Use this command to display BOOTP Relay details for IPv6.

Example

The following command :

```
# show bootprelay configuration ipv6
DHCPv6 BOOTP Relay : Enabled on virtual router "VR-Default"
Include Secondary : Enabled (parallel)

VLAN                                DHCPv6 BOOTP Relay
-----
VLAN "Default":
  BOOTP Relay                        : Disabled
VLAN "v1":
  BOOTP Relay                        : Enabled
  Include Secondary                  : Enabled (sequential)
VLAN "v2":
  BOOTP Relay                        : Enabled
  Include Secondary                  : Enabled (parallel)
```

The following example shows DHCPv6/BOOT Relay configuration that is disabled on the VR, but enabled on some VLANs:

```
# show bootprelay configuration ipv6
DHCPv6 BOOTP Relay : Disabled on virtual router "VR-Default", but enabled on some VLANs.
Include Secondary  : Disabled

VLAN                DHCPv6 BOOTP Relay
-----
VLAN "Default":
  BOOTP Relay       : Enabled
```

History

This command was first available in ExtremeXOS 15.4.

Information about DHCP/BOOTP relay being disabled for the VR, but enabled on some VLANs was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show bootprelay dhcp-agent information circuit-id port-information

```
show bootprelay dhcp-agent information circuit-id port-information ports
all
```

Description

Displays the circuit ID sub-option that identifies the port for an incoming *DHCP* request.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the circuit ID port_info value for all ports:

```
Switch.12 # show bootprelay dhcp-agent information circuit-id port-information ports all
Port                Circuit-ID Port information string
-----
-----
```

```
1          1001

Note: The full Circuit ID string has the form '<Vlan Info>--<Port Info>'
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show bootprelay dhcp-agent information circuit-id vlan-information

```
show bootprelay dhcp-agent information circuit-id vlan-information
```

Description

Displays the circuit ID sub-options that identify the VLANs on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the circuit ID vlan_info for all VLANs:

```
Summit # show bootprelay dhcp-agent information circuit-id vlan-information
Vlan          Circuit-ID vlan information string
----          -
Default      1
Mgmt         4095
v1           4094
v2           extreme123
Note: The full Circuit ID string has the form '<Vlan Info>--<Port Info>'
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show bootprelay ipv6

```
show bootprelay ipv6
```

Description

Displays various BOOTP Relay configuration details.

Syntax Description

| | |
|-------------------|------------------------------------|
| bootprelay | Shows the BOOTP relay information. |
| ipv6 | DHCPv6 BOOTP Relay Service. |

Default

Not applicable.

Usage Guidelines

Use this command to display IPv6 bootp relay information.

Example

The following command displays IPv6 bootprelay information:

```
* switch # show bootprelay ipv6
BOOTP Relay: DHCPv6 BOOTP Relay enabled on virtual router "VR-Default"
Include Secondary : Disabled
  BOOTP Relay Servers :2001::1
                      3001::1
```

```

4001::1
VLAN "Default"      :
  BOOTP Relay       : Enabled
  Interface ID      : 3999 (Default)
  Remote ID         : 00:04:96:52:08:76 (Default)
  Prefix Snooping   : Disabled
VLAN "v1"          :
  BOOTP Relay       : Enabled
  Interface ID      : Interface-Sring1
  Remote ID         :
* switch #

```

When vr is disabled:

```

* SWITCH # show bootprelay ipv6 configuration
BOOTP Relay: DHCPv6 BOOTP Relay disabled on virtual router "VR-Default"

```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show bootprelay ipv6 prefix-delegation snooping

```
show bootprelay ipv6 prefix-delegation snooping {vlan} vlan_name
```

Description

Displays the information about snooped IPv6 prefixes delegated via [DHCP](#).

Syntax Description

| | |
|------------------------|--|
| <code>vlan_name</code> | Specifies the VLAN name. |
|------------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command displays snooped IPv6 prefixes delegated via DHCP for all VLANs.

```
show bootprelay ipv6 prefix-delegation snooping
```

The following is sample output:

| Delegated Prefix Gateway | Interface Valid For |
|-----------------------------|------------------------|
| 2000::/48 2000::1 | v1 7154 secs |
| 3000::/48 3000::1 | v2 992 secs |
| 2800::/56 2800::1 | v3 10 secs |

The following command displays snooped IPv6 prefixes delegated via DHCP for VLAN v1:

```
show bootprelay ipv6 prefix-delegation snooping vlan v1
```

The following is sample output:

| Delegated Prefix Gateway | Interface Valid For |
|-----------------------------|------------------------|
| 2000::/48 2000::/1 | v1 7074 secs |

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cdp

```
show cdp
```

Description

Displays the interval between advertisements, the hold time and the version of the advertisement.

Syntax Description

There are no arguments or keywords for this command.

Default

N/A.

Usage Guidelines

Use this command to display the interval between advertisements, the hold time and the version of the advertisement.

Example

The following command displays specific information on the CDP feature:

```
# show cdp
1234567890123456789012345678901234567890123456789012345678901234567890
CDP Transmit time           : 60 seconds
CDP Hold time               : 180 seconds
CDP Device ID               : 00:04:96:8B:C2:CA
CDP Enabled ports           : 1-2, 7
Power Available TLV Enabled ports : 1-2,23
CDP Local management address : VLAN Chicago (2001:db8:85a3::7334)
```

History

This command was first available in ExtremeXOS 15.4.

The output of this command was updated in ExtremeXOS 21.1.

Management IP address information was added in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cdp counters

```
show cdp counters {ports port_list}
```

Description

Displays CDP port counter statistics.

Syntax Description

| | |
|------------------|-------------------------------|
| ports | Displays CDP port statistics. |
| <i>port_list</i> | Port list of CDP ports. |

Default

N/A.

Usage Guidelines

Use this command to display CDP port counter statistics.

Example

The following command displays counter statistic for CPD ports:

```
# show cdp counters ports 10
Port    Tx PDU      Rx PDU      Rx Drop      Rx Drop
      Count      Count      Checksum Err  Invalid
-----
10      3729        3729        0            0
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cdp neighbor

```
show cdp neighbor {detail}
```

Description

Displays information about neighbors.

Syntax Description

| | |
|---------------|--------------------------------|
| detail | Displays detailed information. |
|---------------|--------------------------------|

Default

N/A.

Usage Guidelines

Use this command to display CDP neighbor information.

History

This command was first available in ExtremeXOS 15.4.

The output of this command was updated in ExtremeXOS 21.1

Management IP address information was added in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cdp ports

```
show cdp ports {port_list} {configuration | detail}
```

Description

Displays information about neighbors in ports.

Syntax Description

| | |
|----------------------|--|
| <i>port_list</i> | Specifies the port list, separated by a comma. |
| configuration | CDP local port configuration. |
| detail | Detailed information. |

Default

N/A.

Usage Guidelines

Use this command to display CDP port information.

Example

The following command displays neighbor port information on the CDP feature:

```
# show cdp ports

Neighbor Information-----
Port  Device-Id                Hold time  Remote CDP  Port
ID
                                     Version
-----
1     Eni-Extreme-x440-sw> 149        Version-1   Slot: 1, Port: 1
2     00:04:96:8B:9D:B0    160        Version-2   Slot: 1, Port: 2
7     00:04:96:8B:C1:ED    138        Version-2   Slot: 1, Port: 7
```

Note

">" indicates that the value was truncated to the column size in the output.

The following example displays the COS extended neighbor port information on the CDP feature:

```
Local Port Information
-----
```

| Port | Trust | Cos | VoIP VLAN | VoIP VLAN Advertise |
|------|---------|-----|-----------|---------------------|
| 1 | Trusted | 0 | Default | Solicited |
| 2 | Trusted | 0 | Default | Unsolicited |

The following example shows detailed information for port 10:

```
# show cdp port 10 detail

Neighbor Information
-----
Device ID           : X670G2-48x-4q
Port ID (outgoing port) : Slot: 1, Port: 10
Advertisement Version  : 2
Platform            : X670G2-48x-4q
Interface           : 10
Holdtime            : 162

ExtremeXOS version 22.4.0.5 xos_22.4 by kosharma
                   on Fri Jul 14 12:28:36 IST 2017

Native VLAN         : 1
Duplex              : Full
Trust               : Trusted
SysName             : X670G2-48x-4q
```

History

This command was first available in ExtremeXOS 15.4.

The output of this command was updated in ExtremeXOS 21.1.

The **detail** option was added and the output of this command was updated in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm detail

```
show cfm {domain_name {association_name {ports port_list} {[end-point
[up | down]]}}}} detail
```

Description

Displays the MEP CCM database.

Syntax Description

| | |
|-------------------------|---|
| <i>domain_name</i> | Enter the name of the domain for which you want to display the MEP CCM databases. |
| <i>association_name</i> | IEEE 802.lag or ITU-T Y.1731 association name. |

| | |
|------------------|--|
| <i>port_list</i> | Enter the ports in the domain/association for which you want to display the CCM databases. |
| up | Enter this to display the CCM database on the UP MEP for the specified MA. |
| down | Enter this to display the CCM database on the DOWN MEP for the specified MA. |

Default

N/A.

Usage Guidelines

If you do not specify any parameters or variables, the system displays information on all CCM databases on the switch.

This command displays the following items of the CCM database:

- The name of the domain and association
- Port number
- MP and type
- MAC address of remote end points
- MEP IDs
- Lifetime for CCM messages from each remote end point
- Actual age of CCM messages

Note

The TTL for the CCM messages from the MP you are working on is 3.5 times the transmission interval.

Example

The following command displays the CCM databases on the switch:

```
show cfm detail
```

The following is sample output from this command:

```
# show cfm detail
Domain/      Port      MP      Remote End-Point      Remote End-Point      MEP      Life      Age      Flags

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm groups

```
show cfm groups {group_name}
```

Description

This command displays the details of specified or all groups. The information contains group name, group status, LMEP id, the physical port of the LMEP, RMEP ids, registered clients, domain and association names.

Syntax Description

| | |
|-------------------|---------------------------------------|
| <i>group_name</i> | Group name, maximum of 31 characters. |
|-------------------|---------------------------------------|

Default

N/A.

Usage Guidelines

Use this command to display the details of specified or all groups. The information contains group name, group status, LMEP id, the physical port of the LMEP, RMEP ids, registered clients, domain and association names.

Example

The following output shows the typical output of this command:

```
# sh cfm groups
Group : eapsCfmGrp1      Status : UP
Local MEP   : 11      port   : 41
Remote MEPs : 10
Client(s)   : eaps
Domain      : MD1
Association : MD1v2
Group : eapsCfmGrp2      Status : UP
Local MEP   : 12      port   : 31
Remote MEPs : 13
Client(s)   : eaps
Domain      : MD1
Association : MD1v2
```

The following example shows the output for *ERPS* with Y.1731 CCMs:

```
# show configuration cfm
#
# Module dotlag configuration.
#
create cfm domain string "dom" md-level 5
configure cfm domain "dom" add association meg "VSNLMEG1" vlan "v1"

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm segment frame-delay statistics

```
show cfm segment frame-delay statistics {segment-name} {mep mep_id}
```

Description

This command displays frame-delay information for the given CFM segment.

Syntax Description

| | |
|---------------------|---|
| <i>segment_name</i> | An alpha numeric string identifying the segment name. |
| mep | Maintenance association End Point. |
| <i>mep_id</i> | MEP-ID. The range is 1-8191. |

Default

N/A.

Usage Guidelines

Use this command to display the delay for the last received frame, the minimum, maximum and average delay, and the delay variance during the current transmission. When the segment name is not specified, only the segments which have valid statistics alone are displayed. When the segment name is specified, that particular segment's information, although not present, is displayed.

Example

The following command displays the frame delay statistics for the CFM segment:

```
show cfm segment frame-delay statistics
```

Following is sample output for this command:

```
-----
Segment Name      Mep      Recent  Min      Max      Mean      Jitter      Errored
                  ID       Delay   Delay   Delay   Delay   Delay      Frames*
                  (ms)    (ms)    (ms)    (ms)    (ms)    (ms)
-----
segment1          ----    0.000  0.000  0.000  0.000  0.000      0
segment2          100    0.000  0.000  0.000  0.000  0.000      0
                  200    0.000  0.000  0.000  0.000  0.000      0
segment3          100    0.000  0.000  0.000  0.000  0.000      0
                  300    0.000  0.000  0.000  0.000  0.000      0
-----
Flags: (*) % of frames beyond alarm threshold in the current measurement window
Total Configured Segments      : 3
Total Active Segments          : 3
```

History

This command was first available in ExtremeXOS 12.3.

The **mep id** show output was added in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm segment frame-delay

```
show cfm segment frame-delay {segment_name}
```

Description

This command displays frame-delay information for the given CFM segment.

Syntax Description

| | |
|---------------------|---|
| <i>segment_name</i> | An alpha numeric string identifying the segment name. |
|---------------------|---|

Default

N/A.

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm segment frame-delay/frame-loss mep id

```
show cfm segment {{segment_name} | {frame-delay {segment_name}} |  
  {frame-loss {segment_name {mep mep_id}}}}
```

Description

This command is used to display the current status and configured values of a CFM segment.

Syntax Description

| | |
|---------------------|--|
| <i>segment_name</i> | An alphanumeric string identifying the segment name. |
|---------------------|--|

Default

N/A.

Usage Guidelines

Use this command to display the current status and configured values of a CFM segment.

Note

In this command, the row "pending frames" will be displayed only for on-demand mode of transmission.

A segment is considered as active if any of the MEPs in the segment is enabled for Frame Loss measurement. Active Segment count will be incremented by one only even if there are multiple MEPs enabled for Frame Loss. For example, assume that there are 3 segments created - seg1, seg2 and seg3. Segment "seg1" is enabled for Frame Delay measurement. Segment "seg3" has 10 MEPs added with 4 enabled for Frame Loss measurement, the following are the valid counts. Switch wide "Total Configured Segments" will be 3 and "Total Active Segments" will be 2. For Segments "seg1" and "seg2", "Total Configured MEPs" and "Total Active MEPs" will be 0. For segment "seg3", "Total Configured MEPs" will be 10 and "Total Active MEPs" will be 4.

By default, both the Frame Delay and Frame Loss sections are displayed for all the CFM segments. The user has option to filter out based on Segment Name or Frame Delay / Frame Loss.

The behavior for each of the optional parameters is explained below:

- `show cfm segment`: Displays frame-delay and frame-loss information for all the CFM segments.
- `show cfm segment segment_name`: Displays frame-delay and frame-loss information for the given CFM segment.
- `show cfm segment frame-delay`: Displays frame-delay information for all the CFM segments.
- `show cfm segment frame-delay segment_name`: Displays frame-delay information for the given CFM segment.
- `show cfm segment frame-loss`: Displays frame-loss information for all the CFM segments (and all the MEPs under each of the segment).
- `show cfm segment frame-loss segment_name`: Displays frame-loss information for the given CFM segment (and all the MEPs under the given segment).
- `show cfm segment frame-loss segment_name mep mep_id`: Displays frame-loss information for the given CFM segment - MEP ID combination.

Example

```
Switch#show cfm segment sc-rtp
CFM Segment Name      : sc-rtp
Domain Name           : pbt-d2
Association            : pbt-d2-protecting
```

History

This command was first available in ExtremeXOS 12.3.

The **mep id** show output was added in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm segment frame-loss statistics

```
show cfm segment frame-loss statistics {segment-name}
```

Description

Displays shows frame-loss statistics.

Syntax Description

| | |
|---------------------|---|
| <i>segment_name</i> | An alpha numeric string identifying the segment name. |
|---------------------|---|

Default

N/A.

Usage Guidelines

The below output is an example for displaying the frame-loss stats for the cfm segments. This command shows the recent, minimum, maximum and average near-end and far-end frame loss ratios during the current transmission. The stats for a particular segment will be preserved till the user triggers the next LMM transmission or until it does a clear counter.

Example

The following command displays the frame loss statistics for the CFM segment:

```
LEFT.93 # show cfm segment frame-loss statistics
-----
Segment Name      MEP      Last      Last      Min      Max      Min      Max      Mean
Mean

show cfm segment mep

```
show cfm segment {segment_name} {mep mep_id }
```

Description

This command displays frame-delay information for the given CFM segment – MEP ID combination.

Syntax Description

| | |
|---------------------|---|
| <i>segment_name</i> | An alpha numeric string identifying the segment name. |
|---------------------|---|

Default

N/A.

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment – MEP ID combination.

Example

```
Switch#showcfm segment sc-rtp

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm segment

```
show cfm segment {segment_name}
```

Description

Displays information for CFM segments.

Syntax Description

| | |
|---------------------|---|
| <i>segment_name</i> | An alpha numeric string identifying the segment name. |
|---------------------|---|

Default

N/A.

Usage Guidelines

Use this command to display information for the selected CFM segment.

If a segment name is not specified, the information for all of the segments that are currently configured are displayed.

Example

The following command displays information for an active CFM segment that is configured to transmit with a specific count:

```
show cfm segment s2
CFM Segment Name       : s2
Domain Name           : pbt-d2
Association            : pbt-d2-protecting
MD Level              : 2
Destination MAC       : 00:04:96:1e:14:70
DMM Transmission      : In Progress
Transmission mode     : Continuous
Frames Transmitted    : 2
Frames Received       : 2
DMM TX Interval       : 2secs
DMR RX Timeout        : 10 msec
Alarm Threshold        : 10 %
Clear Threshold        : 95 %
Measurement Window Size : 60
Class of Service      : 0
Tx Start Time         : Sun Apr 19 21:18:58 2009
Min Delay              : Sun Apr 19 21:18:58 2009
Max Delay              : Sun Apr 19 21:19:00 2009
Last Alarm Time       : None
Alarm State           : Not Set
Lost Frames in Current window : 0
-----
Total Configured Segments : 2
Total Active Segments    : 1
```

The following command displays information for a disabled segment:

```
BD-12804.1 # sh cfm seg s2
CFM Segment Name       : s2
```

```

Domain Name                : pbt-d2
Association                 : pbt-d2-protecting
MD Level                   : 2
Destination MAC            : 00:04:96:1e:14:70
DMM Transmission          : Disabled
Frames Transmitted        : 10
Frames Received            : 10
DMM TX Interval           : 2secs
DMR RX Timeout            : 10 msec
Alarm Threshold            : 10 %
Clear Threshold            : 95 %
Measurement Window Size   : 60
Class of Service           : 0
Tx Start Time             : Sat Apr 18 05:39:54 2000
Min Delay                  : Sat Apr 18 05:40:12 2000
Max Delay                  : Sat Apr 18 05:39:56 2000
Last Alarm Time           : None
Alarm State                : Not Set
Lost Frames in Current window : 1
-----
Total Configured Segments  : 2
Total Active Segments     : 0

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm session counters missed-hellos

```

show cfm session counters missed-hellos { domain_name { association_name
    { {ports port_list} { end-point [up|down] } } } } {history | no-
    refresh | refresh}

```

Description

This command displays current and historical CFM session missed-hellos statistics.

Syntax Description

| | |
|-------------------------|--|
| <i>domain_name</i> | IEEE 802.lag domain name. |
| <i>association_name</i> | IEEE 802.lag or ITU-T Y.1731 association name. |
| ports | Specify ports to show. |
| <i>port_list</i> | List of ports to show. |
| end-point | Show MEPs (Maintenance association End Point). |
| up | End point is up. |
| down | End point is down. |

| | |
|-------------------|--|
| history | Historical set of bins. |
| no-refresh | Page by page display without continuous refresh. |
| refresh | Continuous refresh of output. |

Default

Refresh.

Usage Guidelines

None.

Example

The following example show the current statistics with no-refresh:

```
# show cfm session counters missed-hellos no-refresh
      1      2      3      4      5      6      7      8

```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cfm

```
show cfm { domain_name { association_name {{ports port_list
  {[intermediate-point | [end-point [up|down]]]]}}}}
```

Description

Displays the current CFM configuration on the switch.

Syntax Description

| | |
|---------------------------|--|
| <i>domain_name</i> | Enter the name of the domain you want to display. |
| <i>association_name</i> | IEEE 802.1ag or ITU-T Y.1731 association name. |
| <i>port_list</i> | Enter the ports in the domain and association you want to display. |
| up | Enter this to display the UP MEP for the specified MA. |
| down | Enter this to display the DOWN MEP for the specified MA. |
| intermediate-point | Enter this to display the MIPs for the specified MA. |

Default

N/A.

Usage Guidelines

This command displays the following information:

- Domain names
- MA levels
- Association names
- VLAN names
- Transmit Interval
- UP MEPs
- MEPIDs
- MEP transmit intervals
- MEP State
- DOWN MEPs

- Intermediate points (MIPs)
- Total number of CFM ports on the switch
- Destination MAC Type
- VPLS-based MPs
- Sender ID information
- ISID Intermediate Point

For the number of domains, ports, MEPs, MIPs, and associations supported on the switch, see the *Supported Instances for CFM* section in the [ExtremeXOS 31.3 User Guide](#).

Example

The `show cfm` command displays the current CFM configuration on the switch:

```
* switch # show cfm
Domain: "dnsname", MD Level: 2
  Association: "10", Destination MAC Type: Multicast, VLAN "v1" with 2 cfm ports
  Transmit Interval: 1000 ms, Type : IEEE 802.1ag Maintenance Association
  port 1; Up End Point, mepid: 100, transmit-interval: 1000 ms (from association)
  MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV:
Disabled
  Faulting State : No
  Last Faulting State Change : Wed Jun 19 09:12:13 2013
  MEP Error Defects : None
  Port Status : Up
  port 15; Intermediate Point ( Dynamic )
  Association: "VSNLMEG1", Destination MAC Type: Multicast, VLAN "none" with 0 cfm
ports
  Transmit Interval: 1000 ms, Type : ITU-T Y.1731 Maintenance Entity Group
  Association: "snmp_ma_name", Destination MAC Type: Multicast, VLAN "none" with 0
cfm ports
  Transmit Interval: 1000 ms, Type : IEEE 802.1ag Maintenance Association
  Domain: "dom1", MD Level: 5
  Association: "VSNLMEG1", Destination MAC Type: Multicast, VLAN "v2" with 2 cfm
ports
  Transmit Interval: 10 ms, Type : ITU-T Y.1731 Maintenance Entity Group
  port 1; Down End Point, mepid: 100, transmit-interval: 3.3 ms
(configured)
  MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV:
Disabled
  Faulting State : Yes
  Last Faulting State Change : Wed Jun 19 09:08:12 2013
  MEP Error Defects : Remote
  Port Status : Up
  port 15; Down End Point, mepid: 200, transmit-interval: 10 ms (from association)
  MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV:

Total Number of VPLS MIP(Static/Up): 0 / 0

=====
MEP Error Defect Types:
Remote : Not receiving CCMs from Remote MEP
Error  : Erroneous CCM received

```

```
XCON : Cross-connect CCM received
RDI  : Remote Defect Indication sent by some MEP
```

History

This command was first available in ExtremeXOS 11.4.

Transmit Interval and MEP State were added in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show checkpoint-data

```
show checkpoint-data {process}
```

Description

Displays the status of one or more processes being copied from the master node to the backup node.

Syntax Description

| | |
|----------------|---|
| <i>process</i> | Specifies the name of the processes being copied. |
|----------------|---|

Default

N/A.

Usage Guidelines

This command displays, in percentages, the amount of internal state copying completed by each process and the traffic statistics between the process on both the master and the backup nodes.

This command is also helpful in debugging synchronization problems that occur at run-time. To check the status of synchronizing the nodes, use the `show switch` command.

Depending on the software version running on your switch and the type of switch you have, additional or different checkpoint status information may be displayed.

Example

The following command displays the checkpointing status and the traffic statics of all of the processes between the master and the backup nodes:

```
# show checkpoint-data
Process      Tx      Rx  Errors  Sent  Total  % Chkpt  Debug-info
-----
devmgr      3812   1731     0     3     3  100% ON  OK  1 (00008853)
```

```

dirser          0      0      0      0      0      0% ON OK 1 (000008D3)

pim            0      0      0      0      0      0% ON OK 1 (000008D3)
etmon          185    185      0      0      0 100% ON OK 1 (000008D3)
Flags : S - Server started, c - Client started, D - Checkpoint dependency satisfied
        C - Checkpointing is ON, f - No config dependency, N - DMLIB not in sync
        R - CM Backend not ready, l - Process is loading config, L - Process config is
loaded
        I - IPML connection alive, n - Backup process not in sync with Primary process

```

To view the output for a specific process, use the process option. The following command displays detailed information for the *STP* process:

```

# show checkpoint-data stp
Process      Tx      Rx  Errors  Sent  Total      % Chkpt  Debug-info
-----
stp          1      0      0      0      0      0% ON OK 1 (000008D3)

```

History

This command was first available in ExtremeXOS 10.1.

An error count was added to the output in ExtremeXOS 11.1.

IPML connection alive flag added in ExtremeXOS 22.5.

The "n" flag for the backup process being out of sync was added in ExtremeXOS 31.1.

Platform Availability

This command is available only on SummitStack.

show clear-flow

```
show clear-flow
```

Description

Displays the status of the CLEAR-Flow agent, any CLEAR-Flow policies on each interface, and the number of CLEAR-Flow rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following display shows output for the command show clear-flow:

```
clear-flow: Enabled

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show clear-flow acl-modified

```
show clear-flow acl-modified
```

Description

Displays the ACLs modified by CLEAR-Flow actions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the ACLs that have been modified by CLEAR-Flow rules that have been triggered.

Example

The following display shows output for the command `show clear-flow acl-modified`:

| Policy Name Actions | Vlan Name Actions | Port | Rule Name | Default ACL | CF Added |
|------------------------|----------------------|------|------------|-------------|----------|
| clearFlow | * | 2:26 | acl-rule-4 | D | QP1 |
| clearFlow | * | 2:26 | acl-rule-3 | D | D |
| clearFlow | * | 2:26 | acl-rule-2 | D | M |
| clearFlow | * | 2:26 | acl-rule-1 | | P |
| clearFlow | Default | * | acl-rule-4 | D | QP1 |
| clearFlow | Default | * | acl-rule-3 | D | D |
| clearFlow | Default | * | acl-rule-2 | D | M |
| clearFlow | Default | * | acl-rule-1 | | P |

Total Entries: 8
 Notation:
 P - Permit, D- Deny, M - mirror enabled, m - mirror disabled

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show clear-flow rule

```
show clear-flow [port port | vlan vlanname | any] {rule rulename}
                {detail}
```

Description

Displays the CLEAR-Flow rules, values, and configuration.

Syntax Description

| | |
|-----------------|--|
| <i>port</i> | Specifies the port. |
| <i>vlanname</i> | Specifies the <u>VLAN</u> . |
| any | Specifies the wildcard interface. |
| <i>rulename</i> | Specifies the entry name of a CLEAR-Flow rule. |
| detail | Display detailed information. |

Default

N/A.

Usage Guidelines

If you issue the command without the rule keyword, all of the CLEAR-Flow rules for the policy on the port, VLAN, and the wildcard are displayed. If you specify a rule name, only that rule will be displayed. The detail keyword displays detailed information about the rule.

Example

The following display shows output for the command `show clear-flow port 2:6`:

| Rule Name Value | Type Oper | Period | Last | Rel If | Threshold Else | TCNT | NumAction |
|--------------------|--------------|--------|----------|-----------|-------------------|------|-----------|
| rule-count | CN | 30 | 16892762 | > | 100 | 7 | 3 3 |
| rule-delta | DT | 30 | 7762385 | > | 1000 | 1 | 4 3 |
| rule-delta-2 | DT | 5 | 0 | > | 1000 | 0 | 4 3 |
| rule-delta-ratio | DR | 30 | 0 | > | 20 | 0 | 2 0 |
| rule-ratio | RT | 30 | 0 | > | 10 | 0 | 3 3 |
| rule-ratio-2 | RT | 5 | 0 | > | 10 | 0 | 3 3 |

=====
Total Entries: 6

} else {
DENY:     Block ACL rule acl-rule-3
QOS:      Set rule acl-rule-4 qos value to QP1
CLI:      [enable port $port]
}

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show clear-flow rule-all

```
show clear-flow rule-all
```

Description

Displays all the CLEAR-Flow rules on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following display shows output for the command show clear-flow rule-all:

| Policy Name | Vlan Name | Port | Rule Name | Last Value | OP | Threshold | TCNT | Sec |
|-------------|-----------|------|------------|------------|----|-----------|------|-----|
| clearFlow | * | 2:1 | rule-count | 1 | > | 100 | 0 | 11 |
| clearFlow | * | 2:1 | rule-delta | 1 | > | 1000 | 0 | 11 |
| clearFlow | * | 2:1 | rule-delta | 0 | > | 1000 | 0 | 4 |
| clearFlow | * | 2:1 | rule-delta | 0 | > | 20 | 0 | 11 |
| clearFlow | * | 2:1 | rule-ratio | 0 | > | 10 | 0 | 11 |

clearFlow      Default    *          rule-ratio 0          > 10         0 4
=====
Total Entries: 18
Notation:
TCNT - Number of times expression is continuously evaluated to be true
Sec - Number of seconds elapsed from last sampled data

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show clear-flow rule-triggered

```
show clear-flow rule-triggered
```

Description

Displays the triggered CLEAR-Flow rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the rules that have been triggered; in other words, the rule threshold has been reached.

Example

The following display shows output for the command `show clear-flow rule-triggered`:

```

Policy Name      Vlan Name      Port Rule Name  Last Value OP Threshold  TCNT Sec
=====
clearFlow        *              2:26 rule-count 9130377  > 100        2 25

```

```

clearFlow      *          2:26 rule-delta 99742      > 1000      2    25
clearFlow      Default    *          rule-count 37069465 > 100       2    25
clearFlow      Default    *          rule-delta 403026 > 1000      2    25
=====
Total Entries: 4
Notation:
TCNT - Number of times expression is continuously evaluated to be true
Sec - Number of seconds elapsed from last sampled data

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show cli journal

```
show cli journal
```

Description

This command shows the historical list (journal) of the most recently executed CLI commands.

Syntax Description

This command has no arguments or variables.

Default

By default, one hundred commands are preserved in the journal.

Usage Guidelines

The journal retains as many as 200 of the most recently executed commands along with the timestamp and user name. Commands are saved even after logging off, rebooting, or switch crashes.

To set the size (number of commands) of the journal, use the `configure cli journal size size` command.

Example

The following is sample output from the command:

| Timestamp | Session | User Name | Command |
|------------------------|---------|-----------|------------------------|
| 03/31/2016 13:29:29.62 | serial | admin | show tech |
| 03/31/2016 13:29:30.21 | serial | unknown | debug cfgmgr show next |

```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show configuration

```
show configuration {module-name} {detail}
```

Description

Displays the current configuration for the system or the specified module.

Syntax Description

| | |
|--------------------|--|
| <i>module-name</i> | Specifies the name of configuration module. The term configuration module refers to feature in ExtremeXOS. By displaying a module, you can view the commands used to configure that feature. For example, to display all of the configurations that you made for only <i>STP</i> , specify the stp as the module-name. |
| detail | Displays configuration data including default. If the detail option is not specified, only the configuration changes you made to the factory defaults are shown. |

Default

N/A.

Usage Guidelines

If the output scrolls off the top of the screen, you can use the `enable clipaging` command to pause the display when the output fills the screen. The default for clipaging is enabled.

These files have the .cfg file extension. Do not use a text editor to view or modify your XML-based switch configuration files.

To save the configuration file as an ASCII-formatted file, and to view it with a text editor, see the `upload configuration [hostname | ipaddress] filename {vr vr-name}` and the `load script filename {arg1} {arg2} ... {arg9}` commands.

Beginning with ExtremeXOS 12.1, when you specify `show configuration` only, the switch displays configuration information for each of the switch modules excluding the default data.

You can display only the configuration of a module of interest by using the module-name keyword. For example, some of the modules are AAA, ACL, BGP, EDP, FDB, SNMP, and VLAN. Use [TAB]-completion to see a list.

You must have administrator access to view the output of the `show configuration` command.

Depending on the software version running on your switch, the configurations on your switch, and the type of switch you have, additional or different configuration information may appear.

Loading ARP and neighbor discovery (ND) configurations from versions earlier than ExtremeXOS 30.1 after upgrading to ExtremeXOS 30.1, abide by the following rules:

- The number of static ARP/ND entries configured in all VRs (default + Mgmt + user VRs) do not exceed the new global max. entries.
- The number of static proxy entries configured in all VRs do not exceed the new global max. proxy entries.
- The sum of (per VR configured limits of VR-default + default limit of VR-Mgmt) do not exceed the respective new max. global limit.
- ExtremeXOS ignores pre-30.1 user VR configured limits in 30.1.
- ExtremeXOS logs any static entry restoration failures after they exceed new global limits.

The output of `show configuration fdb` after upgrading to ExtremeXOS 30.1 differs from 22.x output because of the changes in per VR-based IPARP and ND configurations (see examples below).

Example

The following example shows the current configuration of the OSPF module on the switch:

```
# show configuration ospf
# Module ospf configuration.
#
configure ospf routerid automatic
configure ospf spf-hold-time 3
configure ospf metric-table 10M 10 100M 5 1G 4 10G 2
```

```

configure ospf lsa-batch-interval 30
configure ospf import-policy none
configure ospf ase-limit 0
disable ospf originate-default
disable ospf use-ip-router-alert
disable ospf
configure ospf restart none
configure ospf restart grace-period 120
disable ospf export direct
disable ospf export static
disable ospf export rip
disable ospf export e-bgp
disable ospf export i-bgp
configure ospf area 0.0.0.0 external-filter none
configure ospf area 0.0.0.0 interarea-filter none

```

The following example illustrates the difference between ExtremeXOS 30.1 versus 22.x output for *FDB*.

Example 1

22.x

```

# show configuration fdb detail
configure iparp vr VR-Default max_entries 8192
configure iparp vr VR-Mgmt max_entries 4096
configure neighbor-discovery vr VR-Default max_entries 4096
configure neighbor-discovery vr VR-Mgmt max_entries 4096

```

30.1 and Later

```

# show configuration fdb detail
configure iparp max_entries 12288 ---- > Default values of (VR-Default + VR-Mgmt) = 8192
+ 4096
configure neighbor-discovery max_entries 8192

```

Example 1

22.x

```

# show configuration fdb
configure iparp vr VR-Default max_entries 10000
configure iparp vr VR-Default max_pending_entries 10
configure iparp vr VR-Default max_proxy_entries 10
configure iparp vr VR-Mgmt max_entries 2000
configure iparp vr VR-Mgmt max_pending_entries 20
configure iparp vr VR-Mgmt max_proxy_entries 20
configure iparp vr vr1 max_entries 3000
configure iparp vr vr1 max_pending_entries 30
configure iparp vr vr1 max_proxy_entries 30
configure neighbor-discovery vr VR-Default max_entries 10000
configure neighbor-discovery vr VR-Default max_pending_entries 100
configure neighbor-discovery vr VR-Mgmt max_entries 1000
configure neighbor-discovery vr VR-Mgmt max_pending_entries 10
configure neighbor-discovery vr vr1 max_entries 60
configure neighbor-discovery vr vr1 max_pending_entries 70

```

30.1 and Later

```

# show configuration fdb
configure iparp max_entries 14096 ----- max_entries = (Configured VR-Default
max_entries) + (Default VR-Mgmt max_entries) = 10000 + 4096
configure iparp max_pending_entries 266 ----- max_pending_entries = (Configured VR-
Default max_pending_entries) + (Default VR-Mgmt max_pending_entries) = 10 + 256

```

```

configure iparp max_proxy_entries 266 ----- max_proxy_entries = (Configured VR-
Default max_proxy_entries) + (Default VR-Mgmt max_proxy_entries) = 10 + 256
configure neighbor-discovery max_entries 14096 ----- max_entries = (Configured VR-
Default max_entries) + (Default VR-Mgmt max_entries) = 10000 + 4096
configure neighbor-discovery max_pending_entries 1124 ----- max_pending_entries =
(Configured VR-Default max_pending_entries) + (Default VR-Mgmt max_pending_entries) =
100 + 1024

```

Example 1

22.x

```

# show configuration fdb
#
# Module fdb configuration.
#
configure iparp vr VR-Default max_entries 10000
configure iparp vr VR-Mgmt max_entries 1000
configure iparp vr vr-user1 max_entries 2000
configure iparp add 20.0.0.100 vr VR-Default 00:0a:0b:0c:0d:0e
configure iparp add 10.68.13.100 vr VR-Mgmt 00:66:77:88:99:aa
configure iparp add 100.0.0.150 vr vr-user 00:11:22:33:44:55

```

30.1 and Later

```

# show configuration fdb
#
# Module fdb configuration.
#
configure iparp max_entries 14096 --- max. limit of one current global table of kernel
configure iparp add 20.0.0.100 vr VR-Default 00:0a:0b:0c:0d:0e ---
configure iparp add 10.68.13.100 vr VR-Mgmt 00:66:77:88:99:aa | --- All static entries of
all VRs are restored back as long as they do not exceed current max limit.
configure iparp add 100.0.0.150 vr vr-user 00:11:22:33:44:55 --- Once they exceed the
limit, rest of the entries will be discarded and logged as failures.

```

History

This command was first available in ExtremeXOS 11.0.

The detail variable was added in ExtremeXOS 12.1.

The display of blackhole output was first available in ExtremeXOS 12.1.

Impacts to ARP, ND, and FDB output introduced in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show configuration difference

```

show configuration difference { from-config-file {to-config-file} }
      {module-name} {detail} {context lines}

```

Description

Displays the difference between switch configurations.

Syntax Description

| | |
|-------------------------|--|
| difference | Compare one configuration file to another. |
| <i>from-config-file</i> | Configuration file from which to base the difference (the booted configuration if not specified). |
| <i>to-config-file</i> | Configuration file to which the base configuration is compared (the running configuration if not specified). |
| <i>module-name</i> | Configuration module name: aaa, acl, bfd, bgp, brm, cfgmgr, cfm, devmgr, dirser, dosprotect, eaps, edp, elrp, elsm, ems, epm, erps, esrp, ethoam, etmon, exsshd, fdb, hal, hclag, idMgr, ipfix, ipSecurity, lACP, lldp, mcmgr, mrrp, msdp, netlogin, nettools, nodealias, nodemgr, ntp, ospf, ospfv3, otm, pim, policy, polMgr, pwmib, rip, ripng, rtmgr, snmp, stp, techSupport, telnetd, tftpd, throw, thttpd, twamp, upm, vlan, vmt, vrrp, vsm, xmlc, xmldbe |
| detail | Specifies showing configuration difference including default configuration choices; If not selected, default configuration information does not appear. |
| context | Adjusts the number of context lines around the difference output. Default is three lines. |
| <i>lines</i> | Specifies the number of context lines around the difference output. Default is three lines. |

Default

If not specified, *from-config-file* is the booted configuration; if not specified, *to-config-file* is the running configuration.

If not specified, the default is three context lines.

Usage Guidelines

Use this command to compare the difference between two configuration files, or configuration files with the running configuration. When using the `save configuration automatic {every minutes {primary | secondary | existing-config | new-config} | never}` command this can be especially helpful for comparing what changed between the running (or "startup") configuration and the most recently autosaved configuration.

Example

The following example compares the factory default configuration (new switch or after `unconfigure switch {all | erase [all | nvram]}` using the `all` keyword:

```
# show configuration difference
--- Factory Default          Tue Feb 27 19:54:10 2018
+++ Running Configuration    Wed Feb 28 12:37:36 2018
@@ -0,0 +1,212 @@
```

```

+#
+# Module devmgr configuration.
+#
+configure snmp sysContact "support@extremenetworks.com, +1 888 257 3000"
+#
+# Module vlan configuration.
+#
+create vlan "VLAN_0008"
+configure vlan VLAN_0008 tag 8
.
.
.
+#
+# Module vsm configuration.
+#

```

The following example compares the `primary.cfg` file with the currently running configuration (default) showing default configuration information (**detail** option) and changing the number of context lines to six (as opposed to the default of three):

```

# show configuration difference primary detail context 6
--- primary.cfg          Mon Dec  4 18:08:59 2017
+++ Running Configuration Mon Dec  4 18:11:45 2017

```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show configuration “xmlc”

```
show configuration "xmlc" {detail | non-persistent {detail}}
```

Description

Displays the configuration of an XMLC module.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Displays the configuration of an XMLC module.

When the detail option is chosen, all configuration data including the default is displayed. Otherwise the default would not be displayed.

When the non-persistent option is chosen, UPM non-persistent configuration data is displayed.

Example

The following command displays the xmlc configuration:

```
show configuration "xmlc" detail
```

Following is sample output from this command:

```
Module xmlc configuration.
#
create xml-notification target test url http://10.255.42.73:9080/axis/services/eventPort
configure xml-notification test queue-size 100
disable xml-notification test
create xml-notification target test2 url http://10.255.42.48:9080/axis/services/eventPort
configure xml-notification test2 queue-size 100
enable xml-notification test2
create xml-notification target epicenter-target url http://10.255.42.48:8080/xos/
webservice
configure xml-notification target epicenter-target user admin encrypted-auth

configure xml-notification epicenter-target queue-size 100
enable xml-notification epicenter-target
configure xml-notification target test add idMgr
configure xml-notification target test2 add idMgr
configure xml-notification target epicenter-target add idMgr
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cos-index

```
show cos-index {cos_index}
```

Description

This command displays a one-to-one mapping of CoS reference to resource.

Syntax Description

| | |
|------------------------|-------------------------------------|
| <code>cos-index</code> | Class of Service (CoS) index value. |
|------------------------|-------------------------------------|

Default

N/A.

Usage Guidelines

None

Example

```
# show cos-index
COS Index  QoS      TOS  TOS  Ingress
  Profile  Value  Mask Meter
-----
0  qp0      --   --   --
1  qp1      64  0xfc ingmeter2
2  qp2      --   --   ingmeter15
3  qp3      --   --   ingmeter2
4  qp4      32  0xfc ingmeter12
5  qp5      --   --   --
6  qp6      --   --   --
7  qp7      --   --   --
32 qp4      --   --   --
255 qp6      --   --   ingmeter3
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show counters vr

```
show counters vr {vpn-vrf-name}
```

Description

Displays statistics information about VPN VRF operation.

Syntax Description

| | |
|---------------------------|----------------------------------|
| <code>vpn-vrf-name</code> | Specifies the name of a VPN VRF. |
|---------------------------|----------------------------------|

Default

N/A.

Usage Guidelines

This command displays counters that show:

- The total number of IP unicast and multicast routes.
- Route add operation count.
- Route delete operation count.
- Routes dropped count.

Note

The total route count displayed for this command can exceed the total route count displayed by the `show iproute` command because the `show iproute` command displays either unicast or multicast routes, but not both.

This command is supported only on VPN VRFs.

Example

The following example displays the counters for VPN VRF "red":

```
Switch.19 # show counters vr red
Num of Current Routes: 4           Num of Routes Dropped: 0
Num of Route Add:      12          Num of Route Del:      6
Num of Current Routes: 10         Num of Routes Dropped: 0
Num of Route Add:      5           Num of Route Del:      2
```

History

This command was introduced in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show cpu-monitoring

```
show cpu-monitoring {process name}
```

Description

Displays the CPU utilization history of one or more processes.

Syntax Description

| | |
|-------------|------------------------------------|
| <i>name</i> | Specifies the name of the process. |
|-------------|------------------------------------|

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

By default, CPU monitoring is enabled and occurs every 5 seconds. The default CPU threshold value is 90%.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different CPU and process information might be displayed.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays CPU utilization history for all the processes running on the master node and the backup node in the Active Topology.
- From the stack manager or a standby node, the stack displays CPU utilization history for all the processes running on the master node and the standby node in the Active Topology.

Modular Switches Only

Reading the Output

The show cpu-monitoring command is helpful for understanding the behavior of a process over an extended period of time. The following information appears in a tabular format:

- Process—The name of the process.
- Range of time (5 seconds, 10 seconds, and so forth)—The CPU utilization history of the process or the system. The CPU utilization history goes back only 1 hour.

- Total User/System CPU Usage—The amount of time recorded in seconds that the process spends occupying CPU resources. The values are cumulative meaning that the values are displayed as long as the system is running. You can use this information for debugging purposes to see where the process spends the most amount of time: user context or system context.

Example

The following example displays CPU utilization on the switch:

```
show cpu-monitoring
```

The following is sample output from a switch:

```

CPU Utilization Statistics - Monitored every 25 seconds
-----
Process          5   10   30   1    5    30   1   Max      Total

History

This command was first available in an ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show database

```
show database database_name
```

Description

Shows information about all servers configured for Automation Edge remote VXLAN network identifier (VNI)-device databases.

Syntax Description

| | |
|----------------------|---|
| database | Shows database information. |
| <i>database_name</i> | Shows database information for the specific named database. |

Default

N/A.

Usage Guidelines

N/A.

Example

The following example shows server information for all databases:

```
# show database
Retries : 3
-----
Database Name
  Server                               Port  Flags
-----
NewsroomNetwork1
  2001:0db8:85a3:0000:0000:8a2e:0370:7334  5456  C----
  CastleBlack                               34344  D----
  10.10.10.10                               12345  C----
NewsroomNetwork2
  3001:0db8:85a3:0000:0000:8a2e:0370:7334  5456  C----
  EastWatch                               34344  D----
  10.10.10.12                               12345  T----
-----
Flags : (C) Connected, (D) Disconnected, (T) Timed out.
```

The following example shows server information for the database "NewsroomNetwork1":

```
# show database NewsroomNetwork1
Database : NewsroomNetwork1                Retry : 3
  Server: 2001:0db8:85a3:0000:0000:8a2e:0370:7334  Port  : 5456
  Status: DOWN
    Last connect   : Tue Sep 10 20:22:48 UTC 2019
    Last disconnect: Tue Sep 10 20:22:48 UTC 2019
    # Disconnects  : 2
  Server: EastWatch                            Port  : 34245
  Status: UP
    Last connect   : Tue Sep 10 20:22:48 UTC 2019
    Last disconnect: Tue Sep 10 20:22:48 UTC 2019
    # Disconnects  : 5
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching X465, X590, X670-G2, X690, X695, X870, 5520 series switches.

show debug

```
show debug
```

Description

This command displays whether the writing of core dump files is enabled or disabled and whether the files are written to internal memory, a compact flash card, or a USB 2.0 storage device.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

By default, the switch writes core dump files to the internal memory card. To change the default configuration, use the `configure debug core-dumps [off | directory_path]` command.

Example

The following example shows that the switch is configured to send core dump files to the internal memory card:

```
Switch.2 # show debug
Debug Settings:
  Core dumps: Enabled (/usr/local/tmp)
```

The following example shows that the sending core dump files is disabled:

```
Switch.99 # show debug
Debug Settings:
  Core dumps: Disabled
```

The following example shows that the switch is configured to send core dump files to a compact flash card or USB 2.0 storage device:

```
Switch.76 # show debug
Debug Settings:
  Core dumps: Enabled (/usr/local/ext)
```

History

This command was first available in ExtremeXOS 11.1.

Support for the internal memory card was added in ExtremeXOS 11.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

The output was changed to show a directory path ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dhcp-client state

```
show dhcp-client {ipv4 | ipv6} state {vlan}
```

Description

Displays the current *DHCP*/BOOTP client state for each vlan.

Syntax Description

This command has no arguments or variables.

Default

If the IPv4 or IPv6 keyword is not specified, IPv4 is the default.

Usage Guidelines

None.

Example

The following command displays the DHCP/BOOTP status for all VLANs:

```
show dhcp-client state
```

Depending on your configurations, output from this command is similar to the following:

```
# sh dhcp-client ipv6 state v3
Client VLAN           : v3
Client Type           : Stateful
Identity Association Type : IA-NA
                        IA-NA       : Identity Association for Non-Temporary
Addresses
Identity Association Identifier : 96:7e:1f:5a
Client IP Address             : 2001::550b:ebf8:d0b8:9a8
Client Identifier Type        : Link-Layer Address Plus Time
Client Identifier             : 00:01:00:01:1a:85:0a:bd:00:04:96:7e:1a:5a:00:00
```

```

Server Identifier      : 00:01:00:01:13:e0:f4:93:00:11:43:c0:06:50
State                 : Bound

Identity Association Types:
  IA-NA - Identity Association for Non-Temporary Addresses,
  IA-TA- Identity Association for Temporary Addresses.

```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 15.6 to include the **ipv4** and **ipv6** keywords.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dhcp-server

```
show dhcp-server {vlan vlan_name}
```

Description

Displays the DHCP server's configuration and address allocation on a specified VLAN.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies the VLAN of the DHCP server of interest. |
|------------------|--|

Default

N/A.

Usage Guidelines

If no VLAN is specified, the configuration and address allocation for the servers on all the VLANs is displayed.

Example

The following command displays the configuration and address allocation for the DHCP server for the VLAN test:

```
show dhcp-server vlan test
```

The following is sample output from this command:

```
# show dhcp-server
VLAN "Default":
```

```

DHCP Address Range      : Not configured
Netlogin Lease Timer   : Not configured (Default = 10 seconds)
DHCP Lease Timer       : Not configured (Default = 7200 seconds)
DHCP Option Code  12   : hex "11:22:33:44:45"
DHCP Option Code  69   : ipaddress 10.0.0.1 10.0.0.2
Ports DHCP Enabled     : No ports enabled

```

History

This command was first available in ExtremeXOS 11.0.

The output is modified to show primary and secondary DNS servers in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show diagnostics

```
show diagnostics {slot [slot_number]}
```

Description

Displays the status of the last diagnostic test run on the switch.

Syntax Description

| | |
|--------------------|--|
| <i>slot</i> | Specifies which node to display diagnostic status information on. |
| <i>slot_number</i> | Specifies the slot number of the node on which you need to run the diagnostics. Values can be from 1 to 8. |

Default

N/A.

Usage Guidelines

Use this command to display information from the last diagnostic test run on the switch.

To run diagnostics on a switch in a stack, you need to remove the node from the stacking mode, restart the node, and then run the diagnostics locally on the node. You can see the latest diagnostics results from the Master node of a stack after the node has rejoined the stack.

Output

The switch displays the following diagnostic information:

If you have run diagnostics, information includes the:

- Date the test was run—The month, date, and year.
- Last Test Version—The ExtremeXOS version associated with the results.
- Test data—If the diagnostic test failed, the switch displays the name of the failed test. The switch displays a message similar to the following:MAC memory test failed
- Summary—A brief summary of the overall diagnostic test. Options are:
 - Diagnostics Pass—The diagnostic test has passed.
 - Diagnostics Fail—One or more diagnostic tests have failed.

If you have never run diagnostics on the switch or stack ports, the switch displays a message similar to the following:

```
Result: FAIL
Test date run is invalid. Please run Diagnostics.
Error reading diagnostics information.
```

This message is normal and expected if you have never run diagnostics on the switch. After you run diagnostics, you should see information about the executed test.

Running Diagnostics

To run diagnostics, use the following command:

```
run diagnostics [extended | normal | stack-port]
```

Depending on the software version running on your switch or your switch model, additional or different diagnostic information might be displayed. For more information, see the command [run diagnostics](#).

Example

The following command displays the results of the switch diagnostics:

```
show diagnostics
```

The following is sample output from this command:

```
Last Test Date: May-04-2006
Last Test Version: 12.3.0.1
Summary: Diagnostics Pass
```

When the version is unknown, Last Test Version reads “Unknown.”

History

This command was available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show diffserv examination

```
show diffserv examination
```

Description

Displays the DiffServ-to-QoS profile mapping.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Once you alter the default mappings, the “->” in the display (shown below) becomes “* >”.

Example

Because the SummitStack and ExtremeSwitching series switches have two default [QoS](#) profiles, you see different displays depending on the platform.

The following is sample output:

```
show diffserv examination
CodePoint->QoSProfile mapping:
00->QP1 01->QP1 02->QP1 03->QP1 04->QP1 05->QP1 06->QP1 07->QP1
08->QP1 09->QP1 10->QP1 11->QP1 12->QP1 13->QP1 14->QP1 15->QP1
16->QP1 17->QP1 18->QP1 19->QP1 20->QP1 21->QP1 22->QP1 23->QP1
24->QP1 25->QP1 26->QP1 27->QP1 28->QP1 29->QP1 30->QP1 31->QP1
32->QP1 33->QP1 34->QP1 35->QP1 36->QP1 37->QP1 38->QP1 39->QP1
40->QP1 41->QP1 42->QP1 43->QP1 44->QP1 45->QP1 46->QP1 47->QP1
48->QP1 49->QP1 50->QP1 51->QP1 52->QP1 53->QP1 54->QP1 55->QP1
56->QP8 57->QP8 58->QP8 59->QP8 60->QP8 61->QP8 62->QP8 63->QP8
```

History

This command was first available in ExtremeXOS 10.1.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show diffserv replacement

```
show diffserv replacement
```

Description

Displays the DiffServ replacement code-point values assigned to each [QoS](#) profile.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Once you alter the default mappings, the “->” in the display (shown below) becomes “* >”.

Example

The following is sample output:

```
show diffserv replacement
QoSProfile->CodePoint mapping:
QP1->00
QP8->56
```

History

This command was first available in ExtremeXOS 10.1.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns-client

```
show dns-client
```

Description

Displays the DNS configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the DNS configuration:

```
show dns-client
```

Output from this command looks similar to the following:

```
Number of domain suffixes: 2
Domain Suffix 1:          njudah.local
Domain Suffix 2:          dbackman.com
Number of name servers: 2
Name Server 1:  172.17.1.104
Name Server 2:  172.17.1.123
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns cache analytics configuration

```
show dns cache analytics configuration {{vr} vr_name}
```

Description

Displays Domain Name System (DNS) analytics configuration.

Syntax Description

| | |
|--------------|------------------------|
| dns | Domain Network System. |
| cache | Specifies DNS cache. |

| | |
|----------------------|---|
| analytics | Specifies showing DNS analytics information. |
| configuration | Specifies showing the DNS analytics configuration. |
| vr | Specifies the DNS analytics for a specific VR. |
| <i>vr_name</i> | Specifies the VR name. If not specified, the VR of the current command context is used. |

Default

If not specified, the VR of the current command context is used.

Usage Guidelines

This command shows if DNS analytics is enabled and shows the configured maximum entries and timeout period.

Example

The following example shows the DNS analytics configuration for the current VR:

```
# show dns cache analytics configuration
DNS Cache Analytics : Enabled
Maximum Entries      : 10000
Timeout              : 1440
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns cache analytics protected-client

```
show dns cache analytics protected-client {{vr} vr_name}
```

Description

Shows the Domain Name System (DNS) cache analytics protected client list for a virtual router (VR).

Syntax Description

| | |
|------------------|--|
| dns | Domain Name System. |
| cache | Specifies showing DNS cache information. |
| analytics | Specifies showing DNS cache analytics information. |

| | |
|-------------------------|--|
| protected-client | Specifies showing the DNS cache analytics protected client list. |
| vr | Specifies the VR for the protected client list. |
| <i>vr_name</i> | Specifies the VR. If not specified, the VR of the current command context is used. |

Default

If not specified, by default the VR of the current command context is used.

Usage Guidelines

None.

Example

The following example shows DNS analytics protected client list for VR "VR-Default":

```
# show dns cache analytics protected-client VR-Default
VR Name                               Client IP/Mask length
-----                               -
VR-Default                             192.168.1.2/32
VR-Default                             192.168.3.0/32
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns cache configuration

```
show dns cache configuration [{vlan} vlan_name | {vr} vr_name]
```

Description

Shows the Domain Name System (DNS) cache configuration (enabled or disabled) on a virtual router (VR) or VLAN.

Syntax Description

| | |
|----------------------|--|
| dns | Domain name system. |
| cache | Specifies showing the DNS cache information. |
| configuration | Specifies showing the DNS cache configuration (enabled or disabled). |
| vlan | Specifies showing the DNS cache configuration on a VLAN. |

| | |
|------------------|---|
| <i>vlan_name</i> | Specifies the VLAN name. |
| vr | Specifies showing the DNS configuration cache on a VR. |
| <i>vr_name</i> | Specifies the VR name. If not specified, the VR of the current command context is used. |

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

None.

Example

The following example shows the DNS cache configuration on VR "vrA":

```
# show dns cache configuration vrA
DNS Cache : Enabled on some VLANs of virtual router "vrA"
DNSSEC    : Enabled

VLAN                DNS Cache Operational
-----
vlanA1              Enabled    Up
```

History

This command was first available in ExtremeXOS 30.3.

Domain Name System Security Extension (DNSSEC) status was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns cache analytics statistics

```
show dns cache analytics statistics {client client_ip domain
    domain_name } {detail} {{vr} vr_name}}
```

Description

Shows Domain Name System (DNS) cache analytics statistics for clients on a virtual router (VR).

Syntax Description

| | |
|--------------------|---|
| dns | Domain Name System. |
| cache | DNS cache. |
| analytics | Specifies showing information about the DNS cache analytics. |
| statistics | Specifies showing information about the DNS cache analytics statistics. |
| client | Specifies client statistics. |
| <i>client_ip</i> | Specifies which client by IP address. |
| domain | Specifies detailed domain. |
| <i>domain_name</i> | Specifies the domain. |
| detail | Displayed detailed statistics information. |
| vr | Specifies showing DNS cache analytics statistics on a VR. |
| <i>vr_name</i> | Specifies the VR name. If not specified, the VR of the current command context is used. |

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

This command displays DNS analytics statistics for a given VR. This command displays the total DNS queries received from clients, displaying IPv4 and IPv6 queries separately. For a specific client IP address, this command displays domain names queried by the client, number of DNS queries received for the domains, and the time stamp of the last received DNS query. Also, for a particular domain, it displays a detailed view of the specific domain with all the DNS query time stamps separately for IPv4 and IPv6.

Example

The following example shows DNS cache analytics statistics for all clients on the current VR:

```
# show dns cache analytics statistics
DNS Cache           : Enabled
DNS Cache Analytics : Enabled

Client IP                               # IPv4    # IPv6
                                         Queries  Queries
-----
10.127.2.251                             21928    2682
```

The following example shows DNS cache analytics statistics for the client at IP address "1.1.1.1" at domain "www.aaaaa.com" on the current VR:

```
# show dns cache analytics statistics client 1.1.1.1 domain www.aaaaa.com
DNS Cache           : Enabled
DNS Cache Analytics : Enabled

Domain Name                Query Type      Query Time
```

```

-----
www.aaaaa.com          IPv4 [A]          Thu Jan 15 06:56:07 1970
                      IPv4 [A]          Thu Jan 15 06:56:07 1970

Number of DNS IPv4 [A] Queries: 2
Number of DNS IPv6 [AAAA] Queries: 0

Flags: > - Indicates Domain Name is truncated past 44 characters.

```

The following example shows detailed DNS cache analytics statistics for the client at IP address "10.127.2.200" on the current VR:

```

# show dns cache analytics statistics client 10.127.2.200 detail
Domain Name           : geo.yahoo.com
# IPv4 Queries        : 1
# IPv6 Queries        : 0
Last IPv4 Query Time  : Fri Jan  4 06:48:56 2019
Last IPv6 Query Time  :

Domain Name           : acdn.adnxs.com
# IPv4 Queries        : 1
# IPv6 Queries        : 0
Last IPv4 Query Time  : Fri Jan  4 06:48:59 2019
Last IPv6 Query Time  :

Domain Name           : cdn.adnxs.com
# IPv4 Queries        : 1
# IPv6 Queries        : 0
Last IPv4 Query Time  : Fri Jan  4 06:48:59 2019
Last IPv6 Query Time  :

Domain Name           : sync.adaptv.advertising.com
# IPv4 Queries        : 1
# IPv6 Queries        : 0
Last IPv4 Query Time  : Fri Jan  4 06:49:02 2019
Last IPv6 Query Time  :

Domain Name           : ocsp.digicert.com
# IPv4 Queries        : 1
# IPv6 Queries        : 0
Last IPv4 Query Time  : Fri Jan  4 06:49:02 2019
Last IPv6 Query Time  :

Domain Name           : teredo.ipv6.microsoft.com
# IPv4 Queries        : 1
# IPv6 Queries        : 0
Last IPv4 Query Time  : Fri Jan  4 06:49:18 2019
Last IPv6 Query Time  :

```

The following example shows DNS cache analytics statistics for the domain "www.google.com" on the current VR:

```

# show dns cache analytics statistics domain www.google.com

```

| IPv4 | # IPv6 | Client IP | # |
|------------|---------|-------------|---|
| VR Name | Queries | Queries | |
| VR-Default | | 192.168.1.1 | |
| 1 | 1 | | |
| Durga | | 192.168.2.1 | |

```
2          0
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns cache

```
show dns cache {current} {detail}
```

Description

Shows Domain Name System (DNS) cache entries.

Syntax Description

| | |
|----------------|--|
| dns | Domain Name System. |
| cache | Specifies showing DNS cache entries. |
| current | Retrieves the current entries rather than most recent cache. Using this option might take some time to display the output. |
| detail | Displays output without truncation. |

Default

N/A.

Usage Guidelines

To clear the DNS cache, use the command `clear dns cache`.

Example

The following example shows DNS cache entries (truncated):

```
# show dns cache
Domain Name                Address                Flag  Expiry Time

```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dns cache name-server

```
show dns cache name-server
```

Description

Displays the Domain Name System (DNS) name server.

Syntax Description

| | |
|--------------------|-------------------------------------|
| dns | Domain Name System. |
| cache | Specifies viewing DNS name servers. |
| name-server | Specifies viewing DNS name servers. |

Default

N/A.

Usage Guidelines

None.

Example

The following example shows DNS name servers:

```
# show dns cache name-server
Name Server 1: 1.1.1.2          VR: VR-Default
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dos-protect

```
show dos-protect {detail}
```

Description

Displays DoS protection configuration and state.

Syntax Description

| | |
|---------------|---|
| detail | Specifies to display statistics in addition to configuration and state. |
|---------------|---|

Default

N/A.

Usage Guidelines

Use this command to display the DoS protection settings. Using the detail option will also display the following cumulative statistics:

- trusted.
- notify.
- alerts.

Example

The following command displays the DoS protection settings for the switch:

```
show dos-protect
```

The following is sample output from this command:

```
dos-protect is disabled
dos-protect settings:
interval:      1 (measurement interval secs)
acl expire time: 5 (secs)
trusted ports:
no trusted ports configured
type L3-Protect:
notify threshold: 3500 (level to log a message)
alert threshold: 4000 (level to generate an ACL)
```

The following command displays detailed DoS protection settings for the switch:

```
show dos-protect detail
```

The following is sample output from this command:

```
dos-protect is enabled
dos-protect settings:
interval:      1 (measurement interval secs)
acl expire time: 5 (secs)
trusted ports:
1:2
type L3-Protect:
notify threshold: 3500 (level to log a message)
```

```
alert threshold:    4000 (level to generate an ACL)
dos-protect statistics:
trusted:    1301
notify:    0
alerts:    0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dot1p

```
show dot1p
```

Description

Displays the 802.1p-to-QoS profile mappings.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The SummitStack and ExtremeSwitching series switches have two default [QoS](#) profiles.

Following is sample output from the show dot1p command:

```
show dot1p
802.1p Priority Value    QOS Profile    Ingress Meter
      0                   QP1            ingmeter0
      1                   QP1            none
      2                   QP1            ingmeter0
      3                   QP1            ingmeter4
      4                   QP1            ingmeter4
      5                   QP1            ingmeter15
      6                   QP1            none
      7                   QP8            ingmeter8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show dwdm channel-map

```
show dwdm channel-map { channel_first { - channel_last } } {port
  port_num}
```

Description

Displays the channel scheme adopted for mapping the DWDM wavelengths.

Syntax Description

| | |
|----------------------|---|
| <i>channel_first</i> | Specifies the starting channel number. |
| <i>channel_last</i> | Specifies the ending channel number. |
| <i>port_num</i> | Specifies the port for which the status is to be displayed. |

Default

N/A.

Usage Guidelines

Use this command to display the wavelength and the supportability of the channel by the optical module in the port.

Example

The following command displays information for channels 50 through 60 on port 3:1:

```
show dwdm channel-map 50 - 60 port 3:1
```

The following is sample output for this command:

```
=====
Channel #      Wavelength (nm)      Port 3:1
=====
50             1537.40              Supported
51             1536.61              Supported
52             1535.82              Supported
...           .....
58             1531.12              Supported
```

| | | |
|----|---------|-----------|
| 59 | 1530.33 | Supported |
| 60 | 1529.55 | Supported |

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show eaps

```
show eaps {eapsDomain} {detail}
```

Description

Displays *EAPS* status information.

Syntax Description

| | |
|-------------------|---|
| <i>eapsDomain</i> | Specifies the name of an EAPS domain. |
| detail | Specifies all available detail for each domain. |

Default

N/A.

Usage Guidelines

If you enter the show eaps command without a keyword, the command displays less than with the detail keyword.

Use the optional eapsDomain parameter to display status information for a specific EAPS domain.

Some state values are different on a transit node than on a master node.

When you enter the show eaps command without a domain name, the switch displays the following fields:

| | |
|-------------------------------|--|
| EAPS Enabled: | Current state of EAPS on this switch: Yes—EAPS is enabled on the switch.No—EAPS is not enabled. |
| EAPS Fast Convergence: | Displays only when Fast Convergence is on. |
| EAPS Display Config Warnings: | Displays the setting for loop protection messages: On—Loop protection messages are displayed (this is the default behavior).Off—Loop protection messages are not displayed. |

| | |
|---|---|
| EAPS Multicast Add Ring Ports: | Displays the configuration of the multicast add-ring-ports feature as configured with the <code>configure eaps multicast add-ring-ports</code> command. |
| EAPS Multicast Send <i>IGMP</i> Query: | Displays the configuration of the multicast send-igmp-query feature as configured with the <code>configure eaps multicast send-igmp-query</code> command. |
| EAPS Multicast Temporary Flooding: | Displays the configuration of the multicast temporary-flooding feature as configured with the <code>configure eaps multicast temporary-flooding</code> command. |
| EAPS Multicast Temporary Flooding Duration: | Displays the duration configuration for the multicast temporary-flooding feature as configured with the <code>configure eaps multicast temporary-flooding duration</code> command. |
| Number of EAPS instances: | Number of EAPS domains created. The maximum number of EAPS domains per switch is 128. |
| Domain: | Entries in this column identify the name of an EAPS domain. |
| State: | <p>On a transit node, the command displays one of the following states:</p> <ul style="list-style-type: none"> Idle—The EAPS domain has been enabled, but the configuration is not complete. Links-Up—This EAPS domain is running, and both its ports are up and in the FORWARDING state. Links-Down—This EAPS domain is running, but one or both of its ports are down. Preforwarding—This EAPS domain is running, and both of its ports are up, but one of them is in a temporary BLOCKED state. <p>On a master node, the command displays one of the following states:</p> <ul style="list-style-type: none"> Idle—The EAPS domain has been enabled, but the configuration is not complete. Init—The EAPS domain has started but has not yet determined the status of the ring. The secondary port is in a BLOCKED state. Complete—The ring is in the COMPLETE state for this EAPS domain. Failed—There is a break in the ring for this EAPS domain. Pre-Init—The EAPS domain has started operation for Init state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from hardware layer indicating the operation is completed. Pre-Complete—The EAPS domain has started operation for Complete state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from the hardware layer indicating the operation is completed. [Failtimer Expired]—When the failtimer expires and its action is set to send-alert, this flag is set. This flag indicates there is a misconfiguration or hardware problem in the EAPS ring. The EAPS master node continues to remain in COMPLETE or INIT state with its secondary port blocking. |
| Mo: | The configured EAPS mode for this switch: transit (T) or master (M). |
| Primary/Secondary port: | The port numbers assigned as the EAPS primary and secondary ports. On the master node, the port distinction indicates which port is blocked to avoid a loop. |
| Prio | The EAPS domain priority, which is H for high priority or N for normal priority. |

When you enter the show eaps command with a domain name or the detail keyword, the switch displays the following fields:

| | |
|-------------------------|---|
| Name: | Identifies the EAPS domain displayed. |
| Priority | The EAPS domain priority, which is either High or Normal. |
| State: | <p>On a transit node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete. Links-Up—This EAPS domain is running, and both its ports are up and in the FORWARDING state. Links-Down—This EAPS domain is running, but one or both of its ports are down. Preforwarding—This EAPS domain is running, and both of its ports are up, but one of them is in a temporary BLOCKED state.</p> <p>On a master node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete. Init—The EAPS domain has started but has not yet determined the status of the ring. The secondary port is in a BLOCKED state. Complete—The ring is in the COMPLETE state for this EAPS domain. Failed—There is a break in the ring for this EAPS domain. Pre-Init—The EAPS domain has started operation for Init state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from hardware layer indicating the operation is completed. Pre-Complete—The EAPS domain has started operation for Complete state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from the hardware layer indicating the operation is completed. [Failtimer Expired]—When the failtimer expires and it's action is set to send-alert, this flag is set. This flag indicates there is a misconfiguration or hardware problem in the EAPS ring. The EAPS master node continues to remain in COMPLETE or INIT state with it's secondary port blocking.</p> |
| [Running: ...] | Yes—This EAPS domain is running. No—This EAPS domain is not running. |
| Enabled: | Indicates whether EAPS is enabled on this domain. Y—EAPS is enabled on this domain. N—EAPS is not enabled. |
| Mode: | The configured EAPS mode for this switch: transit (T) or master (M). |
| Primary/Secondary port: | The port numbers assigned as the EAPS primary and secondary ports. On the master node, the port distinction indicates which port is blocked to avoid a loop. |
| Port status: | Unknown—This EAPS domain is not running, so the port status has not yet been determined. Up—The port is up and is forwarding data. Down—The port is down. Blocked—The port is up, but data is blocked from being forwarded. |
| Tagstatus: | <p>Tagged status of the control <u>VLAN</u>:</p> Tagged—The control VLAN has this port assigned to it, and the port is tagged in the VLAN. Untagged—The control VLAN has this port assigned to it, but the port is untagged in the control VLAN. Undetermined—Either a VLAN has not been added as the control VLAN to this EAPS domain or this port has not been added to the control VLAN. |

| | |
|--------------------------------|--|
| Hello timer interval: | The configured value of the timer in seconds and milliseconds, specifying the time that the master node waits between transmissions of health check packets. |
| Fail timer interval: | The configured value of the timer in seconds, specifying the time that the master node waits before the failtimer expires. |
| Faultimer expiry action: | Displays the action taken when the failtimer expires: Send-alert—Sends a critical message to the syslog when the failtimer expires. Open-secondary-port—Opens the secondary port when the failtimer expires. Displays only for master nodes. |
| Preforwarding Timer interval: | The configured value of the timer. This value is set internally by the EAPS software. The set value is 15 seconds. Note: If two links in an EAPS domain go down at the same time and one link comes back up, it takes 15 seconds for the reconnected link to start receiving traffic again. Displays only for transit nodes. |
| Last valid EAPS update: | Indicates the last time a hello packet was received. |
| EAPS Domain Controller Vlan: | Lists the assigned name and ID of the control VLAN. |
| EAPS Domain Protected Vlan(s): | Lists the assigned names and VLAN IDs of all the protected VLANs configured on this EAPS domain. |
| Number of Protected Vlans: | The count of protected VLANs configured on this EAPS domain. |

Example

The following command displays information for all EAPS domains:

```
Switch.5 # show eaps
EAPS Enabled: Yes
EAPS Fast-Convergence: Off
EAPS Display Config Warnings: On
EAPS Multicast Add Ring Ports: Off
EAPS Multicast Send IGMP Query: On
EAPS Multicast Temporary Flooding: Off
EAPS Multicast Temporary Flooding Duration: 15 sec
Number of EAPS instances: 2
# EAPS domain configuration :
-----
Domain          State           Mo  En  Pri  Sec  Control-Vlan  VID  Count  Prio
-----
d1              Idle           T   N   1    2    cv1           (101) 0    H
d2              Links-Up      T   Y   3:8  3:16 c2           (1001) 100  H
-----
```

The following command displays information for EAPS domain d1:

```
Switch.7 # show eaps d1
Name: d1          Priority: High
State: Idle      Running: No
Enabled: No      Mode: Transit
Primary port: 1  Port status: Unknown  Tag status: Undetermined
Secondary port: 2  Port status: Unknown  Tag status: Undetermined
```

⁶ These fields apply only to transit nodes; they are not displayed for a master node.

```

Hello timer interval: 1 sec 0 millise
Fail timer interval: 3 sec 0 millise
Fail Timer expiry action: Send alert
Last valid EAPS update: From Master Id 00:01:30:f9:9c:b0, at Wed Jun 9 09:09:35 2004
EAPS Domain has following Controller Vlan:
Vlan Name          VID
c1                  1000
EAPS Domain has following Protected Vlan(s) :
Vlan Name          VID
p_1                 1
p_2                 2
p_3                 3
p_4                 4
p_5                 5

p_21                21
p_22                22
p_23                23
p_24                24
p_25                25
p_26                26
p_27                27
p_28                28
p_29                29
p_30                30

```

The following command displays information on EAPS domain domain12, which is configured to send hello packets on the secondary port:

```

Switch.9 # show eaps "domain12"
Name: domain12      Priority: High
State: Complete    Running: Yes
Enabled: Yes       Mode: Master
Primary port: 17    Port status: Up Tag status: Tagged
Secondary port: 27  Port status: Blocked Tag status: Tagged
Hello Egress Port: Secondary
Hello timer interval: 0 sec 100 millise
Fail timer interval: 0 sec 300 millise
Fail Timer expiry action: Send alert
Last update: From Master Id 00:04:96:34:e3:43, at Tue May 11 15:39:29 2010
EAPS Domain has following Controller Vlan:
Vlan Name          VID
vlancl2            1002
EAPS Domain has following Protected Vlan(s) :
Vlan Name          VID
pvlan11            204
pvlan12            205

```

```
pvlan13                206
Number of Protected Vlans: 3
```

Note

You might see a slightly different display, depending on whether you display the master node or the transit node.

