redundancy and high availability, and are the basis for all production deployments. The replica set can contain a maximum of fifty (50) members, with each member (with the exception of the arbiter) hosting an instance of the database. For more information on creating replica sets, see <a href="#">database-policy</a> (global config mode). |

| verbose | Optional. Displays full packet body                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| write   | <p>Captures packets to a specified file. Provide the file name and location in the following format:</p> <ul style="list-style-type: none"> <li>flash:/path/file</li> <li>usbX:/path/file</li> </ul> <p>URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported.</p> <ul style="list-style-type: none"> <li>nvrn:startup-config</li> <li>tftp://&lt;hostname IP&gt;[:port]/path/file</li> <li>ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IP&gt;[:port]/path/file</li> <li>sftp://&lt;user&gt;@&lt;hostname IP&gt;[:port]/path/file</li> <li>tzsp – TZSP (Tazman Sniffer Protocol) host. Specify the TZSP host's IP address or hostname.</li> </ul> |

```
service show last-passwd
```

|             |                                                                   |
|-------------|-------------------------------------------------------------------|
| show        | Displays running system statistics based on the parameters passed |
| last-passwd | Displays the last password used to enter shell                    |

```
service signal [abort <PROCESS-NAME>|kill <PROCESS-NAME>]
```

|        |                                                                                                                                                                                       |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| signal | <p>Sends a signal to a process</p> <ul style="list-style-type: none"> <li>tech-support – Copies extensive system information useful for troubleshooting</li> </ul>                    |
| abort  | <p>Sends an abort signal to a process, and forces it to dump to core</p> <ul style="list-style-type: none"> <li>&lt;PROCESS-NAME&gt; – Specify the process name.</li> </ul>           |
| kill   | <p>Sends a kill signal to a process, and forces it to terminate without a core</p> <ul style="list-style-type: none"> <li>&lt;PROCESS-NAME&gt; – Specify the process name.</li> </ul> |

```
service start-shell
```

|             |                       |
|-------------|-----------------------|
| start-shell | Provides shell access |
|-------------|-----------------------|

```
service trace <PROCESS-NAME> {summary}
```

|                |                                                             |
|----------------|-------------------------------------------------------------|
| trace          | Traces a process for system calls and signals               |
| <PROCESS-NAME> | Specifies the process name                                  |
| summary        | Optional. Generates summary report of the specified process |

### Syntax (Privilege Exec Mode: NX 95XX)

#### Service Commands - Intro

The following service commands are specific to the NX 95XX series service platforms:

```
service copy analytics-support [<FILE>|<URL>]
```

## Parameters(Privilege Exec Mode: NX 95XX)

### Service Commands - Intro

```
service copy analytics-support [<FILE>|<URL>]
```

|                        |                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| copy analytics-support | Enables copying of analytics information to a specified. Use one of the following options to specify the file:<br><br><b>Note:</b> This information is useful to troubleshoot issues by the Technical Support team.                                                                                                                                                    |
| <FILE>                 | Specify the file name and location using one of the following formats: <ul style="list-style-type: none"><li>• usb1:/path/file</li><li>• usb2:/path/file</li></ul>                                                                                                                                                                                                     |
| <URL>                  | Specify the location URL to copy file. Both IPv4 and IPv6 formats are supported. <ul style="list-style-type: none"><li>• tftp://&lt;hostname IPv4/IPv6&gt;[:port]/path/file</li><li>• ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IPv4/IPv6&gt;[:port]/path/file</li><li>• sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname IPv4/IPv6&gt;[:port]/path/file</li></ul> |

### Usage Guidelines

The NX 95XX and NX 96XX model service platforms (NOC) provide granular and robust analytic reporting for a managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of Access Point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves. analytics licenses available.

### Syntax (Global Config Mode)

#### Service Commands - Intro

```
service [set|show cli]
service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|
virtual-machine-history <10-200>] {on <DEVICE-NAME>}
service show cli
```

### Parameters (Global Config Mode)

#### Service Commands - Intro

```
service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|
virtual-machine-history <10-200>] {on <DEVICE-NAME>}
```

|                          |                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| set                      | Sets the size of history files                                                                                                                                  |
| command-history <10-300> | Sets the size of the command history file <ul style="list-style-type: none"><li>• &lt;10-300&gt; – Specify a value from 10 - 300. The default is 200.</li></ul> |

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| upgrade-history<br><10-100>         | Sets the size of the upgrade history file <ul style="list-style-type: none"> <li>• &lt;10-100&gt; – Specify a value from 10 - 100. Examples for the `service > wireless > meshpoint` command.

The following example displays meshpoint modules:

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C
```

```

 | SUBZONE
 | 0 1 2 3 4 5 6 7
-----|-----
ZONE |
2-LLC | GEN TX RX BEA TXF
 | 0 0 0 0 0
3-ND | GEN TX RX NBR LQM LSA
 | 0 0 0 0 0 0
4-ORL | GEN
 | 0
5-LQ | GEN TX RX HEL PRO
 | 0 0 0 0 0
6-PS | GEN
 | 0
7-RS | GEN ROOT NBR REC
 | 0 0 0 0
8-IA | GEN
 | 0
11-MGT | GEN SET GET
 | 0 0 0
13-LSA | GEN RX TX R0 LMST LSUP LKEY KEY
 | 0 0 0 0 0 0 0 0
14-ACS | GEN SCAN TRIG
 | 0 0 0
15-EAP | GEN
 | 0
16-L2P | GEN
 | 0
```

```
ROOT1-ap81xx-71174C#
```

In the preceding example,

- The meshpoint name is `mesh_root`
- The device on which the command is executed is `ROOT1-ap81xx-71174C`
- The vertical ZONE column represents meshpoint modules. For example, 3-ND presents the Neighbor Discovery module.

- The SUBZONE 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.

To enable meshpoint module debugging, specify the module number and the process number separated by a period (.). And then specify the debugging level from 0 - 7.

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C 3.2 7
```

In the preceding command,

- The meshpoint module number provided is 3 (ND)
- The process number provided is 2 (RX - Received signals from neighbors)
- The debugging level provided is 7 (highest level - warning)

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C
```

|        | SUBZONE |      |      |     |      |      |      |     |

```
ROOT1-ap81xx-71174C#
```

In the preceding example, level 7 debugging has been enabled only for the ND module's received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C 0
```

To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C 5
```

```
ROOT1-ap81xx-71174C#service wireless meshpoint z1 mesh_root on ROOT1-ap81xx-71174C
```

The following examples show the purging of users from the guest-registration database:

```

nx7500-112233#service guest-registration delete ?
 all Delete all users
 email Email address
 group Group
 mac MAC address
 mobile Mobile phone number
 name Full name
 offline-for Specify minimum amount of time offline
 otp-incomplete-for Specify minimum amount of time registration with
 one-time-passcode incomplete
 social Social site used to log in
 wlan Wireless LAN

nx7500-112233#

```

Purges users belonging to a specified RADIUS group.

```

nx7500-112233#service guest-registration delete group mac_reg_gr1
delete user status: delete users matching a group will take time, please wait
nx7500-112233#

```

Purges users using social-site (Facebook or Google) credentials to login.

```

nx7500-112233#service guest-registration delete social facebook
delete user status: delete users matching a social category will take time, please wait
nx7500-112233#

```

Purges users inactive for a specified time period.

```

nx7500-112233#service guest-registration delete offline-for days 5
delete user status: Deleting users offline for minimum 5 days. This will take time, please
wait
nx7500-112233#

```

Purges users who have failed to complete registration using the OTP within a specified time period.

```

nx7500-112233#service guest-registration delete otp-incomplete-for days 5
delete user status: Deleting registration with one-time-passcode incomplete for minimum 5
days. This will take time, please wait
nx7500-112233#

```

The following example displays IP ACLs to WLAN mapping summary on the 'TechPubs' RF Domain:

```

nx9500-6C8809#service show ip-access-list wlan TechPubs status
Reporting Device: ap7161-99BE7C - success
Reporting Device: ap7532-80C2AC - success
Reporting Device: ap7562-84A224 - success
Reporting Device: nx9500-6C8809 - success
Reporting Device: ap8163-74B45C - success
Total reporting devices: 5
nx9500-6C8809#

```

Consider an RF Domain (name guest-domain) with 3 APs adopted to a controller. The CLI output for the **service > show > ip-access-list** command in this set up varies for different scenarios, as shown in the following examples:

- Scenario 1: Executing the command on a device (access point).

```
AP01#service show ip-access-list wlan status
Reporting Device: AP01 - fail
WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
Total reporting devices: 1
AP01#

AP01#service show ip-access-list wlan status detail
=====
Reporting Device: AP01

WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
 use ip-access-list out BC-MC-CONTROL : success

WLAN: PartnerNet
 use ip-access-list in default : success
 use ip-access-list out default : success

Total reporting devices: 1
AP01#
```

- Scenario 2: IP ACL to WLAN mapping is successful for all APs in a specified RF Domain.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - success
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#
```

- Scenario 3: IP ACL has failed in dataplane due to unknown reasons.

```
SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - fail
WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#

SW01#service show ip-access-list wlan status detail on guest-domain
=====
Reporting Device: AP01

WLAN: XPO-Guest-PSK
 use ip-access-list in guest_access_inbound : fail
 use ip-access-list out BC-MC-CONTROL : success

WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

=====
Reporting Device: AP02

WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

```

```

=====
Reporting Device: AP03

WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

Total reporting devices: 3
SW01#

```

- Scenario 4: AP in RF Domain is unreachable or does not support this functionality.

```

SW01#service show ip-access-list wlan status on guest-domain
Reporting Device: AP01 - unreachable
Reporting Device: AP02 - success
Reporting Device: AP03 - success
Total reporting devices: 3
SW01#
SW01#service show ip-access-list wlan status detail on guest-domain
=====
Reporting Device: AP01
Timed out waiting for remote device: xpath=wing-stats/device/00-23-68-0B-86-38/firewall/
ip_acl_intf_status/wlan[mac='*']
=====
Reporting Device: AP02

WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

Reporting Device: AP03

WLAN: PartnerNet
 use ip-access-list in guest_access_inbound : success
 use ip-access-list out BC-MC-CONTROL : success

Total reporting devices: 3
SW01#

```

## show

Displays specified system component settings. There are a number of ways to invoke the show command.

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show <PARAMETERS>
```

## Parameters

show <PARAMETERS>

|                   |                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show <PARAMETERS> | The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The example below shows the configuration details that can be viewed in the Priv Executable mode. |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809#show ?
adoption Adoption related information
bluetooth Bluetooth Configuration/Statistics commands

| timezone            | The timezone                                                                   |
| traffic-shape       | Display traffic shaping                                                        |
| upgrade-status      | Display last image upgrade status                                              |
| version             | Display software & hardware version                                            |
| virtual-machine     | Virtual Machine                                                                |
| vrrp                | VRRP protocol                                                                  |
| web-filter          | Web filter                                                                     |
| what                | Perform global search                                                          |
| wireless            | Wireless commands                                                              |
| wwan                | Display wireless WAN Status                                                    |

nx9500-6C8809#

**Note**

For more information on the show command, see [SHOW COMMANDS](#).

*write*

Writes the system running configuration to memory or terminal

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

`write [memory|terminal]`

**Parameters**

`write [memory|terminal]`

---

|          |                                        |
|----------|----------------------------------------|
| memory   | Writes to the NV (non-volatile) memory |
| terminal | Writes to the terminal                 |

### Examples

```
nx9500-6C8809>write memory
[OK]
nx9500-6C8809>
```

# SHOW COMMANDS

## SHOW COMMANDS

---

Show commands displays configuration settings and statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context configuration.

This chapter describes the 'show' CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the 'show' commands in the 'GLOBAL CONFIG' mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.

### show-commands

The following table summarizes the show commands:

*Table: Show Commands*

| Command                                       | Description                                                                                                           |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <a href="#">show</a>                          | Displays settings for the specified system component                                                                  |
| <a href="#">adoption</a>                      | Displays adoption related information                                                                                 |
| <a href="#">bluetooth</a> on page 709         | Displays Bluetooth radio statistics for RF Domain member access points                                                |
| <a href="#">boot</a>                          | Displays a device boot configuration                                                                                  |
| <a href="#">bonjour</a> on page 712           | Displays the configured Bonjour services available on local and remote sites                                          |
| <a href="#">captive-portal</a>                | Displays WLAN hotspot functions                                                                                       |
| <a href="#">captive-portal-page-upload</a>    | Displays captive portal Web pages upload related information                                                          |
| <a href="#">cdp</a>                           | Displays a CDP (Cisco Discovery Protocol ) neighbor table                                                             |
| <a href="#">classify-url</a> on page 717      | Queries a specified global data center or a pre-configured classification server for the category of a specified URL. |
| <a href="#">clock</a>                         | Displays the system clock                                                                                             |
| <a href="#">cluster</a>                       | Displays device-cluster related statistics                                                                            |
| <a href="#">cmp-factory-certs</a> on page 719 | Displays factory installed CMP certificates                                                                           |
| <a href="#">commands</a>                      | Displays command list                                                                                                 |
| <a href="#">context</a>                       | Displays information about the current context                                                                        |
| <a href="#">critical-resources</a>            | Displays critical resources deployed within the managed network and associated statistics                             |

| Command                                              | Description                                                                                                                                                                                        |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">crypto</a>                               | Displays encryption mode information                                                                                                                                                               |
| <a href="#">database</a> on page 724                 | Displays database-related statistics and status                                                                                                                                                    |
| <a href="#">device-upgrade</a>                       | Displays device firmware upgradation information for devices adopted by a wireless controller or access point                                                                                      |
| <a href="#">dot1x</a>                                | Displays dot1x information on interfaces                                                                                                                                                           |
| <a href="#">dpi</a> on page 730                      | Displays statistics for all configured and canned applications                                                                                                                                     |
| <a href="#">eguest</a> on page 732                   | Displays EGuest server status and EGuest registration statistics                                                                                                                                   |
| <a href="#">environmental-sensor</a>                 | Displays environmental sensor's historical data (applicable only to AP 8132)                                                                                                                       |
| <a href="#">event-history</a>                        | Displays event history                                                                                                                                                                             |
| <a href="#">event-system-policy</a>                  | Displays event system policy configuration information                                                                                                                                             |
| <a href="#">ex3500</a> on page 737                   | Displays EX3500-related statistical data                                                                                                                                                           |
| <a href="#">extdev</a> on page 740                   | Displays external device (T5 or EX3500) configuration error history                                                                                                                                |
| <a href="#">fabric-attach</a> on page 740            | Displays the current status of VLAN to I-SID assignments for all ports                                                                                                                             |
| <a href="#">file</a>                                 | Displays file system information                                                                                                                                                                   |
| <a href="#">file-sync</a> on page 742                | Displays file synchronization settings and status on a controller. The file-sync command syncs trustpoint/wireless-bridge certificate between the staging-controller and its adopted access points |
| <a href="#">firewall</a>                             | Displays wireless firewall information                                                                                                                                                             |
| <a href="#">global</a>                               | Displays global information for network devices based on the parameters passed                                                                                                                     |
| <a href="#">gre</a>                                  | Displays GRE tunnel related information                                                                                                                                                            |
| <a href="#">guest-registration</a> on page 750       | Displays guest registration statistics based on the option and time entered                                                                                                                        |
| <a href="#">interface</a>                            | Displays interface status                                                                                                                                                                          |
| <a href="#">iot-device-type-imagotag</a> on page 759 | Displays the configuration of ESL communicator on a specified AP or on all APs within an RF Domain.                                                                                                |
| <a href="#">ip</a>                                   | Displays IP related information                                                                                                                                                                    |
| <a href="#">ip-access-list-stats</a>                 | Displays IP access list statistics                                                                                                                                                                 |
| <a href="#">ipv6</a> on page 768                     | Displays IPv6 related information                                                                                                                                                                  |
| <a href="#">ipv6-access-list</a> on page 771         | Displays IPv6 access list statistics                                                                                                                                                               |
| <a href="#">l2tpv3</a>                               | Displays L2TPv3 (Layer 2 Tunnel Protocol Version 3) information                                                                                                                                    |
| <a href="#">lACP</a> on page 774                     | Displays LACP (Link Aggregation Control Protocol) related information                                                                                                                              |
| <a href="#">ldap-agent</a>                           | Displays an LDAP agent's join status (join status to a LDAP server domain)                                                                                                                         |
| <a href="#">licenses</a>                             | Displays installed licenses and usage information                                                                                                                                                  |
| <a href="#">lldp</a>                                 | Displays LLDP ( <i>Link Layer Discovery Protocol</i> ) information                                                                                                                                 |
| <a href="#">logging</a>                              | Displays logging information                                                                                                                                                                       |
| <a href="#">mac-access-list-stats</a>                | Displays MAC access list statistics                                                                                                                                                                |

| Command                                         | Description                                                                                                                                                                                                 |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">mac-address-table</a>               | Displays MAC address table entries                                                                                                                                                                          |
| <a href="#">macauth</a> on page 782             | Displays details of wired ports that have MAC address-based authentication enabled                                                                                                                          |
| <a href="#">mac-auth-clients</a> on page 783    | Displays MAC-authenticated clients based on the parameters passed                                                                                                                                           |
| <a href="#">mint</a>                            | Displays MiNT protocol configuration commands                                                                                                                                                               |
| <a href="#">nsight</a> on page 787              | Displays NSight module related statistics and also displays the database server status (reachable or not)                                                                                                   |
| <a href="#">ntp</a>                             | Displays NTP server related information                                                                                                                                                                     |
| <a href="#">password-encryption</a> on page 789 | Displays password encryption status                                                                                                                                                                         |
| <a href="#">pppoe-client</a>                    | Displays PPPoE (Point to Point Protocol over Ethernet) client information                                                                                                                                   |
| <a href="#">privilege</a>                       | Displays current privilege level information                                                                                                                                                                |
| <a href="#">radius</a> on page 791              | Displays the amount of access time consumed and the access time remaining for all guest users configured on a RADIUS server                                                                                 |
| <a href="#">reload</a>                          | Displays scheduled reload information                                                                                                                                                                       |
| <a href="#">rf-domain-manager</a>               | Displays RF Domain manager selection details                                                                                                                                                                |
| <a href="#">role</a>                            | Displays role-based firewall information                                                                                                                                                                    |
| <a href="#">route-maps</a>                      | Display route map statistics                                                                                                                                                                                |
| <a href="#">rtls</a>                            | Displays RTLS (Real Time Location Service) statistics of Access Points                                                                                                                                      |
| <a href="#">running-config</a>                  | Displays configuration file contents                                                                                                                                                                        |
| <a href="#">session-changes</a>                 | Displays configuration changes made in the current session                                                                                                                                                  |
| <a href="#">session-config</a>                  | Displays configurations made in the current session                                                                                                                                                         |
| <a href="#">sessions</a>                        | Displays a list of currently active open sessions on the device                                                                                                                                             |
| <a href="#">site-config-diff</a>                | Displays the difference between site configuration available on NOC and the actual site configuration                                                                                                       |
| <a href="#">smart-rf</a>                        | Displays Smart RF management statistics                                                                                                                                                                     |
| <a href="#">spanning-tree</a>                   | Displays spanning tree information                                                                                                                                                                          |
| <a href="#">startup-config</a>                  | Displays complete startup configuration script on the console                                                                                                                                               |
| <a href="#">t5</a> on page 814                  | Displays adopted T5 controller details. This command is applicable only on the RFS 4000, NX 95XX, NX 96XX, and VX 9000.                                                                                     |
| <a href="#">terminal</a> on page 822            | Displays terminal configuration parameters                                                                                                                                                                  |
| <a href="#">timezone</a>                        | Displays timezone information for the system and managed devices                                                                                                                                            |
| <a href="#">traffic-shape</a> on page 822       | Displays traffic-shaping related configuration details and statistics                                                                                                                                       |
| <a href="#">upgrade-status</a>                  | Displays image upgrade status                                                                                                                                                                               |
| <a href="#">version</a>                         | Displays a device's software and hardware version                                                                                                                                                           |
| <a href="#">vrrp</a>                            | Displays VRRP (Virtual Router Redundancy Protocol) protocol details                                                                                                                                         |
| <a href="#">web-filter</a> on page 829          | Displays pre-configured, in-built Web filter options available. These options are: category (URL category), category-types, filter-level, etc. This command also displays Web filter statistics and status. |

| Command                           | Description                                                           |
|-----------------------------------|-----------------------------------------------------------------------|
| <code>what</code>                 | Displays details of a specified search phrase                         |
| <code>wireless</code> on page 831 | Displays wireless configuration parameters                            |
| <code>wwan</code>                 | Displays the wireless WAN status                                      |
| <code>virtual-machine</code>      | Displays the virtual-machine (VM) configuration, logs, and statistics |

#### Note

The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore ( \_ ) character. In other words, the name of a device cannot contain an underscore.

## show

The show command displays the following information:

- A device's current configuration
- A device's start-up configuration
- A device's current context configuration, such as profiles and policies

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show <PARAMETER>

#### Parameters

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show <PARAMETERS> | The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes. |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Examples

The following examples list the *show* commands in the User Exec, Priv Exec, and Global Config modes:

#### Global Config Mode:

```
<DEVICE>(config)#show ?
 adoption Adoption related information
 bluetooth Bluetooth Configuration/Statistics commands
 bonjour Bonjour Gateway related commands
 boot Display boot configuration.
 captive-portal Captive portal commands
 captive-portal-page-upload Captive portal internal and advanced page upload
 cdp Cisco Discovery Protocol
 classify-url Query the category of an URL
 clock Display system clock
```

|                           |                                                                                |
|---------------------------|--------------------------------------------------------------------------------|
| cluster                   | Cluster Protocol                                                               |
| cmp-factory-certs         | Display the CMP certificate status                                             |
| commands                  | Show command lists                                                             |
| context                   | Information about current context                                              |
| critical-resources        | Critical Resources                                                             |
| crypto                    | Encryption related commands                                                    |
| database                  | Database                                                                       |
| debug                     | Debugging functions                                                            |
| debugging                 | Debugging functions                                                            |
| device-upgrade            | Device Upgrade                                                                 |
| dot1x                     | 802.1X                                                                         |
| dpi                       | Deep Packet Inspection                                                         |
| eguest                    | ExtremeGuest                                                                   |
| environmental-sensor      | Display Environmental Sensor Module status                                     |
| event-history             | Display event history                                                          |
| event-system-policy       | Display event system policy                                                    |
| ex3500                    | EX3500 device details                                                          |
| extdev                    | External device (T5, Ex3500..)                                                 |
| fabric-attach             | Fabric attach                                                                  |
| file                      | Display filesystem information                                                 |
| file-sync                 | File sync between controller and adoptees                                      |
| firewall                  | Wireless Firewall                                                              |
| global                    | Global-level information                                                       |
| gre                       | Show l2gre tunnel info                                                         |
| guest-notification-config | Show guest-notification information                                            |
| guest-registration        | Guest registration commands                                                    |
| interface                 | Interface Configuration/Statistics commands                                    |
| iot-device-type-imagotag  | Iot device type imagotag                                                       |
| ip                        | Internet Protocol (IP)                                                         |
| ip-access-list            | IP ACL                                                                         |
| ipv6                      | Internet Protocol version 6 (IPv6)                                             |
| ipv6-access-list          | IPv6 ACL                                                                       |
| l2tpv3                    | L2TPv3 information                                                             |
| lacp                      | LACP commands                                                                  |
| ldap-agent                | LDAP Agent Configuration                                                       |
| licenses                  | Show installed licenses and usage                                              |
| lldp                      | Link Layer Discovery Protocol                                                  |
| logging                   | Show logging information                                                       |
| mac-access-list           | MAC ACL                                                                        |
| mac-address-table         | Display MAC address table                                                      |
| mac-auth                  | MAC authentication                                                             |
| mac-auth-clients          | MAC authenticated clients                                                      |
| mint                      | MiNT protocol                                                                  |
| mirroring                 | Show mirroring sessions                                                        |
| nsight                    | Nsight Server Module                                                           |
| ntp                       | Network time protocol                                                          |
| password-encryption       | Pasword encryption                                                             |
| pppoe-client              | PPP Over Ethernet client                                                       |
| privilege                 | Show current privilege level                                                   |
| radius                    | RADIUS statistics commands                                                     |
| raid                      | Show RAID status                                                               |
| reload                    | Scheduled reload information                                                   |
| remote-debug              | Show details of remote debug sessions                                          |
| rf-domain-manager         | Show RF Domain Manager selection details                                       |
| role                      | Role based firewall                                                            |
| route-maps                | Display Route Map Statistics                                                   |
| rtls                      | RTLS Statistics                                                                |
| running-config            | Current operating configuration                                                |
| session-changes           | Configuration changes made in this session                                     |
| session-config            | This session configuration                                                     |
| sessions                  | Display sessions                                                               |
| site-config-diff          | Difference between site configuration on the NOC and actual site configuration |
| slot                      | Expansion slots stats                                                          |

|                 |                                           |
|-----------------|-------------------------------------------|
| smart-rf        | Smart-RF Management Commands              |
| spanning-tree   | Display spanning tree information         |
| startup-config  | Startup configuration                     |
| t5              | Display T5 inventory information          |
| terminal        | Display terminal configuration parameters |
| timezone        | The timezone                              |
| traffic-shape   | Display traffic shaping                   |
| upgrade-status  | Display last image upgrade status         |
| version         | Display software & hardware version       |
| virtual-machine | Virtual Machine                           |
| vrrp            | VRRP protocol                             |
| web-filter      | Web filter                                |
| what            | Perform global search                     |
| wireless        | Wireless commands                         |
| wwan            | Display wireless WAN Status               |

```
<DEVICE>(config)#
rfs4000-6DB5D4(config)#show clock
2018-02-06 09:26:53 IST
rfs4000-6DB5D4(config)#
```

### Privilege Executable Mode:

```
<DEVICE>#show ?
adoption Adoption related information
bluetooth Bluetooth Configuration/Statistics commands

### adoption

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

In an HM network devices are deployed in two levels. The first level consists of the NOC controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and second-level controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'.

Use this command to confirm if a device is an adoptee or an adopter. This command also allows you to determine the devices adopted by an adopter device.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```

show adoption [config-errors|controllers|history|info|log|offline|pending|status|timeline]
show adoption offline
show adoption config-errors <DEVICE-NAME>
show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}
show adoption [controllers {include-ipv6}|history|info|pending|status {summary}|timeline]
{on <DEVICE-NAME>}

```

## Parameters

show adoption offline

|          |                                                                                 |
|----------|---------------------------------------------------------------------------------|
| adoption | Displays AP adoption history and status. It also displays configuration errors. |
| offline  | Displays non-adopted status of the logged device and its adopted Access Points  |

show adoption config-errors <DEVICE-NAME>

|                             |                                                                                                                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adoption                    | Displays AP adoption history and status. It also displays configuration errors.                                                                                                                              |
| config-errors <DEVICE-NAME> | Displays configuration errors for a specified adopted device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

show adoption log [adoptee|adopter] {on <DEVICE-NAME>}

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| history             | Displays the adoption history of the logged device and its adopted Access Points                                                                                                                                                                                                                                                                                      |
| info                | Displays adopted device information                                                                                                                                                                                                                                                                                                                                   |
| pending             | Displays information for devices pending adoption                                                                                                                                                                                                                                                                                                                     |
| status<br>{summary} | Displays adoption status for the logged device. When executed without using the 'on <DEVICE-NAME>' parameter, this command displays detailed information of all devices adopted by the device on which the command is executed. <ul style="list-style-type: none"> <li>summary - Optional. Displays a summary of all devices adopted by the logged device.</li> </ul> |
| timeline            | Displays the logged device's adoption timeline. It also shows the adoption time for the logged device's adopted APs. To view the adoption timeline of a specific device, use the on <DEVICE-NAME> option to specify the device.                                                                                                                                       |
| on <DEVICE-NAME>    | The following keywords are common to all of the above parameters: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays a device's adoption information, based on the parameter passed.</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                  |

### Usage Guidelines

In a device's Global Config mode, use the **customize > show-adoption-status** command to customize the **show > adoption > status** command output. The following columns can be added to the output:

```
nx9500-6C8809(config)#customize show-adoption-status ?
 adopted-by Device name to which the AP is adopted
 ap-name Host-name of the adopted AP
 cdp-lldp-info Cdp/lldp info of the Adopted AP
 config-status Configuration status of the adopted AP
 last-adoption Last known adoption time
 msgs Messages status
 uptime Uptime of the adopted AP
 version Current version of the adopted AP
nx9500-6C8809(config)#
```

For more information on the customize command, see [customize](#) on page 349.

### Examples

The following example displays details of the:

- device to which the logged device (rfs4000-6DB5D4) is adopted, and
- devices adopted by the logged device.