The display from the `show eaps detail` command shows all the information shown in the `show eaps eapsDomain` command, but displays information for all configured EAPS domains.

For the CFM support in EAPS, the existing `show eaps` output places a “!” next to a CFM monitored ring port if the CFM indicates the MEP group for that port is down.

```
# sh eaps
EAPS Enabled: Yes
EAPS Fast-Convergence: Off
EAPS Display Config Warnings: Off
EAPS Multicast Add Ring Ports: Off
EAPS Multicast Send IGMP Query: On
EAPS Multicast Temporary Flooding: Off
EAPS Multicast Temporary Flooding Duration: 15 sec
Number of EAPS instances: 1
# EAPS domain configuration :
-----
Domain          State          Mo  En  Pri   Sec  Control-Vlan VID  Count Prio
-----
d2              Failed        M   Y   !41   31   v2                (101 ) 1   N
-----
Flags : (!) CFM Down
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show eaps cfm groups

```
show eaps cfm groups
```

Description

Displays summary *EAPS* CFM groups information.

Syntax Description

There are no keywords or variables for this command.

Default

N/A.

Usage Guidelines

The following command displays EAPS CFM group information:

```
# sh eaps cfm groups
-----
MEP Group Name          Status Port   MEP ID
-----
eapsCfmGrp1             Up      41      11
eapsCfmGrp2             Up      31      12
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show eaps counters shared-port

```
show eaps counters shared-port [global | port {segment-port segport
    {eapsDomain}}]
```

Description

Displays summary *EAPS* shared port counter information.

Syntax Description

| | |
|-------------------|--|
| global | Displays general counter information for all configured EAPS shared port instances. The output displayed is calculated for all configured EAPS shared ports; not just one specific shared port instance. |
| <i>port</i> | Identifies the port number of the specified common link port. |
| <i>segport</i> | Identifies the segment port. The segment port is the other ring port of an EAPS domain that is not the shared-port. |
| <i>eapsDomain</i> | Specifies the name of the EAPS domain. If no EAPS domain is specified, all counters for all EAPS domains on the specified segment port are displayed. |

Default

N/A.

Usage Guidelines

If the switch is configured for EAPS shared ports, use this command to display an array of counters associated with the EAPS shared port functionality.

If you specify the global keyword, the switch displays general counter information for all configured EAPS shared port instances. The output displayed is calculated for all configured EAPS shared ports; not just one specific shared port instance.

If you specify a particular EAPS shared port, the switch displays counter information related to only that shared port.

If you specify a particular EAPS segment port, the switch displays counter information related to only that segment port for the specified EAPS domain.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults.

Clearing the Counters

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring. To clear, reset the EAPS counters, including the shared port counters, use one of the following commands:

- `clear counters`
- `clear eaps counters`

Understanding the Output

The following table describes the significant fields and values in the display output of the `show eaps counters shared-port` global command:

| Field | Description |
|---------------------|---|
| Rx-Invalid-Instance | Displays the number of dropped EAPS shared-port PDUs because there is not a valid EAPS shared port instance for the incoming port. |
| Rx-Unknown | Displays the number of unknown EAPS PDUs dropped by the shared port instances. |
| Fw-Invalid-Instance | Displays the number of EAPS shared-port PDUs that could not be forwarded in slow path because the shared port instances could not find a valid EAPS shared port instance for the outgoing port. |

The following table describes the significant fields and values in the display output of the `show eaps counters shared-port portsegment-port segport eapsDomain` command:

| Field | Description |
|-------------------------|---|
| Rx-Seg-Health | Indicates the shared port instance received EAPS shared ports Segment-Health-Check PDUs. |
| Rx-Path-Detect | Indicates the shared port instance received EAPS shared ports Path-Detect PDUs. |
| Rx-Flush-Notify | Indicates the shared port instance received EAPS shared ports Flush-Notify PDUs and flushed the <i>FDB</i> . If this PDU reaches a port of the shared ports pair that initiated the PDU, the shared port instance might terminate the PDU. Otherwise, the shared port instance forwards the PDU. |
| Rx-Unknown | Displays the number of unknown EAPS PDUs dropped by the shared port instance. |
| Rx-Seg-Health-Dropped | Displays the number of EAPS shared ports Segment-Health-Check PDUs dropped by the shared port instance. This counter increments if the Segment-Health-Check PDU returns to the sending switch. If that occurs, the switch drops the Segment-Health-Check PDU. |
| Rx-Path-Detect-Dropped | Displays the number of EAPS shared ports Path-Detect PDUs dropped by the shared port instance. This counter increments in the following situations: If the packet's Fwd-id matches the EAPS shared port's Link-Id, the port is not in the blocking state, and the incoming port is a segment port.If the packet's Link-Id matches the EAPS shared port's Link-Id, the port is not in the blocking state, and the incoming port is a segment port. |
| Rx-Flush-Notify-Dropped | Displays the number of EAPS shared ports Flush-Notify-Dropped PDUs dropped by the shared port instance. This counter increments in the following situations: If the Flush-Notify-Dropped PDU returns to the sending switch.If the packet's Fwd-Id matches the EAPS shared port's Link-Id and the port is not in the blocking state. |
| Rx-Dropped-Invalid-Port | Displays the number of EAPS shared ports PDUs dropped by the shared port instance because it does not exist. |
| Tx-Seg-Health | Indicates the shared port instance sent EAPS shared ports Segment-Health-Check PDUs. |
| Tx-Path-Detect | Indicates the shared port instance sent EAPS shared ports Path-Detect PDUs. NOTE: This counter appears under Common Link Port Stats and should always be 0. |
| Tx-Flush-Notify | Indicates the shared port instance sent EAPS shared ports Flush-Notify PDUs to flush the FDB. NOTE: This counter appears under Common Link Port Stats and should always be 0. |
| Tx-Flush-Fdb | Indicates the shared port instance sent EAPS Flush-Fdb PDUs because the FDB needs to be flushed. NOTE: This counter appears under Common Link Port Stats and should always be 0. |

| Field | Description |
|-----------------|--|
| Tx-Unknown | Indicates the number of unknown EAPS PDUs sent by the shared port instance. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the sending routine. |
| Tx-Transmit-Err | Indicates the number of EAPS PDUs the shared port instance was unable to send because of an error. |
| Fw-Seg-Health | Indicates the number of EAPS shared ports Segment-Health-Check PDUs received by the shared port instance and forwarded in slow path. |
| Fw-Path-Detect | Indicates the number of EAPS shared ports Path-Detect PDUs received by the shared port instance and forwarded in slow path. |
| Fw-Flush-Notify | Indicates the number of EAPS Flush-Notify PDUs received by the shared port instance and forwarded in slow path to flush the FDB. |
| Fw-Flush-Fdb | Indicates the number of EAPS Flush-Fdb PDUs received by the shared port instance and forwarded in slow path. |
| Fw-Unknown | Indicates the number of unknown EAPS PDUs forwarded in slow path. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the forwarding routine. |
| Fw-Transmit-Err | Indicates the number of EAPS PDUs the shared port instance was unable to forward in slow path because of an error. |

Example

The following command displays global, high-level counter information for EAPS shared port:

```
show eaps counters shared-port global
```

The following is sample output from this command:

```
Global counters for EAPS Shared-Ports:
Rx Dropped
Rx-Invalid-Instance : 0
Rx-Unknown          : 0
Fw Dropped
Fw-Invalid-Instance : 0
```

The following example assumes that port 17 is configured as an EAPS shared port. The following command displays counter information the specified EAPS shared port:

```
show eaps counters shared-port 17
```

The following is sample output from this command:

```
Counters for EAPS Shared-Port 17:
Common Link Port Stats
Rx Stats
Rx-Seg-Health          : 0
Rx-Path-Detect         : 0
Rx-Flush-Notify        : 0
Rx Dropped
```

```

Rx-Seg-Health-Dropped      : 0
Rx-Path-Detect-Dropped    : 0
Rx-Flush-Notify-Dropped   : 0
Rx-Dropped-Invalid-Port   : 0
Tx Stats
Tx-Seg-Health              : 0
Tx-Path-Detect             : 0
Tx-Flush-Notify            : 0
Tx-Flush-Fdb               : 0
Tx Dropped
Tx-Unknown                 : 0
Tx-Transmit-Err            : 0
Fw Stats
Fw-Seg-Health              : 0
Fw-Path-Detect             : 0
Fw-Flush-Notify            : 0
Fw Dropped
Fw-Unknown                 : 0
Fw-Transmit-Err            : 0

```

The following example assumes that port 1:2 is configured as an EAPS shared port and port 1:1 is a segment port. The following command displays counter information the specified EAPS shared port, segment port, and EAPS domain:

```
show eaps counters shared-port 1:2 segment-port 1:1 eaps1
```

The following is sample output from this command:

```

Counters for EAPS Shared-Port 1:2, Segment Port: 1:1, EAPS Domain: eaps1
Rx Stats
Rx-Seg-Health              : 0
Rx-Path-Detect             : 0
Rx-Flush-Notify            : 0
Rx-Seg-Health-Dropped     : 0
Rx-Path-Detect-Dropped    : 0
Rx-Flush-Notify-Dropped   : 0
Rx-Dropped-Invalid-Port   : 0
Tx Stats
Tx-Seg-Health              : 2275
Tx-Path-Detect             : 0
Tx-Flush-Notify            : 0
Tx-Flush-Fdb               : 0
Tx-Transmit-Err            : 0
Tx-Unknown                 : 0
Fw Stats
Fw-Seg-Health              : 0
Fw-Path-Detect             : 0
Fw-Flush-Notify            : 0
Fw-Transmit-Err            : 0
Fw-Unknown                 : 0

```

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show eaps counters

```
show eaps counters [eapsDomain | global]
```

Description

Displays summary *EAPS* counter information.

Syntax Description

| | |
|-------------------|---|
| <i>eapsDomain</i> | Specifies the name of an EAPS domain. The switch displays counter information for only that domain. |
| global | Displays EAPS counter information when the events counted are not applicable to any specific EAPS domain. |

Default

N/A.

Usage Guidelines

If you specify the name of an EAPS domain, the switch displays counter information related to only that domain. If you specify the global keyword, the switch displays EAPS counter information when the events counted are not applicable to any specific EAPS domain. The output displayed is for all configured EAPS domains, not just one specific EAPS domain.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults.

Clearing the Counters

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring. To clear, reset the EAPS counters, use one of the following commands:

- `clear counters`
- `clear eaps counters`

Understanding the Output

The following table describes the significant fields and values in the display output of the `show eaps counters eapsDomain` command:

| Field | Description |
|-------------------------|--|
| Rx-Health | Indicates the EAPS domain received EAPS Health PDUs. |
| Rx-RingUp-FlushFdb | Indicates the EAPS ring is up, and the EAPS domain received EAPS RingUp-FlushFdb PDUs to flush the <u>FDB</u> . |
| Rx-RingDown-FlushFdb | Indicates the EAPS ring is down, and the EAPS domain received EAPS RingDown-FlushFdb PDUs to flush the FDB. |
| Rx-Link-Down | Indicates the EAPS domain received EAPS Link-Down PDUs and took down the link. |
| Rx-Flush-Fdb | Indicates the EAPS domain received EAPS Flush-Fdb PDUs and flushed the FDB. |
| Rx-Suspend-Prefwd-Timer | Indicates the EAPS domain received EAPS Suspend-Preforward-Timer PDUs. |
| Rx-Query-Link-Status | Indicates the EAPS domain received EAPS Query-Link-Status PDUs. |
| Rx-Link-Up | Indicates the EAPS domain received EAPS Link-Up PDUs and brought the link back up. |
| Rx-Unknown | Indicates the EAPS domain dropped unknown EAPS PDUs. |
| Rx-Another-Master | Indicates the EAPS domain dropped EAPS PDUs because there is another Master switch in the same EAPS domain. |
| Rx-Unconfigured-Port | Indicates the EAPS domain dropped EAPS PDUs because the ingress port is not configured to be a ring port for the EAPS domain and the corresponding control <u>VLAN</u> . |
| Rx-Health-Pdu-Pri-Port | Indicates the EAPS domain dropped EAPS Health PDUs because the primary port received them instead of the secondary port. NOTE: The secondary port of the Master switch must receive EAPS Health PDUs, not the primary port. |
| Tx-Health | Indicates the EAPS domain sent EAPS Health PDUs. |
| Tx-RingUp-FlushFdb | Indicates the EAPS ring is up, and the EAPS domain sent EAPS RingUp-FlushFdb PDUs to flush the FDB. |
| Tx-RingDown-FlushFdb | Indicates the EAPS ring is down, and the EAPS domain sent EAPS RingDown-FlushFdb PDUs to flush the FDB. |
| Tx-Link-Down | Indicates the EAPS domain sent EAPS Link-Down PDUs because the link went down. |
| Tx-Flush-Fdb | Indicates the EAPS domain sent EAPS Flush-Fdb PDUs because the FDB needs to be flushed. |
| Tx-Suspend-Prefwd-Timer | Indicates the EAPS domain sent EAPS Suspend-Preforward-Timer PDUs. |
| Tx-Query-Link-Status | Indicates the EAPS domain sent EAPS Query-Link-Status PDUs. |
| Tx-Link-Up | Indicates the EAPS domain sent EAPS Link-Up PDUs and the link is up. |
| Tx-Unknown | Indicates the number of unknown EAPS PDUs sent by the EAPS domain. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the sending routine. |

| Field | Description |
|----------------------|--|
| Tx-Transmit-Err | Indicates the number of EAPS PDUs the EAPS domain was unable to send because of an error. |
| Fw-Link-Down | Indicates the number of EAPS Link-Down PDUs received by the EAPS domain and forwarded in slow path. |
| Fw-Flush-Fdb | Indicates the number of EAPS Flush-Fdb PDUs received by the EAPS domain and forwarded in slow path. |
| FW-Query-Link-Status | Indicates the number of EAPS Query-Link-Status PDUs received by the EAPS domain and forwarded in slow path. |
| Fw-Unknown | Indicates the number of unknown EAPS PDUs forwarded in slow path. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the forwarding routine. |
| Fw-Transmit-Er | Indicates the number of EAPS PDUs the EAPS domain was unable to forward in slow path because of an error. |

Note

Rx and Fw counters—If a PDU is received, processed, and consumed, only the Rx counter increments. If a PDU is forwarded in slow path, both the Rx counter and Fw counter increment.

The following table describes the significant fields and values in the display output of the `show eaps counters` global command:

| Field | Description |
|----------------------------|---|
| Rx-Failed | Indicates an error occurred when receiving packets from the Layer 2 forwarding engine. |
| Rx-Invalid-Vlan-Intf | Indicates that the VLAN interface for the incoming VLAN cannot be found. |
| Rx-Undersize-Pkt | Indicates the length of the packet is less than the length of the header. |
| Rx-Invalid-8021Q-Tag | Indicates the VlanTypeLength field in the Ethernet header does not match the default Ethernet value for the 802.1Q tag. |
| Rx-Invalid-SNAP-Type | Indicates an invalid Subnetwork Access Protocol (SNAP) value in the Ethernet header. |
| Rx-Invalid-OUI | Indicates the Organizational Unique Identifier (OUI) value in the Ethernet header does not match 00:E0:2B. |
| Rx-EEP-Unsupported-Version | Indicates an unsupported Extreme Encapsulation Protocol (EEP) version. The EEP version should be 1. |
| Rx-EEP-Invalid-Length | Indicates the length of the EEP header is greater than the length of the packet. |
| Rx-EEP-Checksum-Invalid | Indicates the EEP checksum is invalid. |
| Rx-Domain-Invalid | Indicates the control VLAN's incoming PDU is not associated with an EAPS domain. |

| Field | Description |
|----------------|--|
| Rx-Lif-Invalid | Indicates that EAPS is unable to determine the logical interface (LIF) for the ingress port. |
| Rx-Lif-Down | Indicates the LIF for the ingress port is in the Down state. |
| Tx-Failed | Indicates an error occurred when sending packets to the Layer 2 forwarding engine. |

Example

The following command displays the counters for a specific EAPS domain named eaps1:

```
show eaps counters eaps1
```

The following is sample output from this command:

```
Counters for EAPS domain: eaps1
Rx Stats
Rx-Health                : 0
Rx-Ringup-Flushfdb      : 0
Rx-Ringdown-Flushfdb    : 0
Rx-Link-Down            : 0
Rx-Flush-Fdb            : 0
Rx-Suspend-Prefwd-Timer : 0
Rx-Query-Link-Status    : 0
Rx-Link-Up              : 0
Rx Dropped
Rx-Unknown               : 0
Rx-Another-Master       : 0
Rx-Unconfigured-Port    : 0
Rx-Health-Pdu-Pri-Port  : 0
Tx Stats
Tx-Health                : 5011
Tx-Ringup-Flushfdb      : 0
Tx-Ringdown-Flushfdb    : 0
Tx-Link-Down            : 0
Tx-Flush-Fdb            : 0
Tx-Suspend-Prefwd-Timer : 0
Tx-Query-Link-Status    : 3342
Tx-Link-Up              : 0
Tx Dropped
Tx-Unknown               : 0
Tx-Transmit-Err         : 0
Fw Stats
Fw-Link-Down            : 0
Fw-Flush-Fdb            : 0
Fw-Query-Link-Status    : 0
Fw Dropped
Fw-Unknown               : 0
Fw-Transmit-Err         : 0
```

The following command displays the global EAPS counters:

```
show eaps counters global
```

The following is sample output from this command:

```
Global counters for EAPS:
Rx-Failed : 0
Rx-Invalid-Vlan-Intf : 0
Rx-Undersize-Pkt : 0
Rx-Invalid-SNAP-Type : 0
Rx-Invalid-OUI : 0
Rx-EEP-Unsupported-Version : 0
Rx-EEP-Invalid-Length : 0
Rx-EEP-Checksum-Invalid : 0
Rx-Domain-Invalid : 0
Rx-Failed : 0
Rx-Lif-Invalid : 0
Rx-Lif-Down : 0
Tx-Failed : 0
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show eaps shared-port

```
show eaps shared-port {port} {detail}
```

Description

Displays shared-port information for one or more *EAPS* domains.

Syntax Description

| | |
|---------------|--|
| <i>port</i> | Specifies a shared-port. |
| detail | Specifies to display the status of all segments and VLANs. |

Default

N/A.

Usage Guidelines

If you enter the `show eaps shared-port` command without the `detail` keyword, the command displays a summary of status information for all configured EAPS shared ports.

If you specify an EAPS shared-port, the command displays information about that specific port and the related segment ports. The segment ports are sorted in ascending order based on their port number.

You can use this order and your knowledge of the EAPS topology to determine which segment port becomes the active-open port if the common link fails. For more information, see “Common Link Fault Detection and Response” in the [ExtremeXOS 31.3 User Guide](#).

You can use the detail keyword to display more detailed status information about the segments and VLANs associated with each shared port.

The following table describes the significant fields and values in the display output of the `show eaps shared-port {port {detail}}` commands:

| Field | Description |
|--------------|---|
| Shared Port | Displays the port number of the shared port. |
| Mode | Indicates whether the switch on either end of the common link is a controller or partner. The mode is configured by the user. |
| Link ID | The link ID is the unique common link identifier configured by the user. |
| Up | Displays one of the following: Yes—Indicates that the link ID and the mode are configured. No—Indicates that the link ID or the mode is not configured. |
| State | Displays one of the following states: Idle—Shared-port instance is not running. Ready—The EAPS shared-port instance is running, the neighbor can be reached, and the common link is up. Blocking—The EAPS shared-port instance is running, the neighbor cannot be reached, or the common link is down. Preforwarding—The EAPS shared-port instance is in a blocking state, and the common link came up. To prevent a superloop, a temporary blocking state is created before going into Ready state. |
| Domain Count | Indicates the number of EAPS domains sharing the common link. |
| VLAN Count | Indicates the total number of VLANs that are protected under the EAPS domains sharing this common link. |
| Nbr | Yes—Indicates that the EAPS instance on the other end of the common link is configured with matching link ID and opposite modes. For example, if one end of the common link is configured as a controller, the other end must be configured as a partner. Err—Indicates that the EAPS instance on the other end of the common link is configured with a matching link ID, but the modes are configured the same. For example, both modes are configured as controller, or both modes are configured as partner. No—The neighbor on the other end of the common link cannot be reached. Indicates one or more of the following: <ul style="list-style-type: none"> The switch on the other end of the common link is not running. The shared port has not been created. The link IDs on each side of the common link do not match. The common link, and any other segment, between the controller and partner are not fully connected. |
| RB ID | The ID of the root blocker. If the value is none, there are not two or more common-link failures. |

| Field | Description |
|---|--|
| RB State | None—This EAPS shared-port is not the root blocker.Active—This EAPS shared-port is the root blocker and is currently active.Inactive—This EAPS shared-port is the root blocker but is currently inactive. |
| Active Open (available with the detail keyword) | None—Indicates that there is no Active-Open port on the VLAN.Port # —Indicates the port that is Active-Open and is in a forwarding state. |
| Segment Timer expiry action | Segment down—Specifies that if the controller or partner switch detects a down segment, that segment stays down and a query is not sent through the ring. The switch marks the segment status as Down. Send alert—Specifies that if the controller or partner switch detects a down segment, that switch keeps the segment up and sends a warning message to the log (default). The switch sends a trap alert and sets the failed flag [F]. |
| Segment Port (available with the detail keyword or by specifying a shared port) | Identifies the segment port of an EAPS ring that shares the common link. |
| Status (available with the detail keyword or by specifying a shared port) | Up—Connectivity is established between the segment and the EAPS shared-port on the common link neighbor. Down—There is a break in the path between the segment and the EAPS shared-port on the common link neighbor. Blocking-Up—The path is Up, but due to the root blocker being in the Active state, this port is blocked to prevent a loop. Blocking-Down—The root blocker is in the Active state; however, the path is Down. Because the path is Down, there is no need to block the root blocker port to prevent a loop. [F]—The segment timer has expired but has not received an explicit link-down notification. The segment port remains in the Up state, with the timer expired flag set to True. |
| EAPS Domain (available with the detail keyword or by specifying a shared port) | The EAPS domain assigned to the segment port. |
| Vlan-port count (available with the detail keyword or by specifying a shared port) | The total number of VLANs being protected on this segment port. |
| Adjacent Blocking Id (available with the detail keyword or by specifying a shared port) | None—The neighbor on this port is not reporting a Controller in the Blocking state. <i>Link-Id</i> —The neighbor on this port is a controller in the Blocking state with a link ID of <i>Link-Id</i> . |
| Segment RB Id (available with the detail keyword or by specifying a shared port) | None—The neighbor on this port is not aware of a root blocker in the network. <i>RB-Id</i> —The neighbor on this port has determined that there is a root blocker in the network with a link ID of <i>RB-Id</i> . |
| Vlan (available with the detail keyword or by specifying a shared port) | Displays a list of VLANs protected by the segment port. |

| Field | Description |
|--|--|
| Virtual-port Status (available with the detail keyword or by specifying a shared port) | This information appears for the Controller, when it is in either the Blocking or Preforwarding state. Active-Open—This VLAN or port is in the Forwarding state and has connectivity to the neighboring EAPS shared port via this port. Open—This VLAN or port is in the Forwarding state but does not have connectivity to the neighboring EAPS shared port via this port. Blocked—This VLAN or port is in the Blocking state to prevent a loop in the network. Down—This port’s link is down. Active—At this moment, this VLAN or port is not being handled by EAPS shared port. Rather, this VLAN or port is being handled by the regular EAPS protocol. |
| Bvlan | When a common link connects an access VLAN (CVLAN or SVLAN) to a core VLAN (BVLAN), this field displays the BVLAN name. For more information, see the <i>Common Link Fault Detection and Response</i> section in the ExtremeXOS 31.3 User Guide . |

Example

The following command displays shared-port information for all EAPS shared ports on a switch:

```
#show eaps shared-port
EAPS shared-port count: 1
-----
Link          Domain Vlan      RB      RB
Shared-port  Mode            Id  Up State  count  count Nbr State  Id
-----
10:1         Controller 1    Y  Ready    2      1    Yes None  None
Segment Timer expiry action: Send alert
-----
```

The following command displays detailed information for all EAPS shared ports:

```
#show eaps shared-port detail
EAPS shared-port count: 1
-----
Link          Domain Vlan      RB      RB
Shared-port  Mode            Id  Up State  count  count Nbr State  Id
-----
4:1          Controller 10    Y  Blocking  2      1    Yes Active  10
Segment Timer expiry action: Send alert
Segment Port: 5:7, Status: Blocking-Up
EAPS Domain:          d1
Vlan-port count:     1
Adjacent Blocking Id: None
Segment RB Id:       None
Vlan                Virtual-port Status
p_1                  Blocked
Segment Port: 2:11,  Status: Down
EAPS Domain:          d2
Vlan-port count:     1
Adjacent Blocking Id: 20
Segment RB Id:       None
Vlan                Virtual-port Status
p_1                  Open
Vlan: p_1, Vlan-port count: 2, Active Open: None
Segment Port        Virtual-port Status
```

```
5:7          Blocked
2:11         Open
```

The following command displays detailed information for an EAPS shared port that is in the Blocking state:

```
# show eaps shared-port 1:24
-----
Link          Domain Vlan      RB      RB
Shared-port  Mode   Id  Up State  count  count Nbr State  Id
-----
1:24         Controller 10  Y  Blocking  3     5     Yes None  None
Segment Health Check interval:  1 sec
Segment Timeout:                 3 sec
Segment Fail Timer expiry action: Send alert
Common Path Health Check interval: 1 sec
Common Path Timeout:             3 sec
Segment Port: 3:35  Status: Up
EAPS Domain:        d3
Vlan-port count:    3
Adjacent Blocking Id:  None
Segment RB Id:      None
Segment Port: 3:36  Status: Up
EAPS Domain:        d2
Vlan-port count:    3
Adjacent Blocking Id:  None
Segment RB Id:      None
Segment Port: 3:38  Status: Up
EAPS Domain:        d1
Vlan-port count:    5
Adjacent Blocking Id:  None
Segment RB Id:      None
Vlan: data1,      Vlan-port count: 3,   Active Open: 3:38 Bvlan: metro1
Vlan: data2,      Vlan-port count: 3,   Active Open: 3:38 Bvlan: metro1
Vlan: data3,      Vlan-port count: 3,   Active Open: 3:38 Bvlan: metro2
Vlan: metro1,     Vlan-port count: 1,   Active Open: 3:38
Vlan: metro2,     Vlan-port count: 1,   Active Open: 3:38
-----
```

Note

The BVLAN information in the previous example appears only when a BVLAN configuration is present.

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show eaps shared-port neighbor-info

```
show eaps shared-port {port} neighbor-info {detail}
```

Description

Displays shared-port information from neighboring shared links for one or more *EAPS* domains.

Syntax Description

| | |
|---------------|--|
| <i>port</i> | Specifies a shared-port. |
| detail | Specifies to display the status of all segments and VLANs. |

Default

N/A.

Usage Guidelines

If you enter the command without the detail keyword, the command displays a summary of status information for all configured EAPS shared ports from neighboring shared links. If you specify an EAPS shared-port, the command displays information about that specific port. Otherwise, the command displays information about all of the shared-ports configured on the switch.

You can use the detail keyword to display more detailed status information about the segments and VLANs associated with each shared port. For full details of the significant fields and values in the display output of the command, see the relevant tables in the `show eaps shared port {port} {detail}` command description.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show edp

```
show edp {ports [all | ports] {detail | vlan-id {mismatch {untagged}}
        {neighbor nbr}}}
```

Description

Displays connectivity and configuration information for neighboring Extreme Networks switches.

Syntax Description

| | |
|--------------|---|
| all | Specifies all ports. |
| <i>ports</i> | Specifies one or more ports or slots and ports. |

| | |
|-----------------|---|
| vlan-id | Shows local and neighbor VLAN IDs. |
| mismatch | Shows only VLAN IDs that are mismatched to neighbor VLAN IDs. |
| untagged | Shows only mismatches for untagged ports. |
| neighbor | Shows only VLAN IDs for a specific neighbor. |
| <i>nbr</i> | Specifies the neighbor by Neighbor-ID (for example: 00:00:08:00:27:f3:f8:d9). |
| detail | Shows detailed information. |

Default

N/A.

Usage Guidelines

port_list can be one or more port numbers. For a detailed explanation of port specification, see [Port Numbering](#) in [Command Reference Overview](#). To clear the counters, use the [clear lacp counters](#) command.

The neighbor-ID value is eight bytes. The first two bytes are always set to 00:00; the last six bytes are set to the neighbor's system MAC address.

Use the `show edp` command to display neighboring switches and configurations. This is most effective with Extreme Networks switches.

Example

The following example displays the configuration of the switch:

```
# show edp
EDP advert-interval      :60 seconds
EDP holddown-interval   :180 seconds
EDP enabled on ports    :1:1 1:2 1:3 1:4 1:5 1:6 3:1 3:2 3:3 3:4
```

The following example shows Extreme switch connectivity and configuration information for port 1:1:

```
# show edp ports 1:1
Port Neighbor                Neighbor-ID Remote Age Num
Port Vlans
=====
1:1 Oban                      00:00:00:30:48:41:ed:97 1:1 54 1
=====
```

The following example displays detailed connectivity and configuration information of neighboring Extreme switches on port 1:1:

```
# show edp ports 1:1 detail
=====
Port 1:1: EDP is Enabled
Tx stats: sw-pdu-tx=2555      vlan-pdu-tx=1465      pdu-tx-err=0
Rx stats: sw-pdu-rx=2511      vlan-pdu-rx=2511      pdu-rx-err=0
Time of last transmit error: None
Time of last receive error:  None
```

```

Remote-System:      Oban                               Age = 41
Remote-ID:          00:00:00:30:48:41:ed:97
Software version:   11.1.0.19
Remote-Port:        1:1
Port Type:          Ethernet
Auto Negotiation:   OFF
Flow Control:       SYMMETRIC/ASYMMETRIC
Duplex Speed:       Configured = HALF           Actual = HALF
Port Speed (MB):    Configured = ERROR           Actual = 100 Mbps
Remote-Vlans:
test (4094) Age = 41
=====
    
```

The following example shows local and neighbor VLAN IDs on port 3:

```

# show edp port 3 vlan-id
Local      Remote                               |----- Local VLAN -----| |----- Remote VLAN
-----|
Port  Port  Neighbor ID                               ID  Name                               ID
Name                                     Age
-----|-----|-----|-----|-----|-----|
3      1:3  00:00:08:00:27:88:2e:2b  200* v2-deepsouth                200* v2-
deepsouth                                     10
                                           300 v3-articnorth                  300 v3-
articnorth                                     10
-----|-----|-----|-----|-----|-----|
3      1:3  00:00:08:00:27:f2:57:b5+  200 v2-                             1
Default                                     12
deepsouth                                     300 v3-
articnorth
-----|-----|-----|-----|-----|-----|
3      1:3  00:00:08:00:27:f3:e8:c9  200* v2-
deepsouth                                     300 v3-articnorth                300* v3-
articnorth                                     7
-----|-----|-----|-----|-----|-----|

Flags: (*) Port is untagged in VLAN, (+) Neighbor does not send port tagged/untagged
information
    
```

The following example show mismatched neighbor VLAN IDs for untagged ports on port 3 :

```

# show edp port 3 vlan-id mismatch untagged

History

This command was first available in ExtremeXOS 10.1.

Mismatched VLAN IDs check ability was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show elrp

```
show elrp
```

Description

Displays ELRP information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following:

- State of ELRP (enabled/disabled).
- Total number of ELRP sessions.
- ELRP packets transmitted.
- ELRP packets received.

In addition to the summary information at the top of the display, the `show elrp` command also displays the following information:

| | |
|-------------|---|
| Client | Displays the name of the ELRP client. |
| <u>VLAN</u> | Displays the name of the VLAN with ELRP enabled. |
| Ports | Displays the set of VLAN ports used for packet transmission. |
| Interval | Displays the configured interval. An interval of 3 indicates that ELRP PDUs are transmitted every 3 seconds. |
| Count | Lists the configured number of ELRP PDUs that are transmitted. The PDUs are transmitted at the configured interval. This method of ELRP PDU transmission is used by <u>ESRP</u> in the pre-master state. A count of 0 indicates continuous PDU transmission. If the Cyclic value is Yes, the count is always 0. |

| | |
|--------------|--|
| Cyclic | Indicates whether ELRP PDUs are being continuously sent. The column shows Yes for the master VLAN because that VLAN is continuously sending ELRP PDUs for loop detection. When a VLAN is in the pre-master state, it only sends three ELRP PDUs before changing to master or slave. During this time the column shows No for that VLAN. |
| Pkts-Xmit | Displays the number of ELRP PDUs transmitted. |
| Pkts-Rcvd | Displays the number of ELRP PDUs received. |
| Action | Displays the configured action the switch takes when ELRP messages are received back indicating a detection of a network loop or no packets are received within the specified duration. The following list describes the actions: Print (P)—Specifies that the switch prints a message to the console. Log (L)—Specifies that the switch sends a message to the system log file. Trap (T)—Specifies that the switch sends a message to the <i>SNMP</i> manager. Callback (C)—Specifies a callback action. If you use ELRP with another protocol (for example ESRP), ELRP uses a callback action to notify the protocol of a loop detection. |
| Disable Port | Displays the configured hold time (number of seconds or permanent) for a port that was disabled with the <code>configure elrp-client periodic</code> command. When the time in seconds expires, the port is automatically enabled. |

With hardware-assisted ELRP, one ACL egress counter is used to record ELRP PDUs transmitted per VLAN port, and the displayed Pkts-Xmit is calculated after all egress counters are queried from hardware. If show commands are executed very frequently, the statistics might not change every time.

Example

The following example displays summary ELRP status information on the switch:

```
# show elrp

ELRP Standalone Client:      Enabled
ELRP Inter-VLAN loop detection: On
ELRP client hardware assist: Enabled
Loopback port:              1

Number of ELRP sessions:    1
Number of ELRP pkts transmitted: 0
Number of ELRP pkts received: 0

Disable Client VLAN          Ports          Interval          Pkts          Pkts
(sec)                        (sec)      (sec) Count Cyclic   Xmit          Rcvd Action Port
-----
CLI   Default                All,          1.0            0 Yes          0            0 LT
-
                                All VXLAN RTEPs
-----
----
```

History

This command was first available in ExtremeXOS 11.1.

VXLAN remote endpoint information was added in ExtremeXOS 22.4.

Hardware-assisted ELRP information was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show elrp disabled-ports

```
show elrp disabled-ports
```

Description

Displays information about ELRP disabled ports.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the results of disabling ports using the `configure elrp-client periodic` command.

This command displays the following:

- Exclude EAPS ring ports—Whether EAPS ring ports can be excluded.
- Exclude VXLAN RTEPs—Whether VXLAN remote endpoints can be excluded.
- Exclude inter-VLAN loop ports—Whether inter-VLAN loop ports can be excluded.
- Excluded Ports—User defined ports that will not be disabled.
- Disabled Port—The port that ELRP disabled.
- Detected VLAN—The VLAN with looping ELRP PDU(s).
- Duration—The configured time to keep the port disabled.
- Time Disabled—The time when ELRP disabled the port.

Example

The following example shows ELRP information for disabled ports:

```
# show elrp disabled-ports

Exclude EAPS ring ports : No
Exclude VXLAN RTEPs    : Yes
```

```

Exclude inter-VLAN loop ports :No
Excluded Ports
-----

-----

Disabled          Detected          Duration   Time
Disable
Port/Virtual Port   Vlan             (sec)      Disabled
Direction
-----
--
-----
--

```

History

This command was first available in ExtremeXOS 12.4.

The excluded port list was added in ExtremeXOS 12.5.3.

VXLAN remote endpoint exclusion information was added in ExtremeXOS 22.4.

Inter-VLAN loop ports exclusion information was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show elrp dynamic-vlans

```
show elrp dynamic-vlans {vm-tracking | netlogin | mvrp | all}
```

Description

This command shows ELRP configuration information for all, or specific types of, dynamic [VLANs](#).

Syntax Description

| | |
|----------------------|--|
| dynamic-vlans | ELRP configuration options for dynamically created VLANs. |
| mvrp | Shows ELRP information for dynamic VLANs created by Multiple VLAN Registration Protocol (MVRP) only. |
| netlogin | Shows ELRP information for dynamic VLANs created by Network Login only. |
| vm-tracking | Shows ELRP information for dynamic VLANs created by virtual machine MAC tracking only. |
| all | (Default) Shows ELRP information for all dynamic VLANs. |

Default

If you do not specify the type of dynamic VLAN, information about all types appear.

Example

The following example shows ELRP information for all types of dynamic VLANs:

```
# show elrp dynamic-vlans

VM-Tracking :
ELRP on client ports : Enabled
ELRP on uplink ports : Disabled
Transmit interval   : 1 second(s)
Loop detect action  : log and trap
Port disable on loop : Yes
Disabled port       : Ingress
Disabled duration   : 30 seconds

Netlogin :
ELRP on client ports : Enabled
ELRP on uplink ports : Disabled
Transmit interval   : 2 second(s)
Loop detect action  : log
Port disable on loop : No

MVRP
Transmit interval   : 3 second(s)
Loop detect action  : trap
Port disable on loop : Yes
Disabled port       : Egress
Disabled duration   : Permanent
```

The following example shows ELRP information for dynamic VLANs created by virtual machine MAC tracking only:

```
# show elrp dynamic-vlans vm-tracking
VM-Tracking:
ELRP for dynamic VLANs      : Enabled
ELRP on client ports        : Enabled
ELRP on uplink ports        : Enabled
```

History

This command was first available in ExtremeXOS 22.2.

Loop detection action information was added in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show elsm ports

```
show elsm ports all | port_list
```

Description

Displays detailed information for one or more ELSM-enabled ports.

Syntax Description

| | |
|------------------|---|
| all | Displays detailed ELSM information for all ports. |
| <i>port_list</i> | Displays detailed ELSM information for one or more ports. |

Default

N/A.

Usage Guidelines

Use this command to display detailed information about the operational state of ELSM on the configured ports.

This command displays in a tabular format the following ELSM data for one or more ELSM-enabled ports on the switch:

- Port—The port number of the ELSM-enabled port.
- Link State—The state of the link between ELSM-enabled (peer) ports. The link state can be one of the following:
 - Ready—Indicates that the port is enabled but there is no link.
 - Active—Indicates that the port is enabled and the physical link is up.
- ELSM Link State—The current state of the ELSM logical link on the switch. The ELSM link state can be one of the following:
 - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
 - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM State—The current state of ELSM on the port. The ELSM state can be one of the following:
 - Up—Indicates a healthy remote system and this port is receiving Hello+ messages from its peer.

If an ELSM-enabled port enters the Up state, the up timer begins. Each time the port receives a Hello+ message from its peer, the up timer restarts and the port remains in the Up state. The up timer is 6* hello timer, which by default is 6 seconds.
 - Down—Indicates that the port is down, blocked, or has not received Hello+ messages from its peer.

If an ELSM-enabled port does not receive a hello message from its peer before the up timer expires, the port transitions to the Down state. When ELSM is down, data packets are neither forwarded nor transmitted out of that port.
 - Down-Wait—Indicates a transitional state.

If the port enters the Down state and later receives a Hello+ message from its peer, the port enters the Down-Wait state. If the number of Hello+ messages received is greater than or equal to the hold threshold, the port transitions to the Up state. If the number of Hello+ messages received is less than the hold threshold, the port enters the Down state.

- Down-Stuck—Indicates that the port is down and requires user intervention.

If the port repeatedly flaps between the Up and Down states, the port enters the Down-Stuck state. Depending on your configuration, there are two ways for a port to transition out of this state:

By default, automatic restart is enabled, and the port automatically transitions out of this state. See the command `enable elsm ports auto-restart` for more information.

If you disabled automatic restart, and the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

```
clear elsm ports port_list auto-restart
```

```
enable elsm ports port_list auto-restart
```

- Hello Transmit State—The current state of ELSM hello messages being transmitted. The transmit state can be one of the following:
 - HelloRx(+)—Specifies that the ELSM-enabled port is up and receiving Hello+ messages from its peer. The port remains in the HelloRx+ state and restarts the HelloRx timer each time it receives a Hello+ message. If the HelloRx timer expires, the hello transmit state enters HelloRX(-). The HelloRx timer is 6 * hello timer, which by default is 6 seconds.
 - HelloRx(-)—Specifies that the ELSM-enabled port either transitions from the initial ELSM state or is up and not receiving hello messages because there is a problem with the link or the peer is missing.
- Hello time—The current value of the hello timer, which by default is 1 second. The hello timer indicates the number of seconds between consecutive hello messages.
- Hold Threshold—The number of Hello+ messages required by the ELSM-enabled port to transition from the Down-Wait state to the Up state within the hold threshold.
- UpTimer Threshold—The number of hello times that span without receiving Hello+ packets before a port changes its ELSM state from Up to Down.
- Auto Restart—The current state of ELSM automatic restart on the port. The state of Auto Restart can be one of the following:
 - Enabled—If an ELSM-enabled port goes down, ELSM automatically brings up the down port. This is the default behavior.
 - Disabled If an ELSM-enabled port goes down, the port enters and remains in the Down-Stuck state until you clear the stuck state.

For more information about automatic restart, see the command `enable elsm ports auto-restart`.

- Sticky Threshold—Specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.

- Sticky Threshold Counter—The number of times the port transitions from the Up state to the Down state.
- Down Timeout—The actual waiting time (msecs or secs) before a port changes its ELSM state from Down to Up. When ELSM is enabled on a port and it is in a Down state, before it changes its ELSM state from Down to Up, it expects to receive at least a “Hold Threshold” number of Hello+ packets during the Down Timeout period after it receives the first Hello+ packet from its peer. It is equal to $[\text{Hello Time} * (\text{Hold Threshold} + 2)]$.
- Up Timeout—The actual waiting time (msecs or secs) before a port changes its ELSM state from Up to Down after receiving the last Hello+ packets. When a port is in an Up state, it expects to receive a Hello+ packet from its peer every “Hello Time” period to maintain its Up state. When it does not receive a Hello+ packet after an “Up Timeout” period, it changes its ELSM state from Up to Down. It is equal to $[\text{Hello Time} * \text{UpTimer Threshold}]$.

The remaining output displays counter information. Use the counter information to determine the health of the ELSM peers and how often ELSM has gone up or down. The counters are cumulative.

- RX Hello+—The number of Hello+ messages received by the port.
- Rx Hello- —The number of Hello- messages received by the port.
- Tx Hello+—The number of Hello+ messages sent by the port.
- Tx Hello- —The number of Hello- messages sent by the port.
- ELSM Up/Down Count—The number of times ELSM has been up or down.

To clear, reset the counters, use either the `clear elsm {ports port_list} counters` or the `clear counters` command.

Additional show Command

You can also use the `show ports {port_list} information {detail}` command to display ELSM information.

If you do not specify the detail parameter, the following columns display the current state of ELSM on the switch:

- Flags:
 - L—Indicates that ELSM is enabled on the switch.
 - - —Indicates that ELSM is disabled on the switch.
- ELSM:
 - up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
 - dn—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
 - - —Indicates that ELSM is disabled on the switch.

If you specify the optional detail parameter, the following ELSM output is called out in written explanations versus displayed in a tabular format:

- ELSM Link State (displayed only if ELSM is enabled on the switch).
 - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
 - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM:
 - Enabled—Indicates that ELSM is enabled on the switch.
 - Disabled—Indicates that ELSM is disabled on the switch.

Example

The following command displays detailed ELSM information for all configured ports on the switch:

```
show elsm ports all
```

The following is sample output from this command:

```

ELSM Info Port 4:4
Link State           : Active
ELSM Link State     : Up
ELSM State          : Up
Hello Transmit State : HelloRx(+)

Tx Hello-           : 0
ELSM Up/Down Count  : UP: 0    DOWN: 0
ELSM Info Port 4:4
Link State           : Active
ELSM Link State     : Up
ELSM State          : Up
Hello Transmit State : HelloRx(+)
Hello Time          : 100 msec
Hold Threshold      : 2
UpTimer Threshold   : 6
Auto Restart        : Disabled
Sticky Threshold    : 1
Sticky Threshold Counter : 0
Down Timeout        : 400 msec
Up Timeout          : 600 msec
Rx Hello+           : 708204
Rx Hello-           : 0
Tx Hello+           : 708201

```

```
Tx Hello-          : 0
ELSM Up/Down Count : UP: 0   DOWN: 0
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show elsm

```
show elsm
```

Description

Displays summary information for all of the ELSM-enabled ports on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the operational state of ELSM on the configured ports.

If no ports are configured for ELSM, the switch does not display any information.

For ELSM-enabled ports, this command displays the following information in a tabular format:

- Port—The port number of the ELSM-enabled port.
- ELSM State—The current state of ELSM on the port. The ELSM state can be one of the following:
 - Up—Indicates a healthy remote system and this port is receiving Hello+ messages from its peer.

If an ELSM-enabled port enters the Up state, the up timer begins. Each time the port receives a Hello+ message from its peer, the up timer restarts and the port remains in the Up state.

- Down—Indicates that the port is down, blocked, or has not received Hello+ messages from its peer.

If an ELSM-enabled port does not receive a hello message from its peer before the up timer expires, the port transitions to the Down state. When ELSM is down, data packets are neither forwarded nor transmitted out of that port.

- Down-Wait—Indicates a transitional state.

If the port enters the Down state and later receives a Hello+ message from its peer, the port enters the Down-Wait state. If the number of Hello+ messages received is greater than or equal to the hello threshold (by default 2 messages), the port transitions to the Up state. If the number of Hello+ messages received is less than the hold threshold, the port enters the Down state.

- Down-Stuck—Indicates that the port is down and requires user intervention.

If the port repeatedly flaps between the Up and Down states, the port enters the Down-Stuck state. Depending on your configuration, there are two ways for a port to transition out of this state:

By default, automatic restart is enabled, and the port automatically transitions out of this state. See the command `enable elsm ports auto-restart` for more information.

If you disabled automatic restart, and the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

```
clear elsm ports port_list auto-restart
```

```
enable elsm ports port_list auto-restart
```

- Hello time —The current value of the hello timer, which by default is 1 second. The hello timer indicates the number of seconds between consecutive hello messages.

Additional show Command

You can also use the `show ports {port_list} information {detail}` command to display ELSM information.

If you do not specify the detail parameter, the following columns display the current state of ELSM on the switch:

- Flags:
 - L—Indicates that ELSM is enabled on the switch.
 - - —Indicates that ELSM is disabled on the switch.
- ELSM:
 - up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
 - dn—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
 - - —Indicates that ELSM is disabled on the switch.

If you specify the optional detail parameter, the following ELSM output is called out in written explanations versus displayed in a tabular format:

- ELSM Link State (displayed only if ELSM is enabled on the switch):
 - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.

- Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM:
 - Enabled—Indicates that ELSM is enabled on the switch.
 - Disabled—Indicates that ELSM is disabled on the switch.

Example

The following command displays summary configuration information for all of the ELSM-enabled ports on the switch:

```
show elsm
```

The following is sample output from this command:

```
Port      ELSM State   Hello Time
====      ============
5:14      Up 1 (second)
5:18      Down        1 (second)
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show erps

```
show erps
```

Description

Display global information for *ERPS*.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to display global information for ERPS.

Example

```
# show erps

ERPS Enabled: Yes
ERPS Display Config Warnings: On
ERPS Multicast Add Ring Ports: Off
ERPS Multicast Send IGMP Query: On
ERPS Multicast Temporary Flooding: Off
ERPS Multicast Temporary Flooding Duration: 15 sec
Number of ERPS instances: 1
# ERPS ring configuration :

-----
Ring          State          Type   East   West   Control-Vlan  VID
-----
R1            Protection    R r    21     +20    cvl            (1000)
-----

where State: Init/Idle/Protection/Manual-Switch/Force-Switch/Pending
Type: (I) Interconnected node, (N) RPL Neighbor,
      R) RPL Owner, (X) Ring node
Flags: (n) Non-revertive, (r) Revertive,
      (+) RPL Protection Port, (^) RPL Neighbor Port
      (f) Force Switch Port, (m) Manual Switch Port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps ring-name

```
show erps ring-name
```

Description

Display specific details for an ERPS ring.

Syntax Description

| | |
|------------------|--|
| <i>ring-name</i> | Alphanumeric string that identifies the ERPS ring. |
|------------------|--|

Default

N/A.

Usage Guidelines

Use this command to display specific details for an ERPS ring.

Example

The following example displays details for an ERPS ring named "R1":

```
# show erps "R1"

Name: R1
Operational State: Protection enabled           Node Type: RPL Owner, Revertive
Configured State : Enabled

East Ring Port : 21 MepId: 1 Remote MepId: 3      Status: Blocked
West Ring Port : +20 MepId: 2 Remote MepId: 4      Status: Blocked

Periodic timer interval: 5000 millisec (Enabled)
Hold-off timer interval: 0 millisec (Enabled)
Guard timer interval : 500 millisec (Enabled)
WTB timer interval : 5500 millisec (Enabled)
WTR timer interval : 1000 millisec (Enabled)

Ring MD Level : 1
CCM Interval East : 1000 millisec
CCM Interval West : 1000 millisec
Notify Topology Change : -----
Subring Mode : Virtual Channel

ERPS Control Vlan: cv1 VID:1000
Topology Change Propagation List: None
Topology Change Propagation : Disabled
ERPS Ring's Sub-Ring(s): None
ERPS Ring has following Protected Vlan(s):
  Vlan Name      VID
  pvl            1001

Number of Protected Vlans: 1
(+) RPL Protection Port, (^) RPL Neighbor Port
(f) Force Switch Port, (m) Manual Switch Port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps statistics

```
show erps ring-name statistics
```

Description

Display control packet and event statistics for an ERPS ring.

Syntax Description

| | |
|------------------|--|
| <i>ring-name</i> | Alphanumeric string that identifies the ERPS ring. |
|------------------|--|

Default

N/A.

Usage Guidelines

Use this command to display control packet and event statistics for an ERPS ring.

Example

The following example displays statistics for an ERPS ring named "R1":

```
# show erps "R1" statistics

```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show esrp

```
show esrp { {name} | {type [vpls-redundancy | standard]} }
```

Description

Displays *ESRP* configuration information for one or all ESRP domains on the switch.

Syntax Description

| | |
|------------------------|---|
| name | Specifies an ESRP domain name. |
| type | Specifies whether ESRP is standard or redundant VPLS. |
| vpls-redundancy | Specifies redundant VPLS. |
| standard | Specifies standard ESRP. |

Default

Shows summary ESRP information.

Usage Guidelines

This command shows information about the state of an ESRP domain and its neighbors. This includes information about tracked devices.

In addition to ESRP information, ELRP status information is also displayed. This includes information about the master and pre-master states, number of transitions to the pre-master state, and the ports where ELRP is disabled.

The output varies depending upon the configuration and the state of the switch.

Example

The following command displays summary ESRP status information for the ESRP domains on the switch:

```
show esrp
```

The following is sample output from this command:

```

ESRP:                               Enabled
Configured Version:                 Extended
# ESRP domain configuration :
----- Domain
Grp Ver VLAN   VID  DId  IP/IPX      State  Master MAC Address Nbr
-----
ed2   0  E v2      2    2    2.2.2.3     Master 00:01:30:f9:9e:90 0
ed2   5  E v2      2    2    2.2.2.3     Aware  00:01:00:0D:9e:8a 0
ed3   0  E v3      3    3    0.0.0.0     Aware  00:01:00:0C:F0:D1 0
ed4   0  E v4      4    4    0.0.0.0     Slave  00:00:00:00:00:00 0
-----
# ESRP Port configuration:
-----
Port      Weight      Host      Restart
-----

6:2       10
6:3       0           R

```

The following command displays detailed ESRP status information for the specified ESRP domain on the switch (the election policy displayed is the default policy in extended mode):

```
show esrp ed2
```

The following is sample output from this command:

```

show esrp ed2
Domain:                ed2
Group:                 0
Operational Version:  extended
Vlan Interface:       v2

```

History

This command was first available in ExtremeXOS 11.0.

ELRP status information was added in ExtremeXOS 11.1.

Ping success information added in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show esrp aware

```
show esrp domain aware {selective-forward-ports | statistics}
```

Description

Displays all selective forwarding information for a given *ESRP*-aware domain.

Syntax Description

| | |
|--------------------------------|---|
| <i>domain</i> | Specifies the name of an ESRP domain. |
| selective-forward-ports | Specifies that the selective-forward-port table is the only table displayed. |
| statistics | Specifies that the selective-forward-port statistics table is the only table displayed. |

Default

Disabled.

Usage Guidelines

An ESRP-aware switch floods ESRP PDUs from all ports in an ESRP-aware *VLAN*. This flooding creates unnecessary network traffic because some ports forward ESRP PDUs to switches that are not running the same ESRP groups. You can select the ports that are appropriate for forwarding ESRP PDUs by configuring selective forwarding on an ESRP-aware VLAN and thus reduce this excess traffic. Configuring selective forwarding creates a port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware VLAN. This aware port list is then used for forwarding ESRP PDUs.

The first of the two tables that this command displays shows Selective Forward Ports information:

- Group—The number of an ESRP group within the given domain.
- Port Count—The number of ports in the group that are selected to forward PDUs on the master VLAN.
- Selective Forward Ports—The list of ports in the group that are selected to forward PDUs on the master VLAN.

The second of the two tables displays statistical information about the activity of the ports:

- Group—The number of an ESRP group within the given domain.
- Master MAC—The MAC address for the master of the group.
- Rx—The number of PDUs received matching the domain/group pair.
- Fwd—The number of PDUs received and forwarded matching the domain/group pair.
- *FDB* Flush—The number of FDB Flush requests received from the ESRP Master for this domain/group pair.
- Fwd Ports—Selective or Default.

Selective describes the group as having a configured aware port list for selective forwarding of PDUs on the Master VLAN. The list of ports is displayed in the first table above.

Default describes the group as one where all the ports on the master VLAN forward the ESRP PDUs that are received for the domain/group pair. Because there is no selective forwarding configuration for this group, there is no entry in the first table.

Example

The following command displays the ESRP aware information for the domain d1.

```
show esrp d1 aware
Domain:          d1
Vlan:           vesrp1
-----
Group           Port Count           Selective Forward Ports
-----
0               5               5:1, 5:2, 7:31, 7:32: 8:1
3               2               5:1, 8:1
-----
Group           Master MAC           Rx           Fwd
FDB Flush           Fwd Ports
-----
0               00:12:00:33:44:55           10
10              1               selective
1               00:22:00:12:21:1F           77
77              3
default
3               00:02:00:13:11:11           99
99              3               selective
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show esrp counters

```
show esrp {name} counters
```

Description

Displays *ESRP* counter information for ESRP or for a specified ESRP domain.

Syntax Description

| | |
|-------------|--------------------------------|
| <i>name</i> | Specifies an ESRP domain name. |
|-------------|--------------------------------|

Default

Displays summary ESRP counter information.

Usage Guidelines

The `show esrp counters` command displays information about the number of:

- Failed received protocol packets
- Failed sent protocol packets
- Dropped protocol packets belonging to unknown ESRP domains
- Dropped protocol packets due to invalid Extreme Encapsulation Protocol (EEP) data
- Dropped packets due to old sequence numbers
- Dropped packets due to an invalid 802.1Q tag
- Dropped packets because the packet length was truncated (packet length is less than expected)
- Dropped packets due to failed checksum verification

The `show esrp {name} counters` command displays information about the number of times ESRP, ESRP-aware, and ESRP error packets were transmitted and received.

Example

The following command displays ESRP counter information:

```
show esrp counters
```

The following is sample output from this command:

```
Current-time:                Sun Nov 16 00:25:08 2003
esrpStatsRxHelloFailed      = 0
esrpStatsTxHelloFailed      = 0
esrpStatsUnknownDomain     = 0
esrpStatsUnsupportedEEPVersion = 0
esrpStatsInvalidEEPLength  = 0
esrpStatsNotInTimeWindow   = 0
esrpStatsInvalid8021Qtag   = 0
esrpStatsInvalidSNAPType   = 0
esrpStatsUndersizePkt      = 0
esrpStatsInvalidChecksum   = 0
esrpStatsWrongDigest       = 0
```

The following command displays counter information for ESRP domain ed5:

```
show esrp ed5 counters
```

The following is sample output from this command:

```
Domain: ed5                Current-time: Sun Nov 16 00:25:27 2003
Rx-Esrp-Pkts              = 628      Tx-Esrp-Pkts              = 630
Rx-Aware-Esrp-Pkts       = 112     Tx-Aware-Esrp-Pkts       = 34
Rx-Err-Pkts               = 0       Tx-Err-Pkts               = 0
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ethernet oam

```
show ethernet oam {ports [port_list] {detail}}
```

Description

Displays Ethernet OAM information.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies the particular ports. |
| detail | Specifies that detailed information be displayed. |

Default

N/A.

Usage Guidelines

Use this command to display basic Ethernet OAM information for specified ports on the switch. If you do not specify the port(s), information for all ports is displayed.

Use the detail option for additional information.

When operating as a stack master, the switch can process this command for ports on supported platforms.

Example

The following command displays basic Ethernet OAM information for all ports:

```
show ethernet oam
```

Following is sample output from the command:

```
switch # show ethernet oam
=====
Port  Flags  Tx Cnt Rx Cnt Tx Err Rx Err
=====
1     E--u   2      2      0      0
2     ---u   0      0      0      0
3     E-Ru   2      2      0      0
4     ---u   0      0      0      0
5     EU-u   0      0      0      0
6     ---u   0      0      0      0
7     ---u   0      0      0      0
```

```

8      ---u      0      0      0      0
9      ---u      0      0      0      0
10     ---u      0      0      0      0
11     ---u      0      0      0      0
12     ---u      0      0      0      0
13     ---u      0      0      0      0
14     ---u      0      0      0      0
15     ---u      0      0      0      0
16     ---u      0      0      0      0
17     ---u      0      0      0      0
18     ---u      0      0      0      0
19     ---u      0      0      0      0
20     ---u      0      0      0      0
21     ----      0      0      0      0
22     ----      0      0      0      0
23     ----      0      0      0      0
24     ----      0      0      0      0
25     ----      0      0      0      0

         (u) Unidirectional OAM Supported

```

The following command displays detailed information for port 1:

```
show ethernet oam port 1 detail
```

Following is sample output from the command:

```

switch # show ethernet oam port 1 detail
Port Number      : 1
Admin Status     : Enabled           Unidirectional OAM : Supported
Oper Status      : Disabled         Remote Fault       : Not Exists
Tx Pkts          : 2527              Rx Pkts            : 2550
Tx Error         : 0                 Rx Error           : 0

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fabric attach agent

```
show fabric attach agent
```

Description

Displays known fabric attach agent information.

Syntax Description

| | |
|--------------|---|
| agent | Displays Fabric Attach agent information. |
|--------------|---|

Default

N/A.

Example

The following example shows Fabric Attach agent information:

```
# show fabric attach agent
Fabric Attach Agent Status
-----
Service Status:           Enabled
Element Type:             Disabled
Zero Touch Status:       Not Supported
Auto Provision Setting:   Not Supported
Provision Mode:          Not Supported
Client Proxy Status:     Enabled
Standalone Proxy Uplink: 10
Agent Timeout:           240 seconds
Extended Logging Status: Not Supported
Primary Server ID:       00-04-96-a0-a4-93-00-01-00-05
Server Descr: ExtremeXOS (X670G2-48x-4q) version 22.5.0.43 xos_22.5
    by cmbuild on Wed Mar 28 08:57:47 EDT 2018
Forward Management VLAN: Enabled
```

History

This command was first available in ExtremeXOS 22.5.

The information about whether or not Fabric Attach proxy switches send Management VLAN data to clients was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fabric attach assignments

```
show fabric attach {{vlan} | {vlan} vlan_name | vlan vlan_id}
    assignments
```

Description

Displays known fabric attach assignment information.

Syntax Description

| | |
|--------------------|------------------------------------|
| assignments | Display Fabric Attach assignments. |
| vlan | Designates specifying the VLAN. |
| <i>vlan_name</i> | Specifies VLAN name. |
| <i>vlan_id</i> | Specifies VLAN ID. |

Default

N/A.

Example

The following example shows Fabric Attach assignments information:

```
# show fabric attach assignments
Fabric Attach Mode: Proxy
Port      VLAN  VLAN Name                Type      ISID/NSI  Status
-----  -
          100  VLAN_0100                Static    100       Active
          400  v4                        Static    400       Active
          1000 VLAN_1000                 Static    1000      Active
5         400  v4                        Dynamic   404040    Rejected
9         20   SYS_VLAN_0020            Dynamic   20        Active
9         2500 SYS_VLAN_2500            Dynamic   25        Active
9         3500 SYS_VLAN_3500            Dynamic   35        Active
```

History

This command was first available in ExtremeXOS 30.2.

VLAN syntax was clarified in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fabric attach elements

```
show fabric attach elements
```

Description

Displays known fabric attach elements information.

Syntax Description

| | |
|-----------------|---|
| elements | Display Fabric Attach elements (neighbors). |
|-----------------|---|

Default

N/A.

Example

The following example shows Fabric Attach element information:

```
# show fabric attach elements
Fabric Attach Mode: Standalone Proxy

System Id                Port    Type                Mgmt    Auto
-----                -
00-21-70-f2-37-05-00-00-00-00 2      Virtual Switch     1212 Mix Disabled
6c-a8-49-5a-44-00-00-00-00-d3 20     Server (No Auth)  1212 Mix Disabled
```

History

This command was first available in ExtremeXOS 22.4.

The the term **neighbors** was changed to **elements** in ExtremeXOS 22.5.

Standalone proxy mode information was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

NEW! show fabric attach port

```
show fabric attach ports [port_list | all]
```

Description

Displays the Fabric Attach port configuration.

Syntax Description

| | |
|------------------|--|
| ports | Specifies the port to configure. |
| <i>port_list</i> | Specifies a list of ports to configure. |
| all | Specifies configuring all ports in the system. |

Default

If no mapping is present, no information will be displayed for the client type.

Usage Guidelines

Use this command to display configured Fabric Attach ports.

Example

The following example displays configured Fabric Attach ports:

```
# show fabric attach ports 25
Port          Disabled Management Forward Authentication
-----
25            Yes           Off              Disabled
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fabric attach ports authentication

```
show fabric attach ports [port_list | all] authentication {detail}
```

Description

Shows Fabric Attach authentication information.

Syntax Description

| | |
|-----------------------|--|
| ports | Specifies ports to show. |
| <i>port_list</i> | Specifies the list of ports to show. |
| all | Shows information for all ports in the system. |
| authentication | Specifies showing Fabric Attach authentication information. |
| detail | Specifies showing detailed Fabric Attach authentication information. |

Default

N/A.

Usage Guidelines

This command shows the configuration settings from the `configure fabric attach ports [port_list | all] authentication [disable | enable | key {key | default | encrypted encrypted_key}]` command.

Example

The following example shows Fabric Attach authentication information on port 1:

```
# show fabric attach ports 1 authentication
Port      Authentication
-----
1         Enabled
```

The following example shows detailed Fabric Attach authentication information on all ports:

```
show fabric attach ports all authentication detail
Port      Authentication  Encrypted Key
-----
1         Enabled        "#$GuZJvU40xnRwKd+PU1sBxSwfpQYr5w=="
2         Disabled       "#
$4MoonVveq8vrk9BrKO9I673CCDfnWUEcAcKeTZcvQup3XFapn36GWvMGXA13TpufRUXPZPV2geztybwV/0xfLoFt
+zg/4g=="
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fabric attach statistics

```
show fabric attach statistics
```

Description

Displays known fabric attach statistics information.

Syntax Description

| | |
|-------------------|------------------------------------|
| statistics | Displays Fabric Attach statistics. |
|-------------------|------------------------------------|

Default

N/A.

Usage Guidelines

To clear these statistics, use the `clear counters` command.

Example

The following example shows Fabric Attach statistics information:

```
# show fabric attach statistics
Port      Element Received      Element Timed Out      Element Deleted      Auth Failed
-----
1:20      4000000000 4000000000 4000000000 N/A
1:2       25          0          3          N/A
2:32     1234        0          12         N/A
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

NEW! show fabric attach zero-touch-client

```
show fabric attach zero-touch-client
```

Description

Displays the configured ZTC mappings for Fabric Attach Zero Touch Clients.

Syntax Description

| | |
|--------------------------|------------------------------|
| zero-touch-client | Displays Zero Touch Clients. |
|--------------------------|------------------------------|

Default

If no mapping is present, no information will be displayed for the client type.

Usage Guidelines

This command is only used when mappings are present.

Example

The following example displays configured Fabric Attach Zero Touch Clients:

```
# show fabric attach zero-touch-client
Client Name      VLAN Name      NSI/I-SID Priority Status
-----
wap-type1       VLAN_123       11111 dot1p Enabled
camera          VLAN_200       2000          5 Disabled
ona-spb-over-ip VLAN_4001      40001          7 Enabled
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show failsafe-account

```
show failsafe-account
```

Description

Displays whether the user configured a username and password for the failsafe account or shows the configured connection type access restrictions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the failsafe account configuration.

The command shows the access permissions and whether or not the user configured a username and password. It does not show the configured username or password.

Example

The following command displays the failsafe account configuration:

```
show failsafe-account
```

Output from this command looks similar to the following when a failsafe account username and password have been configured with all connections types permitted for failsafe account access:

```
The Failsafe Account is enabled for these connection types:  
- Serial Console  
- Control Fabric (inter-node)
```

Output from this command looks similar to the following when the factory default (i.e. no user-specified username and password are configured) is in effect:

```
The Failsafe Account is disabled.
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fans

```
show fans {detail}
```

Description

Displays the status of the fans in the system.

Syntax Description

| | |
|---------------|---|
| detail | The detail option is reserved for future use. |
|---------------|---|

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the health of the fans.

This status information may be useful for your technical support representative if you have a network problem.

The switch collects and displays the following fan information:

- State—The current state of the fan. Options are:
 - Empty: There is no fan installed.
 - Failed: The fan failed.
 - Operational: The fan is installed and working normally.
- NumFan—The number of fans in the fan tray.
- Fan Name, displayed as Fan-1, Fan-2, and so on—Specifies the individual state for each fan in a fan tray and its current speed in revolutions per minute (rpm).

Note

For the ExtremeSwitching X435-24P-4S switches, you cannot view the fan speed.

Bridge Port Extenders (BPEs)

Fan information for bridge port extenders (BPEs) does not appear in this command. Use the `show vpx bpe {slot slot_num} {environment}` command instead.

Example

The following command displays the status of the installed fans. If a fan is not installed, the state of the fan is Empty.

```
show fans
```

The following is sample output from an ExtremeSwitching switch:

```
FanTray information:
State:                Operational
NumFan:               6
PartInfo:             0931G-00064 450237-00-05
Revision:             5.0
Fan-1:                Operational at 14894 RPM
Fan-2:                Operational at 15360 RPM
Fan-3:                Operational at 15360 RPM
Fan-4:                Operational at 9637 RPM
Fan-5:                Operational at 9637 RPM
Fan-6:                Operational at 9637 RPM
```

The following is a sample output from a SummitStack:

```
FanTray-1 information:
State:                Operational
NumFan:               1
Fan-1:                Operational at 1000 RPM
FanTray-2 information:
State:                Operational
NumFan:               1
Fan-1:                Operational at 1000 RPM
FanTray-3 information:
State:                Operational
NumFan:               1
Fan-1:                Operational at 1000 RPM
FanTray-4 information:
State:                Operational
NumFan:               1
Fan-1:                Operational at 1000 RPM
FanTray-5 information:
State:                Empty
FanTray-6 information:
State:                Empty
FanTray-7 information:
State:                Empty
FanTray-8 information:
State:                Empty
```

History

This command was first available in an ExtremeXOS 10.1.

Information about the current speed in RPM was added to the `show fans` output in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

For ExtremeSwitching X435 series switches, only the X435-24P-4S switches have a fan (internal).

show fdb

```
show fdb {blackhole {netlogin [all | mac-based-vlans]} | netlogin [all |
mac-based-vlans] | permanent {netlogin [all | mac-based-vlans]} |
mac_addr {netlogin [all | mac-based-vlans]} | ports port_list
{netlogin [all | mac-based-vlans]} | [ {vlan} vlan_name | vlan
vlan_list] {netlogin [all | mac-based-vlans]} | {{vpls} {vpls_name} |
vxlan { vni } | virtual-network vn_name}}
```

Description

Displays *FDB* entries.

Syntax Description

| | |
|---------------------------------|---|
| blackhole | Displays the blackhole entries. (All packets addressed to these entries are dropped.) |
| slot | Specifies a slot in the switch. |
| num_entries | Specifies the maximum number of hardware entries to display. The range is 1 to 25. |
| netlogin all | Displays all FDBs created as a result of the netlogin process. |
| netlogin mac-based-vlans | Displays all netlogin MAC-based <i>VLAN</i> FDB entries. |
| permanent | Displays all permanent entries, including the ingress and egress <i>QoS</i> profiles. |
| <i>mac_addr</i> | Specifies a MAC address, using colon-separated bytes, for which FDB entries should be displayed. |
| <i>port_list</i> | Displays the entries for one or more ports or ports and slots. |
| <i>vlan_name</i> | Displays the entries for a specific VLAN. |
| <i>vlan_list</i> | Displays a VLAN list of IDs. |
| <i>vpls_name</i> | Specifies a specific VPLS for which to display entries. |
| vxlan | MAC addresses reachable through VXLAN-encapsulated Tunnels. |
| <i>vni</i> | MAC Addresses reachable through VXLAN tunnels encapsulated with the specified Virtual Network Identifier value. |

| | |
|------------------------|--|
| virtual-network | MAC addresses associated with a Virtual Overlay Network learning domain. |
| <i>vn_name</i> | Alphanumeric string identifying the Virtual Network whose associated MAC addresses need to be displayed. |

Default

All.

Usage Guidelines

The pulling of MAC addresses for display purposes is given a lower priority to the actual data path learning. Eventually all the MAC addresses are learned in a quiescent system.