```
rfs4000-6DB5D4(config)#show adoption status
Adopted by:
Type : nx9000
System Name : nx9500-6C8809
MAC address : B4-C7-99-6C-88-09
MiNT address : 19.6C.88.09
Time : 7 days 01:02:34 ago

Adopted Devices:

## bluetooth

Displays Bluetooth radio statistics for RF Domain member access points

AP 8432 and AP 8533 model access points utilize a built-in Bluetooth chip for specific Bluetooth functional behaviors in a WiNG managed network. AP 8432 and AP 8533 models support both Bluetooth classic and BLE (Bluetooth low energy) technology. These platforms use their Bluetooth classic enabled radio to sense other Bluetooth enabled devices and report device data (MAC address, RSSI and device calls) to an ADSP server for intrusion detection. If the device presence varies in an unexpected manner, ADSP can raise an alarm.

AP 8432 and AP 8533 model access points support Bluetooth beaconing to emit either iBeacon or Eddystone-URL beacons. The access point's Bluetooth radio sends non-connectable, undirected LE (low-energy) advertisement packets periodically. These advertisement packets are short and sent on Bluetooth advertising channels that conform to already-established iBeacon and Eddystone-URL standards.

### Supported in the following platforms:

- Access Points — AP 8432, AP 8533

## Syntax

```
show bluetooth radio {detail/on}
show bluetooth radio {detail {<DEVICE-NAME> <1-1>/filter bluetooth-radio-mac <BT-RADIO-
MAC>}}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

## Parameters

```
show bluetooth radio {detail {<DEVICE-NAME> <1-1>/filter bluetooth-radio-mac <BT-RADIO-
MAC>}}
{(on <DEVICE-OR-DOMAIN-NAME>)}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### boot

Displays a device's boot configuration. Use this command to view the primary and secondary image details, such as Build Date, Install Date, and Version. This command also displays the current boot and next boot information.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show boot {on <DEVICE-NAME>}
```

### Parameters

```
show boot {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| boot             | Displays primary and secondary image boot configuration details (build date, install date, version, and the image used to boot the current session)                                                                                                                                                                     |
| on <DEVICE-NAME> | Optional. Displays a specified device's boot configuration <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> <p><b>Note:</b> Use the <i>on</i> &lt;DEVICE-NAME&gt; option to view a remote device's boot configuration.</p> |

### Examples

```
NOC-NX9500#show boot
```

```

 IMAGE BUILD DATE INSTALL DATE VERSION

 Primary 09/21/2017 14:51:03 09/22/2017 10:32:33 5.9.1.0-029R
 Secondary 12/14/2017 13:57:13 01/03/2018 10:33:25 5.9.2.0-005D

Current Boot : Primary
Next Boot : Secondary
Software Fallback : Enabled
VM support : Not present
NOC-NX9500#
```

### bonjour

Displays the configured Bonjour services available on local and remote sites

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show bonjour services {on <DEVICE-NAME>}
```

### Parameters

```
show bonjour services {on <DEVICE-NAME>}
```

### *captive-portal*

Displays WLAN captive portal information. Use this command to view a configured captive portal's client information.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```

show captive-portal sessions {include-ipv6/on <DEVICE-OR-DOMAIN-NAME>/statistics}
{(filter [captive-portal [<CAPTIVE-PORTAL>/not <CAPTIVE-PORTAL>]|ip [<IPv4>/not <IPv4>]|
ipv6 [<IPv6>/not <IPv6>]|state [pending/success/not [pending/success]]|vlan [<VLAN-ID>/
not <VLAN-ID>]|wlan [<WLAN-NAME>/not <WLAN-NAME>]})}

```

#### **Parameters**

```

show captive-portal sessions {include-ipv6/on <DEVICE-OR-DOMAIN-NAME>/statistics}
{(filter [captive-portal [<CAPTIVE-PORTAL>/not <CAPTIVE-PORTAL>]|ip [<IPv4>/not <IPv4>]|
ipv6 [<IPv6>/not <IPv6>]|state [pending/success/not [pending/success]]|vlan [<VLAN-ID>/
not <VLAN-ID>]|wlan [<WLAN-NAME>/not <WLAN-NAME>]})}

```

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| captive-portal sessions                                | Displays active captive portal client session details                                                                                                                                                                                                                                                                                                                                                                                                  |
| include-ipv6                                           | Optional. Includes IPv6 address (if known) of captive portal clients. By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.                                                                                                                                                                                                                                                  |
| statistics                                             | Optional. Displays statistical information regarding client sessions                                                                                                                                                                                                                                                                                                                                                                                   |
| on <DEVICE-OR-DOMAIN-NAME>                             | Optional. Displays active captive portal session details on a specified device or RF Domain. <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul>                                                                                                                                                                                      |
| filter                                                 | This parameter is recursive and can be used with any of the above parameters to define additional filters.<br>Optional. Defines additional filters. Use one of the following options: <b>captive-portal</b> , <b>ip</b> , <b>ipv6</b> , <b>state</b> , <b>vlan</b> , or <b>wlan</b> .                                                                                                                                                                  |
| captive-portal [<CAPTIVE-PORTAL>] not <CAPTIVE-PORTAL> | Optional. Displays captive portal client and client session information, based on the captive portal name passed <ul style="list-style-type: none"> <li>• &lt;CAPTIVE-PORTAL&gt; - Specify the captive portal name. Displays client details for the specified captive portal.</li> <li>• not &lt;CAPTIVE-PORTAL&gt; - Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.</li> </ul> |

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip [<IPv4> not <IPv4>]                         | Optional. Displays captive portal client/client sessions information, based on the IPv4 address passed <ul style="list-style-type: none"> <li>• &lt;IPv4&gt; - Specify the client's IPv4 address. Displays information of the client identified by the &lt;IPv4&gt; parameter.</li> <li>• not &lt;IPv4&gt; - Inverts the match selection. Displays client details for all clients other than the one identified by the &lt;IPv4&gt; parameter.</li> </ul>                                                                                                                                                                                             |
| ipv6 [<IPv6> not <IPv6>]                       | This filter option is available only for the 'include-ipv6' keyword.<br>Optional. Displays captive portal client/client sessions information, based on the IPv6 address passed <ul style="list-style-type: none"> <li>• &lt;IPv6&gt; - Specify the client's IPv6 address. Displays information of the client identified by the &lt;IPv6&gt; parameter</li> <li>• not &lt;IPv6&gt; - Inverts the match selection. Displays client details for all clients other than the one identified by the &lt;IPv6&gt; parameter.</li> </ul>                                                                                                                      |
| state [pending success  not [pending success]] | Optional. Filters clients/client sessions based on the client's authentication state <ul style="list-style-type: none"> <li>• pending - Displays information of clients redirected for authentication</li> <li>• success - Displays information of successfully authenticated clients</li> <li>• not [pending success] - Inverts match selection <ul style="list-style-type: none"> <li>• pending - Displays information of successfully authenticated clients (opposite of pending authentication)</li> <li>• success - Displays information of clients redirected for authentication (opposite of successful authentication)</li> </ul> </li> </ul> |
| vlan [<VLAN-ID> not <VLAN-ID>]                 | Optional. Displays captive portal client/client sessions information based on the VLAN ID passed <ul style="list-style-type: none"> <li>• &lt;VLAN-ID&gt; - Specify the VLAN ID. Displays client details for the specified VLAN.</li> <li>• not &lt;VLAN-ID&gt; - Inverts match selection. Displays client details for all VLANs other than the one identified by the &lt;VLAN-ID&gt; parameter.</li> </ul>                                                                                                                                                                                                                                           |
| wlan [<WLAN-NAME> not <WLAN-NAME>]             | Optional. Displays captive portal client/client sessions information based on the WLAN name passed <ul style="list-style-type: none"> <li>• &lt;WLAN-NAME&gt; - Specify the WLAN name. Displays client details for the specified WLAN.</li> <li>• not &lt;WLAN-NAME&gt; - Inverts match selection. Displays client details for all WLANs other than the one identified by the &lt;WLAN-NAME&gt; parameter.</li> </ul>                                                                                                                                                                                                                                 |

### Examples

```
rfs4000-229D58#show captive-portal sessions

rfs4000-229D58#
```

### *captive-portal-page-upload (show commands)*

Displays captive portal page information, such as upload history, upload status, and page file download status

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show captive-portal-page-upload [history|list-files|load-image-status|status]
show captive-portal-page-upload load-image-status
show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>/<RF-DOMAIN-MANAGER>]}
show captive-portal-page-upload list-files <CAPTIVE-PORTAL-NAME>
```

## Parameters

```
show captive-portal-page-upload load-image-status
```

|                   |                                                                               |
|-------------------|-------------------------------------------------------------------------------|
| load-image-status | Displays captive portal advanced page file upload status on the logged device |
|-------------------|-------------------------------------------------------------------------------|

```
show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
```

|                               |                                                                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| history {on <RF-DOMAIN-NAME>} | Displays captive portal page upload history <ul style="list-style-type: none"><li>• on &lt;RF-DOMAIN-NAME&gt; - Optional. Displays captive portal page upload history within a specified RF Domain. Specify the RF Domain name.</li></ul> |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>/<RF-DOMAIN-MANAGER>]}
```

## cdp

Displays the CDP neighbor table

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show cdp [neighbors|report] {detail {on <DEVICE-NAME>}/on <DEVICE-NAME>}
```

### Parameters

```
show cdp [neighbors|report] {detail {on <DEVICE-NAME>}/on <DEVICE-NAME>}
```

|                           |                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cdp [neighbors report]    | Displays CDP neighbors table or aggregated CDP neighbors table                                                                                                                                                                                                                                                               |
| detail {on <DEVICE-NAME>} | Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays table details on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
| on <DEVICE-NAME>          | Optional. Displays table details on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                                       |

### Examples

The following example shows detailed CDP neighbors table:

```

nx9500-6C8809#show cdp neighbors detail

Device ID: ap8163-74B45C
Entry address(es):
 IP Address: 192.168.13.26
Platform: AP-8163-66040-WR, Capabilities: Router Switch
Interface: ge1, Port ID (outgoing port): ge1
Hold Time: 165 sec

advertisement version: 2
Native VLAN: 1
Duplex: full
Version :
5.9.2.0-007D

Device ID: ap7532-80C2AC
Entry address(es):
 IP Address: 192.168.13.28

```

```
Platform: AP-7532-67040-WR, Capabilities: Router Switch
Interface: ge1, Port ID (outgoing port): ge1
Hold Time: 169 sec
```

```
--More--
nx9500-6C8809#
```

The following example shows a non-detailed CDP neighbors table:

```
nx9500-6C8809#show cdp neighbors

 Device ID Platform Local Interface Port ID Duplex

 rfs4000-880DA7 RFS-4010-11110-US ge2 ge1 full

nx9500-6C8809#
```

### *classify-url*

Displays a specified URL's category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

#### **Parameters**

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

|                           |                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| classify-url              | Queries the category of a specified URL                                                                                                                    |
| <URL-TO-QUERY>            | Specify the URL to query. The query is sent to the configured classification server.                                                                       |
| datacenter <URL-TO-QUERY> | The query is sent to a global classification datacenter <ul style="list-style-type: none"><li>• &lt;URL-TO-QUERY&gt; - Specify the URL to query.</li></ul> |

#### **Examples**

```
nx9500-6C8809#show classify-url www.google.com
Categories: search-engines-portals,
Custom Categories:
nx9500-6C8809#
nx9500-6C8809#show classify-url www.ndtv.com
Categories: news,
Custom Categories: list1,
nx9500-6C8809#
```

### *clock*

Displays system clock on the logged device or on a specified device

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show clock {on <DEVICE-NAME>}
```

### Parameters

```
show clock {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clock            | Displays a system's clock                                                                                                                                                                                      |
| on <DEVICE-NAME> | Optional. Displays system clock on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li></ul> |

### Examples

```
ap8432-070235>show clock
2018-01-09 02:34:22 UTC
ap8432-070235>
```

## cluster

Displays cluster information (cluster configuration parameters, members, status, etc.)

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show cluster [configuration|history|members|status]
show cluster [configuration|history {on <DEVICE-NAME>}|members {detail}|status]
```

### Parameters

```
show cluster [configuration|history {on <DEVICE-NAME>}|members {detail}|status]
```

|                          |                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster                  | Displays cluster information                                                                                                                                                                                                                 |
| configuration            | Displays cluster configuration details                                                                                                                                                                                                       |
| history on <DEVICE-NAME> | Displays cluster history status <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Optional. Specify the controller or access point name. If the device name is not specified, the system displays all cluster history.</li></ul> |
| members {detail}         | Displays cluster members configured on the logged device <ul style="list-style-type: none"><li>• detail - Optional. Displays detailed information of known cluster members</li></ul>                                                         |
| status                   | Displays cluster status                                                                                                                                                                                                                      |

## Examples

```
nx9500-6C8809(config)#show cluster configuration
Cluster Configuration Information
```

```
Name : SiteConRFS6k

## *cmp-factory-certs*

Displays factory installed CMP certificates

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show cmp-factory-certs {all}
```

### Parameters

```
show cmp-factory-certs {all}
```

|                         |                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| cmp-factory-certs {all} | Displays factory installed CMP certificates on the logged device. Optionally use the 'all' keyword to view certificate details. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|

### Examples

```
nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
```

---

## commands

Displays commands available for the current mode

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show commands
```

### Parameters

None

### Examples

```
rfs4000-880DA7(config)#show commands
 help
 help search WORD (|detailed|only-show|skip-show|skip-no)
 show commands
 show adoption log adoptee(|on DEVICE-NAME)
 show adoption log adopter (|mac AA-BB-CC-DD-EE-FF)(|on DEVICE-NAME)

## context

Displays the current context details

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show context {include-factory/session-config {include-factory}}
```

## Parameters

```
show context {include-factory/session-config {include-factory}}
```

|                                |                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include-factory                | Optional. Includes factory defaults                                                                                                                                        |
| session-config include-factory | Optional. Displays running system information in the current context <ul style="list-style-type: none"><li>include-factory – Optional. Includes factory defaults</li></ul> |

## Examples

## *critical-resources*

Displays critical resource information. Critical resources are resources vital to the network.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show critical-resources {on <DEVICE-NAME>}
```

## Parameters

```
show critical-resources {on <DEVICE-NAME>}
```

|                    |                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| critical-resources | Displays critical resources information                                                                                                                                                                              |
| on <DEVICE-NAME>   | Optional. Displays critical resource information on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

### Examples

```
rfs4000-229D58(config)#show critical-resources

CRITICAL RESOURCE IP VLAN PING-MODE STATE

172.168.1.103 1 arp-icmp up

rfs4000-229D58(config)#
```

### crypto

Displays encryption mode information

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show crypto [cmp|ike|ipsec|key|pki]
show crypto cmp request status
show crypto ike sa {detail/on/peer/version}
show crypto ike sa {detail/peer <IP>} {on <DEVICE-NAME>}
show crypto ike sa {version [1/2]} {peer <IP>} {(on <DEVICE-NAME>)}
show crypto ipsec sa {detail/on/peer}
show crypto ipsec sa {detail} {on <DEVICE-NAME>}
show crypto ipsec sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}
show crypto key rsa {on/public-key-detail}
show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all/on}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}
```

### Parameters

show crypto cmp request status

|                    |                                                                                       |
|--------------------|---------------------------------------------------------------------------------------|
| crypto cmp request | Displays current status of in-progress CMP (certificate management protocol) requests |
| status             | For more information, see <a href="#">CRYPTO-CMP-POLICY</a> .                         |

```
show crypto ike sa {detail/peer <IP>} {on <DEVICE-NAME>}
```

|               |                                                                           |
|---------------|---------------------------------------------------------------------------|
| crypto ike sa | Displays IKE (Internet Key Exchange) SA (security association) statistics |
| detail        | Displays detailed IKE SA statistics                                       |

|                  |                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| peer <IP>        | Optional. Displays IKE SA statistics for a specified peer <ul style="list-style-type: none"> <li>• &lt;IP&gt; – Specify the peer’s IP address in the A.B.C.D format</li> </ul>                             |
| on <DEVICE-NAME> | Optional. Displays IKE SA statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto ike sa    | Displays IKE SA details                                                                                                                                                                            |
| version [1 2]    | Optional. Displays IKE SA version statistics <ul style="list-style-type: none"> <li>• 1 – Displays IKEv1 statistics</li> <li>• 2 – Displays IKEv2 statistics</li> </ul>                            |
| on <DEVICE-NAME> | Optional. Displays IPSec SAs on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
show crypto sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto ipsec sa  | Displays IPSec SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session                                                                                                                                                    |
| peer <IP> detail | Optional. Displays IPSec SA statistics for a specified peer <ul style="list-style-type: none"> <li>• &lt;IP&gt; – Specify the peer’s IP address in the A.B.C.D format.</li> <li>• detail – Displays detailed IPSec SA statistics for the specified peer</li> </ul>         |
| on <DEVICE-NAME> | The following keyword is recursive: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Displays IPSec SAs on a specified device</li> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}
```

|                   |                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypto key rsa    | Displays RSA public keys                                                                                                                                                                                                                                                    |
| public-key-detail | Optional. Displays public key in the PEM ( <i>Privacy-Enhanced Mail</i> ) format                                                                                                                                                                                            |
| on <DEVICE-NAME>  | The following keyword is recursive: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; – Optional. Displays public key on a specified device</li> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}
```

|                   |                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------|
| crypto pki        | Displays PKI related information                                                                        |
| trustpoints       | Displays WLAN trustpoints<br>This command displays all trustpoints including CMP-generated trustpoints. |
| <TRUSTPOINT-NAME> | Optional. Displays a specified trustpoint details. Specify the trustpoint name.                         |

|                  |                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all              | Optional. Displays details of all trustpoints                                                                                                                                                                                                                                                                                                |
| on <DEVICE-NAME> | The following keyword is recursive and common to the 'trustpoint-name' and 'all' parameters: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays trustpoints configured on a specified device</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

## database

Displays database-related statistics and status

## Supported in the following platforms:

- Service Platforms — NX 95XX, VX 9000

## Syntax

```
show database [backup-status|keyfile|restore-status|statistics|status|users] {on <DEVICE-NAME>}
```

## Parameters

```
show database [backup-status|keyfile|restore-status|statistics|status|users] {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database         | Displays all configured database-related statistics and status                                                                                                                                                      |
| backup-status    | Displays the last database backup status                                                                                                                                                                            |
| keyfile          | Displays the keyfiles generated on the database host to enable authenticated database access                                                                                                                        |
| back-restore     | Displays the last database restore status                                                                                                                                                                           |
| statistics       | Displays database-related statistics, such as name of the database (NSight or captive portal), data size, storage size, free disk space available, etc.                                                             |
| status           | Displays database status, such as online time.                                                                                                                                                                      |
| users            | Displays database users created. These are the users that can access the databases.                                                                                                                                 |
| on <DEVICE-NAME> | Optional. Displays database-related information on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

### device-upgrade

Displays firmware upgradation information for devices adopted by a wireless controller or access point

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show device-upgrade [history|load-image-status|status|versions]
show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-
DOMAIN-NAME>}]
show device-upgrade status {on [<DOMAIN-NAME>/rf-domain-manager]/summary {on <DOMAIN-
NAME>}}
```

#### Parameters

```
show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-
DOMAIN-NAME>}]
```

|                                                  |                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device-upgrade                                   | Displays firmware upgrade information based on the parameters passed                                                                                                                                                                                                                                                         |
| history {on<br><DOMAIN-<br>NAME>}                | Displays firmware upgrade history <ul style="list-style-type: none"> <li>on &lt;DOMAIN-NAME&gt; - Optional. ## dot1x

Displays dot1x information on interfaces.

Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

However, dot1x-enabled devices can be configured either as:

- supplicants only – Devices seeking network access
- authenticators only – Devices authenticating the supplicants, or
- supplicants as well authenticators

---

### Note

Dot.1x supplicant configuration is supported on the following platforms:

- Access Points – AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP8163, AP8432, AP8533
- Wireless Controllers – RFS4000
- Service Platforms – NX5500, NX7500

---

### Note

Dot.1x authenticator configuration is supported on the following platforms:

- Access Points – AP6522, AP6562, AP7161, AP7502, AP8163
- Wireless Controllers – RFS4000
- Service Platforms – NX5500, NX7500

---

### Supported in the following platforms:

- Access Points – AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers – RFS 4000
- Service Platforms – NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show dot1x {all/interface/on}
show dot1x {all {on <DEVICE-NAME>}/on <DEVICE-NAME>}
show dot1x {interface [<INTERFACE-NAME>/ge <1-4>/port-channel <1-2>} {on <DEVICE-NAME>}
```

### Parameters

```
show dot1x {all {on <DEVICE-NAME>}/on <DEVICE-NAME>}
```

|                              |                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x all {on <DEVICE-NAME>} | Optional. Displays dot1x information for all interfaces <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays dot1x information for all interfaces on a specified device</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
| dot1x {on <DEVICE-NAME>}     | Optional. Displays dot1x information for interfaces on a specified device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the name of AP, wireless controller, or service platform.</li> </ul>                                                                                                   |

show dot1x {interface [<INTERFACE-NAME>/ge <1-4>/port-channel <1-2>]} {on <DEVICE-NAME>}

|                    |                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x interface    | Optional. Displays dot1x information for a specified interface or interface type                                                                                                                                                                                                                                   |
| <INTERFACE-NAME>   | Displays dot1x information for the layer 2 (Ethernet port) interface specified by the <INTERFACE-NAME> parameter                                                                                                                                                                                                   |
| ge <1-4>           | Displays dot1x for a specified GigabitEthernet interface <ul style="list-style-type: none"> <li>&lt;1-4&gt; - Select the interface index from 1 - 4.</li> </ul>                                                                                                                                                    |
| port-channel <1-2> | Displays dot1x for a specified port channel interface <ul style="list-style-type: none"> <li>&lt;1-2&gt; - Select the interface index from 1 - 2.</li> </ul>                                                                                                                                                       |
| on <DEVICE-NAME>   | The following keywords are common to all of the above parameters: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays dot1x interface information on a specified device</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of AP, wireless controller, or service platform.</li> </ul> |

## Examples

```
ap8432-070235>show dot1x all
802.1X information

 SysAuthControl : disabled
 Guest-Vlan : disabled
 AAA-Policy : none
 Holdtime : 60

802.1X information for interface GE1

Supplicant MAC N/A
 Auth SM State : FORCE AUTHORIZED
 Bend SM State : REQUEST
 Port Status : AUTHORIZED
 Host Mode : SINGLE
 Auth Vlan : None
 Guest Vlan : None

802.1X information for interface GE2

Supplicant MAC N/A
 Auth SM State : FORCE AUTHORIZED
 Bend SM State : REQUEST
 Port Status : AUTHORIZED
 Host Mode : SINGLE
 Auth Vlan : None
 Guest Vlan : None

ap8432-070235>
```

## dpi

Displays DPI (Deep Packet Inspection) statistics for all configured and canned applications. DPI is an advanced packet analysis technique, which analyzes packet and packet content headers to determine the nature of network traffic. When DPI is enabled, packets of all flows are subjected to DPI to get accurate results. DPI identifies applications (such as, Netflix, Twitter, Facebook, etc.) and also extracts metadata (such as, host name, server name, TCP-RTT, etc.) for further use by the WiNG firewall.

### Note

The **show > dpi** command returns results only if executed on a device that supports DPI and has DPI logging enabled. DPI logging can be enabled either on the device or on the profile applied to the device. For more information, see [dpi](#) on page 986 (profile config mode).

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show dpi [app|app-category|application|application-policy|per-category]
show dpi app wireless-clients stats <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}
show dpi application-policy stats <APPLICATION-POLICY-NAME> {on <DEVICE-OR-DOMAIN-NAME>}
show dpi application brief
show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}
```

### Parameters

```
show dpi app wireless-clients stats <MAC> {<DEVICE-OR-DOMAIN-NAME>}
```

|                                |                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dpi app wireless-clients <MAC> | Displays application-related statistics for all or a specified wireless clients <ul style="list-style-type: none"><li>• &lt;MAC&gt; - Displays statistics for a specified wireless client. Specify the client's MAC address.</li></ul>              |
| on <DEVICE-OR-DOMAIN-NAME>     | Optional. Displays statistical data on a specified device or RF Domain <ul style="list-style-type: none"><li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the access point, wireless controller, service platform, or RF Domain.</li></ul> |

```
show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all]
{on <DEVICE-OR-DOMAIN-NAME>}
```

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <pre>dpi application brief</pre> | <p>Displays a brief summary of applications their status and configuration</p> |
|----------------------------------|--------------------------------------------------------------------------------|

```
show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes]
{on <DEVICE-OR-DOMAIN-NAME>}
```

|                                   |                                                                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>dpi per-category stats</pre> | <p>Displays statistics for the top ten applications based on the application category and the Sort ID specified. The Sort ID options are: bytes-in, bytes-out or total-bytes.</p> |
| <pre>&lt;APP-CATEGORIES&gt;</pre> | <p>Specify the application category name. The system displays statistics for the top ten applications in this category.</p>                                                       |

[bytes-in|bytes-out| total-bytes]

Filters and displays statistical data for the top ten utilized applications in respect to the following:

- bytes-in - Displays total data bytes uploaded through the controller managed network. If this application data is not aligned with application utilization expectations, consider allowing or denying additional applications and categories or adjusting their precedence (priority).
- bytes-out - Displays total data bytes downloaded through the controller managed network. If this application data is not aligned with application utilization expectations, consider allowing or denying additional applications and categories or adjusting their precedence (priority).
- total-bytes - Displays total data bytes (uploaded and downloaded) through the controller managed network. These are only the administrator allowed applications approved for proliferation within the managed network.

on <DEVICE-OR-DOMAIN-NAME>

Optional. Displays statistical data on a specified device or RF Domain

- <DEVICE-OR-DOMAIN-NAME> - Specify the name of the access point, wireless controller, service platform, or RF Domain.

## Examples

```
nx9500-6C8809>show dpi application brief

## environmental-sensor

Displays environmental sensor's recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

### Note

The environmental sensor is supported only on an AP 8132. When executed on any controller (other than an AP 8132), the **show > environmental-sensor > <parameters>** command displays environmental-sensor details for adopted AP 8132s (if any).

### Supported in the following platforms:

- AP 8132

### Syntax

```
show environmental-sensor [history|humidity|light|motion|summary|temperature|version]
```

```
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
```

```
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

### Parameters

```
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
```

|                              |                                                                                                                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environmental-sensor history | Displays environmental sensor history once in every hour, 20 minutes, or 24 hours. History includes the humidity, light, motion, and temperature data recorded by the sensor at specified time interval. |
| 1 hour                       | Optional. Displays environmental sensor history once in every 1 (one) hour.                                                                                                                              |
| 20-minute                    | Optional. Displays environmental sensor history once in every 20 minutes.                                                                                                                                |
| 24-hour                      | Optional. Displays environmental sensor history once in every 24 hours.                                                                                                                                  |

```
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

|                      |                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environmental-sensor | Displays environmental sensor's recorded data, based on the parameters passed. The system displays the specified recorded data. The environmental sensor records data at the following intervals: 20 minutes, 1 hour, and 24 hours. |
| humidity             | Displays the minimum, average, and maximum humidity recorded.                                                                                                                                                                       |
| light                | Displays the minimum, average, and maximum light recorded.                                                                                                                                                                          |
| motion               | Displays the minimum, average, and maximum motion recorded.                                                                                                                                                                         |
| temperature          | Displays the minimum, average, and maximum temperature recorded.                                                                                                                                                                    |
| version              | Displays the hardware and firmware versions.                                                                                                                                                                                        |
| summary              | Displays a summary of the data recorded at following intervals:                                                                                                                                                                     |

### event-history

Displays event history report

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

```
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

|                            |                                                                                                                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event-history              | Displays event history report                                                                                                                                                                                                         |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays event history report on a device or RF Domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

## Examples

### *event-system-policy*

Displays detailed event system configuration

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>
```

#### Parameters

```
show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>
```

|                             |                                                        |
|-----------------------------|--------------------------------------------------------|
| event-system-policy         | Displays event system policy configuration             |
| config                      | Displays configuration for a specified policy          |
| detail                      | Displays detailed configuration for a specified policy |
| <EVENT-SYSTEM- POLICY-NAME> | Specify the event system policy name.                  |

#### Examples

```
nx9500-6C8809(config)#show event-system-policy config testpolicy
```

```

MODULE EVENT SYSLOG SNMP FORWARD EMAIL

aaa radius-discon-msg on on on default

nx9500-6C8809(config)#
```

### *ex3500*

Displays EX3500-related statistical data

## Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

## Syntax

```
show ex3500 [dir|interfaces|system|upgrade|version|whichboot]
show ex3500 dir {boot-rom/config/on/opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|
ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}
```

## Parameters

```
show ex3500 dir {boot-rom/config/on/opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
```

|                         |                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 dir              | Displays EX3500 directory information based on the option selected. The options are: boot-rom, config, opcode<br><br><b>Note:</b> If none of the specified options is selected, all EX3500 system-related information is displayed. |
| boot-rom                | Optional. Displays only the Boot-ROM information                                                                                                                                                                                    |
| config                  | Optional. Displays only the configuration file                                                                                                                                                                                      |
| opcode                  | Optional. Displays only the run-time operation code                                                                                                                                                                                 |
| <FILE-NAME>             | Displays the contents of a specified file identified by the <FILE-NAME> keyword. This is the name of configuration file or code image.                                                                                              |
| on <EX3500-DEVICE-NAME> | Optional. Executes the command on a specified EX3500 device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Specify the device's name.</li></ul>                                                                      |

```
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|
ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500 interfaces counters | Displays EX3500 interface counter information based on the option selected. The options are: ether-like, ethernet, ext-if-table, if-table, portUtil, rmon                                                                                                                                                                                                                                                                                                                                                                                               |
| ether-like stats           | Displays MIB (Managed Information Base) object statistics for Ethernet-like interfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ethernet <1-1> <1-52>      | Displays the Ethernet port statistics based on the unit identifier and port number selected <ul style="list-style-type: none"><li>• &lt;1-1&gt; - Specify the EX3500 unit's identifier from 1 - 1.</li><li>• &lt;1-52&gt; - Specify the port number from 1 - 52. This range varies for the EX3524 (1-28) and EX3548 (1-52) devices.</li></ul><br><b>Note:</b> This option displays the following for the selected Ethernet interface: extended interface table stats, interface table stats, port utilization information, and remote monitoring stats. |
| ext-if-table stats         | Displays only the extended interface table statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| if-table stats             | Displays only the interface table statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| portUtil stats             | Displays only the port utilization information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                         |                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rmon stats              | Displays only RMon (remote monitoring) statistics                                                                                                              |
| on <EX3500-DEVICE-NAME> | Optional. Executes the command on a specified EX3500 device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the device's name.</li> </ul> |

show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}

|                         |                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ex3500                  | Displays the following information for a specified EX3500 device or all EX3500 devices in the managed network                                                                                                                                  |
| system                  | Displays EX3500 system information, such as device description, OID string, up time, name, location, contact, MAC address, etc. Some of these information (example, system name) are configurable items, and if not configured are left blank. |
| upgrade                 | Displays the opcode upgrade configuration settings                                                                                                                                                                                             |
| version                 | Displays hardware and software version information for a EX3500 system                                                                                                                                                                         |
| whichboot               | Displays boot information                                                                                                                                                                                                                      |
| on <EX3500-DEVICE-NAME> | Optional. Executes the command on a specified EX3500 device <ul style="list-style-type: none"> <li>&lt;DEVICE-NAME&gt; - Specify the device's name.</li> </ul>                                                                                 |

### *extdev*

Displays external device (T5 or EX3500) configuration error history

#### **Supported in the following platforms:**

- Wireless Controllers — RFS 4000
- Service Platforms — NX 95XX

#### **Syntax**

```
show extdev error history {on <T5/EX3500-DEVICE-NAME>}
```

#### **Parameters**

```
show extdev error history {on <T5/EX3500-DEVICE-NAME>}
```

|                            |                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extdev error history       | Displays external device error history. This command is applicable only to the external devices T5, and EX3500 series switches. Use this command to view configuration error history for all or a specified external device adopted and managed by a WiNG NX 95XX series service platform. |
| on <T5/EX3500-DEVICE-NAME> | Optional. Displays configuration error history on a specified T5 or EX3500 device <ul style="list-style-type: none"> <li>• &lt;T5/EX3500-DEVICE-NAME&gt; - Specify the name of the device.</li> </ul>                                                                                      |

#### **Examples**

```

nx9500-6C8809#show extdev error history on t5-ED5EAC
%% No History for this device
nx9500-6C8809#

```

### *fabric-attach*

Displays the current status of FA (Fabric Attach) VLAN to I-SID (Individual Service Identifier) assignments for all ports.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show fabric-attach assignments {on <DEVICE-NAME>}
```

### Parameters

```
show fabric-attach assignments {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fabric-attach    | Displays the status of VLAN to I-SID mappings, if configured, on the Ethernet ports of an FA Client. The status displays as: <ul style="list-style-type: none"><li>• active – If the VLAN to I-SID mapping is accepted by the FA Server and applied to the VLAN traffic from the client.</li><li>• pending – If the VLAN to I-SID mapping acceptance is not achieved (i.e, pending acceptance)</li></ul> |
| on <DEVICE-NAME> | Optional. Displays VLAN to I-SID mappings on a specified FA client. If executing this command on a controller, you may, optionally, specify the device for which the FA VLAN to I-SID assignments is to be displayed. <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li></ul>                                      |

### Example

The Following example shows the fabric-attach VLAN to ISID assignment configured on the ap7532-000100 access point:

```
nx9600-7F3B2C#
ap7532 B8-50-01-00-01-00
 use profile default-ap7532
 use rf-domain default
 hostname ap7532-000100
 interface gel
 switchport mode trunk
 switchport trunk fabric-attach vlan 110 isid 10180110
 switchport trunk native vlan 110
 switchport trunk native tagged
 switchport trunk allowed vlan 110
 interface vlan110
 ip address dhcp
 ip dhcp client request options all
nx9600-7F3B2C#
```

The following example shows the fabric-attach assignment status for the ap7532-000100 access point:

```
nx9600-7F3B2C#show fabric-attach assignments on ap7532-000100

Assignment status for port : gel
VLAN ISID STATUS
---- -
110 10180110 Accepted

nx9600-7F3B2C#
```

file

Displays file system information

#### Note

This command is not available in the USER EXEC mode.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show file [information <FILE>|systems]
```

#### Parameters

```
show file [information <FILE>|systems]
```

|                    |                                                                                                                   |

file-sync

Displays file synchronization settings and status on a controller

The file-sync command syncs wireless-bridge certificate and trustpoint between the staging-controller and its adopted access points. The **show > file-sync** command displays information related to this process.

#### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 7510, NX 95XX, NX 96XX

#### Syntax

```
show file-sync [configuration|history|load-file-status|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

## Parameters

```
show file-sync [configuration|history|load-file-status|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| file-sync                   | Displays the following file-synchronization (trustpoint and wireless-bridge certificate) related information: configuration, history, load-file-status, and status                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| configuration               | <p>Displays the following file-synchronization configuration details:</p> <ul style="list-style-type: none"><li>• automatic file-syncing enabled or disabled. The default setting is disabled.</li></ul> <p>The X.509 certificate needs synchronization only if the access point's radio2 is configured to use EAP-TLS authentication. In which case PKCS#12 certificate needs to be pushed on AP adoption. To enable automatic file syncing, in the controller's device/profile configuration mode, execute the <b>file-sync &gt; auto</b> command. For more information, see <a href="#">file-sync</a> on page 999 (profile config mode).</p> <ul style="list-style-type: none"><li>• Number of access points to which the certificate can be simultaneously uploaded. The default is 10.</li></ul> <p>To modify the number of simultaneous uploads, in the controller's device/profile configuration mode, execute the <b>file-sync &gt; count &lt;1-20&gt;</b> command. For more information, see <a href="#">file-sync</a> on page 999 (profile config mode).<li>• Scheduled certificate upload, if any, details, such time and date of upload.</li><p>To schedule certificate upload, use the <b>file-sync &gt; wireless-certificate</b> command. For more information, see <a href="#">file-sync</a> on page 999 (profile config mode).</p></p> |
| history                     | Displays file synchronization history. Use this option to view statistical data relating to wireless-bridge certificate synchronization between staging controller and its access points. When executed, a list of all certificate transfers made to the APs is displayed, with the latest transfer listed at the top.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| load-file-status            | Displays the status of the file upload to the controller. Use this command to view the status of a in-progress certificate upload. For more information on initiating a PKCS#12 certificate upload, see <a href="#">file-sync</a> on page 999 (profile config mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| status                      | Displays status of the file synchronization between the controller and its adopted access point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| on <DEVICE-OR-DOMAIN- NAME> | <p>Optional. Displays file synchronization settings and status on a specified device or RF Domain</p> <ul style="list-style-type: none"><li>• &lt;DEVICE-OR-DOMAIN- NAME&gt; – Specify the name of the controller, service platform, or RF Domain.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Examples

```
nx9500-6C8809#show file-sync configuration
File Sync Configuration Information
 Auto : Disabled
 Simultaneous Upload Count : 128
```

```

Wireless Bridge Cert Load Time : Thu May 29 23:23:35 2015
nx9500-6C8809#
nx9500-6C8809#show file-sync load-file-status
Download of wireless_bridge certificate is complete
nx9500-6C8809#
nx9500-6C8809#show file-sync history

 AP RESULT TIME RETRIES SYNCED-BY LAST-SYNC-ERROR

nx9500-6C8809#

```

## firewall

Displays wireless firewall information, such as DHCP (Dynamic Host Configuration Protocol) snoop table entries, denial of service statistics, active session summaries, etc.

### Note

This command is not available in the USER EXEC mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

show firewall [dhcp|flows|neighbors]
show firewall dhcp snoop-table {on <DEVICE-NAME>}
show firewall flows {filter|management|on/stats/wireless-client}
show firewall flows {filter} {(dir|dst port <1-65535>|ether|flow-type|icmp|
icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)}
show firewall flows {management {on <DEVICE-NAME>}|stats {on <DEVICE-NAME>}|
wireless-client <MAC>|on <DEVICE-NAME>}
show firewall neighbors snoop-table {on <DEVICE-NAME>}

```

### Parameters

```
show firewall dhcp snoop-table {on <DEVICE-NAME>}
```

|                                              |                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| firewall dhcp snoop-table {on <DEVICE-NAME>} | <p>Displays DHCP snoop table entries</p> <ul style="list-style-type: none"> <li>• snoop-table - Displays DHCP snoop table entries</li> </ul> <p>DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server. Snoop table entries contain MAC address, IP address, lease time, binding type, and interface information of non-trusted interfaces.</p> |
| on <DEVICE-NAME>                             | <p>The following keyword is common to the 'DHCP snoop table' and 'DoS stats' parameters:</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. |----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| firewall flows                                                       | Notifies a session has been established                                                                                                                                                                                                                                                                                                                                                                                             |
| filter                                                               | Optional. Defines additional firewall flow filter parameters                                                                                                                                                                                                                                                                                                                                                                        |
| dir [wired-wired  wired-wireless  wireless-wired  wireless-wireless] | Optional. Matches the packet flow direction <ul style="list-style-type: none"> <li>wired-wired – Wired to wired flows</li> <li>wired-wireless – Wired to wireless flows</li> <li>wireless-wired – Wireless to wired flows</li> <li>wireless-wireless – Wireless to wireless flows</li> </ul>                                                                                                                                        |
| dst port <1-65535>                                                   | Optional. Matches the destination port with the specified port <ul style="list-style-type: none"> <li>port &lt;1-65535&gt; – Specifies the destination port number from 1 - 65535</li> </ul>                                                                                                                                                                                                                                        |
| ether [dst <MAC>  host <MAC>  src <MAC>  vlan <1-4094>]              | Optional. Displays Ethernet filter options <ul style="list-style-type: none"> <li>dst &lt;MAC&gt; – Matches only the destination MAC address</li> <li>host &lt;MAC&gt; – Matches flows containing the specified MAC address</li> <li>src &lt;MAC&gt; – Matches only the source MAC address</li> <li>vlan &lt;1-4094&gt; – Matches the VLAN number of the traffic with the specified value. Specify a value from 1- 4094.</li> </ul> |
| flow-type [bridged natted routed  wired wireless]                    | Optional. Matches the traffic flow type <ul style="list-style-type: none"> <li>bridged – Bridged flows</li> <li>natted – Natted flows</li> <li>routed – Routed flows</li> <li>wired – Flows belonging to wired hosts</li> <li>wireless – Flows containing a mobile unit</li> </ul>                                                                                                                                                  |
| icmp {code type}                                                     | Optional. Matches flows with the specified ICMP (Internet Control Message Protocol) version 4 code and type <ul style="list-style-type: none"> <li>code – Matches flows with the specified ICMPv4 code</li> <li>type – Matches flows with the specified ICMPv4 type</li> </ul>                                                                                                                                                      |
| icmpv6 {code type}                                                   | Optional. Matches flows with the specified ICMP version 6 code and type <ul style="list-style-type: none"> <li>code – Optional. Matches flows with the specified ICMPv6 code</li> <li>type – Optional. Matches flows with the specified ICMPv6 type</li> </ul>                                                                                                                                                                      |
| igmp                                                                 | Optional. Matches IGMP (Internet Group Management Protocol) flows                                                                                                                                                                                                                                                                                                                                                                   |
| ip [dst <IP>  host <IP>  proto <0-254>  src <IP>]                    | Optional. Filters firewall flows based on the IPv4 parameters passed <ul style="list-style-type: none"> <li>dst &lt;IP&gt; – Matches destination IP address</li> <li>host &lt;IP&gt; – Matches flows containing IPv4 address</li> <li>proto &lt;0-254&gt; – Matches the IPv4 protocol number with the specified number</li> <li>src &lt;IPv4&gt; – Matches source IP address</li> </ul>                                             |
| ipv6 [dst <IPv6>  host <IPv6>  proto <0-254>  src <IPv6>]            | Optional. Filters firewall flows based on the IPv6 parameters passed <ul style="list-style-type: none"> <li>dst &lt;IPv6&gt; – Matches destination IPv6 address</li> <li>host &lt;IPv6&gt; – Matches flows containing IPv6 address</li> <li>proto &lt;0-254&gt; – Matches the IPv6 protocol number with the specified number</li> <li>src &lt;IPv6&gt; – Matches source IPv6 address</li> </ul>                                     |

|                          |                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| max-idle <1-4294967295>  | Optional. Filters firewall flows idle for at least the specified duration. Specify a max-idle value from 1 - 4294967295 bytes.     |
| min-bytes <1-4294967295> | Optional. Filters firewall flows with at least the specified number of bytes. Specify a min-bytes value from 1 - 4294967295 bytes. |
| min-idle <1-4294967295>  | Optional. Filters firewall flows idle for at least the specified duration. Specify a min-idle value from 1 - 4294967295 bytes.     |
| min-pkts <1-4294967295>  | Optional. Filters firewall flows with at least the given number of packets. Specify a min-bytes value from 1 - 4294967295 bytes.   |
| not                      | Optional. Negates the filter expression selected                                                                                   |
| port <1-65535>           | Optional. Matches either the source or destination port. Specify a port from 1 - 65535.                                            |
| src <1-65535>            | Optional. Matches only the source port with the specified port. Specify a port from 1 - 65535.                                     |
| tcp                      | Optional. Matches TCP flows                                                                                                        |
| udp                      | Optional. Matches UDP flows                                                                                                        |

```
show firewall flows {management {on <DEVICE-NAME>}}/stats {on <DEVICE-NAME>}/
wireless-client <MAC>/on <DEVICE-NAME>}
```

|                               |                                                                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| firewall flows                | Notifies a session has been established                                                                                                                                                                                                                                                      |
| management {on <DEVICE-NAME>} | Optional. Displays management traffic firewall flows <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; – Optional. Displays firewall flows on a specified device</li> <li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

## global

Displays global information for network devices based on the parameters passed

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show global [device-list|domain]
show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>/not <DOMAIN-NAME>]}
show global domain managers
```

### Parameters

```
show global device-list {filter {offline|online}}
```

|                        |                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| global device -list    | Displays global information for all network devices. Use the following keywords to specify additional filters: <b>offline</b> , <b>online</b> , and <b>rf-domain</b> .                                                                             |
| filter{offline online} | Optional. Specifies additional filters <ul style="list-style-type: none"><li>• offline – Optional. Displays global information for offline devices only</li><li>• online – Optional. Displays global information for online devices only</li></ul> |

```
show global device-list {filter rf-domain [<DOMAIN-NAME>/not <DOMAIN-NAME>]}
```

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| global device -list                                       | Displays global information for all network devices. Use the following keywords to specify additional filters: <b>offline</b> , <b>online</b> , and <b>rf-domain</b> .                                                                                                                                                                                                                                                                                                        |
| filter rf-domain<br>[<DOMAIN-NAME> <br>not <DOMAIN-NAME>] | Optional. Specifies additional filters <ul style="list-style-type: none"><li>• rf-domain – Optional. Displays global information for all devices in a specified RF Domain</li><li>• &lt;DOMAIN-NAME&gt; – Optional. Displays information for all devices within the domain identified by the &lt;DOMAIN-NAME&gt; keyword</li><li>• not &lt;DOMAIN-NAME&gt; – Optional. Displays information for all devices in domains not matching the &lt;DOMAIN-NAME&gt; keyword</li></ul> |

```
show global domain managers
```

|                        |                                                                         |
|------------------------|-------------------------------------------------------------------------|
| global domain managers | Displays global information for all RF Domains managers in the network. |
|------------------------|-------------------------------------------------------------------------|

### Examples

## gre

Displays layer 2 GRE (Generic Routing Encapsulation) tunnel traffic flow information

GRE is one of the available tunneling mechanisms which uses IP as the transport protocol and can be used for carrying many different passenger protocols. The tunnels behave as virtual point-to-point links that have two endpoints identified by the tunnel source and tunnel destination addresses at each endpoint.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show gre info {detail} {(on <DEVICE-NAME>)}
```

### Parameters

```
show gre info {detail} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gre info         | Displays GRE tunnel related information and stats.                                                                                                                                                                                                                                                                                                              |
| detail           | Optional. Displays GRE tunnel information in detail, such as tunnel state, tunnel's remote-end peer device's IP address, session ID of an operational tunnel, total number of packets received and transmitted through the tunnel, and the number of dropped packets during tunneled exchanges between access point and a peer at the remote end of the tunnel. |
| on <DEVICE-NAME> | Optional. Executes the command on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the access point, controller, or service platform.</li> </ul>                                                                                                                                                           |

### Examples

```

nx9500-6C8809#show gre info
Gre Tunnel info:
Tunnel info not found
nx9500-6C8809#

```

## guest-registration

Displays information on the performance of clients using guest access permissions to obtain network resources within the WiNG network. The reporting timeline can be adjusted as needed, as can the RF Domain(s) and WLAN(s) used to filter and report guest client statistics.

### Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show guest-registration [age-range|backup-snapshots|browsers|client|devices|
gender|loyalty-app-status|notification-status|os|social|user-trends|visitors]
{on <DEVICE-NAME>}
show guest-registration backup-snapshots
show guest-registration [age-range|browsers|devices|gender|os|user-trends|
visitors] time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]
{(rfdomain <DOMAIN-NAME>/wlan <WLAN-NAME>)}
show guest-registration client [email|mac|member|mobile|name|time]

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| guest-registration | Displays guest registration statistics based on the parameters and time entered                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| loyalty-app-status | Displays captive portal clients' Loyalty Application analytics, such as the number of guest clients with loyalty application detection enabled, associating with the captive portal's access point during a specified time period.<br>Loyalty application detection occurs on the access point to which the guest client is associated, allowing a retail administrator to assess whether a captive portal client is using specific retail (loyalty) applications in their captive portal. For more information on enabling loyalty application detection on a captive portal, see <a href="#">report-loyalty-application</a> (captive portal config mode). |

## interface

Displays configured system interfaces and their status

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```

show interface {<INTERFACE-NAME>|brief|counters|ge|me1|port-channel|pppoe1|
switchport|vlan|wwan1}
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|
pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}

```

## Parameters

show interface {<INTERFACE-NAME>/brief/counters/ge <1-4>/me1/port-channel <1-2>/pppoe1/switchport/vlan <1-4094>/wwan1} {on <DEVICE-NAME>}

|                    |                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interfaces         | Optional. Displays system interface status based on the parameters passed                                                                                                                                                                                                                                                |
| <INTERFACE-NAME>   | Optional. Displays status of the interface specified by the <INTERFACE-NAME> parameter. Specify the interface name.                                                                                                                                                                                                      |
| brief              | Optional. Displays a brief summary of the interface status and configuration                                                                                                                                                                                                                                             |
| counters           | Optional. Displays interface Tx or Rx counters                                                                                                                                                                                                                                                                           |
| ge <1-4>           | Optional. Displays Gigabit Ethernet interface status and configuration <ul style="list-style-type: none"> <li>&lt;1-4&gt; - Select the Gigabit Ethernet interface index from 1 - 4.</li> </ul>                                                                                                                           |
| me1                | Optional. Displays Fast Ethernet interface status and configuration                                                                                                                                                                                                                                                      |
| port-channel <1-2> | Optional. Displays port channel interface status and configuration <ul style="list-style-type: none"> <li>&lt;1-2&gt; - Specify the port channel index from 1 - 2.</li> </ul>                                                                                                                                            |
| pppoe1             | Optional. Displays PPP over Ethernet interface status and configuration                                                                                                                                                                                                                                                  |
| switch port        | Optional. Displays layer 2 interface status                                                                                                                                                                                                                                                                              |
| vlan <1-4094>      | Optional. Displays VLAN interface status and configuration <ul style="list-style-type: none"> <li>&lt;1-4094&gt; - Specify the Switch Virtual Interface (SVI) VLAN ID from 1 - 4094.</li> </ul>                                                                                                                          |
| wwan1              | Optional. Displays Wireless WAN interface status, configuration, and counters                                                                                                                                                                                                                                            |
| on <DEVICE-NAME>   | The following keywords are common to all of the above interfaces: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays interface related information on a specified device</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

## Examples

```
nx9500-6C8809(config)#show interface switchport
```

```

INTERFACE STATUS MODE VLAN(S)

ge1 UP access 1
ge2 DOWN access 1

```

A '\*' next to the VLAN ID indicates the native vlan for that trunk port

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show interface vlan 1
```

```
Interface vlan1 is UP
```

```
Hardware-type: vlan, Mode: Layer 3, Address: B4-C7-99-6C-88-09
```

```
Index: 5, Metric: 1, MTU: 1500
```

```
IP-Address: 192.168.13.13/24
```

```
input packets 4623946, bytes 568905032, dropped 0, multicast packets 0
```

```
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
```

```
output packets 458235, bytes 90317187, dropped 0
```

```
output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

```
collisions 0
```

```
IPv6 mode is disabled
```

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show interface ge 1
```

```
Interface ge1 is UP
```

```
Hardware-type: ethernet, Mode: Layer 2, Address: 00-1E-67-4B-BF-BC
```

```

### *iot-device-type-imagotag*

Displays the configuration of ESL communicator on a specified AP or on all APs within an RF Domain.

#### **Supported in the following platforms:**

- Access Points — AP 8432
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
show iot-device-type-imagotag status {on <DEVICE-OR-DOMAIN-NAME>}
```

#### **Parameters**

```
show iot-device-type-imagotag status {on <DEVICE-OR-DOMAIN-NAME>}
```

|                                 |                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| iot-device-type-imagotag status | Displays Imagotags ESL communicator configuration at device or domain level status                                                                                                               |
| on <DEVICE-NAME>                | Optional. Displays configuration on a specified device or RF Domain <ul style="list-style-type: none"> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP or RF Domain.</li> </ul> |

#### **Example**

```

*ip*

Displays IP related information

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show ip [arp|bgp|ddns|default-gateways|dhcp|dhcp-vendor-options|domain-name|
extcommunity-list|igmp|interface|name-server|nat|ospf|route|routing]
show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}
show ip bgp {<IP>|<IP/M>|community|community-list|filter-list|neighbors|
on|paths|prefix-list|regexp|route-map|state|summary}
show ip ddns bindings {on <DEVICE-NAME>}
show ip dhcp [binding|networks|status]
show ip dhcp binding {manual} {(on <DEVICE-NAME>)}
show ip dhcp [networks|status] {on <DEVICE-NAME>}
show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing] {on <DEVICE-
NAME>}
show ip extcommunity-list [<1-500>|<NAME>]
show ip igmp snooping [mrouter|querier|vlan]
show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}
show ip igmp snooping vlan <1-4095> {<IP>} {(on <DEVICE-NAME>)}
show ip interface {<INTERFACE-NAME>|brief|on}
show ip interface {<INTERFACE-NAME>|brief} {(on <DEVICE-NAME>)}
show ip nat translations verbose {on <DEVICE-NAME>}
show ip route {<INTERFACE-NAME>|ge|me1|on|port-channel|pppoe1|vlan|wwan1}
show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|
pppoe1|wwan1} {(on <DEVICE-NAME>)}
show ip ospf {border-router|interface|neighbor|on|route|state}
show ip ospf {border-router|neighbor|route|on|state} {on <DEVICE-NAME>}
show ip ospf {interface} {vlan|on}
show ip ospf {interface} {vlan <1-4094>} {(on <DEVICE-NAME>)}
```

### Note

The **show > ip > ospf** command is also available under the 'profile' and 'device' modes.