The show fdb command output displays the following information:

| | |
|-----------|---|
| Mac | The MAC address that defines the entry. |
| Vlan | The PVLAN or VLAN for the entry. |
| Age | The age of the entry, in seconds (does not appear if the keyword permanent is specified). |
| Flags | Flags that define the type of entry: <ul style="list-style-type: none"> • b - Ingress Blackhole • B - Egress Blackhole • D - Drop entry for an isolated subscriber VLAN • d - Dynamic • h - hardware aging • i - an entry also exists in the IP FDB • l - lockdown MAC • L - lockdown-timeout MAC • m - MAC • M - Mirror • n - <i>NetLogin</i> • o - IEEE 802.1ah backbone MAC • P - PVLAN created entry • p - Permanent • s - Static • v - NetLogin MAC-Based VLAN • x - an entry also exists in the IPX FDBs. • X - VXLAN |
| Port List | The ports on which the MAC address has been learned. |

Example

The following example shows how the FDB entries appear for all options except the hardware option:

```
# show fdb
Mac                Vlan    Age  Flags          Port / Virtual Port List
-----
```

```

00:0c:29:4b:34:cf      v101(0101) 0041 d m      D 1:2
00:0c:29:4b:34:cf      v100(0100) 0041 d m      P 1:2
00:0c:29:d2:2d:48      v102(0102) 0045 d m      1:3
00:0c:29:d2:2d:48      v100(0100) 0045 d m      P 1:3
00:0c:29:f1:f2:f5      v100(0100) 0045 d m      1:1
00:0c:29:f1:f2:f5      v102(0102) 0045 d m      P 1:1
00:0c:29:f1:f2:f5      v101(0101) 0045 d m      P 1:1
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, L - lockdown-timeout MAC, M- Mirror, B - Egress
      Blackhole,
b - Ingress Blackhole, v - MAC-Based VLAN, P - Private VLAN, T - VLAN
      translation,
D - drop packet, h - Hardware Aging, o - IEEE 802.1ah Backbone MAC.
S - Software Controlled Deletion, r - MSRP
X - VXLAN, E - EVPN
Total: 3 Static: 0 Perm: 0 Dyn: 3 Dropped: 0 Locked: 0 Locked with Timeout: 0
FDB Aging time: 300
FDB VPLS Aging time: 300

```

The following example output shows where the port tag is displayed in parentheses:

```

# show fdb
Mac                Vlan      Age  Flags      Port / Virtual Port List
-----
00:00:00:00:04:0a  test(0200) 0057 d m      3(0010)
00:00:00:00:04:0b  test(0200) 0300 d m      3(0011)
00:01:02:03:04:05  test(0200) 0000 spm      3(0010)
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, L - lockdown-timeout MAC, M- Mirror, B - Egress
      Blackhole,
b - Ingress Blackhole, v - MAC-Based VLAN, P - Private VLAN, T - VLAN translation,
D - drop packet, h - Hardware Aging, o - IEEE 802.1ah Backbone MAC,

```

History

This command was first available in ExtremeXOS 10.1.

The **stats** and **netlogin** parameters were first available in ExtremeXOS 11.3.

The blackhole output under the **b** and **B** flags was first available for all platforms in ExtremeXOS 12.1.

The **o** flag was first available in ExtremeXOS 12.4.

The `vlan_list` variable was added in ExtremeXOS 16.1.

The command was enhanced to show the MAC to IP binding entries in ExtremeXOS 21.1. In addition to retrieving all FDB entries known to the switch, you can query the filtering database for all fdb entries learned within a virtual network (key: <vn_name>), all entries learnt on VXLAN tunnels (token: vxlan) and entries learned on VXLAN tunnels on a specific VNI (key:VNI).

Flag for EVPN-learned entries was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fdb mac-tracking configuration

```
show fdb mac-tracking configuration
```

Description

Displays configuration information for the MAC address tracking feature.

Syntax Description

This command has no arguments or variables.

Default

The MAC address tracking table is empty.

Usage Guidelines

None.

Example

The following example displays the contents of the MAC address tracking table:

```
# show fdb mac-tracking configuration
MAC-Tracking enabled ports: 1-3,10,20
SNMP trap notification      : Enabled
```

```
MAC address tracking table (4 entries):
00:30:48:72:ee:88
00:21:9b:0e:ca:32
00:12:48:82:9c:56
00:30:48:84:d4:16
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fdb mac-tracking statistics

```
show fdb mac-tracking statistics {mac_addr} {no-refresh | refresh}
```

Description

Displays statistics for the MAC addresses that are being tracked.

Syntax Description

| | |
|-------------------|---|
| <i>mac_addr</i> | Specifies a MAC address, using colon-separated bytes, for which <i>FDB</i> entries should be displayed. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |

Default

N/A.

Usage Guidelines

Use the keys listed below the display to clear the statistics counters or page up or down through the table entries.

Example

The following example displays statistics for the entries in the MAC address tracking table:

```
# show fdb mac-tracking statistics
MAC Tracking Statistics      Fri Mar 20 15:25:01 2009
Add      Move      Delete
MAC Address      events      events      events
=====
00:00:00:00:00:01      0           0           0
```

```

00:00:00:00:00:02      0      0      0
00:00:00:00:00:03      0      0      0
00:00:00:00:00:04      0      0      0
00:00:00:00:00:05      0      0      0
00:00:00:00:00:06      0      0      0
00:00:00:00:00:07      0      0      0
00:00:00:00:00:08      0      0      0
00:00:00:00:00:09      0      0      0
00:00:00:00:00:10      0      0      0
00:00:00:00:00:11      0      0      0
00:00:00:00:00:12      0      0      0
00:00:00:00:00:13      0      0      0
00:00:00:00:00:14      0      0      0
00:00:00:00:00:15      0      0      0
00:00:00:00:00:16      0      0      0
00:00:00:00:00:17      0      0      0
00:00:00:00:00:18      0      0      0
=====
0->Clear Counters  U->page up  D->page down  ESC->exit

```

History

This command was first available in ExtremeXOS 12.3.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fdb static-mac-move configuration

```
show fdb static-mac-move configuration
```

Description

Displays the configuration for the feature that reports the discovery of MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example shows the command display:

```
# show fdb static-mac-movement configuration
Static MAC Movement Notification: Enabled
MAC learning Packets Count      : 5
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show fdb stats

```
show fdb stats {{ports {all | port_list} | vlan {all} | [ {vlan}
  vlan_name | vlan vlan_list] {no-refresh | refresh}}}
```

Description

Displays FDB entry statistics for the specified ports or VLANs in either a dynamic or a static report.

Syntax Description

| | |
|------------------|--|
| all | Requests statistics for all ports or all VLANs. |
| <i>port_list</i> | Specifies which ports are to be included in the statistics display. |
| <i>vlan_name</i> | Specifies a single <u>VLAN</u> to be included in the statistics display. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs to be included in the statistics display. |
| refresh | Specifies a continuous refresh of output. |

Default

Summary FDB statistics for the switch.

Usage Guidelines

The dynamic display remains visible and continues to update until you press **[Esc]**.

The `show fdb stats` command output displays the following information:

| | |
|------------|---|
| Port | When you chose to display statistics for ports, this column displays port numbers. |
| Link State | When you chose to display statistics for ports, this column displays the link states, which are described at the bottom of the display. |

| | |
|---------------|---|
| VLAN | When you chose to display statistics for VLANs, this column displays VLAN names. |
| MAC Addresses | This column displays the total number of MAC addresses for each port or VLAN. |
| Dynamic | This column displays the total number of MAC addresses that were learned dynamically for each port or VLAN. |
| Static | This column displays the total number of MAC addresses that are configured on this switch for each port or VLAN. |
| Dropped | This column displays the total number of dynamic MAC addresses that were discovered, but not stored in the FDB. Discovered MAC addresses might be dropped because a configured learning limit is reached, the FDB is in lockdown, or a port forwarding state is in transition. Some conditions that lead to dropped MAC addresses can produce log messages or SNMP traps. |

Example

The following command example displays summary FDB statistics for the switch:

```
torino1.1 # show fdb stats
Total: 4 Static: 3 Perm: 3 Dyn: 1 Dropped: 0
FDB Aging time: 300
FDB VPLS Aging time: 300
torino1.2 #
```

The following command example displays FDB statistics for ports 1 to 16 on slot 1:

```
# show fdb stats ports 1:1-1:16
FDB Stats
Port          Link  MAC
State  Addresses      Dynamic      Static      Dropped
=====
1:1          A      2394      2389          5          2
1:2          A         37         37           0           0

=====
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
U->page up D->page down ESC->exit
```

The following command example displays FDB statistics for all VLANs:

```
# show fdb stats vlan all
FDB Stats
VLAN          MAC Addresses      Dynamic      Static      Dropped
=====
```

```

SV_PPPOE                2394        2389            5            2
NV_PPPOE                122         121            1           452
=====
U->page up  D->page down  ESC->exit

```

History

The dynamic display for this command was first available in ExtremeXOS 12.4.2.

The **no-refresh** keyword was removed in ExtremeXOS 16.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show flow-redirect

```
show flow-redirect {flow_redirect_name}
```

Description

Displays nexthop ipaddresses, up/down status, health-checking (ping/ARP/ND) and [ACL](#) bindings.

Syntax Description

| | |
|--|--|
| <code><i>flow_redirect_name</i></code> | Specifies the name of the flow redirection policy. |
|--|--|

Default

N/A.

Usage Guidelines

None.

Example

The following example displays information for all redirection policies:

```

Switch.1 # show flow-redirect
Name          Nexthop  Active          VR Name      Inactive  Health
Count        IP Address  Nexthops  Check
=====
pkh           2         2001:400::100  VR-Default  Forward  PING
ND: Neighbor Discovery

```

The next example displays an IPv6 redirection policy for a longer IPv6 address, which causes a two-line display for the related redirection policy:

```
Switch.13 # sh flow-redirect
Name          Nexthop  Active          VR Name      Inactive  Health
Count        IP address  Nexthops  Check
=====
pbr1          2         2004:1000:1000:1000::10
VR-Default   Forward   PING
ND: Neighbor Discovery
```

This example displays information for a specified IPv6 redirection policy:

```
* Switch.14 # show flow-redirect "pbr1"
Name          : pbr1          VR Name      : VR-Default
Inactive Nexthops: Forward   Health Check : PING
Nexthop Count : 2
Active IP Address : 2004:1000:1000:1000::10
Index  State  Priority  IP Address          Status Interval Miss Success
=====
0      Disabled 200      2003::10           DOWN 2          2      5
1      Enabled  100      2004:1000:1000:1000::10
UP      2        2
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Ping success count information added in ExtremeXOS 22.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document..

show forwarding configuration

```
show forwarding configuration
```

Description

Displays the configured selection criteria for [ECMP](#) routes and load-sharing group ports and the hardware table settings, including the configured and current hash algorithm and dual-hash settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- Configured hash algorithm—The hash algorithm configured on the switch. After the configuration is saved and the switch is rebooted, the switch uses this hash algorithm.
- Current hash algorithm—The hash algorithm currently used by the switch.
- Configured dual-hash setting—Whether the dual-hash feature is configured 'on' or 'off' on the switch. After the configuration is saved and the switch is rebooted, the switch uses this setting.
- Current dual-hash setting—Whether the dual-hash feature is currently 'on' or 'off' on the switch.
- Dual-Hash recursion level—The current dual-hash recursion level; default is '1.'
- Sharing criteria—Current selection criterion used for ECMP route sharing as well as for load-sharing groups. Specifies which Layer 3 and Layer 4 information is used in the sharing hash algorithm. For more information, see the description for the [configure forwarding sharing \[L3 | L3_L4\]](#) command.
- Group Table Compression—Whether the group table compression is currently 'on' or 'off' on the switch.
- Switching mode—Whether the switching mode is currently set to 'cut-through' or 'store-and-forward.'
- Fabric flow control—Whether flow control fabric configuration is set to 'auto' or 'off.'
- ARP and ND Settings:—Suppression filter status.
- Extended Edge Switching—VLAN port membership and IP multicast replication status.

It is possible for the values of the configured and the current hash, or the configured and current dual-hash settings to be different. For example, if you modified the hash algorithm and have not saved the configuration and rebooted the switch, the values might be different. In this situation, the switch also displays the following message:

```
NOTE: A save and reboot are required before the configured hash will take effect
```

Example

The following command displays the hardware forwarding algorithm configured on the switch:

```
show forwarding configuration

L2 and L3 Forwarding table hash algorithm:
  Configured hash algorithm:      crc32
  Current hash algorithm:         crc32

L3 Dual-Hash configuration:
  Configured setting:             on
  Current setting:                on
  Dual-Hash Recursion Level:     1

Hash criteria for IP unicast traffic for L2 load sharing and ECMP route sharing
  Sharing criteria:                L3_L4

IP multicast:
```

```

Group Table Compression:          on
Local Network Forwarding:        slow-path
Lookup-Key:                       (SourceIP, GroupIP, VlanId)

Internal lookup tables:
  Configured Setting:             12-and-13
  Current Setting:                 12-and-13

Switch Settings:
  Switching mode:                  store-and-forward

L2 Protocol:
  Fast convergence:                on

Rate Limit:
  Overhead Bytes:                  20

Fabric Flow Control:
  Fabric Flow Control:             auto

ARP and ND Settings:
  ARP Suppression Filters:         per-port
  ND Suppression Filters:          per-port

VPEX Settings:
  VLAN Port Membership:           hash-table
  IPMC Replication:                bpe

```

History

This command was first available in ExtremeXOS 11.3.2.

The flow control feature was added in ExtremeXOS 12.5.

The Forwarding Lookup-Key feaure show output is added in ExtremeXOS 15.3.

Extended Edge Switching setting for VLAN port membership was added in ExtremeXOS 22.6.

Extended Edge Switching IP multicast replication feature information was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show forwarding hardware-utilization

```
show forwarding hardware-utilization {slot [slot_num | all]}
```

Description

Shows forwarding hardware table utilization statistics.

Syntax Description

| | |
|-----------------------------|--|
| hardware-utilization | Specifies showing hardware table utilization statistics. |
| slot | Specifies selecting slots. |
| <i>slot_num</i> | Specifies which slots to show statistics for. |
| all | Specifies showing statistics for all slots. |

Usage Guidelines

Shows forwarding hardware table utilization statistics with L2, L3 and ACLs configured.

Example

The following example shows table utilization statistics:

```
# show forwarding hardware-utilization

Hardware Table Utilization Statistics

Slot: 1
Type: X870-32c
Resource Type          Current    Maximum    % Util.
-----
MAC Entries            0         73727      0
Host Entries           0         73728      0
IPv4 Entries           0         73728      0
IPv6 Entries           0         36864      0
Long IPv6 Entries      0          2048      0
Total Routes           0        16384      0
IPv4 Neighbors         0          N/A        N/A
IPv6 Neighbors         0          N/A        N/A
IPv4 Routes            0          N/A        N/A
IPv6 Routes            0          N/A        N/A
ECMP Next Hops         0         1023       0
ACL Ingress Entries    40         6144       0
ACL Ingress Counters   0        38912       0
ACL Ingress Meters     0         2048       0
ACL Ingress Slices     0           12         0
ACL Egress Entries     0         1024       0
ACL Egress Counters    0         1024       0
ACL Egress Meters      0         1024       0
ACL Egress Slices      0           4          0
ACL VLAN Entries *     1         2048       0
ACL VLAN Slices *     1           4          25

Legend: N/A - Maximum not defined in published sFlow structure.
* - Resource type not defined in published sFlow structure.
    Also see IP usage in 'show iproute reserved-entries statistics'.
```

History

This command was first available in ExtremeXOS 22.6.

Legend explaining N/A entries was added in ExtremeXOS 30.1.

ACL VLAN entries and slices was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show heartbeat process

```
show heartbeat process {name}
```

Description

Displays the health of the ExtremeXOS processes.

Syntax Description

| | |
|-------------|------------------------------------|
| <i>name</i> | Specifies the name of the process. |
|-------------|------------------------------------|

Default

N/A.

Usage Guidelines

The software monitors all of the ExtremeXOS processes running on the switch. This process monitor creates and terminates XOS processes on demand (for example, when you log in or log out of the switch) and restarts processes if an abnormal termination occurs (for example, if your system crashes). The process monitor also ensures that only version-compatible processes and processes with proper licenses are started.

The `show heartbeat process` command is a resource for providing background system health information because you can view the health of ExtremeXOS processes on the switch.

Use this command to monitor the health of the ExtremeXOS processes. The switch uses two algorithms to collect process health information: polling and reporting. Both polling and reporting measure the heartbeat of the process. Polling occurs when a HELLO message is sent and a HELLO_ACK message is received. The two counts are the same. Reporting occurs when a HELLO_ACK message is sent only. Therefore, no HELLO messages are sent and the HELLO count remains at zero.

The `show heartbeat process` command displays the following information in a tabular format:

- Process Name—The name of the process.
- Hello—The number of hello messages sent to the process.
- HelloAck—The number of hello acknowledgement messages received by the process manager.
- Last Heartbeat Time—The timestamp of the last health check received by the process manager. (Unknown specifies kernel modules and they do not participate in heartbeat monitoring.)

This status information may be useful for your technical support representative if you have a network problem.

You may find it useful to capture the process information under normal operating conditions to establish a baseline. By having a baseline, if you experience a problem, you and your technical support representative can more easily identify the problem.

Example

To display the health of all processes on your system, use the following command:

```
show heartbeat process
```

The following is sample output from a switch:

| Process Name | Hello | HelloAck | Last Heartbeat Time |
|--------------|-------|----------|--------------------------|
| aaa | 0 | 254328 | Tue Feb 10 05:21:46 2004 |
| acl | 50867 | 50867 | Tue Feb 10 05:21:43 2004 |
| bgp | 0 | 0 | Wed Feb 4 08:03:18 2004 |
| cfgmgr | 25433 | 25433 | Tue Feb 10 05:21:33 2004 |
| cli | 84779 | 84779 | Tue Feb 10 05:21:47 2004 |
| cna | 20234 | 20234 | Mon Feb 9 00:28:35 2004 |
| devmgr | 0 | 250507 | Tue Feb 10 05:21:47 2004 |
| dirser | 0 | 254336 | Wed Feb 4 08:03:18 2004 |
| dosprotect | 0 | 254335 | Tue Feb 10 05:21:47 2004 |
| eaps | 0 | 254336 | Tue Feb 10 05:21:48 2004 |
| edp | 50867 | 50867 | Tue Feb 10 05:21:44 2004 |
| elrp | 50867 | 50867 | Tue Feb 10 05:21:43 2004 |
| ems | 63584 | 63584 | Tue Feb 10 05:21:44 2004 |
| epm | 0 | 0 | Wed Feb 4 08:03:18 2004 |
| esrp | 50867 | 50867 | Tue Feb 10 05:21:46 2004 |
| ... | | | |

To display the health of the *STP* process on your system, use the following command:

```
show heartbeat process stp
```

The following is sample output from a switch:

| Process Name | Hello | HelloAck | Last Heartbeat Time |
|--------------|-------|----------|--------------------------|
| stp | 50870 | 50870 | Tue Feb 10 05:22:13 2004 |

History

This command was first available in an ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management blacklist

```
show identity-management blacklist
```

Description

Displays the identities in the identity manager blacklist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identities in the blacklist:

```
* Switch.93 # show identity-management blacklist
-----
Type      BlackList Entry
-----
MAC       01:02:03:04:05:06/ff:ff:ff:00:00:00
IP        1.2.3.4/255.255.255.0
User      john@mydomain.com
-----
> indicates entry value truncated past 35 characters
Number of BlackList Entries      : 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management entries

```
show identity-management entries {user id_name} {domain domain} {ports
  port_list} {mac mac_address} {vlan vlan_name} {ipaddress ip_address}
  {detail}
```

Description

Displays the entries in the identity management database.

Syntax Description

| | |
|--------------------|--|
| <i>id_name</i> | Limits the display to entries that contain the specified user ID. |
| <i>domain</i> | Limits the display to entries for the specified domain. |
| <i>port_list</i> | Limits the display to entries for the specified ports. |
| <i>mac_address</i> | Limits the display to entries that contain the specified MAC address. |
| <i>vlan_name</i> | Limits the display to entries that contain the specified <i>VLAN</i> name. |
| <i>ip_address</i> | Limits the display to entries that contain the specified IP address. |
| detail | Expands the display to include more information about identity management entries. |

Default

N/A.

Usage Guidelines

Only admin-level users can execute this command.

The displayed ID Name is the actual user name when Network Login or Kerberos Snooping is enabled. For unknown users, the software creates a user name using the format: User_XXXXXXXXXXXXXXXX. The number in the user name is a 16-bit hash number that is generated using the user’s port, MAC address, and IP address numbers.

The displayed Domain Name is displayed only if the client is discovered through Kerberos snooping or Dot1x and the domain name is supplied in the form of *domain\user*). The NetBIOS hostname is only displayed if this information was present in the Kerberos packets.

When the role is shown as multiple, the identity is connected through multiple ports/locations and different roles apply to each device.

Example

The following command displays all entries in the identity management database:

```
* Switch.4 # show identity-management entries
ID Name/      Flags  Port      MAC/      VLAN      Role
Domain Name   IP
-----

```

The following command example shows that you can specify multiple options, such as the user name and ports:

```
show identity-management entries user eelco ports 2:2
```

History

This command was first available in ExtremeXOS 12.4.

Kerberos Force Aging TTL and Inactive Aging TTL information was added in ExtremeXOS 12.6.

Support for multiple roles for a single identity was added in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management greylist

```
show identity-management greylist
```

Description

Displays the identities in the identity manager greylist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the identities in the identity manager greylist.

Example

```
* Switch.94 # show identity-management greylist
-----
Type      GreyList Entry
-----
User      june@mydomain.com
User      Richard@corp.acme.com
-----
> indicates entry value truncated past 35 characters
Number of GreyList Entries      : 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management list-precedence

```
show identity-management list-precedence
```

Description

This command displays the order of list-precedence. The default list-precedence is: greylist blacklist whitelist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the order of list-precedence.

Example

```
* Switch.97 # show identity-management list-precedence
List Precedence:
1.   Greylist
2.   Blacklist
3.   Whitelist
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management role

```
show identity-management role {role_name} {detail}
```

Description

Displays summary or detailed configuration information for one or all roles.

Syntax Description

| | |
|------------------|--|
| <i>role_name</i> | Specifies a name of an existing role to display. |
| all | Specifies that all roles are to be displayed. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays all roles that are configured on the switch:

```
* Switch.95 # show identity-management role
-----
Role Name           Priority   Child Roles   # Identities
*authenticated     255                    0
*unauthenticated   255                    0
extr-empl          255      extr-engr     2
extr-engr          255                    0
```

```
*whitelist          0          0
*blacklist          0          3
-----
Flags : * - Default Roles
-----
Total number of role(s) configured : 6
```

The following command displays detailed information for all roles that are configured on the switch:

```
* Switch.96 # show identity-management role detail
Role name : extr-empl
Child Roles : engr
Match Criteria : "company==Extreme;"
Policies : extrPol
Identities : john_smith@d.com; MAC: 00:16:23:51:77:99; Port:8
bob_craig@e.com; MAC: 00:18:23:51:77:99; Port:9
Role name : engr
Child Roles : india-engr
Match Criteria : "department==Engineering;"
Policies : engrPol, extrPol
Identities : joe_hardy@b.com; MAC: 00:12:23:51:77:99; Port:10
Role name : india-engr
Child Roles : -
Match Criteria : "country=India; AND department=Engineering;"
Policies : indEngrPol, engrPol, extrPol
Identities : bill_jacob@b.com; MAC: 00:12:33:51:77:99; Port:11
Role name : marketing
Child Roles : -
Match Criteria : "department=Marketing;"
Policies : markrPol, extrPol
Identities : will_smith@a.com; MAC: 00:11:33:51:77:99; Port:14
Role Name: whitelist (Default Role)
Child Roles : ---
Priority : 0
Match Criteria : "Not Applicable"
Policies : --
Identities # : 0
Identities : --
Role Name: blacklist(Default Role)
Child Roles : ---
Priority : 0
Match Criteria : "Not Applicable"
Policies : --
Identities # : 3
Identities : Unknown_00:11:22:33:44:55; MAC: 00:11:22:33:44:55; Port:1
johndoe@extremenetworks.com; MAC: 00:01:02:03:04:05; Port:2
janedoe@extremenetworks.com; MAC: 00:02:04:06:08:10; Port:3
```

The next two examples display detailed information for a single role:

```
* Switch.97 # show identity-management role extr-empl detail
Role name : extr-empl
Child Roles : engr
Match Criteria : "company=Extreme;"
Policies : extrPol
Identities : johnsmith@extreme.com; MAC: 00:11:33:55:77:99; Port:4
bobcraig@extreme.com; MAC: 00:01:03:05:07:09; Port:5
* Switch.98 # show identity-management role NotAccessibleUser detail
Role name : NotAccessibleUser
Child Roles : engr
Match Criteria : "UserName = adam; AND IP-Address == 1.2.3.0/24; AND port == 1;"
```

```
Policies : extrPol
Identities : adam; MAC: 00:00:11:22:33:44; Port: 1
```

History

This command was first available in ExtremeXOS 12.5.

MAC addresses were added to the displays for the detail option in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management statistics

```
show identity-management statistics
```

Description

Displays operation statistics for the identity management feature.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

A user can login from multiple machines or ports, so the total number of login instances can be more than the number of unique users logged in.

Example

The following command displays the identity management feature statistics:

```
Switch.4 # show identity-management statistics
Total number of users logged in      : 2
Total number of login instances      : 2
Total memory used                    : 1 Kbytes
Total memory used by events          : 0 Kbytes
Total memory available               : 511 Kbytes
High memory usage level reached count : 0
Critical memory usage level reached count: 0
Max memory usage level reached count  : 0
Current memory usage level           : Normal
Normal memory usage level trap sent   : 0
High memory usage level trap sent     : 0
```

```
Critical memory usage level trap sent : 0
Max memory usage level trap sent    : 0
Event notification sent              : 0
Total number of roles configured     : 3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management whitelist

```
show identity-management whitelist
```

Description

Displays the identities in the identity manager whitelist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identities in the whitelist:

```
* Switch.94 # show identity-management whitelist
-----
Type      WhiteList Entry
-----
MAC       04:32:13:44:25:06/ff:ff:ff:00:00:00
IP        11.12.13.14/255.255.255.0
User      jane@mydomain.com
-----
> indicates entry value truncated past 35 characters
Number of WhiteList Entries      : 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show identity-management

```
show identity-management
```

Description

Displays the identity management feature configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identity management feature configuration:

```
# show identity-management
Identity Management           : Enabled
Stale entry age out (effective) : 180 Seconds (180 Seconds)
Max memory size              : 512 Kbytes
Enabled ports                 : 1-26
FDB Detection Disabled ports  : None
IPARP Detection Disabled ports : None
IPSecurity Detection Disabled ports : None
Kerberos Detection Disabled ports : None
LLDP Detection Disabled ports  : None
Netlogin Detection Disabled ports : None
SNMP trap notification       : Enabled
Match Criteria Inheritance    : On
Access list source address type : MAC
Kerberos aging time (DD:HH:MM) : None
Kerberos force aging time (DD:HH:MM) : None
Valid Kerberos servers        : none configured(all valid)
```

History

This command was first available in ExtremeXOS 12.4.

Kerberos Force Aging Time information was added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show igmp

```
show igmp {vlan} {vlaname}
```

Description

This command can be used to display an *IGMP*-related configuration and group information, per *VLAN*.

Syntax Description

| | |
|----------------|------------------------|
| <i>vlaname</i> | Specifies a VLAN name. |
|----------------|------------------------|

Default

N/A.

Usage Guidelines

The output of this command shows:

- The VLAN name.
- The router interface IP address and subnet mask.
- If the interface is active (up), by the letter U.
- If IP forwarding is enabled for the interface, by the letter f.
- If multicast forwarding is enabled, by the letter M.
- If IGMP is enabled, by the letter i.
- If IGMP snooping is enabled, by the letter z.

Example

The following command displays the IGMP configuration:

```
# show igmp
VLAN          IP Address      Flags      nLRMA  nLeMA  IGMPver
Default       0.0.0.0        / 0      ---izpt-  0      0      3
isc           50.50.50.1     /24      ---izpt-  0      0      3
v1            0.0.0.0        / 0      U--izpt-  0      2      3
v3000        1.1.1.1        /24      ---izpt-  0      0      3
v666         6.0.0.1        /16      ---izpt-  0      0      3
```

```

Flags: (f) Forwarding Enabled, (i) IGMP Enabled
(m) Multicast Forwarding Enabled, (p) IGMP Proxy Query Enabled
(r) Receive Router Alert Required (t) Transmit Router Alert
(U) Interface Up, (z) IGMP Snooping Enabled
(nLeMA) Number of Learned Multicast Addresses
(nLRMA) Number of Locally Registered Multicast Addresses

```

The following command displays the IGMP configuration for VLAN vlan1:

```

# show igmp vlan1
Query Interval      :    125 sec
Max Response Time  :     10 sec
Last Member Query  :     1 sec
Robustness         :         2
Interface on VLAN vlan1 is enabled and up.
inet 0.0.0.0/0
Locally registered multicast addresses:
Learned multicast addresses (Last Querier=118.1.1.100):
224.0.0.2          224.0.0.22
s = static igmp member
Flags:
IP Fwding  NO          IPmc Fwding  NO          IGMP YES
IGMP Ver   V3          Snooping    YES          Proxy Query YES
XmitRtrAlrt YES      RcvRtrAlrtReq NO

```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp counters

```
show igmp counters
```

Description

Shows Internet Group Management Protocol (IGMP) counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows IGMP counters:

```
# show igmp counters
Global IGMP Statistics:
Out Query   =          13 Out Report =          0 Out Leave =          0
In Query    =          0 In Report  =         13 In Leave  =          0
In Error    =          0
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp group

```
show igmp group {{vlan} {name} | {grpipaddress}} {IGMPv3}
```

Description

Lists the *IGMP* group membership for the specified *VLAN*.

Syntax Description

| | |
|---------------------|--|
| <i>name</i> | Specifies a VLAN name. |
| <i>grpipaddress</i> | Specifies a group IP address. |
| IGMPv3 | Displays the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise displays in earlier format). |

Default

IGMPv2.

Usage Guidelines

If no VLAN is specified, all VLANs are displayed. You can also filter the display by group address or by multicast stream sender address.

The output of this command shows:

- The multicast group address received.
- The version of the IGMP group.
- The name of the VLAN where the group address is being received.

- The physical port where the group address is being received. If multiple ports within the VLAN have subscribers for the group, all the ports are listed.
- The age since the last IGMP report for this group was received.

Note

The `show igmp group` command output is populated on the router that is the PIM Rendezvous Point.

Example

The following is sample output from the `show igmp group` command, listing the IGMP group membership:

| Group Address | Ver | Vlan | Port | Age |
|-----------------|-----|--------|------|-----|
| 239.2.4.70 | 2 | banana | 7 | 101 |
| 224.0.1.24 | 2 | banana | 7 | 107 |
| 239.255.255.254 | 2 | banana | 7 | 103 |
| Total: 3 | | | | |

History

This command was first available in ExtremeXOS 10.1.

The **IGMPv3** option was added in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp snooping cache

This command is provided for backward compatibility. The recommended command is:

```
show mcast cache {{vlan} name} {[group grpaddressMask | grpaddressMask]
  {source sourceIP | sourceIP}} {type [snooping | pim | mvr]}|
  {summary}}
```

The syntax for the original form of this command is:

```
show igmp snooping cache {{vlan} name} {{group} grpaddressMask}
```

Description

Displays multicast cache entries added by [IGMP](#) snooping for all VLANs and groups. The display can be limited to specific VLANs or groups.

Syntax Description

| | |
|-----------------------|---|
| <i>name</i> | Specifies a <u>VLAN</u> name. |
| <i>grpaddressMask</i> | Specifies a multicast group address and mask. |

Default

Displays information for all VLANs and groups.

Usage Guidelines

None.

Example

The following command displays IGMP snooping cache information for all VLANs and groups:

```
show igmp snooping cache
```

This command display is the same as for the following preferred command:

```
show mcast cache {{vlan} name} {[group grpaddressMask | grpaddressMask]
{source sourceIP | sourceIP}} {type [snooping | pim | mvr]}| {summary}}
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp snooping vlan filter

```
show igmp snooping {vlan} name filter
```

Description

Displays IGMP snooping filters.

Syntax Description

| | |
|-------------|-------------------------------|
| <i>name</i> | Specifies a <u>VLAN</u> name. |
|-------------|-------------------------------|

Default

None.

Usage Guidelines

Use this command to display IGMP snooping filters configured on the specified VLAN. When no VLAN is specified, all the filters are displayed.

Example

The following command displays the IGMP snooping filter configured on VLAN vlan101:

```
# show igmp snooping vlan101 filter
Filter          Port Flags
igmppermit0    5:10 a
Flags: (a) Active
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp snooping vlan static

```
show igmp snooping {vlan} name static [group | router]
```

Description

Displays static *IGMP* snooping entries.

Syntax Description

| | |
|---------------|-----------------------------------|
| <i>name</i> | Specifies a <i>VLAN</i> name. |
| group | Displays static multicast groups. |
| router | Displays static router entries. |

Default

None.

Usage Guidelines

Use this command to display the IGMP snooping static groups or router ports configured on the specified VLAN. When no VLAN is specified, all the static groups or router ports are displayed.

Example

The following command displays the IGMP snooping static groups configured on VLAN vlan101:

```
# show igmp snooping vlan101 static group
VLAN vlan101 (4094)
Group      Port  Flags
239.1.1.2  29    s-
239.1.1.2  30    s-
239.1.1.2  31    sa
239.1.1.2  32    s-
239.1.1.2  34    s-
Total number of configured static IGMP groups = 5
Flags: (s) Static, (a) Active
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp snooping vlan

```
show igmp snooping {vlan} name {port port} {IGMPv3}
```

Description

Displays *IGMP* snooping registration information for a specific *VLAN*. The display can be further limited to a specific port or to only IGMPv3 entries.

Syntax Description

| | |
|---------------|--|
| <i>name</i> | Specifies a VLAN name. |
| <i>port</i> | Specifies a single port for which information is displayed. |
| IGMPv3 | Displays the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise displays in earlier format). |

Default

IGMPv2.

Usage Guidelines

The two types of IGMP snooping entry are sender entry and subscribed entry.

The following information is displayed in a per-interface format:

- Group membership information
- Router entry
- Timeout information
- Sender entry

Example

The following output displays IGMP snooping registration information on VLAN v1:

```
# show igmp snooping vlan v1
Router Timeout      :      260 sec
Host Timeout       :      260 sec
Igmp Snooping Fast Leave Time : 1000 ms
VLAN v1 d          (4084) Snooping=Enabled
Port  Host          Subscribed   Age    Group-Limit
25    118.1.1.100      All Groups   3      0
```

The following command displays IGMP snooping registration information for port 2:1 on VLAN test:

```
show igmp snooping test port 2:1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp snooping

```
show igmp snooping {detail {IGMPv3}}
```

Description

Displays *IGMP* snooping registration information for all VLANs.

Syntax Description

| | |
|---------------|--|
| detail | Displays the information in detailed format. |
| IGMPv3 | Displays the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise displays in earlier format). |

Default

IGMPv2.

Usage Guidelines

None.

Example

The following command displays IGMP snooping registration information for all VLANs:

```
# show igmp snooping
Igmp Snooping Flag           : forward-all-router
Igmp Snooping Flood-list     : none
Igmp Snooping Proxy          : Disable
Igmp Snooping Filters        : per-port
Vlan          Vid  Port  #Senders #Receivers Router Enable
-----
Default      1    0    0         0         Yes
v1           4090 0    0         0         Yes
```

History

This command was first available in ExtremeXOS 10.1.

The IGMP Forwarding Lookup mode output was removed from this command in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show igmp ssm-map

```
show igmp ssm-map {group_ip} {vr vr-name}
```

Description

Displays the *IGMP* SSM feature status (enabled or disabled), the mappings for the specified multicast group IP address, and the total count of maps.

Syntax Description

| | |
|-----------------|--|
| <i>group_ip</i> | Specifies an IP multicast group, for which all mappings in the PIM SSM range are to be displayed. If no group address is specified, the switch displays all IGMP-SSM mappings. |
| <i>vr-name</i> | Specifies a virtual router name. If the VR name is omitted, the switch displays the mappings on the VR specified by the current CLI VR context. |

Default

N/A.

Usage Guidelines

When a target group is specified, this command displays all mapping entries for the configured range in which the group IP address resides.

Example

The following example displays the mappings for the multicast group starting at IP address 232.1.1.1:

```
X620-16x-DUT1.1 # show igmp ssm-map
IGMP SSM mapping : Enabled

Group          Source      Type
232.1.1.1/32   2.1.1.3    Static
232.1.1.2/32   2.1.1.3    Static
232.1.1.3/32   2.1.1.3    Static
232.1.1.4/32   2.1.1.3    Static
232.1.1.5/32   2.1.1.3    Static
232.1.1.6/32   2.1.1.3    Static
232.1.1.7/32   2.1.1.3    Static
232.1.1.8/32   2.1.1.3    Static
232.1.1.9/32   2.1.1.3    Static
232.1.1.10/32  2.1.1.3    Static
232.1.1.11/32  2.1.1.3    Static
232.1.1.12/32  2.1.1.3    Static
232.1.1.13/32  2.1.1.3    Static
232.1.1.14/32  2.1.1.3    Static
232.1.1.15/32  2.1.1.3    Static
232.1.1.16/32  2.1.1.3    Static
232.1.1.17/32  2.1.1.3    Static
232.1.1.18/32  2.1.1.3    Static
232.1.1.19/32  2.1.1.3    Static
232.1.1.20/32  2.1.1.3    Static
232.1.1.21/32  2.1.1.3    Static
Total Number of Mappings : 510
X620-16x-DUT1.2 # show igm ssm-map 232.1.1.1
IGMP SSM mapping : Enabled
Group   : 232.1.1.1
Type    : STATIC
DNS Name: -
Aging TTL (Expiry Time): -
Sources :
        2.1.1.3
Total Number of Mappings : 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show inline-power configuration ports

```
show inline-power configuration ports {port_list}
```

Description

Displays inline power configuration information for the specified ports.

Syntax Description

| | |
|------------------------|--|
| <code>port_list</code> | Specifies one or more ports. If you do not specify ports, information for all ports appears. |
|------------------------|--|

Default

N/A.

Usage Guidelines

The output displays the following inline power configuration information for the specified ports:

- Config—Indicates whether the port is enabled to provide inline power:
 - Enabled: The port can provide inline power.
 - Disabled: The port cannot provide inline power.
- Operator Limit—Displays the configured limit, in milliwatts, for inline power on the port.
- Label—Displays a text string, if any, associated with the port.

Example

The following command displays inline power configuration information for ports 1 to 6:

```
# show inline-power configuration ports 1-6
```

| Port | Config | Operator Limit | Priority | Detection | Fast | Label |
|------|---------|-------------------|----------|--------------|------|-------|
| 1 | Enabled | 90000 mW | Low | 802.3af-only | Y | |
| 2 | Enabled | 90000 mW | Low | 802.3af-only | Y | |
| 3 | Enabled | 90000 mW | Low | 802.3af-only | Y | |
| 4 | Enabled | 90000 mW | Low | 802.3af-only | Y | |
| 5 | Enabled | 90000 mW | Low | 802.3af-only | N | |
| 6 | Enabled | 90000 mW | Low | 802.3af-only | N | |

History

This command was first available in ExtremeXOS 11.1.

Per-port Fast PoE information was added in ExtremeXOS 31.1.

Platform Availability

This command is available on the [PoE](#) devices listed in [Extreme Networks PoE Devices](#).

show inline-power fast ports

```
show inline-power fast ports {port_list}
```

Description

Displays fast *PoE* information by port.

Syntax Description

| | |
|------------------|---|
| fast | Specifies showing fast PoE power status, which is the ability to provide power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. |
| ports | Designates showing fast PoE information for specified ports. |
| <i>port_list</i> | Specifies on which ports to show fast PoE information. |

Default

N/A.

Usage Guidelines

This command shows the port level fast PoE configurations saved in hardware, along with the ones currently configured to allow you to see any mismatches. If the default configuration file has never been saved in this boot session, the hardware configurations shown are the initial running configurations from hardware at boot time. If the default configuration file has been saved in this boot session (by `save configuration`), the hardware configurations shown are the last configurations saved to hardware.

Example

The following example shows fast PoE information on ports 1:1-2, 2:1-5, 3:1-3:

```
# show inline-power fast ports 1:1-2,2:1-5,3:1-3
Port  State  Enable  Operator Limit  Priority  Detection
----  -
1:1   HW       Enabled  28000 mW      Low      802.3af-only
      Cfg     Enabled  28000 mW      Low      802.3af-only
1:2   HW       Enabled  30000 mW      High     4-point legacy-and-802.3af
      Cfg     Enabled  30000 mW      High     4-point legacy-and-802.3af
3:1   HW       Enabled  30000 mW      Critical 802.3af-only
      Cfg     Enabled  30000 mW      Critical 802.3af-only
3:2   HW       Disabled 15000 mW      Low      802.3af-only
      Cfg     Disabled 15000 mW      Low      802.3af-only
3:3   HW       Enabled  30000 mW      High     802.3af-only
      Cfg     Enabled  30000 mW      Low      802.3af-only
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is only available on ExtremeSwitching X465 and X435 series switches.

show inline-power info ports

```
show inline-power info {detail} ports {port_list}
```

Description

Displays inline power information for the specified ports.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports. If you do not specify ports, information for all ports appear. |
|------------------|---|

Default

N/A.

Usage Guidelines

Note

Ports in the denied or faulted state periodically display the searching state as the hardware retests the PD state.

You can use this command to generate a summary report or a detailed report.

Summary output displays the following inline power information for the specified ports:

- State—Displays the port power state:
 - Disabled.
 - Searching.
 - Delivering.
 - Faulted.
 - Disconnected.
 - Other.
 - Denied.
- PD's power class—Displays the class type of the connected PD:
 - "----": disabled or searching.
 - "class0": class 0 device.
 - "class1": class 1 device.
 - "class2": class 2 device.
 - "class3": class 3 device.
 - "class4": class 4 device.
 - "class5": class 5 device.

- "class6": class 6 device.
- "class7": class 7 device.
- "class8": class 8 device.
- Volts—Displays the measured voltage. A value from 0 to 2 is valid for ports that are in a searching state.
- Curr—Displays the measured current, in milliamperes, drawn by the PD.
- Power—Displays the measured power, in watts, supplied to the PD.
- Fault—Displays the fault value:
 - None.
 - UV/OV fault.
 - UV/OV spike.
 - Over current.
 - Overload.
 - Undefined.
 - Underload.
 - HW fault.
 - Discovery resistance fail.
 - Operator limit violation.
 - Disconnect.
 - Discovery resistance, A2D failure.
 - Classify, A2D failure.
 - Sample, A2D failure.
 - Device fault, A2D failure.
 - Force on error.

The detail command lists all inline power information for the selected ports.

Detail output displays the following information:

- Configured Admin State—Displays the port's configured state; Enabled or Disabled.
- Inline Power State—Displays the port power state.
- MIB Detect Status—Displays the port state as reported by *SNMP*; valid values are as follows:
 - disabled
 - searching
 - delivering
 - fault
 - test
 - otherFault
 - denyLowPriority
- Label—Displays the port's configured label.
- Operator Limit—Displays the port's configured operator limit value.
- PD Class—Displays the class type of connected PD:
- Max Allowed Power—Displays the amount of maximum allowed power for a device of this class.
- Measured Power—Displays the measured power, in watts, supplied to the PD.

- Line Voltage—Displays the measured voltage. A value from 0 to 2 is valid for ports in a searching state.
- Current—Displays the measured current, in milliamperes, drawn by the PD.
- Fault Status—Displays the fault value.
- Detailed Status
- Priority
- Power Up Status—2-pair or 4-pair, 15W-90W
- Powered Channels—primary channel, alternative channel, or both
- Detection

Example

The following command displays summary inline power information for ports 1 to 3 on a switch:

```
show inline-power info ports 1-3
```

Following is sample output from this command:

| Port | State (mA) | Class | Volts | Curr | Power | Fault |
|------|---------------|--------|-------|------|-------|-------|
| 1 | delivering | class3 | 48.3 | 192 | 9.300 | None |
| 2 | delivering | class3 | 48.3 | 192 | 9.300 | None |
| 3 | searching | ----- | 0.0 | 0 | 0.0 | None |

The following command displays detail inline power information for port 1 on slot 3:

```
show inline-power info detail port 3:1
```

Following is sample output from this command:

```
Port 3:1
Configured Admin State: enabled
Inline Power State      : delivering
MIB Detect Status      : delivering
Label                  :
Operator Limit         : 16800 milliwatts
PD Class                : class3
Max Allowed Power      : 15.400 W
Measured Power         : 9.400 W
Line Voltage           : 48.3 Volts
Current                : 193 mA
Fault Status           : None
Detailed Status        :
```

The following command displays detail inline power information for port 27:

```
# show inline-power info detail ports 27
```

Following is sample output from this command:

```
Port 27
Configured Admin State: enabled
Inline Power State      : delivering
MIB Detect Status      : delivering
Label                  :
Operator Limit         : 90000 milliwatts
PD Class                : class8
```

```

Max Allowed Power      : 90.0 W
Measured Power         : 33.300 W
Line Voltage           : 53.7 Volts
Current                : 621 mA
Fault Status           : None
Detailed Status        : Delivering power to IEEE PD
Priority                : low
Power Up Status        : 4-pair 60W
Powered Channels       : Primary and Alternative
Detection              : 802.3af-only

```

History

This command was first available in ExtremeXOS 11.1.

PD classes 7 and 8, and power up status and powered channels information for ExtremeSwitching X465 PoE switches with 60W ('u') and 90W ('w') ports was added in ExtremeXOS 30.2.

Platform Availability

This command is available on the [PoE](#) devices listed in [Extreme Networks PoE Devices](#).

show inline-power slot

```
show inline-power [fast | perpetual] slot slot
```

Description

Displays inline power information for the specified node (slot) on SummitStacks.

Syntax Description

| | |
|------------------|---|
| <i>slot</i> | Specifies the node (slot). |
| fast | Specifies showing fast PoE power status, which is the ability to provide power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. |
| perpetual | Specifies showing perpetual PoE power status, which is the ability to preserve PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting. |

Default

N/A.

Usage Guidelines

On SummitStacks, the output indicates the following inline power status for each system:

- Configured power:
 - Enabled.

- Disabled.
- System power surplus.
- Redundant power surplus.
- Power usage threshold.
- Disconnect precedence.
- Legacy—The status of the legacy mode, which allows detection of many non-standard PDs.

The output indicates the following inline power status information for each slot:

- Inline power status—The status of inline power. The status conditions are:
 - Enabled.
 - Disabled.
- Firmware status—The operational status of the slot. The status conditions are:
 - Operational.
 - Not operational.
 - Disabled.
 - Subsystem failure.
 - Card not present.
 - Slot disabled.
- Budgeted power—The amount of power, in watts, that is available to the slot.
- Measured power—The amount of power, in watts, that currently being used by the slot.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Using the **fast** option of this command shows the slot-level fast PoE information. It shows the last fast PoE boot result. It also shows the slot-level PoE configurations saved in hardware along with the ones currently configured so that you can see any mismatches. If the default configuration file has never been saved in this boot session, the hardware configurations shown in this command are the initial running configurations from hardware at boot time. If the default configuration file has been saved in this boot session (by `save configuration`), the hardware configurations shown in this command are the last configurations saved to hardware.

Example

The following command displays inline power information for node (slot) 3 on a SummitStack:

```
# show inline-power slot 3
Inline Power System Information
Configured           : Enabled
System Power Surplus : 1500 Watts available for budgeting
Redundant Power Surplus : 465 Watts available for budgeting to maintain N+1
Power Usage Threshold : 70 percent (per slot)
Disconnect Precedence : lowest-priority
Legacy Mode          : Disabled
Budgeted             Measured
Slot  Inline-Power  Firmware Status  Power (Watts)  Power (Watts)
3     Enabled       Operational      50 W           9 W
4     Enabled       Card Not Present ( 50 W)           n/a
7     Enabled       Operational      50 W           0 W
Note: A budget value in parentheses is not allocated from the system power
```

The following example shows fast PoE status on a stack:

```
# show inline-power fast
Slot  State  Enable  Disconnect  Last Fast Boot Status
-----
1     HW     Enabled  Deny-port   Succeeded
      Cfg   Enabled  Deny-port
3     HW     Disabled Deny-port   Disabled
      Cfg   Disabled Deny-port
4     HW     Enabled  Lowest-priority  Mismatch
      Cfg   Enabled  Deny-port
5     HW     Enabled  Deny-port   Failed (Query failed)
      Cfg   Enabled  Deny-port
6     HW     Enabled  Deny-port   Failed (Firmware upgrade)
      Cfg   Enabled  Deny-port
7     HW     Enabled  Deny-port   Failed (In reset)
      Cfg   Enabled  Deny-port
8     HW     Enabled  Deny-port   Failed (Invalid config)
      Cfg   Enabled  Deny-port

State: (HW) Hardware state per-slot, (Cfg) Configured state per-slot.
Fast Boot Status:
  Succeeded - Fast PoE boot succeeded and configuration matches.
  Disabled  - Fast PoE was disabled in hardware at boot time.
  Mismatch  - Fast PoE booted but the configuration in hardware
              did not match the configuration file.
  Failed    - Fast PoE boot failed and PoE was reset.
```

The following example shows perpetual PoE status on slot 3:

```
# show inline-power perpetual on slot 3
Perpetual POE is Enabled
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Platform Availability

It is available on SummitStack when the stack contains switches listed in [Extreme Networks PoE Devices](#).

The **fast** and **perpetual** options are only available on the ExtremeSwitching X465, X435, and 5520 series switches.

show inline-power stats ports

```
show inline-power stats ports {port_list}
```

Description

Displays inline power statistics for the specified ports.

Syntax Description

| | |
|------------------------|---|
| <code>port_list</code> | Specifies one or more slots and ports. If you do not specify ports, information for all ports appear. |
|------------------------|---|

Default

N/A.

Usage Guidelines

The output displays the following inline power statistics for the specified ports:

- State—Displays the port power state:
 - Disabled.
 - Searching.
 - Delivering.
 - Faulted.
 - Disconnected.
 - Other.
 - Denied.
- PD's power class—Displays the class type of the connected PD:
 - "-----": disabled or searching.
 - "class0": class 0 device.
 - "class1": class 1 device.
 - "class2": class 2 device.
 - "class3": class 3 device.
 - "class4": class 4 device.
- Absent—Displays the number of times the port was disconnected.
- InvSig—Displays the number of times the port had an invalid signature.
- Denied—Displays the number of times the port was denied.
- Over-current—Displays the number of times the port entered an overcurrent state.
- Short—Displays the number of times the port entered undercurrent state.

Example

The following command displays inline power configuration information for ports 1 to 10 in node (slot) 3 on a SummitStack:

```
show inline-power stats ports 3:1-10
```

Following is sample output from this command:

```

STATISTICS COUNTERS
Port  State      Class  Absent  InvSig  Denied  OverCurrent  Short
3:1   delivering  class3    0       0       0        18           0
3:2   delivering  class3    0       0       0         0           0

```

| | | | | | | | |
|------|-----------|--------|---|---|---|---|---|
| 3:3 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:4 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:5 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:6 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:7 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:8 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:9 | searching | class0 | 0 | 0 | 0 | 0 | 0 |
| 3:10 | searching | class0 | 0 | 0 | 0 | 0 | 0 |

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the *PoE* devices listed in [Extreme Networks PoE Devices](#).

show inline-power stats slot

```
show inline-power stats slot slot
```

Description

Displays inline power statistics for the specified slot on SummitStacks.

Syntax Description

| | |
|-------------|---------------------|
| <i>slot</i> | Specifies the slot. |
|-------------|---------------------|

Default

N/A.

Usage Guidelines

Use this command to produce a report that shows the firmware status and version plus how many ports are currently faulted, powered, and waiting for power for the selected slots. Unlike the values displayed with the `show inline-power stats ports` command, these values (displayed with the `show inline-power stats slot` command) are current readings, not cumulative counters.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command displays inline power statistics information for node (slot) 3 on a SummitStack:

```
show inline-power stats slot 3
```

Following is sample output from this command:

```
Inline-Power Slot Statistics
Slot: 3
Firmware status           : Operational
Firmware revision         : 292b1
Total ports powered       : 7
Total ports awaiting power : 41
Total ports faulted       : 0
Total ports disabled      : 0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on SummitStacks when the stack contains switches listed in [Extreme Networks PoE Devices](#).

show inline-power stats

```
show inline-power stats
```

Description

Displays inline power statistics for the specified switch.

Syntax Description

There are no variables or parameters for this command.

Default

N/A.

Usage Guidelines

Use this command to produce a report that shows the firmware status and version plus how many ports are currently faulted, powered, and waiting for power for the switch. Unlike the values displayed with the `show inline-power stats ports` command, these values are current readings, not cumulative counters.

Example

The following command displays inline power statistics information:

```
show inline-power stats
```

Following is sample output from this command:

```

Inline-Power Slot Statistics
Firmware status      : Operational
Firmware revision    : 292b1
Total ports powered  : 7
Total ports awaiting power : 17
Total ports faulted   : 0
Total ports disabled : 0
  
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on the switches listed in [Extreme Networks PoE Devices](#).

show inline-power

```
show inline-power [fast | perpetual]
```

Description

Displays inline power status information for the specified *PoE* switch.

Syntax Description

| | |
|------------------|---|
| fast | Specifies showing fast PoE power status, which is the ability to provide power to devices at the time of switch power on without waiting for boot up based on last saved PoE state. |
| perpetual | Specifies showing perpetual PoE power status, which is the ability to preserve PoE power delivery to devices during reboot. Perpetual PoE is a switch-wide setting. |

Default

N/A.

Usage Guidelines

The output varies depending on the PoE device you are using.

Note

For additional information on inline power parameters, see the [show power budget](#) command.

Example

The following command displays inline power status for the switch:

```
# show inline-power
Inline Power System Information
Configured           : Enabled
Power Usage Threshold : 70 percent
Firmware Status      Power (Watts) Power (Watts) Legacy
Operational          405 W           0 W           Disabled
```

The following example displays fast PoE status:

```
# show inline-power fast
State   Enable   Disconnect   Last Fast Boot Status
-----
HW      Disabled Deny-port    Disabled
Cfg     Disabled Deny-port

State: (HW) Hardware state per-slot, (Cfg) Configured state per-slot.
Fast Boot Status:
  Succeeded - Fast PoE boot succeeded and configuration matches.
  Disabled  - Fast PoE was disabled in hardware at boot time.
  Mismatch  - Fast PoE booted but the configuration in hardware
              did not match the configuration file.
  Failed    - Fast PoE boot failed and PoE was reset.
```

The following example displays perpetual PoE status:

```
# show inline-power perpetual
Perpetual POE is Enabled
```

History

This command was first available in ExtremeXOS 11.1.

The **fast** and **perpetual** PoE options were added in ExtremeXOS 30.3.

Platform Availability

This command is available on the switches listed in [Extreme Networks PoE Devices](#).

The **fast** and **perpetual** options are only available on the ExtremeSwitching X465, X435, and 5520 series switches.

show ip nat

```
show ip nat
```

Description

Shows Network Address Translation (NAT) information.

Syntax Description

| | |
|------------|---|
| ip | Shows Internet Protocol (IP) information. |
| nat | Shows NAT information. |

Default

N/A.

Usage Guidelines

NAT maps IP addresses from one address domain (typically a private IP address space) to an another address domain (typically a public Internet IP address space) to provide transparent routing to end hosts. This translation is accomplished transparently by having a NAT device translate the IP address and/or Layer 4 port of the packets.

To enable or disable IP NAT, use the commands `enable ip nat` and `disable ip nat`.

Example

The following example shows IP NAT information:

```
# show ip nat
NAT                               : Disabled
Number of NAT VLANs               : 0
Maximum number of NAT VLANs      : 4
Number of NAT rules               : 0
Number of source NAT rules        : 0
Number of destination NAPT rules  : 0
Number of configured NAPT rules   : 0
Number of dynamic NAPT rules      : 0
Maximum number of NAT rules       : 1024
Aging Time                        : 20 minutes
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ip nat rule

```
show ip nat rule {detail}
```

Description

Displays information about IP Network Address Translation (NAT) rules.

Syntax Description

| | |
|---------------|--|
| ip | Specifies Internet Protocol (IP). |
| nat | Specifies NAT. |
| rule | Specifies viewing NAT rule information. |
| detail | Specifies showing detailed NAT rule information. |

Default

N/A.

Usage Guidelines

Example

The following example shows basic information about all IP NAT rules configured on the switch:

```
# show ip nat rule
Rule Name           State   VR           IPAddr
NewIPAddr
                    Type    EgressVLAN   Protocol  L4Port
-----
baseNapt            Enabled VR-Default   10.1.1.100/24
112.123.234.200
                    NAPT    out          ---      -----
-----
srcTxlate           Enabled VR-Default   10.20.30.40/32
50.1.1.100
                    Src-NAT out          ---      -----
-----
natIncomplete       Disabled -----
-----
                    Src-NAT -----
                    ---      -----
-----
dnat-http-server    Enabled VR-Default   40.1.1.2/32
10.1.1.100
                    Dst-NAPT out          UDP      8080
80
-----
-----
NAT                  : Enabled
Total number of NAT rules      : 4
Total number of source NAT rules : 2
Total number of destination NAPT rules : 1
Total number of configured NAPT rules : 1
Total number of dynamic NAPT rules : 0
Maximum number of NAT rules    : 1024
Aging Time                   : 10 minutes
```

The following example shows detailed information about all IP NAT rules configured on the switch:

```
show ip nat rule detail
Rule Name      : baseNapt
Type           : NAPT
Admin State    : Enabled
```

```

VR Name           : VR-Default
New VR Name       : VR-Default
Egress VLAN Name  : out
Source IP Address : 10.1.1.100

```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ip nat rule statistics

```
show ip nat rule {rule_name} statistics {no-refresh}
```

Description

Shows statistics IP Network Address Translation (NAT) statistics (byte/packet counters) in the outward direction.

Syntax Description

| | |
|-------------------|--|
| ip | Specifies Internet Protocol (IP). |
| nat | Specifies NAT. |
| rule | Specifies NAT rules. |
| <i>rule_name</i> | Specifies displaying statistics only for the specified NAT rule. |
| statistics | Specifies showing IP NAT rule statistics. |
| no-refresh | Specifies displaying page-by-page without auto-refresh. |

Default

N/A.

Usage Guidelines

Example

The following example shows NAT statistics in the outward direction:

```
# show ip nat rule statistics
NAT Rule Statistics                               Sat Sep 11 16:27:23 2019
NAT Rule Name                                     Tx Packet                                     Tx Byte
-----
nat59                                             2168                                         138752
nat60                                             2168                                         138752
nat61                                             2168                                         138752
nat62                                             2168                                         138752
nat63                                             2168                                         138752
nat64                                             2168                                         138752
nat65                                             2168                                         138752
nat66                                             2168                                         138752
nat67                                             2168                                         138752
nat68                                             2168                                         138752
nat69                                             2168                                         138752
nat70                                             2168                                         138752
```

```

nat71          2168          138752

nat73          2168          138752
nat74          2168          138752
nat75          2168          138752
nat76          2168          138752
nat77          2168          138752
=====
0->Clear Counters  U->page up  D->page down  ESC->exit

```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ip nat vlan

```
show ip nat vlan {vlan_name}
```

Description

Shows Network Address Translation (NAT) VLAN information.

Syntax Description

| | |
|------------------|---|
| ip | Shows Internet Protocol (IP) information. |
| nat | Shows NAT information. |
| vlan | Specifies VLAN NAT information. |
| <i>vlan_name</i> | Specifies which VLAN to show NAT information for. |

Default

N/A.

Usage Guidelines

To view information for a specific VLAN, specify the VLAN name when running this command.

Example

The following example shows VLAN NAT information:

```

# show ip nat vlan
VLAN Name          Direction
=====

```

```

engineering          Both
in                   Ingress
out                   Egress
=====
Total Number of NAT VLANs   : 3
Maximum number of NAT VLANs : 4

```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ip nat vlan counters

```
show ip nat vlan counters {vlan_name}
```

Description

Shows the number of packets translated and discarded in the Network Address Translation (NAT) VLAN egress and ingress directions.

Syntax Description

| | |
|------------------|---|
| ip | Shows Internet Protocol (IP) information. |
| nat | Shows NAT information. |
| vlan | Shows VLAN NAT information. |
| counters | Shows NAT VLAN counter information |
| <i>vlan_name</i> | Specifies which VLAN to show NAT information for. |

Default

N/A.

Usage Guidelines

Source translations and discards constitute the packet counts in the egress direction. Destination translations and discards constitute the packet counts in the ingress direction.

To clear counters, run the command `clear ip nat counters vlan {vlan_name}`.

Example

The following example shows NAT VLAN counter information:

```
# show ip nat vlan counters
```

| VLAN Name | Source Translations | Source Discards | Destination Translations | Destination Discards |
|-----------|---------------------|-----------------|--------------------------|----------------------|
| out | 203284 | 0 | 0 | 0 |
| in | 0 | 0 | 0 | 0 |

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show iparp

```
show iparp {ip_addr | mac | [{vlan} vlan_name | vlan vlan_list] |
  permanent} {port port {vr vr_name}}
```

Description

Displays the IP Address Resolution Protocol (ARP) table. You can filter the display by IP address, MAC address, VLAN, or permanent entries.

Syntax Description

| | |
|------------------|---|
| <i>ip_addr</i> | Specifies an IP address. |
| <i>mac</i> | Specifies a MAC address. |
| <i>vlan_name</i> | Specifies a VLAN name. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs. |
| permanent | Specifies permanent entries. |
| port | Show entries for a specific port. |
| <i>port</i> | Show only entries for this port number. |
| <i>vr_name</i> | Specifies a VR or VRF. |

Default

Show all entries, except for proxy entries.

Usage Guidelines

Displays the IP ARP table, including:

- IP address
- MAC address
- Aging timer value
- VLAN name, VLAN ID and port number
- Flags

If you do not specify a VR or VRF, the command applies to the current VR context.

The show output displays the following information:

| | |
|---------------------|--|
| ARP address check | Whether IP ARP checking is enabled or disabled. IP ARP checking verifies if the ARP request's source address is in the receiving interface's subnet. |
| ARP refresh | Whether ARP refresh is enabled or disabled. ARP refresh is performed when an ARP entry's age is three-fourths of the timeout value. |
| Dynamic entries | The number of dynamic (learned ARP) entries in the table. |
| Pending entries | The number of sent ARP requests that have not yet received a response. |
| Static entries | The number of configured (static ARP) entries in the table. |
| Timeout | Timeout value for a dynamic (learned) ARP entry. |
| ARP Global Settings | |
| Max Entries | Maximum number of ARP entries. |
| Max Pending Entries | Maximum number of pending ARP entries. |
| Max Proxy Entries | Maximum number of proxy ARP entries. |

Example

The following example displays the IP ARP table for the current VR or VRF context:

```
# show iparp
VR      Destination      Mac                Age  Static  VLAN      VID  Port

Max Entries     :          4096
Max Pending Entries :          256
Max Proxy Entries :          256

```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

The `vlan_list` variable was added in ExtremeXOS 16.1.

For ARP, virtual network remote endpoints appear in the port column in ExtremeXOS 22.3

In Request, Out Request, Failed Requests, Proxy Answered, Rx Error, Rejected Count, Rejected Port, Max ARP entries, In Response, Out Response, Dup IP Addr, Rejected IP, Rejected I/F, and Max ARP pending entries output removed; ARP Global Settings Max Entries, Max Pending Entries, Max Proxy Entries output added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iparp proxy

```
show iparp proxy {[ipNetmask | ip_addr mask]} {vr vr_name}
```

Description

Displays the proxy ARP table.

Syntax Description

| | |
|------------------|--------------------------------------|
| <i>ipNetmask</i> | Specifies an IP address/mask length. |
| <i>ip_addr</i> | Specifies an IP address. |
| <i>mask</i> | Specifies a subnet mask. |
| <i>vr_name</i> | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

If no argument is specified, then all proxy ARP entries are displayed.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command displays the proxy ARP table:

```
# show iparp proxy
VR          Destination      Mask           Mac              Refcnt  Always  Dynamic
VR-Default  1.1.0.4             255.255.255.255  00:04:96:97:f5:32  0       NO     YES
VR-Default  10.1.1.200          255.255.255.255  vrrp              0       YES    YES
VR-Default  10.1.1.201          255.255.255.255  vrrp              0       NO     NO
VR-Default  10.1.1.202          255.255.255.255  00:11:22:33:44:55  0       NO     NO
VR-Default  10.1.1.204          255.255.255.255  vrrp              0       YES    YES
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iparp security

```
show iparp security [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays the IP ARP security violation information for one or all VLANs.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies a single VLAN for which to display security violation information. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs to display security violation information. |

Default

Shows security violation information for all VLANs except Mgmt.

Usage Guidelines

None.

Example

The following example displays IP ARP security violation information for all VLANs:

```
Switch.4 # show iparp security
Most Recent Violation
=====
Vlan          Security  Violations  Type  IP address  MAC  Port
=====
Default      ----
test         ----
Security Setting: (G) Gratuitous ARP Protection
Violation Type  : (g) Gratuitous ARP Violation
```

The following example displays IP ARP security violation information for VLAN Default:

```
Switch.5 # show iparp security "Default"
Most Recent Violation
=====
Vlan          Security  Violations  Type  IP address  MAC  Port
=====
Default      ----
Security Setting: (G) Gratuitous ARP Protection
Violation Type  : (g) Gratuitous ARP Violation
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** option was added in ExtremeXOS 11.0.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iparp stats

```
show iparp stats [[vr_name | vr {all | vr_name} ] { no-refresh | refresh}
                 {vr} summary]

show iparp stats [vlan {all {vr vr_name}} | [ {vlan} vlan_name | vlan
                 vlan_list] {no-refresh | refresh}]

show iparp stats ports {all | port_list} { no-refresh | refresh}
```

Description

Displays the IP ARP statistics for one or more VRs, VLANs, or ports.

Syntax Description

| | |
|------------------|--|
| <i>vr_name</i> | Specifies a VR or VRF for which to display statistics. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> for which to display statistics. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs to display statistics. |
| refresh | Continuous refresh of output. |
| <i>port_list</i> | Specifies a list of ports for which to display statistics. |

Default

Shows all VLAN ARP statistics in a dynamic display.

Usage Guidelines

VLAN statistics and totals are displayed for a single VR. When you display IPARP statistics for one or all VLANs, the display includes the specified VLANs for the specified VR. If you do not specify a VR for a VLAN report, the display includes the specified VLANs for the current VR context.

Periodically as part of cleanup, failed entries go down and hence the total entries goes down. In certain scenarios, they may help detect a problem (memory leak or an attack). The `show iparp stats` command shows totals across all VRs, including VR-Mgmt.

Example

The following example displays ARP table statistics for all VRs and VRFs:

```
# show iparp stats vr all
IP ARP VR Statistics           Wed Apr 07 15:30:49 2010
ARP Total   Dynamic   Static   Pending
=====
VR-Default
96          89          5         0
VR-Mgmt
4           2           2         0
VR-SV_PPPOE
287        286         1         0
VR-NV_PPPOE
```

```

19          19          0          0
chicago2
50          44          5          0
Total for all VRs
456         440         13         0
=====
U->page up  D->page down  ESC->exit

```

The following example displays ARP table statistics for all VLANs in the current VR context:

```

# show iparp stats vlan all
IP ARP VLAN Statistics                               Wed Apr 07 15:30:49 2010
VLAN                                                ARP Total          Dynamic            Static
=====
VLAN_06-AAR                                         94                 89                5
VLAN_07-AAR                                         122                121               1
VLAN_02-BOT                                         43                 42                1
=====
Totals for VR U3c-South.
Dynamic :           440   Static   :           13   Pending   :           0
=====
U->page up  D->page down  ESC->exit

```

The following example displays ARP table statistics for ports 1:1 to 1:17:

```

# show iparp stats ports 1:1-1:17
IP ARP Port Statistics                               Wed Apr 07 15:30:49 2010
Port                                                Link State         ARP Total          Dynamic            Static
=====
1:1          A          94                 89                5
1:2          A          37                 37                0

```

History

This command was first available in ExtremeXOS 12.4.2.

The **no-refresh** keyword was removed in ExtremeXOS 16.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

The **refresh** keyword was added in ExtremeXOS 16.1.

The ARP unneeded, failed, rejected, total entries, and last rejected information was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ipconfig

```
show ipconfig {ipv4} {vlan vlan_name}
```

Description

Displays configuration information for one or more VLANs in the current VR context.

Syntax Description

| | |
|------------------|------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
|------------------|------------------------|

Default

N/A.

Usage Guidelines

If no VLAN information is specified, then global IP configuration is displayed. Otherwise, specific VLAN information is displayed.

Example

```
# show ipconfig
  Use Redirects : Disabled
  IpOption LSRR : Enabled
  IpOption SSRR : Enabled
    IpOption RR : Enabled
    IpOption TS : Enabled
    IpOption RA : Enabled
  Route Sharing : Disabled
  Originated Packets : Don't require ipforwarding
  IP Fwding into LSP : Disabled
  Max Shared Gateways : Current: 4   Configured: 4
  Route Sharing Hash : XOR, Custom Method
  Ping Protection : Enabled for static routes Interval: 2 Misses: 3
  IP Anycast MAC : 00:00:AB:BA:BA:BA
  IRDP:
    Advertisement Address: 255.255.255.255
    Maximum Interval: 600
    Minimum Interval: 450      Lifetime: 1800      Preference: 0
  Interface  IP Address      Flags              nSIA
  data2      200.0.0.1         /24 EUf---R-----  0
```

| | | | |
|-------|---------|------------------|---|
| inet | 1.1.1.2 | /24 EUf---R----- | 0 |
| mytun | 2.0.0.2 | /24 EU---R----- | 0 |

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

This command changed to display information for the current VR context in ExtremeXOS 12.5.

Ping protection information added in ExtremeXOS 22.1.

Route sharing hashing algorithm (default or custom) added in ExtremeXOS 22.1.

The D (duplicate address detected on VLAN), t (tentative address), A (address mask reply enabled), M (send parameter problem enabled), P (send port unreachables enabled), T (time stamp reply enabled), u (send unreachables enabled), and X (send time exceeded enabled) flags were removed in ExtremeXOS 30.1.

IP anycast information was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ipconfig ipv6

```
show ipconfig ipv6 {vlan vlan_name | tunnel tunnel_name}
```

Description

Displays configuration information for one or more interfaces in the current VR context.

Syntax Description

| | |
|--------------------|--|
| <i>vlan_name</i> | Specifies an IPv6 configured <u>VLAN</u> . |
| <i>tunnel_name</i> | Specifies an IPv6 tunnel. |

Default

N/A.

Usage Guidelines

If no interface is specified, then global IPv6 configuration is displayed. Otherwise, specific interface(s) will be displayed. Global IPv6 configuration information includes:

- IPv6 address/netmask/etc.

- IPv6 forwarding information/IPv6 multicast forwarding information

Example

The following example displays configuration information on a VLAN "accounting":

```
show ipconfig ipv6 vlan accounting
```

The current and configured values for **max-gateways** now apply to IPv6 gateway sets as well as IPv4, so these values are added to the output:

```
# show ipconfig ipv6
Route Sharing : Disabled
ICMP Redirect for Fast Path : Disabled
Max Shared Gateways : Current: 32 Configured: 32
```

The configuration settings for static route ping protection enable/disable, interval, and misses also appear:

```
# show ipconfig ipv6
Route Sharing : Enabled
Route Compression : Enabled
ICMP Redirect for Fast Path : Disabled
Max Shared Gateways : Current: 16 Configured: 16
Route Sharing Hash : CRC Lower
Ping Protection : Enabled for static routes Interval: 2 Misses: 3
IPv6 Anycast MAC : 00:00:AB:BA:BA:BA
```

The following example displays configuration information for ICMP multicast and anycast echo requests (lines 4-5):

```
# show ipconfig ipv6
Route Sharing : Disabled
Route Compression : Enabled
Ignore ICMP Multicasts : Enabled
Ignore ICMP Anycasts : Enabled
ICMP Redirect for Fast Path : Disabled
Max Shared Gateways : Current: 16 Configured: 16
Route Sharing Hash : CRC Lower, Default Method
Ping Protection : Enabled for static routes Interval: 2 Misses: 3
IPv6 Anycast MAC : None
```

History

This command was first available in ExtremeXOS 11.2.

This command changed to display information for the current VR context in ExtremeXOS 12.5.

The show output for **max-gateways** was added in ExtremeXOS 15.3.

Ping protection information added in ExtremeXOS 22.1.

Route sharing hashing algorithm (default or custom) added in ExtremeXOS 22.1.

IP anycast information was added in ExtremeXOS 30.6.

Enabling or disabling replies to multicast and anycast echo requests was added in ExtremeXOS 31.3.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ip-fix

```
show ip-fix
```

Description

Displays IPFIX information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display IPFIX information regarding the global state, collector information and which ports are enabled.

Example

Following is sample IPFIX output:

```
# show ip-fix
Global IPFIX State: Enabled
Domain: 0
Source (Exporter) IP: Default (Switch IP) Virtual Router: "VR-Mgmt"
Collector IP: 10.66.9.32
Transport Protocol/Port/State: SCTP, Port 4739, NA
Flow Keys:
IPv4: "Source-IP" "Source L4 Port" "Dest-IP" "Dest L4 Port" "L4 Protocol" "TOS"
Unused:
IPv6: "Source-IP" "Source L4 Port" "Dest-IP" "Dest L4 Port" "Next Header" "TOS"
"Flow Label"
Unused:
Non-IP: "Source MAC" "Dest MAC" "Ethertype" "VLAN ID" "Priority" "Tagged"
Unused:
IPFIX Enabled on Port(s): 3:1, 4:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on only the ExtremeSwitching X460-G2 series switches.

show ipmroute

```
show ipmroute {source-net mask-len | source-net mask | summary} {vr vr-name}
```

Description

Displays the contents of the IP multicast routing table or the route origin priority.

Syntax Description

| | |
|-------------------|--|
| <i>source-net</i> | Specifies an IP address/mask length. |
| <i>mask-len</i> | Mask length for the IP multicast source's subnet. Range is 1-32. |
| <i>mask</i> | Specifies a subnet mask. |
| summary | Displays the statistics of multicast static routes. |
| <i>vr-name</i> | Specifies the virtual router to which the route is added. |

Default

vr-name is the VR of the current CLI context.

Usage Guidelines

This command allows you to view the configured multicast static routes. You can specify the filtering criteria on this command to view only the desired route. The multicast static routes are displayed in ascending order of their prefix (same order as `show iproute displays`).

Example

The following example shows a multicast static route from a default virtual router:

```
# show ipmroute
Destination      Gateway      Mtr      Flags      Protocol      VLAN
Default Route    20.20.20.1   255      UG         None          pc4-1
*1.1.0.0/16      20.20.20.1   10       UG         bgp           pc4-1
*11.0.0.0/8      30.30.30.1   12       U-         None          pc5-3
11.22.0.0/16     20.20.20.1   10       UG         None          pc4-1
*11.22.33.0/24   30.30.30.1   8        U-         None          pc5-3
11.22.33.44/32   20.20.20.1   4        UG         None          pc4-1
*12.0.0.0/8      20.20.20.1   0        UG         None          pc4-1
12.24.0.0/16     30.30.30.1   0        U-         None          pc5-3
*12.24.48.96/32  30.30.30.1   2        U-         ospf-extern1 pc5-3
44.66.0.0/16     30.30.30.1   0        U-         None          pc5-3
Flags: (*) Active, (G) Gateway, (U) Up
Mask distribution:
1 default routes 2 routes at length 8
4 routes at length 16 1 routes at length 24
```

```
2 routes at length 32
Total number of multicast static routes = 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show iproute

```
show iproute {ipv4} {priority | vlan vlan_name | permanent | ip_address
  netmask | summary} {multicast | unicast} {vr vrname}}
```

Description

Displays the contents of the IP routing table or the route origin priority.

Syntax Description

| | |
|-------------------|--|
| priority | Displays the priority values for each route origin type. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name. |
| permanent | Specifies permanent routing. |
| <i>ip_address</i> | Specifies an IP address. |
| <i>netmask</i> | Specifies a subnet mask. |
| summary | Displays summary information. |
| multicast | Displays information for IPv4 multicast routes only. |
| unicast | Displays information for IPv4 unicast routes only. |
| <i>vrname</i> | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

A **c** flag in the **Flags** column indicates a compressed route resulting from enabling compression using the enable iproute compression command. The total number of compressed routes is also shown.

All routes that are provided to the FIB display the **f** flag.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example displays detailed information about all IP routing:

```
# show iproute vr vr-b
Ori Destination      Gateway      Mtr  Flags          VLAN          Duration
#d  1.1.1.100/32      1.1.1.100    1    U-----um--f-  l3vni_vr_b    0d:0h:1m:17s
*evn 2.2.2.2/32      2.2.2.2      1    UGHD---u---f-  l3vni_vr_b    0d:0h:0m:8s
*evn 2.2.2.200/32    2.2.2.2      1    UGHD---u---f-  l3vni_vr_b    0d:0h:0m:7s

    4 routes at length 32

Route Origin distribution:
    2 routes from Direct          5 routes from EVPN

Total number of routes = 7
Total number of compressed routes = 0
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The c flag was added in ExtremeXOS 12.0.

The f flag was added in ExtremeXOS 12.2.2.

The I flag showing *ICMP* ping protection was added in ExtremeXOS 22.1.

The ap flag showing auto-peering information was added in ExtremeXOS 22.5.

The evn origin prefix showing EVPN information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iproute bfd

```
show iproute bfd
```

Description

Shows BFD protection gateway status for static routes added with BFD protection.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows BFD protection gateway status for static routes added with BFD protection:

```
# show iproute bfd
Strict BFD for static routes : Enabled
Gateway      BFD Session State      # Routes      VR
-----
1.1.1.2      Active (Down)           1             VR-Default
1.1.1.3      Pending
```

History

This command was first available in ExtremeXOS 12.4.

Strict BFD session protection for static routes status was added in ExtremeXOS 30.3.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show iproute ipv6 origin

```
show iproute ipv6 origin [auto-peering | direct | static | blackhole |
ripng | ospfv3 | ospfv3-intra | ospfv3-inter | ospfv3-extern1 |
ospfv3-extern2 | isis | isis-level-1 | isis-level-2 | isis-level-1-
```

```
external | isis-level-2-external | bgp | ibgp | ebgp | bootp | host-  
mobility] {vr vr_name}
```

Description

Displays the contents of the IPv6 routing table for routes with the specified origin.

Syntax Description

| | |
|------------------------------|---|
| direct | Specifies direct routes. |
| auto-peering | Specifies BGP auto-peering routes. |
| static | Specifies static routes. |
| blackhole | Specifies blackhole routes. |
| ripng | Specifies <i>RIPng</i> routes. |
| ospfv3 | Specifies <i>OSPFv3</i> routes. |
| ospfv3-intra | Specifies OSPFv3 Intra routing. |
| ospfv3-inter | Specifies OSPFv3 Inter routing. |
| ospfv3-extern1 | Specifies OSPFv3 External 1 routing. |
| ospfv3-extern2 | Specifies OSPFv3 External 2 routing. |
| isis | Specifies IS-IS routes. |
| isis-level-1 | Specifies IS-IS Level 1 routing. |
| isis-level-2 | Specifies IS-IS Level 2 routing. |
| isis-level-1-external | Specifies IS-IS Level 1 External routing. |
| isis-level-2-external | Specifies IS-IS Level 2 External routing. |
| bgp | Specifies Border Gateway Protocol. |
| ibgp | Specifies Interior <i>BGP</i> route. |
| ebgp | Specifies Exterior BGP route. |
| bootp | Specifies BOOTP route. |
| host-mobility | Specifies host-mobility routes. |
| <i>vr_name</i> | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

None.

Example

The following example displays the RIPng routes:

```
show iproute ipv6 origin ripng
```

History

This command was first available in ExtremeXOS 11.2.

The **bootp** attribute was added in 15.7.1

The **auto-peering** option was added in ExtremeXOS 22.5.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show iproute ipv6

```
show iproute ipv6 {priority | vlan vlan_name | tunnel tunnel_name |  
  ipv6Netmask | summary {multicast | unicast}} {vr vr_name}}
```

Description

Displays the contents of the IPv6 routing table.

Syntax Description

| | |
|--------------------|--|
| priority | Displays the priority values for each route origin type. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name. |
| <i>tunnel_name</i> | Specifies a tunnel name. |
| <i>ipv6Netmask</i> | Specifies an IPv6 address/prefix length. |
| summary | Specifies summary information. |
| <i>vr_name</i> | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example displays detailed information about all IPv6 routing:

```
Switch.18 # show iproute ipv6
Ori Destination                               Mtr  Flags          Duration

| OSPFv3Ext1 | 3200 |
| OSPFv3Ext2 | 3300 |
| IsisL1Ext | 3400 |
| IsisL2Ext | 3500 |

History

This command was first available in ExtremeXOS 11.2.

The I flag showing ICMP ping protection was added in ExtremeXOS 22.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show iproute mpls origin

```
show iproute mpls origin [bgp | blackhole | bootp | direct | ebgp | ibgp
| icmp | isis | isis-level-1 | isis-level-1-external | isis-level-2 |
isis-level-2-external | mpls evpn {signaling-protocol [ldp | rsvp-te
| static]} | ospf | ospf-extern1 | ospf-extern2 | ospf-inter | ospf-
intra | rip | static ] {unicast} {vr vrname}
```

Description

Displays the MPLS contents of the IP routing table for routes with the specified origin.

Syntax Description

| | |
|------------------------------|--|
| bgp | Specifies <u>BGP</u> routes. |
| blackhole | Specifies blackhole routes. |
| bootp | Specifies BOOTP routes. |
| direct | Specifies direct routes. |
| ebgp | Specifies E-BGP routes. |
| ibgp | Specifies I-BGP routes. |
| icmp | Specifies <u>ICMP</u> routes. |
| isis | Specifies IS-IS routes. |
| isis-level-1 | Specifies ISIS Level 1 routing. |
| isis-level-1-external | Specifies ISIS Level 1 External routing. |

| | |
|---|---|
| isis-level-2 | Specifies ISIS Level 2 routing. |
| isis-level-2-external | Specifies ISIS Level 2 External routing. |
| mpls | Specifies MPLS routes. This option is available only on platforms that support the MPLS feature pack, which is described in the ExtremeXOS 31.3 Feature License Requirements document. |
| evpn | Specifies EVPN routes. |
| signaling-protocol [ldp rsvp-te static] | Specifies an MPLS signaling protocol. This option is available only on platforms that support the MPLS feature pack, which is described in the ExtremeXOS 31.3 Feature License Requirements document. |
| ospf | Specifies <i>OSPF</i> routes. |
| ospf-extern1 | Specifies OSPF External 1 routing. |
| ospf-extern2 | Specifies OSPF External 2 routing. |
| ospf-inter | Specifies OSPFInter routing. |
| ospf-intra | Specifies OSPFIntra routing. |
| rip | Specifies <i>RIP</i> routes. |
| static | Specifies static routes. |
| unicast | Displays unicast routes with the specified origin. |
| vrname | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

None.

Example

The following example displays all the MPLS routes that originate from BGP:

```
# show iproute mpls origin bgp
```

History

This command was first available in ExtremeXOS 12.2.2.

The **evpn** option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support MPLS.

show iproute mpls

```
show iproute mpls {lsp lsp_name | vlan vlan_name | permanent |
  ip_address netmask | summary} {unicast} {vr vrname}
```

Description

Displays the MPLS contents of the IP routing table.

Syntax Description

| | |
|-------------------|-------------------------------|
| <i>lsp_name</i> | Specifies an LSP name. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name. |
| permanent | Specifies permanent routing. |
| <i>ip_address</i> | Specifies an IP address. |
| <i>netmask</i> | Specifies a subnet mask. |
| unicast | Displays unicast routes. |
| <i>vrname</i> | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

A c flag in the Flags column indicates a compressed route resulting from enabling compression using the enable iproute compression command. The total number of compressed routes is also shown.

All routes that are provided to the FIB display the f flag.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following example displays detailed information about all IP routing:

```
Switch.3 # show iproute mpls
```

History

This command was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iproute multicast

```
show iproute {ipv4} {{vlan} name | [ipaddress netmask | ipNetmask] |
origin [direct | static | mbgp | imbgp | embgp]} multicast {vr
  vr_name}
```

Description

Displays all or a filtered set of multicast routes in the IP multicast routing table.

Syntax Description

| | |
|--------------------------|---|
| ipv4 | Selects only IPv4 multicast routes. |
| <i>name</i> | Specifies a <u>VLAN</u> for which to display multicast routes. |
| <i>ipaddress netmask</i> | Specifies an IP address and network mask (in dotted decimal notation) for which to display multicast routes. |
| <i>ipNetmask</i> | Specifies the IP address and network mask in classless inter domain routing (CIDR) notation. |
| origin | Limits the displayed multicast routes to those generated by the specified origin. Origin options select direct routes, static routes, and routes created by the MBGP, IMBGP, and EMBGP protocols. |
| <i>vr_name</i> | Specifies the virtual router for which to display multicast routes. |

Default

vr_name is the VR of the current CLI context.

Usage Guidelines

This command does not display unicast routes, which can be used for multicast traffic.

Example

The following example displays all the routes in multicast routing table:

```
# show iproute multicast
Ori  Destination      Gateway      Mtr  Flags          VLAN          Duration

```

Description

Displays the contents of the IP routing table for routes with the specified origin.

Syntax Description

| | |
|---------------------|---|
| auto-peering | Specifies <i>BGP</i> auto-peering routes. |
| bgp | Specifies <i>BGP</i> routes. |
| blackhole | Specifies blackhole routes. |
| bootp | Specifies BOOTP routes. |

| | |
|---|---|
| direct | Specifies direct routes. |
| ebgp | Specifies E-BGP routes. |
| embgp | Specifies EMBGP routes. |
| ibgp | Specifies I-BGP routes. |
| icmp | Specifies <i>ICMP</i> routes. |
| imbgp | Specifies IMBGP routes. |
| isis | Specifies IS-IS routes. |
| isis-level-1 | Specifies IS-IS Level 1 routing. |
| isis-level-1-external | Specifies IS-IS Level 1 External routing. |
| isis-level-2 | Specifies IS-IS Level 2 routing. |
| isis-level-2-external | Specifies IS-IS Level 2 External routing. |
| mbgp | Specifies MBGP routes. |
| mpls | Specifies <i>MPLS</i> routes. This option is available only on platforms that support the MPLS feature pack, which is described in the ExtremeXOS 31.3 Feature License Requirements document. |
| evpn | Specifies EVPN routes. |
| signaling-protocol [ldp rsvp-te static] | Specifies an MPLS signaling protocol. This option is available only on platforms that support the MPLS feature pack, which is described in the ExtremeXOS 31.3 Feature License Requirements document. |
| ospf | Specifies <i>OSPF</i> routes. |
| ospf-extern1 | Specifies OSPF External 1 routing. |
| ospf-extern2 | Specifies OSPF External 2 routing. |
| ospf-inter | Specifies OSPF Inter routing. |
| ospf-intra | Specifies OSPF Intra routing. |
| rip | Specifies <i>RIP</i> routes. |
| static | Specifies static routes. |
| unicast | Displays unicast routes with the specified origin. |
| <i>vrname</i> | Specifies a VR or VRF. |

Default

N/A.

Usage Guidelines

None.

Example

The following example displays all the BGP routes:

```
# show iproute origin bgp
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The **embgp**, **mbgp**, and **mpls** options were added and the **ipv4** and **multicast** options removed in ExtremeXOS 12.2.2.

The **evpn** option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iproute protection ping

```
show iproute {ipv4 | ipv6} protection ping {v4_or_v6_gateway} {vr
  vr_name} {detail}
```

Description

Displays the current ping protection state for IPv4 or IPv6 routes, along with the number of protected routes. The information can be displayed per gateway, or for all gateways in a given VR.

Syntax Description

| | |
|--------------------------|---|
| ipv4 | Specifies IPv4 routes (default). |
| ipv6 | Specifies IPv6 routes. |
| protection ping | Specifies protection ping information. |
| v4_or_v6_gateway | Name of the specific IPv4 or IPv6 gateway to show protected routes for. |
| vr <i>vr_name</i> | Shows all protected routes for the specified VR. |
| detail | Displays timestamps of the last time each gateway transitioned to the "up" state and to the "down" state. |

Default

If not specified, IPv4 is the default.

Example

The following example shows all ping protected IPv4 routes only:

```
# show iproute protection ping
Ping protection for static IPv4 routes : Enabled
      Interval : 2
      Misses   : 3
```

```

Gateway          State  # Routes  VR
-----
1.2.3.4          Down   1         VR-Default
1.2.3.5          Up     1         VR-Default

```

The following example shows ping protected IPv6 routes only:

```

# show iproute ipv6 protection ping
Ping protection for static IPv6 routes : Enabled
      Interval : 2
      Misses   : 3

Gateway          State  # Routes  VR
-----
2000:2000:2000:2000:2000:2000:2000:2001  Up     2         VR-Default
3000::2          Down   2         VR-Default

```

The following example shows ping protected IPv6 routes with gateway up/down transition timestamp information:

```

# show iproute ipv6 protection ping detail
Ping protection for static IPv6 routes : Enabled
      Interval : 2
      Misses   : 3

Gateway: 2000:2000:2000:2000:2000:2000:2000:2001
State:    Up
# Routes: 2
VR:      VR-Default
Last Up:  Thu Mar 31 22:44:12 2016
Last Down: Thu Mar 31 22:42:22 2016

Gateway: 3000::2
State:    Down
# Routes: 2
VR:      VR-Default
Last Up:  --
Last Down: Thu Mar 31 22:42:22 2016

```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on all platforms with any license level as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show iproute reserved-entries statistics

```
show iproute reserved-entries statistics {slot slot_num}
```

Description

Displays the current usage statistics of the Longest Prefix Match (LPM) hardware table and the Layer 3 hardware hash table by resource type.

Syntax Description

| | |
|-----------------------|---|
| <code>slot_num</code> | For SummitStack only, this option displays the statistics for the specified slot. |
|-----------------------|---|

Default

N/A.

Usage Guidelines

This command shows the current number of IP routes and local and remote IPv4 hosts in the LPM hardware table. It also shows the number of IPv4 unicast, multicast, and IPv6 unicast entries in the Layer 3 hardware hash table. The theoretical maximums for each individual resource type are shown at the bottom of the output. These maximum values cannot all be achieved simultaneously, and individual values might not be reached depending on the addresses or routes in use.

The ExtremeXOS software supports the coexistence of higher- and lower-capacity hardware. To allow for coexistence and increased hardware forwarding, when the number of IPv4 routes exceeds 25,000, the lower-capacity hardware automatically transitions from using LPM routing to forwarding of individual remote hosts, also known as IP Forwarding Database (IP *FDB*) mode. Higher-capacity hardware continues using LPM routing. Lower-capacity hardware operating in IP FDB mode will be indicated with a d flag in the output of `show iproute reserved-entries statistics` command, indicating that only direct routes are installed. For more information, see “Coexistence of Higher- and Lower-Capacity Hardware” in the [ExtremeXOS 31.3 User Guide](#).

Example

The following example displays usage statistics for the LPM and Layer 3 hardware tables:

```
# show iproute reserved-entries statistics
          |-----In HW Route Table-----| |-----In HW L3 Hash Table-----|
          # Used Routes                # IPv4 Hosts  IPv4  IPv4
IPv6      IPv4      IPv6
Slot Type                IPv4  IPv6    Local Remote  Local  Rem.
Local  MCast  MCast
-----
1      5420M-24T-4YE-EXOS          0    0      0    0      0    0
0      0      0

Theoretical maximum for each resource type:
X435
* 2048 * 1024          32    16     64    64     509  4096  509

* 73728 * 36864
X695
* 73728 * 36864

```

```

Flags: (!) Indicates all reserved route entries in use.
(d) Indicates only direct IPv4 routes are installed.
(>) Some IPv6 routes with mask > 64 bits are installed and do not use
entries in the internal HW Route Table.
(*) Assumes IP Multicast compression is on.
(M) IPMC entries stored in L2 MAC Table when lookup-key is 'mac-vlan'.

```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iproute reserved-entries

```
show iproute reserved-entries {slot slot_num}
```

Description

Displays the configured number of IPv4 and IPv6 routes reserved in the Longest Prefix Match (LPM) hardware table.

Syntax Description

| | |
|-----------------|---|
| <i>slot_num</i> | For SummitStack only, this option displays the reservations for the specified slot. |
|-----------------|---|

Default

N/A.

Usage Guidelines

The IPv4 Routes column in the command output shows whether IPv4 routes are stored in internal or external LPM tables.

To modify the configuration that this command displays, use the following command:

```
configure iproute reserved-entries [ num_routes_needed | maximum |
default ] slot [all |slot_num]
```

Example

The following example displays the reserved space for IP routes:

```
Slot-3 Stack.30 # show iproute reserved-entries
Slot  Type                IPv4      # Reserved Routes      Minimum #
-----  -----                -
1      X460G2-48t-10G4         Internal   8144 ( 4072)              4112
2      X460G2-48t-10G4         Internal   8144 ( 4072)              4112
3      X670G2-48x-4q           Internal   12240 ( 6120) [default]  4112
4
5
6
7
8

Maximum supported # IPv4 (or IPv6) Reserved Routes:
X435                                Internal    32 ( 16)
X440G2, X620                        Internal    480 ( 240)
X460G2, 5420F, 5420M                Internal   12256 ( 6128)
X450G2, X460G2-16MP, 5520           Internal   16352 ( 8176)
X465, X590, X690                    Internal   16352 ( 8176)
X670G2, X870                        Internal   16352 ( 8176)
X695                                Internal   32736 ( 16368)

Note: IPv4 Hosts can occupy unused HW Route table space,
      unless # Reserved Routes is "maximum".
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security anomaly-protection notify cache ports

```
show ip-security anomaly-protection notify cache ports port_list
```

Description

Displays most anomaly notification caches.

Syntax Description

| | |
|------------------------|---|
| <code>port_list</code> | Specifies one or more ports or slots and ports. |
|------------------------|---|

Default

N/A.

Usage Guidelines

This command displays most anomaly notification caches.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security arp gratuitous-protection

```
show ip-security arp gratuitous-protection
```

Description

If configured for gratuitous ARP, displays the gratuitous ARP protection configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The switch displays the name of each VLAN configured for gratuitous ARP.

If you do not have gratuitous ARP configured, the switch does not display any VLAN information.

Example

The following command displays the gratuitous ARP configuration on the switch:

```
show ip-security arp gratuitous-protectection
```

The following is sample output from this command:

```
Gratuitous ARP Protection enabled on following VLANs:  
Default, test
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security arp learning

```
show ip-security arp learning [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays how the switch builds an ARP table and learns MAC addresses for devices on a specific [VLAN](#) and associated member ports.

Syntax Description

| | |
|------------------------|---|
| <code>vlan_name</code> | Specifies the name of the VLAN. |
| <code>vlan_list</code> | Specifies the name of the VLAN list of IDs. |

Default

N/A.

Usage Guidelines

The switch displays the following ARP learning information:

- Port—The member port of the VLAN.
- Learn-from—The method the port uses to build the ARP table. The methods are:
 - ARP—ARP learning is enabled. The switch uses a series of requests and replies to build the ARP table.
 - [DHCP](#)—DHCP secured ARP is enabled. The switch uses DHCP snooping to build the ARP table.
 - None—Both DHCP secured ARP and ARP learning are disabled.

Example

The following sample output displays how the switch builds its ARP table for the VLAN learn:

```
# show ip-security arp learning vlan learn
Port          Learn-from
-----
2:1           ARP
2:2           DHCP, poll 300 sec, retries 3
2:3           ARP
2:4           None
2:5           ARP
```

```
2:6      ARP
2:7      ARP
2:8      ARP
```

History

This command was first available in ExtremeXOS 11.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security arp validation

```
show ip-security arp validation [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays ARP validation information for the specified VLAN.

Syntax Description

| | |
|------------------------|---------------------------------|
| <code>vlan_name</code> | Specifies the name of the VLAN. |
| <code>vlan_list</code> | Specifies a VLAN list of IDs. |

Default

N/A.

Usage Guidelines

The switch displays the following ARP validation information:

- Port—Indicates the port that received the ARP entry.
- Validation—Indicates how the entry is validated.
- Violation-action—Determines what action(s) the switch takes when an invalid ARP is received.

Example

The following sample output displays ARP validation on for the VLAN valid:

```
# show ip-security arp validation vlan valid
-----
Port      Validation          Violation-action
-----
7         DHCP                drop-packet, block-port for 120 seconds, snmp-trap
23        DHCP                drop-packet, block-port for 120 seconds, snmp-trap
```

History

This command was first available in ExtremeXOS 11.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security arp validation violations

```
show ip-security arp validation violations [ {vlan} vlan_name | vlan
vlan_list]ports [ports | all]
```

Description

Displays the violation count on an ARP validation.

Syntax Description

| | |
|------------------------|---|
| <code>vlan_name</code> | Specifies the name of the <u>VLAN</u> . |
| <code>vlan_list</code> | Specifies a VLAN list of IDs. |
| <code>ports</code> | Specifies the name of the port. |
| all | Specifies all ports. |

Default

N/A.

Usage Guidelines

The switch displays the following ARP validation information:

- Port—Indicates the port that received the ARP entry.
- Validation—Indicates how the entry is validated.
- Violation count—Indicates the number of violations for each port.

Example

The following sample output displays ARP validation violation counts on all ports:

```
# show ip-security arp validation violations ragu ports all
-----
Port      Validation Violation Count
-----
1:1 ip,DHCP 1233
1:3 ip,DHCP 3425
1:4 ip,DHCP 5654
```

```
1:5 ip,DHCP 0
1:6 ip,DHCP 3645
```

History

This command was first available in ExtremeXOS 12.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping entries

```
show ip-security dhcp-snooping entries [ {vlan} vlan_name | vlan
vlan_list]
```

Description

Displays the *DHCP* bindings database on the switch.

Syntax Description

| | |
|------------------------|---|
| <code>vlan_name</code> | Specifies the name of the DHCP-snooping <i>VLAN</i> . |
| <code>vlan_list</code> | Specifies the DHCP-snooping VLAN list of IDs. |

Default

N/A.

Usage Guidelines

The switch displays the following DHCP bindings database information:

- VLAN—The name of the DHCP-snooping VLAN.
- IP Addr—The IP address of the untrusted interface or client.
- MAC Addr—The MAC address of the untrusted interface or client.
- Port—The port number where the untrusted interface or client attempted to access the network.

Example

The following sample output displays the DHCP bindings database on the switch:

```
# show ip-security dhcp-snooping entries vlan dhcpVlan
-----
Vlan: dhcpVlan
-----
```

```

Server      Client
IP Addr      MAC Addr      Port      Port
-----      -
172.16.100.9  00:90:27:c6:b7:65  1:1      1:2

```

History

This command was first available in ExtremeXOS 11.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping information circuit-id port-information

```

show ip-security dhcp-snooping information circuit-id port-information
  ports [port_list | all ]

```

Description

Displays the port information portion of the circuit ID for the indicated port(s).

Syntax Description

| | |
|------------------------|------------------------------|
| <code>port_list</code> | Specifies one or more ports. |
| all | Specifies all ports. |

Default

N/A.

Usage Guidelines

This command displays the port information portion of the circuit ID for the indicated ports.

Example

The following command:

```
# show ip-security dhcp-snooping information circuit-id port-information ports 1-7
```

Displays the following output:

```

Port      Circuit-ID Port information string
----      -
1         portinfostring1

```

```

2          portinfostring2
3          portinfostring3
4          portinfostring4
5          portinfostring5
Port      Circuit-ID Port information string
-----
6          1006
7          1007
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping information-option

```
show ip-security dhcp-snooping information-option
```

Description

Displays the *DHCP* relay agent option (option 82) settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays DHCP relay agent option (option 82) settings. For example, the following command:

```
show ip-security dhcp-snooping information-option
```

Generates the following output:

```
Information option insertion: Enabled Information option checking : Disabled Information
option policy : Drop
```

The following command:

```
show ip-security dhcp-snooping information-option
```

Generates the following output:

```
Information option insertion: Enabled Information option checking : Enabled Information
option policy : Keep
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping information-option circuit-id vlan-information

```
show ip-security dhcp-snooping information-option circuit-id vlan-
information {{vlan} [vlan_name | vlan_list]}
```

Description

Displays the VLAN information portion of the circuit ID for the indicated VLAN.

Syntax Description

| | |
|------------------|-------------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs. |

Default

N/A.

Usage Guidelines

This command displays the VLAN information portion of the circuit ID for the indicated VLAN. When a VLAN is not specified, the circuit ID information for all the VLANs is displayed.

Example

The following sample output displays circuit ID information for vlan "Mktg":

```
# show ip-security dhcp-snooping information-option circuit-id vlan-information vlan Mktg
Vlan                               Circuit-ID vlan information string
----                               -
Mktg                               DSLAM1
Note: The full Circuit ID string has the form <Vlan Info>-<Port ifIndex>.
```

History

This command was first available in ExtremeXOS 12.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping information remote-id

```
show ip-security dhcp-snooping information remote-id
```

Description

Shows the DHCP relay agent remote ID.

Syntax Description

This command has no arguments or variables.

Default

If a remote ID has not been configured, or it has been unconfigured, the default remote ID is the switch's MAC address. However, this default remote ID does not appear in this command.

Usage Guidelines

This command shows the remote ID set by the `configure ip-security dhcp-snooping information remote-id [system-name | remote-id_info]` command. If the remote ID has never been configured, or it has been unconfigured (`unconfigure ip-security dhcp-snooping information remote-id`), the default remote ID is the switch's MAC address, which does not appear in the output of this command.

Example

The following command shows the DHCP remote ID:

```
# show ip-security dhcp-snooping information-option remote-id

Switch          Remote-ID information string
-----          -
X465-48P        mydhcp
```

The following command shows that the DHCP remote ID has never been configured, or that it was unconfigured, and that the default (switch MAC address) is being used, but this default remote ID does not appear in the output of the command:

```
Switch          Remote-ID information string
-----          -
```

Note: If neither System Name nor the Customized remote id is configured the default will be the Switch MAC address, that will not be shown

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping

```
show ip-security dhcp-snooping [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays the DHCP snooping configurations on the switch.

Syntax Description

| | |
|------------------|---|
| <i>vlan_name</i> | Specifies the name of the DHCP-snooping <u>VLAN</u> . |
| <i>vlan_name</i> | Specifies the name of the DHCP-snooping VLAN list. |

Default

N/A.

Usage Guidelines

The switch displays the following DHCP snooping information:

- DHCP snooping enabled on ports—The ports that have DHCP snooping enabled.
- Trusted ports—The ports configured as trusted ports.
- Trusted DHCP servers—The servers configured as trusted DHCP servers.
- Port—The specific port that has DHCP snooping enabled.
- Violation-action—The action the switch takes upon detecting a rogue DHCP packet on the port.

Example

The following sample output displays the DHCP snooping settings for the switch:

```
# show ip-security dhcp-snooping vlan "Default"
DHCP Snooping enabled on ports: 7, 9, 11
Trusted Ports: None
Trusted DHCP Servers: None
Bindings Restoration      : Enabled
```

```

Bindings Filename      : dhcpsonia.xsf
Bindings File Location :
Primary Server   : 10.1.1.14, VR-Default, TFTP
Secondary Server: None
Bindings Write Interval : 5 minutes
Bindings last uploaded at:
-----
Port          Violation-action
-----
7             none
9             none
11            none

```

History

This command was first available in ExtremeXOS 11.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security dhcp-snooping violations

```
show ip-security dhcp-snooping violations [ {vlan} vlan_name | vlan
vlan_list]
```

Description

Displays the MAC addressed from which the rouge *DHCP* packet was received by the switch.

Syntax Description

| | |
|------------------------|---|
| <code>vlan_name</code> | Specifies the name of the DHCP-snooping <i>VLAN</i> . |
| <code>vlan_list</code> | Specifies the DHCP-snooping VLAN list of IDs. |

Default

N/A.

Usage Guidelines

The switch displays the following DHCP snooping information:

- Port—The specific port that received the rouge DHCP packet.
- Violating MAC—The MAC address from which the rouge DHCP was received by the switch.

Example

The following sample output displays the DHCP snooping violations for the VLAN green:

```
# show ip-security dhcp-snooping violations green
Violations seen on following ports
-----
Port                Violating MAC
-----
2:3                 00-0c-11-a0-3e-12
```

History

This command was first available in ExtremeXOS 11.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ip-security source-ip-lockdown

```
show ip-security source-ip-lockdown
```

Description

Displays the source IP lockdown configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The switch displays the following source IP lockdown information:

- Port—Indicates the port that has *DHCP* snooping enabled and is configured for source IP lockdown.
- Locked IP Address—Indicates a valid DHCP-assigned address obtained by a DHCP snooping-enabled port or an authenticated static IP address.

Example

The following command displays the source IP configuration on the switch:

```
show ip-security source-ip-lockdown
```

The following is sample output from this command:

```
Ports          Locked IP Address
23 10.0.0.101
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ipstats ipv6

```
show ipstats ipv6 [{vlan name | tunnel tunnel_name}]
```

Description

Displays IPv6 statistics handled by the CPU for the switch for a particular VLAN.

Syntax Description

| | |
|--------------------|--------------------------|
| <i>name</i> | Specifies a VLAN name. |
| <i>tunnel_name</i> | Specifies a tunnel name. |

Default

N/A.

Usage Guidelines

This command only shows statistics of the CPU-handled packets. Not all packets are handled by the CPU. For example, packets forwarded in hardware do not increment the statistics counters.

Example

The following example displays IPv6 statistics for the VLAN accounting:

```
show ipstats ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

The VR option was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ipstats

```
show ipstats {ipv4} [{vlan name } | {tunnel} tunnel_name]
```

Description

Displays IP statistics for the switch CPU for a particular *VLAN*.

Syntax Description

| | |
|--------------------|--------------------------|
| <i>name</i> | Specifies a VLAN name. |
| <i>tunnel_name</i> | Specifies a tunnel name. |

Default

N/A.

Usage Guidelines

This command only shows statistics of the CPU-handled packets. Not all packets are handled by the CPU.

The fields displayed in the `show ipstats` command are defined in the following tables.

Table 29: Router Interface Statistics Field Definitions

| Field | Definition |
|--------------------------|---|
| Packets IN/OUT | Total number of IP packets received or transmitted on a VLAN router interface. |
| Octets IN/OUT | Total number of octets received or transmitted on a VLAN router interface. |
| Mcast packets IN/OUT | Total number of multicast packets received or transmitted on a VLAN router interface. |
| Bcast packets IN/OUT | Total number of broadcast packets received or transmitted on a VLAN router interface. |
| Errors IN/OUT | Total number of IP packets with errors received or transmitted on a VLAN router interface. |
| Discards IN/OUT | Total number of IP packets that cannot travel up to the CPU due to lack of buffer space. |
| Unknown Protocols IN/OUT | Total number of IP packets with unknown upper layer protocols received by the router interface. |

Example

The following example displays IP statistics for the VLAN "accounting":

```
show ipstats vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The VR option was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ipv6 dad

```
show ipv6 dad [{vr} vr_name {ip_address} | vr all | [ { vlan }
  vlan_name | vlan vlan_list ] {tentative | valid | duplicate} | {vr}
  vr_name} ipaddress] | {tunnel} tunnel_name}
```

Description

Displays the configuration and run time status for the DAD feature on the specified IPv6 interface.

Syntax Description

| | |
|-------------------|--|
| <i>vr_name</i> | Specifies a VR for which to display the DAD information. |
| <i>ip_address</i> | Specifies an IPv6 address for which to display the DAD information. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name for which to display the DAD information. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs to display the DAD information. |
| tentative | Displays information for IPv6 interfaces for which the status is up and the DAD check is incomplete. |
| valid | Displays information for IPv6 interfaces for which the status is up, the DAD check is complete, and no duplicate IPv6 addresses were detected. |
| duplicate | Displays information for IPv6 interfaces for which the status is down because a duplicate IPv6 address was detected. |

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The **vr all** option displays DAD information for all IPv6 interfaces on the switch.

Example

The following example displays the DAD feature status for all interfaces in the current VR context:

```
IPv6 Duplicate Address Detection

DAD Status           : On
Max Solicitation Attempts : 1

Virtual Router      Interface      Flags Failures IP
Address
-----
VR-Default         vwest          D1E-U         1
fe80::204:96ff:fe99:1424%vwest
VR-Default         vwest          -1E-U         0
fe80::1%vwest
VR-Default         vwest          --E-U         0 2010::1

Flags: (D) Duplicate address detected, (E) L2 Interface enabled,
       (l) Link-local address, (L) Loopback enabled,
       (t) Tentative due to the lack of a valid link-local address,
       (T) Tentative address, (U) L2 Interface up
```

History

This command was first available in ExtremeXOS 12.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

The Conflict MAC heading was removed and Interface Failures heading added; the P (prefix address) flag was removed and the l (Link-local address) was added; the t flag was renamed (tentative due to the lack of a valid link-local address); and the **detail** option was removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show iqagent

```
show iqagent discovery
```

Description

Displays information about the ExtremeCloud™ IQ Agent.

Syntax Description

| | |
|------------------|---|
| iqagent | Specifies showing information about IQ Agent. |
| discovery | Specifies showing information about IQ Agent discovery. |

Default

N/A.

Usage Guidelines

If IQ Agent is not running, only the first section appears. A device is registered on an IQ server using the serial number.

Example

The following example shows information about IQ Agent:

```
# show iqagent
-----
State                Enabled
Active VR           VR-Mgmt
Detected VR         VR-Mgmt
XIQ Address          10.16.231.95
Serial Number        1405G-00056
-----
```

The following example shows discovery information for IQ Agent:

```
# show iqagent discovery
-----
Virtual-Router   : VR-Default
  XIQ FQDN CLI   :
  XIQ DHCP IP    :
  XIQ DHCP FQDN : test.com
  Redirector     :
-----
Virtual-Router   : VR-Mgmt
  XIQ FQDN CLI   : 10.16.231.95
  XIQ DHCP IP    : 1.2.3.4
  XIQ DHCP FQDN : test2.com
  Redirector     :
-----
```

The following example shows information about IQ Agent with a configured HTTP proxy (line 14):

```
# show iqagent
-----
State                Enabled
Active VR           VR-Mgmt
Detected VR         VR-Mgmt
XIQ Address          10.51.3.175
Serial Number        1546N-40030
-----
Status              CONNECTED TO XIQ
Version              0.4.5
Last Onboard Time   15:05:38 11 12 2020 UTC
Debug                ON
```

```

Source Interface          DEFAULT

-----

```

History

This command was first available in ExtremeXOS 30.7.

IQ Agent status was added in ExtremeXOS 31.1.

HTTP proxy support was added in ExtremeXOS 31.3.

Platform Availability

This command is available ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, 5420, and 5520 series switches.

show isis

```
show isis
```

Description

This command displays the global IS-IS configuration information as well as a summarized router process listing.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The displayed global configuration information includes the restart enablement, restart grace period, and import-policy setting. The router process listing includes the area name, system ID, whether it's

enabled, the IS type, and a count of associated interfaces and area addresses. This command applies only to the IS-IS router processes running in the current virtual router.

Example

The following command displays IS-IS information:

```
show isis
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [**ExtremeXOS 31.3 Feature License Requirements**](#) document.

show isis area summary-addresses

```
show isis area area_name summary-addresses
```

Description

This command displays the configured IPv4 and IPv6 summary addresses for the specified area.

Syntax Description

| | |
|------------------|---|
| <i>area_name</i> | Specifies the router process for which you want to display summary addresses. |
|------------------|---|

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the summary addresses for areax:

```
show isis area areax summary-addresses
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [**ExtremeXOS 31.3 Feature License Requirements**](#) document.

show isis area

```
show isis area [area_name | all]
```

Description

This command displays configuration information for a specific router process or for all IS-IS router processes.

Syntax Description

| | |
|------------------------|---|
| <code>area_name</code> | Specifies the router process for which to display IS-IS area information. |
| all | Displays information for all IS-IS router processes. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays IS-IS configuration for areax:

```
show isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [**ExtremeXOS 31.3 Feature License Requirements**](#) document.

show isis counters

```
show isis counters {area [area_name | all] | vlan [vlan_name | all]}
```

Description

This command displays counters for an area or a [VLAN](#).

Syntax Description

| | |
|------------------|--|
| <i>area_name</i> | Specifies a router process for which to display the IS-IS counters. If you do not specify an IS-IS area, the software displays counters for all areas. |
| <i>vlan_name</i> | Specifies a VLAN for which to display IS-IS counters. |
| all | Displays IS-IS counters for all areas or VLANs. |

Default

None.

Usage Guidelines

If you enter the show isis counters command without any additional keywords or parameters, the software displays the counters for all areas.

Example

The following command displays the IS-IS counters for the configured area:

```
show isis counters
```

The following command displays the IS-IS counters for the SJvlan VLAN:

```
show isis counters vlan SJvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show isis lsdb

```
show isis lsdb {area area_name {lsp-id lsp_id}} {level [1|2]} {detail |
stats}
```

Description

Displays a summary of the IS-IS link state database for one or all IS-IS router processes running in the current virtual router.

Syntax Description

| | |
|--------------------|---|
| <i>area_name</i> | Specifies the name of a router process for which to display the IS-IS link state database. If the area name is omitted, this command displays information for all areas. |
| <i>lsp_id</i> | Limits the display to the specified LSP ID, which is specified in the form <i>system id.pseudonode ID-LSP number</i> . For example: 0102.0ff2.0023.00-01. The pseudonode ID and LSP numbers are optional. If they are not included, multiple listings might appear. |
| level [1 2] | Limits the display to LSPs for either level 1 or level 2. |
| detail | Expands the display to include the LSP TLVs and IPv4 and IPv6 reachability information. The displayed information varies depending on what is included in the LSPs. |
| stats | Displays counts of the number of LSPs and prefixes in the LSP database. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays information for a specific LSP:

```
show isis lsdb area areax lsp-id 0102.0ff2.0023.00-01
```

The following example shows the display for the stats option:

```
(debug) Switch.6 # show isis lsdb stats
Area "a1" :
IS-IS Level-1 Link State Database:
LSPs (including fragments)    : 4
Internal Prefixes (Type 128)  : 7
External Prefixes (Type 130)  : 0
IPv4 Prefixes (Type 135)     : 0
IPv6 Prefixes (Type 236)     : 0
```

```

MT IPv4 Prefixes (Type 235) : 0
MT IPv6 Prefixes (Type 237) : 0
IS-IS Level-2 Link State Database:
LSPs (including fragments) : 1
Internal Prefixes (Type 128) : 5
External Prefixes (Type 130) : 0
IPv4 Prefixes (Type 135) : 0
IPv6 Prefixes (Type 236) : 0
MT IPv4 Prefixes (Type 235) : 0
MT IPv6 Prefixes (Type 237) : 0

```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show isis neighbors

```

show isis neighbors {area area_name} {vlan vlan_name} {ipv4 | ipv6}
                    {detail}

```

Description

This command displays information about neighbors and their adjacencies.

Syntax Description

| | |
|------------------------|--|
| <code>area_name</code> | Specifies a router process for which to specify neighbor information. If you do not specify an IS-IS area, the software displays the neighbors in all areas. |
| <code>vlan_name</code> | Specifies a <u>VLAN</u> for which to specify neighbor information. |
| <code>ipv4</code> | Displays only the neighbors that advertise the IPv4 protocol as supported. |
| <code>ipv6</code> | Displays only the neighbors that advertise the IPv6 protocol as supported. |
| <code>detail</code> | Displays detailed information for IS-IS neighbors. |

Default

N/A.

Usage Guidelines

If you do not specify either the `ipv4` or the `ipv6` keyword, this command displays all neighbors regardless of the supported protocol.

Example

The following command displays IS-IS neighbor information for area:

```
show isis neighbors area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show isis topology

```
show isis topology {area area_name {level [1 | 2]}} {ipv4 | ipv6}
```

Description

This command displays the topology for IPv4, IPv6, or both IPv4 and IPv6 for the specified area and level.

Syntax Description

| | |
|----------------------|--|
| <i>area_name</i> | Specifies the router process for which the topology applies. |
| level [1 2] | Specifies the IS-IS level of the topology you want to view. |
| ipv4 | Selects the IPv4 topology for display. If you omit the ipv4 and ipv6 options, the IPv4 topology appears. |
| ipv6 | Selects the IPv6 topology for display. If you omit this option, the IPv4 topology appears. |

Default

None.

Usage Guidelines

Each known IS in the area or domain is displayed along with the next-hop and metric information.

Example

The following command display IPv4 topology information for area:

```
show isis topology area areax ipv4
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show isis vlan

```
show isis vlan { enabled | { vlan_name | all } }
```

Description

This command displays configuration and status information about the specified IS-IS interface.

Syntax Description

| | |
|------------------|--|
| enabled | Displays information only for IS-IS-enabled VLANs. |
| <i>vlan_name</i> | Specifies a VLAN for which to display IS-IS interface information. |
| all | Displays information on all IS-IS interfaces. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays IS-IS interface information for the SJvlan VLAN:

```
show isis vlan SJvlan
ISIS Interfaces Summary :
-----
VLAN      Area      State   Cfg      Address
-----
v2        a1        u46--  p1246    2.1.1.2/24
2001:db8:2010::1/64
v3        a1        u46-g  p1246    2001:db8:2011::2/64
State Flags :
u - Links up, d - Links down,
4 - IPv4 forwarding enabled, 6 - IPv6 forwarding enabled,
n - Multinetted (v4), g - Multiple global addresses (v6)
Cfg Flags   :
b - Broadcast interface, p - Point-To-Point interface,
1 - L1 circuit type, 2 - L2 circuit type,
4 - ISIS-enabled for IPv4, 6 - ISIS-enabled for IPv6
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

NEW! show keychain

```
show keychain {keychain_name {detail}}
```

Description

Displays the configured keychains.

Syntax Description

| | |
|----------------------|---|
| <i>keychain_name</i> | Defines a name for the new keychain. The range is 1-31. |
| detail | Specifies a detailed output. |

Default

N/A.

Usage Guidelines

Use this command to display the configured keychains.

Example

The following is an example of the command's output with no specified keychain name:

```
# show keychain
Name                               # Keys  # Clients  Accept Tolerance
-----
auth1                               3       2         10s
auth2                               4       0          0s
ospfv3-keys                         6       1          0s
```

Example

The following is an example of the command's output with a keychain name of keys1:

```
show keychain ospfv3-keys1
Accept Tolerance : 0s
Number of Clients: 1

Key ID  Algorithm      Start Time          End Time            Duration
```

```
-----
+1      HMAC-SHA-256  2021-06-01 00:00:00  2021-07-01 00:00:00  2592000s
2       HMAC-SHA-512  2021-07-01 00:00:00  2021-08-01 00:00:00  2678400s
3       HMAC-SHA-256  2021-08-01 00:00:00  2021-09-01 00:00:00  2678400s

Legend: (*) Active Key, (+) Selected Key, (Z) Time is in UTC.
```

Example

The following is an example of the command's output with a keychain name of keys1 with detail specified:

```
show keychain ospfv3-keys1 detail
Accept Tolerance      : 0s
Number of Clients     : 1
Clients               : ospfv3-2

Key ID                : +1
Encrypted Key String: #y209VBgcxFr4NkVKnadBL5y1s9cvnA==
Algorithm             : HMAC-SHA-256
Start Time            : 2021-06-01 00:00:00
End Time              : 2021-07-01 00:00:00
Duration              : 2592000s

Key ID                : 2
Encrypted Key String: #f4Vtob4C5TdAs9Qf0w/pbB8RecE9vA==
Algorithm             : HMAC-SHA-512
Start Time            : 2021-07-01 00:00:00
End Time              : 2021-08-01 00:00:00
Duration              : 2678400s

Key ID                : 3
Encrypted Key String: #bvE/wSf/6sztYL4wJw8ZUTWjJT2ZWw==
Algorithm             : HMAC-SHA-256
Start Time            : 2021-08-01 00:00:00
End Time              : 2021-09-01 00:00:00
Duration              : 2678400s

Legend                : (*) Active Key, (+) Selected Key.
```

History

This command was first available in ExtremeSwitching 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show l2pt

```
show l2pt
```

Description

Displays the global parameters for L2PT.

Syntax Description

| | |
|-------------|--|
| l2pt | Displays global Layer 2 protocol tunneling parameters. |
|-------------|--|

Default

Disabled.

Usage Guidelines

Use this command to display the global parameters for L2PT.

Example

The following is an example of the command's output:

```
# show l2pt
Encapsulation Destination MAC Address: 01:00:00:01:01:02
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show l2pt profile

```
show l2pt profile profile_name
```

Description

Displays the contents of an L2PT profile.

Syntax Description

| | |
|---------------------|--|
| profile | Displays profile that defines L2PT configuration for L2 protocols. |
| <i>profile_name</i> | Displays only the specified profile. |

Default

Disabled.

Usage Guidelines

Use this command to display the contents of an L2PT profile.

Example

The following is an example of the command's output:

```
# show l2pt profile
Profile Name          Protocol Filter Name          DSCP
Replace              Action   CoS      DSCP
-----
my_l2pt_access_prof  my_list          tunnel   1      63
Yes
my_l2pt_network_prof mylist           encap    20
No
my_l2pt_network_prof my_other_list    encap    8
No
my_l2pt_network_prof my_none_list    none     25
No

# show l2pt profile my_l2pt_access_prof
DSCP
Profile Name          Protocol Filter Name          Action   CoS      DSCP
Replace              -----
my_l2pt_access_prof  my_list          tunnel   1      23
Yes
my_l2pt_access_prof  my_other_list    tunnel   7      0
No
```

History

This command was first available in ExtremeXOS 15.5.

Support for DSCP was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show L2stats

```
show l2stats [ { vlan } vlan_name | vlan vlan_list ]
```

Description

Displays the counters for the number of packets bridged, switched, and snooped (Layer 2 statistics).

Syntax Description

| | |
|------------------------|-------------------------------|
| <code>vlan_name</code> | Specifies a <u>VLAN</u> name. |
| <code>vlan_list</code> | Specifies a VLAN list of IDs. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the counters for the number of packets bridged, switched, and snooped (Layer 2 statistics) for the VLAN accounting:

```
show l2stats accounting
```

Note

You can also enter the command as `show L2stats`. We use the uppercase letter here to avoid confusion with the numeral 1.

History

This command was first available in ExtremeXOS 11.0.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show l2vpn

```
show [ {l2vpn} vpls {vpls_name} | l2vpn vpws {vpws_name} | l2vpn ] {peer  
ipaddress} {detail} | summary }
```

Description

Displays Layer 2 VPN configuration and status information.

Syntax Description

| | |
|------------------------|--|
| <code>l2vpn</code> | Displays specified Layer 2 VPN information. |
| <code>vpls_name</code> | Displays information for the specified VPLS. |

| | |
|------------------|---|
| <i>vpws_name</i> | Displays information for the specified VPWS. |
| <i>ipaddress</i> | Specifies a Layer 2 VPN peer for which to display information. |
| detail | Displays additional information in comprehensive detail format. |
| summary | Displays summary information about all VPLS or VPWS instances. |

Default

N/A.

Usage Guidelines

The `show l2vpn` command (without any optional parameters) displays all currently configured Layer 2 VPN instances for the switch. The summarized list of Layer 2 VPN instances is displayed in alphabetical order based on the Layer 2 VPN name. Peers are displayed in the reverse of the order they were added.

When you specify a Layer 2 VPN peer, the display includes a list of all PWs established to the peer, the PW status and PW ID, and information about each Layer 2 VPN to which this peer belongs.

The following table describes the display fields that appear when this command is entered with the **detail** option.

Table 30: Selected show l2vpn Field Definitions

| Field | Definition |
|-----------------------|--|
| VPLS Name | VPLS instance or domain name. |
| VPN ID | Virtual Private Network identifier. |
| Source Address | Source IP address. |
| VCCV Status | Virtual Circuit Connectivity Verification (VCCV) feature status, which is either Enabled or Disabled. |
| VCCV Interval Time | Displays the configured VCCV interval time. |
| VCCV Fault Multiplier | Displays the configured VCCV fault multiplier. |
| Redundancy Type | Displays the configured VPLS redundancy type, which is <i>EAPS</i> , <i>ESRP</i> , <i>STP</i> , or None. |
| Service Interface | Displays a <i>VLAN</i> or VMAN interface name. |
| Admin State | Displays the administrative state of the VPLS, which is either Enabled or Disabled. |
| Oper State | Displays the operational state of the VPLS, which is either Enabled or Disabled. |
| MTU | Displays the maximum transmission unit (MTU) size for the VPLS. |
| Ethertype | Displays the ethertype for the service interface. |
| .1q tag | Displays the 802.1q priority tag for the VPLS. |
| Peer IP | Displays the IP address for the VPLS peer. |

Table 30: Selected show l2vpn Field Definitions (continued)

| Field | Definition |
|------------------|---|
| PW State | <p>PW State represents the state, or status, of a PW. The possible PW state values are:</p> <ul style="list-style-type: none"> • UP—The PW is fully operational and installed in hardware. Traffic is forwarded over PW and VPLS service VLAN/VMAN. • Down—The PW is not operational and is not installed in hardware. This only happens when the VPLS instance is disabled, VPLS service is disabled, or there is no service VLAN assigned to the VPLS. No traffic is forwarded. • Sgnl—The PW is in a signalling state. The PW is not operational, and no traffic is forwarded. This can occur for a number of reasons, including: No LDP adjacency to peer, No transport LSP to peer, No VC LSP to peer. • Remote peer not configuredReady—The PW has been signalled, but it has not been installed in hardware. Traffic is not forwarded. The PW can be in a Ready state for a number of reasons, including: <ul style="list-style-type: none"> ◦ The VPLS instance is configured for EAPS redundancy, and the EAPS shared port associated with this VPLS instance is Connected. ◦ The VPLS instance is configured for ESRP redundancy, and the ESRP domain associated with this VPLS instance is Slave. ◦ The service VLAN associated with this VPLS instance is down. ◦ The remote peer has signalled that it has a fault (remote PW status). The remote peer may have a fault due to its service VLAN being down. |
| PW Uptime | PW Uptime is the elapsed time that the PW has been in the UP state. |
| PW Installed | PW Installed is a flag to indicate whether the PW is installed in hardware or not. If the PW is in the UP state, this field is True, otherwise, this field is False. |
| Local PW Status | <p>Local PW Status displays the VC status of the local PW. The values are:</p> <ul style="list-style-type: none"> • No Faults—No faults detected. • PW-Tx—Local PSN-facing PW transmit fault. This is set if there is a problem with the VPLS transport LSP. • PW-Rx—Local PSN-facing PW receive fault. This is set if there is a problem with the VPLS transport LSP. • Att-Tx—Local attachment circuit transmit fault. This is set if there is a problem with the VPLS service VLAN. • Att-Rx—Local attachment circuit receive fault. This is set if there is a problem with the VPLS service VLAN. • Not Forwarding—The local PW is not forwarding. Look for more information in the PW State field. For example, if VPLS is configured for EAPS redundancy, the Local PW Status is Not Forwarding and the PW State is Ready whenever the EAPS Shared Port state is Connected. |
| Remote PW Status | Remote PW Status is the VC status of the remote PW. The values for this field are the same values as for Local PW Status. |

Table 30: Selected show l2vpn Field Definitions (continued)

| Field | Definition |
|---------------|---|
| PW Mode | PW Mode describes how the PW was configured. The values are: <ul style="list-style-type: none"> Core-to-Core—This VPLS instance is a core node, and the other end of the PW connects to a core node. Core-to-Spoke—This VPLS instance is a core node, and the other end of the PW connects to a spoke node. This is for HVPLS. Spoke-to-Core—This VPLS instance is a spoke node, and the other end of the PW connects to a core node. This is for HVPLS. |
| Transport LSP | Transport LSP is the LSP that is used to forward frames over the PW. When an LDP LSP is used as a transport, the display shows LDP LSP (Not configured). If an RSVP LSP is used, the name of the RSVP LSP being used as a transport LSP is displayed. An RSVP LSP can be specified as the LSP to use during VPLS configuration. |
| Next Hop I/F | Displays the interface name for the next hop router. |
| Next Hop Addr | Displays the interface IP address for the next hop router. |
| PW Rx Label | Receive label for the VPLS PW. |
| PW Rx Pkts | Total packets received on the VPLS PW. |
| PW Rx Bytes | Total bytes received on the VPLS PW. |
| Tx Label | Transmit label for the LSP. |
| PW Tx Label | Transmit label for the VPLS PW. |
| PW Tx Pkts | Total packets transmitted on the VPLS PW. |
| PW Tx Bytes | Total bytes transmitted on the VPLS PW. |

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when displaying VPWS information. For backward compatibility, the **l2vpn** keyword is optional when displaying VPLS information. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following example shows the display that appears when you enter the `show l2vpn` command without any options:

```
# show l2vpn

L2VPN Name      VPN ID  Flags  Services Name  Peer IP      State  Flags
-----
Pws-3344        20      EAX--W NONE

PW Rx Pkts      : 3806161633       PW Tx Pkts     : 4294967296
PW Rx Bytes     : 912385942        PW Tx Bytes    : 4294967296
MAC Limit       : No Limit
VCCV HC Status   : Not Sending (VCCV Not Enabled For This VPLS)
CC Type          : Rtr Alert          Total Pkts Sent : 0
CV Type          : LSP Ping          Total Pkts Rcvd : 0
```

```

Send Next Pkt      : --

Total Failures    : 0          Pkts During Last Failure : 0
Last Failure Tm   : --

```

The detail version of this command now displays a “PW Signaling” line that will display “LDP” or “None (Static)”, depending on the PW configuration. The “Local PW Status” will show “--” instead of “Not Signaled”, since the PW status is not currently signaled; however, for informational purposes, any local faults are still shown. The “Remote PW Status” and “Remote I/F MTU” will always show “--”.

Since the configured labels can be changed while the current labels are in-use, there is a small window where the configured labels and in-use labels are different. If you issue the `show l2vpn detail` command during this window, an extra line will be output to indicate this extra information. The configured labels are noted as “pending” in this case.

```

#show l2vpn vpls red04 detail
L2VPN Name: red04
  VPN ID           : 104                Admin State    : Enabled

```

History

This command was first available in ExtremeXOS 11.6.

This command was updated to display flags for H-VPLS spoke nodes and protected VPLS and H-VPLS in ExtremeXOS 12.1.

The output for this command was modified in ExtremeXOS 12.2.2.

The **12vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show lacp

```
show lacp
```

Description

Displays LACP, or dynamic link aggregation, settings on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following information about the LACP [LAGs](#) configured on the switch:

- Up or Down.
- Enabled or disabled (not configurable).
- System MAC.
 - MAC address for the system, which is used for LACP priority in the absence of a specifically configured priority.
- LACP PDUs dropped on non-LACP ports.
- LAG.
 - Identifies the particular LAG. This number comes from logical port assigned to the LAG and is the LAG group ID.
- Actor Sys-Pri.
 - Shows the system priority for that LAG.
 - If this number is lower than the number displayed for the Partner Sys-Pri, the system you are working on is the controlling partner in the LAG.
- Actor Key.
 - Automatically generated LACP key.
- Partner MAC.
 - Identifies the MAC address for the system connecting to the LAG on the remote end.
- Partner Sys-Pri.
 - Shows the system priority for that LAG on the remote end.

- If this number is lower than the number displayed for the Actor Sys-Pri, the system at the remote end is the controlling partner in the LAG.
- Partner Key.
 - LACP key automatically generated by the system to which this aggregator is connected.
 - If this number is lower than the number displayed for the Actor Key, the partner system is the controlling partner in the LAG.
- Agg Count.
 - Identifies the number of ports added to the aggregator for that LAG.

Example

The following command displays the LACP LAGs on the switch:

```
show lacp
```

The following is sample output from this command on a switch:

```
LACP Up                : Yes
LACP Enabled           : Yes
System MAC             : 00:04:96:10:33:60
LACP PDUs dropped on non-LACP ports : 0
Lag      Actor      Actor      Partner      Partner  Partner  Agg
Sys-Pri  Key         MAC        Sys-Pri     Key      Count
-----
1         90         0x07d1    00:01:30:f9:9c:30    601     0x1391   2
5         100        0x0fa5    00:01:30:f9:9c:30    321     0x1f47   16
9         677        0x0fa9    00:01:30:f9:9c:30    87      0x0fa9   8
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lacp counters

```
show lacp counters
```

Description

Displays all LACP, or dynamic link aggregation, counters for all member ports in the system.

Syntax Description

This command has no parameters or variables.

Default

N/A.

Usage Guidelines

This command displays the following information for all link aggregation groups (LAGs):

- LACP PDUs dropped on non-LACP ports.
- LACP bulk checkpointed messages sent.
- LACP bulk checkpointed messages received.
- LACP PDUs checkpointed sent.
- LACP PDUs checkpointed received.
- LAG group ID.
- Member port.
- Packets received.
- Packets dropped from PDU error.
- Packets dropped because LACP is not enabled on this port.
- Packets dropped because sender's system MAC address matches that of receiver.
- Packets successfully transmitted.
- Packets with errors during transmission.

Example

The following command displays LACP counters:

```
show lacp counters
```

The following is sample output from this command on a switch:

```
LACP PDUs dropped on non-LACP ports : 519392
LACP Bulk checkpointed msgs sent   : 1
LACP Bulk checkpointed msgs recv   : 0
LACP PDUs checkpointed sent       : 575616
LACP PDUs checkpointed recv       : 0

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lacp lag

```
show lacp lag group-id {detail}
```

Description

Displays LACP, or dynamic link aggregation, settings for the specified *LAG*.

Syntax Description

| | |
|-----------------|---|
| <i>group-id</i> | Specifies the LAG group ID you want to display. This is the number of the port you configured as the logical port of the LAG. |
| detail | Show detailed information. |

Default

N/A.

Usage Guidelines

This command displays the following information about the specified LACP LAG:

- LAG
 - Identifies the particular LAG. This number comes from logical port assigned to the LAG and is the LAG group ID.
- Actor Sys-Pri
 - Shows the system priority for that LAG.
 - If this number is lower than the number displayed for the Partner Sys-Pri, the system you are working on is the controlling partner in the LAG.
- Actor Key
 - Automatically generated LACP key.
- Partner MAC
 - Identifies the MAC address for the system connecting to the LAG on the remote end.
- Partner Sys-Pri
 - Shows the system priority for that LAG on the remote end.
 - If this number is lower than the number displayed for the Actor Sys-Pri, the system at the remote end is the controlling partner in the LAG.
- Partner Key
 - LACP key automatically generated by the system to which this aggregator is connected.
 - If this number is lower than the number displayed for the Actor Key, the partner system is the controlling partner in the LAG.

- Agg Count
 - Identifies the number of ports added to the aggregator for that LAG.
- Member port
- Port priority
- Rx State—Receiving state of the port
 - Idle.
 - Initialized.
 - Current—Receiving LACP PDUs.
 - Expired.
 - Defaulted.
- Sel Logic—Selection state of the port
 - Selected—Ports with a matching admin key on the remote end.
 - Unselected—Ports that failed to meet with a matching admin key on the remote end.
 - Standby—Ports that exceed the number of ports that can be active in the LAG simultaneously. These ports can be moved into selected mode if one of the currently selected ports in the LAG goes down.
- Mux State—Ability to transmit and collect data of the port.
 - Waiting—Selected port that is waiting for LACP to determine if it can join the aggregator.
 - Attached—Ports ready to be added to the aggregator.
 - Collecting-Dist—Ports that are added to the aggregator and are transferring data.
 - Detached—Ports that cannot be added to the aggregator.
- Actor Flag—Mux state of the port.
 - A—Activity.
 - T—Timeout.
 - G—Aggregation.
 - S—Synchronization.
 - C—Collecting.
 - D—Distributing.
 - F—Defaulted.
 - E—Expired.
- Partner Port
 - The operational value of the port number assigned to this link by partner.
- Up—Yes or no.
- Enabled—Yes or no.
- LAG State—Up or Down.
- Unack count.
- Wait-for-count.
- Current timeout.
- Activity mode.
- Defaulted action.
- Receive state.
- Transmit state.

- Minimum Active—The minimum number of active links that must be up for the trunk to remain up.
- Selected count—Number of selected ports in the LAG.
- Standby count—Number of standby ports in the LAG.
- LAG Id flag
 - S—Displays information on controlling partner of LAG.
 - T—Displays information on controlled partner of LAG.

Example

The following command displays information on the specified LACP LAG:

```
show lacp lag 4:9
```

The following is sample output from this command on a switch:

```
Lag          Actor   Actor   Partner          Partner  Partner  Agg   Actor
            Sys-Pri Key     MAC              Sys-Pri  Key      Count Mac

```

History

This command was first available in ExtremeXOS 11.3.

Support for the LAG State and Minimum active parameters was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lacp member-port

```
show lacp member-port port {detail}
```

Description

Displays LACP, or dynamic link aggregation, settings for the specified port that is a member of any [LAG](#).

Syntax Description

| | |
|---------------|----------------------------|
| <i>port</i> | Specifies the port number. |
| detail | Show detailed information. |

Default

N/A.

Usage Guidelines

This command displays the following information about the specified port:

- Member Port.
- Port Priority.
- Rx State—Receiving state of the port.
 - Idle.
 - Initialized.
 - Current—Receiving LACP PDUs.
 - Expired.
 - Defaulted.
- Sel Logic—Selection state of the port.
 - Selected—Ports with a matching admin key on the remote end.
 - Unselected—Ports that failed to meet with a matching admin key on the remote end.
 - Standby—Ports that exceed the number of ports that can be active in the LAG simultaneously. These ports can be moved into selected mode if one of the currently selected ports in the LAG goes down.
- Mux State—Ability to transmit and collect data of the port.
 - Waiting—Selected port that is waiting for LACP to determine if it can join the aggregator.
 - Attached—Ports ready to be added to the aggregator.
 - Collecting-Dist—Ports that are added to the aggregator and are transferring data.
 - Detached—Ports that cannot be added to the aggregator.
- Actor Flag.
 - A—Activity.
 - T—Timeout.
 - G—Aggregation.
 - S—Synchronization.
 - C—Collecting.
 - D—Distributing.
 - F—Defaulted.
 - E—Expired.
- Partner Port.
 - The operational value of the port number assigned to this link by partner.
- Up or Down—LACP protocol running or not on specified port.

- Enabled or disabled (not configurable).
- Link State—Link state on this port up or down.
- Actor Churn—True or false.
- Partner Churn—True or false.
- Ready_N—Ready to be added to aggregator.
- Wait pending.
- Ack pending.
- LAG Id.
 - S—Displays information on controlling partner of LAG.
 - T—Displays information on controlled partner of LAG.
- Stats.
 - Rx - Accepted.
 - Rx - Dropped due to error in verifying PDU.
 - Rx - Dropped due to LACP not being up on this port.
 - Rx - Dropped due to matching own MAC.
 - Tx - Sent Successfully.
 - Tx - Transmit error.

Example

The following command displays LACP information on the specified port:

```
show lacp member-port 4:9
```

The following is sample output from this command on a switch:

```
Member      Port      Rx      Sel      Mux      Actor      Partner
Port      Priority  State   Logic    State    Flags      Port
-----
4:9        300      Current Selected Collect-Dist A-GSCD-- 4009
=====
Actor Flags: A-Activity, T-Timeout, G-Aggregation, S-Synchronization
C-Collecting, D-Distributing, F-Defaulted, E-Expired
```

The following command displays detailed LACP information on the specified port:

```
show lacp member-port 4:9 detail
```

The following is sample output from this command on a switch:

```
Member      Port      Rx      Sel      Mux      Actor      Partner
Port      Priority  State   Logic    State    Flags      Port
-----
4:9        300      Current Selected Collect-Dist A-GSCD-- 4009

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ldap domain

```
show ldap domain {domain_name | all}
```

Description

This command displays the LDAP servers and other LDAP configuration details of one or all LDAP domains.

Syntax Description

| | |
|--------------------|---|
| <i>domain_name</i> | Displays the details of the specified domain. |
| all | Displays the details for all domains. |

Default

N/A.

Usage Guidelines

Use this command to display the LDAP servers and other LDAP configuration details of one or all LDAP domains. The summary version (show ldap domain) displays the list of LDAP domains configured.

Example

```
# show ldap domain
-----
LDAP Domains
-----
XYZCorp.com (Default)
engg.XYZCorp.com
mktg.XYZCorp.com
sales.XYZCorp.com
-----
```

If no default domain is configured, this note appears at the bottom:

```
Note: No default domain configured
# show ldap domain all

If the server was specified as a host name and the IP address was not resolved, this is shown:

```
LDAP Server1   : server1.domain.com(IP address unresolved)
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ldap statistics

```
show ldap statistics
```

Description

This command displays LDAP packet statistics per LDAP domain.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show all LDAP related statistics per LDAP domain.