## Parameters

```
show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip arp           | Displays ARP (Address Resolution Protocol) mappings                                                                                                                                                                                                                                                                             |
| <VLAN-NAME>      | Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name.                                                                                                                                                                                                                                                      |
| on <DEVICE-NAME> | The following keyword is recursive and common to the 'vlan-name' parameter: <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; - Optional. Displays ARP configuration details on a specified device</li><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

```

| ip bgp                         | Displays BGP routing table statistics based on the match criteria specified here. Routes matching the specified criteria are filtered. Use available options to filter the information displayed.<br>This command is applicable to the RFS 4000 and NX 95XX model devices.                                                                                                                                                                                                                                                                                                                                                                                        |
| <IP>                           | Optional. Filters routes matching the specified IP address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <IP/M>                         | Optional. Filters routes matching the specified network                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| community                      | Optional. Filters routes based on the community attribute specified. The options are: <ul style="list-style-type: none"> <li>• AA:NN – Filters routes based on the community number (AA: is the autonomous system number (ASN), NN: is the community number within the specified ASN)</li> <li>• local-as – Filters routes carrying the local-as attribute (these routes are not sent outside the local AS)</li> <li>• no-advertise – Filters routes carrying the no-advertise attribute (these routes are not advertised to any peers)</li> <li>• no-export – Filters routes carrying no-export attribute (these routes are not exported to next AS)</li> </ul>  |
| community-list                 | Optional. Displays routes that are members of communities included in the specified BGP community-list <ul style="list-style-type: none"> <li>• &lt;1-500&gt; – Specify the community-list number.</li> <li>• &lt;WORD&gt; – Specify the community-list name.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |
| filter-list                    | Optional. Filters routes having AS-path matching the specified AS-path access list. Specify the AS-path ACL name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| neighbors                      | Optional. Displays BGP neighbor details. Specify the IP address, to view a specific neighbor details. Use one of the following options to filter information: <ul style="list-style-type: none"> <li>• advertised-routes – Displays route information for routes advertised to the selected neighbor device</li> <li>• received-routes – Displays route information for routes received from the selected neighbor device</li> <li>• routes – Displays the route information for routes learned from the selected neighbor device</li> </ul> <p>If no neighbor IP address is specified, the system displays all neighbor-related routes on the logged device.</p> |
| on <DEVICE-NAME>               | Optional. Displays BGP routing table statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| paths                          | Optional. Displays BGP path details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| prefix-list <PREFIX-LIST-NAME> | Optional. Displays routes conforming to the specified prefix-list <ul style="list-style-type: none"> <li>• &lt;PREFIX-LIST-NAME&gt; – Specify the prefix list name.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| regexp <LINE>                  | Optional. Displays routes matching the specified AS path regular expression <ul style="list-style-type: none"> <li>• &lt;LINE&gt; – Specify the regular expression.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| route-map <ROUTE-MAP-NAME>     | Optional. Displays routes matching the specified route map <ul style="list-style-type: none"> <li>• &lt;ROUTE-MAP-NAME&gt; – Specify the route map name.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

```

| ip ospf                                          | Displays overall OSPF information                                                                                                                                                                                                                                                                                                                             |
| border-router                                    | Optional. Displays details of all the border routers connected                                                                                                                                                                                                                                                                                                |
| interface {on  vlan <1-4094>} {on <DEVICE-NAME>} | Optional. Displays details of all the interfaces with OSPF enabled <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; – Optional. Displays specified device details</li> <li>vlan &lt;1-4094&gt; – Displays VLAN interface details</li> <li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |
| neighbor                                         | Optional. Displays an OSPF neighbors list                                                                                                                                                                                                                                                                                                                     |
| route                                            | Optional. Displays OFPS routes information                                                                                                                                                                                                                                                                                                                    |

|                  |                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| state            | Optional. Displays an OSPF process state                                                                                                                                                                                                                                                                                                                           |
| on <DEVICE-NAME> | The following keywords are recursive and common to all of the above parameters: <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; - Optional. Displays overall OSPF information, based on the parameters passed, on a specified device</li> <li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

## Examples

```
nx9500-6C8809(config)#show ip arp
```

| IP            | MAC               | INTERFACE | TYPE    |
|---------------|-------------------|-----------|---------|
| 192.168.13.10 | 00-02-B3-28-D1-55 | vlan1     | dynamic |
| 192.168.13.13 | B4-C7-99-6C-88-09 | vlan1     | dynamic |
| 192.168.13.2  | 00-0F-8F-19-BA-4C | vlan1     | dynamic |

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show ip interface brief
```

| INTERFACE | IP-ADDRESS/MASK  | TYPE    | STATUS | PROTOCOL |
|-----------|------------------|---------|--------|----------|
| me1       | unassigned       | n/a     | UP     | down     |
| vlan1     | 192.168.13.24/24 | primary | UP     | up       |

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show ip route
```

| DESTINATION     | GATEWAY      | FLAGS | INTERFACE | METRIC | DISTANCE |
|-----------------|--------------|-------|-----------|--------|----------|
| default         | 192.168.13.2 | S     | vlan1     | 0      | 1        |
| 192.168.13.0/24 | 0.0.0.0      | C     | vlan1     | 0      | 0        |

Flags: C - Connected G - Gateway O - OSPF B - BGP S - Static

Gateway: N - Normalized Gateway Address

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show ip route port-channel 1
```

| DESTINATION     | GATEWAY      | FLAGS | INTERFACE | METRIC | DISTANCE |
|-----------------|--------------|-------|-----------|--------|----------|
| 192.168.0.0/24  | direct       | C     | me1       | 0      | 0        |
| 172.18.0.0/24   | direct       | C     | vlan1     | 0      | 0        |
| 10.2.0.0/24     | 172.18.0.1   | S     | vlan1     | 0      | 1        |
| default         | 192.168.13.2 | S     | vlan192   | 0      | 1        |
| 192.168.13.0/24 | direct       | C     | vlan192   | 0      | 0        |

Flags: C - Connected G - Gateway O - OSPF B - BGP S - Static

Gateway: N - Normalized Gateway Address

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show ip routing on rfs6000-81742D
```

IP routing is enabled.

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show ip dhcp status
```

State of DHCP server: not-running

```
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show ip ospf state
```

Maximum number of OSPF routes allowed: 9216

Number of OSPF routes received: 0

Ignore-count allowed: 5, current ignore-count: 0

Ignore-time 60 seconds, reset-time 360 seconds

Current OSPF process state: Running

```
nx9500-6C8809(config)#
```

## ip-access-list-stats

Displays IP access list statistics

### Note

This command is not available in the USER EXEC Mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show ip-access-list-stats {<IP-ACCESS-LIST-NAME>/detail/on}
show ip-access-list stats {<IP-ACCESS-LIST-NAME>/detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}
```

### Parameters

```
show ip-access-list stats {<IP-ACCESS-LIST-NAME>/detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}
```

|                              |                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip-access-list-stats         | Displays IP access list statistics                                                                                                                                                                                                                                                                                                                           |
| <IP-ACCESS-LIST-NAME>        | Optional. Displays statistics for a specified IP access list. Specify the IP access list name.                                                                                                                                                                                                                                                               |
| detail <IP-ACCESS-LIST-NAME> | Optional. Displays detailed statistics for a specified IP access list. Specify the IP access list name.                                                                                                                                                                                                                                                      |
| on <DEVICE-NAME>             | The following keyword is recursive and common to the 'IP-ACCESS-LIST-NAME' parameter: <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; - Optional. Displays all or a specified IP access list statistics on a specified device</li><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

### Examples

```
nx9500-6C8809(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
 permit tcp any any eq ftp rule-precedence 1 Hitcount: 0
 permit tcp any any eq www rule-precedence 2 Hitcount: 4
 permit tcp any any eq ssh rule-precedence 3 Hitcount: 448
 permit tcp any any eq https rule-precedence 4 Hitcount: 0
 permit udp any any eq snmp rule-precedence 5 Hitcount: 0
 permit tcp any any eq telnet rule-precedence 6 Hitcount: 4
nx9500-6C8809(config)#
```

The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```
rfs4000-1B3596(config)#ip access-list auto-tunnel-acl
rfs4000-1B3596(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
 permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
 permit ip host 200.200.200.99 any rule-precedence 3
rfs4000-1B3596(config-ip-acl-auto-tunnel-acl)#
```

The following example displays the statistics for the 'auto-tunnel-acl' ACL:

```
rfs4000-1B3596#show ip-access-list stats
IP Access-list: auto-tunnel-acl
 permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2 Hitcount: 0
 permit ip host 200.200.200.99 any rule-precedence 3 Hitcount: 0

rfs4000-1B3596#
```

## ipv6

Displays IPv6 related information and statistical data

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show ipv6 [default-gateways|delegated-prefix|dhcp|hop-limit|interface|mld|name-server|
neighbors|route]
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}
show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}
show ipv6 interface {<IF-NAME>/brief} {(on <DEVICE-NAME>)}
show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>]
{on <DEVICE-NAME>}
show ipv6 neighbors <VLAN-NAME> {(on <DEVICE-NAME>)}
show ipv6 route {<IF-NAME>/ge <1-X>/me1/port-channel <1-2>/pppoe1/serial <1-4>/
t1e1 <1-4> <1-1>/up/vlan <1-4095>/wwan1/xge} {(on <DEVICE-NAME>)}
```

### Parameters

```
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6             | Displays IPv6 related information and statistical data                                                                                                                                                                                                                                                                                                       |
| default-gateways | Displays all learnt default gateways                                                                                                                                                                                                                                                                                                                         |
| delegated-prefix | Displays prefix delegation information                                                                                                                                                                                                                                                                                                                       |
| hop-limit        | Displays the configured IPv6 hop count value                                                                                                                                                                                                                                                                                                                 |
| name-server      | Displays DNS name servers                                                                                                                                                                                                                                                                                                                                    |
| on <DEVICE-NAME> | This parameter is common to all of the above keywords. <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays the specified information on a device (access point, wireless controller, or service platform)</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}
```

|                         |                                                        |
|-------------------------|--------------------------------------------------------|
| ipv6                    | Displays IPv6 related information and statistical data |
| dhcp                    | Displays DHCPv6 related information                    |
| client received-options | Displays DHCP options received from clients            |
| relay status            | Displays the DHCPv6 relay agent's running status       |

|                  |                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status           | Displays the DHCPv6 stateless server daemon's status. In case the DHCPv6 server is up and running, it also displays interface names.                                                                                                                                                                                                                     |

### ipv6-access-list

Displays IPv6 access list related information and statistics

#### Note

This command is not available in the USER EXEC Mode.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}
```

#### Parameters

```
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}
```

|                         |                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6-access-list stats  | Displays IPv6 access list related information and statistics                                                                                                                                                                          |
| <IPv6-ACCESS-LIST-NAME> | Optional. Displays statistics for a specified IPv6 access list. Specify the IPv6 access list name.<br>If IPv6 ACL name is not provided, the system displays statistics for all ACLs configured and applied.                           |
| on <DEVICE-NAME>        | Optional. Displays all or a specified IPv6 access list statistics on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li></ul> |

#### Examples

```
nx9500-6C8809#show ipv6-access-list stats
IPv6 Access-list: test
 deny ipv6 any any rule-precedence 20 Hitcount: 4

nx9500-6C8809#
```

### l2tpv3

Displays a L2TPv3 (Layer 2 Tunnel Protocol Version 3) session information

#### Note

This command is not available in the USER EXEC mode.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show l2tpv3 {on/tunnel/tunnel-summary}
show l2tpv3 {on <DEVICE-NAME>}
show l2tpv3 {tunnel <L2TPv3-TUNNEL-NAME>} {session <L2TPv3-SESSION-NAME>} {on <DEVICE-NAME>}}
show l2tpv3 {tunnel-summary} {down/on/up}
show l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
show l2tpv3 {tunnel-summary} {down/up} {on <DEVICE-NAME>}
```

### Parameters

```
show l2tpv3 {on <DEVICE-NAME>}
```

|                           |                                                                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l2tpv3 {on <DEVICE-NAME>} | <p>Displays L2TPv3 tunnel and session details or summary</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays L2TPv3 information on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of AP, wireless controller, or service platform.</li> </ul> |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```

## lACP

Displays LACP (Link Aggregation Control Protocol) related information

### Note

For more information on enabling dynamic LACP, see [lACP](#) on page 1029 (profile - inf - ge - config mode), [lACP-channel-group](#) on page 1029 (profile - inf - ge - config mode), and [lACP](#) on page 1265 (device config mode).

### Supported in the following platforms:

- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show lACP [<1-4>|counters|details|sys-id]
show lACP <1-4> ([counters|details])
show lACP sys-id
```

### Parameters

```
show lACP <1-4> ([counters|details])
```

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show lACP <1-4> | Shows the LACP related information for a specified port-channel or all port-channels using LACP <ul style="list-style-type: none"><li>• &lt;1-4&gt; - Select the port-channel index number from 1 - 4. Note, LACP is supported only on the NX 5500, NX 7510, and NX 95XX model service platforms. However, the NX 95XX series service platforms support only two (2) port-channels. Where as the other model service platforms support four (4) port-channels.</li></ul> If the port-channel index number is not specified, the system displays LACP counters and details for all port-channels configured on the device. |
| counters        | Shows LACP counters for LACP-enabled port-channels. When passed without the <1-4> keyword, the system displays LACP counters for all configured port-channels. However, if the port-channel index number is specified, the system displays LACP counters only for the specified port-channel.                                                                                                                                                                                                                                                                                                                             |
| details         | Shows details for LACP-enabled port-channels. When passed without the <1-4> keyword, the system displays LACP details for all configured port-channels. However, if the port-channel index number is specified, the system displays LACP details only for the specified port-channel.                                                                                                                                                                                                                                                                                                                                     |

```
show lACP sys-id
```

|                  |                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show lACP sys-id | Shows the LACP related information for all LACP-enabled port-channels <ul style="list-style-type: none"><li>• sys-id - Shows the LACP system identifier and priority. This is the identifier assigned to the LACP peers (devices).</li></ul> |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```

### ldap-agent

Displays an LDAP agent's join status (join status to a LDAP server domain)

Use this command When LDAP is specified the external resource (as opposed to local RADIUS resources) to validate PEAP-MS-CHAP v2 authentication requests, user credentials, and password information needs to be made available locally to successfully connect to the external LDAP server. Up to two LDAP Agents (primary and secondary external resources) can be defined as external resources for PEAP-MS-CHAP v2 authentication requests.

#### Note

This command is not available in USER EXECUTABLE ,mode

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show ldap-agent join-status {on <DEVICE-NAME>}
```

### Parameters

|                  |                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ldap-agent       | Displays LDAP agent related configuration                                                                                                                                                                                                                                                 |
| join-status      | Displays if the LDAP agent has successfully joined a LDAP server's domain                                                                                                                                                                                                                 |
| on <DEVICE-NAME> | Optional. Displays if the LDAP agent has successfully joined a specified LDAP server's domain. <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the device running the LDAP server (access point, wireless controller, or service platform).</li> </ul> |

### Examples

```

nx9500-6C8809#show ldap-agent join-status
Primary LDAP Server's agent join-status : Joined domain TEST.

```

```
Secondary LDAP Server's agent join-status : Not Configured
nx9500-6C8809#
```

## licenses

Displays installed licenses and usage information

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show licenses {borrowed|lent}
```

### Parameters

```
show licenses {borrowed|lent}
```

|                          |                                                                                                                                                                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| licenses {borrowed lent} | Displays installed licenses and usage information <ul style="list-style-type: none"><li>• borrowed - Optional. Displays information on licenses borrowed</li><li>• lent - Optional. Displays information on licenses lent.</li></ul> |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Usage Guidelines

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single NOC controller, The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage Access Points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, Access Points and adaptive Access Points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:

- AP/AAP license packs installed on the NOC controller only. The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.
- AP/AAP license packs installed on the NOC and site controllers. The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NoC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.
- AP/AAP license packs installed on one controller within a cluster. The site controller shares its installed and borrowed licenses with other cluster controllers.

### Examples

```
rfs4000-229D58#show licenses

*lldp*

Displays LLDP (Link Layer Discovery Protocol) related information

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show lldp [neighbors|report]
show lldp neighbors {on <DEVICE-NAME>}
show lldp report {detail/on}
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

## Parameters

```
show lldp neighbors {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lldp             | Displays L2TPv3 neighbors table or aggregated LLDP neighbors table                                                                                                                                            |
| neighbors        | Displays LLDP neighbors table                                                                                                                                                                                 |
| on <DEVICE-NAME> | Optional. Displays L2TPv3 neighbors table on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

```
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

|                            |                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lldp                       | Displays L2TPv3 neighbors table or aggregated LLDP neighbors table                                                                                                                                                                                                                                                                                                          |
| report detail              | Displays aggregated LLDP neighbors table <ul style="list-style-type: none"><li>• detail - Optional. Displays detailed aggregated LLDP neighbors table</li></ul> <p><b>Note:</b> If the 'on' keyword is used without the 'detail' keyword, the system displays LLDP neighbors table summary on the specified device or RF Domain.</p>                                        |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to the 'report detail' parameter: <ul style="list-style-type: none"><li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Displays aggregated LLDP neighbors table on a specified device or RF Domain</li><li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li></ul> |

## Examples

```
nx9500-6C8809#show lldp neighbors

Chassis ID: 00-18-71-D0-0B-00
System Name: TechPubs-ProCurve-Switch
Platform: ProCurve J8697A Switch 5406z1, revision K.12.1X, ROM K.11.03 (/sw/code/build/
btm(sw_espl))
Capabilities: Bridge Router
Enabled Capabilities: Bridge
Local Interface: gel, Port ID(Port Description) (outgoing port): 5(A5)
TTL: 113 sec
Management Addresses: 192.168.13.40
nx9500-6C8809#
```

### logging

Displays the network's activity log

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show logging {on <DEVICE-NAME>}
```

### Parameters

```
show logging {on <DEVICE-NAME>}
```

|                            |                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging {on <DEVICE-NAME>} | Displays logging information on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Optional. Specify the name of the AP or wireless controller.</li></ul> |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```

### *mac-access-list-stats*

Displays MAC access list related statistics

#### Note

This command is not present in USER EXEC mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>/on}
show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}
```

## Parameters

```
show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}
```

|                       |                                                                                                                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-access-list-stats | Displays MAC access list statistics                                                                                                                                                                                                |
| <MAC-ACCESS-LIST>     | Optional. Displays statistics for a specified MAC access list. Specify the MAC access list name.<br><br><b>Note:</b> The system displays all configured ACL statistics if no ACL name is specified.                                |
| on <DEVICE-NAME>      | Optional. Displays all or a specified MAC access list statistics on a specified device <ul style="list-style-type: none"><li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

## Examples

```

```

## mac-address-table

Displays MAC address table entries

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show mac-address-table {on <DEVICE-NAME>}
```

## Parameters

```
show mac-address-table {on <DEVICE-NAME>}
```

|                   |                                                                                                                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-address-table | Displays MAC address table entries                                                                                                                                                                             |
| on <DEVICE-NAME>  | Optional. Displays MAC address table entries on a specified device <ul style="list-style-type: none"><li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

## Examples

```
NOC-NX9500#show mac-address-table
```

```

```

## macauth

Displays details of wired ports that have MAC address authentication enabled.

Use this command to view MAC authentication configuration and authentication state. The command displays the current authentication state of the wired host, the authorization state of the Ge1 port, and the wired hosts' MAC address. The port status displays as Authorized if the wired host has successfully authenticated and Not Authorized if the wired host has not authenticated or has failed MAC authentication.

For more information on enabling MAC address authentication on a wired port, see [mac-auth](#) on page 1183 (profile-config-mode).

### Supported in the following platforms:

- Wireless Controllers — RFS 4000

### Syntax

```
show mac-auth {all|interface|on}
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|
t1e1 <1-4>|up <1-2>|xge <1-4>]} {(on <DEVICE-NAME>)}
```

### Parameters

```
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|
t1e1 <1-4>|up <1-2>|xge <1-4>]} {(on <DEVICE-NAME>)}
```

|                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

```

### *mac-auth-clients*

Displays MAC authenticated clients

#### **Supported in the following platforms:**

- Wireless Controllers — RFS 4000

#### **Syntax**

```
show mac-auth-clients [all|interface]
show mac-auth-clients all {on <DEVICE-NAME>}
show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|xge <1-4>}
```

#### **Parameters**

```
show mac-auth-clients all {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-auth-clients | Displays MAC authenticated clients based on the parameters passed. The options are: all and interface.                                                                                                                                |
| all              | Displays MAC authenticated clients for all interfaces                                                                                                                                                                                 |
| on <DEVICE-NAME> | Optional. Displays MAC authenticated clients for all interfaces on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

```
show mac-auth-clients interface {<INF-NAME>/ge <1-X>/port-channel <1-2>/xge <1-4>}
```

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| mac-auth-clients                                                | Displays MAC authenticated clients based on the parameters passed. The options are: all and interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| interface [<INF-NAME>] ge <1-X>  port-channel <1-2>  xge <1-4>] | Displays MAC authenticated clients for the specified interface. Select the interface type from the following options: <ul style="list-style-type: none"> <li>• &lt;INF-NAME&gt; – Optional. Displays MAC authenticated clients for the interface identified by the &lt;INF-NAME&gt; keyword. Specify the layer 2 (ethernet port) interface name.</li> <li>• ge &lt;1-X&gt; – Optional. Displays MAC authenticated clients for the selected GigabitEthernet interface. Specify the GE interface index from 1 - X. This will vary for different device types.</li> <li>• port-channel &lt;1-2&gt; – Optional. Displays MAC authenticated clients for the selected port channel interface. Specify the port channel interface index from 1 - 2.</li> <li>• xge &lt;1-4&gt; – Optional. Displays MAC authenticated clients for the selected TenGigabitEthernet interface. Specify the interface index from 1 - 4.</li> </ul> |
| on <DEVICE-NAME>                                                | Optional. Displays MAC authenticated clients for the specified interface on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Examples

```
rfs4000-229D58(config-device-B4-C7-99-22-9D-58)#show mac-auth-clients interface ge 1

MAC STATE INTERFACE

Total number of MACs displayed: 0
rfs4000-229D58(config-device-B4-C7-99-22-9D-58)#
```

### mint

Displays MiNT protocol related statistics and configuration

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show mint [config|dis|id|info|known-adopters|links|lsp|lsp-db|mlcp|neighbors|route|
 stats|tunnel-controller|tunneled-vlans]
show mint [config|id|info|known-adopters|route|stats|tunneled-vlans] {on <DEVICE-NAME>}
show mint [dis|links|neighbors|tunnel-controller] {details} {(on <DEVICE-NAME>)}
show mint lsp
show mint lsp-db {details <MINT-ADDRESS>} {(on <DEVICE-NAME>)}
show mint mlcp {history} {(on <DEVICE-NAME>)}
```

## Parameters

```
show mint [config|id|info|known-adopters|route|stats|tunneled-vlans]
{on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mint             | Displays MiNT protocol information based on the parameters passed                                                                                                                                                                                                                                             |
| config           | Displays MiNT configuration                                                                                                                                                                                                                                                                                   |
| id               | Displays local MiNT ID                                                                                                                                                                                                                                                                                        |
| info             | Displays MiNT status                                                                                                                                                                                                                                                                                          |
| known-adopters   | Displays known, possible, or reachable adopters                                                                                                                                                                                                                                                               |
| route            | Displays MiNT route table details                                                                                                                                                                                                                                                                             |
| stats            | Displays MiNT related statistics                                                                                                                                                                                                                                                                              |
| tunneled-vlans   | Displays MiNT tunneled VLAN details                                                                                                                                                                                                                                                                           |
| on <DEVICE-NAME> | The following keywords are common to all of the above parameters: <ul style="list-style-type: none"><li>on &lt;DEVICE-NAME&gt; - Optional. Displays MiNT protocol details on a specified device</li><li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

```
show mint [dis|links|neighbors|tunnel-controller] {details} {(on <DEVICE-NAME>)}x
```

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mint                          | Displays MiNT protocol information based on the parameters passed                                                                                                                                                                                                                                                                                                                                                                                                                           |
| dis                           | Displays MiNT network DISes (Designated Intermediate Systems) and EVISes (Ethernet Virtualization Interconnects)                                                                                                                                                                                                                                                                                                                                                                            |
| links                         | Displays MiNT networking link details                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| neighbors                     | Displays adjacent MiNT peer details                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| tunnel-controller             | Displays details of MiNT VLAN network tunnel wireless controllers for extended VLAN load balancing                                                                                                                                                                                                                                                                                                                                                                                          |
| details {(on <DEVICE-NAME>)}x | The following keywords are common to the 'dis', 'links', 'neighbors', and 'tunnel-controller' parameters: <ul style="list-style-type: none"><li>details - Optional. Displays detailed MiNT information</li><li>on &lt;DEVICE-NAME&gt; - Optional. This is a recursive parameter, which displays MiNT information on a specified device<ul style="list-style-type: none"><li>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul></li></ul> |

```
show mint lsp
```

|      |                                                                   |
|------|-------------------------------------------------------------------|
| mint | Displays MiNT protocol information based on the parameters passed |
| lsp  | Displays this router's MiNT LSPs (Label Switched Paths)           |

```
show mint lsp-db {details <MINT-ADDRESS>} {(on <DEVICE-NAME>)}
```

|                        |                                                                                                                                                                                                                                                                                                                                  |

## *nsight*

Displays NSight related information and also displays the database server status (reachable or not)

### **Supported in the following platforms:**

- Service Platforms — NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
show nsight status
```

### **Parameters**

```
show nsight status
```

|               |                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nsight status | <p>Displays the NSight module related status, such as</p> <ul style="list-style-type: none"> <li>• NSight is enabled or not on the device</li> <li>• NSight report and aggregation daemon is running or not</li> <li>• NSight alarm daemon is running or not</li> <li>• NSight server daemon is running or not</li> <li>• Database server is reachable or not</li> </ul> |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
nx9500-6C8809(config)#show nsight status
Naight is enabled
 Naight report and aggregation daemon is running
 Naight alarm daemon is running
 Naight server daemon is running
 Database server is local
 Database server is reachable
nx9500-6C8809(config)#
```

## ntp

Displays NTP (Network Time Protocol) information. NTP enables clock synchronization within a network.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show ntp [associations|status]
show ntp [associations {detail/on}|status {on <DEVICE-NAME>}]
```

### Parameters

```
show ntp [associations {detail/on}|status {on <DEVICE-NAME>}]
```

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ntp associations {detail/on}</code>        | <p>Displays existing NTP associations. The interaction between the controller or service platform and a SNTP server constitutes an association. SNTP associations are of two kinds:</p> <ul style="list-style-type: none"><li>• peer associations - where a controller or service platform synchronizes to another system or allows another system to synchronize to it, or</li><li>• - server associations - where only the controller or service platform synchronizes to the SNTP resource, not the other way around.</li></ul> <p>Specify the following parameters to view NTP association details:</p> <ul style="list-style-type: none"><li>• detail - Optional. Displays detailed NTP associations<ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; - Optional. Displays NTP associations on a specified device</li></ul></li></ul> <p>&lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</p> <p><b>Note:</b> If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.</p> |
| <code>ntp status {on &lt;DEVICE-NAME&gt;}</code> | <p>Displays the performance (status) information relative to the NTP association status. Use this command to view the access point, controller, or service platform's current NTP resource.</p> <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; - Optional. Displays NTP association status on a specified device</li><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### *password-encryption*

Displays password encryption status (enabled/disabled)

#### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### **Syntax**

```
show password-encryption status
```

#### **Parameters**

```
show password-encryption status
```

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| password-encryption status | Displays password encryption status (enabled/disabled) |
|----------------------------|--------------------------------------------------------|

#### **Examples**

```

nx9500-6C8809(config)#show password-encryption status
Password encryption is enabled
nx9500-6C8809(config)#

```

### *pppoe-client*

Displays PPPoE client information

Use this command to view PPPoE statistics derived from access to high-speed data and broadband networks. PPPoE uses standard encryption, authentication, and compression methods as specified by the PPPoE protocol. PPPoE enables point-to-points connection to an ISP over existing Ethernet interface.

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

**Parameters**

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pppoe-client     | Displays PPPoE client information (configuration and status)                                                                                                                                                                                                                                                                                             |
| configuration    | Displays detailed PPPoE client configuration                                                                                                                                                                                                                                                                                                             |
| status           | Displays detailed PPPoE client status                                                                                                                                                                                                                                                                                                                    |
| on <DEVICE-NAME> | The following keywords are common to 'configuration' and 'status' parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays detailed PPPoE client status or configuration on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul> |

**Examples**

```
nx9500-6C8809#show pppoe-client configuration
 PPPoE Client Configuration:
+-----+
| Mode : Disabled
| Service Name :
| Auth Type : pap
| Username :

| Idle Time : 600
| Keepalive : Disabled
| Local n/w : vlan1
| Static IP : __wing_internal_not_set__
| MTU : 1492
+-----+

nx9500-6C8809#
```

*privilege*

Displays the logged-in user's privilege level

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show privilege
```

### Parameters

None

### Examples

```
nx9500-6C8809(config)#show privilege
Current user privilege: superuser
nx9500-6C8809(config)#
```

## *radius*

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server

Every captive portal guest user can access the captive portal for a specified duration. This results in following three scenarios:

- Scenario 1: Access duration not specified (in this case the default of 1440 minutes is applied)
- Scenario 2: Access duration is specified and is greater than 0
- Scenario 3: Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged.