Example

```
Switch.21 # show ldap statistics
-----
Domain           : XYZCorp.com (default)
```

```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show licenses

```
show licenses {[slot slot |all]} {detail}
```

Description

Displays current software license level, port speed licensing, and feature packs enabled on your switches.

Syntax Description

| | |
|---------------|--|
| all | Specifies all slots on a stack. |
| <i>slot</i> | Specifies one or more slots on a stack. |
| detail | Specifies showing detailed license information. ExtremeSwitching 5420 and 5520 series switches only. |

Default

N/A.

Usage Guidelines

The command displays information on the software license level and feature packs enabled on the switch or nodes on a stack, including the trial license or factory default license and days left to expiry.

To see the license information on a SummitStack node, run the command while logged into that node.

Note

See the specific chapter of the [ExtremeXOS 31.3 User Guide](#) that discusses each feature to determine if a license is required for some functionality. If not noted, all functionality is available, and license is not required.

For ExtremeSwitching 5420 and 5520 series switches, the DEF-EVAL-PRMR is a 30-day evaluation license that is enabled on the switch from the factory, or after changing the network operating to ExtremeXOS from VOSS, or after a rescue boot.

Example

The following command displays the license level configuration:

```
show licenses
```

On a SummitStack, the output from this command looks similar to the following:

```
Slot-3 Stack.12 > show licenses
Enabled License Level:
Advanced Edge
Enabled Feature Packs:
None
Effective License Level:Edge
```

The show output also includes the current status of the non-Extreme optical device license:

```
# show license
Enabled License Level:
Advanced Core
Enabled Feature Packs:
MPLS ServiceProviderEdge 3rdPartyOptics
```

For ExtremeSwitching X870-96x-8c switches, port speed license information appears:

```
# show license
Enabled License Level:
Advanced Edge
Enabled Feature Packs:
DirectAttach
Enabled Port Speed:
4 ports (81, 85, ..., 93) can be partitioned to 1x100G, 2x50G, 1x40G, 4x25G, or
4x10G.
```

To see all license levels on a stack:

```
Slot-1 Stack.6 # show licenses slot all
Slot Enabled License      Effective License      Feature Packs
-----
1    Advanced Edge         Advanced Edge         DirectAttach
2    Advanced Edge         Advanced Edge         ServiceProviderEdge
                                   DirectAttach
                                   NetworkTiming
```

To view detailed license information on the ExtremeSwitching 5420 and 5520 series switches:

```
# show licenses detail
Slot License Product      Feature(s)  Installed  Effective  Expiration
-----
1    DEF-EVAL-PRMR          Premier    Yes        No         Mon Sep 14 12:41:22 2020
1    PRD-5000-MACSEC       MACsec     No         N/A        N/A
2    PRD-5000-PRMR         Premier    No         N/A        N/A
2    PRD-5000-MACSEC       MACsec     Yes        N/A        Never
3    PRD-5000-PRMR         Premier    No         N/A        N/A
3    PRD-5000-MACSEC       MACsec     No         N/A        N/A
```

History

This command was first available in ExtremeXOS 11.1.

The information on enabled feature packs was added in ExtremeXOS 11.4.

The information on the trial licenses was added in ExtremeXOS 11.6.

The show output was updated to include the current status of the non-Extreme optical device license in ExtremeXOS 15.4.

ExtremeSwitching X870-96x-8c switch port speed license information was added in ExtremeXOS 22.2

The options **all** and **slot** were added in ExtremeXOS 22.5.

The **detail** option and ExtremeSwitching unified license information was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lldp

```
show lldp {port [all | port_list]} {detailed}
```

Description

Displays LLDP configuration information for the specified port or ports.

Use the detailed keyword to display the configured VLANs on the port and the enabled VLAN-specific TLVs.

Syntax Description

| | |
|------------------|--|
| all | Specifies all ports on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| detailed | Shows information on the configured VLANs on the port. |

Default

N/A.

Usage Guidelines

Use the detailed variable to display information regarding configured VLANs on the ports and any enabled VLAN-specific TLVs.

Example

The following example displays LLDP configuration information for the switch:

```
# show lldp
LLDP transmit interval      : 30 seconds
LLDP transmit hold multiplier : 4 (used TTL = 120 seconds)
LLDP transmit delay        : 2 seconds
LLDP SNMP notification interval : 5 seconds
LLDP reinitialize delay    : 2 seconds
LLDP-MED fast start repeat count : 4
LLDP local management address : VLAN Chicago (10.127.2.30)
LLDP Port Configuration:
Port   Rx      Tx      SNMP      --- Optional enabled transmit TLVs ---
Mode   Mode      Notification LLDP      802.1  802.3  MED   AvEx   DCBX
=====
1      Enabled  Enabled  --        --D--  ---   ----   ----   IB
2      Enabled  Enabled  --        --D--  ---   ----   ----   IB
=====
Notification: (L) lldpRemTablesChange, (M) lldpXMedTopologyChangeDetected
LLDP Flags   : (P) Port Description, (N) System Name, (D) System Description
              (C) System Capabilities, (M) Mgmt Address
802.1 Flags  : (P) Port VLAN ID, (p) Port & Protocol VLAN ID, (N) VLAN Name
802.3 Flags  : (M) MAC/PHY Configuration/Status, (P) Power via MDI
              (+) Power via MDI with DLL Classification for PoE+,
              (L) Link Aggregation, (F) Frame Size
MED Flags    : (C) MED Capabilities, (P) Network Policy,
              (L) Location Identification, (p) Extended Power-via-MDI
AvEx Flags   : (P) PoE Conservation Request, (C) Call Server, (F) File Server
              (Q) 802.1Q Framing
DCBX Flags   : (I) IEEE 802.1Qaz DCBX, (B) Baseline v1.01 DCBX
```

The following example includes detailed information on the LLDP configuration for port 1:1:

```
# show lldp port 1:1 detailed
LLDP transmit interval      : 30 seconds
LLDP transmit hold multiplier : 4 (used TTL = 120 seconds)
LLDP transmit delay        : 2 seconds
LLDP SNMP notification interval : 5 seconds
LLDP reinitialize delay    : 2 seconds
LLDP-MED fast start repeat count : 4
LLDP local management address : VLAN Chicago (10.127.2.30)
LLDP Port Configuration:
Port   Rx      Tx      SNMP      --- Optional enabled transmit TLVs ---

```

History

This command was first available in ExtremeXOS 11.2.

The information on fast-start repeat count, MED, AvEx, and notification was added in ExtremeXOS 11.5.

An additional flag was added for PoE+ in ExtremeXOS 12.5.

The display was updated for DCBX in ExtremeXOS 12.6.

Management IP address information was added in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lldp dcbx

```
show lldp {port [all | port_list]} dcbx {ieee|baseline} {detailed}
```

Description

Displays DCBX configuration and statistics information for one or all ports.

Syntax Description

| | |
|------------------|--|
| all | Specifies all ports on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| ieee | Specifies IEEE 802.1Qaz information only. |
| baseline | Specifies Baseline v1.01 information only. |
| detailed | Shows information on the configured VLANs on the port. |

Default

N/A.

Usage Guidelines

The summary display (without the detailed option) displays the status for each DCBX TLV on each port. For each TLV, the status is reported as shown in the following table.

| | |
|----------------|--|
| DISABLED | DCBX is disabled on the port. This port status appears only in the summary display when DCBX is enabled for one version and disabled for the other. In the detailed display, ports on which DCBX are disabled are not shown. |
| OK | This TLV has been received by the peer, and either the configuration matches, or the peer is reporting that it is in willing mode and is not reporting an explicit error. |
| UNKNOWN | This TLV has not been received by the peer since the port has been active. |
| EXPIRED | This TLV has been received by the peer, but the time to live has expired. |
| ERROR | Either a mismatch exists between the local and remote configuration and the peer is not willing, or the peer is reporting an error. |
| MULTIPLE PEERS | More than one <u>LLDP</u> peer has been detected on the link. |

When you specify a port or the detailed option, local TLV information includes the information that will be contained in the next TLV that is sent, and if the configuration hasn't changed, this is the same information that was sent in the last TLV. Peer TLV information displays the information from the last TLV that has been received. For each TLV, statistics are reported as follows:

- Sent: Total number of TLVs sent since port has been operational.
- Received: Total number of TLVs received since port has been operational.
- Errors: Total number of mal-formed TLVs received since port has been operational.

You can clear the statistics using the clear counters command.

Table 31 describes the IEEE 802.1Qaz DCBX TLVs that can be displayed. Table 32 on page 2841 describes the Baseline v1.01 DCBX TLVs.

Table 31: IEEE 802.1Qaz DCBX TLVs

| TLV/Description | Contents/Description |
|--|---|
| <p>ETS TLV Advertises the ETS configuration of the local port and the configuration recommended to/by the peer for the specified port, respectively.</p> | <p>Willing—Whether or not the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes. The Willing bit does not apply to the ETS Recommendation TLV, and should always be zero.</p> <p>CBS—Whether the device supports the credit-based shaper algorithm. Zero (0) means No, and one (1) means Yes.</p> <p>Max TCs— Maximum number of traffic classes that the node can support.</p> <p>Priority Assgn—Priority Assignment Table. A priority group (PG) table describing how 802.1p priorities are assigned to PGs. The table is laid out as follows: Priority-0 : Priority-1 : Priority-2 : Priority-3 : Priority-4 : Priority-5 : Priority-6 : Priority-7 The value in the Priority-N position indicates the TC ID to which packets with an 802.1p priority of N are mapped.</p> <p>Note: For Extreme Networks products, a traffic class (TC) is synonymous with a QoS Profile (QP), except that TCs are zero-based, and QPs are one-based, so TC 1 maps to QP 0.</p> <p>TC Bwdth—TC Bandwidth Table. Indicates the percentage of bandwidth allocated for each traffic class. The table is laid out as follows: TC%-0 : TC%-1 : TC%-2 : TC%-3 : TC%-4 : TC%-5 : TC%-6 : TC%-7 The value in the TC%-N position indicates the percentage of the link bandwidth allocated to TC N. The total of all positions must equal 100.</p> <p>TSA—Transmission Selection Algorithm (TSA) Assignment Table. The table is laid out as follows: TC-0 : TC-1 : TC-2 : TC-3 : TC-4 : TC-5 : TC-6 : TC-7 The value in the TC-N position indicates the TSA used by TC N, which is one of the following: S - Strict priority (TSA 0)C - Credit-based shaper (TSA 1)E - Enhanced Transmission Selection (TSA 2)V - Vendor-specific Transmission Selection algorithm (TSA 255)</p> <p>Note: TSA values 3 to 254 are reserved for future standardization.</p> |
| <p>Common Feature TLVs TLVs common to the Priority Group, PFC, and Application TLVs</p> | <p>Oper Vers—Operating version of the feature.</p> <p>Max Vers—Highest feature version supported by the system.</p> <p>Enabled—Locally administered parameter that indicates whether the DCB feature is enabled. Zero (0) means No, and one (1) means Yes.</p> <p>Willing—Indicates whether the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes.</p> <p>Error—Indicates whether an error has occurred during the configuration exchange with the peer. Zero (0) means No, and one (1) means Yes.</p> |

Table 31: IEEE 802.1Qaz DCBX TLVs (continued)

| TLV/Description | Contents/Description |
|---|--|
| <p>Priority Group TLV Advertises priority to priority group mapping, priority group bandwidth and the scheduling algorithm.</p> | <p>PG IDs—Priority Allocation Table. A priority group (PG) table describing how 802.1p priorities are assigned to PGs. The table is laid out as follows: Priority-0 : Priority-1 : Priority-2 : Priority-3 : Priority-4 : Priority-5 : Priority-6 : Priority-7 The value in the Priority-N position indicates the PG ID to which packets with an 802.1p priority of N are mapped. If the value is in the range of 0 to 7, this is the actual PG. If the value is equal to 15, this priority is mapped to a non-ETS group. In the case of Extreme Networks products, this would be a strict priority group.</p> <p>Note: For Extreme Networks products, a priority group (PG) is synonymous with a QoS Profile (QP), except that PGs are zero-based, and QPs are one-based, so PG1 maps to QP 0.</p> <p>PG%—Priority Group Allocation Table. Indicates the percentage of bandwidth allocated for each priority group. The table is laid out as follows: PG%-0 : PG%-1 : PG%-2 : PG%-3 : PG%-4 : PG%-5 : PG%-6 : PG%-7 The value in the PG%-N position indicates the percentage of the link bandwidth allocated to PG N. The total of all positions must equal 100.</p> <p>Num TCs—Maximum number of priority groups that the node can support.</p> |
| <p>PFC TLV Describes the PFC configuration for the given port.</p> | <p>Willing—Whether or not the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes. MBC—MACsec Bypass Capability. If set to zero (0), the device is capable of bypassing MACsec processing when MACsec is disabled. If set to one (1), the sending station is not capable of bypassing MACsec processing when MACsec is disabled. PFC Cap—PFC Capability. The maximum number of classes on which the device may simultaneously support PFC. PFC Enable—List of priorities on which PFC is enabled.</p> |
| <p>Application TLV Displays the priority the device expects to be used for the specified application.</p> | <p>Priority—The priority to be used for the given protocol. Application—Specifies one of the following:</p> <ul style="list-style-type: none"> • FCoE • FIP • iSCSI • EtherType: <i>ethertype</i> • TCP/UDP Port: <i>port number</i> • TCP Port: <i>port number</i> • TCP Port: <i>port number</i> |

Table 32: Baseline v1.01 DCBX TLVs

| TLV/Description | Contents/Description |
|---|--|
| <p>Control TLV Contains general information about the DCBX session.</p> | <p>Oper Vers—Operating version of the DCBX protocol. Max Vers—Highest DCBX protocol version supported by the system.</p> |

Table 32: Baseline v1.01 DCBX TLVs (continued)

| TLV/Description | Contents/Description |
|---|--|
| | <p>Seq No—A value that changes each time an exchanged parameter in one or more of the DCB feature TLVs changes.</p> <p>Ack No—The SeqNo value from the most recent peer DCBX TLV that has been handled. This value acknowledges to the peer that a specific SeqNo has been received.</p> |
| <p>Common Feature TLVs TLVs common to the Priority Group, PFC, and Application TLVs</p> | <p>Oper Vers—Operating version of the feature.</p> <p>Max Vers—Highest feature version supported by the system.</p> <p>Enabled—Locally administered parameter that indicates whether the DCB feature is enabled. Zero (0) means No, and one (1) means Yes.</p> <p>Willing—Indicates whether the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes.</p> <p>Error—Indicates whether an error has occurred during the configuration exchange with the peer. Zero (0) means No, and one (1) means Yes.</p> |
| <p>Priority Group TLV Advertises priority to priority group mapping, priority group bandwidth and the scheduling algorithm.</p> | <p>PG IDs—Priority Allocation Table. A priority group (PG) table describing how 802.1p priorities are assigned to PGs. The table is laid out as follows: Priority-0 : Priority-1 : Priority-2 : Priority-3 : Priority-4 : Priority-5 : Priority-6 : Priority-7 The value in the Priority-N position indicates the PG ID to which packets with an 802.1p priority of N are mapped. If the value is in the range of 0 to 7, this is the actual PG. If the value is equal to 15, this priority is mapped to a non-ETS group. In the case of Extreme Networks products, this would be a strict priority group.</p> <p>Note: For Extreme Networks products, a priority group (PG) is synonymous with a QoS Profile (QP), except that PGs are zero-based, and QPs are one-based, so PG1 maps to QP 0.</p> <p>PG%—Priority Group Allocation Table. Indicates the percentage of bandwidth allocated for each priority group. The table is laid out as follows: PG%-0 : PG%-1 : PG%-2 : PG%-3 : PG%-4 : PG%-5 : PG%-6 : PG%-7 The value in the PG%-N position indicates the percentage of the link bandwidth allocated to PG N. The total of all slots must equal 100.</p> <p>Num TCs—Maximum number of priority groups that the node can support.</p> |
| <p>PFC TLV Describes the PFC configuration for the given port.</p> | <p>PFC Enable—List of priorities on which PFC is enabled.</p> <p>Num TC PFCs—The maximum number of classes on which the device may simultaneously support PFC.</p> |
| <p>Application TLV Displays the priority the device expects to be used for the specified application.</p> | <p>Priority—The priority to be used for the given protocol.</p> <p>Application—Specifies one of the following:</p> <ul style="list-style-type: none"> • FCoE • FIP • iSCSI • EtherType: <i>ethertype</i> • TCP/UDP Port: <i>port number</i> |

```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lldp neighbors

```
show lldp {port [all | port_list]} neighbors {detailed}
```

Description

Displays the information related to the LLDP neighbors detected on the specified port or ports.

Syntax Description

| | |
|------------------|---|
| all | Specifies all ports on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| detailed | Shows detailed information on the neighbors. |

Default

N/A.

```

- Time To Live: 120 seconds
- System Name: "Stack"
- System Description: "ExtremeXOS (Stack) version 22.2.0.7 dot1br_22.2.0\
                      .7 by release-manager on Wed Sep 7 14:33:29 EDT 2016"
- IEEE802.3 Link-aggregation
  Capability/Status : Capable, Enabled (0x03)
  Aggregated Port ID: 0 (0x00000000)
- MED Model Name: "BPE-G24t."
- IEEE802.1BR Port Extension:
  Priority          : 255
  PE CSP Address: 00:00:01:48:00:1a
  PE Address       : 00:00:01:48:00:00

```

The following example shows BGP Config TLVs. This TLV allows SLX switches to communicate with ExtremeXOS's BGP Auto-peering feature:

```

# show lldp neighbors detailed

-----
LLDP Port 18 detected 1 neighbor
Neighbor: 00:04:96:97:D1:5C/18, age 28 seconds
- Chassis ID type: MAC address (4)
  Chassis ID      : 00:04:96:97:D1:5C
- Port ID type: ifName (5)
  Port ID        : "18"
- Time To Live: 120 seconds
- System Name: "X460G2-48t-10G4"
- System Description: "ExtremeXOS (X460G2-48t-10G4) version 30.2.0.11 xo\
                      s_30.2 by kmalone on Mon Oct 29 13:46:24 EDT 2018"
- EXTR Capabilities: "EasyBGP"
- EXTR EasyBGP:
  EXTR EasyBGP AS-NUM : 100
  EXTR EasyBGP RouterId: 1.1.0.100
  EXTR EasyBGP Address : fe80::204:96ff:fe97:d15c
- BGP Config:
  BGP Config Peer Address      : fe80::204:96ff:fe97:d15c
  BGP Config Peer Address AFI/SAFI: IPv6/Unicast
  BGP Config Local-AS         : 100
  BGP Config Identifier        : 1.1.0.100

```

History

This command was first available in ExtremeXOS 11.2. Information on the LLDP MED extension and Avaya-Extreme proprietary TLVs was added in ExtremeXOS 11.5.

Additional PoE+ information can appear when present in a Power via MDI TLV received from a neighbor starting in ExtremeXOS 12.5.

"System Name" was added to the output in ExtremeXOS 22.1.

Management IP address information was added in ExtremeXOS 22.4.

Port Extension TLV information for bridge port extenders (BPEs) was added in ExtremeXOS 22.5.

Fabric Attach authentication information and BGP Config TLVs (allows SLX switches to communicate with ExtremeXOS's BGP auto-peering feature) were added in ExtremeXOS 30.2.

Fabric Attach detailed link information was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show lldp statistics

```
show lldp {port [all | port_list]} statistics
```

Description

Displays statistical counters related to the specified port or ports.

Syntax Description

| | |
|------------------|---|
| all | Specifies all ports on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

N/A.

Usage Guidelines

The following counters are presented with the standard command (taken from the IEEE 802.1ab MIB definition):

- Last table change time: Last time an entry in the LLDP database was added, changed or deleted.
- Number of table inserts: The number of times the complete set of information advertised by a particular neighbor has been inserted into tables.
- Number of table deletes: The number of times the complete set of information advertised by a particular neighbor has been deleted from tables.
- Number of table drops: The number of times the complete set of information advertised by a particular neighbor could not be stored in memory because of insufficient resources.
- Number of table age outs: The number of times the complete set of information advertised by a particular neighbor has been deleted from tables because the information timeliness interval has expired.
- Tx Total: The number of LLDP frames transmitted by this switch on the indicated port.
- Tx Total Length Exceeded: The number of LLDP frames sent out on this port that could not hold all the information configured because the total frame length would exceed the maximum LDDPDU size of 1500 bytes.
- Rx Total: The number of valid LLDP frames received by this switch on the indicated port, while this LLDP agent is enabled.
- Rx Discarded: The number of LLDP frames received by this switch on the indicated port, and then discarded for any reason.
- Rx Errors: The number of invalid LLDP frames received by this switch on the indicated port, while this LLDP agent is enabled.

- TLVs Discarded: The number of LLDP TLVs discarded for any reason by this switch on the indicated port.
- TLVs Unrecognized: The number of LLDP TLVs received on the given port that are not recognized by the switch.

Example

The following example lists statistical counters for all ports on the switch:

```
# show lldp port all statistics
Last table change time   : Fri Dec 17 10:42:33 2004
Number of Table Inserts  : 3
Number of Table Deletes  : 0
Number of Table Drops    : 0
Number of Table Age Outs : 0
Port      Tx          Tx LengthRx Rx          Rx          TLVs          TLVs
Total     Exceeded TotalDiscarded  Errors    Discarded    Unrecogn.
=====
1:1       189          05654      0          0          0          0
2:2       188          0565      0          0          0          0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log

```
show log {messages [memory-buffer | nvram]} {events {event-condition |
event-component}} {severity severity {only}} {starting [date date
time time | date date | time time]} {ending [date date time time |
date date | time time]} {match regex} {chronological}
```

Description

Displays the current log messages.

Syntax Description

| | |
|------------------------|---|
| messages | Specifies the target location from which to display the log messages. |
| memory-buffer | Show messages stored in volatile memory (default). |
| nvr am | Show messages stored in NVRAM. |
| events | Show event messages. |
| <i>event-condition</i> | Specifies the event condition to display. |

| | |
|------------------------|--|
| <i>event-component</i> | Specifies the event component to display. |
| <i>severity</i> | Specifies the minimum severity level to display (if the keyword only is omitted). |
| only | Specifies that only the specified severity level is to be displayed |
| starting | Show messages with timestamps equal to or greater than that specified |
| <i>date</i> | Specifies the date, where date is <i>month (1-12) / day (1-31) {/ year (yyyy)}</i> . |
| <i>time</i> | Specifies the time, where time is <i>hour (0-23) {:minute (0-59) {:seconds (0-59) {.hundredths}}</i> . |
| ending | Show messages with timestamps equal to or less than that specified. |
| <i>regex</i> | Specifies a regular expression. Only messages that match the regular expression will be displayed. |
| chronological | Specifies displaying log messages in ascending chronological order (oldest to newest). |

Default

The following defaults apply:

- messages—memory buffer.
- event—no restriction (displays user-specified event).
- severity—none (displays everything stored in the target).
- starting, ending—if not specified, no timestamp restriction.
- match—no restriction.
- chronological—if not specified, show messages in order from newest to oldest.

Usage Guidelines

Switch configuration and fault information is filtered and saved to target logs, in a memory buffer, and in NVRAM. Each entry in the log contains the following information:

- Timestamp—records the month and day of the event, along with the time (hours, minutes, seconds, and hundredths).
- Severity Level—indicates the urgency of a condition reported in the log. [Table 33](#) on page 2851Table describes the severity levels assigned to events.
- Component, Subcomponent, and Condition Name—describes the subsystem in the software that generates the event. This provides a good indication of where a fault might lie.
- Message—a description of the event occurrence. If the event was caused by a user, the user name is also provided.

This command displays the messages stored in either the internal memory buffer or in NVRAM. The messages shown can be limited by specifying a severity level, a time range, or a match expression. Messages stored in the target have already been filtered as events occurred, and specifying a severity or match expression on the show log command can only further limit the messages shown.

If the `messages` keyword is not present, the messages stored in the `memory-buffer` target are displayed. Otherwise, the messages stored in the specified target are displayed.

If the `only` keyword is present following the severity value, then only the events at that exact severity are included. Without the `only` keyword, events at that severity or more urgent are displayed. For example, `severity warning` implies `critical`, `error`, or `warning`, whereas `severity warning only` implies only `warning`.

Messages whose timestamps are equal or later than the starting time and are equal or earlier than the specified ending time will be shown if they also pass the severity requirements and match expression, if specified.

If a match phrase is specified, the formatted message must match the simple regular expression specified by `match-expression` for it to be shown.

A simple regular expression is a string of single characters including the dot character (`.`), which are optionally combined with quantifiers and constraints. A dot matches any single character while other characters match only themselves (case is significant). Quantifiers include the star character (`*`) that matches zero or more occurrences of the immediately preceding character or dot. Constraints include the caret character (`^`) that matches at the beginning of a message, and the currency character (`$`) that matches at the end of a message. Bracket expressions are not supported. There are a number of sources available on the Internet and in various language references describing the operation of regular expressions.

If the `chronological` keyword is specified, messages are shown from oldest to newest; otherwise, messages are displayed newest to oldest.

Severity Level

The severity levels are `critical`, `error`, `warning`, `notice`, and `info`, plus three severity levels for extended debugging, `debug-summary`, `debug-verbose`, and `debug-data`. In log messages, the severity levels are shown by four letter abbreviations. The abbreviated forms are:

- `Critical`—`Crit`.
- `Error`—`Erro`.
- `Warning`—`Warn`.
- `Notice`—`Noti`.
- `Info`—`Info`.
- `Debug-Summary`—`Summ`.
- `Debug-Verbose`—`Verb`.
- `Debug-Data`—`Data`.

The three severity levels for extended debugging, debug-summary, debug-verbose, and debug-data, require that debug mode be enabled (which may cause a performance degradation). See the command `enable log debug-mode`. The following table describes the severity levels:

Table 33: Severity Levels Assigned by the Switch

| Level | Description |
|----------------------|---|
| Critical | A serious problem has been detected that is compromising the operation of the system and that the system cannot function as expected unless the situation is remedied. The switch may need to be reset. |
| Error | A problem has been detected that is interfering with the normal operation of the system and that the system is not functioning as expected. |
| Warning | An abnormal condition, not interfering with the normal operation of the system, has been detected that may indicate that the system or the network in general may not be functioning as expected. |
| Notice | A normal but significant condition has been detected, which signals that the system is functioning as expected. |
| Info (Informational) | A normal but potentially interesting condition has been detected, which signals that the system is functioning as expected and simply provides information or confirmation about the condition. |
| Debug-Summary | A condition has been detected that may interest a developer determining the reason underlying some system behavior. |
| Debug-Verbose | A condition has been detected that may interest a developer analyzing some system behavior at a more verbose level than provided by the debug summary information. |
| Debug-Data | A condition has been detected that may interest a developer inspecting the data underlying some system behavior. |

Messages stored in NVRAM are in encoded format. To restore the ASCII text of a message, the version of ExtremeXOS loaded must be able to interpret the data written prior to reboot. When the encoded format for a particular message cannot be interpreted by the version of ExtremeXOS currently loaded, the messages are displayed in the following format:

```
03/21/2005 17:15:37.36 : NO MESSAGE DECODE; Missing component "epm" v24.2 DUMP-10: 00 14
C3 C1 00 11 00 1C 01 FF 00 08 65 70 6D 00 '.....epm.' DUMP-20: 08 FF 00 0C 00 18 00
02 65 70 6D 00 '.....epm.'
```

Log entries remain in the NVRAM log after a switch reboot. Issuing a clear log command does not remove these static entries. To remove log entries from NVRAM, use the following command:

```
clear log messages nvram
```

Example

The following command displays messages with a critical severity:

```
show log severity critical
```

The following command displays messages with warning, error, or critical severity:

```
show log severity warning
```

The following is sample output from a switch:

```
11/12/2004 00:38:10.30 <Warn:dm.Warn> MSM-A: Insufficient Power to power-on Slot-7
11/12/2004 00:38:08.77 <Warn:dm.Warn> MSM-A: Slot-7 being Powered OFF due to insuf
ficient power
11/12/2004 00:36:23.77 <Warn:dm.Warn> MSM-A: Slot-7 being Powered OFF due to insuf
ficient power
...
A total of 83 log messages were displayed.
```

The following command displays messages containing the string "slot 2":

```
show log match "slot 2"
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log components

```
show log components {event component } {version}
```

Description

Displays the name, description and default severity for all components.

Syntax Description

| | |
|------------------------|--|
| <i>event component</i> | Specifies the component to display. |
| version | Specifies the version number of the component. |

Default

N/A.

Usage Guidelines

This command displays the name, description, and default severity defined for the specified components or subcomponents.

Depending on the software version running on your switch or your switch model, additional or different component information might be displayed.

Example

The following command displays the log components:

```
show log components
```

The following is sample output from this command:

| Severity Component | Title | Threshold |
|-----------------------|---|-----------|
| AAA | Authentication, Authorization, Accounting | Info |
| RADIUS | Remote Authentication Dial In User Service | Error |

A total of 143 component(s) were displayed.

The following command displays the version number of the VRRP component:

```
show log components vrrp version
```

The following is sample output from this command:

| Component | Title | Version |
|-----------|-------------------------|---------|
| VRRP | Config/State messages | 2.4 |
| Advert | Subsystem description | 3.1 |
| System | System/Library messages | 3.2 |

A total of 3 component(s) were displayed.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log configuration filter

```
show log configuration filter {filter_name}
```

Description

Displays the log configuration for the specified filter.

Syntax Description

| | |
|--------------------|----------------------------------|
| <i>filter_name</i> | Specifies the filter to display. |
|--------------------|----------------------------------|

Default

If no options are specified, the command displays the configuration for all filters.

Usage Guidelines

This command displays the configuration for filters.

Example

The following command displays the configuration for the filter, myFilter:

```
show log configuration filter myFilter
```

The following is sample output from this command:

```
Log Filter Name: myFilter
I/                               Severity
E Comp.   Sub-comp.   Condition   CEWNISVD
- - - - -
I STP
I aaa
Include/Exclude: I - Include, E - Exclude
Component Unreg: * - Component/Subcomponent is not currently registered
Severity Values: C - Critical, E - Error, W - Warning, N - Notice, I - Info
* - Pre-assigned severities in effect for specified component
Debug Severity : S - Debug-Summary, V - Debug-Verbose, D - Debug-Data
+ - Debug Severities, but log debug-mode not enabled
If Match parameters present:
Parameter Flags: S - Source, D - Destination, (as applicable)
I - Ingress, E - Egress, B - BGP
Parameter Types: Port - Physical Port list, Slot - Physical Slot #
MAC - MAC address, IP - IP Address/netmask, Mask - Netmask
VID - Virtual LAN ID (tag), VLAN - Virtual LAN name
L4 - Layer-4 Port #, Num - Number, Str - String
Nbr - Neighbor, Rtr - Routerid, EAPS - EAPS Domain
```

```

Proc - Process Name
Strict Match   : Y - every match parameter entered must be present in the event
N - match parameters need not be present in the event

```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log configuration target

```

show log configuration target {console | memory-buffer | nvram |
    primary-node | backup-node | session | syslog {ipaddress {udp-port
    {udp_port }}| ipPort |ipaddress tls-port {tls_port}} {vr vr_name}
    {[local0...local7]}}

```

Description

Displays the log configuration for the specified target.

Syntax Description

| | |
|--------------------------|--|
| console | Show the log configuration for the console display. |
| memory-buffer | Show the log configuration for volatile memory. |
| nvram | Show the log configuration for NVRAM. |
| primary-node | Specifies the primary node in a stack. |
| backup-node | Specifies the backup-node in a stack. |
| session | Show the log configuration for the current session (including console display). |
| syslog | Show the configuration for the specified syslog target. |
| <i>ipaddress</i> | Specifies the syslog IP address. |
| <i>ipPort</i> | Specifies the UDP port number for the syslog target. |
| tls_port | Specifies remote Syslog server Transport Layer Security (TLS) for connection type. |
| <i>tls_port</i> | TLS port number. |
| <i>vr_name</i> | Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document.. |
| local0 ... local7 | Specifies the local syslog facility. |

Default

If no options are specified, the command displays the configuration for the current session and console display.

If a virtual router is not specified, VR-Mgmt is used.

Usage Guidelines

This command displays the log configuration for the specified target. The associated filter, severity, match expression, and format is displayed.

Example

The following command displays the log configuration:

```
show log configuration target
```

The following is sample output from this command:

```
Log Target      : memory-buffer
Enabled ?      : yes
Filter Name    : DefaultFilter
Match regex   : Any
Severity      : Debug-Data (through Critical)
Format        : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size   : 1000 messages
Log Target      : nvr
Enabled ?      : yes
Filter Name    : DefaultFilter
Match regex   : Any
Severity      : Warning (through Critical)
Format        : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Log Target      : console
Enabled ?      : no
Filter Name    : DefaultFilter
Match regex   : Any
Severity      : Info (through Critical)
Format        : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Log Target      : primary-msm
Enabled       : yes
Filter Name    : DefaultFilter
Match regex   : Any
Severity      : Warning (through Critical)
Log Target      : backup-msm
Enabled       : yes
Filter Name    : DefaultFilter
Match regex   : Any
Severity      : Warning (through Critical)
```

In the case that the alert is not configured:

```
# sh log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled         : yes
```

```

Filter Name : DefaultFilter
Match regex : Any
Severity    : Debug-Data (through Critical)
Format     : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size : 1000 messages
Percent Full : 60%
Full Alert  : None

Log Target  : nvram
Enabled     : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Warning (through Critical)
Format     : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target  : console
Enabled     : no
Filter Name : DefaultFilter
Match regex : Any
Severity    : Info (through Critical)
Format     : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

```

In the case that the alert is configured and the percentage threshold is set to 90:

```

# sh log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size    : 1000 messages
Percent Full   : 60%
Full Alert     : 90%

Log Target      : nvram
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Warning (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target      : console
Enabled         : no
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Info (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

```

In the case that the buffer is currently wrapping and the percentage threshold is set to 90:

```

# show log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size    : 1000 messages
Percent Full   : 100% (wrapping)
Full Alert     : 90%

```

```

Log Target      : nvram
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Warning (through Critical)
Format          : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target      : console
Enabled         : no
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Info (through Critical)
Format          : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

```

Showing Syslog as log target:

```

# show log configuration target syslog

Log Target      : syslog; 10.68.6.3:6555 (vr VR-Mgmt), local0
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format          : PRI Mmm DD HH:MM:SS HOSTNAME TAG:
Port Type      : TLS
Recnct Cnt     : 2
Recnct Msg     : CA Certificate not found. Use 'Download ssl certificate trusted-ca'
command to download a CA certificate.

Log Target      : syslog; 10.68.6.3:6555 (vr VR-Mgmt), local1
Enabled         : no
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format          : PRI Mmm DD HH:MM:SS HOSTNAME TAG:
Port Type      : TLS
Recnct Cnt     : 0
Recnct Msg     : No Error

Log Target      : syslog; 10.68.6.3:6519 (vr VR-Mgmt), local0
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format          : PRI Mmm DD HH:MM:SS HOSTNAME TAG:
Port Type      : UDP

```

History

This command was first available in ExtremeXOS 10.1.

The **ipPort** parameter was first available in ExtremeXOS 11.0.

The **local0** ... **local17** keywords were made optional in ExtremeXOS 11.4.

The **udp-port** parameter was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Connection port type (TLS or UDP) and connection messages added in ExtremeXOS 22.1

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log configuration target upm

```
show log configuration target upm {upm_profile_name}
```

Description

Displays a UPM target profile configuration.

Syntax Description

| | |
|-------------------------|--|
| <i>upm_profile_name</i> | Specifies the name of the UPM target profile you want to view. |
|-------------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following example displays the configuration for the UPM log target named testprofile1:

```
show log configuration target upm testprofile1
```

In the case that the alert is not configured:

```
X670V-48t.1 # sh log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled        : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity       : Debug-Data (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size    : 1000 messages
Percent Full   : 60%
Full Alert     : None

Log Target      : nvram
Enabled        : yes
Filter Name     : DefaultFilter
Match regex    : Any
```

```

Severity      : Warning (through Critical)
Format       : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target   : console
Enabled      : no
Filter Name  : DefaultFilter
Match regex  : Any
Severity     : Info (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

```

In the case that the alert is configured and the percentage threshold is set to 90:

```

X670V-48t.1 # sh log configuration
Debug-Mode: Disabled

Log Target   : memory-buffer
Enabled      : yes
Filter Name  : DefaultFilter
Match regex  : Any
Severity     : Debug-Data (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size  : 1000 messages
Percent Full : 60%
Full Alert   : 90%

Log Target   : nvram
Enabled      : yes
Filter Name  : DefaultFilter
Match regex  : Any
Severity     : Warning (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target   : console
Enabled      : no
Filter Name  : DefaultFilter
Match regex  : Any
Severity     : Info (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

```

In the case that the buffer is currently wrapping and the percentage threshold is set to 90:

```

X670V-48t.1 # sh log configuration
Debug-Mode: Disabled

Log Target   : memory-buffer
Enabled      : yes
Filter Name  : DefaultFilter
Match regex  : Any
Severity     : Debug-Data (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size  : 1000 messages
Percent Full : 100% (wrapping)
Full Alert   : 90%

Log Target   : nvram
Enabled      : yes
Filter Name  : DefaultFilter
Match regex  : Any
Severity     : Warning (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target   : console
Enabled      : no

```

```
Filter Name : DefaultFilter
Match regex : Any
Severity    : Info (through Critical)
Format     : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show log configuration target xml-notification

```
show log configuration target xml-notification {xml_target_name}
```

Description

Displays XML target information.

Syntax Description

| | |
|------------------------------|---|
| <code>xml_target_name</code> | Specifies the configured xml notification target. |
|------------------------------|---|

Default

N/A.

Usage Guidelines

Use this command to display XML target information.

Example

The following command displays XML target information for all targets:

```
show log configuration target xml-notification
```

Following is sample output from the command:

```
Log Target      : xml-notification (sqa)
Enabled        : yes
Filter Name    : DefaultFilter
Match regex    : Any
Severity       : Info (through Critical)
Log Target     : xml-notification (epi)
Enabled        : yes
```

```
Filter Name : xmlc_filter_epi
Match regex : Any
Severity    : Info (through Critical)
```

In the case that the alert is not configured:

```
X670V-48t.1 # sh log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size    : 1000 messages
Percent Full   : 60%
Full Alert     : None

Log Target      : nvram
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Warning (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target      : console
Enabled         : no
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Info (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
```

In the case that the alert is configured and the percentage threshold is set to 90:

```
X670V-48t.1 # sh log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size    : 1000 messages
Percent Full   : 60%
Full Alert     : 90%

Log Target      : nvram
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Warning (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target      : console
Enabled         : no
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Info (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
```

In the case that the buffer is currently wrapping and the percentage threshold is set to 90:

```
X670V-48t.1 # sh log configuration
Debug-Mode: Disabled

Log Target      : memory-buffer
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Debug-Data (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
Buffer size    : 1000 messages
Percent Full   : 100% (wrapping)
Full Alert     : 90%

Log Target      : nvram
Enabled         : yes
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Warning (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target      : console
Enabled         : no
Filter Name     : DefaultFilter
Match regex    : Any
Severity        : Info (through Critical)
Format         : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log configuration

```
show log configuration
```

Description

Displays the log configuration for switch log settings, and for certain targets.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the log configuration for all targets. The state of the target, enabled or disabled, appears. For the enabled targets, the associated filter, severity, match expression, and format appears. The debug mode state of the switch is also appears.

Example

The following command displays the configuration of all the log targets and all existing filters:

```
# show log configuration
Debug-Mode: Disabled
Show Message Privilege: User (non-administrative)
Enabled TLS Ciphers: aes128-sha256, dhe-rsa-aes256-sha256
Disabled TLS Ciphers: aes128-sha, aes256-sha256, dhe-rsa-aes128-sha256
Syslog TLS TCP User Timeout: Default
Syslog TLS OCSP: On

Log Target      : memory-buffer
  Enabled       : yes
  Filter Name   : DefaultFilter
  Match regex   : Any
  Severity      : Debug-Data (through Critical)
  Format        : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>
  Buffer size   : 1000 messages
  Percent Full  : 100% (wrapping)
  Full Alert    : None

Log Target      : nvram
  Enabled       : yes
  Filter Name   : DefaultFilter
  Match regex   : Any
  Severity      : Warning (through Critical)
  Format        : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Target      : console
  Enabled       : no
  Filter Name   : DefaultFilter
  Match regex   : Any
  Severity      : Info (through Critical)
  Format        : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condition>

Log Filter Name: DefaultFilter
I/
E Component      SubComponent Condition          Severity
- - - - -
I All
*****

Include/Exclude: I - Include, E - Exclude
Component Unreg: * - Component/SubComponent is not currently registered
Severity Values: C - Critical, E - Error, W - Warning, N - Notice, I - Info
                 * - Pre-assigned severities in effect for specified component
Debug Severity  : S - Debug-Summary, V - Debug-Verbose, D - Debug-Data
                 + - Debug Severities, but log debug-mode not enabled
If Match parameters present:
Parameter Flags: S - Source, D - Destination, (as applicable)
                 I - Ingress, E - Egress, B - BGP
Parameter Types: Port - Physical Port list, Slot - Physical Slot #
                 MAC - MAC address, IP - IP Address/netmask, Mask - Netmask
                 VID - Virtual LAN ID (tag), VLAN - Virtual LAN name
                 VR - Virtual Router Name, VRID - VR Identifier
                 VRF - Virtual Routing and Forwarding Name
```

```

L4 - Layer-4 Port #, Num - Number, Str - String
Nbr - Neighbor, Rtr - Routerid, EAPS - EAPS Domain
Proc - Process Name
Strict Match : Y - every match parameter entered must be present in the event
              N - match parameters need not be present in the event

```

History

This command was first available in ExtremeXOS 10.1.

Syslog reference identifier information was added in ExtremeXOS 22.3.

Which Syslog TLS session ciphers are enabled/disabled was added in ExtremeXOS 22.4.

Information about the Syslog TLS TCP user timeout value was added in ExtremeXOS 22.5.

OCSP check status information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log counters

```

show log counters {event condition | [all | event component]} {include |
notified | occurred} {severity severity {only}}

```

Description

Displays the incident counters for events.

Syntax Description

| | |
|------------------------|---|
| <i>event condition</i> | Specifies the event condition to display. |
| all | Specifies that all events are to be displayed. |
| <i>event component</i> | Specifies that all the events associated with a particular component or subcomponent should be displayed. |
| include | Specifies if one or more targets should be included in this event. |
| notified | Specifies the number of times this event has occurred. |
| occurred | Specifies the number of times this event has occurred since the last clear or reboot. |
| <i>severity</i> | Specifies the minimum severity level of events to display (if the keyword only is omitted). |
| only | Specifies that only events of the specified severity level are to be displayed. |

Default

If severity is not specified, then events of all severity are displayed.

Usage Guidelines

This command displays the incident counters for each event specified. Two incident counters are displayed. One counter displays the number of times an event has occurred, and the other displays the number of times that notification for the event was made to the system (an incident record was injected into the system for further processing). Both incident counters reflect totals accumulated since reboot or since the counters were cleared using the `clear log counters` or `clear counters` command, regardless of whether it was filtered or not.

The keywords `include`, `notified`, and `occurred only` display events with non-zero counter values for the corresponding counter.

This command also displays a reference count (the column titled `Rf` in the output). The reference count is the number of enabled targets receiving notifications of this event.

See the command `show log` for more information about severity levels.

To get a listing of the event conditions in the system, use the following command:

```
show log events
```

To get a listing of the components present in the system, use the following command:

```
show log components
```

Example

The following example displays the event counters for event conditions of severity `debug-summary` or greater in the component `STP`:

```
# show log counters stp included severity debug-summary
Component  SubComponent Condition          Severity          Occurred I Ntfd Last
Notified Time
-----
STP          AllocCntMsgFail  Warning          0 Y  0
STP          BindAutobindFail Error            0 Y  0
STP          ChangeTag        Warning          0 Y  0
STP          CreatDmnFail     Warning          0 Y  0
STP          DomainDisable   Warning          0 Y  0
STP          DomainEnable     Warning          1 Y  1 01/05/2001
23:43:39.03
STP          DsblPortBrdgDtect Warning          0 Y  0
STP          DsblPortLoopDtect Warning          0 Y  0
STP          EnblPortTimerExp Warning          0 Y  0
STP          ESRPConflict     Error            0 Y  0
STP          GetAvailDomainFail Error            0 Y  0
STP          GetAvailPortFail Error            0 Y  0
STP          LicenseError     Warning          0 Y  0
STP          NULLBridgeId     Error            0 Y  0
STP          PhysPortAssocInv Warning          0 Y  0
STP          PhysPortInv      Error            0 Y  0
STP          PortAlrdyBndDmn Warning          0 Y  0
STP          PortInuse        Error            0 Y  0
```

| | | | | | |
|-----|--------------------|----------|---|---|---|
| STP | PortModeNotExpct | Error | 0 | Y | 0 |
| STP | SendClntMsgFail | Warning | 0 | Y | 0 |
| STP | UnsupPhysInterface | Critical | 0 | Y | 0 |

The following example displays the event counters for the event condition PDUDrop in the component STP.InBPDU:

```
# show log counters "STP.InBPDU.Drop"
Component  SubComponent Condition          Severity      Occurred I Ntfld Last
Notified Time
-----
STP        InBPDU      Drop              Error         0 Y      0

Occurred  : # of times this event has occurred since last clear or reboot
Flags      : (*) Not all applications responded in time with their counters
I(ncluded): Set to Y(es) if one or more targets filter includes this event
Notified   : # of times this event has occurred when 'Included' was Y(es)
```

The following example displays the event counters for the AAA component:

```
# show log counters aaa
Component  SubComponent Condition          Severity      Occurred I Ntfld Last
Notified Time
-----
AAA        accountLockedOut  Warning       0 Y      0
AAA        accountMod        Info          0 Y      0
AAA        authFail          Warning       0 Y      0
AAA        authPass          Info          2 Y      2 02/27/2018
16:27:10.80

History

This command was first available in ExtremeXOS 10.1.

Last notified information was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show log events

```
show log events [event condition | [all | event component]] {severity
  severity {only}}] {details}
```

Description

Displays information about the individual events (conditions) that can be logged.

Syntax Description

| | |
|------------------------|--|
| <i>event condition</i> | Specifies the event condition to display. |
| all | Specifies that all events are to be displayed. |
| <i>event component</i> | Specifies that all the events associated with a particular component should be displayed. |
| <i>severity</i> | Specifies the minimum severity level of events to display (if the keyword only is omitted). |
| only | Specifies that only events of the specified severity level are to be displayed. |
| details | Specifies that detailed information, including the message format and parameter types, be displayed. |

Default

If severity is not specified, then events of all severity are displayed. If detail is not specified, then summary only information is displayed.

Usage Guidelines

This command displays the mnemonic, message format, severity, and parameter types defined for each condition in the event set specified.

See the command [show log](#) for more information about severity levels.

When the detail option is specified, the message format is displayed for the event conditions specified. The message format parameters are replaced by the value of the parameters when the message is generated.

To get a listing of the components present in the system, use the following command:

```
show log components
```

Example

The following command displays the event conditions of severity debug-summary or greater in the component STP.InBPDU:

```
show log events stp.inbpdu severity debug-summary
```

The following is sample output from this command:

| Comp | SubComp | Condition | Severity | Parameters |
|------|---------|-----------|---------------|------------|
| STP | InBPDU | Drop | Error | 2 total |
| STP | InBPDU | Ign | Debug-Summary | 2 total |
| STP | InBPDU | Mismatch | Warning | 2 total |

The following command displays the details of the event condition PDUTrace in the component STP.InBPDU:

```
show log events stp.inbpdu.pdutrace details
```

The following is sample output from this command:

| Comp | SubComp | Condition | Severity | Parameters |
|---------------------|---------|-----------|---------------|------------|
| STP | InBPDU | Trace | Debug-Verbose | 2 total |
| 0 - string | | | | |
| 1 - string (printf) | | | | |
| Port=%0%: %1% | | | | |

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mac-lockdown-timeout fdb ports

```
show mac-lockdown-timeout fdb ports [all | port_list]
```

Description

Displays the MAC entries that are learned on the specified port or group of ports or for all ports on the switch along with the aging time of each port.

Syntax Description

| | |
|------------------|---|
| all | Specifies all ports |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

N/A.

Usage Guidelines

If a port is down, the command displays all of the MAC entries that are maintained locally in the software.

The MAC entries learned on the specified port are displayed only if the MAC lock down timeout feature is enabled on the port. If you specify a port on which this feature is disabled, the MAC entries learned on that port are not displayed.

The switch displays the following information:

- Mac—The MAC address that defines the entry.
- Vlan—The *VLAN* name and ID for the entry.
- Age—The age of the entry, in seconds.
- Flags—Flags that define the type of entry:
 - B—Egress Blackhole.
 - b—Ingress Blackhole.
 - F—Entry in the hardware *FDB*.
 - L—Entry in the software.
- Port—The port on which the MAC address has been learned.

Example

The following command displays information about the MAC address lock down timeout settings for ports 2:3 and 2:4:

```
show mac-lockdown-timeout fdb ports 2:3, 2:4
```

The following is sample output from this command:

```

Mac                Vlan      Age  Flags  Port
-----
00:00:01:02:03:04v1(4094)0010F2:3
00:00:01:00:00:02v1(4094)0030FB b2:3
00:00:0A:02:03:04v2(4093)0050L2:4
00:00:0B:02:03:04v2(4093)0090F2:4
Flags : (F) Entry as in h/w FDB, (L) Entry in s/w and not in h/w
        (B) Egress Blackhole, (b) Ingress Blackhole
Total: 4 Entries in FDB: 3Entries in s/w: 1

```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mac-lockdown-timeout ports

```
show mac-lockdown-timeout ports [all | port_list]
```

Description

Displays information about the MAC address lock down timeout feature for the specified port or group of ports or for all ports on the switch.

Syntax Description

| | |
|------------------|---|
| all | Specifies all ports |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

N/A.

Usage Guidelines

The switch displays the following MAC address timeout information:

- Port—Indicates the port number that you specified in the command.
- MAC Lockdown Timeout—Specifies the enabled/disabled state of the MAC address lock down timeout feature.
- Timeout (in seconds)—Specifies the timeout value for the specified ports. By default, the timeout value is 15 seconds. Even if MAC address lock down is disabled, the default timeout value is displayed.

Example

The following command displays information about the MAC address lock down timeout settings for ports 2:3, 2:4, and 2:6:

```
show mac-lockdown-timeout ports 2:3, 2:4, 2:6
```

The following is sample output from this command:

```
Ports   MAC Lockdown Timeout   Timeout (in seconds)
-----
2:3 Enabled300
2:4 Enabled 300
2:6Disabled              15
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mac-locking stations

```
show mac-locking {first-arrival | static} {ports port_list}
```

Description

Displays MAC locking information about end stations connected to the switch.

Syntax Description

| | |
|----------------------|--|
| first-arrival | Displays only first-arrival MAC locking information. |
| static | Displays only static MAC locking information. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

N/A

Usage Guidelines

If you do not specify any parameters, MAC locking information for end stations on all ports (both static and first-arrival) is displayed.

Example

The following example displays MAC locking information for end stations on all ports.

```
show mac-locking stations

Port    MAC Address           Status   State           Aging
-----  -
1:2     00:00:11:22:33:00    inactive static          false
2:3     00:00:11:22:33:99    active   static          false
3:4     00:bb:00:00:00:00    active   first-arrival   false
4:5     00:e0:2b:00:00:01    active   first-arrival   true
Total for all ports: 4 Static: 2 First-Arrival: 2
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mac-locking

```
show mac-locking {ports port_list}
```

Description

Displays the status of MAC locking on one or more ports

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
|------------------|---|

Default

N/A

Usage Guidelines

If you do not specify a port, MAC locking status is displayed for all ports.

In MLAG, the mac-locking entries shown in this command's output are only natively learned FDB entries on the switch.

Example

The following example displays MAC locking status for all ports.

```
show mac-locking
```

MAC locking is globally disabled.

| Port | MAC Lock Stat | Trap Thr | Viol | Log Thr | Viol | FA Aging | Limit Action Cfg Stat | Link Down Action | Max Stc | Max FA | Last Violating MAC Address |
|------|---------------|----------|---------|---------|---------|----------|-----------------------|------------------|---------|--------|----------------------------|

Limit Action Stat - Port status on exceeding learn limit

```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show macsec

```
show macsec
```

Description

Displays a system-wide view of MAC Security (MACsec).

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command allows you to quickly see which ports support MACsec, which are configured, and which are secure.

- MACsec Capable without External Adapter—Ports that inherently support MACsec
- HW-Mode MACsec—Ports configured for MACsec versus for half-duplex (only applicable on half-duplex/MACsec ports).
- MACsec Capable with External Adapter—Ports that support MACsec-capable adapters.
- LRM/MACsec Adapter Present—Ports with a LRM/MACsec adapter plugged in.
- Valid MACsec License—Ports with a valid MACsec license installed.
- MACsec Capable, Present, and Licensed—Ports that support MACsec, external adapter is present (if applicable), and are licensed for MACsec.
- MACsec Configured—Ports that have been assigned to a connectivity association (CA) that in turn has been configured with a pre-shared-key (PSK).
- MKA Active—Ports that have MACsec configured and are actively participating in MKA (transmitting MKPDUs).
- Connect Status:
 - Pending—no connectivity (MKA not successful; no connectivity).
 - Authenticated—unsecure connectivity (peer authenticated; packets not encrypted).
 - Secure—secure connectivity (peer authenticated, and packets encrypted).

Note

Extreme Network switches always attempt to connect securely. However, if the peer is a third-party device and the peer is elected key server and the peer chooses to connect without MACsec protection, the port's connect status becomes "authenticated" instead of "secure". In authenticated mode, MKA continues to authenticate the remote peer, but MACsec protection is not enabled and all traffic transmits in the clear.

For ports with shared media (one copper and one fiber), normally fiber is the preferred medium; however, for proper detection/operation, the fiber port must be the preferred medium. For example, if link is detected on the copper port it becomes the preferred medium. As such it is removed from the MACsec-capable port list. The copper ports of the shared media ports are not MACse-capable. Only the fiber side with an LRM/MACsec adapter installed is MACse-capable.

Example

The following example shows system-wide view of MACsec:

```
# show macsec
MACsec Capable Without External Adapter: 1:25-48,2:25-48
HW-Mode MACsec: 1:25-48,2:25-48
MACsec Capable with External Adapter: 1:49-54,2:49-54
  LRM/MACsec Adapter Present: 2:49-50
Valid MACsec License: 1:25-54,2:25-54
MACsec Capable, Present and Licensed: 1:25-48,2:25-50
MACsec Configured: 1:37,1:48,2:25,2:29,2:32,2:49
```

```

MKA Active:                               1:37,2:49      (Transmitting MKPDUs)
Connect Status
  Pending:                                1:48,2:25,2:29,2:32 (No connectivity)
  Secure:                                  1:37,2:49      (Secured connectivity: MKA with
MACsec)

```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note

The MACsec feature requires the installation of the MAC Security feature pack license.

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|--|--|
| ExtremeSwitching X460-G2-24p-24hp, X460-G2-24t-24ht switches | Half-duplex, 1G ports (25-48) | No |
| | All other SFP/SFP+ ports * | Yes |
| ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X590, X620, X690, and X695 series switches | SFP/SFP+ ports * | Yes |
| ExtremeSwitching X465 | X465-24W, X465-24XE: ports 1-24 X465-48T, X465-48P, X465-48W, X465i-48W: ports 1-48 X465-24MU-24W: ports 25-48 VIM5-4XE: all 4 ports VIM5-4YE in X465-24MU, X465-24MU-24W switches: all 4 ports VIM5-4YE in X465-24W, X465-48T, X465-48P, X465-48W, X464.24S, X465-24S, X465i-48W: first 2 ports only | No |
| ExtremeSwitching 5520 | All ports, except 5520-VIM-4X and 24X 10G ports | No |
| Note: * For ExtremeSwitching X460-G2 series switches, the VIM-2X option does not support the LRM/MACsec Adapter. | | |

show macsec connectivity-association

```
show macsec { connectivity-association {ca_name}
```

Description

Displays a global summary of MAC Security (MACsec) capabilities and status for all or a specified connectivity-association (CA).

Syntax Description

| | |
|---------------------------------|---|
| connectivity-association | Secure connectivity provided between MACsec stations. |
| <i>ca_name</i> | Selects the Connectivity Association (CA) name. |

Default

N/A.

Example

The following example shows general information about CAs:

```
# show macsec connectivity-association
MACsec
CA Name                Ports                CAK Bit
Length                CAK Name (CKN)
-----
CentOS-50              50                  256  SaturnS
foo128                 None                128  short
foo256                 None                256  long
MyLittleCa             33                  128  My128bitKeyName
MyBigCa                None                256  My256bitKeyName
```

The following example shows information about CA "testca":

```
# show macsec connectivity-association testca

MACsec Connectivity Association: ca25
  Pre-shared-key
  CKN: blue
  CAK: 256-bit
  Ports: 25
```

History

This command was first available in ExtremeXOS 30.1.

Information for 256 cipher suite support was added in ExtremeXOS 30.2.

Platform Availability

This command is available on the following platforms.

Note

The MACsec feature requires the installation of the MAC Security feature pack license.

| Platform | Ports | LRM/ MACsec Adapter Required? |
|--|-------------------------------|--|
| ExtremeSwitching X460-G2-24p-24hp, X460-G2-24t-24ht switches | Half-duplex, 1G ports (25-48) | No |
| | All other SFP/SFP+ ports * | Yes |

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|--|--|
| ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X590, X620, X690, and X695 series switches | SFP/SFP+ ports * | Yes |
| ExtremeSwitching X465 | X465-24W, X465-24XE: ports 1-24 X465-48T, X465-48P, X465-48W, X465i-48W: ports 1-48 X465-24MU-24W: ports 25-48 VIM5-4XE: all 4 ports VIM5-4YE in X465-24MU, X465-24MU-24W switches: all 4 ports VIM5-4YE in X465-24W, X465-48T, X465-48P, X465-48W, X464.24S, X465-24S, X465i-48W: first 2 ports only | No |
| ExtremeSwitching 5520 | All ports, except 5520-VIM-4X and 24X 10G ports | No |
| Note: * For ExtremeSwitching X460-G2 series switches, the VIM-2X option does not support the LRM/MACsec Adapter. | | |

show macsec ports

```
show macsec ports port-list
```

Description

Displays per-port MKA and MAC Security (MACsec) data in tabular format.

Syntax Description

| | |
|------------------|--|
| ports | Specifies ports to show information on. |
| <i>port_list</i> | Lists which ports to view MACsec information on. |

Default

N/A.

Usage Guidelines

This commands displays a table containing both control-layer (MKA) status and data-layer (MACsec) statistics:

- **Port**—Underlying physical port's name. Only MACsec capable ports appear.
- **MKA**—Shows the message number (MN) contained in the MKPDUs sent by the port ("Local MN"), as well as the MN's in the MKPDUs being received ("Peer MN"). During normal operation, each MN should increment by 1 once every 2 seconds (MKA Hello Time).

- **Peer Status**—Indicates whether or not the peer is potential or live. Per *IEEE802.1X-2010's Clause 9.4.3 Determining Liveness*, a peer is considered “live” when it transmits an MKPDU that contains a local MKA participant’s member identifier (MI). A newly detected peer should start in the “P” state, and then transition to “L” in a matter of 2 to 4 seconds. A peer remaining in “P” indicates that the remote peer is not acknowledging the local peer’s existence.
- **Connect Status**—Represents the controlled port state machine’s “connect” variable. States are defined in *IEEE802.1X-2010 clause 12.3 CP state machine interfaces*:
 - **Pending**—Prevent connectivity by clearing the controlledPortEnabled parameter. Controlled port traffic is dropped.
 - **Authenticated**—Provide unsecured connectivity, setting controlledPortEnabled. Controlled port traffic is unencrypted.
 - **Secure**—Provide secure connectivity, using SAKs provided by the KaY (when available) and setting controlledPortEnabled when those keys are installed and in use, as specified in detail by the CP state machine. Controlled port traffic is encrypted.

Note

ExtremeXOS never chooses ‘Unauthenticated’ or ‘Authenticated’ access, but these options are allowed by the IEEE802.1X-2010 standard, so these cases may arise when interoperating with MKA/MACsec devices from other vendors.

- **Key Server**—Key server status:
 - **None**—Key server has yet to be elected (if persisting in this state, verify MACsec peer is enabled and PSKs are identical).
 - **Local**—This port has been elected key server.
 - **Peer**—Remote port has been elected key server.
- **MACsec**—Displays packet and byte statistics for both transmit and receive secure channels (SCs). Packet counters are 32-bits, while byte counters are 64-bits.

Example

The following example shows MKA and MACsec information for ports 25 and 50:

Note

To accommodate the width of the page, the MACsec columns are shown below the MKA content. In the actual output from the command, these columns appear beside each other.

```
# show macsec ports 25,50
MAC Security
-----MKA-----
      Local      Peer
      MACsec     Message Message Peer   Connect Key
      Enabled   Number  Number Status Status Server
=====
25      Yes         0        -  N/A   PENDING None
50      Yes       162244   162361 L      SECURE Peer
=====

# show macsec ports 25,50
MAC Security
-----SecY-Tx-SC-----SecY-Rx-SC-----

=====

```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note

The MACsec feature requires the installation of the MAC Security feature pack license.

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|--|--|
| ExtremeSwitching X460-G2-24p-24hp, X460-G2-24t-24ht switches | Half-duplex, 1G ports (25-48) | No |
| | All other SFP/SFP+ ports * | Yes |
| ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X590, X620, X690, and X695 series switches | SFP/SFP+ ports * | Yes |
| ExtremeSwitching X465 | X465-24W, X465-24XE: ports 1-24 X465-48T, X465-48P, X465-48W, X465i-48W: ports 1-48 X465-24MU-24W: ports 25-48 VIM5-4XE: all 4 ports VIM5-4YE in X465-24MU, X465-24MU-24W switches: all 4 ports VIM5-4YE in X465-24W, X465-48T, X465-48P, X465-48W, X464.24S, X465-24S, X465i-48W: first 2 ports only | No |
| ExtremeSwitching 5520 | All ports, except 5520-VIM-4X and 24X 10G ports | No |
| Note: * For ExtremeSwitching X460-G2 series switches, the VIM-2X option does not support the LRM/MACsec Adapter. | | |

show macsec ports configuration

```
show macsec ports port-list configuration
```

Description

Displays a table of all configurable parameters.

Syntax Description

| | |
|----------------------|---|
| ports | Specifies ports to show configurable parameters on. |
| <i>port_list</i> | Lists which ports to show configurable parameters on. |
| configuration | Selects showing configurable MKA and MACsec parameters. |

Default

N/A.

Usage Guidelines

None.

Example

The following example shows configurable parameters for ports 25 through 29:

```
# show macsec ports 51-52 configuration
MACsec          MKA Actor's  Cipher      Include  Replay Protect
Port            CA Name     Priority    Suite     SCI      Window Size
-----
51              None        0x10      gcm-aes-128  Disabled  0
52              None        0x0       gcm-aes-256  Disabled  0
```

History

This command was first available in ExtremeXOS 30.1.

Cipher information added in ExtremeXOS 30.2.

Platform Availability

This command is available on the following platforms.

Note

The MACsec feature requires the installation of the MAC Security feature pack license.

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|-------------------------------|--|
| ExtremeSwitching X460-G2-24p-24hp, X460-G2-24t-24ht switches | Half-duplex, 1G ports (25-48) | No |
| | All other SFP/SFP+ ports * | Yes |
| ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X590, X620, X690, and X695 series switches | SFP/SFP+ ports * | Yes |

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|--|--|
| ExtremeSwitching X465 | X465-24W, X465-24XE: ports 1-24 X465-48T, X465-48P, X465-48W, X465i-48W: ports 1-48 X465-24MU-24W: ports 25-48 VIM5-4XE: all 4 ports VIM5-4YE in X465-24MU, X465-24MU-24W switches: all 4 ports VIM5-4YE in X465-24W, X465-48T, X465-48P, X465-48W, X464.24S, X465-24S, X465i-48W: first 2 ports only | No |
| ExtremeSwitching 5520 | All ports, except 5520-VIM-4X and 24X 10G ports | No |
| Note: * For ExtremeSwitching X460-G2 series switches, the VIM-2X option does not support the LRM/ MACsec Adapter. | | |

show macsec ports detail

```
show macsec ports port-list detail
```

Description

Displays configuration, status, and statistics for both MKA and MAC Security (MACsec).

Syntax Description

| | |
|------------------|---|
| ports | Specifies ports to show MKA and MACsec detailed information on. |
| <i>port_list</i> | Lists which ports to show MKA and MACsec detailed information on. |
| detail | Selects showing detailed MACsec port information. |

Default

N/A.

Example

The following example shows detailed MACsec information for port 25:

```
# show macsec ports 25 detail

History

This command was first available in ExtremeXOS 30.1.

Cipher information was added in ExtremeXOS 30.2.

Platform Availability

This command is available on the following platforms.

Note

The MACsec feature requires the installation of the MAC Security feature pack license.

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|--|--|
| ExtremeSwitching X460-G2-24p-24hp, X460-G2-24t-24ht switches | Half-duplex, 1G ports (25-48) | No |
| | All other SFP/SFP+ ports * | Yes |
| ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X590, X620, X690, and X695 series switches | SFP/SFP+ ports * | Yes |
| ExtremeSwitching X465 | X465-24W, X465-24XE: ports 1-24 X465-48T, X465-48P, X465-48W, X465i-48W: ports 1-48 X465-24MU-24W: ports 25-48 VIM5-4XE: all 4 ports VIM5-4YE in X465-24MU, X465-24MU-24W switches: all 4 ports VIM5-4YE in X465-24W, X465-48T, X465-48P, X465-48W, X464.24S, X465-24S, X465i-48W: first 2 ports only | No |

| Platform | Ports | LRM/ MACsec Adapter Required? |
|---|---|--|
| ExtremeSwitching 5520 | All ports, except 5520-VIM-4X and 24X 10G ports | No |
| Note: * For ExtremeSwitching X460-G2 series switches, the VIM-2X option does not support the LRM/MACsec Adapter. | | |

show management

show management

Description

Displays the *SNMP* and CLI settings configured on the switch and the SNMP statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The following management output appears:

- Enable/disable state for Telnet, and SNMP access.
- Login statistics.
 - Enable/disable state for idle timeouts.
 - Maximum number of CLI sessions.
- SNMP community strings.
- SNMP trap receiver list.

For ExtremeXOS 11.0 and later, the following management output appears:

- SNMP trap receiver source IP address.
- SNMP statistics counter.
- SSH access state (enabled/disabled), idle time, rekey interval, and web access.
- CLI configuration logging.
- SNMP access states of v1, v2c disabled and v3 enabled.

If all three types of SNMP access are enabled or disabled, SNMP access is displayed as either Enabled or Disabled.

For ExtremeXOS 11.1 and later, the following management output appears:

- Enable/disable state for RMON.

For ExtremeXOS 11.2 and later, the following management output appears:

- Access-profile usage configured via *ACLs* for additional Telnet and SSH2 security.

For ExtremeXOS 11.6 and later, the following management output appears:

- CLI scripting settings
 - Enable/disable state.
 - Error message setting.
 - Persistence mode.

For ExtremeXOS 12.4 and later, the following management output appears:

- Dropped SNMP packet counter.

For ExtremeXOS 12.5 and later, the following management output appears:

- CLI prompting.
- SNMP INFORM.

For ExtremeXOS 22.1 and later, configured journal size (historical list of commands) appears.

For ExtremeXOS 22.3 and later, SSHv2 rekey interval time appears.

For ExtremeXOS 30.2 and later, CLI history expansion and port notation status appear.

For ExtremeXOS 30.3 and later, moved CLI commands information appears. The **CLI hidden moved-keywords** field shows:

- **Hidden**—moved commands do not appear in the CLI.
- **Displayed with Help**—moved commands appear with help text to direct you to the preferred new syntax.
- **Displayed with No Help**—moved commands appear without help text to direct you to the preferred new syntax.

The **CLI moved-keywords hidden release** field shows if the switch has been configured to hide moved-commands, which version of ExtremeXOS version was running when the hide command was issued. To clear the ExtremeXOS version in this field, execute `unconfigure switch {all | erase [all | nvram]}` using the **all**, **erase all**, or **nvram** option. This also sets the moved command option back to **Displayed with Help**.

Example

The following command displays configured SNMP settings on a switch:

```
# show management
CLI idle timeout           : Enabled (20 minutes)
CLI max number of login attempts : 3
CLI max number of sessions : 8
CLI paging                 : Enabled (this session only)
CLI space-completion       : Disabled (this session only)
CLI configuration logging   : Disabled (with expansion)
CLI journal size           : 100
```

```

CLI password prompting only      : Disabled
CLI hidden moved-keywords       : Displayed with Help
CLI moved-keywords hidden release: 30.3
CLI RADIUS cmd authorize tokens  : 2
CLI scripting                    : Disabled (this session only)
CLI scripting error mode         : Ignore-Error (this session only)
CLI persistent mode              : Persistent (this session only)
CLI prompting                    : Enabled (this session only)
CLI screen size                  : 24 Lines 80 Columns (this session only)
CLI refresh                      : Enabled
CLI history expansion            : Enabled
Current system port notation     : port
Configured system port notation  : port
Telnet access                    : Enabled (tcp port 23 vr all)
                                : Access Profile : not set
SSH access                       : Enabled (Key valid, tcp port 22 vr all)
                                : Secure-Mode   : Off
                                : Access Profile : not set
SSH2 idle time                   : 60 minutes
SSH2 rekey interval              : 4096 MB and no time limit
Web access                       : Enabled (tcp port 80)
                                : Access Profile : not set
Total Read Only Communities     : 1
Total Read Write Communities    : 1
RMON                             : Disabled
SNMP access                      : Enabled
                                : Access Profile : not set
SNMP Notifications              : Enabled
SNMP Notification Receivers     : None
SNMP stats:      InPkts 0      OutPkts 0      Errors 0      AuthErrors 0
                  Gets  0      GetNexts 0      Sets  0      Drops  0
SNMP traps:      Sent  0      AuthTraps Enabled
SNMP inform:     Sent  0      Retries 0      Failed 0

```

History

This command was first available in ExtremeXOS 10.1.

The trap receiver source IP address, SNMP counter statistics, SSH access, CLI logging, and SNMP access states were added to the output in ExtremeXOS 11.0.

The enabled/disabled state for RMON was added to the output in ExtremeXOS 11.1.

Additional Telnet and SSH2 information about ACL usage was added to the output in ExtremeXOS 11.2.

Information about CLI scripting including, the enabled/disabled state, error mode, and persistent mode was added to the output in ExtremeXOS 11.6.

The dropped SNMP packet counter (Drops) was added to the output in ExtremeXOS 12.4.

CLI prompting was added to the output in ExtremeXOS 12.5.

SNMP INFORM was added in ExtremeXOS 12.5.3.

Configured journal size (historical list of commands) was added in ExtremeXOS 22.1.

SSHv2 rekey interval time was added in ExtremeXOS 22.3.

Status of CLI configuration logging unabbreviated form (expansion) was added in ExtremeXOS 22.5.

CLI history expansion status and system port notation information were added in ExtremeXOS 30.2.

CLI moved commands information was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mcast cache

```
show mcast {ipv4 | ipv6} cache {{vlan} name} {[group grpaddressMask |
  grpaddressMask] {source sourceIP | sourceIP}} {type [snooping | pim |
  mvr]}| {summary}}
```

Description

Displays multicast cache information.

The display can be limited to entries for specific VLANs or groups, and it can be limited to specific types of entries, such as those created by snooping protocols, PIM, or MVR.

Syntax Description

| | |
|-----------------------|---|
| ipv4 | Specifies the IPv4 address family. |
| ipv6 | Specifies the IPv6 address family. |
| <i>name</i> | Specifies a <u>VLAN</u> name. |
| <i>grpaddressMask</i> | Specifies a multicast group address and mask. |
| <i>sourceIP</i> | Specifies the source IP address for a multicast group. |
| snooping | Limits the display to cache entries created by PIM or <u>IGMP</u> snooping. |
| pim | Limits the display to cache entries created by PIM. |
| mvr | Limits the display to cache entries created by MVR. |
| summary | Specifies the summary display format. |

Default

Displays information for all entries in the multicast cache.

Usage Guidelines

If the `configure forwarding ipmc lookup-key mac-vlan` command is configured, the following message displays:

NOTE: Traffic is forwarded based on MAC address. Actual traffic forwarded based on the installed MAC address need not be the same displayed in this command, if overlapping IP multicast addresses are used in the network.

If the mode is **mixed-mode**, the following message displays:

NOTE: Traffic could be forwarded based on MAC address. Actual traffic forwarded based on the installed MAC address need not be the same displayed in this command, if overlapping IP multicast addresses are used in the network.

Example

The following command displays all multicast cache information:

```
# show mcast cache
Snooping/MVR Cache Timeout: 300 sec
Type Group Sender Age InVlan
snoop 225.1.1.1 222.222.222.222 17 snvlan
Vlan Port Vid
snvlan 2 400
23 400
snoop 224.0.0.5 100.1.2.2 2 pmvlan2
Vlan Port Vid
pmvlan2 4 402
snoop 224.0.0.5 100.1.3.3 17 pmvlan3
Vlan Port Vid
pmvlan3 23 403
snoop 224.0.0.13 100.1.2.2 11 pmvlan2
Vlan Port Vid
pmvlan2 4 402
snoop 224.0.0.13 100.1.3.3 14 pmvlan3
Vlan Port Vid
pmvlan3 23 403
pim 226.1.1.1 100.1.1.12 0 pmvlan1
Vlan Port Vid
pmvlan2 4 402
pmvlan3 23 403
Multicast cache distribution:
5 entries from Snooping 0 entries from MVR 1 entries from PIM
Total Cache Entries: 6
```

The following command displays summary cache information for VLAN pmvlan1:

```
# show mcast cache vlan pmvlan1 summary
Snooping/MVR Cache Timeout: 300 sec
=====MULTICAST CACHE SUMMARY=====
Multicast cache distribution:
5 entries from Snooping 0 entries from MVR 1 entries from PIM
pmvlan1: Multicast cache distribution:
0 entries from Snooping 0 entries from MVR 1 entries from PIM
Total Cache Entries: 6
Total Cache Entries for VLAN pmvlan1: 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mcast ipv6 cache

```
show mcast ipv6 cache {{vlan} name} {[group v6GrpAddressMask |
v6GrpAddressMask] {source v6SourceIP | v6SourceIP}} {type [snooping |
pim]} {with-in-port} | {summary}}
```

Description

Displays multicast cache information. The display can be limited to entries for specific [VLANs](#) or groups, and it can be limited to specific types of entries, such as those created by snooping protocols, or PIM.

Syntax Description

| | |
|-------------------------|--|
| <i>name</i> | Specifies a VLAN name. |
| <i>v6GrpAddressMask</i> | Specifies a multicast group address and mask. |
| <i>v6SourceIP</i> | Specifies the source IP address for a multicast group. |
| snooping | Limits the display to cache entries created by MLD snooping. |
| pim | Limits the display to cache entries created by PIM. |
| summary | Specifies the summary display format. |

Default

Displays information for all entries in the multicast cache.

Usage Guidelines

None.

Example

The following command displays all multicast cache information:

```
# show mcast ipv6 cache
Snooping Cache Timeout: 300 sec
(ff03::1 3001::1)
Type: snoop Age: 9 Ingress Vlan: v1
Vlan      Port      Vid
v1        25        4084
(ff03::1 3001::2)
Type: snoop Age: 9 Ingress Vlan: v1
Vlan      Port      Vid
v1        25        4084
Multicast cache distribution:
2 entries from Snooping          0 entries from PIM
Total Cache Entries: 2
```

The following command displays summary cache information for VLAN v1:

```
# show mcast ipv6 cache vlan v1 summary
Snooping Cache Timeout: 300 sec
=====MULTICAST CACHE SUMMARY=====
```

```

Multicast cache distribution:
2 entries from Snooping          0 entries from PIM
v1: Multicast cache distribution:
2 entries from Snooping          0 entries from PIM
Total Cache Entries: 2
Total Cache Entries for VLAN v1: 2
#

```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show memory

```
show memory {slot slotid}
```

Description

Displays the current system memory information.

Syntax Description

| | |
|---------------|--|
| slotid | Specifies slot number for the node in a stack. The value can be from 1 to 8. |
|---------------|--|

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. When you keep simple daily records, you see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different memory information might be displayed.

You can also use the `show memory process name {slotslotid}` command to view the system memory and the memory used by the individual processes.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays the current system memory information for the master node and the back-up node in the Active Topology.
- From a standby node, the stack displays the current system memory information for the master node and the standby node in the Active Topology.

Reading the Output

The show memory command displays the following information in a tabular format:

- System memory information (both total and free).
- Current memory used by the individual processes.

The current memory statistics for the individual process also includes the name of the process.

In general, the free memory count for a switch decreases when one or more running processes experiences an increase in memory usage.

If you observe a continuous decrease in the free memory over an extended period of time, and you have not altered your switch configuration, please contact Extreme Networks Technical Support.

Example

The following command displays current system memory information for a switch:

```
show memory
```

The following is sample output from this command:

```
System Memory Information
-----
Total DRAM (KB): 262144

```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show memory process

```
show memory process name {slot slotid}
```

Description

Displays the current system memory and that of the specified process.

Syntax Description

| | |
|---------------|--|
| <i>name</i> | Specifies the name of the process. |
| <i>slotid</i> | In a SummitStack, <i>slotid</i> specifies the slot number of the node in the stack topology. The value can be from 1 to 8. |

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. When you keep simple daily records, you see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different memory information might be displayed.

You can also use the `show memory {slot slotid}` command to view the system memory and the memory used by the individual processes.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays current system memory and that of the specified process running on the master node and the back-up node in the Active Topology.
- From a standby node, the stack displays current system memory and that of the specified process running on the master node and the standby node in the Active Topology.

Reading the Output

The `show memory process` command displays the following information in a tabular format:

- System memory information (both total and free).
- Current memory used by the individual processes.

The current memory statistics for the individual process also includes the following:

- For SummitStacks, the slot number.
- The name of the process.

Example

The following example displays system memory and VRRP memory usage:

```
show memory process vrrp
```

The following is sample output from a Summit switch:

```
System Memory Information
-----
Total DRAM (KB): 262144
System      (KB): 25852
User        (KB): 96608
Free        (KB): 139684
Memory Utilization Statistics
-----
Process Name      Memory (KB)
-----
vrrp                11184
```

The following is sample output from a SummitStack:

```
Slot-1 stacK.4 # show memory process "aaa"
System Memory Information
-----
Slot-1    Total DRAM (KB): 262144
Slot-1    System      (KB): 25476
Slot-1    User          (KB): 132276
Slot-1    Free          (KB): 104392
Slot-6    Total DRAM (KB): 262144
Slot-6    System      (KB): 25476
Slot-6    User          (KB): 122820
Slot-6    Free          (KB): 113848
```

Memory Utilization Statistics

```
-----
Card Slot Process Name      Memory (KB)
-----
Slot-1 1   aaa                2548
Slot-6 6   aaa                2440
```

History

This command was first available in an ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show meter

```
show meter meter_name {ports [port_group | port_list]} {out-actions}
```

Description

Displays the configured meters.

Syntax Description

| | |
|--------------------|---------------------------------|
| <i>meter_name</i> | Specifies the meter name. |
| ports | Ports to display. |
| <i>port_group</i> | Port group name. |
| <i>port_list</i> | Port list separated by a comma. |
| out-actions | Out-of-profile actions. |

Default

N/A.

Usage Guidelines

None.

Example

The following sample output displays meters on the switch:

```
#show meter
-----
Name      Committed Rate (Kbps)  Peak Rate (Kbps)
-----
peggy          1000000--
```

The following example uses the *port-group* variable:

```
# show meter ports ingMeterGrpA

Group: ingMeterGrpA
Ports: 1-3
Name      Committed Rate      Peak Rate  Burst Size (Kb)
-----
ingmeter2      21000 Kbps      30000 Kbps      2
ingmeter3      30000 Pps      40000 Pps      5
ingmeter4      21000 Kbps      --              2
ingmeter5      30000 Pps      --              5
```

The following example uses *port_group out-actions*:

```
# show meter ingmeter2 ports ingMeterGrpB out-actions

Group: ingMeterGrpB
Ports: 4-5

Out-actions
Meter      Log  Trap  Disable  Drop  Drop  Drop
Name      Name      Port      Port      Precedence
-----
ingmeter2      --  On    On    On    63
```

The following example uses *port_list*:

```
# show meter ports 1-4

Name      Committed Rate      Peak Rate  Burst Size(Kb)  Port
-----
ingmeter2      21000 Kbps      30000 Kbps      2 1
ingmeter5      30000 Kbps      --              5 1
ingmeter2      21000 Kbps      --              2 2
ingmeter5      30000 Kbps      --              5 2
ingmeter2      21000 Kbps      --              2 3
ingmeter5      30000 Kbps      --              5 3
ingmeter5      2000 Pps      10000 Pps      3 4
ingmeter7      10000 Kbps      --              5 4
```

The following example uses *port_list out_actions*:

```
# show meter "ingmeter2" ports 4-6 out-actions

Out-
```

| Meter Name | Log | Trap | Disable Port | Drop | Drop | |
|------------|-----|------|--------------|------|-------------------|------|
| | | | | | Precedence (dscp) | Port |
| ingmeter2 | On | On | On | -- | 63 | 4 |
| ingmeter2 | On | On | On | -- | 63 | 5 |
| ingmeter2 | On | On | On | On | -- | 6 |

Note

You configure a peak rate for QoS meters using the `configure meter metername {committed-rate cir [Gbps | Mbps | Kbps | Pps]} {max-burst-size burst-size [Kb | Mb | packets]} {out-actions [{disable-port} {drop | set-drop-precedence {dscp [none | dscp-value]} {dot1p [none | dot1p-value]}]}` command.

History

This command was first available in ExtremeXOS 11.4.

The `ports`, `port_group`, `port_list`, and `out-actions` options were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show meter out-of-profile

```
show meter {metername} out-of-profile {{disabled-ports} ports [portlist
| port_group] | global-count}
```

Description

This command displays the meters that are out-of-profile and the ports that have been disabled as a result of a meter that is out-of-profile. The show screen will display the out-of-profile status and rate-limit counters for both per-port and global meters. Both the per-port and global meter counters and status are an aggregate of the rule based counters and status which includes both ACL and dot1p rules. In addition a screen will display the global out-of-profile count for per-port meters. The global count is used for debugging systems that do not support per-port counters in the hardware. This global counter for per-port meters is an aggregate of the rule based counters which includes both ACL and dot1p rules.

Syntax Description

| | |
|-----------------------------|--|
| <code>metername</code> | Meter name. |
| <code>disabled-ports</code> | Show the meter out-of-profile status that resulted in disable-port action. |
| <code>ports</code> | Show the meter applied to a specified port list. |

| | |
|---------------------|--|
| <i>portlist</i> | Port list separated by a comma or - |
| <i>port_group</i> | Port group name. |
| global-count | Counter of all the rules (ACL and dot1p) using a per-port meter. |

Default

N/A.

Usage Guidelines

None.

Example

```
#show meter out-of-profile ports ingMeterGrp
```

```
Group: ingMeterGrp
```

```
Ports: 4-5
```

| Name | Status | Disabled | Rate-Limit | Counter | Port |
|-----------|----------------|----------|------------|---------|------|
| ingmeter1 | Out of profile | Yes | | 1234567 | 4 |
| ingmeter1 | Ok | No | | 0 | 5 |
| ingmeter2 | Out of profile | No | | 0 | 4 |
| ingmeter2 | Out of profile | No | | 1467 | 5 |
| ingmeter3 | Out of profile | No | | 0 | 4 |
| ingmeter3 | Ok | No | | 0 | 5 |

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mirror

```
show mirror [mirror_name | control_index | mirror_name_li] | [all | enabled]
```

Description

Displays various show output for mirror instances.

Syntax Description

| | |
|-----------------------|---|
| <i>mirror_name</i> | Displays the mirror name. |
| <i>mirror_name_li</i> | Displays mirror instance name for Lawful Intercept account only. You must have lawful intercept user privileges to specify this variable. |
| all | Displays all mirror instances. |
| enabled | Displays only enabled mirror instances. |
| <i>control_index</i> | Selects the particular mirror MIB instance, as defined by a control index (1-4), to show information about. |

Default

N/A.

Usage Guidelines

Use this command to display mirror statistics and determine if mirroring is enabled or disabled on the switch.

For mirror instances to remote IP addresses, one the following statuses appears:

- **Disabled**—User has disabled the mirror instance.
- **Down. No route**—No route is available to reach the remote IP address.
- **Down. IP forwarding not enabled on VLAN to route**—Route is available to reach the remote IP address, but egress VLAN does not have IP forwarding enabled (see [enable ipforwarding](#) on page 2189).
- **Down. Ping timed out**—Route is available, IP address forwarding is enabled on the egress VLAN, but ping check is “on” and a timely ping response from the remote IP address was not received during three consecutive ping requests, sent every five seconds.
- **Up. Active**—Remote IP address is reachable and ARP entry is resolved. Ping health check is either “off”, or is “on” and a timely ping response has been received. The status is “Up. Active” for the remote IP address in “Up” state with the highest configured priority, and therefore is sent mirrored packets.
- **Up. Standby**—Remote IP address is reachable and ARP entry is resolved. Ping health check is either “off”, or is “on” and a timely ping response has been received. Status is “Up. Standby” for remote IP addresses in “Up” state, but whose configured priority is below the priority of the remote IP address that is “Up. Active”.

Note

The mirror instance for a remote IP address is only installed in hardware if the status is “Up.Active”.

Example

The following command displays switch mirroring information:

```
# show mirror
DefaultMirror (Disabled) Description: Default Mirror Instance, created
```

```

automatically
  Mirror to port: -

PolicyMirror-1003  (Enabled)
  Mirror Destination Indices: 1 - Enabled
  Description:
  Mirror to port: 3

TunMir  (Enabled)
  Mirror Destination Indices: 3 - Enabled
  Description:
  Mirror to remote IP: 192.168.97.100   VR      : VR-Default
  From IP              : 192.168.97.184   Ping check: On
  Status                : Up

Mirrors defined:          3
Mirrors enabled:         2 (Maximum 4)
HW filter instances used: 0 (Maximum 128)
HW mirror instances used: 0 ingress, 0 egress (Maximum 4 total, 2 egress)
Remote IP protocol type: Trans Ether Bridging (0x6558)

Destination Control Index 1: Enabled (Active)
Destination Control Index 3: Enabled (Active)

```

The following example displays output for a lawful intercept user session:

```

* show mirror
DefaultMirror  (Disabled)
  Description:   Default Mirror Instance, created automatically
  Mirror to port: -

law_mirror  (Enabled)
  Description:   user for lawful intercept
  Mirror to port: 3
  Source filter instances used : 2
    Port 7, all vlans, ingress only
    Port 8, all vlans, ingress only

main_mirror  (Enabled)
  Description:
  Mirror instance for Admin
  Mirror to port: 2
  Source filter instances used : 1
  Port 10, all vlans, ingress only

Mirrors defined:          3
Mirrors enabled:         2 (0 with egress filters)
HW filter instances used: 3 (Maximum 128)
Remote IP protocol type: ERSPAN v1 (0x88BE)

```

The following example shows mirroring to remote IP addresses:

```

# show mirror

analytics_chicago_1  (Enabled)
  Description:
  Mirror to remote IP: 5.1.1.2           VR      : VR-Default
  From IP              : Auto source IP   Ping check: On
  Priority              : 50
  Status                : Up. Active

  Mirror to remote IP: 4.1.1.2           VR      : VR-Default
  From IP              : Auto source IP   Ping check: On
  Priority              : 40

```

```

Status          : Up. Standby

HW mirror instances used: 3 ingress, 0 egress (Maximum 4 total, 2 egress)
Remote IP protocol type: ERSPAN v1 (0x88BE)

```

The following example shows information about Mirror MIB instance for control index "1":

```

# show mirror 1
Destination Control Index 1: Enabled (Active)

```

History

This command was first available in ExtremeXOS 15.3.

The *mirror_name_li* variable was added in ExtremeXOS 15.3.2.

Mirroring to remote IP addresses information was added in ExtremeXOS 22.4.

Mirror MIB instance (control index) information for policy-based mirrors was added in ExtremeXOS 30.2.

Redundant remote IP address information was added in ExtremeXOS 30.4.

GRE protocol type for mirror-to-remote IP addresses was added in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mlag peer

```
show mlag peer {peer_name}
```

Description

Displays information about an *MLAG*.

Syntax Description

| | |
|------------------|---|
| <i>peer_name</i> | Specifies an alpha numeric string identifying the MLAG peer switch. |
|------------------|---|

Default

N/A.

Usage Guidelines

Use this command to display configured items, MLAG peer switch state, MLAG group count, and health-check statistics.

Example

The following command displays information for an MLAG peer switch:

```
# show mlag peer
Following is sample output for the command:
Multi-switch Link Aggregation Peers:

MLAG Peer      : leftBD8k
VLAN           : isc           Virtual Router   : VR-Default
Local IP Address : 1.1.1.2       Peer IP Address  : 1.1.1.1
MLAG ports     : 2           Tx-Interval     : 1000 ms
Checkpoint Status : Up         Peer Tx-Interval : 1000 ms
Rx-Hellos      : 184        Tx-Hellos       : 184
Rx-Checkpoint Msgs : 12       Tx-Checkpoint Msgs : 12
Rx-Hello Errors : 0         Tx-Hello Errors  : 0
Hello Timeouts  : 1         Checkpoint Errors : 0
Up Time         : 0d:0h:0m:10s    Peer Conn.Failures : 1
Local MAC :00:04:96:11:22:44 Peer MAC :00:04:96:11:22:33
Config'd LACP MAC :None     Current LACP MAC:00 :04:96:11:22:33
Multi-switch Link Aggregation Peers:

MLAG Peer      : rightBD8k
VLAN           : isc           Virtual Router   : VR-Default
Local IP Address : 1.1.1.1       Peer IP Address  : 1.1.1.2
MLAG ports     : 2           Tx-Interval     : 1000 ms
Checkpoint Statu : Up         Peer Tx-Interval : 1000 ms
Rx-Hellos      : 167        Tx-Hellos       : 167
```

```

Rx-Checkpoint Msgs: 12           Tx-Checkpoint Msgs : 12
Rx-Hello Errors   : 0           Tx-Hello Errors    : 0
Hello Timeouts    : 1           Checkpoint Errors  : 0
Up Time           : 0d:0h:0m:7s Peer Conn.Failures  : 1
Local MAC         :00:04:96:11:22:44 Peer MAC           :00:04:96:11:22:33
Config'd LACP MAC :None         Current LACP MAC   :00:04:96:11:22:33

```

Following is sample output when an MLAG peer has been created but the IP address is yet to be configured:

```

* switch # show mlag peer switch101

Multi-switch Link Aggregation Peers:

MLAG peer      : switch101
VLAN           :           Virtual Router      :
Local IP address :           Peer IP address   :
MLAG groups    : 0           Tx-Interval      : N/A
Checkpoint Status : Down       Peer Tx-Interval : N/A
Rx-Hellos      : 0           Tx-Hellos       : 0
Rx-Checkpoint Msgs : 0       Tx-Checkpoint Msgs : 0
Rx-Hello Errors : 0           Tx-Hello Errors  : 0
Hello Timeouts  : 0           Checkpoint Errors : 0
Up Time: N/A    : 0           Peer Conn.Failures : 0
Local MAC       :00:04:96:11:22:44 Peer MAC         :00:04:96:11:22:33
Config'd LACP MAC :None         Current LACP MAC : 00:04:96:11:22:33

```

Following is sample output displaying LACP MAC for a MLAG peer:

```

* switch # show mlag peer switch101

Multi-switch Link Aggregation Peers:

MLAG Peer      :S2
VLAN           :isc           Virtual Router      :VR-Default
Local IP Address :1.1.1.1     Peer IP Address    :1.1.1.2
MLAG ports     :0           Tx-Interval       :1000 ms
Checkpoint Status :Up       Peer Tx-Interval   :1000 ms
Rx-Hellos      :153379      Tx-Hellos         :153895
Rx-Checkpoint Msgs :6       Tx-Checkpoint Msgs :14
Rx-Hello Errors :0           Tx-Hello Errors   :0
Hello Timeouts  :0           Checkpoint Errors  :0
Up Time         :1d:17h:45m:8s Peer Conn. Failures :0
Local MAC       :00:04:96:11:22:44 Peer MAC           :00:04:96:11:22:33
Config'd LACP MAC :None         Current LACP MAC   :
MAC             :00:04:96:11:22:33 Config'd LACP MAC

```

Configured LACP MAC is the configured LACP MAC using the:

```
configure {mlag peer} peer_name lACP-mac lACP_mac_address
```

command.

If no MAC is configured,

```
Config'd LACP MAC
```

is shown as None.

If same LACP MAC is configured on both the switches, the current LACP MAC will be the same as

```
Config'd LACP MAC.
```

If LACP MAC is not configured on any of the MLAG peers or if a different MAC is configured on the peers,

```
Current LACP MAC
```

is different from Config'd LACP MAC and is selected from Local MAC/Peer MAC combination.

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show mlag ports

```
show mlag ports {port_list}
```

Description

Displays information about each MLAG group.

Syntax Description

| | |
|------------------------|------------------------------|
| <code>port_list</code> | Specifies one or more ports. |
|------------------------|------------------------------|

Default

N/A.

Usage Guidelines

Use this command to display information about each MLAG group including local port number, local port status, remote MLAG port state, MLAG peer name, MLAG peer status, local port failure count, remote MLAG port failure count.

Local and remote link state and fail counts reflect the status of the entire LAG when a LAG is used in conjunction with an MLAG. For example, if 1 and 2 ports in a local LAG on the switch associated with an MLAG is down, the local link state will still show as ready and the associated local fail count will be incremented. The remote fail count shown at MLAG neighboring switch will also be incremented.

Example

The following command displays information for an MLAG group:

```
# show mlag ports
Local
MLAG      Local   Link   Remote
Id        Port   State  Link   Peer
=====
2         1:1    A      Up     leftBD8K
1         1:2    A      Up     leftBD8K
=====
Local Link State: A - Active, D - Disabled, R - Ready, NP - Port not present
Remote Link      : Up - One or more links are active on the remote switch,
Down - No links are active on the remote switch,
N/A - The peer has not communicated link state for this MLAG
```

```

port,
Virtual - MLAG peer switch does not have physical port.
Number of Multi-switch Link Aggregation Groups : 2
Convergence control : Fast
Reload Delay Interval : 30 seconds
Reload Delay : Disabled
Link Up Isolation : Off

```

The following command displays information about an MLAG group on ports 1 and 2:

```

show mlag port 1,2
Local
MLAG Local Link Remote Local Remote
Id Port State Link Peer Peer Status Fail Fail
Count Count
=====
100 1 A Up switch101 Up 0 2
101 2 A Down switch101 Up 0 1
=====
Local Link State: A - Active, D - Disabled, R - Ready, NP - Port not present
Remote Link: Up - One or more links are active on the remote switch,
Down - No links are active on the remote switch,
N/A - The peer has not communicated link state for this MLAG
group
Virtual - MLAG peer switch does not have physical port.

Number of Multi-switch Link Aggregation Groups: 2
Convergence Control : Conserve Access Lists
Reload Delay Interval : 30 seconds
Reload Delay : Disabled
Link Up Isolation : Off

```

History

This command was first available in ExtremeXOS 12.5.

MLAG reload delay timer information was added in ExtremeXOS 22.3.

Virtual port information was added in ExtremeXOS 22.7.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show mld

```
show mld {vlan} {name}
```

Description

This command can be used to display an MLD-related configuration and group information, per [VLAN](#) or for the switch as a whole.

Syntax Description

| | |
|-------------|------------------------|
| <i>name</i> | Specifies a VLAN name. |
|-------------|------------------------|

Default

N/A.

Usage Guidelines

If you do not specify a VLAN, the command displays the switch configuration.

Example

The following is sample output from the `show mld` command:

```
# show mld
VLAN          IP Address          Flags  nLRMA  nLeMA  MLDver
Default      ::/0                ---iz-  0      0      0
v1           ::/0                U--iz-  0      5      0
Flags:  (f) Forwarding Enabled, (g) Fast-learning on, (i) MLD Enabled,
(m) Multicast Forwarding Enabled, (U) Interface Up,
(z) MLD Snooping Enabled.
(nLeMA) Number of Learned Multicast Addresses
(nLRMA) Number of Locally Registered Multicast Addresses
```

The following command displays the MLD configuration for VLAN v1:

```
# show mld v1
Query Interval      : 125 sec
Max Response Time  : 10 sec
Last Member Query  : 1 sec
Robustness         : 2
Interface on VLAN v1 is enabled and up.
inet6 ::/0
Locally registered multicast addresses:
Learned multicast addresses (Last Querier=fe80::204:96ff:fe3a:ce50):
ff02::2             ff02::1:ff56:5c2b
ff02::1:ff00:2      ff02::1:ff3a:ce50
ff02::1:ff55:5c27
s = static MLD member
Flags:
IP Fwding  NO      IPmc Fwding  NO      MLD YES
MLD Ver   v0      Snooping    YES
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mld counters

```
show mld counters {{vlan} name}
```

Description

Use this command to display an MLD packet statistics.

Syntax Description

| | |
|-------------|-------------------------------|
| <i>name</i> | Specifies a <u>VLAN</u> name. |
|-------------|-------------------------------|

Default

N/A.

Usage Guidelines

The following command displays the MLD configuration:

```
* topleft.74 # show mld counters
MLD Message type      Received  Originated  Forwarded
MLD Query (v1/v2)    0         20         0
MLDv1 Report         499       0         157
MLDv1 Done           101       0         91
MLDv2 Report         0         0         0
Global Statistics:
MLD Packet unknown   0
MLD Packet Error     617
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mld group

```
show mld group {{vlan} {name} | {v6grpipaddress}} {MLDv2}
```

Description

Lists the MLD group membership for the specified VLAN or group.

Syntax Description

| | |
|-----------------------|---|
| <i>name</i> | Specifies a VLAN name. |
| <i>v6grpipaddress</i> | Specifies a group IPv6 address. |
| MLDv2 | DisplayS the MLD group in MLDv2 format (if group record is MLDv2 compatible, otherwise displayS in earlier format). This option is not supported in this release. |

Default

MLDv1.

Usage Guidelines

If no VLAN is specified, all VLANs are displayed. You can also filter the display by group address or by multicast stream sender address.

Example

The following command lists the MLD group membership for the VLAN accounting:

```
show mld group vtest3
```

Output from this command looks similar to the following:

| Group | Address | Ver | Vlan | Port | Age |
|-------|-------------------|-----|--------|------|-----|
| | ff03::1:1 | 1 | vtest3 | 4:5 | 25 |
| | ff03::1:2 | 1 | vtest3 | 4:5 | 25 |
| | ff02::1:ff22:124 | 1 | vtest3 | 4:45 | 26 |
| | ff05::a:abcd | 1 | vtest3 | 4:15 | 23 |
| | ff05::a:abce | 1 | vtest3 | 4:15 | 23 |
| | ff02::1:ff22:112 | 1 | vtest3 | 4:45 | 26 |
| | ff02::1:ff1f:a418 | 1 | vtest3 | 4:45 | 26 |

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mld snooping

```
show mld snooping {vlan name | detail} {MLDv2}
```

Note

MLD snooping is not supported in this software release.

Description

Displays MLD snooping registration information and a summary of all MLD timers and states.

Syntax Description

| | |
|---------------|---|
| <i>name</i> | Specifies a <u>VLAN</u> name. |
| detail | Displays the information in detailed format. |
| MLDv2 | Displays the MLD group in MLDv2 format (if group record is MLDv2 compatible, otherwise displays in earlier format). This option is not supported in this release. |

Default

MLDv1.

Usage Guidelines

The two types of MLD snooping entries are sender entry and subscribed entry.

The following information is displayed in a per-interface format:

- Group membership information
- Router entry
- Timeout information
- Sender entry

Example

Here is an example of the show output:

```
# show mld snooping
MLD Snooping Flood-list : none
MLD Snooping Proxy      : Enable
MLD Snooping Filters    : per-port
Vlan                    Vid  Port  #Senders #Receivers Router Enable
-----
Default                 1    0      0         0         No      Yes
v1                      4084 0      0         0         No      Yes
25                      1    1      Yes
41                      2    0      No
42                      2    0      No
```

The following command displays MLD snooping registration information for the VLAN V1:

```
# show mld snooping v1
Router Timeout          : 260 sec
Host Timeout           : 260 sec
MLD Snooping Fast Leave Time : 1000 ms
VLAN v1                (4084) Snooping=Enabled
Port  Host
Subscribed                    Join Limit  Age
25   fe80::204:96ff:fe3a:ce50      13
ff02::1:ff3a:ce50             No Limit
25   fe80::204:96ff:fe3a:ce50      14
```

```

All Groups                               No Limit
41    fe80::200:8ff:fe55:5c27             13
ff02::1:ff00:2                           No Limit
41    fe80::200:8ff:fe55:5c27             13
ff02::1:ff55:5c27                         No Limit
42    fe80::200:8ff:fe56:5c2b             14
ff02::1:ff00:2                           No Limit
42    fe80::200:8ff:fe56:5c2b             13
ff02::1:ff56:5c2b                         No Limit
s = static MLD member
#

```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mld snooping vlan filter

```
show mld snooping {vlan} name filter
```

Description

Displays MLD snooping filters..

Syntax Description

| | |
|-------------|-------------------------------|
| <i>name</i> | Specifies a <u>VLAN</u> name. |
|-------------|-------------------------------|

Default

None.

Usage Guidelines

Use this command to display MLD snooping filters configured on the specified VLAN. When no VLAN is specified, all the filters are displayed.

Example

The following command displays the MLD snooping filter configured on VLAN vlan101:

```

# show mld snooping vlan101 filter
Filter Port Flags
mldpermit0 5:10 a
Flags: (a) Active

```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mld snooping vlan static

```
show mld snooping vlan name static [group | router]
```

Description

Displays static MLD snooping entries.

Syntax Description

| | |
|-------------|-------------------------------|
| <i>name</i> | Specifies a <u>VLAN</u> name. |
|-------------|-------------------------------|

Default

None.

Usage Guidelines

Use this command to display the MLD snooping static groups or router ports configured on the specified VLAN. When no VLAN is specified, all the static groups or router ports are displayed.

Example

The following command displays the MLD snooping static groups configured on VLAN vlan101:

```
show mld snooping vlan101 static group
```

The following is sample output for this command:

```
Group                Port    Flags
ff03::1:1:1         7       sa
ff03::1:1:1         15      sa
Flags: (s) Static, (a) Active
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mld ssm-map

```
show mld ssm-map {v6groupnetmask} [{vr} vr_name]
```

Description

Displays the status of MLD-SSM mapping feature on a VR (if it is enabled or disabled), and displays the MLD-SSM mapping entries.

Syntax Description

| | |
|--------------------------|---|
| <i>v6groupnetmask</i> | Displays the specific group information. When <i>v6groupnetmask</i> is not specified, the SSM Mapping status and all SSM Mapping entries on the VR are displayed. |
| vr <i>vr_name</i> | Specifies the virtual router name. |

Default

N/A.

Usage Guidelines

Use this command to display the status of MLD-SSM mapping feature on a VR (if it is enabled or disabled), or to display the MLD-SSM mapping entries.

Example

The following command displays MLD SSM mapping on a VR :

```
# show mld ssm-map
MLD SSM mapping : Enabled
Group
-----
      Flags      Source
      -----
ff33::1/128
      d          2001:0DB8:1::3
      d          2001:0DB8:1::4
ff33::2/128
      -          2001:0DB8:1::5
      -          2001:0DB8:1::6

Flags : (d) Dynamic address obtained from DNS server
Total Entries : 6
```

When *v6groupnetmask* is specified, the SSM Mapping status and the SSM Mapping entries specific to the group range on the VR are displayed.

The following example displays a group containing only DNS name. “DNS” in parenthesis indicates the source is learned from the DNS server.

```
# show mld ssm-map ff33::1/128
MLD SSM mapping : Enabled

Group           : ff33::1/128
DNS Name        : abc
DNS Age         : 1512 seconds
Sources         : 2001:0DB8:1::3 (DNS)
                  2001:0DB8:1::4 (DNS)

Total Entries   : 4
```

The following example displays a group not configured with DNS name.

```
# show mld ssm-map ff32::1/128
MLD SSM mapping : Enabled
Group           : ff32::1/128
Sources         : 2001:0DB8:1::5
                  2001:0DB8:1::6

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls

```
show mpls
```

Description

Displays MPLS configuration information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The `show mpls` command displays the current values for all the MPLS configuration parameters that apply to the entire switch. The parameters displayed include:

- MPLS and MPLS protocol (RSVP-TE and LDP) status.
- [SNMP](#) traps configuration.
- EXP examination/replacement configuration.
- the MPLS LSR ID.
- the list of the VLANs which have been added to MPLS.

Example

The following command displays the MPLS configuration parameters for the switch:

```
# show mpls
MPLS System
MPLS System           : User VR (Green)
MPLS Admin Status     : Enabled
MPLS Oper Status      : Enabled
RSVP-TE Admin Status  : Enabled
RSVP-TE Oper Status   : Enabled
LDP Admin Status      : Enabled
LDP Oper Status       : Enabled
SNMP Traps            : Disabled
L2VPN SNMP Traps     : Enabled
EXP Examination       : Disabled
EXP Replacement       : Disabled
LSR ID                : 11.100.100.20
```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls bfd

```
show mpls bfd [{vlan} vlan_name | ip_addr]
```

Description

Displays [MPLS](#) BFD client information for a [VLAN](#) or interface.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies the VLAN for which to display MPLS BFD client information. |
| ip_addr | Specifies the IP address of an interface for which to display MPLS client information. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the MPLS BFD client information for all next-hop peers:

```
Switch.1 # show mpls bfd
Next Hop IP      Count  Flags  Admin  Oper  IfName
-----
192.84.86.2      13    ASIU   Up     Up    vlan1
192.84.93.12    13    ASIU   Up     Up    vlan2
Flags: A=Session added to BFD server, S=BFD Server synced,
I=Session Init complete, U=State Updates accepted
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls exp examination

```
show mpls exp examination
```

Description

Displays [MPLS](#) EXP value to [QoS](#) profile mappings and whether MPLS EXP examination is enabled or disabled.

Syntax Description

This command has no arguments or keywords.

Default

N/A.

Usage Guidelines

This command displays MPLS EXP value to QoS profile mappings and the status of MPLS EXP examination (enabled or disabled). These values are set using the `configure mpls exp examination qosprofile` command and can be reset using the `unconfigure mpls exp examination` command.

Example

The following is an example of the output of the `show mpls exp examination` command:

```
# show mpls exp examination
EXP --> QoS Profile mapping:
00 --> QP1
01 --> QP2
02 --> QP3
03 --> QP4
04 --> QP5
05 --> QP6
06 --> QP7
07 --> QP8
EXP Examination is disabled
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls exp replacement

```
show mpls exp replacement
```

Description

Displays the MPLS QoS profile to EXP value mappings and the status of MPLS EXP replacement (enabled or disabled).

Syntax Description

This command has no arguments or keywords.

Default

N/A.

Usage Guidelines

This command displays MPLS QoS profile to EXP value mappings and the status of MPLS EXP replacement (enabled or disabled). These values are set using the `configure mpls exp replacement qosprofile` command and can be reset using the `unconfigure mpls exp replacement` command.

Example

The following is an example of the output of the `show mpls exp replacement` command:

```
* BD-10K.28 # show mpls exp replacement
QoS Profile --> EXP mapping:
QP1 --> 00
QP2 --> 01
QP3 --> 02
QP4 --> 03
QP5 --> 04
QP6 --> 05
QP7 --> 06
QP8 --> 07
EXP Replacement is disabled
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls interface

```
show mpls interface {{vlan} vlan_name} {detail}
```

Description

Displays the *MPLS* interface information. Information is displayed in tabular format for all *VLANs* that have been added to MPLS.

Syntax Description

| | |
|------------------|---|
| vlan | Specifies to display information for one VLAN. |
| <i>vlan_name</i> | Specifies the name of the VLAN. |
| detail | Specifies to display additional status information about the interface. |

Default

N/A.

Usage Guidelines

Information displayed includes:

- a list of all VLANs added to MPLS.
- MTU size.
- Local interface IP address.
- Number of RSVP-TE neighbors.
- Number of LDP adjacencies.
- RSVP-TE and LDP uptimes.
- MPLS protocols and capabilities configured on each VLAN.

Specifying the optional detail keyword displays the information in verbose form and also includes the operational state for RSVP-TE and LDP. Specifying a VLAN limits the output to that of the individual VLAN.

Example

The following command display MPLS interface information:

```
Switch # show mpls interface
Local          RSVP-TE          LDP
VLAN Name      IP Address      MTU   UpTm #Nbr UpTm #Adj  Flags
-----
loopb          11.100.100.218 1500  3h   0   3h   0   MRL-I-U
toratora      192.84.86.1    1500  3h   0   3h   1   MRL-IBU
tordoze       192.84.93.1    1500  3h   0   3h   1   MRL-IbU
torfour       192.84.83.1    1500  --   0   --   0   MRL-I--
torinasp      192.84.85.1    1500  --   0   --   0   MRL-I--
Flags: (M) MPLS Enabled, (R) RSVP-TE Enabled, (L) LDP Enabled,
(P) PHP Enabled, (I) IP Forwarding Enabled, (B) BFD Enabled,
(b) BFD Disabled(Sessions Exist) (U) MPLS Operational
```

The following command displays detailed MPLS information for VLAN 1:

```
# show mpls interface vlan1 detail
VLAN Name : vlan1
Local IP Address      : 192.84.86.1
IP Forwarding         : Enabled
MPLS I/F MTU         : 1500
PHP Status            : Disabled
BFD Status            : Enabled
MPLS Admin Status     : Enabled
MPLS Oper Status      : Disabled
RSVP-TE Admin Status  : Enabled
Oper Status           : Disabled
UpTime                : 0d:0h:0m:0s
# Neighbors           : 0
LDP Admin Status      : Enabled
Oper Status           : Disabled
UpTime                : 0d:0h:0m:0s
# Link Adjacencies    : 0
```

History

This command was first available in ExtremeXOS 11.6.

The BFD flags and status were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls label

```
show mpls {rsvp-te | static} label {summary | label_num | [advertised | received] {label_num} | received implicit-null}
```

Description

Displays label information for all label types and protocols.

Syntax Description

| | |
|----------------------|---|
| rsvp-te | Specifies that only RSVP-TE LSP labels are displayed. |
| static | Specifies that only static LSP labels are displayed. |
| summary | Specifies that summary information for the labels is displayed. |
| <i>label_num</i> | Specifies that only labels that match the specified hexadecimal label number are displayed. |
| advertised | Specifies that only labels advertised to other routers are displayed. |
| received | Specifies that only labels received from other routers are displayed. |
| implicit-null | Specifies that only implicit-null labels are displayed. |

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all labels, except advertised implicit-null labels, is displayed. The following table describes the display fields that appear when this command is entered.

Table 34: show mpls label Field Definitions

| Field | Definition |
|---------------------|---|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |

Table 34: show mpls label Field Definitions (continued)

| Field | Definition |
|----------------|--|
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field. locl—Indicates that the tunnel destination is local to this switch. VLAN—The label on the packet is stripped and is IP routed according to the Destination Mapping field. VRF—For advertised labels, the Next Hop column contains the name of the virtual router to which packets with the given Layer 3 VPNlabel will be forwarded. For received labels, the Next Hop column displays the router ID of the <i>BGP</i> peer, and the Name column displays the name of the VR using this label. VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field. |
| Next Hop | Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address. |
| Name | Displays a VPLS or LSP name. |
| Received Label | Received Label displays the label received from other routers. |

**Note**

Unsupported labels will contain no information.

Example

The following command displays all labels except received implicit-null labels:

```
* Switch.1 # show mpls label
```

| Advertised Label | Destination Mapping | LSP Flags | Peer Label | NHop Type | NextHop | Name |
|------------------|---------------------|-----------|------------|-----------|-----------|-------------|

(M) Multiple Next Hops

```

| Summary of Labels | Advertised | Received |
|------------------------------------|------------|----------|
| Total number of RSVP-TE LSP labels | 2 | 2 |

History

This command was first available in ExtremeXOS 11.6.

This command was modified to display only RSVP-TE and static label information in ExtremeXOS 12.5. Additional commands were added to display LDP Layer 2 VPN and Layer 3 VPN labels.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls label l3vpn

```
show mpls label l3vpn {summary | label_num | [advertised | received]
                       {label_num}}
```

Description

Displays Layer 3 VPN label information.

Syntax Description

| | |
|-------------------|---|
| summary | Specifies that summary information for the labels is displayed. |
| <i>label_num</i> | Specifies that only labels that match the specified hexadecimal label number are displayed. |
| advertised | Specifies that only labels advertised to other routers are displayed. |
| received | Specifies that only labels received from other routers are displayed. |

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all Layer 3 VPN labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 35: show mpls label l3vpn Field Definitions

| Field | Definition |
|---------------------|---|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: VRF—For advertised labels, the Next Hop column contains the name of the virtual router to which packets with the given Layer 3 VPN label will be forwarded. For received labels, the Next Hop column displays the router ID of the <i>BGP</i> peer, and the Name column displays the name of the VR using this label. |
| Next Hop | Displays an interface ID for the next hop router, which can be a <i>VLAN</i> name, vMAN name, or IP address. |
| Name | Displays the name of the VR using this label. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays all Layer 3 VPN labels:

```
* Switch.1 # show mpls label l3vpn
```

| Advertised Label | Destination Mapping | LSP Flags | Peer Label | NHop Type | NextHop | Name |
|------------------|---------------------|-----------|------------|-----------|----------|------|
| 0x80400 | -- | 3-E | -- | VRF | blue-vr | -- |
| 0x80401 | -- | 3-E | -- | VRF | red-vr | -- |
| 0x80402 | -- | 3-E | -- | VRF | white-vr | -- |

| Received Label | Destination Mapping | LSP Flags | NextHop | Name |
|----------------|---------------------|-----------|---------|----------|
| 0x80400 | -- | 3-I | 3.3.3.3 | red-vr |
| 0x80400 | -- | 3-I | 3.3.3.3 | blue-vr |
| 0x80401 | -- | 3-I | 3.3.3.3 | red-vr |
| 0x80401 | -- | 3-I | 3.3.3.3 | blue-vr |
| 0x80402 | -- | 3-I | 3.3.3.3 | white-vr |

Flags: (3) L3VPN, (2) L2VPN, (L) LDP, (R) RSVP-TE, (S) Static, (P) LSP
 (T) Transit LSP, (I) Ingress to LSP, (E) Egress from LSP,
 (M) Multiple Next Hops

Total number of L3VPN Labels advertised : 3
 Total number of L3VPN Labels received : 5

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls label usage

```
show mpls label usage {static}
```

Description

Displays the label ranges on the current running system, including configurable and non-configurable ranges.

Syntax Description

| | |
|---------------|--|
| usage | Displays <i>MPLS</i> label ranges on the current running system, including configurable and non-configurable ranges. |
| static | Displays MPLS label usage of static labels. |

Default

N/A.

Usage Guidelines

With the addition of the static PW configuration, there is the need to configure static labels and display more detailed label information. This command displays the label ranges on the current running system, including configurable and non-configurable ranges. The output also includes hardware resource usage to provide better information about MPLS hardware utilization and capacity.

Example

The following command displays label ranges in-use, information about the static label usage, and some of the label hardware usage:

```
* show mpls lab usage
Label Type           Size      Label Range
-----
Supported            1048576   0x00000 - 0xfffff (0 - 1048575)
Reserved              16        0x00000 - 0x0000f (0 - 15)
Static                300       0x00010 - 0x0013b (16 - 315)
L3VPN                 255       0x0013c - 0x0023a (316 - 570)
Dynamic              7365     0x0023b - 0x01eff (571 - 7935)
Internal Use         256       0x01f00 - 0x01fff (7936 - 8191)

Static Label Configuration Usage
-----
                In-Use  Avail  Total  %Avail
-----
Total                24    276    300    92%
  Ingress LSP         2
  Egress LSP          0
  Transit LSP         2
  L2VPN               17
  CES                  3

Label Hardware Resource Usage
-----
                Incoming
Outgoing
-----
                In-Use  Avail  Total  %Avail  In-Use  Avail  Total %Avail
-----
Static Ingress LSP    -     -     -     -       2     0     0     0%
Static Transit LSP   0    278    300    92%     0     0     0     0%
Static Egress LSP    2    278    300    92%     -     -     -     -
Static L2VPN         17   278    300    92%     0     0     0     0%
RSVP-TE Ingress LSP -     -     -     -       5     0     0     0%
RSVP-TE Transit LSP 0    7342   7365   99%     0     0     0     0%
RSVP-TE Egress LSP  1    7342   7365   99%     -     -     -     -
LDP Ingress LSP     -     -     -     -       5     0     0     0%
LDP Transit LSP     5    7342   7365   99%     5     0     0     0%
LDP Egress LSP      1    7342   7365   99%     -     -     -     -
LDP L2VPN           14   7342   7365   99%    14     0     0     0%
L3VPN                0    255    255   100%    0     0     0     0%
```

Here is an example of the **static** option:

```
Summit1.2 # show mpls label usage static
Inbound Label      Name                Peer/Dest          Flags
-----
0x22 (34)          green01             11.100.100.241    2
0x23 (35)          green01             11.100.100.243    2

Flags: (2) L2VPN, (C) CES, (L) Static LSP

Static Label Range:      0x10 - 0x13b (16 - 315)
Static Label Statistics: 300 total, 22 in-use, 278 (92%) available

```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp

```
show mpls ldp
```

Description

Displays summary configuration and status information for LDP. Global status of LDP, LDP session timer configuration, loop detection, and label advertisement status are included in the display output.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the global status of LDP, LDP session timer configuration, loop detection, label advertisement, and LDP-enabled VLANs.

The following table describes the display fields that appear when this command is entered.

Table 36: show mpls ldp Field Definitions

| Field | Definition |
|---------------------------------|---|
| LDP Admin Status | LDP Admin Status shows whether LDP has been administratively Enabled or Disabled . |
| LDP Oper Status | LDP Oper Status shows whether LDP is operating (Enabled) or not (Disabled). |
| Protocol Version | Protocol Version specifies the LDP protocol version number. |
| Label Retention Mode | Label Retention Mode is either Conservative or Liberal , as described in RFC 3036, LDP Specification. The ExtremeXOS software only supports Liberal mode. In Liberal mode, a label switch router maintains all received label-to-FEC mapping advertisements. |
| Label Distribution Method | Label Distribution Method is either Downstream Unsolicited or Downstream On Demand , as described in RFC 3036, LDP Specification. The ExtremeXOS software only supports Downstream Unsolicited mode. In Downstream Unsolicited mode, a label switch router distributes label bindings to peer label switch routers without waiting for the bindings to be requested. |
| Label Distribution Control Mode | Label Distribution Control Mode is either Independent or Ordered , as described in RFC 3036, LDP Specification. The ExtremeXOS software only supports Ordered mode. In Ordered control mode, a label switch router only creates a binding of a label-to-FEC when it is the egress router or it has received a label binding for that FEC from the next hop router for that FEC. |
| LDP <i>BGP</i> LSPs | LDP BGP LSPs shows whether LDP uses BGP routes. When the displayed value is Enabled , LDP accepts BGP routes and stores them in the LDP internal routing table. When the displayed value is Disabled , LDP does not accept BGP routes, which reduces memory requirements when LSPs based on BGP routes are not desired. Note that when Disabled is displayed, no LDP LSPs are established to prefixes for which BGP is the preferred routing protocol. |
| LDP Loop Detection | LDP Loop Detection displays the LDP loop detection configuration. |
| LDP Targeted Timers | LDP Targeted Timers displays the LDP timer configuration used for LDP targeted adjacencies and sessions. |
| LDP Link Timers | LDP Link Timers displays the LDP timer configuration used for LDP link adjacencies and sessions. |

Example

The following command displays summary configuration and status information for LDP:

```
# show mpls ldp
LDP Admin Status           : Enabled
LDP Oper Status            : Enabled
```

```

Protocol Version           : v1*
Label Retention Mode      : Liberal*
Label Distribution Method  : Downstream Unsolicited*
Label Distribution Control Mode : Ordered*
LDP BGP LSPs              : Enabled

```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp interface

```
show mpls ldp interface {{vlan} vlan_name} {detail | counters}
```

Description

Displays LDP information about *MPLS* interfaces. Summary information is displayed in tabular format for all *VLANs* that are configured for MPLS.

Syntax Description

| | |
|------------------|---|
| vlan | Displays LDP interface information for one VLAN. |
| <i>vlan_name</i> | Specifies the name of the VLAN. |
| detail | Displays LDP interface information including LDP control packet counts. |
| counters | Displays only the LDP control protocol packet counts. |

Default

N/A.

Usage Guidelines

If the optional **detail** keyword is specified, the information is shown in verbose form and LDP control packet counts are displayed. If the optional **counters** keyword is specified, only the LDP control protocol packet counts are shown. The counters are described in RFC 3036, LDP Specification.

Example

The following command displays detailed LDP information for the interface associated with VLAN 1:

```
# show mpls ldp interface vlan1 detail
VLAN Name : vlan1
Local IP Address      : 11.121.96.20
MPLS Admin Status    : Enabled
MPLS Oper Status     : Enabled
LDP Admin Status     : Enabled
LDP Oper Status      : Enabled
LDP UpTime           : 0d:1h:59m:56s
Current Adjacencies  : 1
Negotiated Hello Hold Time : 15000 ms
Time to Send Next Hello : 4060 ms
Link Targeted
Counter              Adjacencies  Adjacencies
-----
Shutdown Notifications (Rcvd)      0           0
Shutdown Notifications (Sent)      0           0
Failed Session Attempts (NAKs)     0           0
Hello Errors                        0           0
Parameters Advertised Errors       0           0
Max PDU Length Errors              0           0
Label Range Errors                  0           0
Bad LDP ID Errors                   0           0
```

| | | |
|---------------------------|---|---|
| Bad PDU Length Errors | 0 | 0 |
| Bad Msg Length Errors | 0 | 0 |
| Bad TLV Length Errors | 0 | 0 |
| Bad TLV Value Errors | 0 | 0 |
| Keep-Alive Timeout Errors | 0 | 0 |

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp label

```
show mpls {ldp} label {lsp} {summary | label_num | [advertised |
received] {label_num} | received implicit-null}
```

Description

Displays LDP LSP label information.

Syntax Description

| | |
|----------------------|---|
| ldp | Specifies that only LDP labels are displayed. |
| summary | Specifies that summary information for the labels is displayed. |
| <i>label_num</i> | Specifies that only labels that match the specified hexadecimal label number are displayed. |
| advertised | Specifies that only labels advertised to other routers are displayed. |
| received | Specifies that only labels received from other routers are displayed. |
| implicit-null | Specifies that only implicit-null labels are displayed. |

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LDP labels, except advertised implicit-null labels, is displayed. The following table describes the display fields that appear when this command is entered.

Table 37: show mpls ldp label Field Definitions

| Field | Definition |
|---------------------|--|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field. vlan—The label on the packet is stripped and is IP routed according to the Destination Mapping field. locl—Indicates that the tunnel destination is local to this switch. |
| Next Hop | Displays an interface ID for the next hop router, which can be a <u>VLAN</u> name, VMAN name, or IP address. |
| Name | Displays an LSP name. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays all LDP labels except received implicit-null labels:

```
* Switch.1 # show mpls ldp label
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp label advertised

```
show mpls ldp label {lsp} advertised implicit-null {ipNetmask}
```

Description

Displays advertised LDP LSP implicit-null label information.

Syntax Description

| | |
|------------------------|-------------------------------|
| <code>ipNetmask</code> | Specifies an IP network mask. |
|------------------------|-------------------------------|

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LDP advertised implicit-null labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 38: show mpls ldp label Field Definitions

| Field | Definition |
|---------------------|--|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field. vlan—The label on the packet is stripped and is IP routed according to the Destination Mapping field. locl—Indicates that the tunnel destination is local to this switch. |
| Next Hop | Displays an interface ID for the next hop router, which can be a <u>VLAN</u> name, VMAN name, or IP address. |
| Name | Displays a VPLS or LSP name. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays all advertised LDP implicit-null labels:

```
* Switch.1 # show mpls ldp label advertised implicit-null
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp label l2vpn retained

```
show mpls ldp label l2vpn retained {ipaddress}
```

Description

Displays Layer 2 VPN liberally retained labels received from a peer.

Syntax Description

| | |
|------------------|--------------------------|
| <i>ipaddress</i> | Specifies an IP address. |
|------------------|--------------------------|

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all Layer 2 VPN liberally-retained labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 39: show mpls ldp label l2vpn retained Field Definitions

| Field | Definition |
|---------------------|--|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field. |
| Next Hop | Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address. |
| Name | Displays a VPLS name. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays liberally-retained Layer 2 VPN labels received from peers:

```
show mpls ldp label l2vpn retained
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp label l2vpn

```
show mpls {ldp} label l2vpn {summary | label_num | [advertised |
received] {label_num}}
```

Description

Displays LDP Layer 2 VPN label information.

Syntax Description

| | |
|-------------------|---|
| ldp | Specifies that only LDP labels are displayed. |
| summary | Specifies that summary information for the labels is displayed. |
| <i>label_num</i> | Specifies that only labels that match the specified hexadecimal label number are displayed. |
| advertised | Specifies that only labels advertised to other routers are displayed. |
| received | Specifies that only labels received from other routers are displayed. |

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LDP Layer 2 VPN labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 40: show mpls ldp label l2vpn Field Definitions

| Field | Definition |
|---------------------|---|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |

Table 40: show mpls ldp label l2vpn Field Definitions (continued)

| Field | Definition |
|----------------|--|
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field. |
| Next Hop | Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address. |
| Name | Displays a VPLS or LSP name. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays all Layer 2 VPN labels:

```
* Switch.1 # show mpls ldp label l2vpn
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp label lsp retained

```
show mpls ldp label lsp retained {ipNetmask}
```

Description

Displays LSP liberally retained labels received from a peer.

Syntax Description

| | |
|------------------|-------------------------------|
| <i>ipNetmask</i> | Specifies an IP network mask. |
|------------------|-------------------------------|

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LSP liberally-retained labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 41: show mpls ldp label lsp retained Field Definitions

| Field | Definition |
|---------------------|--|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field. vlan—The label on the packet is stripped and is IP routed according to the Destination Mapping field. locl—Indicates that the tunnel destination is local to this switch. |
| Next Hop | Displays an interface ID for the next hop router, which can be a <u>VLAN</u> name, VMAN name, or IP address. |
| Name | Displays an LSP name. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays liberally-retained LSP labels received from peers:

```
* Switch.1 # show mpls ldp label lsp retained lsp
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp label retained

```
show mpls ldp label retained [l2vpn {ipaddress} | lsp {ipNetmask}]
```

Description

Displays liberally-retained labels received from a peer for either the Layer 2 VPN protocol or LSP protocol.

Syntax Description

| | |
|------------------|-------------------------------|
| <i>ipaddress</i> | Specifies an IP address. |
| <i>ipNetmask</i> | Specifies an IP network mask. |

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all liberally-retained labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 42: show mpls label retained Field Definitions

| Field | Definition |
|---------------------|---|
| Advertised Label | Advertised Label is the label advertised to other routers. |
| Destination Mapping | Destination Mapping displays the destination IP address and mask. |
| LSP Flags | LSP Flags lists the flags for each label, which are described in the key at the bottom of the display. |
| Peer Label | The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs. |
| NHop Type | NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field. local—Indicates that the tunnel destination is local to this switch. VLAN—The label on the packet is stripped and is IP routed according to the Destination Mapping field. VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field. |
| Next Hop | Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address. |
| Name | Displays a VPLS or LSP name. |
| Received Label | Received Label displays the label received from other routers. |

Example

The following command displays liberally-retained LSP labels received from peers:

```
# show mpls ldp label retained lsp
Peer          Peer      Next
Prefix        LSR ID   Label    Hop      VLAN
-----
```

| | | | | |
|----------------|-------------|---------|------------|-------|
| 30.30.30.0/24 | 3.3.3.3 | 0x00435 | 30.30.30.2 | r1-r3 |
| 2.2.2.2/32 | 3.3.3.3 | 0x00439 | 30.30.30.2 | r1-r3 |
| 22.22.22.22/32 | 3.3.3.3 | 0x0043a | 30.30.30.2 | r1-r3 |
| 10.10.10.0/24 | 22.22.22.22 | 0x00434 | 10.10.10.2 | r1-r2 |
| 30.30.30.0/24 | 22.22.22.22 | 0x00438 | 10.10.10.2 | r1-r2 |
| 1.1.1.1/32 | 22.22.22.22 | 0x00439 | 10.10.10.2 | r1-r2 |
| 3.3.3.3/32 | 22.22.22.22 | 0x0043a | 10.10.10.2 | r1-r2 |

History

This command was first available in ExtremeXOS 12.5.

Peer LSR information added in ExtremeXOS 22.5.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp lsp

```
show mpls ldp lsp {prefix ipNetmask} {ingress | egress | transit} {detail}
```

Description

Displays the LSP information associated with LDP that is used to forward packets within the [MPLS](#) network. If no options are specified, summary information for all LSPs is displayed.

Syntax Description

| | |
|------------------|---|
| prefix | Displays information for a single FEC that matches the prefix. |
| <i>ipNetmask</i> | Designates the FEC for which to display information. |
| ingress | Displays information for LSPs that originate from the switch into the MPLS network. |
| egress | Displays information for LSPs that terminate at the switch from the MPLS network. |
| transit | Displays information for LSPs that traverse the switch. |
| detail | Display detailed LSP information. |

Default

N/A.

Usage Guidelines

If no options are specified, this command displays summary information for all LSPs.

Optionally, the LSPs displayed can be further qualified by the keywords **ingress**, **egress**, and **transit**. These keywords qualify the LSPs displayed from the perspective of the switch. Ingress LSPs originate from the switch into the MPLS network. Egress LSPs terminate at the switch from the MPLS network. Transit LSPs traverse the switch. If the optional **prefix** keyword is specified, only the LSP information associated with the FEC that matches the prefix is displayed.

If the **detail** keyword is specified, information is displayed in verbose form and includes received packet and byte counts.

Example

The following command displays LDP information for an ingress LSP:

```
# show mpls ldp lsp 11.100.100.59/32 ingress detail
FEC IP/Prefix: 11.100.100.59/32
Next Hop I/F      : m5vlan1
Next Hop Addr    : 12.224.0.55
Advertised Label : n/a                Received Label : 0x80403 (525315)
Rx Packets       : n/a                Tx Packets    : 61
Rx Bytes        : n/a                Tx Bytes     : 4294967296
```

The following command displays LDP information for a transit LSP:

```
# show mpls ldp lsp 11.100.100.55/32 transit detail
FEC IP/Prefix: 11.100.100.55/32
Next Hop I/F      : m5vlan1
Next Hop Addr    : 12.224.0.55
Advertised Label : 0x11 (17)         Received Label : 0x80403 (525315)
Rx Packets       : 61                Tx Packets    : 61
Rx Bytes        : 4294967296        Tx Bytes     : 4294967296
```

The following command displays LDP information for an egress LSP:

```
# show mpls ldp lsp 11.100.100.30/32 egress detail
FEC IP/Prefix: 11.100.100.30/32
Direct VLAN      : loop

Rx Bytes        : 4294967296        Tx Bytes     : n/a
```

History

This command was first available in ExtremeXOS 11.6.

The output for this command was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls ldp peer

```
show mpls ldp peer {ipaddress} {detail}
```

Description

Displays information about the status of the LDP sessions and hello adjacencies for all LDP peers.

Syntax Description

| | |
|------------------|---|
| <i>ipaddress</i> | Display session and hello adjacency information for a single LDP peer. |
| detail | Display additional detailed information related to the session and adjacencies. |

Default

N/A.

Usage Guidelines

Specifying the LDP peer's *ipaddress* displays session and hello adjacency information for a single LDP peer. When the *detail* keyword is specified, additional detailed information related to the session and adjacencies is displayed.

[Table 34](#) on page 2923 describes the display fields that appear when this command is entered.

Table 43: show mpls ldp peer Field Definitions

| Field | Definition |
|------------------------|---|
| IP Address | Local IP address, which is used as the LSR-ID. |
| LDP Peer | LDP identifier of LDP peer. |
| State | Displays the state of the Initialization State Machine as described in RFC 3036, LDP Specification. The states are: NonExistent, Initialized, OpenRec, OpenSent, and Operational. |
| Uptime | Displays the total time the session has been operational. |
| Adjacencies | Displays the number of active adjacencies with the LDP peer. |
| Index | The Entity Index used in the LDP Entity Table MIB. |
| Targeted Peer | The IP address of the peer used in Extended Discovery. If this is not a targeted peer (Basic Discovery was used), this field displays Not Targeted. |
| Attempted Sessions | This and other counters are described in RFC 3036, LDP Specification. |
| Shutdown Notifications | This and other counters are described in RFC 3036, LDP Specification. |
| Peer | IP address of peer. |
| Peer Label Space | The label space as given by the peer and derived from the LDP Identifier. A zero value represents the global or per-platform label space. A non-zero value represents a per interface label space. |

Table 43: show mpls ldp peer Field Definitions (continued)

| Field | Definition |
|---------------------------|---|
| Session State | Displays the state of the Initialization State Machine as described in RFC 3036, LDP Specification. The states are: NonExistent, Initialized, OpenRec, OpenSent, and Operational. |
| Session Uptime | Displays the total time the session has been operational. |
| Discontinuity Time | The system uptime for the most recent period after which one or more of the session's counters suffered a discontinuity. |
| Keep Alive Hold Timer | Displays the configured keep alive hold timer value and the remaining hold time. |
| Label Distribution Method | Label Distribution Method is either DU (Downstream Unsolicited) or DOD (Downstream On Demand), as described in RFC 3036, LDP Specification. |
| Max PDU Length | The maximum allowable length for LDP PDUs (Protocol Data Units) for this session. |
| Unknown Msg Type Errors | The number of messages received for this session without a recognized message type and without the ignore bit set. |
| Unknown TLV Errors | The number of TLVs received for this session without a recognized TLV type and without the ignore bit set. |
| Next Hop Addr(s) | A list of next hop addresses received from the peer through LDP address messages. |

Example

The following command displays *MPLS* LDP session information for the LDP entity 11.100.100.30:

```

Mariner3.59 # show mpls ldp peer
IP Address      LDP Peer          State      Uptime          Adjacencies
11.100.100.30   11.100.100.55:0   Operational 0d:14h:51m:53s  1
11.100.100.30   14.4.0.99:15      Operational 0d:1h:0m:43s    1
11.100.100.30   14.4.0.99:16      Operational 0d:0h:34m:51s   1
Adjacencies:
Index           : 1                Attempted Sessions : 1

```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te bandwidth

```
show mpls rsvp-te bandwidth {{vlan} vlan_name} {{detail}}
```

Description

Displays the reserved bandwidth for each TE LSP by interface.

Syntax Description

| | |
|------------------|---|
| <i>vlan_name</i> | Displays the reserved bandwidth for each TE LSP associated with the specified <i>VLAN</i> . |
| detail | Displays the path information in verbose format. |

Default

All TE LSPs for all RSVP-TE-enabled interfaces are shown.

Usage Guidelines

This command displays the reserved bandwidth for each TE LSP by interface. By default, all TE LSPs for all RSVP-TE enabled interfaces are shown.

Note

Beginning with ExtremeXOS Release 12.2.1, the receive bandwidth can only be used for tracking. If the configured receive bandwidth is exceeded, the available bandwidth shown might be negative. In this case, “Ovr” is displayed to indicate that the link is oversubscribed in the receive direction. The **detail** option can be used to show the actual LSPs using this bandwidth.

The optional **vlan** keyword limits the display to only those LSPs that have bandwidth reservations against the specified VLAN. Only committed-rate bandwidth is displayed. Bandwidth is displayed as either received or transmitted bandwidth with respect to the switch.

LSPs are listed using the configured or signaled LSP name. If the LSP name was not included in the setup control messages (which can only occur when using OEM vendor equipment), the LSP is uniquely identified using a concatenated string that includes the tunnel ID and source IP address. Per VLAN, each LSP is listed in descending priority order. That is, the LSPs listed at the top of each VLAN have the highest bandwidth priority and are less likely to be preempted. Bandwidth priority is determined by the signaled hold-priority and the uptime. The TE LSP with a hold-priority of zero and the highest uptime has the highest bandwidth priority and the TE LSP with a hold-priority of seven and the lowest uptime has the lowest bandwidth priority.

Use the **detail** keyword to display detailed information.

Example

The following command displays bandwidth reservation information for the specified VLAN:

```
show mpls rsvp-te bandwidth vlan vlan_1 detail
# show mpls rsvp-te bandwidth vlan_1 detail
Vlan      Dir Pool      CIR (per priority level)
LSP       0      1      2      3      4      5      6      7
-----
vlan_1    Rx    300
vlalsp1   -     -     10    -     -     -     -     -
-----
Available 300   300   290   290   290   290   290   290
Tx        500
```

```

vlalosp2      -      -      9      -      -      -      -      -
-----
Available    500    500    491    491    491    491    491    491
(Rx)Receive  Bandwidth  (Tx)Transmit Bandwidth

```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te interface

```
show mpls rsvp-te interface {{vlan} vlan_name} {detail | counters}
```

Description

Displays RSVP-TE information about [MPLS](#) interfaces.

Syntax Description

| | |
|------------------|--|
| vlan | Display information for one VLAN . |
| <i>vlan_name</i> | Specifies the name of the VLAN. |
| detail | Display RSVP-TE information including the interface up time and LDP control packet counts. |
| counters | Display only the RSVP-TE control protocol packet counts. |

Default

N/A.

Usage Guidelines

This command displays RSVP-TE information about MPLS interfaces. Summary information is displayed in tabular format for all VLANs that are configured for MPLS. The following information is displayed:

- VLAN name.
- Bandwidth reserved.
- TE metric.
- Hello interval time.
- Refresh interval time.
- Summary refresh time.
- Bundle message time.
- Uptime.

- Number of neighbors.
- RSVP-TE state information

When the optional **detail** keyword is specified, additional RSVP-TE information is displayed. This additional information includes:

- RSVP-TE hello keep multiplier.
- RSVP-TE refresh keep multiplier.
- RSVP-TE available bandwidth per priority level.
- RSVP-TE control protocol packet counts.

When the optional **counters** keyword is specified, only the RSVP-TE control protocol packet counts are shown.

Example

The following command displays detailed RSVP-TE information for the interfaces associated with VLAN 1:

```
# show mpls rsvp-te interface vlan1 det
VLAN Name : vlan1
Local IP Address      : 11.121.96.20
MPLS Admin Status    : Enabled
MPLS Oper Status     : Enabled
RSVP-TE Admin Status : Enabled
RSVP-TE Oper Status  : Enabled
RSVP-TE Up-Time      : 0d:1h:19m:46s
# Neighbors          : 1
Receive CIR          : 50000 Kbps
Transmit CIR         : 50000 Kbps
TE Metric            : Use IGP Cost/Metric
Hello Interval       : 3 seconds
Refresh Time         : 30 seconds
Hello Keep Multiplier : 3
Refresh Keep Multiplier : 3
Summary Refresh      : Disabled
Summary Refresh Time : 3000 milliseconds
Bundle Message       : Disabled
Bundle Message Time  : 1000 milliseconds
-----

RESV_TEAR                             0         2
RESV_ERR                              0         0
RESV_CONFIRM                          4         1
SUMMARY_REFRESH                       0         0
BUNDLE                                0         0
HELLO                                 42        30
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te lsp

```
show mpls rsvp-te lsp {[destination | origin] ipaddress} {fast-reroute}
  {detail} | summary}
```

Description

Displays complete or filtered information for all RSVP-TE LSPs.

Syntax Description

| | |
|---------------------|---|
| destination | Displays only those LSPs that terminate at the specified IP address. |
| origin | Displays only those LSPs that originate at the specified IP address. |
| <i>ipaddress</i> | Specifies an IP address for an LSP origin or destination. |
| fast-reroute | Limits the display to only those LSPs with fast reroute protection. |
| detail | Displays the LSP information in verbose format. |
| summary | Displays only the LSP summary statistics section of the normal display. |

Default

N/A.

Usage Guidelines

If no options are specified, information for all RSVP-TE LSPs is displayed.

You can limit the display to ingress, transit, or egress LSPs with the following commands:

```
show mpls rsvp-te lsp [ingress {fast-reroute} | ingress_lsp_name |
ingressingress_lsp_name | ingress [destination | origin]ipaddress]
{[all-paths | detail] | summary | down-paths {detail}} show mpls rsvp-te
lsp [egress | transit] {fast-reroute} {[lsp_name]} {[destination |
origin] ipaddress} {detail} | summary}
```

When label recording is enabled for an LSP, labels are displayed only for the ingress node (the egress label from the previous node always matches the ingress node label).

Example

The following command example displays information about all RSVP-TE LSPs:

```
# show mpls rsvp-te lsp
Ingress LSP Name Path Name      Destination      Next Hop I/F      UpTm  Flags
-----
frrlspltom2      any              11.100.100.50   m2vlan1           5m    UEF---IV
lsptom2          pathtom2        11.100.100.50   m2vlan1           5m    UES--OIV
tom5             any              11.100.100.55   m5vlan1           5m    UEP---IV

```

History

This command was first available in ExtremeXOS 11.6.

This command and its output were modified, and the summary option was added in ExtremeXOS 12.0.

The fast-reroute feature was first available in ExtremeXOS 12.1.

This command and its output were modified in ExtremeXOS 12.2.2.

The output was modified to include the include/exclude information in ExtremeXOS 15.7.1.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te lsp [egress | transit]

```
show mpls rsvp-te lsp [egress | transit] {fast-reroute} {{lsp_name}
  { [destination | origin] ipaddress } {detail} | summary}
```

Description

Displays complete or filtered information for one or all egress or transit RSVP-TE LSPs.

Syntax Description

| | |
|---------------------|--|
| egress | Limits the display to only the LSPs that terminate at this switch. |
| transit | Limits the display to only the LSPs that transit this switch. |
| fast-reroute | Limits the display to only those LSPs with fast reroute protection. |
| <i>lsp_name</i> | When either the transit or the egress option is specified, this variable specifies a name for a single LSP for which information is displayed. |
| destination | Displays only those LSPs that terminate at the specified IP address. |
| origin | Displays only those LSPs that originate at the specified IP address. |
| <i>ipaddress</i> | Specifies an IP address for an LSP origin or destination. |
| detail | Displays the LSP information in verbose format. |
| summary | Displays only the LSP summary statistics section of the normal display. |

Default

N/A.

Usage Guidelines

You can limit the display to ingress LSPs with the following command:

```
show mpls rsvp-te lsp [ingress {fast-reroute} | ingress_lsp_name |
ingress ingress_lsp_name | ingress [destination | origin] ipaddress]
{[all-paths | detail] | summary | down-paths {detail}}
```

You can display information for all LSPs with the following command:

```
show mpls rsvp-te lsp {[destination | origin] ipaddress} {fast-reroute}
{detail} | summary
```

When label recording is enabled for an LSP, labels are displayed only for the ingress node (the egress label from the previous node always matches the ingress node label).

Example

The following command example displays RSVP-TE LSPs that terminate at this switch and at IP address 11.100.100.30:

```
# show mpls rsvp-te lsp egress destination 11.100.100.30
Egress LSP Name  Source IP      Destination    Prev Hop I/F    UpTm
-----
tom3             11.100.100.55  11.100.100.30  m5vlan1      5m
frrlsp1tom3     11.100.100.50  11.100.100.30  m2vlan1      5m
tom3            11.100.100.50  11.100.100.30  m2vlan1      5m
Summary of Egress RSVP-TE LSPs to destination 11.100.100.30
Egress LSPs                : 3
Egress Protected LSPs     : 0
```

History

This command was first available in ExtremeXOS 11.6.

This command and its output were modified, and the summary option was added in ExtremeXOS 12.0.

The fast-reroute feature was first available in ExtremeXOS 12.1.

This command and its output were modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te lsp ingress

```
show mpls rsvp-te lsp [ingress {fast-reroute} | ingress_lsp_name |
ingress ingress_lsp_name | ingress [destination | origin] ipaddress]
{[all-paths | detail] | summary | down-paths {detail}}
```

Description

Displays information for the specified ingress RSVP-TE LSP.

Syntax Description

| | |
|-------------------------|--|
| fast-reroute | Limits the display to only those LSPs with fast reroute protection. |
| <i>ingress_lsp_name</i> | Identifies the ingress LSP for which you want to display information. |
| destination | Displays only those LSPs that terminate at the specified IP address. |
| origin | Displays only those LSPs that originate at the specified IP address. |
| <i>ipaddress</i> | Specifies an IP address for an LSP origin or destination. |
| all-paths | Specifies that the display include all redundant paths. |
| detail | Displays the LSP information in verbose format. |
| summary | Displays only the LSP summary statistics section of the normal display. |
| down-paths | Specifies that the display include only those paths that are operationally down. |

Default

N/A.

Usage Guidelines

You can limit the display to egress or transit LSPs with the following command:

```
show mpls rsvp-te lsp [egress | transit] {fast-reroute} {{lsp_name}
[destination | origin]ipaddress} {detail} | summary}
```

You can display information for all LSPs with the following command:

```
show mpls rsvp-te lsp {[destination | origin] ipaddress} {fast-reroute}
{detail} | summary}
```

When label recording is enabled for an LSP, labels are displayed only for the ingress node (the egress label from the previous node always matches the ingress node label).

Example

Use the following command to display information about a specific LSP:

```
# show mpls rsvp-te lsp jefflsp1
Ingress LSP Name Path Name      Destination      Next Hop I/F      UpTm  Flags
-----
jefflsp1      jeffpath1      11.100.100.204  n/a                0  --PR--IV
Flags: (U) Up, (E) Enabled, (P) Primary LSP, (S) Secondary LSP,
(F) FRR Primary LSP (R) Redundant Paths, (B) Bandwidth Requested,
(O) ERO Specified, (I) IP Traffic Allowed, (V) VPN Traffic Allowed,
(v) VPN Assigned Traffic Allowed
Summary of Ingress RSVP-TE LSPs named jefflsp1
Ingress LSPs (Enabled/Disabled)      : 1 (0/1)
```

```
Ingress LSPs with no configured path : 0
Ingress LSP Paths (Up/Down)         : 2 (0/2)
```

Use the following command to display detailed information about a specific ingress LSP:

```
# show mpls rsvp-te lsp ingress "lsp598" detail
Ingress LSP Name: lsp598
Destination   : 11.100.100.8           Admin Status : Enabled
IP Traffic    : Allow                  #VPLS Cfgd   : 0
VPN Traffic   : Allow                  #VPLS In-Use : 0
Path Name: path598
Profile Name  : prof598
Tunnel ID    : 1                      Ext Tunnel ID : 11.100.100.20
LSP ID       : 0                      State Changes  : 5
Oper Status  : Enabled                 Bandwidth Cfgd : False
LSP Type     : Primary
Activity     : Active
Failures     : 2                      Retries-since last failure : 0
Retries-Total : 12
Rcv Label    : 0x0052e                UpTime       : 0d:0h:3m:44s
Next Hop     : 11.121.96.5
Tx I/F       : 11.121.96.20 - vlan1
Record Route : Indx  IP Address
: 1 11.121.96.5
: 2 11.95.96.9
: 3 11.98.96.8
```

Use the following command to display detailed information about all paths for an LSP:

```
# show mpls rsvp-te lsp jefflsp1 all-paths
Ingress LSP Name Path Name      Destination      Transmit I/F      UpTm  Flags
-----
jefflsp1         jeffpath0       11.100.100.204  n/a              0 --SR--IV
jefflsp1         jeffpath1       11.100.100.204  n/a              0 --PR--IV
Flags: (U) Up, (E) Enabled, (P) Primary LSP, (S) Secondary LSP,
(F) FRR Primary LSP (R) Redundant Paths, (B) Bandwidth Requested,
(O) ERO Specified, (I) IP Traffic Allowed, (V) VPN Traffic Allowed,
(v) VPN Assigned Traffic Allowed
Summary of Ingress RSVP-TE LSPs named jefflsp1
Ingress LSPs (Enabled/Disabled) : 1 (0/1)
Ingress LSPs with no configured path : 0
Ingress LSP Paths (Up/Down)    : 2 (0/2)
```

Use the following command to display information about all ingress down paths:

```
# show mpls rsvp-te lsp ingress down-paths
Ingress LSP Name Path Name      Destination      Transmit I/F      UpTm  Flags
-----
jefflsp1         jeffpath0       11.100.100.204  n/a              0 --SR--IV
jefflsp1         jeffpath1       11.100.100.204  n/a              0 --PR--IV
jefflsp2         jeffpath2       11.100.100.203  n/a              0 -EPR--OIV
Flags: (U) Up, (E) Enabled, (P) Primary LSP, (S) Secondary LSP,
(F) FRR Primary LSP (R) Redundant Paths, (B) Bandwidth Requested,
(O) ERO Specified, (I) IP Traffic Allowed, (V) VPN Traffic Allowed,
(v) VPN Assigned Traffic Allowed
Summary of Ingress RSVP-TE LSPs
Ingress LSP Paths that are Down : 3
```

History

This command was first available in ExtremeXOS 11.6.

This command and its output were modified, and the summary option was added in ExtremeXOS 12.0.

The command output was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te neighbor

```
show mpls rsvp-te neighbor {{vlan} vlan_name | ipaddress} {detail}
```

Description

Displays all recognized RSVP-TE neighbors.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Displays only the neighbors for the specified VLAN . |
| <i>ipaddress</i> | Displays only the neighbor with the specified ipaddress. |

Default

N/A.