But the access time remaining varies. It is calculated as follows:

- Scenarios 1 & 2 - It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- Scenario 3 - It is the time until user account expiration.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show radius [guest-users|server]
show radius guest-users {brief|<GUEST-USER-NAME>}
show radius server
```

### Parameters

```
show radius guest-users {brief|<GUEST-USER-NAME>}
```

radius guest-users {brief|<GUEST-USER-NAME>}

Displays RADIUS server's guest user's access details: total time for which the user has logged in, and the amount of access time remaining.

- brief – Displays the total number of guest users provided RADIUS access
- <GUEST-USER-NAME> – Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once.

Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, and current bandwidths (for both downlink and uplink), time configured, and time remaining.

If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as 'unlimited'. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user's account).

**Note:** For more information on configuring bandwidth-based and time-based vouchers, see [user](#) (radius user policy config mode).

show radius server

radius server

Displays RADIUS server related statistical data

## Examples

```
rfs4000-229D58#show radius guest-users
```

```
 TIME (min:sec)
USED REMAINING GUEST USER
0:00 9:00 time9
0:00 5:00 time5
0:00 15:00 time15
0:00 305416:35 notime
2:31 7:29 time10
```

```
rfs4000-229D58#
```

The following example shows a RADIUS user pool with guest users having bandwidth-based, time-based, bandwidth and time based, and no bandwidth or time based vouchers:

```
rfs4000-229D58(config-captive-portal-wdws)#show context
radius-user-pool-policy wdws
 user time_and_data password 0 both group wdws guest expiry-time 12:00 expiry-date
12/31/2015 access-duration 8000 data-limit 500 committed-downlink 3000 committed-
uplink 2000 reduced-downlink 1000 reduce4
 user neither password 0 nine group wdws guest expiry-time 12:00 expiry-date 12/31/2015
 user data_only password 0 data group wdws guest expiry-time 12:00 expiry-date 12/31/2015
data-limit 125 committed-downlink 1000 committed-uplink 800 reduced-downlink 500
reduced-uplink 400
rfs4000-229D58(config-captive-portal-wdws)#
```

The following example shows the captive portal access details for the above mentioned RADIUS user pool users:

```
rfs4000-229D58(config-captive-portal-wdws)#show radius guest-users
 TIME (DD:HH:MM:SS) DATA (kilobytes)
BANDWIDTH (kbps)
GUEST USER CONFIGURED REMAINING CONFIGURED REMAINING CFGD DN CURR
DN CFGD UP CURR UP
```

```

time_and_data 5:13:20:00 5:12:00:50 512000 433727 3000
0 2000 0
neither till expiry 221:19:44:54 unlimited unlimited

Current time: 17:15:07
rfs4000-229D58(config-captive-portal-wdws)#

```

## reload

Displays scheduled reload information for a specific device

### Note

This command is not present in the USER EXEC mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

### Parameters

```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

|                                     |                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reload {on <DEVICE-OR-DOMAIN-NAME>} | <p>Displays scheduled reload information for a specified device</p> <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Displays configuration on a specified device</li> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

```

nx9500-6C8809(config)#show reload
No reload is scheduled.
nx9500-6C8809(config)#

```

## rf-domain-manager

Displays RF Domain manager selection details

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

## Parameters

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

|                            |                                                                                                                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rf-domain-manager          | Displays RF Domain manager selection details                                                                                                                                                                                                            |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays RF Domain manager selection details on a specified device or domain <ul style="list-style-type: none"><li>&lt;DEVICE-OR-DOMAIN-NAME&gt; – specify the name of the AP, wireless controller, service platform, or RF Domain.</li></ul> |

## Examples

```
nx9500-6C8809#show rf-domain-manager
RF Domain TechPubs
RF Domain Manager:
 ID: 19.6C.88.09
Controller Managed
Device under query:
 Priority: 220
 Has IP MiNT links
 Has wired MiNT links
nx9500-6C8809#
```

## role

Displays role based firewall information

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}
```

## Parameters

```
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}
```

|                       |                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| role ldap-stats       | Displays LDAP server status and statistics                                                                                                                                                                                                                                                                                                    |
| role wireless-clients | Displays clients associated with roles                                                                                                                                                                                                                                                                                                        |
| on <DEVICE-NAME>      | The following parameters are common to the 'ldap-stats' and 'wireless-clients' keywords: <ul style="list-style-type: none"><li>on &lt;DEVICE-NAME&gt; – Optional. Displays clients associated with roles on a specified device</li><li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, and service platform.</li></ul> |

## Examples

```
nx9500-6C8809(config)#show role wireless-clients
No ROLE statistics found.
nx9500-6C8809(config)#
```

## route-maps

Displays route map statistics for defined routes

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show route-maps {on <DEVICE-NAME>}
```

### Parameters

```
show route-maps {on <DEVICE-NAME>}
```

|                  |                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-maps       | Displays configured route map statistics for all defined routes<br>For more information on route maps, see <a href="#">route-map</a> .                                                                      |
| on <DEVICE-NAME> | Optional. Displays route map statistics on a specified device <ul style="list-style-type: none"><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> |

### Examples

```
nx9500-6C8809(config)#show route-maps
nx9500-6C8809(config)#
```

## rtls

Displays RTLS (Real Time Location Service) statistics for Access Points contributing locationing information

### Supported in the following platforms:

- Access Points — AP 6522, AP 6532, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 81XX, AP 8232
- Wireless Controllers — RFS 4000, RFS 6000
- Service Platforms — NX 7500, NX 9500, NX 9510

### Syntax

```
show rtls [aer scout|ekahau|omnitrail] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

### Parameters

```
show rtls [aer scout|ekahau|omnitrail] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

|           |                                            |
|-----------|--------------------------------------------|
| rtls      | Displays Access Point RTLS statistics      |
| aer scout | Displays Access Point Aer scout statistics |
| ekahau    | Displays Access Point Ekahau statistics    |
| omnitrail | Displays access point Omnitrail statistics |

|                            |                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <MAC/HOSTNAME>             | Optional. Displays Aeroscout or Ekahau statistics for a specified Access Point. Specify the MAC address or hostname of the Access Point.                                                                                                                                                                                                                                            |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to all of the above parameters: <ul style="list-style-type: none"> <li>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; - Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain.</li> <li>• &lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li> </ul> |

## Examples

```
rfs4000-229D58(config)#show rtls aeroscout
```

```
Aeroscout Engine IP: 0.0.0.0 Port: 0
Send Count : 0
Recv Count : 0
Tag Reports : 0
Nacks : 0
Acks : 0
Lbs : 0
AP Status : 0
AP Notif : 0
Send Err : 0
Errmsg Count : 0
```

```
Total number of APs displayed: 1
```

```
rfs4000-229D58(config)#
ap8533-84A224##show rtls omnitrail
Engine IP: 157.235.90.41
Control Port: 8890
Otls 2.4 GHz Engine status: CONNECTED
Otls 5 GHz Engine status: CONNECTED
Data Port configured for forwarding 2.4GHz Radio detected beacons: 8888
Data Port configured for forwarding 5GHz Radio detected beacons:8889
Heart beats sent for 2.4GHz Port : 1
Heart beats sent for 5GHz Port : 0
Beacon tags received on 2.4GHz Radio and forwarded: 6883
Beacon tags received on 5GHz Radio and forwarded: 0
Beacon tags received on Sensor Radio (2.4GHz Band) and forwarded: 5187
Beacon tags received on Sensor Radio (5Ghz Band) and forwarded: 0
Total number of APs displayed: 1

```

## *running-config*

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show running-config {aaa-policy/application/application-group/application-policy/
association-acl-policy/auto-provisioning-policy/captive-portal-policy/device/database-
client-policy/
database-policy/device/device-overrides/dhcp-server-policy/dhcpv6-server-policy/

show running-config url-filter <URL-FILTER-NAME>
show running-config url-list <URL-LIST-NAME> {include-factory}

```

## Parameters

```

show running-config {flag-unwritten-changes}

```

running-config flag-unwritten-changes

Flags unsaved changes in the show > running-config command output. Optionally use the flag-unwritten-changes keyword to view changes that have been committed but not saved in the startup configuration. When used, all unsaved changes are marked with a “===” marker, as shown in the following show > running-config > flag-unwritten-changes output:

```
nx9500-6C8809(config)#show running-config flag-unwritten-changes
!
! Configuration of NX9500 version 5.9.2.0-017D
!
!
version 2.5
!
!

## session-changes

Displays configuration changes made in the current session

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show session-changes
```

### Parameters

None

### Examples

```
nx9500-6C8809#show session-changes
```

```
No changes in this session
```

```

```

## site-config-diff

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single NOC controller, The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage Access Points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

**Supported in the following platforms:**

- Wireless Controllers – RFS 4000
- Service Platforms – NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

**Note**

This command returns an output only when executed on a NOC controller.

**Syntax**

```
show site-config-diff <SITE-NAME>
```

**Parameters**

```
show site-config-diff <SITE-NAME>
```

|                              |                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------|
| site-config-diff <SITE-NAME> | Displays the configuration difference for the specified site                                 |
|                              | <ul style="list-style-type: none"><li>• &lt;SITE-NAME&gt; – Specify the site name.</li></ul> |

**Examples**

```
nx9500-6C8809#show site-config-diff 5C-0E-8B-18-06-F4
---- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs4000 5C-0E-8B-18-06-F4
interface pppoe1
 no shutdown
nx9500-6C8809#
```

*smart-rf*

Displays Smart RF (Self-Monitoring At Run Time RF) statistical history to assess adjustments made to device configurations to compensate for detected coverage holes or device failures

When invoked by an administrator, Smart RF instructs access point radios to change to a specific channel and begin beaconing using the maximum available transmit power. Within a well-planned deployment, any RF Domain member access point radio should be reachable by at least one other radio. Smart RF records signals received from its neighbors as well as signals from external, un-managed radios. AP-to-AP distance is recorded in terms of signal attenuation. The information from external radios is used during channel assignment to minimize interference.

**Supported in the following platforms:**

- Access Points – AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers – RFS 4000
- Service Platforms – NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show smart-rf [ap|channel-distribution|history|history-timeline|interfering-ap|
interfering-neighbors|radio|select-shutdown]
show smart-rf ap {<MAC>|<DEVICE-NAME>} /activity/energy/neighbors/on <DOMAIN-NAME>}
show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}
show smart-rf ap (activity|energy|neighbors) [<MAC>|<DEVICE-NAME>] {(on <DOMAIN-NAME>)}
show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}
show smart-rf radio {<MAC>|activity/all-11an/all-11bgn/channel/energy/neighbors|
on <DOMAIN-NAME>}
show smart-rf radio {<MAC>|all-11an/all-11bgn/energy <MAC>} {on <DOMAIN-NAME>}
show smart-rf radio {activity|neighbors} {<MAC>|all-11an/all-11bgn} {on <DOMAIN-NAME>}
show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>} /on <DOMAIN-NAME>}
show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>} /on <DOMAIN-NAME>} /
threshold <50-100>}
show smart-rf select-shutdown {AP-MAC|<AP-DEVICE-NAME>} /on <RF-DOMAIN-NAME>}
```

## Parameters

```
show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}
```

|                  |                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smart-rf         | Displays Smart RF related information                                                                                                                           |
| ap               | Displays access point related Smart RF information                                                                                                              |
| <MAC>            | Optional. Uses MAC addresses to identify access points. Displays all access points, if no MAC address is specified.                                             |
| <DEVICE-NAME>    | Optional. Uses an administrator defined name to identify an access point                                                                                        |
| on <DOMAIN-NAME> | Optional. Displays access point details on a specified RF Domain <ul style="list-style-type: none"><li>&lt;DOMAIN-NAME&gt; - Specify the domain name.</li></ul> |

```
show smart-rf ap (activity|energy|neighbors) [<MAC>|<DEVICE-NAME>] {(on <DOMAIN-NAME>)}
```

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| smart-rf | Displays Smart RF related information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ap       | Displays AP related Smart RF information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| activity | Optional. Displays Smart RF activity related information<br>Use this option to view the following: <ul style="list-style-type: none"><li>Time-period - Lists the frequency Smart RF activity is trended for the RF Domain. Trending periods include the current hour, last 24 hours, or the last seven days. Comparing Smart RF adjustments versus the last seven days enables an administrator to assess whether periods of interference and poor performance were relegated to just specific periods.</li><li>Power changes - Displays the number of Smart RF initiated power level changes needed for RF Domain member devices during each of the three trending periods. Determine whether power compensations were relegated to known device outages or if compensations were consistent over the course of a day or week.</li><li>Channel changes - Lists the number of Smart RF initiated channel changes needed for RF Domain member devices during each of the three trending periods. Determine if channel adjustments were relegated to known device count increases or decreases over the course of a day or week.</li><li>Coverage changes - Displays the number of Smart RF initiated coverage changes needed for RF Domain member devices during each of the three trending periods. Determine if coverage changes were relegated to known device failures or known periods of interference over the course of a day or week.</li></ul> |

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| energy                 | Optional. Displays AP energy for a specified AP or all APs<br>Use this option to view an RF Domain member access point's operating channels, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing access points.                                                                                                                           |
| neighbors              | Optional. Displays AP neighbors<br>Use this option to view attributes of neighbor radio resources available for Smart RF radio compensations for other RF Domain member device radios.                                                                                                                                                                                                                                           |
| {<MAC>  <DEVICE-NAME>} | The following keywords are common to all of the above parameters: <ul style="list-style-type: none"> <li>• &lt;MAC&gt; - Displays all of the above mentioned information for a specified AP, identified by its MAC address. Specify the AP's MAC address.</li> <li>• &lt;DEVICE-NAME&gt; - Displays all of the above mentioned information for a specified AP, identified by its hostname. Specify the AP's hostname.</li> </ul> |
| on <DOMAIN-NAME>       | Optional. Displays Access Point details on a specified RF Domain. <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; - Specify the domain name.</li> </ul>                                                                                                                                                                                                                                                             |

```
show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}
```

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smart-rf             | Displays Smart RF related information                                                                                                                                                                                                                                                                                                                                                                           |
| channel-distribution | Displays Smart RF channel distribution information. This provides an overview of how RF Domain member devices are utilizing different channels to optimally support connect devices and avoid congestion and interference with neighboring devices. Assess whether the channel spectrum is being effectively utilized and whether channel changes are warranted to improve RF Domain member device performance. |
| history              | Displays Smart RF calibration history<br>Use this option to view description and types of Smart RF events impacting RF Domain member devices.                                                                                                                                                                                                                                                                   |
| history-timeline     | Displays extended Smart RF calibration history on an hourly or daily timeline<br>Use this option to view the time stamp when Smart RF status was updated on behalf of a Smart RF adjustment within the selected RF Domain.                                                                                                                                                                                      |
| on <DOMAIN-NAME>     | This parameter is common to all of above smart RF options: <ul style="list-style-type: none"> <li>• on &lt;DOMAIN-NAME&gt; - Optional. Displays Smart RF configuration, based on the parameters passed, on a specified RF Domain</li> <li>• on &lt;DOMAIN-NAME&gt; - Specify the RF Domain name.</li> </ul>                                                                                                     |

```
show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}
```

|           |                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| smart-rf  | Displays Smart RF related information                                                                             |
| radio     | Displays radio related commands                                                                                   |
| <MAC>     | Optional. Displays details of a specified radio. Specify the radio's MAC address in the AA-BB-CC-DD-EE-FF format. |
| all-11an  | Optional. Displays all 11a radios currently in the configuration                                                  |
| all-11bgn | Optional. Displays all 11bg radios currently in the configuration                                                 |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| energy {<MAC>}   | Optional. Displays radio energy<br>Specify the MAC address of the radio <ul style="list-style-type: none"> <li>• &lt;MAC&gt; - Optional. Specify the radio's MAC address in the AA-BB-CC-DD-EE-FF format.</li> </ul> <p>Use this option to view an RF Domain member access point radio's operating channel, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing radios.</p> |
| on <DOMAIN-NAME> | The following keyword is common to all of the above parameters: <ul style="list-style-type: none"> <li>• on &lt;DOMAIN-NAME&gt; - Optional. Displays all interfering neighboring Access Point information on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the device name.</li> </ul> <p><b>Note:</b> Considers all APs if this parameter is omitted</p>                                                                                                                                                                                                                           |
| threshold <50-100> | Optional. Specifies the maximum attenuation threshold of interfering neighbors <ul style="list-style-type: none"> <li>• &lt;50-100&gt; - Specify a value from 50 -100 dB.</li> </ul> <p>Attenuation is a measure of the reduction of signal strength during transmission. Attenuation is the opposite of amplification, and is normal when a signal is sent from one point to another. If the signal attenuates too much, it becomes unintelligible. Attenuation is measured in decibels.</p> |
| on <DOMAIN-NAME>   | Optional. Displays radio activity of all radios within a specified RF Domain <ul style="list-style-type: none"> <li>• &lt;DOMAIN-NAME&gt; - Specify the RF Domain name.</li> </ul>                                                                                                                                                                                                                                                                                                            |

```
show smart-rf select-shutdown {AP-MAC/<AP-DEVICE-NAME>/on <RF-DOMAIN-NAME>}
```

|                     |                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smart-rf            | Displays Smart RF related information                                                                                                                                                                                                                                                                      |
| select-shutdown     | Displays 2.4 GHz APs shutdown to maintain co-channel interference (CCI) levels within specified limits. Note, this information is displayed only if select-shutdown is enabled in the smart-rf policy context. For more information, see <a href="#">select-shutdown</a> on page 1643.                     |
| <AP-MAC>            | Optional. Displays if a specified AP, identified by its MAC address, was shutdown as part of the select-shutdown feature. <ul style="list-style-type: none"> <li>• &lt;AP-MAC&gt; - Specify the access point's MAC address.</li> </ul> <p><b>Note:</b> Considers all APs if this parameter is omitted.</p> |
| <AP-DEVICE-NAME>    | Optional. Displays if a specified AP, identified by its device name, was shutdown as part of the select-shutdown feature. <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the AP's device name.</li> </ul> <p><b>Note:</b> Considers all APs if this parameter is omitted.</p>      |
| on <RF-DOMAIN-NAME> | Optional. Displays APs, within a specified RF Domain, that were shutdown as part of the select-shutdown feature. <ul style="list-style-type: none"> <li>• &lt;RF-DOMAIN-NAME&gt; - Specify the RF Domain name.</li> </ul>                                                                                  |

## Examples

```
nx9500-6C8809(config)#show smart-rf calibration-status
No calibration currently in progress
nx9500-6C8809(config)#
rfs4000-22E006#show smart-rf select-shutdown
```

```

## spanning-tree

Displays spanning tree utilization information

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show spanning-tree mst {configuration/detail/instance/on}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface/on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>/ge <1-4>/me1/
port-channel <1-2>/pppoe1/vlan <1-4094>/wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} {(on <DEVICE-NAME>)}
```

### Parameters

```
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
```

|                                  |                                                                                                                                                                                                                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spanning-tree                    | Displays spanning tree utilization information                                                                                                                                                                                                                                     |
| mst                              | Displays MST (Multiple Spanning Tree) related information                                                                                                                                                                                                                          |
| configuration {on <DEVICE-NAME>} | Optional. Displays MST configuration <ul style="list-style-type: none"> <li>• on &lt;DEVICE-NAME&gt; - Optional. Displays MST configuration on a specified device</li> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP,wireless controller, or service platform.</li> </ul> |

```
show spanning-tree mst {detail} interface {<INTERFACE-NAME>/ge <1-4>/me1/

### startup-config

Displays complete startup configuration script

#### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show startup-config {include-factory}
```

#### Parameters

```
show startup-config {include-factory}
```

|                                |                                                                                                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| startup-config include-factory | Displays startup configuration script <ul style="list-style-type: none"> <li>• include-factory - Optional. Includes factory defaults</li> </ul> |

Displays adopted T5 controller statistics

#### Note

This command is applicable only on WiNG controllers with adopted and managed T5 controllers.

#### Supported in the following platforms:

- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show t5 [boot|clock|cpe|interface|mac|system|temperature|uptime|version|
wireless] {on <T5-DEVICE-NAME>}
show t5 [boot|clock|system|temperature|uptime|version] {on <T5-DEVICE-NAME>}
show t5 cpe [address|boot|ether port status|led|reset|system|uptime|version]
{on <T5-DEVICE-NAME>}
show t5 interface [dsl|fe|ge|radio]
show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization]
{on <T5-DEVICE-NAME>}
show t5 interface dsl custom [avg|dses|dsses|peak|uses|usses] {on <T5-DEVICE-NAME>}
show t5 interface radio [stats|status|wlan-map] {on <T5-DEVICE-NAME>}
show t5 mac table [filter name [dsl<1-24>|ge <1-2>|vlan <1-4094>|wlan <1-24>]
{on <T5-DEVICE-NAME>}
show t5 wireless [client|wlan]
show t5 wireless client {filter name [association-status/authentication-status/bss/
mac-address/retry-percentage/rssi-value]} {on <T5-DEVICE-NAME>}
show t5 wireless wlan counters [qos|rate|size] {on <T5-DEVICE-NAME>}
```

#### Parameters

```
show t5 [boot|clock|system|temperature|uptime|version] {on <T5-DEVICE-NAME>}
```

|                     |                                                                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t5                  | Displays adopted T5 controller statistics                                                                                                                                                                                               |
| boot                | Displays the T5 device's boot details. Use this option to view the primary and secondary image files available to use for booting up.                                                                                                   |
| clock               | Displays the T5 controller's system time, as reported from the controller itself or its remote NTP time resource                                                                                                                        |
| system              | Displays T5 controller's system information, which includes the T5 controller's hostname, MAC address, RF Domain, system clock, uptime                                                                                                  |
| temperature         | Displays T5 controller's current temperature                                                                                                                                                                                            |
| uptime              | Displays the T5 controller's uptime (the time it has been actively deployed and operational)                                                                                                                                            |
| version             | Displays the T5 controller's primary and secondary firmware images                                                                                                                                                                      |
| on <T5-DEVICE-NAME> | Optional. Executes the command on a specified T5 device <ul style="list-style-type: none"> <li>• &lt;T5-DEVICE-NAME&gt; - Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.</li> </ul> |

```
show t5 cpe [address|boot|ether port status|led|reset|system|uptime|version]
{on <T5-DEVICE-NAME>}
```

|                     |                                                                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t5                  | Displays adopted T5 controller statistics                                                                                                                                                                                                            |
| cpe                 | Displays the T5 controller managed CPE (Customer Premises Equipment) statistics based on the parameters passed. Use this command to verify each CPE address credentials and whether currently disconnected or ready for radio coverage area support. |
| address             | Displays each linked CPE's current IP address used as its network identifier                                                                                                                                                                         |
| boot                | Displays the primary and secondary firmware versions available to each CPE, along with status of the most recent upgrade operation details                                                                                                           |
| ether port status   | Displays Ethernet port status                                                                                                                                                                                                                        |
| led                 | Displays whether the CPEs currently have their LEDs enabled or disabled. In places like hospitals, its not uncommon for access points to be operational, but their LEDs off as to not disturb patients.                                              |
| reset               | Displays the number times a CPE has been reset                                                                                                                                                                                                       |
| system              | Displays device hardware and SKU information for each CPE. Use this information to assess whether a controller is managing the correct CPE devices out of the total number of CPEs available.                                                        |
| uptime              | Displays the time each CPE device has been actively deployed and operational                                                                                                                                                                         |
| version             | Displays the application and boot versions utilized by the CPE devices                                                                                                                                                                               |
| on <T5-DEVICE-NAME> | Optional. Executes the command on a specified T5 device <ul style="list-style-type: none"> <li>• &lt;T5-DEVICE-NAME&gt; - Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.</li> </ul>              |

```
show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization]
{on <T5-DEVICE-NAME>}
```

|           |                                                                          |
|-----------|--------------------------------------------------------------------------|
| t5        | Displays adopted T5 controller statistics                                |
| interface | Displays T5 interface-related statistics based on the interface selected |

[dsl|fe|ge|radio] [counter|description| errors|status|utilization]

Select the interface type. The options are: dsl, fe, ge.

- dsl – Displays DSL (Digital Subscriber Line) interface related information
- fe – Displays FE (Fast Ethernet) interface related information
- ge – Displays GE (Gigabit Ethernet) interface related information

The system displays the following information for the DSL, GE, and FE ports:

- counter – Displays the following:
  - Number of octets (bytes) received and transmitted on this port
  - Number of data packets received and transmitted on this port
  - Number of flow control (layer 2) packets received and transmitted on this port
- description – Displays the following:
  - The selected port's name
  - The numeric index assignable to each port
  - The 64 character maximum, unique, administrator-assigned description to each port
- errors – Displays the following DSL interface related errors:
  - The name of the DSL utilized by each T5 controller connected CPE device
  - The number of FECs detected in the downstream direction. FEC (Forward Error Correction) or channel coding is used for controlling errors over unreliable or noisy communication channels.
  - The number of CPE DSL coding violations (badly coded packets) detected in the downstream direction.
  - The number of FECs detected in the upstream direction.
  - The number of CPE DSL coding violations (badly coded packets) detected in the upstream direction.
- status – Displays the following:
  - The selected port's name
  - Whether the port is currently up or down as a T5 controller transmit and receive resource
  - The port's current speed in MB
  - Whether pause packet utilization is currently off or on for the selected port
  - Whether each listed port is enabled or disabled by the administrator
- utilization – Displays the following:
  - The selected port's name
  - The port's receive and transmit data rates (in Kbps)
  - The packet per second port receive and transmit rates (p/s)
  - Each port's receive and transmit direction utilization as a percentage of the total transmit bandwidth available.

on <T5-DEVICE-NAME>

Optional. Executes the command on a specified T5 device

- <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 interface dsl custom [avg|dses|dsses|peak|uses|usses]
{on <T5-DEVICE-NAME>}
```

|           |                                                                          |
|-----------|--------------------------------------------------------------------------|
| t5        | Displays adopted T5 controller statistics                                |
| interface | Displays T5 interface-related statistics based on the interface selected |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| t5        | Displays adopted T5 controller statistics                                |
| interface | Displays T5 interface-related statistics based on the interface selected |

radio [stats|status| wlan-map]

Displays following radio interface related information:

- stats – Displays T5 radio interface statistics. A T5 controller uses the operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the operating system. Use this option to view the following:
  - name – The administrator assigned name of each listed CPE radio as its unique identifier
  - Rx (Kbps) – The listed CPE radio's receive data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.
  - Rx Octets – The number of octets (bytes) received with no errors by the listed T5 controller managed CPE radio.
  - Rx Packets – The number of data packets received for the listed T5 managed CPE radio since this screen was last refreshed.
  - Tx (Kbps) – The listed CPE radio's transmit data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.
  - Tx Octets – Displays the number of octets (bytes) transmitted with no errors by the listed T5 controller managed CPE radio.
  - Tx Packets – The number of data packets transmitted from the listed T5 managed CPE radio since this screen was last refreshed.
- status – Displays T5 radio interface status information
  - name – The administrator assigned name of each listed CPE radio as its unique identifier.
  - Operational status – The radio interface's operational status (enabled/disabled).
  - mac – The T5 radio interface's MAC address.
  - transmit power – The T5 radio interface's transmit power.
  - Channel – The T5 radio interface's channel of operation.
- wlan-map – Displays WLAN map membership data for T5 controller managed CPE radio devices. Use this option to view the following:
  - name – The administrator assigned name of each listed CPE radio as its unique identifier.
  - status – Whether a CPE radio is currently enabled or disabled as a radio resource for the WLAN(s) the CPE radio has been mapped to.
  - wlan-radio-mapping – The managed WLAN(s) each listed radio has been mapped to.

on <T5-DEVICE-NAME>

Optional. Executes the command on a specified T5 device

- <T5-DEVICE-NAME> – Specify the T5 device's hostname. An error message is displayed if no T5 device name is specified.

```
show t5 mac table [filter name [dsl<1-24>|ge <1-2>|vlan <1-4094>|wlan <1-24>]
{on <T5-DEVICE-NAME>}
```

## *terminal*

Displays terminal configuration parameters

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
show terminal
```

### **Parameters**

None

### **Examples**

```
nx9500-6C8809(config)#show terminal
Terminal Type: xterm
Length: 24 Width: 200
nx9500-6C8809(config)#
```

## *timezone*

Displays a device's timezone

### **Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### **Syntax**

```
show timezone
```

### **Parameters**

None

### **Examples**

```
nx9500-6C8809(config)#show timezone
Timezone is America/Los_Angeles
nx9500-6C8809(config)#
```

## *traffic-shape*

Displays traffic-shaping related configuration details and statistics

Traffic shaping regulates network data transfers to ensure a specific performance level. Traffic shaping delays the flow of packets defined as less important than prioritized traffic streams. Traffic shaping enables traffic control out an interface to match its flow to the speed of a remote target's interface and ensure traffic conforms applied policies. Traffic can be shaped to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Apply traffic shaping to specific applications to apply application categories. When application and ACL rules are conflicting, ACL rules take precedence for the traffic shaping class. Using traffic shaping, an application takes precedence over an application category.

**Supported in the following platforms:**

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

**Syntax**

```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

**Parameters**

```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

|                        |                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traffic-shape          | Displays traffic-shaping related configuration details and statistics                                                                                                                                                                                                                                                                                     |
| priority-map           | Displays the traffic shaper queue priority. There are 8 queues (0 - 7), and traffic is queued in each based on incoming packets 802.1p markings.                                                                                                                                                                                                          |
| statistics class <1-4> | Displays traffic-shaping related statistics for all traffic shaper classes or for a selected class <ul style="list-style-type: none"> <li>• class &lt;1-4&gt; - Optional. Specify the traffic class from 1 - 4. The system displays traffic shaping statistics for the selected class. If not selected, the system statistics for all classes.</li> </ul> |
| status                 | Displays the controller or service platform's traffic shaping status (whether running or not)                                                                                                                                                                                                                                                             |
| on <DEVICE-NAME>       | Optional. Displays traffic-shaping related configuration details and statistics on a specified device <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li> </ul>                                                                                                     |

Class 4 is not configured:  
ap7532-DEB9B0#

### upgrade-status

Displays the last image upgrade status

#### Note

This command is not available in the USER EXEC Mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show upgrade-status {detail/on}
show upgrade-status {detail} {(on <DEVICE-NAME>)}
```

### Parameters

```
show upgrade-status {detail} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| upgrade-status   | Displays last image upgrade status and log                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| detail           | Optional. Displays last image upgrade status in detail                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| on <DEVICE-NAME> | The following keyword is recursive and common to the 'detail' parameter: <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; - Optional. Displays last image upgrade status on a specified device</li><li>• &lt;DEVICE-NAME&gt; - Specify the name of the AP, wireless controller, or service platform.</li></ul> <p><b>Note:</b> If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of upgrade status and log on the specified device.</p> |

## version

Displays a device's software and hardware version

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show version {on <DEVICE-NAME>}
```

### Parameters

```
show version {on <DEVICE-NAME>}
```

|                            |                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------|
| version {on <DEVICE-NAME>} | Displays software and hardware versions on all devices or a specified device                 |
|                            | • on <DEVICE-NAME> - Optional. Displays software and hardware versions on a specified device |
|                            | • <DEVICE-NAME> - Specify the name of the AP, wireless controller, or service platform.      |

## Examples

```
nx9500-6C8809#show version
NX9500 version 5.9.2.0-008D

```

## vrrp

Displays VRRP (Virtual Router Redundancy Protocol) protocol details

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show vrrp [brief|details|error-stats|stats]
show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}
show vrrp error-stats {on <DEVICE-NAME>}
```

### Parameters

```
show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}
```

|                  |                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrrp             | Displays VRRP related statistics in brief or in detail depending on the option selected                                                                                                                                                                                                                                          |
| brief            | Displays virtual router information in brief                                                                                                                                                                                                                                                                                     |
| details          | Displays virtual router information in detail                                                                                                                                                                                                                                                                                    |
| stats            | Displays virtual router statistics                                                                                                                                                                                                                                                                                               |
| <1-255>          | The following keyword is common to all of the above parameters: <ul style="list-style-type: none"><li>• &lt;1-255&gt; – Optional. Displays information for a specified Virtual Router. Specify the router's ID from 1 -255.</li></ul>                                                                                            |
| on <DEVICE-NAME> | The following keyword is recursive and common to the '<1-255>' parameter: <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; – Optional. Displays specified router information on a specified device</li><li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li></ul> |

```
show vrrp error-stats {on <DEVICE-NAME>}
```

|                                |                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrrp                           | Displays VRRP related statistics in brief or in detail depending on the option selected                                                                                                                                                                                            |
| error-stats {on <DEVICE-NAME>} | Displays global error statistics <ul style="list-style-type: none"><li>• on &lt;DEVICE-NAME&gt; – Optional. Displays global error statistics on a specified device</li><li>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</li></ul> |

### Examples

```
nx9500-6C8809(config)#show vrrp error-stats
Last protocol error reason: none
IP TTL errors: 0
Version mismatch: 0
Packet Length error: 0
Checksum error: 0
Invalid virtual router id: 0
Authentication mismatch: 0
```

```

Invalid packet type: 0
nx9500-6C8809(config)#
nx9500-6C8809(config)#show vrrp details
VRRP Group 1:
 version 2
 interface none
 configured priority 1
 advertisement interval 1 sec
 preempt enable, preempt-delay 0
 virtual mac address 00-00-5E-00-01-01
 sync group disable
nx9500-6C8809(config)#

```

## virtual-machine

Displays the VM (virtual-machine) configuration, logs, and statistics

### Supported in the following platforms:

- Service Platforms — NX 7510, NX 95XX

### Syntax

```

show virtual-machine [configuration|debugging|export|statistics]
show virtual-machine [configuration|statistics] {<VM-NAME>/team-urc/team-rls/
team-vowlan} {(on <DEVICE-NAME>)}
show virtual-machine debugging {level/on}
show virtual-machine debugging {level [debug/error/info/warning]} {on <DEVICE-NAME>}
show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}
show virtual-machine [configuration|statistics] {<VM-NAME>/adsp/team-cmt}

```

### Parameters

```

show virtual-machine [configuration|statistics] {<VM-NAME>/team-urc/team-rls/
team-vowlan} {(on <DEVICE-NAME>)}

```

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| virtual-machine                             | Displays the following VM-related information: configuration or statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| configuration                               | Displays detailed VM configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| statistics                                  | Displays VM statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| [<VM-NAME>] team-urc team-rls  team-vowlan] | The following keywords are common to the 'configuration' and 'statistics' parameters: <ul style="list-style-type: none"> <li>• VM-NAME&gt; - Optional. ## Examples

```
nx9500-6C8809#show virtual-machine statistics
```

```

```

| NAME     | STATE  | VCPUS | MEM (MB) | BRIDGE-IF | IP |
|----------|--------|-------|----------|-----------|----|
| WiNG     | -      | -     | 18432    | -         | -  |
| adsp     | Halted | -     | -        | unknown   | -  |
| team-cmt | Halted | -     | -        | unknown   | -  |

```

```

```
nx9500-6C8809#
```

```
nx9500-6C8809#show virtual-machine configuration
```

```

```

| NAME | AUTOSTART | MEMORY (MB) | VCPUS |
|------|-----------|-------------|-------|
| WiNG | -         | 18432       | -     |
| adsp | ignore    | 12000       | 12    |

```

```

```

team-cmt ignore 1024 1

nx9500-6C8809#
nx9500-6C8809>show virtual-machine statistics adsp
 VM name: adsp
 Base Version : unknown
 Install Status : not_installed
nx9500-6C8809>

```

### web-filter

Displays Web filtering related information

Use this command to view information on Web requests for content and whether the requests were blocked or approved based on URL filter settings defined for the selected controller or service platform. A URL filter is comprised of several filter rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

#### Supported in the following platforms:

- Access Points — AP 6522, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562
- Wireless Controllers — RFS 4000
- Service Platforms — NX 7510, NX 95XX, NX 96XX, VX 9000

#### Syntax

```
show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}|status]
```

#### Parameters

```
show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}|status]
```

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| web-filter                                         | Displays an existing and configured Web filter details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| category                                           | Displays Web filter categories. A category is a pre-defined URL list available in the WING software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| category-type                                      | Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in to which commonly accessed URLs have been classified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| config                                             | Displays all existing Web filters and their configuration details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| filter-level [basic  high low medium  medium-high] | Displays category types for the selected filter-level. Each filter level is pre-configured to use a set of category types. You cannot change the categories in the category types used for these pre-configured filter-level setting. Nor can you add, modify, or remove the category types mapped to a filter-level setting. The options are: <ul style="list-style-type: none"> <li>• basic - Displays all category types configured for the basic filter-level</li> <li>• high - Displays all category types configured for the high filter-level</li> <li>• low - Displays all category types configured for the low filter-level</li> <li>• medium - Displays all category types configured for the medium filter-level</li> <li>• medium-high - Displays all category types configured for the medium-high filter-level</li> </ul> |

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>statistics {on &lt;DEVICE-NAME&gt;}</pre> | <p>Displays Web filter statistics on a specified device</p> <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; – Optional. Specifies the device name</li> <li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, controller, or service platform.</li> </ul> <p><b>Note:</b> Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.</p> |
| <pre>status {on &lt;DEVICE-NAME&gt;}</pre>     | <p>Displays Web filter status on a specified device</p> <ul style="list-style-type: none"> <li>on &lt;DEVICE-NAME&gt; – Optional. Specifies the device name</li> <li>&lt;DEVICE-NAME&gt; – Specify the name of the AP, controller, or service platform.</li> </ul> <p><b>Note:</b> Web filtering is a licensed feature, and only when enforced can the system display Web filtering status.</p>         |

## Examples

```

nx9500-6C8809(config)#show web-filter category
 advertisement-popups
 Sites that provide advertising graphics or other ad content
 files such as banners and pop-ups.
 alcohol-tobacco
 Sites that promote or sell alcohol- or tobacco-related
 products or services.
 anonymizers
 Sites and proxies that act as an intermediary for surfing to
 other websites in an anonymous fashion, whether to
 circumvent web filtering or for other reasons.
 arts
 Sites with artistic content or relating to artistic
 institutions such as theaters, museums, galleries, dance
 companies, photography, and digital graphic resources.
 botnets
 Sites that use bots (zombies) including command-and-control
 sites.
--More--
nx9500-6C8809(config)#
nx9500-6C8809(config)#show web-filter config
URL filters configured for this device are:
 WebFilter_ShoppingSites
 Blacklisted categories:
 shopping,
 Whitelisted categories:
 <AllowedShopping>,
nx9500-6C8809(config)#

```

*what*

Displays details of a specified search phrase (performs global search)

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

## Syntax

```
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

## Parameters

```
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

|                            |                                                                                                                                                                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| contain <WORD>             | Searches for all items that contain a specified word <ul style="list-style-type: none"><li>&lt;WORD&gt; - Specify the string to use as match criteria (for example, MAC address, hostname, etc.).</li></ul>                          |
| is <WORD>                  | Searches for items exactly matching a specified string <ul style="list-style-type: none"><li>Specify the string to use as match criteria (for example, MAC address, hostname, etc.).</li></ul>                                       |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Performs global search on a specified device or RF Domain <ul style="list-style-type: none"><li>&lt;DEVICE-OR-DOMAIN-NAME&gt; - Specify the name of the AP, wireless controller, service platform, or RF Domain.</li></ul> |

## Examples

When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes. |
| multicast                  | Optional. Displays meshpoint multicast information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| path                       | Optional. Displays meshpoint path information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| proxy                      | Optional. Displays meshpoint proxy information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| root                       | Optional. Displays meshpoint root information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| security                   | Optional. Displays meshpoint security information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statistics                 | Optional. Displays meshpoint statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| [<MESHPOINT-NAME> detail]  | The following keywords are common to all of the above parameters: <ul style="list-style-type: none"> <li>• &lt;MESHPOINT-NAME&gt; - Displays meshpoint related information for a specified meshpoint. | wireless mint              | Displays radio MiNT-mesh related statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| links                      | Displays MiNT-mesh links related information. MiNT Links are automatically created between controllers and access points during adoption using MLCP (MiNT Link Creation Protocol). They can also be manually created between a controller and access point (or) between access points. MiNT links are manually created between controllers while configuring a cluster. Level 2 (or) remote MiNT links are controller aware links, and requires IP network for communication. This level 2 MiNT links at access points are intended for remote adaptive AP deployment and management from NOC. With Level2 MiNT links, access points are only aware of the controllers and not about other access points. Level 2 MiNT links also provide partitioning, between access points deployed at various remote sites. |

## wwan

Displays wireless WAN status

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

### Parameters

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

### virtual-machine

Displays the VM (virtual-machine) configuration, logs, and statistics

#### Supported in the following platforms:

- Service Platforms – NX 7510, NX 95XX

#### Syntax

```
show virtual-machine [configuration|debugging|export|statistics]
show virtual-machine [configuration|statistics] {<VM-NAME>/team-urc/team-rls/
team-vowlan} {(on <DEVICE-NAME>)}
show virtual-machine debugging {level [debug/error/info/warning]} {on <DEVICE-NAME>}
show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}
show virtual-machine [configuration|statistics] {<VM-NAME>/adsp/team-cmt}
```

#### Parameters

```
show virtual-machine [configuration|statistics] {<VM-NAME>/team-urc/team-rls/
team-vowlan} {(on <DEVICE-NAME>)}
```

| <VM-NAME>]           | Displays VM configuration export related information for the virtual machine identified by the <VM-NAME> keyword. Specify the VM name.<br>The NX 9500 and NX 9510 series service platforms will display ADSP and TEAM-CMT VM configuration export information. |
| on <DEVICE-<br>NAME> | Specifies the name of the device on which the command is executed <ul style="list-style-type: none"> <li>• &lt;DEVICE-NAME&gt; - Specify the name of the service platform.</li> </ul>                                                                          |

## Examples

```
nx9500-6C8809#show virtual-machine statistics
```

```

```

| NAME     | STATE  | VCPUS | MEM (MB) | BRIDGE-IF | IP |
|----------|--------|-------|----------|-----------|----|
| WiNG     | -      | -     | 18432    | -         | -  |
| adsp     | Halted | -     | -        | unknown   | -  |
| team-cmt | Halted | -     | -        | unknown   | -  |

```

```

```
nx9500-6C8809#
```

```
nx9500-6C8809#show virtual-machine configuration
```

```

```

| NAME     | AUTOSTART | MEMORY (MB) | VCPUS |
|----------|-----------|-------------|-------|
| WiNG     | -         | 18432       | -     |
| adsp     | ignore    | 12000       | 12    |
| team-cmt | ignore    | 1024        | 1     |

```

```

---

```
nx9500-6C8809#
nx9500-6C8809>show virtual-machine statistics adsp
 VM name: adsp
 Base Version : unknown
 Install Status : not_installed
nx9500-6C8809>
```

# PROFILE COMMANDS

## PROFILES

---

Profiles enable administrators to assign a common set of configuration parameters, policies, and WLANs to service platforms, controllers, and access points across a large, multi segment, site. The configuration parameters within a profile are based on the hardware model the profile was created to support.

The service platforms, wireless controllers, and access points support both default and user-defined profiles. Each default and user-defined profile contains policies and configurations that are applied to devices assigned to the profile. Changes made to these configurations are automatically inherited by the devices. The central benefit of a profile is its ability to update devices collectively without having to modify individual device configurations.

Default profiles are system maintained and are automatically applied to service platforms and wireless controllers. The default AP profile is automatically applied to a AP (discovered by a wireless controller or service platform), unless an AP auto-provisioning policy is defined specifically to assign APs to a user-defined profile. After adoption, changes made to a profile's parameters are reflected across all devices using the profile. Default profiles are ideal for single site deployments where service platforms, wireless controllers, and access points share a common configuration.

User-defined profiles, on the other hand, are manually created for each supported service platform, wireless controller, and access point model. User-defined profiles are recommended for larger deployments using centralized controllers and service platforms when groups of devices on different floors, buildings or sites share a common configuration. These user-defined profiles can be manually, or automatically assigned to through an auto provisioning policy. An auto provisioning policy provides the means to assign profiles to access points based on model, serial number, VLAN ID, DHCP options, IP address (subnet) and MAC address. For more information, see [AUTO-PROVISIONING-POLICY](#) on page 1336.

A user-defined profile can be created for each of the following device type:

- AP 6522 – Adds an AP 6522 access point profile
- AP 6562 – Adds an AP 6562 access point profile
- AP 7161 – Adds an AP 7161 access point profile
- AP 7502 – Adds an AP 7502 access point profile
- AP 7522 – Adds an AP 7522 access point profile
- AP 7532 – Adds an AP 7532 access point profile
- AP 7562 – Adds an AP 7562 access point profile
- AP 7602 – Adds an AP 7602 access point profile
- AP 7612 – Adds an AP 7612 access point profile
- AP 7622 – Adds an AP 7622 access point profile
- AP 7632 – Adds an AP 7632 access point profile
- AP 7662 – Adds an AP 7662 access point profile
- AP 8163 – Adds an AP 8163 access point profile

- AP 8432 – Adds an AP 8432 access point profile
- AP 8533 – Adds an AP 8533 access point profile
- EX3524 – Adds an EX3524 wireless controller profile
- EX3548 – Adds an EX3548 wireless controller profile
- RFS 4000 – Adds an RFS 4000 wireless controller profile
- NX 5500 – Adds an NX 5500 wireless controller profile
- NX 7500 – Adds an NX 75XX series service platform profile
- NX 9000 – Adds an NX 95XX series service platform profile
- NX 9600 – Adds an NX 96XX series service platform profile
- VX 9000 – Adds a VX 9000 virtual controller profile
- T5 – Adds a T5 controller profile

**Note**

A T5 profile can be created only on the following platforms: RFS 4000, NX 95XX, and NX 96XX.

Although profiles assign a common set of configuration parameters across devices, individual devices can still be assigned unique configuration parameters that follow the flat configuration model. As individual device updates are made, these devices no longer share the profile based configuration they originally supported. Therefore, changes made to a profile are not automatically inherited by devices who have had their configuration customized. These devices require careful administration, as they cannot be tracked as profile members. Their customized configurations overwrite their profile configurations until the profile is re-applied.

**Note**

The commands present under ‘Profiles’ are also available under the ‘Device mode’. The additional commands specific to the ‘Device mode’ are listed separately.

This chapter is organized into the following topics:

- [Profile Config Commands](#) on page 862
- [Device Config Commands](#) on page 1252
- [T5 Profile Config Commands](#) on page 1285
- [EX3524 & EX3548 Profile/Device Config Commands](#) on page 1296

To view the list of device profiles supported, use the following command:

```
<DEVICE>(config)#profile ?
nx9500-6C8809(config)#profile ?
anyap Any access point profile
ap621 AP621 access point profile
ap622 AP622 access point profile
ap650 AP650 access point profile
ap6511 AP6511 access point profile
ap6521 AP6521 access point profile

| led                                | Turn LEDs on/off on the device                                                  |
| led-timeout                        | Configure the time for the led to turn off after the last radio state change    |
| legacy-auto-downgrade              | Enable device firmware to auto downgrade when other legacy devices are detected |
| legacy-auto-update                 | Auto upgrade of legacy devices                                                  |
| lldp                               | Link Layer Discovery Protocol                                                   |
| load-balancing                     | Configure load balancing parameter                                              |
| logging                            | Modify message logging facilities                                               |
| mac-address-table                  | MAC Address Table                                                               |
| mac-auth                           | 802.1X                                                                          |
| management-server                  | Configure management server address                                             |
| memory-profile                     | Memory profile to be used on the device                                         |
| meshpoint-device                   | Configure meshpoint device parameters                                           |
| meshpoint-monitor-interval         | Configure meshpoint monitoring interval                                         |
| min-misconfiguration-recovery-time | Time interval to check controller connectivity after configuration is received  |
| mint                               | MiNT protocol                                                                   |
| misconfiguration-recovery-time     | Check controller connectivity after configuration is received                   |
| neighbor-inactivity-timeout        | Configure neighbor inactivity timeout                                           |
| neighbor-info-interval             | Configure neighbor information exchange interval                                |
| no                                 | Negate a command or set its defaults                                            |
| noc                                | Configure the noc related setting                                               |
| nsight                             | NSight                                                                          |
| ntp                                | Ntp server WORD                                                                 |
| offline-duration                   | Set duration for which a device remains unadopted before it                     |

|                             |                                                                                    |
|-----------------------------|------------------------------------------------------------------------------------|
| otls                        | generates offline event                                                            |
| power-config                | Omnitrail Location Server                                                          |
| preferred-controller-group  | Configure power mode                                                               |
|                             | Controller group this system will prefer for adoption                              |
| preferred-tunnel-controller | Tunnel Controller Name this system will prefer for tunneling extended vlan traffic |
| radius                      | Configure device-level radius authentication parameters                            |
| raid                        | RAID                                                                               |
| remote-debug                | Configure remote debug parameters                                                  |
| remove-override             | Remove configuration item override from the device (so profile value takes effect) |
| rf-domain-manager           | RF Domain Manager                                                                  |
| router                      | Dynamic routing                                                                    |
| slot                        | PCI expansion Slot                                                                 |
| spanning-tree               | Spanning tree                                                                      |
| traffic-class-mapping       | Configure IPv6 traffic class to 802.1p priority mapping for untagged frames        |
| traffic-shape               | Traffic shaping                                                                    |
| trustpoint                  | Assign a trustpoint to a service                                                   |
| tunnel-controller           | Tunnel Controller group this controller belongs to                                 |
| use                         | Set setting to use                                                                 |
| vrrp                        | VRRP configuration                                                                 |
| vrrp-state-check            | Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP      |
| wep-shared-key-auth         | Enable support for 802.11 WEP shared key authentication                            |
| zone                        | Configure Zone name                                                                |
| clrscr                      | Clears the display screen                                                          |
| commit                      | Commit all changes made in this session                                            |
| do                          | Run commands from Exec mode                                                        |
| end                         | End current mode and change to EXEC mode                                           |
| exit                        | End current mode and down to previous mode                                         |
| help                        | Description of the interactive help system                                         |
| revert                      | Revert changes                                                                     |
| service                     | Service Commands                                                                   |

### Note

The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (\_) character. In other words, the name of a device cannot contain an underscore.

## Profile Config Commands

The following table summarizes profile configuration mode commands:

**Table 33: Profiles Config Mode Commands**

| Command                                                             | Description                                                                                                                                          |
|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">adopter-auto-provisioning-policy-lookup</a> on page 866 | Enables the use of a centralized auto provisioning policy on this profile                                                                            |
| <a href="#">adoption</a> on page 867                                | Configures a minimum and maximum delay time in the initiation of the device adoption process                                                         |
| <a href="#">adoption-mode</a> on page 868                           | Sets the adoption mode for access points to Controller, clou, or Extreme Services                                                                    |
| <a href="#">alias</a> on page 870                                   | Creates various types of aliases, such as network, VLAN, network-group, network-service, encrypted-string, hashed -string, etc. at the profile level |

**Table 33: Profiles Config Mode Commands (continued)**

| Command                                                 | Description                                                                                                                                                                                                             |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">application-policy</a> on page 878          | Associates a RADIUS server provided application policy with this profile. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane. |
| <a href="#">area</a> on page 879                        | Sets the system's area of location (the area name)                                                                                                                                                                      |
| <a href="#">arp</a> on page 880                         | Configures static address resolution protocol                                                                                                                                                                           |
| <a href="#">auto-learn</a> on page 882                  | Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device's host name via DHCP options.          |
| <a href="#">autogen-uniqueid</a> on page 883            | Auto-generates a unique local ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.                                              |
| <a href="#">autoinstall</a> on page 884                 | Configures the automatic install feature                                                                                                                                                                                |
| <a href="#">bridge</a> on page 885                      | Configures bridge specific parameters                                                                                                                                                                                   |
| <a href="#">captive-portal</a> on page 913              | Configures captive portal advanced Web page upload on a device profile                                                                                                                                                  |
| <a href="#">cdp</a> on page 914                         | Enables Cisco Discovery Protocol (CDP) on a device                                                                                                                                                                      |
| <a href="#">cluster</a> on page 915                     | Configures a cluster name                                                                                                                                                                                               |
| <a href="#">configuration-persistence</a> on page 917   | Enables persistence of configuration across reloads                                                                                                                                                                     |
| <a href="#">controller</a> on page 918                  | Configures a wireless controller or service platform                                                                                                                                                                    |
| <a href="#">critical-resource</a> on page 923           | Monitors resources that are critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses.             |
| <a href="#">crypto</a> on page 931                      | Configures data encryption related protocols and settings                                                                                                                                                               |
| <a href="#">database</a> on page 979                    | Backs up captive-portal and/or NSight database to a specified location and file and configures a low-disk-space threshold value                                                                                         |
| <a href="#">device-onboard</a> on page 980              | Configures the logo image file name and title displayed on the EGuest device-onboarding portal. This is the portal a vendor-admin user uses to onboard devices.                                                         |
| <a href="#">device-upgrade</a> on page 981              | Configures device firmware upgrade settings on this profile                                                                                                                                                             |
| <a href="#">diag</a> on page 983                        | Enables looped packet logging                                                                                                                                                                                           |
| <a href="#">dot1x</a> on page 984                       | Configures 802.1x standard authentication controls                                                                                                                                                                      |
| <a href="#">dpi</a> on page 986                         | Enables DPI (Deep Packet Inspection) on this profile                                                                                                                                                                    |
| <a href="#">dscp-mapping</a> on page 989                | Configures an IP DSCP to 802.1p priority mapping for untagged frames                                                                                                                                                    |
| <a href="#">eguest-server (VX9000 only)</a> on page 990 | Enables the EGuest daemon when executed without the 'host' option                                                                                                                                                       |

**Table 33: Profiles Config Mode Commands (continued)**

| Command                                              | Description                                                                                                                                      |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">eguest-server (NOC Only)</a> on page 991 | Points to the EGuest server, when executed along with the 'host' option                                                                          |
| <a href="#">email-notification</a> on page 992       | Configures e-mail notification settings                                                                                                          |
| <a href="#">enforce-version</a> on page 994          | Enables checking of a device's firmware version before attempting adoption or clustering                                                         |
| <a href="#">environmental-sensor</a> on page 995     | Configures the environmental sensor settings on this profile (applicable to AP8132 model access point only)                                      |
| <a href="#">events</a> on page 998                   | Enables system event logging and message generation. This command also configures event message forwarding settings.                             |
| <a href="#">export</a> on page 998                   | Enables export of startup.log file after every boot                                                                                              |
| <a href="#">file-sync</a> on page 999                | Configures parameters enabling synching of trustpoint and/or wireless-bridge certificate between the staging-controller and adopted access point |
| <a href="#">floor</a> on page 1000                   | Sets the floor name where the system is located                                                                                                  |
| <a href="#">gre</a> on page 1001                     | Enables Generic Routing Encapsulation (GRE) tunneling on this profile                                                                            |
| <a href="#">http-analyze</a> on page 1011            | Configures HTTP analysis settings                                                                                                                |
| <a href="#">interface</a> on page 1013               | Configures an interface (VLAN, radio, GE, etc.)                                                                                                  |
| <a href="#">ip</a> on page 1154                      | Configures IPv4 components                                                                                                                       |
| <a href="#">ipv6</a> on page 1162                    | Configures IPv6 components                                                                                                                       |
| <a href="#">l2tpv3</a> on page 1167                  | Defines the L2TP (Layer 2 Tunnel Protocol) for tunneling layer 2 payloads using VPNs (Virtual Private Networks)                                  |
| <a href="#">l3e-lite-table</a> on page 1169          | Configures L3e Lite Table with this profile                                                                                                      |
| <a href="#">led</a> on page 1169                     | Turns device LEDs on or off                                                                                                                      |
| <a href="#">led-timeout</a> on page 1170             | Configures LED-timeout timer. This command is specific to the NX 95XX series service platforms.                                                  |
| <a href="#">legacy-auto-downgrade</a> on page 1171   | Auto downgrades a legacy device firmware                                                                                                         |
| <a href="#">legacy-auto-update</a> on page 1172      | Auto upgrades a legacy device firmware                                                                                                           |
| <a href="#">lldp</a> on page 1173                    | Configures LLDP (Link Layer Discovery Protocol) settings                                                                                         |
| <a href="#">load-balancing</a> on page 1174          | Configures load balancing parameters                                                                                                             |
| <a href="#">logging</a> on page 1180                 | Modifies message logging settings                                                                                                                |
| <a href="#">mac-address-table</a> on page 1182       | Configures the MAC address table                                                                                                                 |
| <a href="#">mac-auth</a> on page 1183                | Enables 802.1x user authentication protocol on this profile                                                                                      |

**Table 33: Profiles Config Mode Commands (continued)**

| Command                                                         | Description                                                                                                                                                                          |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">management-server</a> on page 1186                  | Configures a management server with this profile                                                                                                                                     |
| <a href="#">meshpoint-device</a> on page 1187                   | Configures a meshpoint device parameters                                                                                                                                             |
| <a href="#">meshpoint-monitor-interval</a> on page 1188         | Configures meshpoint monitoring interval                                                                                                                                             |
| <a href="#">min-misconfiguration-recovery-time</a> on page 1189 | Configures the minimum device connectivity verification time                                                                                                                         |
| <a href="#">mint</a> on page 1190                               | Configures MiNT protocol settings                                                                                                                                                    |
| <a href="#">misconfiguration-recovery-time</a> on page 1197     | Verifies device connectivity after a configuration is received                                                                                                                       |
| <a href="#">neighbor-inactivity-timeout</a> on page 1198        | Configures neighbor inactivity timeout                                                                                                                                               |
| <a href="#">neighbor-info-interval</a> on page 1199             | Configures neighbor information exchange interval                                                                                                                                    |
| <a href="#">no</a> on page 1200                                 | Removes or reverts settings to their default. The no command, when used in the profile configuration mode, removes the selected profile's settings or reverts them to their default. |
| <a href="#">noc</a> on page 1202                                | Configures NOC settings                                                                                                                                                              |
| <a href="#">nsight</a> on page 1202                             | Configures NSight database related parameters                                                                                                                                        |
| <a href="#">ntp</a> on page 1207                                | Configures NTP server settings                                                                                                                                                       |
| <a href="#">otls</a> on page 1210                               | Configures support for detection and forwarding of OmniTrail beacon tags                                                                                                             |
| <a href="#">offline-duration</a> on page 1212                   | Sets the duration, in minutes, for which a device remains un-adopted before it generates offline event                                                                               |
| <a href="#">power-config</a> on page 1213                       | Configures the power mode                                                                                                                                                            |
| <a href="#">preferred-controller-group</a> on page 1215         | Specifies the wireless controller or service platform group preferred for adoption                                                                                                   |
| <a href="#">preferred-tunnel-controller</a> on page 1215        | Configures the tunnel wireless controller or service platform preferred by the system to tunnel extended VLAN traffic                                                                |
| <a href="#">radius</a> on page 1216                             | Configures device-level RADIUS authentication parameters                                                                                                                             |
| <a href="#">raid</a> on page 1284                               | Enables alarm on the array. This command is supported only on the NX 95XX series service platform profile/device config modes.                                                       |
| <a href="#">rf-domain-manager</a> on page 1217                  | Enables devices using this profile to be elected as RF Domain manager. Also sets the priority value for devices using this profile in the RF Domain manager election process.        |
| <a href="#">router</a> on page 1218                             | Configures dynamic router protocol settings                                                                                                                                          |
| <a href="#">spanning-tree</a> on page 1220                      | Configures spanning tree related settings                                                                                                                                            |

**Table 33: Profiles Config Mode Commands (continued)**

| Command                                                       | Description                                                                                                                                                             |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">traffic-class-mapping</a> on page 1223            | Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority                                                                                  |
| <a href="#">traffic-shape</a> on page 1224                    | Enables traffic shaping and configures traffic shaping parameters                                                                                                       |
| <a href="#">trustpoint (profile-config-mode)</a> on page 1229 | Configures the trustpoint assigned for validating a CMP auth Operator                                                                                                   |
| <a href="#">tunnel-controller</a> on page 1231                | Configures the name of tunneled WLAN (extended VLAN) wireless controller or service platform                                                                            |
| <a href="#">use</a> on page 1232                              | Uses pre configured policies with this profile                                                                                                                          |
| <a href="#">vrrp</a> on page 1238                             | Configures VRRP (Virtual Router Redundancy Protocol) group settings                                                                                                     |
| <a href="#">vrrp-state-check</a> on page 1242                 | Publishes interface via OSPF or BGP based on VRRP status                                                                                                                |
| <a href="#">virtual-controller</a> on page 1243               | Enables an access point as a VC (virtual-controller) or DVC (dynamic virtual controller). Note, DVC is supported only on the AP 7522, AP 7532, and model access points. |
| <a href="#">wep-shared-key-auth</a> on page 1244              | Enables support for 802.11 WEP shared key authentication                                                                                                                |
| <a href="#">service</a> on page 1245                          | Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode.                            |
| <a href="#">zone</a> on page 1251                             | Configures the zone for devices using this profile. The zone can also be configured on the device's self context.                                                       |

**Note**

For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see [COMMON COMMANDS](#) on page 640.