Usage Guidelines

This command displays all recognized RSVP-TE neighbors. The IP address of each neighbor is displayed along with the VLAN name for the [MPLS](#) interface. For each neighbor, the following information is displayed:

- Number of RSVP-TE LSPs.
- Number of hello periods that have elapsed without receiving a valid hello.
- Remaining time before next hello is sent.
- Remaining time before next bundle message is sent.
- Neighbor up time.
- Neighbor supports RSVP hello.
- RSVP hello state.
- Neighbor supports refresh reduction.

If *vlan_name* is specified, only neighbors for the matching VLAN are shown. If *ipaddress* is specified, only the neighbor with that IP address is shown. If the **detail** keyword is specified, the information is shown in a verbose manner.

Example

The following command displays all recognized RSVP-TE neighbors:

```
# show mpls rsvp-te neighbor
NeighborIP      VLAN Name      #LSPs #Miss  NxtHello  NxtBundl  Flag  UpTm
-----
11.121.96.5     vlan1          2      0      2870      0  UTH-  15m
11.122.96.8     vlan2          2      0      1770      0  UTH-  15m
Flags: (U) Hello Session Up, (T) Two Way Hello, (H) Neighbor Supports Hello,
(R) Neighbor Supports Refresh Reduction
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te path

```
show mpls rsvp-te path {path_name} {detail}
```

Description

Displays the configuration and usage information for *MPLS* RSVP-TE routed paths.

Syntax Description

| | |
|------------------|---|
| <i>path_name</i> | Displays configuration and usage information for the specified MPLS RSVP-TE path. |
| detail | Displays the path information in verbose format. |

Default

N/A.

Usage Guidelines

This command displays the configuration and usage information for MPLS RSVP-TE paths. Information is listed in tabular format and includes:

- Path name.
- Number of configured ERO objects.
- Number of LSPs configured to use this path.
- List of EROs and their type.
- Whether the hop is included in the path calculation.

Specifying the optional **detail** keyword displays the path information in verbose format. If **detail** is specified, all LSPs that are configured to use the path are also displayed.

Example

The following example displays configuration and status information for the MPLS RSVP-TE paths:

```
# show mpls rs path
Path Name      #LSP #ERO Ord#  ERO IP Netmask      Type  Inc/Exc
-----
path1          1    1   100 9.50.1.2/32      strict include
path2          1    1   100 9.50.1.2/32      n/a   exclude
```

The following example displays configuration and status information for the MPLS RSVP-TE paths in the verbose format:

```
# show mpls rs path det

Path Name : path1
Hop List Index      : 1
Path Option Index   : 1
#ERO/Hops           : 1
#LSP References     : 1
ERO                 : Order#  IPAddress/Mask      Type  Inc/Exc
                   : -----
                   :      100 9.50.1.2/32      strict include

Path Name : path2
Hop List Index      : 2
Path Option Index   : 1
#ERO/Hops           : 1
#LSP References     : 1
ERO                 : Order#  IPAddress/Mask      Type  Inc/Exc
                   : -----
                   :      100 9.50.1.2/32      n/a   exclude
```

History

This command was first available in ExtremeXOS 11.6.

The output was modified to include the include/exclude information in ExtremeXOS 15.7.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te profile

```
show mpls rsvp-te profile {profile_name} {detail}
```

Description

Displays the configuration for the specified profile.

Syntax Description

| | |
|---------------------|---|
| <i>profile_name</i> | Displays configuration and usage information for the specified profile, which can be either a standard or a fast-reroute profile. |
| detail | Displays the profile information in verbose format, and displays all LSPs that are configured to use the specified profile. |

Default

N/A.

Usage Guidelines

If the *profile_name* argument is omitted, the profile parameter values for all profiles are displayed.

Example

The following command displays configuration information for all defined profiles:

```
# show mpls rsvp-te profile
Profile Name      Peak      Committed  Max Burst SPri HPri RRO MTU  #LSP
-----
default          0         0          0      7   0 Off i/f  0
prof598          0         0          0      7   0 On  1500  1
FRR Profile Name Mode   Bandwidth SPri HPri HopLmt P-BW P-Node #LSP
-----
Prfl_frr        Detour    0      7    0      3 Ena  Ena    2
```

The following command displays configuration information for a specific fast-reroute profile:

```
# show mpls rsvp-te profile prfl_frr detail
Profile Name : prfl_frr
Profile type  : Fast Reroute / Standard
Peak Rate    : 0 Kbps
Committed Rate : 0 Kbps
Max Burst Size : 0 Kb
Setup Priority : 7
Hold Priority : 4
Hop Limit    : 1
Protected BW : Disabled
Protect Node : Enabled
#LSP References : 2
LSP / Path   : pc10_lsp / p1
```

History

This command was first available in ExtremeXOS 11.6.

The fast-reroute feature was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te profile fast-reroute

```
show mpls rsvp-te profile fast-reroute {detail}
```

Description

Displays the configuration for all fast-reroute profiles.

Syntax Description

| | |
|---------------|---|
| detail | Displays the profile information in verbose format. |
|---------------|---|

Default

N/A.

Usage Guidelines

None.

Example

The following command displays summary configuration information for all fast-reroute profiles:

```
# show mpls rsvp-te profile fast-reroute
FRR Profile Name Mode   Bandwidth SPri HPri HopLmt P-BW P-Node #LSP
-----
default_frr      Detour      10    7    0    3 Dis  Ena    4
prfl_frr         Detour      0     7    0    3 Dis  Ena    2
```

The following command displays detailed configuration information for all fast-reroute profiles:

```
# show mpls rsvp-te profile fast-reroute detail
Profile Name : prfl_frr
Peak Rate    : 0 Kbps
Committed Rate : 0 Kbps
Max Burst Size : 0 Kb
Setup Priority : 7
Hold Priority : 4
Hop Limit    : 1
Protected BW : Off
Protect Node : On
#LSP References : 2
LSP / Path   : pc10_lsp / p1
Profile Name : default_frr
Peak Rate    : 0 Kbps
Committed Rate : 0 Kbps
Max Burst Size : 0 Kb
```

```
Setup Priority      : 4
Hold Priority       : 0
Hop Limit          : 2
Protected BW       : On
Protect Node       : On
#LSP References    : 4
LSP / Path         : pc_frr_lsp / p2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls rsvp-te

```
show mpls rsvp-te
```

Description

Displays displays summary configuration and status information for RSVP-TE.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays summary configuration and status information for RSVP-TE. The parameters displayed include:

- Global status of RSVP-TE.
- Configured standard LSP timer values.
- Configured rapid-retry LSP timer values.
- RSVP-TE VLANs.

Example

The following command shows the summary configuration and status information for RSVP-TE:

```
# show mpls rsvp-te
RSVP-TE Admin Status : Enabled
RSVP-TE Oper Status  : Enabled
```

```

LSP Standard-Retry Timers
Delay-Interval   : 30 seconds
Decay-Rate      : 50 %
Retry-Limit     : unlimited
LSP Rapid-Retry Timers
Delay-Interval   : 500 milliseconds
Decay-Rate      : 50 %
Retry-Limit     : 10
RSVP-TE VLANs  : vlan1
                 : vlan2
                 : vlan3

```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls static lsp

```
show mpls static lsp {summary | {lsp_name} {detail}}
```

Description

Displays the configuration of one or all static LSPs.

Syntax Description

| | |
|-----------------|--|
| summary | Displays only static LSP summary information. |
| <i>lsp_name</i> | Identifies the LSP to be displayed. |
| detail | Displays additional information about the static LSPs, including packet and byte counts. |

Default

N/A.

Usage Guidelines

If no command options are specified, all defined static LSPs are displayed in tabular format. The information displayed includes the configured ingress label, egress label, next-hop router IP address, and the [MPLS](#) interface status for the egress path. The summarized list of static LSPs is displayed in alphabetical order based on the LSP name.

Example

The following command displays detailed information about an ingress static LSP:

```
show mpls static lsp statlsp1 detail
Static LSP Name : statlsp1           LSP Type      : Ingress-Lsp
Destination    : 11.100.100.55      Next Hop Addr : 12.220.0.30
Ingress I/F   : **None**           Egress I/F    : m3vlan1
Admin Status  : Disabled            Oper Status   : Disabled
Ing-Label     : **None**           Eg-Label      : 0x7FF00
IP Traffic    : Allow               VPN Traffic   : Allow
Rx Packets    : n/a                 Tx Packets    : 0
Rx Bytes      : n/a                 Tx Bytes      : 0
```

The following command displays detailed information about a transit static LSP:

```
show mpls static lsp statlsp1 detail
Static LSP Name : statlsp1           LSP Type      : Transit-Lsp
Destination    : 11.100.100.55      Next Hop Addr : 12.224.0.55
Ingress I/F   : m2vlan1            Egress I/F    : m5vlan1
Admin Status  : Disabled            Oper Status   : Disabled
Ing-Label     : 0x7FF00            Eg-Label      : 0x80300
IP Traffic    : Not Applicable      VPN Traffic   : Not Applicable
Rx Packets    : 0                   Tx Packets    : 0
Rx Bytes      : 0                   Tx Bytes      : 0
```

The following command displays detailed information about an egress static LSP:

```
show mpls static lsp statlsp1 detail
Static LSP Name : statlsp1           LSP Type      : Egress-Lsp
Destination    : 11.100.100.55      Next Hop Addr : **None**
Ingress I/F   : m3vlan1            Egress I/F    : **None**
Admin Status  : Disabled            Oper Status   : Disabled
Ing-Label     : 0x80300            Eg-Label      : **None**
IP Traffic    : Not Applicable      VPN Traffic   : Not Applicable

Rx Bytes      : 0                   Tx Bytes      : n/a
```

History

This command was first available in ExtremeXOS 12.1.

The output for this command was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mpls statistics l2vpn

```
show mpls statistics l2vpn {vpls_name | vpws_name } {detail}
```

Description

Displays *MPLS* statistics for one or all Layer 2 VPNs.

Syntax Description

| | |
|------------------|---|
| <i>vpls_name</i> | Specifies VPLS for which to display statistics. |
| <i>vpws_name</i> | Specifies VPWS for which to display statistics. |
| detail | Displays additional information about the Layer 2 VPNs. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays statistics for all Layer 2 VPNs:

```
Switch.1 # show mpls statistics l2vpn
VPN ID      Peer IP          RxPackets      RxBytes      TxPackets      TxBytes
-----
99          11.100.100.219  32866         4967734     14005         2394407
11.100.100.218  398            8235         577         10583
2009        11.100.100.219  0             0           0             0
2008        11.100.100.219  0             0           15           688
```

The following command displays detailed statistics for all Layer 2 VPNs:

```
Switch.2 # (debug) 12.2 # show mpls statistics l2vpn detail
VPNID (L2VPN Name)
Peer IP      State RxLabel TxLabel LSPTxLabel NextHopI/F
RxPackets   RxBytes TxPackets TxBytes
-----
99 (jwcvpls)
11.100.100.219 Up    x80402 x80402 x00010 tordoze
32866      4967734 14005 2394407
11.100.100.218 Up    x80407 x80405 x00011 tornext
398        8235    577    10583
2009 (pws-1)
11.100.100.219 Up    x80403 x80403 x00010 tordoze
0          0       0       0
2008 (pws-2)

0          0       15     688
```

The following show output is for ExtremeXOS 15.4:

```
L2VPN Name
Peer IP/LSP  Flags      RxPackets  RxBytes    TxPackets  TxBytes
-----
vpls1
```

```

1.1.1.1      U          0          0          0          0
  lsp1       +
  lsp2       +

```

Flags: (U) Up, (D) Down, (R) Ready, (S) Signaling, (+) In-use,
(-) Not In-use

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mrp ports

```
show mrp ports {port_list}
```

Description

Shows the MRP timers configured on the given list of ports on the switch.

Syntax Description

| | |
|------------------|---|
| mrp | Multiple Registration Protocol. |
| <i>port_list</i> | Ports on which MRP timers are configured or unconfigured. |

Default

N/A.

Usage Guidelines

Use this command to view MRP timers configured on the given list of ports on the switch.

Example

```

# show mrp ports 1, 4, 5
-----
Ports      Join Time (ms)      Leave Time (ms)      Leave All Time
(ms)      Periodoc (ms)      Extended
-----
                          Refresh (ms)
-----
1          200                600

```

```

10000          1000          10000
   4           300           800
10000          1000          10000
   5           200           600
10000          1000          10000
-----
-----

```

History

This command was first available in ExtremeXOS 15.3.

Output for periodic and extended refresh timers added in 15.3.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show msdp memory

```
show msdp memory {detail | memoryType}
```

Description

This command displays current memory utilization of the *MSDP* process, including all virtual router instances of the MSDP process.

Syntax Description

| | |
|-------------------|--|
| detail | Displays detailed statistics for all memory types. |
| <i>memoryType</i> | Displays statistics for a particular memory type. |

Default

N/A.

Usage Guidelines

Use this command to view and diagnose the memory utilization of the MSDP process.

Example

The following displays current memory utilization of the MSDP process, including all virtual router instances of the MSDP process:

```
show msdp memory
```

The following is sample output from this command:

```
MSDP Memory Information
-----
Bytes Allocated: 79792 AllocFailed: 0 OversizeAlloc: 0
Current Memory Utilization Level: GREEN
Memory Utilization Statistics
-----
Size      16      32      48      64      80      96      128     256     1024     4096     8192     12288
-----
----- Used Blocks

```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show msdp mesh-group

```
show msdp [mesh-group {detail} | {mesh-group} mesh-group-name] {vr
  vrname}
```

Description

This command displays configuration information about [MSDP](#) mesh-groups.

Syntax Description

| | |
|------------------------|---|
| detail | Displays detailed information about MSDP mesh-groups. |
| <i>mesh-group-name</i> | Specifies the name of the MSDP mesh-group. The character string can be a maximum of 31 characters. |
| <i>vrname</i> | Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context. |

Default

N/A.

Usage Guidelines

Use this command to display configuration information about MSDP mesh-groups, as follows:

- For summary information, enter the `show msdp mesh-group` command.
- For detailed information, enter the `show msdp mesh-group detail` command.
- For detailed information about a specific mesh-group, enter the `show msdp mesh-group name` command.

Example

The following command displays the peer count for a mesh-group:

```
show msdp mesh-group
```

The following is sample output from this command:

```
MeshGroupName          PeerCount
-----
external                0
internal                0
msdp_mesh               4
```

The following command displays detailed information about a mesh-group called "msdp_mesh":

```
show msdp mesh-group "msdp_mesh"
```

The following is sample output from this command:

```
Mesh Group Name      : msdp_mesh Num of Peers : 4
Peers                : 54.172.168.97  55.0.0.83      124.56.78.90
221.160.90.228
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show msdp peer

```
show msdp [peer {detail} | {peer} remoteaddr] {vr vr_name}
```

Description

This command displays configuration and run-time parameters about *MSDP* peers.

Syntax Description

| | |
|-------------------|---|
| detail | Displays detailed information about MSDP peers. |
| <i>remoteaddr</i> | Specifies the IP address of the MSDP peer. |
| <i>vr_name</i> | Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context. |

Default

N/A.

Usage Guidelines

Use this command to verify the configuration and run-time parameters for MSDP peers, as follows:

- For summary information, enter the `show msdp peer` command.
- For detailed information for all peers, enter the `show msdp peer detail` command.
- For detailed information for a specific peer, enter the `show msdp peer remoteaddr` command.

Example

The following command displays configuration and run-time parameters for MSDP peers:

```
show msdp peer
```

The following is sample output from this command:

```
Peer Address   AS      State      Up/Down   Resets  SA_Cnt  Name
-----
-d 54.172.168.97 14490  DISABLED   00:31:36  0       0       test
*e 55.0.0.83     100    ESTABLISHED 00:21:04  1       0       to-Hawaii
-d 124.56.78.90  2345   DISABLED   00:31:36  0       0
-d 221.160.90.228 23456  DISABLED   00:31:36  0       0
Flags: (*) default peer, (d) disabled, (e) enabled
```

The following command displays output from an MSDP peer with the IP address 16.0.0.2:

```
* Switch.8 # show msdp peer 16.0.0.2
MSDP Peer      : 16.0.0.2

```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show msdp sa-cache

```

show msdp [sa-cache | rejected-sa-cache] {group-address grp-addr}
        {source-address src-addr} {as-number as-num} {originator-rp
        originator-rp-addr} {local} {peer remoteaddr} {vr vrname}

```

Description

This command displays the SA cache database. The following quadruplet per SA cache entry displays: {Group, Source, originating RP, and peer}. In addition, information about the following displays: the cache uptime, aging, whether sources are local or remote, etc.

Syntax Description

| | |
|---------------------------|---|
| <i>grp-addr</i> | Displays the SA cache within the specified group address range. |
| <i>src-addr</i> | Displays the SA cache within the specified source address range. |
| <i>as-num</i> | Displays all SA cache that originated from the specified Autonomous System (AS) number. |
| <i>originator-rp-addr</i> | Displays all SA cache entries that were originated by the specified rendezvous point. |
| local | Displays locally originated SA cache entries only. |
| <i>remoteaddr</i> | Displays the SA cache entries received from the MSDP peer with the specified IP address. |
| <i>vrname</i> | Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context. |

Default

N/A.

Usage Guidelines

Use this command to view and troubleshoot the SA cache database. There are various filtering criteria you can use to display just a subset of the SA cache database. The following are some of the criteria, which you can use together or separately, to display information about the SA cache:

- Filtering on the group address range.
- Filtering on the source address range.
- Filtering on the originator rendezvous point address.
- Filtering of the advertising MSDP peer.
- Locally originated SA cache.
- Rejected SA cache.

Example

The following command displays the SA cache database:

```
# show msdp sa-cache
Group Address      Source Address    Originator        Peer Address      Age/Ageout In
-----
235.100.200.1     10.20.30.1       60.0.0.5         10.0.0.1         00:44:24/05:10
235.100.200.2     10.20.30.2       60.0.0.5         192.0.0.16       00:44:24/05:16
235.100.200.3     10.20.30.3       60.0.0.5         10.0.0.1         00:44:24/05:10
235.100.200.4     10.20.30.4       60.0.0.5         10.0.0.1         00:44:24/05:10

```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show msdp

```
show msdp {vr vrname}
```

Description

This command displays global configuration and run-time parameters for *MSDP*.

Syntax Description

| | |
|---------------|---|
| <i>vrname</i> | Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context. |
|---------------|---|

Default

N/A.

Usage Guidelines

Use this command to verify the global configuration parameters of MSDP.

Example

The following command displays global configuration and run-time parameters for MSDP:

```
Switch.2 # show msdp

```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show msrp

```
show msrp
```

Description

Displays the MSRP configuration on the switch.

Syntax Description

| | |
|-------------|--|
| msrp | Multiple Stream Registration Protocol. |
|-------------|--|

Default

N/A.

Usage Guidelines

Use this command to display MSRP configuration on the switch.

Example

```
# show msrp
MSRP Status                : Enabled
MSRP Max Latency Frame Size : 1522
MSRP Max Fan-in Ports      : No limit
MSRP First Value Change Recovery Time : 10000 (ms)
MSRP Ignore Latency Changes : On
MSRP Talker VLAN Pruning   : On
MSRP Enabled Ports         : *17ab      *19a    !5
Total MSRP streams         : 4
Total MSRP reservations    : 2
Flags:      (*) Active,          (!) Administratively disabled,
            (a) SR Class A allowed, (b) SR Class B allowed.
```

History

This command was first available in ExtremeXOS 15.3.

The MSRP First Value Change Recovery Time, MSRP Ignore Latency Change, and MSRP Talker VLAN Pruning example outputs were added in 15.3.2.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show msrp listeners

```
show msrp listeners {egress | ingress | ingress-and-egress} {port
  port_num} {source-mac-addr source_mac_addr | stream-id stream_id}
```

Description

Shows MSRP listener information.

Syntax Description

| | |
|---------------------------|--|
| msrp | Multiple Stream Registration Protocol. |
| listeners | Listener attributes. |
| egress | Display egress listeners only. |
| ingress | Display ingress listeners only (default). |
| ingress-and-egress | Display all listeners. |
| <i>port_num</i> | Filter based on ingress port number of the stream. |
| source-mac-addr | Filter based on source MAC address of a data stream. |
| stream-id | Filter based on stream ID of a data stream. |

Default

N/A.

Usage Guidelines

Use this command to show MSRP listener information. The output can be filtered based on the stream id, source MAC, or port number on which the listener is registered.

Example

```
# show msrp listeners
  Stream Id          Port  Dec      Dir      State      Stream Age
-----
App  Reg  (days, hr:mm:ss)
-----

```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show msrp ports

```
show msrp ports {port_list}{detail}
```

Description

Displays the MSRP configured port information.

Syntax Description

| | |
|------------------|--|
| msrp | Multiple Stream Registration Protocol. |
| ports | Ports. |
| <i>port_list</i> | Port list separated by a comma or "-". |
| detail | Port information with more detail. |

Default

N/A.

Usage Guidelines

Displays the MSRP configured port information. Specifying **detail** displays port information with more detail.

Example

```
# show msrp ports
  Port  Enabled  Oper   Port  Dplx  Jumbo  Jumbo  Cls  Bndry  State  Sr-Pvid
      -----  -----  -----  -----  -----  -----  -----  -----  -----  -----

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show msrp ports bandwidth

```
show msrp ports {port_list} bandwidth
```

Description

Displays bandwidth information of an MSRP port.

Syntax Description

| | |
|------------------|---|
| msrp | Multiple Stream Registration Protocol. |
| ports | Ports. |
| <i>port_list</i> | Port list separated by a comma or "-". |
| bandwidth | Bandwidth information per port per traffic-class. |

Default

N/A.

Usage Guidelines

Use this command to display bandwidth information of an MSRP port.

Example

```

# show msrp ports bandwidth
Port      Port      Class  Delta    Maximum    Reserved  Available
          Speed
-----
5ab      0 M A      75.00%   0.00%     0.00%     0.00%

```

```

          B          0.00%    0.00%    0.00%    0.00%
*21ab   1000 M  A      75.00%   75.00%   0.00%   75.00%
          B          0.00%   75.00%   0.00%   75.00%

Flags:  (*) Active,          (!) Administratively disabled,
        (a) SR Class A allowed, (b) SR Class B allowed.

```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms if the AVB feature pack license is installed on the switch.

show msrp ports counters

```
show msrp ports {port_list} counters {event | packet}
```

Description

Shows PDU or event counters per port.

Syntax Description

| | |
|------------------|---|
| msrp | Multiple Stream Registration Protocol. |
| ports | Ports. |
| <i>port_list</i> | Port list separated by a comma or "-". |
| counters | MSRP packet and attribute event counters. |
| event | MSRP attribute event counters. |
| packet | MSRP packet counters (default). |

Default

N/A.

Usage Guidelines

Use this command to display PDU or event counters per port. The counters count the received attributes from talkers and listeners per attribute event, or the number of PDUs received. `show msrp counters` by itself displays PDU counters.

Example

```
#show msrp ports 17 counters packet
Port      Streams  Reservations  Rx Pkt  Rx Error  Tx Pkt
-----  -
```

```

17          0          0          2          0          2

#show msrp ports 17 counters event
Port : 17

Mt      : Not declared, and not registered
New     : Newly declared, and possibly not previously
         registered

```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show msrp streams

```

show msrp streams {detail | propagation} {port port_num} {source-mac-addr source_mac_addr | stream-id stream_id} {destination-mac-addr destination_mac_addr}

```

Description

Shows the MSRP stream information collected from the talker's attributes.

Syntax Description

| | |
|----------------|--|
| msrp | Multiple Stream Registration Protocol. |
| streams | Data streams advertising QoS specification using MSRP. |
| detail | Show stream information with more detail. |

| | |
|-----------------------------|---|
| propagation | Show stream propagation through switch. |
| port | Filter based on ingress port number of the stream. |
| source-mac-addr | Filter based on source MAC address of a data stream. |
| stream-id | Filter based on stream ID of a data stream. |
| destination-mac-addr | Filter based on destination MAC address of a data stream. |

Default

N/A.

Usage Guidelines

Use this command to show the MSRP stream information collected from the talker's attributes. The output can be filtered based on the stream id, source MAC, destination MAC, or port number on which the stream is registered.

Example

```
# show msrp streams
  Stream Id          Destination          Port  Dec  VID  Cls/Rn  BW

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show msrp talkers

```

show msrp talkers {egress | ingress | ingress-and-egress} {port
  port_num}{source-mac-addr source_mac_addr | stream-id stream_id}

```

Description

Shows MSRP talker attributes.

Syntax Description

| | |
|------------------------|--|
| msrp | Multiple Stream Registration Protocol. |
| talkers | Talker attributes. |
| egress | Display egress talkers only (default). |
| ingress | Display ingress talkers only. |
| port | Filter based on ingress port number of the stream. |
| source-mac-addr | Filter based on source MAC address of a data stream. |
| stream-id | Filter based on stream ID of a data stream. |

Default

N/A.

Usage Guidelines

Use this command to shows MSRP talker attributes. The output can be filtered based on the stream id, source MAC, or port number on which the talker is registered.

Example

```
# show msrp talkers
      Stream Id          Port  Dec   Dir   State      Failure Code

```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show mvr

```
show mvr {vlan vlan_name}
```

Description

Displays the MVR configuration on the switch.

Syntax Description

| | |
|------------------------|-------------------------------|
| <code>vlan_name</code> | Specifies a <u>VLAN</u> name. |
|------------------------|-------------------------------|

Default

N/A.

Usage Guidelines

If a VLAN is specified, information for the VLAN is displayed.

Example

The following command displays the MVR configuration for the VLAN accounting:

```
show mvr accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mvr cache

This command is provided for backward compatibility. The recommended command is:

```
show mcast cache {{vlan} vlan_name} {[group grpaddressMask |
  grpaddressMask] {source sourceIP | sourceIP}} {type [snooping | pim |
  mvr]}| {summary}}
```

The syntax for the original form of this command is:

```
show mvr cache {vlan vlan_name}
```

Description

Displays the multicast cache entries added by MVR.

Syntax Description

| | |
|------------------|-------------------------------|
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name. |
|------------------|-------------------------------|

Default

N/A.

Usage Guidelines

If no VLAN is specified, information for all VLANs is displayed.

Example

The following command displays the multicast cache in the MVR range for the VLAN vlan110:

```
Switch.78 # show mvr cache vlan110
```

This command display is the same as for the following preferred command:

```
show mcast cache {{vlan} name} {[group grpaddressMask | grpaddressMask]
  {source sourceIP | sourceIP}} {type [snooping | pim | mvr]}| {summary}}
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show mvrp

```
show mvrp
```

Description

This command is used to show the mvrp settings as follows. If the MVRP enabled port is a load shared port, a suffix 'g' is displayed.

Syntax Description

| | |
|-------------|---|
| mvrp | Multiple <u>VLAN</u> Registration Protocol. |
|-------------|---|

Default

N/A.

Usage Guidelines

Use this command to show the MVRP settings.

Example

```
# show mvrp
MVRP enabled           : Enabled
MVRP dynamic VLAN creation : Enabled
MVRP VLAN registration  : Forbidden
MVRP default STP domain  : s0
MVRP enabled ports      : 9    *11    *13
Flags: (*) Active, (!) Administratively disabled.
      (g) Load Sharing Port
      (G) Multi-switch LAG Group port
```

History

This command was first available in ExtremeXOS 15.3.

MRVP VLAN registration output was added in 15.3.2.

Flag showing if the MVRP-enabled port is an MLAG port added in ExtremeXOS 22.1

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mvrp ports counters

```
show mvrp ports {port_list} counters {event | packet}
```

Description

Shows the port MVRP statistics. The statistics for packet or event counters are displayed as per input.

Syntax Description

| | |
|------------------|--|
| mvrp | Multiple <u>VLAN</u> Registration Protocol. |
| ports | Ports. |
| <i>port_list</i> | List of ports in the switch separated by a comma or "-". |
| counters | MVRP packet and attribute event counters. |
| event | MVRP attribute event counters. |
| packet | MVRP packet counters (default). |

Default

Packet counters.

Usage Guidelines

This command is to show the port MVRP statistics. The statistics for packet or event counters will be displayed as per input. The default is packet counters. The packet counters include Number of VLANs registered on the port, Number of Failed Registrations, Number of MVRPDUs received, Number of MVRPDUs sent, Number of erroneous MVRPDUs received, and the source address of the MVRP message last received by the port. The event counters include the number of different events received/transmitted.

Example

```
# show mvrp ports 9,11,13 counters packet
Port      VLANs   Failed   Rx Pkt  Rx Error  Tx Pkt   Last Source
      Regs   Regs    Count   Count     Count   Address
-----
      9      2       0        0         0        64  00:00:00:00:00:00
      11     2       0   806836         0   433754  00:22:97:00:41:e7
      13     2       0   784176         0   404794  00:22:97:00:41:e8

-----
Regs: Registrations

# show mvrp ports 9 counters event

Lv       : Previously registered, but now withdrawn
Mt       : Not declared, and not registered
New      : Newly declared, and possibly not previously registered

```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show mvrp tag

```
show mvrp tag vlan_tag {ports {port_list}}
```

Description

Shows the port specific applicant and registrar states and the configured control values for all MVRP enabled ports.

Syntax Description

| | |
|------------------|--|
| mvrp | Multiple <u>VLAN</u> Registration Protocol. |
| tag | The 802.1Q VLAN ID. |
| <i>vlan_tag</i> | VLAN ID ranging from 1 to 4094 (default is 2). |
| <i>port_list</i> | Port list separated by comma or "-". |

Default

N/A.

Usage Guidelines

Use this command to show the port specific applicant and registrar states and the configured control values for all MVRP enabled ports. The registrar control value is derived as follows:

- Normal = Dynamically ordered port.
- Fixed = Statically added port.
- Forbidden = VLAN is configured to be forbidden on the port.

Example

```
# show mvrp tag 2

Port      Applicant      Applicant      Registrar      Registrar
State     State           Control        State           Control
-----
          9           VN             On              MT              Normal
          11          QA             On              IN              Normal
          13          QA             On              IN              Normal

Applicant States:
  AA      : Anxious active,      AN      : Anxious new,
  AO      : Anxious observer,   AP      : Anxious passive,
  LA      : Leaving active,     LO      : Leaving observer,
  QA      : Quiet active,       QO      : Quiet observer,
  QP      : Quiet passive,      VN      : Very anxious new,
  VO      : Very anxious observer, VP      : Very anxious passive

Registrar States:
  IN      : In - Registered,    LV      : Leaving - Timing out,
  MT      : Empty - Not Registered

Applicant Control:
  On      : Transmit On,       Off     : Transmit Off

Registrant Control:
  Fixed   : Statically added,   Forbidden : Forbidden VLAN,
  Normal  : Dynamically added
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin

```
show netlogin {port port_list [ {vlan} vlan_name | vlan vlan_list]}
              {dot1x {detail}} {mac} {web-based}
```

Description

Shows status information for network login.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>vlan_name</i> | Specifies the name of a VLAN . |
| <i>vlan_list</i> | Specifies a VLAN list of IDs. |
| dot1x | Specifies 802.1X information. |

| | |
|------------------|----------------------------------|
| detail | Shows detailed information. |
| mac | Specifies MAC-based information. |
| web-based | Specifies web-based information. |

Default

N/A.

Usage Guidelines

Depending on your configuration, software version, and the parameters you choose to display, the information reported by this command may include some or all of the following:

- Whether network login is enabled or disabled.
- The base-URL.
- The default redirect page.
- The logout privileges setting.
- The network login session-refresh setting and time.
- The MAC and IP address of supplicants.
- The type of authentication, 802.1X, MAC-based, or HTTP (web-based).
- The guest VLAN configurations, if applicable.
- The dynamic VLAN state and uplink ports, if configured.
- Whether network login port restart is enabled or disabled.
- Which order of authentication protocols is currently being used.

If you do not specify the authentication method, the switch displays information for all network login authentication methods.

Note

The "current user" count displays how many resources are left to be able to be configured/authenticated. Admin-profile rules consume a resource similar to authenticated users, even if that particular MAC address is not presently on the system (a static admin-profile port rule also increments this count). As a result, the "current user" count value reflects a combination of users and consumed resources (admin-profile rules).

Example

The following sample output shows the summary network login information:

```
# show netlogin

NetLogin Authentication Mode : web-based ENABLED; 802.1X ENABLED; mac-based ENABLED
NetLogin VLAN                : "nvlan"
NetLogin move-fail-action    : Authenticate
NetLogin Client Aging Time   : 5 minutes

```

History

This command was first available in ExtremeXOS 11.1.

Information about the guest VLAN was added in ExtremeXOS 11.2.

Information about the configured port MAC list was added in ExtremeXOS 11.3.

Information about dynamic VLANs and network login port restart was added in ExtremeXOS 11.6.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Information about authentication delay added in ExtremeXOS 21.1.

Authentication username format information was added in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show neighbor-discovery cache ipv6

```
show neighbor-discovery {cache {ipv6}} {[ipv6_addr | mac | permanent]
  {vr vr_name}} | [ {vlan} vlan_name | vlan vlan_list] | vr vr_name
```

Description

This command displays all the entries from the neighbor cache.

Syntax Description

| | |
|------------------|----------------------------|
| <i>ipv6_addr</i> | Specifies an IPv6 address. |
| <i>mac</i> | Specifies a MAC address. |
| permanent | Specifies static entries. |

| | |
|------------------|--|
| <i>vr_name</i> | Specifies a VR or VRF. |
| <i>vlan_name</i> | Specifies an IPv6 configured <u>VLAN</u> . |
| <i>vlan_list</i> | Specifies an IPv6 configured VLAN list of IDs. |

Default

N/A.

Usage Guidelines

This command displays the entries present in the neighbor cache.

The entries displayed can be filtered by IPv6 address, MAC address, or by VLAN. The permanent keyword filters the output to display static entries.

The *vr_name* indicates the VR or VRF on which the operation is performed. In its absence, the operation applies to VR-Default.

Example

The following example output shows all entries from the neighbor cache:

```
# show neighbor-discovery cache ipv6
VR          Destination
Mac         Age  Static  VLAN          VID  Port
VR-Default  2001:db8:100::7
00:01:30:00:6b:00  0    NO    gtag100      100  1:2
VR-Default  2001:db8:100::99
00:01:02:33:33:33  0    YES   gtag100      100
VR-Default  2001:db8:99::99
00:01:02:01:01:01  0    YES   gtag99       99
Total Entries      :      0
Dynamic Entries    :      0          Static Entries      :      0
Pending Entries    :      0
Timeout            :      20 minutes  Refresh              :      Enable
Neighbor Discovery Global Settings
Max Entries        :      4096
Max Pending Entries :      1024
```

History

This command was first available in ExtremeXOS 11.2.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Max entries and max pending entries moved under a global settings heading in ExtremeXOS 30.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show netlogin authentication failure vlan

```
show netlogin authentication failure [ {vlan} vlan_name | vlan
vlan_list]
```

Description

Displays the authentication failure VLAN related configuration details.

Syntax Description

| | |
|------------------|---|
| <i>vlan_name</i> | Specifies the name of a failure VLAN. |
| <i>vlan_list</i> | Specifies the failure VLAN list of IDs. |

Default

N/A.

Usage Guidelines

Use this command to display configuration details for the authentication failure VLAN.

Example

The following is sample output from this command:

```
# show netlogin authentication failure vlan
-----
Authentication Service unavailable
Vlan
port                               Status
-----
corp
1:2                                Disabled
```

History

This command was first available in ExtremeXOS 12.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin authentication service-unavailable vlan

```
show netlogin authentication service-unavailable [ {vlan} vlan_name |
vlan vlan_list]
```

Description

Displays the authentication service-unavailable VLAN related configuration details.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies the name of the authentication service-unavailable VLAN. |
| <i>vlan_list</i> | Specifies the authentication service-unavailable VLAN list of IDs. |

Default

N/A.

Usage Guidelines

Use this command to display configuration details for the service-unavailable VLAN.

Example

The following is sample output from this command:

```
# show netlogin authentication service-unavailable vlan serv
-----
-
Authentication Service unavailable VLAN      Port              Status
-----
-
serv                                         1 (untagged)     Enabled
```

History

This command was first available in ExtremeXOS 12.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Additional information associated with the ability to configure multiple service-unavailable VLANs added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin banner

```
show netlogin banner
```

Description

Displays the user-configured banner string for network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the banner that is displayed on the network login page.

Example

The following command displays the network login banner:

```
show netlogin banner
```

If a custom banner web page exists, show banner netlogin generates the following output:

```
***** Testing NETLOGIN BANNER at <system name>*****  
NOTE: Banner is not in use. Overridden since custom login page "netlogin_login_page.html"  
is present.
```

If a custom banner web page does not exist, nothing is displayed.

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin guest-vlan

```
show netlogin guest-vlan [ {vlan} vlan_name | vlan vlan_list]
```

Description

Displays the configuration for the guest *VLAN* feature.

Syntax Description

| | |
|------------------|---------------------------------------|
| <i>vlan_name</i> | Specifies the name of a guest VLAN. |
| <i>vlan_list</i> | Specifies the guest VLAN list of IDs. |

Default

N/A.

Usage Guidelines

Use this command to display the guest VLANs configured on the switch.

If you specify the *vlan_name*, the switch displays information for only that guest VLAN.

The output displays the following information in a tabular format:

- Port—Specifies the 802.1X enabled port configured for the guest VLAN.
- Guest-vlan—Displays the enabled/disabled state of the guest VLAN feature.
- Vlan—Specifies the name of the guest VLAN.

Example

The following sample output displays the local network login list:

```
# show netlogin guest-vlan

Port      Guest-vlan      Vlan
-----
5:1       Disabledgv11
5:2       Enabledgv12
5:3       Disabledgv13
5:4       Enabledgv14
```

History

This command was first available in ExtremeXOS 11.6.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin local-users

```
show netlogin local-users
```

Description

Displays the local network login users configured on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the list of local network login users and associated [VLANs](#).

If you associated a VLAN with a local network login user, the output displays the name of the VLAN. If you have not associated a VLAN with a local network login user, the output displays not configured.

The Extended-VLAN VSA column displays the name of the VLAN and the following information:

- *not configured*—Specifies that you have not associated a VLAN with a local network login user.
- *—Specifies the movement based on the incoming port's traffic. For example, the VLAN behaves like VSA 203 if identified with a VLAN name or VSA 209 if identified with a VLAN ID.
- T—Specifies a tagged client.
- U—Specifies an untagged client.

In addition, this output is useful to determine which local network login user you want to modify or delete from the system.

Example

The following command displays the local network login list:

```
show netlogin local-users
```

The following is sample output from this command:

| Netlogin Local User Name | Password (encrypted) | Extended-VLAN VSA |
|--------------------------|--------------------------------|-------------------|
| 000000000012 | Iqyydz\$MP7AG.VAmwOoqiKX2u13H1 | U hallo |
| 00008653C314 | Bo028L\$oRVvKv8.wmxcorhhXxQY40 | * default |
| megtest | w7iMbp\$lBL34/dLx4G4M8aAdiCvI | <not configured> |
| testUser | /Jhouw\$iHE15steebwhOibgj6pZq. | T testVlan |

History

This command was first available in ExtremeXOS 11.2.

The output was modified to include VLAN information in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin mac-list

```
show netlogin mac-list
```

Description

Displays the MAC address list for MAC-based network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the MAC address list used for MAC-based network login.

MAC-based authentication is VR aware, so there is one MAC list per VR.

Example

The following command displays the MAC address list:

```
show netlogin mac-list
```

The following is sample output from this command:

```
MAC Address/Mask      Password (encrypted)  Port(s)
-----
00:00:00:00:00:10/48 <not configured>    1:1-1:5
00:00:00:00:00:11/48 <not configured>    1:6-1:10
00:00:00:00:00:12/48 <not configured>    any
00:01:30:70:0C:00/48 yaquany
00:01:30:32:7D:00/48 ravdqsrany
00:04:96:00:00:00/24 <not configured> any
```

History

This command was first available in ExtremeXOS 11.1.

Information about the configured port MAC list was added in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin session

```
show netlogin session {all | summary} {mac-address mac_address} {ports
  ports} {agent [convergence-endpointdot1x | mac | web-based]}
```

Description

Use this command to display the active authenticated sessions for both policy and non-policy mode.

Syntax Description

| | |
|-----------------------------|--|
| all | Include sessions with 'terminated' status. |
| summary | Do not display detailed information. |
| mac-address | Specify a MAC address. |
| <i>mac_address</i> | Specify a MAC address. |
| ports | Port or range of ports. |
| <i>ports</i> | Port or range of ports. |
| agent | Specify an agent type. |
| dot1x | IEEE 802.1X Port-Based Network Access Control. |
| mac | MAC authentication. |
| web-based | Web-based authentication. |
| convergence-endpoint | Convergence-endpoint authentication. |

Default

N/A.

Usage Guidelines

None.

Example

The following example shows a summary of the active authenticated sessions:

```
# show netlogin session summary
Port          Address type Address          X W M C B
-----
23            mac          00:00:88:88:00:00      X
23            mac          00:00:88:88:00:01      X  X
23            mac          00:00:88:88:00:02      X  X
23            mac          00:00:88:88:00:03      X  X
23            mac          00:00:88:88:00:04      X
-----
X - dot1x
W - web-based
M - mac
C - convergence-endpoint
B - Blackholed in FDB
```

The following example shows information about the authentication sessions:

```
show netlogin session
Multiple authentication session entries
-----
Port          : 1:1          Station address   : 00:04:f2:9f:48:fe
Auth status   : success        Last attempt     : Fri Nov 17 21:56:01 2017
Agent type    : cep           Session applied  : true
Server type   : local        VLAN-Tunnel-Attr : None
Policy index  : 2            Policy name      : NProfile_16 (active)
Session timeout : 0          Session duration : 2 days, 21:57:19
Idle timeout  : 300         Idle time        : 0:00:00
Auth-Override : enabled       Termination time : Not Terminated

Port          : 15          Station address   : 00:00:00:00:0b:00
Auth status   : success        Last attempt     : Thu Jan 30 12:48:04 2020
Agent type    : mac           Session applied  : false
Server type   : local        VLAN-Tunnel-Attr : None
Policy index  : 0            Policy name      : No Policy applied
Session timeout : 0          Session duration : 0:00:04
Idle timeout  : 0            Idle time        : 0:00:00
Auth-Override : disabled      Termination time : Not Terminated
```

History

This command was first available in ExtremeXOS 16.1.

Sessions shown for both policy and non-policy mode was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show netlogin timeout

```
show netlogin timeout
```

Description

Use this command to display the *NetLogin* timeout value for an idle or session timeout.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

This example displays the `show netlogin timeout` command output.

```
#show netlogin timeout
Authentication      Session      Idle
Type                Timeout      Timeout
-----            -
dot1x                0            300
web-based            0            300
mac                  0            300
convergence-endpoint      0            300
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2 , X465 , 5520series switches.

show netlogin trap

```
show netlogin trap
```

Description

Use this command to display *NetLogin* trap settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

```
# show netlogin trap

System: Disabled

Enabled-Trap Ports
  Success      :
  Failed       :
  Terminated  :
  Max-Reached  :

Disabled-Trap Ports
  Success      : 1-3
  Failed       : 1-3
  Terminated  : 1-3
  Max-Reached  : 1-3
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2 , X465 , 5520 series switches.

show network-clock gptp

```
show network-clock gptp {default-set | current-set | parent-set | time-  
properties-set}
```

Description

Displays global gPTP configuration and data.

Syntax Description

| | |
|----------------------------|---|
| default-set | Displays this switch's native time capabilities. |
| current-set | Displays this switch's state relative to the grandmaster system. |
| parent-set | Displays the upstream (i.e., toward the grandmaster) system's parameters. |
| time-properties-set | Displays the grandmaster's parameters. |

Default

N/A.

Usage Guidelines

Use this command to display whether gPTP is enabled in the switch and the ports on which gPTP is enabled.

Example

```
# show network-clock gptp
gPTP status      : Enabled
BMCA             : Off
Static slave port : None
gPTP enabled ports : *1m      *21d      *22d      *47d

Flags:          (*) Active, (!) Administratively disabled,
                (d) Disabled gPTP port role, (m) Master gPTP port role,
                (p) Passive gPTP port role, (s) Slave gPTP port role

# show network-clock gptp default-set
Local Clock Identity      : 00:04:96:FF:FE:52:2C:BE

Frequency Traceable    : Yes
Time Source             : 32 (GPS)
```

History

This command was first available in ExtremeXOS 15.3.

Support for BCMA was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show network-clock clock-source

```
show network-clock clock-source
```

Description

Displays the configured network clock source information.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

The ExtremeSwitching switches have clock sources in addition to SyncE. The clock that drives all of the ports on a switch may be selected from:

- SyncE (Synchronous Ethernet).
- PTP - Precision Time Protocol, an optional 1588v2 module.
- TDM - an optional module which has multiple T1/E1 interfaces for TDM/Ethernet interworking.
- BITS - Building Integrated Timing Supply. A connector capable of receiving a timing signal provided by other building equipment.

Example

The following is an example for a switch:

```
# show network-clock clock-source
Input Clock Source      : Sync-E
Input Quality Level     : QL-SEC (11)
Input Region           : E1
Input Clock Status      : LOCAL CLOCK
Output Bits BNC 1 Clock Source : 8KHz
Output Bits BNC 2 Clock Source : E1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching X460-G2 series switches.

show network-clock gtp ports

```
show network-clock gtp ports [port_list | all] {counters}
```

Description

Displays gTP port parameters and counters.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more of the switch's physical ports. |
| all | Specifies all of the switch's physical ports. |

Default

N/A.

Usage Guidelines

The command `show network-clock gtp port` displays the specified port's gTP parameters:

| | |
|----------------------|--|
| Physical port number | The switch's number for this physical port. |
| gTP port status | Indicates whether gTP is enabled on this port. |
| Clock Identity | This switch's gTP Clock Identity. |
| gTP Port Number | gTP number for this physical port. |
| IEEE 802.1AS Capable | Indicates whether this switch and the neighboring systemdevice connected via this port can interoperate via gTP. |

| | |
|-----------------------------------|--|
| Port Role | The port's gPTP role: <ul style="list-style-type: none"> • Disabled (3) • Master (6) • Passive (7) • Slave (9) |
| Announce Initial Interval | The initial announce interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 0 = 1 second. |
| Announce Current Interval | The current announce interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 1 = 2 seconds. |
| Announce Receipt Timeout | The number of announce intervals a slave port waits without receiving an Announce message before it assumes the master port is no longer sending Announce messages and the BMCA needs to be run. |
| Sync Initial Interval | The initial time-synchronization transmission interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, -1 = 500 milliseconds. |
| Sync Current Interval | The current time-synchronization transmission sync interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, -2 = 250 milliseconds. |
| Sync Receipt Timeout | The number of time-synchronization transmission intervals a slave port waits without receiving a Sync message before it assumes the master port is no longer sending Sync messages and the BMCA needs to be run. |
| Sync Receipt Timeout Interval | Sync Receipt Timeout in time units. |
| Peer Delay Initial Interval | The initial Peer Delay Request interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 2 = 4 seconds. |
| Peer Delay Current Interval | The current Peer Delay Request interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 3 = 8 seconds. |
| Peer Delay Allowed Lost Responses | The number of consecutive Peer Delay Request messages that the switch must send on this port without receiving a valid response before it considers the port not to be exchanging Peer Delay messages with its neighbor. |
| Measuring Propagation Delay | Indicates whether this port is measuring its link's propagation delay. |
| Mean Propagation Delay | The link's estimated one-way propagation delay. The peer delay protocol measures the sum of the link's propagation delays in each direction, and this is that sum divided by two, which is accurate only if the link is symmetrical. |
| Mean Propagation Delay Threshold | The propagation delay above which the switch considers this port unable to run gPTP. |

| | |
|--|---|
| Propagation Delay Asymmetry | The configured time that the propagation delay from this switch to the neighbor is less than the estimated one-way propagation delay between the switch and its neighbor (which is also the time that the propagation delay from the neighbor to this switch is greater than the estimate). This value is negative if the propagation delay to the neighbor is greater than the estimate. Let tIR be the propagation delay from this switch (initiator) to the neighbor (responder), tRI be the propagation delay from the neighbor to this switch, and meanPathDelay be the estimated one-way propagation delay. Then: meanPathDelay = (tIR + tRI) / 2 tIR = meanPathDelay - asymmetry_time tRI = meanPathDelay + asymmetry_time |
| Neighbor Rate Ratio | The estimated ratio of the frequency of the local clock in the neighboring systemdevice connected via this port, to this switch's local clock's frequency. The ratio is represented as the ratio minus 1, multiplied by 2 ⁴¹ : (ratio - 1) * 2 ⁴¹ |
| PTP Version | The PTP version number used on this port. Always 2. |
| Peer Delay Correction Field Fractional nano seconds only | Shows whether or not you consider only the fractional nano-second portion of correction field of peer delay messages. Default is off. |

The command `show network-clock gptp port counters` displays the specified port's gPTP counters:

| | |
|--------------------------------|--|
| Physical port number | The switch's number for this physical port. |
| gPTP port status | Indicates whether gPTP is enabled on this port. |
| Announce | The number of Announce messages received and sent. |
| Sync | The number of Sync messages received and sent. |
| Follow Up | The number of Follow Up messages received and sent. |
| Peer Delay Request | The number of Peer Delay Request messages received and sent. |
| Peer Delay Response | The number of Peer Delay Response messages received and sent. |
| Peer Delay Response Followup | The number of Peer Delay Response Follow Up messages received and sent |
| gPTP packet discards | The number of received gPTP packets discarded or lost for one of the following reasons (from 802.1AS-2011 14.7.8): <ul style="list-style-type: none"> Announce message from this switch Announce message with stepsRemoved >= 255 Announce message with a Path Trace TLV that includes this switch Follow Up message not received following Sync message received Peer Delay Response message not received following Peer Delay Request message sent Peer Delay Response Follow Up message not received following Peer Delay Request message sent |
| Announce Receipt Timeout Count | The number of Announce Receipt timeouts. |

| | |
|--|---|
| Sync Receipt Timeout Count | The number of Sync Receipt timeouts. |
| Peer Delay Allowed Lost Responses Exceeded Count | The number of times the number of consecutive Peer Delay Request messages sent without receiving a valid response exceeded the Peer Delay Allowed Lost Responses. |

Example

```
# show network-clock gptp ports 2
Physical port number      : 2
gPTP port status         : Enabled
Clock Identity           : 00:04:96:FF:FE:52:2C:BE
gPTP Port Number         : 2
IEEE 802.1AS Capable     : Yes
Port Role                 : 9 (Slave)
Announce Initial Interval : 0 (1 second)
Announce Current Interval : 1 (2 seconds)
Announce Receipt Timeout : 3
Sync Initial Interval    : -3 (125 milliseconds)
Sync Current Interval     : -2 (250 milliseconds)
Sync Receipt Timeout     : 3
Sync Receipt Timeout Interval : 750 milliseconds
Peer Delay Initial Interval : 2 (4 seconds)
Peer Delay Current Interval : 4 (8 seconds)
Peer Delay Allowed Lost Responses : 3
Measuring Propagation Delay : Yes
Mean Propagation Delay    : 1000 nanoseconds
Mean Propagation Delay Threshold : 10000 nanoseconds
Propagation Delay Asymmetry : 0
Neighbor Rate Ratio      : 200
PTP Version               : 2
Peer Delay Correction Field
  Fractional nano seconds only : On

# show network-clock gptp ports 3 counters
Physical port number      : 3
gPTP port status         : Enabled
-----
Parameter                Receive      Transmit
-----
Announce                  1000        2000
Sync                      1000         500

-----
Announce Receipt Timeout Count : 1000
Sync Receipt Timeout Count     : 500
Peer Delay Allowed Lost Responses Exceeded Count : 2000
```

History

This command was first available in ExtremeXOS 15.3.

Whether or not you consider only the fractional nano-second portion of correction field of peer delay messages information was added in ExtremeXOS 31.1.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show network-clock ptp

```
show network-clock ptp
```

Description

Show the PTP clock recovery state information. The clock recovery using PTP event messages undergoes the following servo state changes:

- Warmup - The local reference clock is in warmup state.
- Fast Loop - The local reference clock is being corrected and the correction is converging.
- Bridge - The local reference clock correction has been interrupted due to changes in the clocking information in the received PTP event messages or loss of PTP event messages.
- Holdover - Prolonged loss of PTP event messages puts the local reference clock correction to holdover state.
- Normal - The local reference clock correction has converged and the corrected clock is synchronous to the master clock information received in the PTP event messages.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

See Description.

Example

```
# show network-clock ptp
=====
Servo State Information
=====
Servo State           : 3 (Normal Loop)
Servo State Duration  : 10285 (sec)
=====
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching X460-G2, X670-G2 series switches.

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp boundary unicast-master

```
show network-clock ptp [boundary | ordinary] unicast-master [{vlan}
  vlan_name | vlan all]
```

Description

Show the unicast master table of the specified clock port or all clock ports. This command is available only for boundary and ordinary clocks.

Syntax Description

| | |
|-----------------------|-------------------------------------|
| boundary | Specifies the boundary clock. |
| ordinary | Specifies the ordinary clock. |
| unicast-master | Specifies table of unicast masters. |
| vlan | <u>VLAN.</u> |
| <i>vlan_name</i> | VLAN name. |
| vlan all | Specifies all vlans. |

Default

N/A.

Usage Guidelines

Use this command to display the unicast master table of the specified clock port or all clock ports. This command is available only for boundary and ordinary clocks.

Example

The following command displays the unicast master table for all clock ports:

```
# show network-clock ptp boundary unicast-master vlan all
VLAN Name                IP Address      Log Query
gm1-lpbk                  1.1.1.101      3
ptp-s1                    22.55.0.2      3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the ExtremeSwitching X670-G2, X460-G2 series switches.

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp boundary unicast-slave

```
show network-clock ptp boundary unicast-slave [{vlan} vlan_name | vlan
all]
```

Description

Show the unicast slave table of the specified clock port, or all clock ports. This command is only available for boundary clocks.

Syntax Description

| | |
|----------------------|-------------------------------------|
| boundary | Specifies the boundary clock. |
| unicast-slave | Specifies table of unicast masters. |
| vlan | <i>VLAN.</i> |
| <i>vlan_name</i> | VLAN name. |
| vlan all | Specifies all vlans. |

Default

N/A.

Usage Guidelines

Use this command to display the unicast master table of the specified clock port or all clock ports. This command is only available for boundary clocks.

Example

The following command displays the unicast master table for all clock ports:

```
# show network-clock ptp boundary unicast-slave vlan all
VLAN Name                IP Address
ptp-m1                    7.1.1.1
ptp-m1                    7.1.2.1
ptp-m1                    88.3.5.1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the ExtremeSwitching X460-G2, X670-G2 series switches.

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp counters

```
show network-clock ptp [boundary | ordinary] vlan [vlan_name
  {{ipv4_address} [unicast-master | unicast-slave]} | all {unicast-
  master | unicast-slave}] counters
```

Description

This command displays the count of PTP packets that include event messages, signaling and management messages transmitted and received on each unicast-slave/unicast-master peers. Use the following queries for the counters:

- Per unicast-master or unicast-slave peer on a clock port.
- All unicast-master or unicast-slave peers on a clock port.
- Peers on a clock port.
- unicast-master or unicast-slave peers on all clock ports.
- Peers on all clock ports.

The refresh option is not supported for the counters. This command is available only for Boundary and Ordinary clocks.

Syntax Description

| | |
|-----------------------|---|
| network-clock | External clock for ethernet synchronization. |
| ptp | Precise time protocol. |
| boundary | Boundary clock. |
| ordinary | Ordinary clock. |
| vlan | <u>VLAN</u> . |
| <i>ipv4_address</i> | Peer IP address. |
| unicast-master | IP addresses that are masters to the local clock. |
| unicast-slave | IP addresses that are slaves to the local clock. |
| all | All VLANs. |
| counters | PTP message counts. |

Default

N/A.

Usage Guidelines

Use this command to display the count of PTP packets that include event messages, signaling and management messages transmitted and received on each unicast-slave/unicast-master peers.

Example

```
# show network-clock ptp boundary vlan lpbk-gm 1.1.1.101 unicast-master counters
VLAN name:      lpbk-gm
Peer IP Address: 1.1.1.101
IN (packets)    OUT (packets)  Message Type
=====
211             0  Announce
27041           0  Sync
0              0  FollowUp
0             26532  DelayReq
26489           0  DelayResp
0              0  Management
141            150  Signaling
0              0  Rejected
# show network-clock ptp boundary vlan all unicast-slave counters
VLAN name:      lpbk-slave
Peer IP Address: 15.1.1.1
IN (packets)    OUT (packets)  Message Type
=====
0              258  Announce
0             32958  Sync
0             32958  FollowUp
0              0  DelayReq
0              0  DelayResp
0              0  Management
0              0  Signaling
0              0  Rejected
VLAN name:      lpbk-slave
Peer IP Address: 15.1.1.2
IN (packets)    OUT (packets)  Message Type
=====
0              258  Announce
0             32960  Sync
0             32960  FollowUp
31569           0  DelayReq
0             31569  DelayResp
0              0  Management
0             166  Signaling
0              0  Rejected
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on the ExtremeSwitching X460-G2, X670-G2 series switches.

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp (datasets)

```
show network-clock ptp [boundary | ordinary] {parent | port | time-  
property}
```

Description

Show PTP clock and port datasets such as parent, port, default, current and time-property.

Syntax Description

| | |
|----------------------|---------------------------|
| boundary | Specifies boundary clock. |
| ordinary | Specifies ordinary clock. |
| parent | Parent clock data set. |
| port | PTP port data set. |
| time-property | Time properties data set. |

Default

N/A.

Usage Guidelines

Show PTP clock and port datasets such as parent, port, default, current and time-property. If no options are specified, the default, current, parent and time-property datasets are shown for the configured clock instance.

Example

The following command displays network clock information on a switch:

```
# show network-clock ptp boundary parent
Mode           : Boundary Clock
State          : Enabled
Instance       : 0

=====

```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the ExtremeSwitching X460-G2, X670-G2 series switches.

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock sync-e ports

```
show network-clock sync-e port [port_list] {details}
```

Description

Displays information about synchronous Ethernet (SyncE).

Syntax Description

| | |
|------------------|--------------------------|
| <i>port_list</i> | Specifies the port(s). |
| details | Show additional details. |

Default

N/A.

Usage Guidelines

Use this command to display the SyncE configuration and port state on one or more ports. The following command will display the SyncE configuration and port state for all ports:

```
show network-clock sync-e ports
```

Example

The following command displays SyncE information for ports 1 - 12:

```
show network-clock sync-e ports 1-12
```

Following is sample output:

```
=====
Port  Flags      Input          Configured      Output          Source
      Clock Quality Clock Quality  Clock Quality  Clock Quality (Port Number)

         (O) SyncE Supported for Output Only,
         (E) SyncE Enabled,   (f) Forced Source Clock,
         (1) Clock Source 1, (2) Clock Source 2,
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the ExtremeSwitching X460-G2.

show node

```
show node {detail}
```

Description

Displays the status of the nodes in the system as well as the general health of the system.

Syntax Description

| | |
|---------------|---|
| detail | Displays the information on a per-node basis rather than in a tabular format. |
|---------------|---|

Default

N/A.

Usage Guidelines

Use this command to display the current status of the nodes and the health of the system. The information displayed shows the node configurations (such as node priority) and the system and hardware health computations. You can use this information to determine which node will be elected primary in case of a failover.

The following table lists the node statistic information collected by the switch.

Table 44: Node States

| Node State | Description |
|------------|---|
| BACKUP | In the backup state, this node becomes the primary node if the primary fails or enters the DOWN state. The backup node also receives the checkpoint state data from the primary. |
| DOWN | In the down state, the node is not available to participate in leader election. The node enters this state during any user action, other than a failure, that makes the node unavailable for management. Examples of user actions are: <ul style="list-style-type: none"> • Upgrading the software • Rebooting the system using the <code>reboot</code> command. • Synchronizing the software and configuration in non-volatile storage using the <code>synchronize</code> command |
| FAIL | In the fail state, the node has failed and needs to be restarted or repaired. The node reaches this state if the system has a hardware or software failure. |
| INIT | In the initial state, the node is being initialized. A node stays in this state when it is coming up and remains in this state until it has been fully initialized. Being fully initialized means that all of the hardware has been initialized correctly and there are no diagnostic faults. |
| MASTER | In the primary state, the node is responsible for all switch management functions. |
| STANDBY | In the standby state, leader election occurs—the primary and backup nodes are elected. The priority of the node is only significant in the standby state. |

Example

The following command displays the status of the node, the priority of the node, and the general health of the system:

```
show node
```

The following is sample output from this command:

```
Node   State      Priority   SwHealth   HwHealth
-----
1  MASTER          0         49         7
2  BACKUP         0 49         7
```

If you specify the detail option, the same information is displayed on a per node basis rather than in a tabular format, as shown in the following example:

```
Node 1 information:
Node State:  MASTER
Node Priority: 0
Sw Health:  49
Hw Health:  7
Node MSM-B information:
Node State:  BACKUP
Node Priority: 0
Sw Health:  49
Hw Health:  7
```

History

This command was first available in an ExtremeXOS 10.1.

Platform Availability

This command is available only on SummitStack.

show nodealias

```
show nodealias
```

Description

This command shows basic information collected by the Node Alias feature. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

This command has no arguments or variables.

Default

None.

Usage Guidelines

The following information about the Node Alias feature appears:

- **Max Entries**—Total number of the entries learned through the Node Alias feature on the switch.
- **Active Entries**—Number of the active entries learned through the Node Alias feature on the switch.
- **Purge Time**—Last time an entry was purged from the Node Alias table on the switch.
- **State**—State of the Node Alias table on the switch.
- **Protocols Enabled**—Lists the currently enabled protocols that Node Alias detects.
- **Ports Enabled**—Lists the currently Node Alias-enabled ports with each port's active and maximum (configured using `configure nodealias ports [port_list |all] maxentries entries`) number of alias entries. This information appears in the form: port # (active alias entries #/maximum alias entries #). For example, "1(2/10)".

Example

The following example shows basic information about the Node Alias feature:

```
# show nodealias
Max Entries:          0                Active Entries: 0
Purge Time:          State:          2
Protocols Enabled:   ip, ipv6, ospf, bgp, bootps, bootpc, vrrp, dhcps, dhcpc, bpdu,
udp, mdns, llmnr, ssdp,
Ports Enabled:

Shown in parentheses are the active # and maximum # aliases on the port.
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show nodealias ip address

```
show nodealias ip ip_address
```

Description

This command shows alias information collected by the Node Alias feature for the specified IP address. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

| | |
|-------------------|---|
| nodealias | Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis. |
| ip | Designates displaying node aliases with the specified IP address. |
| <i>ip_address</i> | Specifies for which IP address to display node alias information. |

Default

N/A

Example

The following example shows node alias information for IP address 10.51.2.1:

```
# show nodealias ip 10.51.2.1
```

| Port | MAC Address | Alias ID | Time Last Learned | VID | Protocol | Source IP |
|------|-------------------|-----------|---------------------|-----|----------|-----------|
| 10 | 00:00:5e:00:01:02 | 716168949 | 2016-06-24 13:26:41 | 1 | ip | 10.51.2.1 |

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, , X695, X870, 5420, 5520 series switches.

show nodealias mac

```
show nodealias mac mac_address {protocol protocol_name | ports
  [port_list | all]}
```

Description

This command shows alias information collected by the Node Alias feature for the specified MAC address. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

| | |
|--------------------|---|
| nodealias | Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis. |
| mac | Designates displaying node aliases with the specified MAC address. |
| <i>mac_address</i> | Specifies for which MAC address to display node alias information. |

| | |
|----------------------|--|
| protocol | Designates that you want to see only alias information discovered by a particular protocol (default is all protocols). |
| <i>protocol_name</i> | Specifies the protocol that you want to see alias information discovered by: ip, ipv6, ospf, bgp, bootps, bootpc, vrrp, dhcpc, dhcpc, bpdu, udp, mdns, llmnr, or ssdp. |
| ports | Designates that you want to only see node alias information for the selected ports (default is all ports). |
| <i>port_list</i> | Specifies for which ports to show node alias information. Designated as a port list separated by comma (,) or dash (-). |
| all | (Default) Shows node alias information for all ports. |

Default

If a specific protocol is not selected, information appears for all protocols. If specific port(s) are not selected, information appears for all ports.

Example

The following example shows node alias information for MAC address 20:b3:99:5e:b5:e5 and on all ports, discovered by all protocols:

```
# show nodealias mac 20:b3:99:5e:b5:e5
```

| Port | MAC Address | Alias ID | Time Last Learned | VID | Protocol | Source IP |
|------|-------------------|-----------|---------------------|-----|----------|-----------|
| 10 | 20:b3:99:5e:b5:e5 | 716168878 | 2016-06-24 13:23:57 | 1 | ip | 10.50.0.2 |

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show nodealias ports

```
show nodealias ports {port_list| all}
```

Description

This commands shows, for the specified ports, the aliases discovered using the Node Alias feature (MAC address, alias ID, time last learned, VID, protocol, and source IP address). Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems are captured in a database that can be queried.

Syntax Description

| | |
|------------------|---|
| nodealias | Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis. |
| ports | Specifies information on the ports for the Node Alias feature. |
| <i>port_list</i> | Specifies for which ports to display information. Designated as a port list separated by comma (,) or dash (-). |
| all | (Default) Specifies showing Node Alias information for all ports. |

Default

If the ports are not specified, information appears for all ports.

Example

The following example shows Node Alias information for port 10:

```
# show nodealias ports 10
```

| Port | MAC Address | Alias ID | Time Last Learned | VID | Protocol | Source IP |
|------|-------------------|-----------|---------------------|-----|----------|--------------|
| 10 | 5c:26:0a:57:e9:2a | 716168369 | 2016-06-24 13:23:56 | 1 | dhcpc | |
| 10 | 00:04:96:97:d1:86 | 716168370 | 2016-06-24 13:23:57 | 1 | ip | 10.50.121.30 |
| 10 | 20:b3:99:5e:b5:e5 | 716168371 | 2016-06-24 13:23:57 | 1 | ip | 10.50.4.2 |
| 10 | 20:b3:99:5e:b5:f5 | 716168378 | 2016-06-24 13:23:57 | 1 | ipv6 | |

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show nodealias protocol

```
show nodealias protocol protocol_name
```

Description

This command shows alias information collected by the Node Alias feature by the specified protocol. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

| | |
|----------------------|--|
| nodealias | Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis. |
| protocol | Designates that you want to see only alias information discovered by a particular protocol (default is all protocols). |
| <i>protocol_name</i> | Specifies the protocol that you want to see alias information discovered by: ip, ipv6, ospf, bgp, bootps, bootpc, vrrp, dhcps, dhcpc, bpdu, udp, mdns, llmnr, or ssdp. |

Default

If a specific protocol is not selected, information appears for all protocols. If specific port(s) are not selected, information appears for all ports.

Example

The following example...

```
example in codeblock
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show ntp

```
show ntp
```

Description

Displays the global NTP status of the switch.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP status of the switch:

```
Switch# show ntp
NTP                : Enabled
Authentication     : Disabled
Broadcast-Client   : Disabled
VR                 : VR-Default
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp association statistics

```
show ntp association [{ip_address} | {host_name}] statistics
                    [{vr}vr_name]
```

Description

Shows NTP-related statistics about a specific NTP server.

Syntax Description

| | |
|-------------------|---|
| <i>ip_address</i> | Server or peer IP address. |
| <i>host_name</i> | Server or peer name. |
| vr | Specifies information for a particular virtual router. |
| <i>vr_name</i> | Name of the particular virtual router. If not specified, VR of current command context is used. |

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows NTP-related statistics about the NTP server called “1.us.pool.ntp.org”:

```
Switch# show ntp association 1.us.pool.ntp.org statistics
Remote Host      : 1.us.pool.ntp.org
Local Interface  : 10.45.203.74
Time Last Received : 40 second
Time Until Next Send: 27 second
Reachability Change : 849 second
Packets Sent     : 18
Packets Received : 18
Bad Authentication : 0
Bogus Origin     : 0
Duplicate        : 0
Bad Dispersion   : 0
Bad Reference Time : 0
Candidate Order  : 4
Peer Flags       : Config, Broadcast Client, Initial Burst
```

The following command shows NTP-related statistics for the NTP server at 128.138.141.172 for virtual router “VR-Mgmt”:

```
# show ntp association 128.138.141.172 statistics vr "VR-Mgmt"
VR Name          : VR-Mgmt
Remote Host      : 128.138.141.172
Local Interface  : 10.127.2.180
Time Last Received : 146 seconds
Time Until Next Send: 113 seconds
Reachability Change : 2564 seconds
Packets Sent     : 86
Packets Received : 86
Bad Authentication : 0
Bogus Origin     : 0
Duplicate        : 0
Bad Dispersion   : 0
Bad Reference Time : 0
Candidate Order  : 6
```

History

This command was first available in ExtremeXOS 12.7.

Virtual router keyword added in ExtremeXOS 22.2

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp association

```
show ntp association [{ip_address} | {host_name}] {{vr} vr_name}
```

Description

Shows all of the NTP clock source information, from a statically configured server, peer, or broadcast server. The NTP service updates the local clock from only one NTP server, with the best stability and stratum value which is considered as a system peer.

Syntax Description

| | |
|-------------------|---|
| <i>ip_address</i> | Server or peer IP address. |
| <i>host_name</i> | Server or peer name. |
| vr | Specifies information for a particular virtual router. |
| <i>vr_name</i> | Name of the particular virtual router. If not specified, VR of current command context is used. |

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows detailed information about the NTP server:

```
# show ntp association
VR Name      Remote                               Reference ID   St Poll Reach Delay   Offset   Disp
=====
VR-Mgmt      !45.125.255.53                        223.255.185.2  2  64   1    0.01172 -0.08789
1.98431
VR-Mgmt      !10.127.2.255                          BCST           16 64   0    0.00000 +0.00000
4.00000
```

The following command shows detailed information for the NTP server at 128.138.141.172 for virtual router "VR-Mgmt":

```
# show ntp association 128.138.141.172 vr "VR-Mgmt"
VR Name      : VR-Mgmt
Remote IP    : 128.138.141.172 Local IP      : 10.127.2.180

```

History

This command was first available in ExtremeXOS 12.7.

Virtual router keyword added in ExtremeXOS 22.2

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp key

```
show ntp key
```

Description

Shows the NTP key index number, trusted or non-trusted, authentication type, and encrypted key string.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP key index number, trusted or non-trusted, authentication type, and encrypted key string:

```

# show ntp key
Key Index      Trusted   Auth      Key String (encrypted)
=====
100            No       MD5       67:74:7d:78:6f:6c:67:5b:33
200            Yes      SHA-256   23:24:6c:35:4a:35:79:74:65

```

History

This command was first available in ExtremeXOS 12.7.

SHA-256 information was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp restrict-list

```
show ntp restrict-list {user | system} [{vr}vr_name]
```

Description

Shows the NTP access list of the current system based on the source IP blocks.

Syntax Description

| | |
|---------------|---|
| user | Displays the NTP access list of the current user. |
| system | Displays the for the current system. |
| all | Displays both user and system data. |
| vr | Specifies showing NTP information for a given VR. |
| vr_name | Specifies which VR to show information about. If a VR name is not specified, the VR of the current command context is used. |

Default

Displays all by default.

Usage Guidelines

N/A.

Example

The following command displays all NTP access list information for VR "VR-Mgmt":

```
# show ntp restrict-list user vr "VR-Mgmt"
VR Name          IP Address      Mask                Count Type  Action
=====
VR-Mgmt          1.1.1.1         255.255.255.255    0 User    Permit
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** keyword was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp server

```
show ntp server
```

Description

Shows the NTP servers configured on the switch, including the name, IP address, key ID, and index.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP servers configured on the switch:

```
# show ntp server
VR Name           Name                IP Address          Type      Flags  Key
Index
=====
VR-Mgmt           45.125.255.53      45.125.255.53      Server    I      -
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp sys-info

```
show ntp sys-info
```

Description

Shows the current system status based on the most reliable clock server or NTP server.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the current system status based on the most reliable clock server or NTP server:

```
switch # show ntp sys-info
System Peer       : 0.us.pool.ntp.org
System Peer Mode  : Client
Leap Indicator    : 00
Stratum           : 3
Precision         : -20
Root Distance     : 0.09084 second
Root Dispersion   : 0.23717 second
Reference ID      : [216.93.242.12]
Reference time    : d140571d.e8389ff7 Fri, Apr 1 2011 6:52:29.907
System Flags      : Monitor, Ntp, Kernel, Stats
Jitter           : 0.004700 second
Stability         : 0.000 ppm
Broadcast Delay   : 0.007996 second
Auth Delay        : 0.000000 second
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp vlan

```
show ntp vlan {{vr} vr_name}
```

Description

Shows the NTP status of each VLAN configured on the switch.