**Note**

The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (\_) character. In other words, the name of a device cannot contain an underscore.

*adopter-auto-provisioning-policy-lookup*

[Profile Config Commands](#) on page 862

Enables the use of a centralized auto provisioning policy on this profile. When enabled, the auto-provisioning policy applied on the NOC gets precedence over the one applied at the site controller level. Optionally, use the 'evaluate-always' option to set flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted. The device's previous adoption status is not taken into consideration.

This command is also applicable in the device configuration context.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
adopter-auto-provisioning-policy-lookup {evaluate-always}
```

### Parameters

```
adopter-auto-provisioning-policy-lookup {evaluate-always}
```

|                                                           |                                                                                                                                                                                                                                                                                   |

## adoption

[Profile Config Commands](#) on page 862

Configures a minimum and maximum delay time in the initiation of the device adoption process. When configured, devices do not attempt adoption immediately on coming up. The process is initiated after the lapse of a specified period of time (configured using this command as the start-delay minimum time).

Once configured and applied, this setting is applicable on all devices using this profile. This option is also available in the device-configuration mode.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
adoption start-delay min <0-30> max <0-30>
```

## Parameters

`adoption start-delay min <0-30> max <0-30>`

|                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### *adoption-mode*

[Profile Config Commands](#) on page 862

Configures the mode of adoption in an access point profile. This command is also applicable to the device configuration context.

By default, any WiNG AP, on being powered-up for the first time, starts the following auto-discovery process. The AP:

- 1 Moves to MLCP\_DISCOVERY state and tries to discover a local controller. If a local controller is found, it
  - a adopts to the controller, and
  - b marks itself as “local-controller” adopted, and
  - c moves to the MLCP\_MODE.
- 2 If a local controller is not found, the AP switches to the CLOUD\_DISCOVERY state, and tries connecting to the ExtremeCloud. If the AP succeeds in connecting to the cloud, it
  - a marks itself as “cloud-adopted”, and
  - b moves to the CLOUD\_MODE.
- 3 If the AP is unable to discover and adopt to the ExtremeCloud, it switches to the WS\_CONTROLLER\_DISCOVERY state, and tries connecting to the WebSocket (WS) Controller. If it succeeds in connecting to the ws\_controller, it
  - a marks itself as “ws-controller-adopted”, and
  - b moves to the WS\_CONTROLLER\_MODE.

- 4 The AP continues to switch between the three discovery states (local controller, cloud, and ws\_controller) until it gets adopted.
- 5 Once adopted, an AP's adoption mode does not change unless,
  - a It is changed from the controller's CLI (using the adoption-mode command), the Cloud dashboard, or the WS controller dashboard.
  - b If the AP is reverted to factory settings, in which case the AP starts the auto-discovery process on bootup.

### Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000
- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

adoption-mode [cloud|controller|ws-controller]

### Parameters

adoption-mode [cloud|controller|ws-controller]

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

*alias*

[Profile Config Commands](#) on page 862

Configures network, VLAN, and service aliases. The aliases defined on this profile applies to all devices using this profile. Aliases can be also defined at the device level.

### Note

You can apply overrides to aliases at the device level. Overrides applied at the device level take precedence. For more information on aliases, see [alias](#) on page 237 (global config mode).

## Supported in the following platforms:

- Access Points — AP 6522, AP 6562, AP 7161, AP 7502, AP 7522, AP 7532, AP 7562, AP 7602, AP 7612, AP 7622, AP 7632, AP 7662, AP 8163, AP 8432, AP 8533
- Wireless Controllers — RFS 4000

- Service Platforms — NX 5500, NX 75XX, NX 95XX, NX 96XX, VX 9000

### Syntax

```
alias [address-range|encrypted-string|hashed-string|host|network|network-group|
network-service|number|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

```
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>alias vlan</b><br><b>&lt;VLAN-ALIAS-NAME&gt;</b> | <p>Creates a new VLAN alias for this profile. Or associates an existing VLAN alias with this profile. A VLAN alias maps a name to a VLAN ID. A VLAN alias is a configuration for optimal VLAN re-use and management for local and remote deployments. Use this option to create unique VLANs aliases for different deployment scenarios. For example, if a VLAN ID is set as 10 for the central network, and the VLAN is set as 26 at a remote location, the VLAN can be overridden at the remote location using an alias.</p> |
|                                                     | <p>At the remote location, the network is functional with an ID of 26, but utilizes the name defined at the central local network. A new VLAN need not be created specifically at the remote location.</p> <ul style="list-style-type: none"> <li>• &lt;VLAN-ALIAS-NAME&gt; – Specify the VLAN alias name.</li> </ul> <p><b>Note:</b> Alias name should begin with '\$'.</p>                                                                                                                                                   |
| <b>&lt;1-4094&gt;</b>                               | <p>Maps the VLAN alias to a VLAN ID</p> <ul style="list-style-type: none"> <li>• &lt;1-4094&gt; – Specify the VLAN ID from 1 - 4094.</li> </ul> <p>Aliases defined at any given level can be overridden at the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.</p>                                                                                                                               |

## Example

The following example shows the global aliases configured. Note the network-service alias '\$kerberos' settings.

```
nx9500-6C8809(config)#show running-config | include alias
alias network-group $NetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20

### *application-policy*

[Profile Config Commands](#) on page 862

Associates an application policy with this profile. This command is also applicable to the device configuration mode. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.

An application policy defines the actions executed on recognized HTTP (Facebook), enterprise (Webex) and peer-to-peer (gaming) applications or application-categories. The following are the actions that can be applied in an application policy:

- Allow - Allows packets for a specific application and its defined category type (for e.g., social networking)
- Deny - Denies (restricts) packets to a specific application and its defined category type
- Mark - Marks recognized packets with DSCP/8021p value
- Rate-limit - Rate limits packets from specific application type

For more information on configuring an application policy, see [application-policy](#) on page 267.

### Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

## Syntax

```
application-policy radius <APP-POLICY-NAME>
```

## Parameters

```
application-policy radius <APP-POLICY-NAME>
```

|                                                          |                                                                                                                                                                                                                               |

## *arp*

[Profile Config Commands](#) on page 862

Adds a static Address Resolution Protocol (ARP) IP address in the ARP cache

The ARP protocol maps an IP address to a hardware MAC address recognized on the network. ARP provides protocol rules for making this correlation and providing address conversion in both directions.

When an incoming packet destined for a host arrives, ARP finds a physical host or MAC address that matches the IP address. ARP looks in its ARP cache and, if it finds the address, provides it so the packet can be converted to the right packet length, formatted, and sent to its destination. If no entry is found for the IP address, ARP broadcasts a request packet in a special format on the LAN to locate a device that recognizes the IP address. A device that recognizes the IP address as its own returns a reply indicating it. ARP updates the ARP cache for future reference and then sends the packet to the MAC address that replied.

### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
arp [<IP>|timeout]
```

```
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|
serial <1-4> <1-1> <1-1>] {dhcp-server/router}
```

```
arp timeout <15-86400>
```

### Parameters

```
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1>
<1-1>] {dhcp-server/router}
```

|                                  |                                                                                                                                                                                                                                                |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## auto-learn

[Profile Config Commands](#) on page 862

Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. The command also enables learning of a device's host name via DHCP options.

### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
auto-learn [host-name-via-dhcp <WORD>|staging-config]
```

### Parameters

```
auto-learn [host-name-via-dhcp <WORD>|staging-config]
```

|                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### *autogen-uniqueid*

[Profile Config Commands](#) on page 862

Auto-generates a unique ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device. A device's unique ID is a combination of a user-defined string (prefix, suffix, or both) and a substitution token. The WiNG implementation provides two built-in substitution tokens: \$SN and \$MiNT-ID that represent the device's serial number and MiNT-ID respectively. The value referenced by these substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for the device.

The general format of this command is: <PREFIX><SUBSTITUTION-TOKEN><SUFFIX>. You can provide both (prefix and suffix) or just a prefix or suffix.

For example, given the following set of inputs:

- user-defined prefix – TestAP6522
- substitution token – \$SN

The unique ID is generated using TestAP6522\$SN, where \$SN is replaced with the device's serial number.

When executed on an AP6522 (having serial number B4C7996C8809), the autogen-uniqueid TestAP6522\$SN command generates the unique ID: TestAP6522B4C7996C8809. When configured on an AP6522 profile, all AP6522s using the profile auto-generate a unique ID in which the device's serial number is preceded by the string 'TestAP6522'.

### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
autogen-uniqueid <WORD>
```

### Parameters

```
autogen-uniqueid <WORD>
```

**autogen-uniqueid**  
**<WORD>**

Auto-generates a device's unique ID (not exceeding 64 characters in length)  
The ID generated is a combination of the text provided and the value referenced through the substitution token \$SN or \$MiNT-ID. Where ever the autogen-uniqueid is used the device's serial number OR MiNT-ID is referenced depending on the substitution token used.

- <WORD> - Specify a auto generate unique ID format using one of the following substitution tokens:

Available tokens:

- \$SN - references SERIAL NUMBER of the device
- \$MINT-ID - references MINT-ID of the device

For example, Test-\$SN-TechPubs. In this example 'Test' and 'TechPubs' represent the user-defined prefix and suffix respectively. And \$SN is the substitution token.

### Example

```

## bridge

[bridge](#) on page 885

Configures VLAN Ethernet bridging parameters. Use this command to configure a Bridge NAT or Bridge VLAN settings

Configuring bridge Network Address Translation (NAT) parameters, allows management of Internet traffic originating at a remote site. In addition to traditional NAT functionality, bridge NAT provides a means of configuring NAT for bridged traffic through an access point. NAT rules are applied to bridged traffic through the access point, and matching packets are NATed to the WAN link instead of being bridged on their way to the router. Using bridge NAT, a tunneled VLAN (extended VLAN) is created between the NOC and a remote location. When a remote client needs to access the Internet, Internet traffic is routed to the NOC, and from there routed to the Internet. This increases the access time for the end user on the client. To resolve latency issues, bridge NAT identifies and segregates traffic heading towards the NOC and outwards towards the Internet. Traffic towards the NOC is allowed over the secure tunnel. Traffic towards the Internet is switched to a local WLAN link with access to the Internet.

A Virtual LAN (VLAN) is a separately administrated virtual network within the same physical managed network. VLANs are broadcast domains defined within wireless controllers or service platforms to allow control of broadcast, multicast, unicast, and unknown unicast within a layer 2 device. Administrators often need to route traffic between different VLANs. Bridging VLANs are only for non-routable traffic, like tagged VLAN frames destined to some other device, which will untag it. When a data frame is received on a port, the VLAN bridge determines the associated VLAN based on the port of reception. Using forwarding database information, the bridge VLAN forwards the data frame on the appropriate port(s). VLANs are useful to set separate networks to isolate some computers from others, without actually having to have separate cabling and Ethernet switches. Controllers can do this on their own, without need for the computer or other gear to know itself what VLAN it is on (this is called port-based VLAN, since it is assigned by port of the switch). Another common use is to put specialized devices like VoIP Phones on a separate network for easier configuration, administration, security, or service quality.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
bridge [nat|vlan]
```

```
bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface
[<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wan1] [(address|interface|
overload|pool <NAT-POOL-NAME>)]
```

```
bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

#### Parameters

```
bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|pool <NAT-POOL-NAME>)]
```

Specify the NAT pool name. For more information on configuring a NAT pool, see <a href="#">nat-pool-config-instance</a> on page 1160.</li> </ul> |

```
bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

|                                     |                                                                                                                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan &lt;1-4094&gt;</b>          | Configures the numerical identifier for the Bridge VLAN when it was initially created. <ul style="list-style-type: none"> <li>&lt;1-4094&gt; - Specify a VLAN index from 1 - 4094.</li> </ul>    |
| <b>vlan &lt;VLAN-ALIAS-NAME&gt;</b> | Configures the VLAN alias (should be existing and configured) identifying the bridge VLAN <ul style="list-style-type: none"> <li>&lt;VLAN-ALIAS-NAME&gt; - Specify a VLAN alias name.</li> </ul> |

#### Usage Guidelines

Creating customized filter schemes for bridged networks limits the amount of unnecessary traffic processed and distributed by the bridging equipment.

If a bridge does not hear Bridge Protocol Data Units (BPDUs) from the root bridge within the specified interval, defined in the max-age (seconds) parameter, assume the network has changed and recomputed the spanning-tree topology.

#### Example

```
nx9500-6C8809(config-profile-default-rfs4000)#bridge vlan 1
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#?
Bridge VLAN Mode commands:
```

| Bridge VLAN Mode commands:                |                                                                                     |
|-------------------------------------------|-------------------------------------------------------------------------------------|
| bridging-mode                             | Configure how packets on this VLAN are bridged                                      |
| captive-portal                            | Captive Portal                                                                      |
| captive-portal-enforcement                | Enable captive-portal enforcement on this extended VLAN                             |
| description                               | Vlan description                                                                    |
| edge-vlan                                 | Enable edge-VLAN mode                                                               |
| firewall                                  | Enable vlan firewall(IPv4)                                                          |
| http-analyze                              | Forward URL and Data to controller                                                  |
| ip                                        | Internet Protocol (IP)                                                              |
| ipv6                                      | Internet Protocol version 6 (IPv6)                                                  |
| l2-tunnel-broadcast-optimization          | Enable broadcast optimization                                                       |
| l2-tunnel-forward-additional-packet-types | Forward additional packet types not normally forwarded by l2 broadcast optimization |
| mac-auth                                  | Enable mac-auth for this bridge vlan                                                |
| name                                      | Vlan name                                                                           |
| no                                        | Negate a command or set its defaults                                                |
| stateful-packet-inspection-l2             | Enable stateful packet inspection in layer2 firewall                                |
| registration                              | Enable dynamic registration of device (or) user                                     |
| tunnel                                    | Vlan tunneling settings                                                             |
| tunnel-over-level2                        | Tunnel extended VLAN traffic over level 2 MiNT links                                |
| use                                       | Set setting to use                                                                  |
| clrscr                                    | Clears the display screen                                                           |
| commit                                    | Commit all changes made in this session                                             |
| do                                        | Run commands from Exec mode                                                         |
| end                                       | End current mode and change to EXEC mode                                            |
| exit                                      | End current mode and down to previous mode                                          |
| help                                      | Description of the interactive help system                                          |
| revert                                    | Revert changes                                                                      |
| service                                   | Service Commands                                                                    |
| show                                      | Show running system information                                                     |
| write                                     | Write running configuration to memory or terminal                                   |

## bridge-vlan-mode commands

[bridge](#) on page 885

The following table summarizes bridge VLAN configuration mode commands:

**Table 34: Bridge VLAN Config Mode Commands**

| Command                                                               | Description                                                                                                                                                                                |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">bridging-mode</a> on page 889                             | Configures how packets on this VLAN are bridged                                                                                                                                            |
| <a href="#">captive-portal</a> on page 890                            | Enables IP packet snooping on wired captive portals, and also configures the subnet to snoop                                                                                               |
| <a href="#">captive-portal-enforcement</a> on page 891                | Enables auto-enforcement of captive portal rules on this extended VLAN interface                                                                                                           |
| <a href="#">description</a> on page 892                               | Configures VLAN bridge description                                                                                                                                                         |
| <a href="#">edge-vlan</a> on page 893                                 | Enables edge VLAN mode                                                                                                                                                                     |
| <a href="#">firewall</a> on page 893                                  | Enables firewall on this bridge VLAN interface                                                                                                                                             |
| <a href="#">http-analyze</a> on page 894                              | Enables the analysis of URLs and data traffic on this Bridge VLAN                                                                                                                          |
| <a href="#">ip</a> on page 895                                        | Configures IP components                                                                                                                                                                   |
| <a href="#">ipv6</a> on page 898                                      | Configures IPv6 components                                                                                                                                                                 |
| <a href="#">l2-tunnel-broadcast-optimization</a> on page 901          | Enables broadcast optimization                                                                                                                                                             |
| <a href="#">l2-tunnel-forward-additional-packet-types</a> on page 902 | Enables forwarding of WNMP (Wireless Network Management Protocol) packets across L2 tunnels. These WNMP packets are normally not forwarded if L2 tunnel broadcast optimization is enabled. |
| <a href="#">mac-auth</a> on page 902                                  | Enables MAC authentication for Extended VLAN and Tunneled traffic (both MiNT and L2TPv3)                                                                                                   |
| <a href="#">name</a> on page 904                                      | Configures a name for the selected Bridge VLAN                                                                                                                                             |
| <a href="#">no</a> on page 909                                        | Negates a command or reverts settings to their default                                                                                                                                     |
| <a href="#">stateful-packet-inspection-l2</a> on page 906             | Enables stateful packet inspection in the layer 2 fire wall                                                                                                                                |
| <a href="#">registration</a> on page 904                              | Enables forwarding of bridge-vlan information (such as, name and vlan) to the ExtremeGuest (EGuest) server.                                                                                |
| <a href="#">tunnel</a> on page 907                                    | Enables tunneling of unicast messages to unknown MAC destinations, on the selected VLAN bridge                                                                                             |
| <a href="#">tunnel-over-level2</a> on page 908                        | Enables extended VLAN traffic over level 2 MiNT links                                                                                                                                      |
| <a href="#">use</a> on page 911                                       | Associates a captive-portal, access control list (IP, IPv6, or MAC), and a URL filter with this bridge VLAN                                                                                |

bridging-mode

[bridge-vlan-mode commands](#) on page 888

Configures how packets are bridged on the selected VLAN

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

#### Parameters

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bridging-mode</b>   | Configures the VLAN bridging mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>auto</b>            | Automatically selects the bridging mode to match the WLAN, VLAN and bridging mode configurations. When selected, the controller or access point determines the best bridging mode for the VLAN. (default setting)                                                                                                                                                                                                                                                                                                                                                      |
| <b>isolated-tunnel</b> | Bridges packets between local Ethernet ports and local radios, and passes tunneled packets through without de-tunneling<br>Select this option for a dedicated tunnel for bridging VLAN traffic.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>local</b>           | Bridges packets normally between local Ethernet ports and local radios (if any)<br>Local mode is typically configured in remote branch offices where traffic on remote private LAN segments need to be bridged locally. Local mode implies that traffic, wired and wireless, is to be bridged locally.                                                                                                                                                                                                                                                                 |
| <b>tunnel</b>          | Bridges packets between local Ethernet ports, local radios, and tunnels to other APs, wireless controllers, or service platforms<br>Select this option to use a shared tunnel for bridging VLAN traffic.<br>In tunnel mode, the traffic at the AP is always forwarded through the best path. The APs decide the best path to reach the destination and forward packets accordingly. Setting the VLAN to tunnel mode ensures packets are bridged between local Ethernet ports, any local radios, and tunnels to other APs, wireless controllers, and service platforms. |

#### Usage Guidelines

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

#### Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#bridging-mode isolated-tunnel

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#show context
 bridge vlan 1
 bridging-mode isolated-tunnel
 ip igmp snooping
 ip igmp snooping querier
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

[captive-portal](#)

[bridge-vlan-mode commands](#) on page 888

Enables IP (IPv4 and IPv6) packet snooping on wired captive portals, and also configures the subnet to snoop. When enabled, IP packets received from wired captive portal clients, on the specified subnet, are snooped to learn IP to MAC mapping.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M>
{excluded-address <IPv4|IPv6>}
```

Parameters

```
captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address
<IPv4|IPv6>}
```

|                                                                          |                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>captive-portal</b><br><b>[ipv4-snooping]</b><br><b>ipv6-snooping]</b> | Enables snooping of IPv4 or IPv6 packets (based on the option selected) for wired captive portal clients                                                                                                                                                                                                                                   |
| <b>subnet &lt;IPv4/M IPv6/M&gt;</b>                                      | Enables IPv4 or IPv6 packet snooping on a specified subnet <ul style="list-style-type: none"> <li>• &lt;IPv4/M IPv6/M&gt; – Specify the subnet address in the A.B.C.D/M or X::X:X/M format to identify an IPv4 or IPv6 subnet respectively. When specified, this is the IPv4/IPv6 subnet on which IP packets are to be snooped.</li> </ul> |
| <b>excluded-address &lt;IPv4 IPv6&gt;</b>                                | Optional. Configures the IPv4 or IPv6 address excluded from snooping within the specified IPv4 IPv6 subnet. <ul style="list-style-type: none"> <li>• &lt;IPv4 IPv6&gt; – Specify the IPv4 or IPv6 address. Use this parameter to configure the gateway's address.</li> </ul>                                                               |

Example

```
nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#captive-portal ip-snooping subnet
192.168.13.0/24 excluded-address 192.168.13.7
```

```
nx9500-6C8809(config-profile NX9500Test-bridge-vlan-4)#show context
bridge vlan 4
captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
ip igmp snooping
ip igmp snooping querier

captive-portal-enforcement

[bridge-vlan-mode commands](#) on page 888

Enables auto-enforcement of captive portal rules on this extended VLAN interface. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
captive-portal-enforcement {fall-back}
```

Parameters

```
captive-portal-enforcement {fallback}
```

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>captive-portal-enforcement</b> | Enables auto-enforcement of captive portal access permission rules to data transmitted over this extended VLAN interface. When enforced, wired network users can pass traffic through the captive portal without being redirected to an authentication page. Authentication instead takes place when the RADIUS server is queried against the wired user's MAC address. If the MAC address is in the RADIUS server's user database, the user is allowed access.<br>A captive portal is an access policy for providing temporary and restrictive access using a standard Web browser. Captive portals capture and re-direct a wired/wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access the network. |
| <b>fall-back</b>                  | Optional. If enabling source MAC authentication for Extended VLAN and tunneled traffic on this bridge VLAN, use this option to enforce captive-portal authentication as the fall-back mode of authentication in case MAC authentication fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Example

```
nx9500-6C8809(config-profile testAP7602-bridge-vlan-20)#show context
bridge vlan 20
captive-portal-enforcement
ip igmp snooping
ip igmp snooping querier
ipv6 mld snooping
ipv6 mld snooping querier
nx9500-6C8809(config-profile testAP7602-bridge-vlan-20)#
```

edge-vlan

[bridge-vlan-mode commands](#) on page 888

Enables the edge VLAN mode. In the edge VLAN mode, a protected port does not forward traffic to another protected port on the same wireless controller or service platform. This feature is enabled by default.

Supported in the following platforms:

- Access Points – AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers – RFS4000
- Service Platforms – NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

`edge-vlan`

Parameters

None

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#edge-vlan
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

| <code>no</code> on page 909 | Disables the edge VLAN mode |
|-----------------------------|-----------------------------|

firewall

[bridge-vlan-mode commands](#) on page 888

Enables IPv4 firewall on this Bridge VLAN. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

**firewall**

Parameters

None

Example

```
nx9500-6c8809(config-profile-default-rfs4000-bridge-vlan-1)#firewall
nx9500-6c8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

http-analyze

[bridge-vlan-mode commands](#) on page 888

Enables the analysis of URLs and data traffic on this Bridge VLAN. When enabled, URLs and data are forwarded to the controller running the HTTP analytics engine.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

**http-analyze** {*filter* [*images*/*post*/*query-string*]}

Parameters

**http-analyze** {*filter* [*images*/*post*/*query-string*]}

|                                   |                                                                                                                                                                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>http-analyze</b>               | Enables URL and HTTP data analysis. Optionally use the filter keyword to filter out specific URLs                                                                                                                                                                                 |
| <b>filter</b>                     |                                                                                                                                                                                                                                                                                   |
| <b>[images post query-string]</b> | <ul style="list-style-type: none"><li>• filter - Optional. Filters out specific URLs</li><li>• images - Filters out URLs referring to images</li><li>• post - Filters out URLs referring to POSTs</li><li>• query-string - Filters out query strings received from URLs</li></ul> |

## Example

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#http-analyze filter images

rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#show context
 bridge vlan 4
 http-analyze filter images
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#
```

ip

[bridge-vlan-mode commands](#) on page 888

Configures this Bridge VLAN's IP components

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

## Syntax

```
ip [arp|dhcp|igmp]
```

```
ip [arp|dhcp] trust
```

```
ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count| mrouter|querier}
```

```
ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count <1-7>}
```

```
ip igmp snooping {mrouter [interface|learn]}
```

```
ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
```

```
ip igmp snooping {querier} {address|max-response-time|timer|version}
```

```
ip igmp snooping {querier} {address <IP>|max-response-time <1-25>|timer expiry <60-300>|version <1-3>}
```

## Parameters

```
ip [arp|dhcp] trust
```

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>         | Configures the VLAN bridge IP parameters                                                                                                                                                                                                                                                                                                                                                                             |
| <b>arp trust</b>  | Configures the ARP trust parameter. Trusted ARP packets are used to update the DHCP snoop table to prevent IP spoof and arp-cache poisoning attacks. This option is disabled by default. <ul style="list-style-type: none"> <li>• trust – Trusts ARP responses on the VLAN bridge</li> </ul>                                                                                                                         |
| <b>dhcp trust</b> | Configures the DHCP trust parameter. Uses DHCP packets, from a DHCP server, as trusted and permissible within the access point, wireless controller, or service platform managed network. DHCP packets are used to update the DHCP snoop table to prevent IP spoof attacks. This feature is enabled by default. <ul style="list-style-type: none"> <li>• trust – Trusts DHCP responses on the VLAN bridge</li> </ul> |

```
ip igmp snooping {fast-leave|forward-unknown-multicast|last-member-query-count <1-7>}
```

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>                                  | Configures the VLAN bridge IP parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>igmp snooping</b>                       | Configures Internet Group Management Protocol (IGMP) snooping parameters. IGMP snooping is enabled by default. IGMP establishes and maintains multicast group memberships for interested members. Multicasting allows a networked device to listen to IGMP network traffic and forward IGMP multicast packets to radios on which the interested hosts are connected. The device also maintains a map of the links that require multicast streams, there by reducing unnecessary flooding of the network with multicast traffic.                                                                                                |
| <b>fast-leave</b>                          | Optional. Enables fast leave processing. When enabled, layer 2 LAN interfaces are removed from the IGMP snooping forwarding table entry without initially sending IGMP group-specific queries to the interface. When receiving a group specific IGMPv2 leave message, IGMP snooping removes the interface from the Layer 2 forwarding table entry for that multicast group, unless a multicast router was learned on the port. Fast-leave processing enhances bandwidth management for all hosts on the network. This option is disabled by default. This feature is supported only on the AP7502, AP8533 model access points. |
| <b>forward-unknown-multicast</b>           | Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>last-member-query-count &lt;1-7&gt;</b> | Optional. Configures the last member query count used in determining the number of group-specific queries sent before removing the snoop entry <ul style="list-style-type: none"> <li>• &lt;1-7&gt; – Specify the count from 1 - 7. The default value is 2.</li> </ul>                                                                                                                                                                                                                                                                                                                                                         |

```
ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
```

|                      |                                                      |

| <b>ip</b>                             | Configures the VLAN bridge IP parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>igmp snooping</b>                  | Configures the IGMP snooping parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>querier</b>                        | Optional. Configures the IGMP querier parameters. This option is disabled by default. Enables IGMP querier. IGMP snoop querier keeps host memberships alive. It is primarily used in a network where there is a multicast streaming server and hosts subscribed to the server and no IGMP querier present. The access point, wireless controller, or service platform performs the IGMP querier role. An IGMP querier sends out periodic IGMP query packets. Interested hosts reply with an IGMP report packet. IGMP snooping is only conducted on wireless radios. IGMP multicast packets are flooded on wired ports. IGMP multicast packet are not flooded on the wired port. IGMP membership is also learnt on it and only if present, then it is forwarded on that port. |
| <b>address &lt;IP&gt;</b>             | Optional. Configures the IGMP querier source IP address. This address is used as the default VLAN querier IP address. <ul style="list-style-type: none"> <li>• &lt;IP&gt; - Specify the IGMP querier source IP address.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>max-response-time &lt;1-25&gt;</b> | Optional. Configures the IGMP querier maximum response time. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;1-25&gt; - Specify the maximum response time from 1 - 25 seconds.</li> </ul> <p>The access point, wireless controller, or service platform forwards multicast packets only to radios present in the snooping table. IGMP reports from wired ports are forwarded to the multicast router ports.</p> <p>If no reports are received from a radio, it is removed from the snooping table. The radio then stops receiving multicast packets.</p>                                                                                                                                                                                    |
| <b>timer expiry &lt;60-300&gt;</b>    | Optional. Configures the IGMP querier expiry time. The value specified is used as the timeout interval for other querier resources. This option is disabled by default. <ul style="list-style-type: none"> <li>• expiry - Configures the IGMP querier timeout <ul style="list-style-type: none"> <li>• &lt;60-300&gt; - Specify the IGMP querier timeout from 60 - 300 seconds.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| <b>version &lt;1-3&gt;</b>            | Optional. Configures the IGMP version. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;1-3&gt; - Specify the IGMP version. The versions are 1- 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

ipv6

[bridge-vlan-mode commands](#) on page 888

Configures this Bridge VLAN's IPv6 components

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
ipv6 [dhcpv6|firewall|mld|nd]
```

```
ipv6 dhcpv6 trust
```

```
ipv6 firewall
```

```
ipv6 mld snooping {forward-unknown-multicast|mrouter|querier}
```

```
ipv6 mld snooping {forward-unknown-multicast}
```

```
ipv6 mld snooping {mrouter [interface|learn]}
```

```
ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
```

```
ipv6 mld snooping {querier} {max-response-time|timer|version}
```

```
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry
<60-300>| version <1-2>}
```

## ipv6 nd raguard

### Parameters

ipv6 dhcpv6 trust

|                     |                                                                                                                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6</b>         | Configures the VLAN bridge IPv6 parameters                                                                                                                                                                                                   |
| <b>dhcpv6 trust</b> | Enables the DHCPv6 trust option. When enabled all DHCPv6 responses are trusted on this bridge VLAN. This option is enabled by default. <ul style="list-style-type: none"><li>• trust - Trusts DHCPv6 responses on this bridge VLAN</li></ul> |

| <b>ipv6</b>     | Configures the VLAN bridge IPv6 parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>firewall</b> | Enables IPv6 firewall on this bridge VLAN. This option is enabled by default. Devices utilizing IPv6 addressing require firewall protection unique to IPv6 traffic. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the neighbor discovery (ND) protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters. Routers respond to such a request with a router advertisement (RA) packet that contains Internet layer configuration parameters. |

## ipv6 mld snooping {forward-unknown-multicast}

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6</b>                      | Configures the VLAN bridge IPv6 parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>mld snooping</b>              | Configures Multicast Listener Discovery Protocol (MLD) snooping parameters. MLD snooping enables a access point, wireless controller, or service platform to examine MLD packets and make forwarding decisions based on the content. MLD is used by IPv6 devices to discover devices wanting to receive multicast packets destined for specific multicast addresses. MLD uses multicast listener queries and multicast listener reports to identify which multicast addresses have listeners and join multicast groups. MLD snooping caps the flooding of IPv6 multicast traffic on controller, service platform or access point VLANs. When enabled, MLD messages between hosts and multicast routers are examined to identify the hosts receiving multicast group traffic. The access point, wireless controller, or service platform forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This option is enabled by default. |
| <b>forward-unknown-multicast</b> | Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}

|                     |                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------|
| <b>ipv6</b>         | Configures the VLAN bridge IPv6 parameters                                                           |
| <b>mld snooping</b> | Configures MLD snooping parameters. This option is enabled by default.                               |
| <b>mrouter</b>      | Optional. Configures the multicast router parameters, such as interfaces and learning protocol used. |

|                                                        |                                                                                                                                                                                                                 |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><b>&lt;INTERFACE-<br/>LIST&gt;</b> | Configures the multicast router interfaces. This option is disabled by default. <ul style="list-style-type: none"> <li>• &lt;INTERFACE-LIST&gt; - Specify a comma-separated list of interface names.</li> </ul> |
| <b>learn pim-dvmrp</b>                                 | Configures the multicast router learning protocols. This option is disabled by default. <ul style="list-style-type: none"> <li>• pim-dvmrp - Enables PIM and DVMRP snooping of packets</li> </ul>               |

```

## l2-tunnel-broadcast-optimization

[bridge-vlan-mode commands](#) on page 888

Enables broadcast optimization on this bridge VLAN. L2 Tunnel Broadcast Optimization prevents flooding of ARP packets over the virtual interface. Based on the learned information, ARP packets are filtered at the wireless controller level.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
l2-tunnel-broadcast-optimization
```

#### Parameters

None

#### Example

```

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#l2-tunnel-broadcast
-optimization

```

```

nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#show context

```

```

bridge vlan 1
 description "This is a description for the bridged VLAN"
 l2-tunnel-broadcast-optimization
 bridging-mode isolated-tunnel
 ip arp trust
 ip dhcp trust
 ip igmp snooping
 ip igmp snooping querier
 ip igmp snooping mrouter interface ge2 ge1
 ip igmp snooping querier version 2
 ip igmp snooping querier max-response-time 24
 ip igmp snooping querier timer expiry 100
 nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#

```

## l2-tunnel-forward-additional-packet-types

[bridge-vlan-mode commands](#) on page 888

Enables forwarding of Wireless Network Management Protocol (WNMP) packets across L2 tunnels. Under normal circumstances, if L2 tunnel broadcast optimization is enabled, WNMP packets are not forwarded across the L2 tunnels. Use this option to enable the forwarding of only WNMP packets.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
l2-tunnel-forward-additional-packet-types wnmp
```

Parameters

None

Example

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-1)#l2-tunnel-forward-additional-packet-types wnmp
```

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-1)#show context
bridge vlan 1

## mac-auth

[bridge-vlan-mode commands](#) on page 888

Enables source MAC authentication for Extended VLAN and tunneled traffic (MiNT and L2TPv3) on this bridge VLAN. When enabled, it provides fast path authentications of clients, whose captive portal session has expired.

Supported in the following platforms:

- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
mac-auth {attempts <1-5>/throttle <0-255>}
```

## Parameters

`mac-auth {attempts <1-5>|throttle <0-255>}`

|                               |                                                                                                                                                                                                                                              |

| <b>mac-auth</b>               | Enables MAC Authentication                                                                                                                                                                                                                   |
| <b>attempts &lt;1-5&gt;</b>   | Optional. Configures the maximum number of retries allowed for MAC authentication requests. <ul style="list-style-type: none"><li>• &lt;1-5&gt; - Specify the maximum allowed authentication retries from 1 - 5. The default is 3.</li></ul> |
| <b>throttle &lt;0-255&gt;</b> | Optional. Configures the throttle value for MAC authentication requests <ul style="list-style-type: none"><li>• &lt;0-255&gt; - Specify the MAC authentication request throttle value from 0 -255. The default is 64.</li></ul>              |

## Usage Guidelines Applying AAA Policy for MAC Authentication

To enable MAC authentication,

- Create an AAA policy.

```
nx9500-6C8809(config)#aaa-policy MAC-Auth
```

- Use the AAA policy on the device for MAC Authentication.

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#mac-auth use aaa-policy MAC-Auth
```

- In the bridge VLAN context, enable MAC Authentication,

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth
```

- Optionally, configure the following MAC Authentication parameters. If not specified, default values are applied.

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth attempts 2
```

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#mac-auth throttle 100
```

## Usage Guidelines Enabling Fall-back Captive Portal Authentication

To enable fall-back captive-portal authentication on the bridge VLAN,

- apply a captive-portal policy to the bridge VLAN.

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#use captive-portal test
```

- enable captive-portal authentication as the fall-back authentication mode.

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-bridge-vlan-20)#captive-portal-enforcement
fall-back
```

## Example

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#mac-auth attempts 2
```

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#mac-auth throttle 80
```

```
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#show context
```

```
bridge vlan 20
 mac-auth attempts 2
 mac-auth throttle 80
 ip igmp snooping
 ip igmp snooping querier
```

```
ipv6 mld snooping
ipv6 mld snooping querier
nx9500-6C8809(config-profile testNX9000-bridge-vlan-20)#
```

name

[bridge-vlan-mode commands](#) on page 888

Configures a name for this Bridge VLAN. This name uniquely identifies the bridge-vlan interface, and is forwarded to the EGuest server along with configuration details.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
name <NAME>
```

#### Parameters

```
name <NAME>
```

| <a href="#">no</a> on page 909 | Removes or modifies this Bridge VLANs configured name |
|--------------------------------|-------------------------------------------------------|

registration

[bridge-vlan-mode commands](#) on page 888

Enables forwarding of bridge-vlan information (such as, name and vlan) to the ExtremeGuest (EGuest) server. The EGuest server updates its WLAN information collection with the received wired-network information.

#### Note

Ensure that the bridge-vlan interface has a name that uniquely identifies it from other bridge-vlan interfaces with similar configurations. For more information, see [name](#) on page 904.

Captive-portal Web pages for wired clients are hosted on the gateway controller's bridge-vlan interface. By updating the EGuest server with bridge-vlan information, you enable the EGuest server to apply of captive-portal's Splash templates to the bridge-vlan interface.

This command also configures the external guest registration and validation server details. If using an external server to perform wired client registration, authentication and accounting, use this command to configure the external server's IP address/hostname. When configured, the gateway controller forwards guest registration requests to the specified registration server. In case of EGuest deployment, this external resource should point to the EGuest server.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
registration [device|device-OTP|external|user]
registration [device|device-otp|user] group-name <RADIUS-GROUP-NAME>
expiry-time <1-43800>
registration external follow-aaa send-mode [http|https|udp]
```

#### Parameters

```
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {expiry-time <1-43800>}
```

stateful-packet-inspection-l2

[bridge-vlan-mode commands](#) on page 888

Enables a stateful packet inspection (SPI) at the layer 2 firewall. SPI, also referred to as dynamic packet filtering, is a security feature that tracks the operating state and characteristics of network connections traversing it. It distinguishes legitimate packets for different types of connections, and only allows packets matching a known active connection to pass.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
stateful-packet-inspection-12
```

Parameters

None

Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#stateful-packet-inspection-12
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

tunnel

[bridge-vlan-mode commands](#) on page 888

Enables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
tunnel [rate-limit|unknown-unicast]
```

```
tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
tunnel unknown-unicast
```

Parameters

```
tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}
```

**tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024>**

- Configures a rate-limit parameters (max-burst-size and rate) for tunneled VLAN traffic over level 2 MiNT links
- rate - Optional. Configures the data rate, in kilobits per second, for the incoming and outgoing extended VLAN traffic tunneled over MiNT level 2 links
  - <50-1000000> - Specify a value from 50 - 1000000 Kbps. The default is 5000 Kbps.
  - max-burst-size - Optional. Configures the maximum burst size
  - <2-1024> - Specify the maximum burst size from 2 - 1024 kbytes. The default is 320 kbytes.

After specifying the max-burst-size, optionally specify the red-threshold value for the different traffic types. The red-threshold is configured as a % of the specified max-burst-size.

- red-threshold - Optional. Configures the random early detection (red) threshold for the different traffic types
  - background - Configures the red-threshold for low priority traffic from 0 - 100. The default is 50% of the specified max-burst-size.
  - best-effort - Configures the red-threshold for normal priority traffic from 0 - 100. The default is 50% of the specified max-burst-size.
  - video - Configures the red-threshold for video traffic from 0 - 100. The default is 25% of the specified max-burst-size.
  - voice - Configures the red-threshold for voice traffic from 0 - 100. The default is 0% of the specified max-burst-size.

tunnel unknown-unicast

**tunnel unknown-unicast**

Enables tunneling of unicast packets destined for unknown MAC addresses

#### Example

```
nx9500-6C8809(config-profile TestAP81xx-bridge-vlan-1)#tunnel unknown-unicast
nx9500-6C8809(config-profile TestAP81xx-bridge-vlan-1)#no tunnel unknown-unicast
nx9500-6C8809(config-profile TestAP81xx-bridge-vlan-1)#show context
bridge vlan 1
 ip igmp snooping
 ip igmp snooping querier
 no tunnel unknown-unicast
nx9500-6C8809(config-profile TestAP81xx-bridge-vlan-1)#
```

#### Related Commands

**no** on page 909

Disables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

tunnel-over-level2

[bridge-vlan-mode commands](#) on page 888

Enables extended VLAN (tunneled VLAN) traffic over level 2 MiNT links. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

`tunnel-over-level2`

#### Parameters

None

#### Example

```
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#tunnel-over-level2
```

```
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#show context
bridge vlan 1
 description "This is a description for the bridged VLAN"
 12-tunnel-broadcast-optimization

no

[bridge-vlan-mode commands](#) on page 888

Negates a command or reverts settings to their default. The no command, when used in the bridge VLAN mode, negates the VLAN bridge settings or reverts them to their default.

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

use

[bridge-vlan-mode commands](#) on page 888

Associates a captive-portal, access control list (IPv4, IPv6, or MAC), and/or a URL filter with this bridge VLAN

Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

Syntax

```
use [application-policy | captive-portal | ip-access-list | ipv6-access-list |
mac-access-list | url-filter]
```

```
use application-policy <APP-POLICY-NAME>
```

```
use captive-portal <CAPTIVE-PORTAL-NAME>
```

```
use [ip-access-list | ipv6-access-list | mac-access-list] tunnel out <IP/
ipv6/MAC-ACCESS-LIST-NAME>
```

```
use url-filter <URL-FILTER-NAME>
```

## Parameters

use application-policy <APP-POLICY-NAME>

|                                                       |                                                                                                                                                                                                                                                                                                                                        |

| <b>use</b>                                             | Sets this VLAN bridge policy to use an IPv4/IPv6 access list or a MAC access list                                                                                                                                                                                                                                                                                                                                                      |
| <b>ip-access-list</b>                                  | Associates a pre-configured IPv4 access list with this VLAN-bridge interface                                                                                                                                                                                                                                                                                                                                                           |
| <b>ipv6-access-list</b>                                | Associates a pre-configured IPv6 access list with this VLAN-bridge interface                                                                                                                                                                                                                                                                                                                                                           |
| <b>mac-access-list</b>                                 | Associates a pre-configured MAC access list with this VLAN- bridge interface                                                                                                                                                                                                                                                                                                                                                           |
| <b>tunnel out &lt;IP/IPv6/MAC-ACCESS-LIST-NAME&gt;</b> | The following keywords are common to the 'IPv4/IPv6 access list' and 'MAC access list' parameters: <ul style="list-style-type: none"><li>• tunnel – Applies IPv4/IPv6 access list or MAC access list to all packets going into the tunnel</li><li>• out – Applies IPv4/IPv6 access list or MAC access list to all outgoing packets</li></ul> <IP/IPv6/MAC-ACCESS-LIST-NAME> – Specify the IP/IPv6 access list or MAC access list name. |

use url-filter <URL-FILTER-NAME>

|                                |                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>use url-filter</b>          | Sets this VLAN bridge to use a URL filter                                                                                    |
| <b>&lt;URL-FILTER-NAME&gt;</b> | Specify the URL filter name. It should be existing and configured.<br>This option enforces URL filtering on the VLAN bridge. |

## Example

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#use mac-access-list tunnel out PERMIT-ARP-AND-IPv4
```

```
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#show context
bridge vlan 1
 ip igmp snooping
 ip igmp snooping querier
```

```
use mac-access-list tunnel out PERMIT-ARP-AND-IPv4
nx9500-6C8809(config-profile-default-rfs4000-bridge-vlan-1)#
```

## *captive-portal*

[Profile Config Commands](#) on page 862

Configures captive portal advanced Web page uploads on this profile

A captive portal is a means of providing guests temporary and restrictive access to the controller managed wireless network. A captive portal provides secure authenticated controller access by capturing and re-directing a wireless user's Web browser session to a captive portal login page, where the user must enter valid credentials. Once the user is authenticated and logged into the controller managed network, additional agreement, welcome, and fail pages provide the administrator with options to control the captive portal's screen flow and user appearance.

### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

### Syntax

```
captive-portal page-upload count <1-20>
```

### Parameters

```
captive-portal page-upload count <1-20>
```

|                           |                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>page-upload</b>        | Enables captive portal advanced Web page upload                                                                                                                                 |
| <b>count &lt;1-20&gt;</b> | Sets the maximum number of APs that can be uploaded concurrently <ul style="list-style-type: none"> <li>• &lt;1-20&gt; - Set a value from 1 - 20. The default is 10.</li> </ul> |

### Example

```
nx9500-6C8809(config-profile-testNX9500)#captive-portal page-upload count 15

### *cluster*

[Profile Config Commands](#) on page 862

Sets the cluster configuration

#### **Supported in the following platforms:**

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### **Syntax**

```
cluster [force-configured-state|force-configured-state-delay|handle-stp|
master-priority|member|mode|name|radius-counter-db-sync-time]
```

```
cluster [force-configured-state|force-configured-state-delay <3-1800>|
handle-stp| master-priority <1-255>]
```

```
cluster member [ip|vlan]
cluster member [ip <IP> {level [1/2]}|vlan <1-4094>]
```

```
cluster mode [active|standby]
```

```
cluster name <CLUSTER-NAME>
```

```
cluster radius-counter-db-sync-time <1-1440>
```

#### **Parameters**

```
cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|master-
priority <1-255>]
```

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>force-configured-state</b>                      | <p>Forces adopted APs to auto revert when a failed wireless controller or service platform (in a cluster) restarts</p> <p>When an active controller (wireless controller, or service platform) fails, a standby controller in the cluster takes over APs adopted by the failed active controller. If the failed active controller were to restart, it starts a timer based on the 'force-configured-state-delay' interval specified. At the expiration of this interval, the standby controller releases all adopted APs and goes back to a monitoring mode. If the active controller fails during this interval, the 'force-configured-state-delay' timer is stopped. The timer restarts as soon as the active controller comes back up.</p> <p>This feature is disabled by default.</p> |
| <b>force-configured-state-delay &lt;3-1800&gt;</b> | <p>Forces cluster transition to the configured state after a specified interval</p> <ul style="list-style-type: none"> <li>• &lt;3-1800&gt; – Specify a delay from 3 - 1800 minutes. The default is 5 minutes.</li> </ul> <p>This is the interval a standby controller waits before releasing adopted APs when a failed primary controller becomes active again.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>handle-stp</b>                                  | <p>Enables Spanning Tree Protocol (STP) convergence handling. This feature is disabled by default.</p> <p>In layer 2 networks, this protocol is enabled to prevent network looping. If enabled, the network forwards data only after STP convergence. Enabling STP convergence delays the redundancy state machine execution until the STP convergence is completed (the standard protocol value for STP convergence is 50 seconds). Delaying the state machine is important to load balance APs at startup.</p>                                                                                                                                                                                                                                                                          |
| <b>master-priority &lt;1-255&gt;</b>               | <p>Configures cluster master priority</p> <ul style="list-style-type: none"> <li>• &lt;1-255&gt; – Specifies cluster master election priority. Assign a value from 1 - 255. Higher the value higher is the precedence. The default is 128.</li> </ul> <p>In a cluster environment one device from the cluster is elected as the cluster master. A device's master priority value decides the device's priority to become cluster master.</p>                                                                                                                                                                                                                                                                                                                                              |

```
cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]

*configuration-persistence*

[Profile Config Commands](#) on page 862

Enables configuration persistence across reloads. This option is enabled by default.

**Supported in the following platforms:**

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

**Syntax**

```
configuration-persistence {auto|secure}
```

**Parameters**

```
configuration-persistence {auto|secure}
```

|               |                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------|
| <b>auto</b>   | Optional. Assigns default value based on the device type                                            |
| <b>secure</b> | Optional. Ensures parts of a file that contain security information are not written during a reload |

### Example

```

nx9500-6C8809(config-profile-default-rfs4000)#configuration-persistence secure

## controller

[Profile Config Commands](#) on page 862

Configures the WiNG controller (wireless controller or service platform) adoption settings

Adoption is the process a controller or service platform uses to discover available access points and/or peer controllers/service platforms, establish an association and provision the adopted device. Adoption settings are configurable and supported within a profile and applied to all devices supported by the profile.

Use this command to add a controller to a pool and group. This command also enables and disables adoption on controllers, and specifies the device types that can be adopted by a controller.

### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

## Syntax

```
controller [adopted-devices|adoption|group|hello-interval|vlan|host]
```

```
controller adopted-devices [aps {controllers}|controllers {aps}/external-devices|external-devices-monitoring-only]hel
```

```
controller adoption
```

```
controller [group <CONTROLLER-GROUP-NAME>|vlan <1-4094>]
```

```
controller hello-interval <1-120> adjacency-hold-time <2-600>
```

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure|level|pool|remote-vpn-client}
```

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure} {gw [<IP>|<HOSTNAME>]}
```

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {level [1/2]|pool <1-2> level [1/2]} {ipsec-secure {gw [<IP>|<HOSTNAME>]}}|remote-vpn-client}
```

```
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {remote-vpn-client}
```

## Parameters

```
controller adopted-devices [aps {controllers}|controllers {aps}|external-devices|external-devices-monitoring-only]
```

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### *critical-resource*

[Profile Config Commands](#) on page 862

Enables monitoring of resources critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses. When enabled, the system monitors these devices regularly and logs their status. Use this command to create a critical resource monitoring (CRM) policy.

A critical resource can be a gateway, AAA server, WAN interface, any hardware, or a service on which the stability of the network depends. Monitoring these resources is therefore essential. When enabled, this feature pings critical resources regularly to ascertain their status. If there is a connectivity issue, an event is generated stating a critical resource is unavailable. By default, there is no enabled critical resource policy and one needs to be created and implemented.

Critical resources can be monitored directly through the interfaces on which they are discovered. For example, a critical resource on the same subnet as an AP8132 access point can be monitored by its IP address. However, a critical resource located on a VLAN must continue to be monitored on that VLAN.

Critical resource monitoring can be enabled on service platforms, wireless controllers, and access points through their respective device profiles.

#### Supported in the following platforms:

- Access Points — AP6522, AP6562, AP7161, AP7502, AP7522, AP7532, AP7562, AP7602, AP7612, AP7622, AP7632, AP7662, AP8163, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600, VX9000

#### Syntax

```
critical-resource [<CR-NAME>|monitor|retry-count]
```

```
critical-resource <CR-NAME> [monitor|monitor-using-flows]
```

```
critical-resource <CR-NAME> monitor [direct|via]
```

```
critical-resource <CR-NAME> monitor direct [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/HOST-ALIAS-NAME>/arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>]}<IP/HOST-ALIAS-NAME>/port [<LAYER2-IF-NAME>/ge <1-4>|port-channel <1-2>]}
```

```
critical-resource <CR-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|pppoe1|vlan|wwan1]
```

```
critical-resource <CR-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [all|any] [<IP/HOST-ALIAS-NAME>| sync-adoptees] {<IP/HOST-ALIAS-NAME>/arp-only [vlan <1-4094>|<VLAN-ALIAS-NAME>]}<IP/HOST-ALIAS-NAME>/port [<LAYER2-IF-NAME>/ge <1-4>|port-channel <1-2>]}
```

```
critical-resource <CR-NAME> monitor-using-flows [all|any] [criteria|dhcp|dns|sync-adoptees]
```

```
critical-resource <CR-NAME> monitor-using-flows [all|any] criteria [all|cluster-master|rf-domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]| dns <IP/HOST-ALIAS-NAME>)} {dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]|/dns <IP/HOST-ALIAS-NAME>}
```

```
critical-resource <CR-NAME> monitor-using-flows [all|any] dhcp vlan <1-4094> {dhcp vlan [<1-4094>|<VLAN-ALIAS-NAME>]|/dns <IP/HOST-ALIAS-NAME>}
```

```
critical-resource <CR-NAME> monitor-using-flows [all|any] dns <IP/HOST-ALIAS-NAME> {dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|/dns <IP/HOST-ALIAS-NAME>}
```

```
critical-resource <CR-NAME> monitor-using-flows [all|any] sync-adoptees criteria [all|cluster-master|rf-domain-manager] (dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|/dns <IP/HOST-ALIAS-NAME>)} {dhcp [vlan <1-4094>|<VLAN-ALIAS-NAME>]|/dns <IP/HOST-ALIAS-NAME>}
```

```
critical-resource monitor interval <5-86400>
```

```
critical-resource retry-count <0-10>
```

### Parameters

```
critical-resource <CR-NAME> monitor direct [all|any] [<IP/HOST-ALIAS-NAME>|sync-adoptees] {<IP/HOST-ALIAS-NAME>|arp-only [vlan <1-4094>|<VLAN-ALIAS-NAME>]}<IP/HOST-ALIAS-NAME>|port [<LAYER2-IF-NAME>/ge <1-4>|port-channel <1-2>]}
```

|                        |                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------|
| <b>&lt;CR-NAME&gt;</b> | Identifies the critical resource to be monitored. Provide the name of the critical resource. |
| <b>monitor</b>         | Enables critical resource(s) monitoring                                                      |

|                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>direct</b> [ <b>all</b>   <b>any</b> ]<br>[<IP/HOST-ALIAS-NAME>  <b>sync-adoptees</b> ]                                                            | Monitors critical resources using the default routing engine <ul style="list-style-type: none"> <li>all - Monitors all resources that are going down (generates an event when all specified critical resources are unreachable)</li> <li>any - Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable) <ul style="list-style-type: none"> <li>&lt;IP/HOST-ALIAS-NAME&gt; - Configures the IP address of the critical resource being monitored (for example, the DHCP or DNS server). Specify the IP address in the A.B.C.D format. You can use a host-alias to identify the critical resource. If using a host-alias, ensure that the host-alias is existing and configured.</li> </ul> </li> <li>sync-adoptees - Syncs adopted access points with the controller. In the stand-alone AP scenario, where the CRM policy is running on the AP, the AP is directly intimated in case a critical resource goes down. On the other hand, when an AP is adopted to a controller (running the CRM policy), it is essential to enable the sync-adoptees option in order to sync the AP with the controller regarding the latest CRM status.</li> </ul> |
| <b>arp-only vlan</b><br>[<1-4094> <VLAN-ALIAS-NAME>]<br>{<IP/HOST-ALIAS-NAME>  <b>port</b><br>[<LAYER2-IFNAME>  <b>ge</b>  <br><b>port-channel</b> ]} | The following keywords are common to the 'all' and 'any' parameters: <ul style="list-style-type: none"> <li>arp-only vlan &lt;1-4094&gt; - Optional. Uses ARP to determine if the IP address is reachable (use this option to monitor resources that do not have IP addresses). ARP is used to resolve hardware addresses when only the network layer address is known.</li> <li>vlan [&lt;1-4094&gt; &lt;VLAN-ALIAS-NAME&gt;] - Specifies the VLAN ID on which to send the probing ARP requests. Specify the VLAN ID from 1 - 4094. Alternately, use a vlan-alias to identify the VLAN. If using a vlan-alias, ensure that the alias is existing and configured. <ul style="list-style-type: none"> <li>&lt;IP/HOST-ALIAS-NAME&gt; - Optional. Limits ARP to a device specified by the &lt;IP&gt; parameter. You can use a host-alias to specify the IP address. If using a host-alias, ensure that the host-alias is existing and configured.</li> <li>port [&lt;LAYER2-IF-NAME&gt; <b>ge</b> <b>port-channel</b>] - Optional. Limits ARP to a specified port</li> </ul> </li> </ul>                                                                                                                               |

```
critical-resource <CRM-POLICY-NAME> monitor via [<IP/HOST-ALIAS-NAME>|<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [all|any] [<IP/HOST-ALIAS-NAME>| sync-adoptees] {<IP/HOST-ALIAS-NAME>|arp-only vlan [<1-4094>|<VLAN-ALIAS-NAME>] {<IP>|port [<LAYER2-IFNAME>|ge|port-channel]}}
```

|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>&lt;CR-NAME&gt;</b>               | Identifies the critical resource to be monitored. Provide the name of the critical resource.                                                                                                                                                                                                                                                                          |
| <b>monitor</b>                       | Enables critical resource(s) monitoring                                                                                                                                                                                                                                                                                                                               |
| <b>via</b>                           | Specifies the interface or next-hop via which the ICMP pings should be sent. Configures the interface or next-hop via which ICMP pings are sent. This does not apply to IP addresses configured for arp-only. For interfaces which learn the default-gateway dynamically (like DHCP clients and PPP interfaces), use an interface name for VIA, or use an IP address. |
| <b>&lt;IP/HOST-ALIAS-NAME&gt;</b>    | Specify the IP address of the next-hop via which the critical resource(s) are monitored. Configures up to four IP addresses for monitoring. All the four IP addresses constitute critical resources. You can use a host-alias to specify the IP address. If using a host-alias, ensure that the host-alias is existing and configured.                                |
| <b>&lt;LAYER3-INTERFACE-NAME&gt;</b> | Specify the layer 3 Interface name (router interface)                                                                                                                                                                                                                                                                                                                 |
| <b>pppoe1</b>                        | Specifies PPP over Ethernet interface                                                                                                                                                                                                                                                                                                                                 |