Syntax Description

| | |
|----------------|---|
| vr | Specifies showing NTP information for a given VR. |
| <i>vr_name</i> | Specifies which VR to show information about. If a VR name is not specified, the VR of the current command context is used. |

Default

If a VR name is not specified, the VR of current command context is used.

Usage Guidelines

N/A.

Example

The following command shows the NTP status of VLAN "mgmt":

```
# show ntp vlan "mgmt"
VR Name      Vlan          NTP Status  Broadcast Server  Key Index
=====
VR-Mgmt      Mgmt          Disabled    Disabled          -
```

The following example displays all VLANs for VR "VR-Default":

```
# show ntp vlan vr "VR-Default"
VR Name      Vlan          NTP Status  Broadcast Server  Key Index
=====
VR-Default   Default       Disabled    Disabled          -
VR-Default   vlan1         Disabled    Disabled          -
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** keyword was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ntp vr

```
show ntp {{vr}}vr_name}
```

Description

This command shows NTP information for the specified VR.

Syntax Description

| | |
|----------------|---|
| ntp | Network Time Protocol. |
| vr | Specifies showing NTP information for a given VR. |
| <i>vr_name</i> | Specifies which VR to show information about. If a VR name is not specified, the VR of the current command context is used. |

Default

If a VR name is not specified, the VR of the current command context is used.

Example

The following example shows NTP information for VR "vr1".

```
# show ntp
NTP           : Enabled
Authentication : Disabled
Broadcast-Client : Disabled
VR            : vr1
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show odometers

```
show odometers
```

Description

Displays a counter for each component of a switch that shows how long it has been functioning since it was manufactured.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output from this command displays how long individual components in the switch have been functioning since it was manufactured. This odometer counter is kept in the EEPROM of each monitored component.

Recorded Statistics

The following odometer statistics are collected by the switch:

- Service Days—The amount of days that the component has been running.
- First Recorded Start Date—The date that the component was powered-up and began running.

Depending on the software version running on your switch and the type of switch you have, additional or different odometer information may appear.

Example

The following command displays how long each component of a switch has been functioning since its manufacture date:

```
show odometers
```

The following is sample output from a stand-alone switch:

```
Service  First Recorded
Field Replaceable Units      Days      Start Date
-----
Switch   : SummitX              7  Dec-08-2004

Service  First Recorded
Field Replaceable Units      Days      Start Date
-----
Switch   : X(SS)                381  Oct-29-2009
VIM1-SS-1 :                    376  Jul-30-2009
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ospf

```
show ospf
```

Description

Displays global *OSPF* information.

Syntax Description

This command has no keywords or arguments.

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command displays global OSPF information:

```
show ospf
```

The following is sample output from this command:

```

OSPF                : Disabled                MPLS LSP as Next-Hop: No

```

History

This command was first available in ExtremeXOS 10.1.

The [SNMP Traps](#) and 40G parameters were added in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf area

```
show ospf area {detail | area-identifier}
```

Description

Displays information about the [OSPF](#) area.

Syntax Description

| | |
|------------------------|--|
| detail | Specifies to display the information in detailed format. |
| <i>area-identifier</i> | Specifies an OSPF area. |

Default

N/A.

Usage Guidelines

None.

Example

The following is sample output from this command:

```
# show ospf area
AREA ID      Type Summ  Def   Num  Num  SPF  Num   LSA
Metric ABR  ASBR Runs LSAs  Checksum
0.0.0.0      NORM ----  -----  0   0   0   0     0x0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf ase-summary

```
show ospf ase-summary
```

Description

Displays the [OSPF](#) external route aggregation configuration.

Syntax Description

this command has no keywords or arguments.

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command displays the OSPF external route aggregation configuration:

```
show ospf ase-summary
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf interfaces

```
show ospf interfaces {vlan vlan-name | area area-identifier | enabled}
```

Description

Displays information about one or all [OSPF](#) interfaces.

Syntax Description

| | |
|------------------------|--|
| <i>vlan-name</i> | Specifies a <u>VLAN</u> name. |
| <i>area-identifier</i> | Specifies an OSPF area. |
| enabled | Displays only OSPF enabled interfaces. |

Default

If no argument is specified, all OSPF interfaces are displayed.

Usage Guidelines

Not applicable.

Example

The following command displays information about one or all OSPF interfaces on the VLAN accounting:

```
show ospf interfaces vlan accounting
```

The following output displays BFD protection configuration information:

```
# show ospf interfaces

VLAN      IP Address      AREA ID      Flags      Cost State  Neighbors
HQ_10_0_2 10.0.2.2        /24 0.0.0.0  -rifb--    4/A R      1
HQ_10_0_5 10.0.5.2        /24 0.0.0.0  -rif---    4/A BR     1

Flags:  b - BFD protection configured, f - Interface Forwarding Enabled,
        i - Interface OSPF Enabled, n - Multinetted VLAN,
        p - Passive Interface, r - Router OSPF Enable,
Cost:    A - Automatic Cost, C - Configured Cost.

Total number of interfaces: 2
```

The following output displays the BFD session state:

```
Interface(rif1000027): 10.0.2.2/24 Vlan: HQ_10_0_2 OSPF: ENABLED Router: ENABLED
AreaId: 0.0.0.0 RtId: 10.0.2.2 Link Type: broadcast(auto) Passive: No
Cost: 4/A Priority: 10 Transit Delay: 1 DAD State:Valid
Hello Interval: 10s Rtr Dead Time: 40s Retransmit Interval: 5s
Wait Timer: 40s
Authentication: NONE
State: DR Number of events: 1
DR RtId: 10.0.2.2 DR IP addr: 10.0.2.2 BDR IP addr: 10.0.2.1
Num Neighbor State Change to FULL : 1
BFD Protection: On

Neighbors:
  RtrId: 10.0.3.1 IpAddr: 10.0.2.1 Pri: 5 Type: Auto
  State: FULL Dr: 10.0.2.2 BDR: 10.0.2.1 Dead Time: 00:00:00:03
  Options (0x42): Opaque LSA: Yes
  BFD Session State: Active
```

History

This command was first available in ExtremeXOS 10.1.

The enabled option was added in ExtremeXOS 12.2.

BFD display output was added in 15.3.2.

The D (duplicate address detected on VLAN) and T (tentative address) flags were removed in ExtremeXOS 30.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf interfaces detail

```
show ospf interfaces detail
```

Description

Displays detailed information about all *OSPF* interfaces.

Syntax Description

| | |
|---------------|--|
| detail | Specifies to display the information in detailed format. |
|---------------|--|

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command displays information about all OSPF interfaces:

```
show ospf interfaces detail
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf lsdb

```
show ospf lsdb {detail | stats} {area [area-identifier | all]} {{lstype}
  [lstype | all]} {lsid lsid-address{lsid-mask}} {routerid routerid-
  address {routerid-mask}} {interface [[ip-address{ip-mask} | ipNetmask]
  | vlan vlan-name]}
```

Description

Displays a table of the current Link-State Database (LSDB).

Syntax Description

| | |
|-------------------------|--|
| detail | Specifies to display all fields of matching LSAs in a multi-line format. |
| stats | Specifies to display the number of matching LSAs, but not any of their contents. |
| <i>area-identifier</i> | Specifies an OSPF area. |
| all | Specifies all OSPF areas. |
| <i>lstype</i> | Specifies an LS type. |
| lsid | Specifies an LS ID. |
| <i>lsid-mask</i> | Specifies an LS ID mask. |
| <i>routerid-address</i> | Specifies a LSA router ID address. |
| interface | Specifies to display interface types. |
| <i>vlan-name</i> | Specifies a VLAN name. |

Default

Display in summary format.

Usage Guidelines

ExtremeXOS provides several filtering criteria for the show ospf lsdb command. You can specify multiple search criteria and only the results matching all of the criteria are displayed. This allows you to control the displayed entries in large routing tables.

A common use of this command is to omit all optional parameters, resulting in the following shortened form:

```
show ospf lsdb
```

The shortened form displays all areas and all types in a summary format.

You can filter the display using either the area ID, the remote router ID, or the link-state ID. The default setting is all with no detail. If detail is specified, each entry includes complete LSA information.

Example

The following command displays all areas and all types in a summary format:

```
show ospf lsdb
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf memory

```
show ospf memory {detail | memoryType}
```

Description

Displays *OSPF* specific memory usage.

Syntax Description

| | |
|-------------------|---|
| detail | Displays detail information. |
| <i>memoryType</i> | Specifies the memory type usage to display. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays OSPF specific memory for all types:

```
show ospf memory detail
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf neighbor

```
show ospf neighbor {routerid [ip-address {ip-mask} | ipNetmask]} {vlan
  vlan-name} {detail}
```

Description

Displays information about an [OSPF](#) neighbor.

Syntax Description

| | |
|-------------------|--|
| <i>ip-address</i> | Specifies an IP address. |
| <i>ip-mask</i> | Specifies a subnet mask. |
| <i>ipNetmask</i> | Specifies IP address / Netmask. |
| <i>vlan-name</i> | Specifies a VLAN name. |
| detail | Specifies detail information. |

Default

If no argument is specified, all OSPF neighbors are displayed.

Usage Guidelines

Not applicable.

Example

The following command displays information about the OSPF neighbors on the VLAN accounting:

```
show ospf neighbor vlan accounting
```

The following command output displays BFD protection status of all OSPF neighbors:

```
# show ospf neighbor
Neighbor ID      Pri State                Up/Dead Time      Address           Interface
      BFD Session State
=====
```

```

  Time since last Hello 00:00:00:00
  Retransmission queue length is 0
  BFD Session State: None

```

History

This command was first available in ExtremeXOS 10.1.

BFD output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospf virtual-link

```
show ospf virtual-link {router-identifier area-identifier}
```

Description

Displays virtual link information about a particular router or all routers.

Syntax Description

| | |
|--------------------------|---|
| <i>router-identifier</i> | Specifies a router interface number. |
| <i>area-identifier</i> | Specifies an OSPF area. |

Default

N/A.

Usage Guidelines

The area-identifier refer to the transit area used for connecting the two end-points. The transit area cannot have an area identifier of 0.0.0.0 and cannot be a stub or NSSA area.

Example

The following command displays virtual link information about a particular router:

```
show ospf virtual-link 1.2.3.4 10.1.6.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3

```
show ospfv3
```

Description

Displays global [OSPFv3](#) information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays global OSPFv3 information:

```
show ospfv3
```

The following is sample output:

```
OSPFv3           : Disabled           RouterId         : 0.0.0.0

```

History

This command was first available in ExtremeXOS 11.2.

The 40G parameter was added in ExtremeXOS 12.6.

SNMP trap status information was added in ExtremeXOS 22.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3 area

```
show ospfv3 area {area_identifier | detail}
```

Description

Displays information about [OSPFv3](#) areas.

Syntax Description

| | |
|------------------------|---|
| <i>area_identifier</i> | Specifies an OSPFv3 area, a four-byte, dotted decimal number. |
| detail | Specifies to display the information in detailed format. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays summary information about the OSPFv3 areas:

```
show ospfv3 area
```

The following is sample output:

```

AREA ID          Type Summ Def   Num Num  Num  SPF  Num  LSA

```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3 interfaces

```
show ospfv3 interfaces {vlan vlan_name | tunnel tunnel_name | area
  area_identifier | detail}
```

Description

Displays information about one or all [OSPFv3](#) interfaces.

Syntax Description

| | |
|------------------------|---|
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN . |
| <i>tunnel_name</i> | Specifies an IPv6 tunnel. |
| <i>area_identifier</i> | Specifies an OSPFv3 area, a four-byte, dotted decimal number. |
| detail | Specifies to display the information in detailed format. |

Default

If no argument is specified, all OSPFv3 interfaces are displayed.

Usage Guidelines

None.

Example

The following command shows a summary of the OSPFv3 interfaces:

```
show ospfv3 interfaces
```

The following is sample output from the command:

```
Interface  IPV6 Address          AREA ID      Flags Cost   State  Nbrs
v100      2001:db8:10::2/64    0.0.0.0     -rif- 40/A   P2P    1

```

History

This command was first available in ExtremeXOS 11.2.

BFD example output was added in 15.3.2.

Support for new **Link Type** and **State** values (Link Type: point-to-point, State: P2P) were added in ExtremeXOS 15.7.1.

IPsec Authentication information was added in ExtremeXOS 31.2.

Authentication Trailer information was added in ExtremeXOS 31.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3 lsdb stats

```
show ospfv3 lsdb stats {area [area_identifier | all] {lstype [router |
network | inter-prefix | inter-router | intra-prefix | nssa]} | [vlan
[vlan_name | all] | tunnel [tunnel_name | all]] {lstype link} |
lstype [as-external | router | network | inter-prefix | inter-router
| intra-prefix | link]} {lsid lsid_address} {adv-router
router_identifier}
```

Description

Displays a table of the current Link-State Database (LSDB) statistics.

Syntax Description

| | |
|--------------------------|---|
| <i>area_identifier</i> | Specifies an OSPFv3 area, a four-byte, dotted decimal number. |
| all | Specifies all OSPFv3 areas, IPv6 configured VLANs, or IPv6 tunnels. |
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN . |
| <i>tunnel_name</i> | Specifies an IPv6 tunnel. |
| link | Link LSA. |
| router | Router LSA. |
| network | Network LSA. |
| inter-prefix | Inter Area Prefix LSA. |
| inter-router | Inter Area Router LSA. |
| intra-prefix | Intra Area Prefix LSA. |
| nssa | NSSA LSA. |
| as-external | AS External LSA. |
| <i>lsid_address</i> | Specifies the link state ID of the LSA. |
| <i>router_identifier</i> | Specifies the router identifier of the advertising router. |

Default

Display in summary format.

Usage Guidelines

ExtremeXOS provides several filtering criteria for the `show ospfv3 lsdb stats` command. You can specify multiple search criteria and only the results matching all of the criteria are displayed. This allows you to control the displayed entries in large routing tables.

A common use of this command is to omit all optional parameters, resulting in the following shortened form:

```
show ospfv3 lsdb stats
```

The shortened form displays all areas and all types in a summary format.

You can filter the display using either the area ID, the remote router ID, or the link-state ID. The default setting is all.

Example

The following command displays all areas and all types in a summary format:

```
show ospfv3 lsdb stats
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3 lsdb

```
show ospfv3 lsdb {detail} {area [area_identifier | all] {lstype [router
| network | inter-prefix | inter-router | intra-prefix | nssa]} |
[vlan [vlan_name | all] | tunnel [tunnel_name | all]] {lstype link} |
lstype [as-external | router | network | inter-prefix | inter-router
| intra-prefix | link]} {lsid lsid_address} {adv-router
router_identifier}
```

Description

Displays a table of the current Link-State Database (LSDB).

Syntax Description

| | |
|------------------------|---|
| detail | Specifies to display all fields of matching LSAs in a multi-line format. |
| <i>area_identifier</i> | Specifies an OSPFv3 area, a four-byte, dotted decimal number. |

| | |
|--------------------------|---|
| <i>vlan_name</i> | Specifies an IPv6 configured <u>VLAN</u> . |
| <i>tunnel_name</i> | Specifies an IPv6 tunnel. |
| all | Specifies all OSPFv3 areas, IPv6 configured VLANs, or IPv6 tunnels. |
| link | Link LSA |
| as-external | AS External LSA |
| router | Router LSA |
| network | Network LSA |
| inter-prefix | Inter Area Prefix LSA |
| inter-router | Inter Area Router LSA |
| intra-prefix | Intra Area Prefix LSA |
| nssa | NSSA LSA. |
| <i>lsid_address</i> | Specifies the link state ID of the LSA. |
| <i>router_identifier</i> | Specifies the router identifier of the advertising router. |

Default

Display in summary format.

Usage Guidelines

ExtremeXOS provides several filtering criteria for the `show ospfv3 lsdb` command. You can specify multiple search criteria and only the results matching all of the criteria are displayed. This allows you to control the displayed entries in large routing tables.

A common use of this command is to omit all optional parameters, resulting in the following shortened form:

```
show ospfv3 lsdb
```

The shortened form displays all areas and all types in a summary format.

You can filter the display using either the area ID, the remote router ID, or the link-state ID. The default setting is all with no detail. If detail is specified, each entry includes complete LSA information.

Example

The following command displays all areas and all types in a summary format:

```
show ospfv3 lsdb
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3 neighbor

```
show ospfv3 neighbor {routerid ip_address} {vlan vlan_name | tunnel
  tunnel_name} {detail}
```

Description

Displays information about an [OSPFv3](#) neighbor.

Syntax Description

| | |
|--------------------------|---|
| <code>ip_address</code> | Specifies a neighbor router ID. |
| <code>vlan_name</code> | Specifies an IPv6 configured VLAN . |
| <code>tunnel_name</code> | Specifies an IPv6 tunnel. |
| detail | Specifies detail information. |

Default

If no argument is specified, all OSPFv3 neighbors are displayed.

Usage Guidelines

None.

Example

The following command displays information about the OSPFv3 neighbors on the VLAN accounting:

```
show ospfv3 neighbor vlan accounting
```

The following three examples provide sample outputs for `show ospfv3 neighbor`:

```
# show ospfv3 neighbor
Neighbor ID      Pri State           Up/Dead Time      Interface          InstanceID
-----
          BFD Session State

```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ospfv3 virtual-link

```
show ospfv3 virtual-link {{routerid} router_identifier {area}
area_identifier}
```

Description

Displays virtual link(s) information.

Syntax Description

| | |
|--------------------------|---|
| <i>router_identifier</i> | Specifies a router identifier, a four-byte, dotted decimal number. |
| <i>area_identifier</i> | Specifies an OSPFv3 area, a four-byte, dotted decimal number. |

Default

N/A.

Usage Guidelines

Router-identifier—Router ID for the other end of the link.

Area-identifier—Transit area used for connecting the two end-points. The transit area cannot have an area identifier of 0.0.0.0 and cannot be a stub or NSSA area.

Example

The following command displays information about the virtual link to a particular router:

```
# show ospfv3 virtual-link

Neighbor Router ID : 0.0.0.3           Transit Area ID      : 0.0.0.1
Hello Interval     : 10s               Router Dead Interval: 40s
Retransmit Interval : 5s               Transit Delay        : 1s

  Options: 0x13 (-|R|-|-|E|V6)
```

History

This command was first available in ExtremeXOS 11.2.

IPsec Authentication information was added in ExtremeXOS 31.2.

Authentication Trailer information was added in ExtremeXOS 31.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show pim anycast-rp

```
show pim {ipv4 | ipv6} anycast-rp {ip_address}
```

Description

Shows rendezvous point (RP) for Anycast RP using PIM (*RFC 4610*) information.

Syntax Description

| | |
|-------------------|--|
| ipv4 | Specifies IPv4 address family. |
| ipv6 | Specifies IPv6 address family. |
| anycast-rp | Shows Anycast RP information. |
| <i>ip_address</i> | Shows information for a specific Anycast RP. |

Default

N/A.

Usage Guidelines

The Anycast RP using PIM feature provides fast convergence when RP routers fail using PIM protocol without using the source discovery protocol Multicast Source Discovery Protocol (MSDP) for both IPv4 and IPv6 address families.

To configure or remove RPs, use the `configure pim {ipv4 | ipv6} anycast-rp ip_address [policy | none]` command.

Example

The following example shows information for all Anycast RP:

```
# show pim anycast-rp
Anycast RP      Policy
-----
Peer's Address  Reg/Stop In  Reg/Stop Out
-----
```

```

150.150.150.1    pim-domain1-v4-anycast-rp
                 10.10.10.1*      50          50
                 20.20.20.1      45          100
                 30.30.30.1      45          56
100.100.100.1   pim-domain1-v4-anycast-rp
                 10.10.10.1*      0           0
                 20.20.20.1      0           0
                 30.30.30.1      0           0

Total number of anycast RP: 2
* Indicates local address

```

The following example shows information for all Anycast RP at IPv6 addresses:

```

# show pim ipv6 anycast-rp
Anycast RP
  Peer's Address
  -----
2002:db8:85a3::8a2e:370:7334
  2001:db8:85a3::8a2e:370:7334*
  2001:db8:85a3::8a2e:370:7335
  2001:db8:85a3::8a2e:370:7336

  45            56
  45            56

Total number of anycast RP: 2
* Indicates local address

```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on platforms that support the appropriate license for the PIM feature. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show pim cache

```
show pim { ipv4 | ipv6 } cache {{detail} | {state-refresh} {mlag-peer-
info} {group_addr {source_addr}}}
```

Description

Displays the multicast cache entries created by PIM.

Syntax Description

| | |
|-----------------------|---|
| ipv4 | Displays IPv4 PIM information |
| ipv6 | Displays IPv6 PIM information. |
| detail | Specifies to display the information in detailed format. |
| <i>group_addr</i> | Specifies an IP group address. |
| <i>source_addr</i> | Specifies an IP source address. |
| state-refresh | Specifies to display the PIM cache entries with state refresh parameters. |
| mlag-peer-info | Shows <i>MLAG</i> peer related information. |

Default

N/A.

Usage Guidelines

Displays the following information:

- IP group address
- IP source address / source mask
- Upstream neighbor (RPF neighbor)
- Interface (*VLAN*) to upstream neighbor
- Cache expire time
- Egress and prune interface list

When the **detail** option is specified, the switch displays the egress VLAN list and the pruned VLAN list.

Example

The following command displays the PIM cache entry for group 239.255.255.1:

```
Switch.33 # show pim cache 239.255.255.1
Index  Dest Group      Source          InVlan  Origin
[0000] 239.255.255.1    124.124.124.124 (WR) v4      Sparse
Entry timer is not run; UpstNbr: 200.124.124.24
EgressIfList = vbs15(0) (FW) (SM) (I)
[0001] 239.255.255.1    118.5.1.1 (S)      vbs5   Sparse
```

```

Expires after 186 secs UpstNbr: 0.0.0.0
RP: 124.124.124.124 via 200.124.124.24 in v4
EgressIfList = vbs15(0) (FW) (SM) (I) , vpim5(170) (FW) (SM) (S)
PrunedIfList = v4(0) (SM)
Number of multicast cache = 20
Entry flags :-
R: RP tree. S: Source tree. W: Any source.
Egress/Pruned interface flags :-
SM: Sparse Mode          DM: Dense Mode
Fw: Forwarding           PP: Prune pending
AL: Assert Loser         N: Neighbor present
I: IGMP member present   S: (s,g) join received
Z: (*,g) join received   Y: (*,*,rp) join received

```

The following command displays the PIM-DM cache entry with state-refresh information for group 225.0.0.1:

```

Switch.5 # show pim cache state-refresh 225.0.0.1
Index  Dest Group      Source              InVlan  Origin
[0001] 225.0.0.1      64.1.1.100 (S)     vixia   Dense   Not Pruned
Expires after 204 secs UpstNbr: 0.0.0.0
Refresh State: Originator(20), TTL: 16
EgressIfList = v36(0) (FW) (DM) (N)
[0001] 225.0.0.1      65.1.1.100 (S)     vixia   Dense   Not Pruned
Expires after 195 secs UpstNbr: 65.1.1.200
Refresh State: Not-Originator(25), TTL: 8
EgressIfList = v36(0) (FW) (DM) (N)

```

The following command displays the ingress VLAN information of all MLAG peers:

```

* (pacman debug) sw6.2 # show pim c mlag-peer-info
Index  Dest Group      Source              InVlan  Origin
[0000] 226.1.1.1      61.2.2.2 (WR)      fifteenth Sparse
Entry timer is not run; UpstNbr: 51.15.15.2
Peer Ingress VLAN (ISC 1): 51.15.15.4/24 (Same)
EgressIfList = eight(0) (FW) (SM) (I) , five(0) (FW) (SM) (I) , ten(0) (FW) (SM) (I)

Peer Ingress VLAN (ISC 1): 51.15.15.4/24 (Same)
EgressIfList = eight(0) (FW) (SM) (I) , five(0) (FW) (SM) (I)
PrunedIfList = ten(0) (SM) (AL)

```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 15.2 to display MLAG peer information.

The **ipv4** and **ipv6** keyword options were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show pim

```
show pim {ipv4 | ipv6 | detail | rp-set {group_addr} | vlan vlan_name}
```

Description

Displays the PIM configuration and statistics.

Syntax Description

| | |
|-------------------|---|
| ipv4 | Displays PIM IPv4 configuration information. |
| ipv6 | Displays PIM IPv6 configuration information. |
| detail | Displays show output in the detailed format. |
| <i>group_addr</i> | Specifies an IP multicast group, for which the RP is to be displayed. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name. |

Default

IPv4 is the default for the `show pim {ipv4 | ipv6}` command.

If no VLAN is specified, the configuration is displayed for all PIM interfaces.

If no multicast group is specified for the `rp-set` option (Rendezvous Point set), all RPs are displayed.

Usage Guidelines

The detail version of this command displays the global statistics for PIM, as well as the details of each PIM enabled VLAN.

Example

The following command displays the global PIM configuration and statistics:

```
* sw4.30 # show pim
PIM Enabled, Version 2
PIM CRP Disabled
BSR state           : ACCEPT_PREFERRED ; BSR Hash Mask : 255.255.255.252
Current BSR Info   : 61.2.2.2 (Priority 20) expires after 78 sec
Configured BSR Info : 0.0.0.0 (Priority 0)
CRP Adv Interval   : 60 sec ; CRP Holdtime: 150
BSR Interval       : 60 sec ; BSR Timeout : 130
Cache Timer        : 210 sec ; Prune Timer : 210

```

History

This command was first available in ExtremeXOS 10.1.

The PIM-SSM information was added in ExtremeXOS 11.4.

Border VLAN information was added in ExtremeXOS 12.0.

The **ipv6** keyword was added to PIM Register Policy Filter feature in ExtremeXOS 15.3.

DR Priority output was added in ExtremeXOS 15.3.2.

IP Route Sharing output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show pim snooping

```
show pim snooping {vlan} vlan_name
```

Description

Displays the PIM snooping configuration for a VLAN.

Syntax Description

| | |
|------------------------|-------------------|
| <code>vlan_name</code> | Specifies a VLAN. |
|------------------------|-------------------|

Default

Disabled.

Usage Guidelines

None.

Example

The following command displays the PIM snooping configuration for the default VLAN:

```
* sw1.79 # show pim snooping "Default"
PIM Snooping          ENABLED
Vlan Default(1)       Snooping DISABLED
```

The following command displays global PIM Snooping configuration:

```
* (pacman debug) sw1.81 # show pim snooping
PIM Snooping          Enabled
<S,G,RPT> Prune       Accept
Vlan                  PIM Snooping   DR          #Nbr
118                   Enabled        NO DR       0
```

History

This command was first available in ExtremeXOS 12.1.

<S,G,RPT> Prune option was added in ExtremeXOS 15.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show policy

```
show policy {policy-name | detail}
```

Description

Displays the specified policy.

Syntax Description

| | |
|--------------------|----------------------------------|
| <i>policy-name</i> | Specifies the policy to display. |
| detail | Show the policy in detail. |

Default

If no policy name is specified, all policies are shown

Usage Guidelines

Use this command to display which clients are using the specified policy. The detail option displays the rules that make up the policy.

Example

The following example displays all policies on the switch:

```
show policy
```

The following is sample output for the command:

```
Switch # sh policy
Policies at Policy Server:
PolicyName                ClientUsage    Client        BindCount
-----
p1                         1              acl           1
p2                         1              acl           1
vlanV1                     1              acl           1
-----
Total Policies : 3
```

History

This command was available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy access-list

```
show policy access-list { [list_dot_ruleprofile-index profile_index ] |
  [ {matches [app-signature | ether | icmp6type | icmptype |
```

```

ipdestsocket | ipfrag | ipproto | ipsourcesocket | iptos | ipttl |
tcpdestportIP | tcpsourceportIP | udpdestportIP | udpsourceportIP ]
{mask mask} {data data} } {actions [ {drop | forward } {cos cos} {-1}
{mirror-destination control_index} {syslog } ] ] } {detail}

```

Description

Displays access list information.

Syntax Description

| | |
|------------------------|---|
| access-list | Specifies configuring access-list features. |
| <i>list_dot_rule</i> | Access-list name with optional rule name in format <i>list_name</i> <i>{rule_name}</i> . |
| profile-index | Specifies the profile index. |
| <i>profile_index</i> | Defines the profile index (range 1–63). This options shows all access list information associated with the specified profile. |
| matches | Shows rules with a specific match type, such as match types such as app-signature, ether, etc. |
| app-signature | Shows application signature specific settings. |
| ether | Shows type field in Ethernet II packet. |
| icmp6type | Shows ICMPv6 type.code. |
| icmptype | Specifies the ICMPv6 type.code. |
| ipdestsocket | Specifies the destination IP address with optional post-fixed port. |
| ipfrag | Specifies IP fragmentation flag. |
| ipproto | Specifies protocol field in IP packet. |
| ipsourcesocket | Specifies source IP address with optional post-fixed port. |
| iptos | Specifies IPv4 type of service/IPv6 traffic class field. |
| ipttl | Specifies IP time to live. |
| tcpdestportIP | Specifies TCP port destination with optional post-fix IPv4 address. |
| tcpsourceportIP | Specifies TCP port source with optional post-fix IPv4 address. |
| udpdestportIP | Specifies UDP port destination with optional post-fix IPv4 address. |
| udpsourceportIP | Specifies UDP port source with optional post-fix IPv4 address. |
| mask | Shows rules based on the number of most significant bits to match data value. |
| <i>mask</i> | Specifies mask value (1-144). Note: You cannot specify "0" because that indicates no mask. |
| data | Specifies showing rules based on the data (corresponds to type option). |

| | |
|---------------------------|---|
| <i>data</i> | Specifies the data value to show (corresponds to type option). You can query for any 'Match data' field of the rule types. The data can be full or partial string or a hexadecimal input that starts with "0x" or "0X" or integer data values (for example: IPTTL, IPTOS, IPProto) Note: Partial matches cannot be found for rule types that have integer values (IPTTL, IPTOS, IPProto, Ether). Since the data field for these rule types only accepts integers (or hex), and are not mixed with IP addresses or ports, it made no sense to do partial matches for these rule types. |
| actions | Shows rules with a specific action, such as CoS, drop, forward, mirror destination, and Syslog. |
| drop | Shows rules that are set to drop any packets that match this rule. |
| forward | Shows rules that are set to forward any packets that match this rule. |
| -1 | Shows rules not assigned a drop or forward action. |
| cos | Shows rules with the specified Class of Service (CoS). |
| <i>cos</i> | Specifies the CoS (0-255 or -1). |
| mirror-destination | Shows rules with the specified mirror destination. |
| <i>control_index</i> | Specifies the mirror destination control index (1-4). |
| syslog | Shows rules with Syslog enabled. |
| detail | Specifies displaying all rule information in detail. |

Default

N/A.

Usage Guidelines

This command provides information about all the rules in an access list and the policy profile index that the access list is associated with.

The **detail** option provides detailed information about each rule.

Note

"Rule Hit Count" is cleared whenever the access list is unassigned from a profile, or the profile's assigned access list changes.

Example

The following example shows information for the access-list "ACL1":

```
# show policy access-list list-name ACL1
PID |ACL/Rule/Match |Match Data |Msk|PortStr |ST|TS|VLAN|CoS |Mir|
 1 |ACL1
   ace4
     UDPSrcPort |135:192.168.0.1 | 22|
     TCPSrcPort |111:123.190.0.1 | 24|All |NV| |drop| | |
   ace3
```

```

    TTL          |22 (0x16)          | 8|All      |NV| |  | 3| |
ace2
    IPTOS        |2 (0x2)           | 8|All      |NV| |  | 2| |
ace1
    Ether        |23 (0x17)         | 16|All     |NV|T |drop| | |

Rule Type - Rule Description: Port, MAC Address, IP address etc.
Rule Data - Varies depending on Rule Type
Mask      - Mask size for rule data where applicable
ST        - V-Volatile NV-NonVolatile
TS        - Flags:
    T-Traps S-Syslog
For Profile Identifier (PID) Rules:
    VLAN - VLAN ID, drop or forward (fwr)
    CoS  - Class Of Service
Mir      - Mirror index if assigned or prohibited (pro)

```

The following example shows detailed information about rules that are configured to drop packets:

```

# show policy access-list action drop detail
=====
Access-list:          :ACL1
Profile Index        :1
  Rule Name           :ace4
    Match Type 1      :UDP Source Port
    Match Data 1      :135:192.168.0.1
    Match Mask 1      :22
    Actions
      VLAN            :0      (Drop)
      COS              :-1     (Unconfigured)
      Mirror           :-1     (Unconfigured)
      Rule Hit Count   : 0
      Syslog Status    : Disabled
      Trap Status      : Disabled
  Rule Name           :ace1
    Match Type 1      :Ether Type
    Match Data 1      :23
    Match Mask 1      :16
    Actions
      VLAN            :0      (Drop)
      COS              :-1     (Unconfigured)
      Mirror           :-1     (Unconfigured)
      Rule Hit Count   : 222
      Syslog Status    : Disabled
      Trap Status      : Enabled
=====

```

The following example shows explicit and implicit forward rules:

```

# show policy access-list actions forward
PID |ACL/Rule/Match |Match Data |Msk|PortStr |ST|S|VLAN|CoS |Mir|
31  |ACE
    rule3
      IPDest      |10.4.5.6:22      | 48|
      TCPSrcPort  |62:10.7.8.9      | 48|All      |NV|S|fwr| 1| 4|
31  |ACE
    rule4
      TCPDestPort |22                | 16|
      IPProto     |6 (0x6)           | 8|
      Ether       |2048 (0x800)      | 16|All      |NV|S|fwr| 7| 2|
31  |ACE
    rule5
      UDPSrcPort  |162:192.1.2.3    | 48|
      UDPDestPort |163:192.3.2.1    | 48|
      TTL         |5 (0x5)           | 8|

```

```

31  IPTOS          |5 (0x5)          | 8|All          |NV|S|fwr| 4| 2|
   |ACE
     rule7
       IPSource    |10.124.8.9       | 32|
       IPProto     |6 (0x6)          | 8|
       Application |Health Car ICICIPrude| 72|All          |NV|S|fwr| 3| 1|

```

The following example displays implicit CoS rule information:

```

# show policy access-list actions cos -1
PID |ACL/Rule/Match |Match Data          |Msk|PortStr |ST|S|VLAN|CoS |Mir|
31  |ACE
     rule1
       IPSource    |10.1.2.3         | 32|
       ICMPType    |8.0              | 16|
       Ether       |2048 (0x800)     | 16|All          |NV|S|drop|   |  |
ACL/Rule/Match:

```

The following example shows partial matches for rules with data "IC":

```

# show policy access-list data IC
PID |ACL/Rule/Match |Match Data          |Msk|PortStr |ST|S|VLAN|CoS |Mir|
31  |ACE
     rule7
       IPSource    |10.124.8.9       | 32|
       IPProto     |6 (0x6)          | 8|
       Application |Health Car ICICIPrude| 72|All          |NV|S|fwr| 3| 1|

```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy access-list action-set

```
show policy access-list action-set {set_id}
```

Description

Shows the pre-defined action set for use in RADIUS Change of Authentication (CoA).

Syntax Description

| | |
|--------------------|--|
| access-list | Specifies access-list features. |
| action-set | Defines viewing the set of actions applied to multiple sets of match conditions. |
| <i>set_id</i> | Specifies viewing a particular action set identified with the global action-set ID (range 1-63). |

Default

N/A.

Usage Guidelines

If you do not specify a *set_id*, all actions sets appear.

You can made configuration changes using the `create policy access-list action-set set-id [{drop | forward} {cos cos} {mirror-destination control_index} {syslog}]` command.

Example

The following example shows information for action set "1":

```
# show policy access-list action-set 1
PID |ACL/Rule/Match |Match Data |Msk|PortStr |ST|S|VLAN|CoS |Mir|
| action set 1 | | | | |NV|S| | 3| |
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy allowed-type

```
show policy allowed-type ports {detail}
```

Description

Use this command to display a list of currently supported traffic rules applied to the administrative profile for one or more ports.

Syntax Description

| | |
|---------------------|--|
| allowed-type | Show the list of currently supported and allowed traffic rules applied to the admin rules for each dot1D bridge ports. |
| <i>ports</i> | Port list. |
| detail | Displays all information in detail. |

Default

If **detail** is not specified, summary information is displayed.

Usage Guidelines

The show policy allowed-type command output displays traffic rule types in attribute ID order (1-31) from left to right. Traffic rule type precedence defaults to the attribute ID order.

The show policy allowed-type command specifies two categories of traffic rule type: supported and allowed. Supported indicates whether the specified port supports the traffic rule type. Allowed is an administrative function. By default, all supported traffic rule types are allowed on the port.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy app-signature

```
show policy app-signature
```

Description

Shows minimum time-to-live (TTL) value for Layer 7 policy/application signature.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The TTL minimum value set by the following command:

```
configure policy app-signature minimum-ttl [none | 1 | 5 | 10]
```

Example

The following example shows the minimum TTL value:

```
# show policy app-signature
Policy Application Signature minimum DNS-reply TTL value is 5 minutes
```

History

This command was first available in ExtremeXOS 30.5.

Limitations

The ExtremeSwitching X435 series switch does not support Layer 7 policy (DNS).

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy app-signature group

```
show policy app-signature group {group {name name}} {built-in | custom
  {detail} | detail}
```

Description

Shows policy application signature information.

Syntax Description

| | |
|----------------------|---|
| app-signature | Shows application signature specific information. |
| group | Shows application signature group-specific settings. |
| <i>group</i> | Shows application signature information for the specified group name. |
| name | Shows application signature display name-specific information. |
| <i>name</i> | Shows application signature information for the specified display name. |
| built-in | Shows only built-in signature names (default is both built-in and custom). |
| custom | Shows only user custom signature names (default is both built-in and custom). |
| detail | Specifies showing additional signature names and also signature patterns if the name is custom. |

Default

By default, both built-in and custom names appear.

Usage Guidelines

Pre-defined/built-in patterns for signature names do not appear.

Example

The following example shows application signature information for the group "E-commerce" and name "Warehouse":

```
# show policy app-signature group "E-commerce" name Warehouse

Application Signature
Index Group Name
-----
5      E-commerce
      Index Type      Signature Name
      -----
      5000 Custom      Warehouse
```

The following example shows pre-defined group names:

```
# show policy application group

Application Signature
Index Group Name
-----
1      "Advertising"
2      "Business Applications"
3      "Cloud Computing"
4      "Databases"
5      "E-commerce"
6      "Games"
7      "Peer to Peer"
8      "Protocols"
9      "Search Engines"
10     "Social Networking"
11     "Software Updates"
12     "VPN and Security"
13     "Web Applications"
14     "Web File Sharing"
16     "News and Information"
17     "Storage"
18     "Certificate Validation"
19     "Mail"
20     "Streaming"
21     "Cloud Storage"
22     "Restricted Content"
23     "Corporate Website"
24     "Web Collaboration"
25     "Real Time and Cloud Communications"
26     "Education"
27     "Health Care"
28     "Travel"
29     "Finance"
30     "Web Content Services"
31     "Sports"
32     "Location Services"
```

Note

Using the **detail** option in the preceding command shows the signature names for each group, as well as the signature patterns for the custom signatures.

The following example shows detailed information for the group "E-Commerce":

```
# show policy application group "E-Commerce" detail
Application Signature
Index Group Name
```

```

-----
5      "E-Commerce"
      Index Type      Signature Name
-----
1      Built-In 360buy
2      Built-In Alibaba
...
54     Custom Warehouse
      Index  Signature Pattern
-----
1      bjs.com
2      costco.com
3      samsclub.com

```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy autoclear

```
show policy autoclear interval
```

Description

Shows the interval at which the switch automatically clears rule usage statistics.

Syntax Description

| | |
|------------------|---|
| autoclear | Designates viewing information about auto-clearing policy rule usage statistics. |
| interval | Shows the interval in minutes when the switch automatically clears rule usage. Default is 0 (statistics are not automatically cleared). |

Default

By default, the **autoclear** interval is 0, which means that statistics are not automatically cleared.

Usage Guidelines

If you have configured Syslog and/or trap actions to notify you when a policy rule is used by using the following command: `configure policy rule profile_index [{app-signature group group name name} | ether ether | icmp6type icmp6type | icmptype icmptype | ip6dest ip6dest | ipdestsocket ipdestsocket | ipfrag | ipproto ipproto | ipsourcesocket ipsourcesocket | iptos iptos | ipttl ipttl | macdest macdest | macsource macsource | port port | tcpdestportIP tcpdestportIP`

```
| tcpsourceportIP tcpsourceportIP | udpdestportIP udpdestportIP |
udpsourceportIP udpsourceportIP ] {mask mask } {port-string
[ port_string | all]} {storage-type [non-volatile | volatile]} {drop |
forward} {syslog syslog} {trap trap} {cos cos } {mirror-destination
control_index} {clear-mirror} , this command shows you the interval when these statistics
will be cleared.
```

To set this auto-clear interval, use the following command:

```
configure policy autoclear {interval interval}
```

Example

The following example shows the interval for automatically clearing rule usage statistics:

```
# show policy autoclear interval
AutoClear interval is 0 minute(s)
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy capability

```
show policy capability
```

Description

This command to display all policy classification capabilities supported by your device.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command shows a table listing classifiable traffic attributes and the type of actions, by rule type, that can be executed relative to each attribute. Above the table is a list of all the actions possible on this device.

Example

The following example displays all policy classification capabilities supported by the device:

```
# show policy capability
Priority          Permit          Deny
Precedence Reordering  TCI Overwrite   Rules Table
Rule-Use Accounting  Rule-Use Notification  CoS Table
Longest Prefix Rules  Port Disable Action  Auto Clear Interval
RFC 3580 Map         Policy Enable     Mirror Action
Web Redirect         Authentication Override  NSI
Access List

=====
```

History

This command was first available in ExtremeXOS 16.1.

The authentication override status was added in ExtremeXOS 22.2

Mirror action was added in ExtremeXOS 30.2.

ACL Style Policy support was added in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy captive-portal

```
show policy captive-portal {web-redirect {redirect_index | all} |
  listening | rule-use}
```

Description

This command shows the current captive portal configuration for web-redirects, L4 listening ports, and rule use space programming.

Syntax Description

| | |
|-----------------------|---|
| <i>redirect_index</i> | Shows the particular web redirect index indicated (1-10). |
| all | Shows all web redirect indexes. |
| listening | Shows captive portal HTTP listening L4 ports. |
| web-redirect | Shows web redirect information. |
| rule-use | Shows captive portal rule use. |

Default

N/A

Example

The following example shows the currently configured captive portal L4 listening ports:

```
# show policy captive-portal listening
Captive Portal Listening Ports: 55 33 22
```

The following example shows the currently configured captive portal servers from all web-redirect indexes:

```
# show policy captive-portal web-redirect
Web-redirect Index: 1
  Server Index: 2
    Server Status: enabled
    Server URL:    http://192.168.1.3:5552/path/to/use

Web-redirect Index: 10
  Server Index: 2
    Server Status: disabled
    Server URL:    http://111.222.22.33:802/path/to/use
```

The following example shows all of the captive portal servers at web-redirect index 1 (regardless of configuration):

```
# show policy captive-portal web-redirect 1

Web-redirect Index: 1
  Server Index: 1
    Server Status: disabled
    Server URL:

  Server Index: 2
    Server Status: enabled
    Server URL:  http://192.168.1.3:5552/path/to/use
```

The following example shows the entire captive portal configuration:

```
# show policy captive-portal

Captive Portal Listening Ports: 55 33 22

Web-redirect Index: 1
  Server Index: 1
    Server Status: disabled
    Server URL:

  Server Index: 2
    Server Status: enabled
    Server URL:  http://192.168.1.3:5552/path/to/use

    Server URL:

  Server Index: 2
    Server Status: disabled
    Server URL: http://111.222.22.33:802/path/to/use
```

The following example shows the captive portal rule use status:

```
# show policy captive-portal rule-use
Captive Portal Rule Use: Reserved
```

History

This command was first available in ExtremeXOS 22.3.

The **rule-use** option was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy convergence-endpoint

```
show policy convergence-endpoint
```

Description

This command displays both the Convergence End Points (CEPs) detection state and global policies of all supported CEP types.

Syntax Description

This command has no arguments or variables.

Default

N/A

Example

The following example shows the CEP detection state and global policies of all supported CEP types:

```
# show policy convergence-endpoint

Global Convergence End Point state enabled

Convergence End Point default policies
Type      Policy Index  Policy Name
-----
cisco     12            Cisco IP Phone
lldp-med  0
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy convergence-endpoint connections

```
show policy convergence-endpoint connections ports [port_list | all]
```

Description

This command displays all learned Convergence End Points (CEPs) information.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | List of ports to show CEPs on. |
| all | Specifies that information for CEPs on all ports should appear. |

Default

N/A

Example

The following example shows CEPs for port 12:

```
# show policy convergence-endpoint connections ports 12
```

```
Convergence End Point Connection Info for port 12
Endpoint Type      cisco
Policy Index       3
Discovery Time     Mon FEB 06 02:31:42 2008
Firmware Version
Address Type       unknown
Endpoint IP        unavailable
Endpoint MAC       00:04:0d:01:f8:35
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy convergence-endpoint ports

```
show policy convergence-endpoint ports [port_list | all]
```

Description

This command displays the enable status of all supported Convergence End Point (CEP) types by port.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Shows enable status for the listed ports. |
| all | Shows enable status for all ports. |

Default

N/A

Example

The following example shows the CEP enable status for port 3:

```
# show policy convergence-endpoint ports 3
```

| Port | Cisco | LLDP-MED |
|------|---------|----------|
| 3 | enabled | disabled |

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy dynamic

```
show policy dynamic [override | syslog-default | trap-default ]
```

Description

This command displays the status of dynamically assigned policy profile options.

Syntax Description

| | |
|-----------------------|---|
| dynamic | Show status of dynamically assigned profiles. |
| override | Shows current status of which current profile assignment rules (administrative/dynamic) are overriding the other. |
| syslog-default | Shows current status of the default that dynamically created rules will have in sending of Syslog messages on rule applied. |
| trap-default | Shows current status of the default that dynamically created rules will have in sending of SNMP notification on rule applied. |

Default

N/A.

Example

The following example shows which current profile admin or dynamic assignment rules are overriding the other:

```
# show policy dynamic override
Administratively assigned rules CURRENTLY OVERRIDE dynamically assigned rules for a given
rule type.
Image : ExtremeXOS version 30.2.0.31 by release-manager
```

History

This command was first available in ExtremeXOS 16.1.

The Syslog and trap default options were added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy invalid

```
show policy invalid [all | {action} {count}]
```

Description

This command displays information about the action the device will apply on an invalid or unknown policy.

Syntax Description

| | |
|----------------|--|
| invalid | Show the status of the action the device shall apply on an invalid/unknown policy. |
| all | Show all the invalid policy status. |
| action | Specifies the action that the device should take if asked to apply an invalid or unknown policy. |
| count | The number of times the device has detected an invalid/unknown policy. |

Default

N/A.

Example

```
x460-G2-SUM46.44 # show policy invalid all
Current action on invalid/unknown profile is: Apply default policy
Number of invalid/unknown profiles detected: 0
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy mactable

```
show policy mactable { vlan_list }
```

Description

Use this command to display the VLAN ID - Policy Profile mappings table for all or the specified VLANs.

Syntax Description

| | |
|------------------|---|
| mactable | Show VLAN ID - Policy Profile mappings table. |
| <i>vlan_list</i> | (Optional) VLAN ID or range of IDs (1 to 4094). |

Default

If a vlan-list is not specified, mactable entries for all VLANs are displayed.

Example

The following example shows the policy profile mappings table for all VLANs:

```
# show policy mactable
Policy map response      : policy
Policy map last change  : 0 days 12:17:15.27
  VLAN ID                Policy Profile
  1-4094                  0
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy profile

```
show policy profile {all | profile_index} {detail}
```

Description

Use this command to display policy profile information.

Syntax Description

| | |
|------------|------------------------------|
| profile | Show current policy profile. |
| all | All profile entries. |

| | |
|----------------------|-------------------------------------|
| <i>profile_index</i> | Profile index. |
| detail | Displays all information in detail. |

Default

If optional parameters are not specified, summary information will be displayed for the specified index or all indexes.

Usage Guidelines

If the rule model is set to ACL Style Policy (access-list), then precedence information does not appear. To change the rule model, use the command `configure policy rule-model [access-list | hierarchical]`.

Example

The following example shows how to display policy information for policy profile 11:

```
show policy profile 11
Profile Index      :11
Profile Name      :
Row Status        :active
Port VID Status   :disabled
Port VID Override :1
CoS Status        :enabled
CoS               :7
Syslog on use     :disabled
Trap on use       :disabled
Disable ingress port :disabled
Replace TCI Status :enabled
Auth Override Status :disabled
NSI               :12345678
Tagged Egress     :
Untagged Egress   :
Forbidden Egress  :
Rule Precedence   :1-2,10,12-19,23,20-22,25,31
                  :MACSource (1), MACDest (2), IPv6Dest (10),
                  :IPSource (12), IPDest (13), IPFrag (14),
                  :UDPSrcPort (15), UDPDestPort (16), TCPSrcPort (17),
                  :TCPDestPort (18), ICMPType (19), ICMP6Type (23),
                  :TTL (20), IPTOS (21), IPProto (22), Ether (25),
                  :Port (31)
Admin Profile Usage :6
Oper Profile Usage  :6
Dynamic Profile Usage :none
```

The following example shows all policy profile information:

```
x460-G2-SUM46.52 # show policy profile
|PID|Name          |RS|PVID|NSI      |CoS|MIR|STDOA|T U F|prec |aSum |dSum |
|1  |gear            |A |555 |none         |   |   |   |   |   |   |
|2  |two             |A |   |none         |   |   |   |   |   |   |
|5  |netadmin        |A |10  |none         |5  |   |   |   |Y  |   |
|10 |Employee        |A |1024|12345678    |   |   |   |   |   |   |
```

History

This command was first available in ExtremeXOS 16.1.

The authentication override status was added in ExtremeXOS 22.2

Network Service Identifier (NSI) and ICMPType/ICMP6Type rule precedence information was added in ExtremeXOS 22.5.

Rule precedence order change supported in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy resource-profile

```
show policy resource-profile {[default | less-acl [more-ipv4 | more-ipv4-
no-ipv6 | more-ipv4-no-l2 | more-ipv4-no-mac-no-ipv6 | more-ipv4-no-
mac-no-ipv6-no-l2] | more-ipv4-no-ipv6 | more-ipv4-no-mac-no-ipv6 |
more-mac-no-ipv6] {profile-modifier [ {no-mac} {no-ipv4} {no-ipv6}
{no-l2}]}}
```

Description

Shows policy resource settings and usage for currently set profile, or optionally shows the potential resource setting for a specified, different profile.

Syntax Description

| | |
|---------------------------------------|---|
| default | Shows potential policy resource settings if configuring default profile. |
| less-acl | Shows potential policy resource settings if configuring profile that removes some access list resources to be used for rules. |
| more-ipv4 | Shows potential policy resource settings if configuring profile that adds IPv4 rules. |
| more-ipv4-no-ipv6 | Shows potential policy resource settings if configuring profile that adds IPv4 rules and removes IPv6 rules. |
| more-ipv4-no-l2 | Shows potential policy resource settings if configuring profile that adds IPv4 rules and removes L2 rules. |
| more-mac-no-ipv6 | Shows potential policy resource settings if configuring profile that adds MAC rules and removes IPv6 rules. |
| more-ipv4-no-mac-no-ipv6-no-l2 | Shows potential policy resource settings if configuring profile that adds IPv4 rules and removes MAC, IPv6, and L2 rules. |
| more-ipv4-no-mac-no-ipv6 | Shows potential policy resource settings if configuring profile that adds IPv4 rules and removes MAC and IPv6 rules. |
| profile-modifier | Shows potential policy resource settings if configuring a profile-modifier. |

| | |
|----------------|---|
| no-mac | Shows potential policy resource settings if configuring a profile-modifier that removes all MAC rules. |
| no-ipv4 | Shows potential policy resource settings if configuring a profile-modifier that removes all IPv4 rules. |
| no-ipv6 | Shows potential policy resource settings if configuring a profile-modifier that removes all IPv6 rules. |
| no-l2 | Shows potential policy resource settings if configuring a profile-modifier that removes all L2 rules. |

Default

None.

Usage Guidelines

Pressing **ENTER** rather than selecting any options for the command shows the current resource profile settings.

Example

The following example shows the current resource profile settings:

```
# show policy resource-profile

Current Configured Profile: default
Current Profile Modifier  : no-l2

      MAC  IPv6  IPv4   L2
      Rules Rules Rules Rules
      ---- -
Max   512   512   440   0
Used   0     0     0     0

L2 ether rules are accounted for in the IPv4 group
```

The following example shows what resources would look like when using a different profile on a stack (with potentially different slot types):

```
show policy resource-profile more-mac-no-ipv6

      MAC  IPv6  IPv4   L2
Slot Rules Rules Rules Rules Type
-----
1     512    0   256   184 X450G2-24t-G4
2     512    0   256   184 X450G2-48t-10G4
3     512    0   256   184 X450G2-48t-G4
4      0     0   256   184 X620-10x
Max    0     0   256   184 (Stack)
Used   3     1    5     0 (Stack)

Max : This row shows the maximum resources available for the stack
      if the specified profile is chosen.
```

The following example shows what resources would look like when using a different profile on a single switch:

```
show policy resource-profile more-mac-no-ipv6

      MAC  IPv6  IPv4   L2
Slot Rules Rules Rules Rules Type
-----
1      0    0   256   184 X620-10x
Max    0    0   256   184 (Switch)
Used   1    0    3     0 (Switch)

Max : This row shows the maximum resources available for the switch
      if the specified profile is chosen.
```

History

This command was first available in ExtremeXOS 22.1.

Profile modification information was added in ExtremeXOS 22.4.

Additional profiles (no-l2) and profile modifier were added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy rule

```
show policy rule {all | app-signature | {profile-index profile_index |
admin-profile} ether {ether} | icmp6type {icmp6type} | icmptype
{icmptype} | ip6dest {ip6dest} | ipdest {ipdest} | ipfrag | ipproto
{ipproto} | ipsource { ipsource } | iptos { iptos } | ipttl { ipttl }
| macdest { macdest } | macsource { macsource } | port { port } |
tcpdestportIP { tcpdestportIP } | tcpsourceportIP { tcpsourceportIP }
| udpdestportIP { udpdestportIP } | udpsourceportIP
{ udpsourceportIP }} {mask mask } {port-string [ port_string | all]}
{storage-type [non-volatile | volatile]} {drop | forward} {cos cos |
admin-pid admin_pid }} {detail | wide}
```

Description

Use this command to display policy classification and admin rule information.

Syntax Description

| | |
|----------------------|--|
| rule | Show current Policy Rule. |
| all | Optional, show all policy rules |
| app-signature | Specifies application signature specific settings. |
| profile-index | Optional: Specify the profile index |

| | |
|------------------------|--|
| admin-profile | Optional: Show rule based on Policy ID of 0 |
| mask | Optional: Show rule based on the number of most significant bits to match data value. |
| <i>mask</i> | Optional: Show rule based on the number of most significant bits to match data value. Range = 1-144. |
| port-string | Optional: Show rule based on the port number on which this rule is applied; single port in port-string format. |
| <i>port-string</i> | Optional: Show rule based on the port number on which this rule is applied; single port in port-string format. |
| storage-type | Optional: Show rule based on its non-volatile storage type (V - volatile; NV - non-volatile). |
| non-volatile | Show rule with non-volatile storage type. |
| volatile | Show rule with volatile storage type. |
| drop | Show rules that are set to 'drop' any packets which match this rule. |
| forward | Show rules that are set to 'forward' any packets which match this rule. |
| cos | Optional: Show rules with Class of Service. |
| <i>cos</i> | Optional: Show rules with Class of Service (0-255) or -1. |
| admin-pid | Policy ID. |
| <i>admin-pid</i> | Policy ID. Range = 0 - 102. |
| wide | Optional: Extend the concise view beyond 80 columns to display complete rule data. |
| detail | Optional: show all rule information in detail. |
| port | Port string. |
| <i>port</i> | Port string - (data: 1; mask: 16). |
| macdest | MAC destination address. |
| <i>macdest</i> | MAC destination address - (data: a-b-c-d-e-f; mask: 1-48). |
| ip6dest | IPv6 address. |
| <i>ip6dest</i> | IPv6 address (data: aaaa::bbbb; mask 1-128). |
| ipsource | Source IP address. |
| <i>ipsource</i> | Source IP address - (data: a.b.c.d; mask: 1-32). |
| ipdest | Destination IP address. |
| <i>ipdest</i> | Destination IP address - (data: a.b.c.d.; mask: 1-32). |
| ipfrag | IP fragmentation flag. |
| tcpdestportIP | TCP port dst with optional post-fix IPv4 address. |
| <i>tcpdestportIP</i> | TCP port dst with optional post-fix IPv4 address - (data: ab[:c.d.e.f]); mask: 1-48. |
| udpdestportIP | UDP port dst with optional post-fix IPv4 address. |
| <i>udpdestportIP</i> | UDP port dst with optional post-fix IPv4 address - (data: ab[:c.d.e.f]); mask: 1-48. |
| tcpsourceportIP | TCP port src with optional post-fix IPv4 address. |

| | |
|------------------------|--|
| <i>tcpsourceportIP</i> | TCP port src with optional post-fix IPv4 address - (data: ab[:c.d.e.f]); mask: 1-48. |
| udpsourceportIP | UDP port src with optional post-fix IPv4 address. |
| <i>udpsourceportIP</i> | UDP port src with optional post-fix IPv4 address - (data: ab[:c.d.e.f]); mask: 1-48. |
| ipttl | IP time to live. |
| <i>ipttl</i> | IP time to live - (data: 0-255). |
| iptos | IPv4 type of service / IPv6 traffic class field. |
| <i>iptos</i> | IPv4 type of service / IPv6 traffic class field - (data: 0-255; mask: 1-8). |
| ipproto | Protocol field in IP packet. |
| <i>ipproto</i> | Protocol field in IP packet - (data: 0-255 or 0-0xFF; mask: 1-8). |
| ether | Type field in Ethernet II packet. |
| <i>ether</i> | Type field in Ethernet II packet - (data: 0-65535 or 0x0-0xFFFF; mask: 1-16). |
| icmp6type | Specifies type code in ICMPv6 packet. |
| <i>icmp6type</i> | ICMPv6 type code [(data: 123.456 (dotted-decimal) or AB-CD (dashed-hexadecimal))] mask: 1-16). |
| icmptype | Specifies type code in ICMP packet. |
| <i>icmptype</i> | ICMP type code (data: a.b; mask: 1-16). |

Default

- If port-string, cos and storage-type are not specified, all rules related to other specifications will be displayed.
- If -verbose is not specified, summary information will be displayed.
- If -wide is not specified, an 80 character display width is used.

Usage Guidelines

Use this command to display policy classification and admin rule information.

Example

The following example shows policy classification and admin rule information:

```
# show policy rule
Admn|Rule Type |Rule Data |Msk|PortStr |RS|ST|dPID|aPID|Mir|
adm|MACSource |00-77-77-77-00-20 | 48|1 | A| V| 5| | |
adm|MACSource |00-77-77-77-00-21 | 48|4 | A| V| 5| | |
adm|Port |1 | 16|1 | A|NV| | 22| |
adm|Port |4 | 16|4 | A|NV| | 22| |
PID |Rule Type |Rule Data |Msk|PortStr |RS|ST|VLAN|CoS |Mir|
5 |Ether |2048 (0x800) | 16|All | A|NV|fwr| | 1|
5 |Ether |33079 (0x8137) | 16|All | A|NV|fwr| | 1|

Rule Type - Rule Description: Port, MAC Address, IP address etc.
Rule Data - Varies depending on Rule Type
```

```

Mask      - Mask size for rule data where applicable
RS - RowStatus:
  A-Active NS-NotInService NR-NotReady CG-CreateAndGo CW-CreateAndWait D-Destroy
ST      - V-Volatile NV-NonVolatile
For Admin Profile Rules (Admn):
  dPID - Dynamic Profile Index
  aPID - Admin Profile Index
For Profile Identifier (PID) Rules:
  VLAN - VLAN ID, drop or forward (fwrd)
  CoS  - Class Of Service
Mir     - Mirror index if assigned

```

The following example shows detailed policy classification and admin rule information:

```

# show policy rule detail

=====

```

History

This command was first available in ExtremeXOS release 16.1.

ICMP and ICMPv6 type information added in ExtremeXOS 22.5.

Mirror information and rule usage counter information were added in ExtremeXOS 30.2.

The **app-signature** option was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy rule port-hit

```
show policy rule port-hit {data} {detail} {wide}
```

Description

Shows a list of used rules when Syslog/trap actions are configured for policy.

Syntax Description

| | |
|-----------------|---|
| port-hit | Shows ports matching the rules. |
| data | Shows rule based on the data (corresponds to type option). |
| detail | Shows all rule information in detail. |
| wide | Extends the concise view beyond 80 columns to display complete rule data. |

Default

N/A.

Usage Guidelines

If you have configured Syslog and/or trap actions to notify you when a policy rule is used by using the following command: `configure policy rule profile_index [{app-signature group group name name} | ether ether | icmp6type icmp6type | icmptype icmptype | ip6dest ip6dest | ipdestsocket ipdestsocket | ipfrag | ipproto ipproto | ipsourcesocket ipsourcesocket | iptos iptos | ipttl ipttl | macdest macdest | macsource macsource | port port | tcpdestportIP tcpdestportIP | tcpsourceportIP tcpsourceportIP | udpdestportIP udpdestportIP | udpsourceportIP udpsourceportIP] {mask mask } {port-string [port_string | all]} {storage-type [non-volatile | volatile]} {drop | forward} {syslog syslog} {trap trap} {cos cos } {mirror-destination`

`control_index` { **clear-mirror** } , this command shows you information about the rules that have been used.

You can clear this information by using the command `clear counters policy`.

Example

The following example shows rule usage information:

```
# show policy rule port-hit
PID |Rule Type  |Rule Data          |Msk|PortStr  |RS|ST|TS|VLAN|CoS |Mir|
1   |MACSource  |00-00-77-77-00-01 | 48|25      | A|NV|TS|fwr|   |None|
1   |MACSource  |00-00-77-77-00-02 | 48|All     | A|NV|T |fwr|   |None|
```

The following example shows detailed rule usage information:

```
# show policy rule port-hit detail
=====
Profile Index      :1
Rule Type          :MAC source address
Rule Data          :00-00-77-77-00-01

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy slices

```
show policy slices
```

Description

Shows the existing usage of policy slices.

Syntax Description

| | |
|---------------|-------------------------------------|
| slices | Shows look-up stage TCAM resources. |
|---------------|-------------------------------------|

Default

N/A.

Example

The following example shows the existing usage of policy slices:

```
# show policy slices
Configured # tci-overwrite slices : 2
Maximum # slices                  : 4
Current Configured shared slices   : 2
Current Configured guaranteed DynAcl percentage: 40%
Current Configured guaranteed L7 percentage : 40%
```

History

This command was first available in ExtremeXOS 30.4.

Information about configured guaranteed Layer 7 policy and dynamic ACL percentages was added in ExtremeXOS 30.5.

Limitations

The ExtremeSwitching X435 series switch does not support Layer 7 policy (DNS).

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy state

```
show policy state
```

Description

This command shows the current policy state.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

```
# show policy state
Policy is currently: DISABLED
Rule-model          : access-list
```

History

This command was first available in ExtremeXOS 16.1.

ACL Style Policy status was added in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy syslog

```
show policy syslog {machine-readable} {extended-format} {every-time}
```

Description

Shows the Syslog parameters for policy rules.

Syntax Description

| | |
|-------------------------|--|
| syslog | Designates showing the Syslog parameters for policy rules. |
| machine-readable | Shows whether Syslog messages are shown in decimal or hexadecimal format. |
| extended-format | Shows whether extended formatting of rule usage messages is enabled or disabled. |
| every-time | Shows whether Syslog messages are sent every time a rule is used or just the first time. |

Default

N/A.

Usage Guidelines

None.

Example

The following example shows the Syslog parameters for policy rules:

```
# show policy syslog
Syslog messages will be logged in DECIMAL format.
Extended format DISABLED on rule usage messages.
Syslog messages sent on EACH USE of rule.
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show policy vlanauthorization

```
show policy vlanauthorization {port port_list }
```

Description

This command displays VLAN Authorization information for a port or list of ports.

Syntax Description

| | |
|------------------|---|
| port | Show VLAN Authorization information for a specific set of ports. |
| <i>port_list</i> | Specifies the list of ports to show VLAN Authorization information for. |

Default

If no parameters are specified, all VLAN Authorization configuration information is displayed.

Usage Guidelines

None.

Example

This example shows how to display VLAN Authorization configuration information for ports 1:1-3:

```
X450G2-48t-10G4.3 # show policy vlanauthorization port 1-3
VLAN Authorization Global Status: ENABLED
      Admin      Oper
Port  Status    Egress  Egress  VLAN ID
=====
1     enabled    untagged untagged none
2     enabled    untagged untagged none
3     enabled    untagged untagged none
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports

```
show ports {port_list | tag tag} {no-refresh | refresh}
```

Description

Displays port summary statistics.

Syntax Description

| | |
|-------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| tag | Specifies an 802.1Q or 802.1ad tag value. |
| no-refresh | Specifies a static snapshot of the data. |
| refresh | Specifies a continuous refresh of output. |

Default

N/A.

Usage Guidelines

Use this command to display the port number, display string, and some of the port states in tabular form.

The *VLAN* name is displayed only if that port contains a single VLAN. If the port contains more than one VLAN, then the number of VLANs is displayed.

The tag value may be associated with either a VMAN or a VLAN.

The default display string for Integrated Application Hosting (IAH) dedicated ports on ExtremeSwitching X465 series switches is “Insight” to indicate that these are to be used for virtualization. On X465-24MU and X465-24XE switches, the dedicated ports are 33-34; on X465-24MU-24W, and X465i-48W switches, the dedicated ports are 57-58. You can change this display string (configure ports *port_list* **display-string** *string*). If you unconfigure the display string, it is reset to “Insight”.

Example

The following command displays information on ports 2, 3, and 12 on a switch:

```
show ports 2,3,12
Port Summary Monitor                               Thu Feb 14 14:19:50 2008
Port  Display          VLAN Name          Port Link Speed Duplex
#    String             (or # VLANs)      State State Actual Actual
=====
2    2nd-Floor-Lab      Lab-Backbone      E    A    1000  FULL
3    Building2          Building2         E    A D
12  AllBackboneLANs (34)  E    R                FULL
=====
Port State: D-Disabled, E-Enabled, F-Disabled by link-flap detection,
            L-Disabled due to licensing, M-MKA enabled
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback,
            D-ELSM enabled but not up,
            d-Ethernet OAM enabled but not up,
            B-MACsec enabled but blocked awaiting authentication
U->page up  D->page down ESC->exit
```

Restricted optics will show similarly to unsupported optics (!) in the show ports command by use of a '\$'. Additionally, when a 3rd-party license has been installed, previously restricted optics are shown using a '%', because those optics are un-restricted by means of the license. Here is an example output:

```
show port conf

0->Clear Counters U->page up D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 12.1.

The tag value was added in ExtremeXOS 12.4.4.

Show output for 3rd party restricted optics support was added in ExtremeXOS 15.3.

The **refresh** keyword was added in ExtremeXOS 16.1.

Flag to show ports disabled by excessive link-flapping added in v 22.1.

Flag (L) to show port disabled due to lack of port speed license (applies to ExtremeSwitching X870-96x-8c switches only).

Flag (B) to show port blocked by MAC Security was added in ExtremeXOS 30.1.

"Insight" display string appears for IAH dedicated ports of ExtremeSwitching X465-24MU and X465-24MU-24W switches for ExtremeXOS 30.2.

"Insight" display string appears for IAH dedicated ports of ExtremeSwitching X465-24XE and X465i-48W switches for ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports advertised

```
show ports {port_list} advertised
```

Description

Shows the remote end advertised ability.

Syntax Description

| | |
|-------------------|---|
| ports | Specifies ports. |
| <i>port_list</i> | Lists the ports that you want remote end advertised ability information on. |
| advertised | Selects showing auto-negotiation advertised capabilities. |

Default

N/A.

Usage Guidelines

Auto-negotiation is an Ethernet feature that facilitates the selection of port speed, duplex, and flow control between the two members of a link. It first shares these capabilities, and then selects the fastest transmission mode that both ends of the link can support.

This command shows the remote end of the link's advertised ability, up to 1Gbps speed only, for duplex and flow control. This command is not supported on Extended Edge Switching bridge port extenders (BPE) ports.

Example

The following example shows the advertised ability for the remote end for ports 1 and 9:

```
# show port 1 9 advertised

```

| Pause Port | 10BaseT | | 100BaseT | | 100X | | 1000BaseT | | 1000X | | | | |
|---------------|---------|------|----------|------|------|------|-----------|------|-------|------|-----|-----|------|
| | Half | Full | Half | Full | Half | Full | Half | Full | Half | Full | TX | RX | Asym |
| *1 | CL- | CL- | CL- | CL- | --- | --- | --- | --- | --- | --- | CLR | CLR | --- |
| !9 | CL- | CL- | CL- | CL- | --- | --- | --- | --- | --- | --- | C-- | C-- | --- |

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X465, X590, X620, X690 , 5520 series switches.

show ports anomaly

```
show ports {port_list | tag tag} anomaly {no-refresh | refresh}
```

Description

Displays statistics of anomaly violation events in real time.

Syntax Description

| | |
|-------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |
| no-refresh | Specifies a static snapshot of data. |
| refresh | Continuous refresh of output. |

Default

N/A.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, statistics are displayed for all ports. To clear the counters, use the `clear counters ports` command. The default display is a constantly

refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

This command takes effect after enabling anomaly-protection.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays real-time anomaly statistics on a switch:

```
show ports anomaly
```

Following is sample output from this command:

```
Port Statistics Thu Nov  9 22:44:31 2006

=====
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters  U->page up  D->page down  ESC->exit
```

History

This command was first available in ExtremeXOS 12.0.

The tag value was added in ExtremeXOS 12.4.4.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports buffer

```
show ports port_list buffer
```

Description

Displays the packet buffer organization for the specified ports.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Optionally specifies the list of ports, or slots and ports, for which packet buffer information is displayed. If the <i>port_list</i> is omitted then packet buffer information is displayed for all ports in the system. |
|------------------|---|

Default

N/A.

Usage Guidelines

This command shows the packet buffer organization for the specified ports.

The *port_list* can span multiple ranges. The packet buffer description for each such port range is displayed.

Since ports and packet buffer are grouped by the hardware, the command displays the range of ports that share the same packet buffer.

The Total Packet Buffer Size for the port range is displayed in bytes, along with an indication of whether or not the user has configured over-commitment of the packet buffer (not overcommitted by default).

The amount of Reserved Buffer allocated to each port and QoS Profile is shown for the ports in the user-specified *port_list*. To configure the reserved buffer, use the `configure qosprofile qosprofile maxbuffer percentage ports port_list` command.

The Total Shared Buffer Size displayed is the Total Packet Buffer Size minus the total Reserved Buffer allocated to all ports and QoS profiles in the port range. Note that some packet buffer is also reserved to internal ports.

For each port, the maximum of the Total Shared Buffer Size that the port is allowed to use (Max Shared Buffer Usage) is shown both as an absolute number of bytes and as a percentage of the Total Shared Buffer Size. A port's Max Shared Buffer Usage may be configured using the command `configure ports {port_list} shared-packet-bufferpercentage`

Note the configured percentage may be different than the displayed percentage. This is because more recent hardware can only allocate shared packet buffer in steps, while older hardware can precisely allocate the requested percentage.

The more recent hardware dynamically adjusts each port's shared buffer usage limit based on simultaneous usage by multiple ports and QoS profiles, automatically providing fair usage of the shared

buffer among the ports and QoS profiles that are currently demanding buffer space. This allows larger packet buffer usage bursts on a port when other ports are not using shared buffer. This dynamic adjustment cannot be observed with this command since only the maximum possible limits are displayed.

The *VLAN* name is displayed only if that port contains a single VLAN. If the port contains more than one VLAN, then the number of VLANs is displayed.

The tag value may be associated with either a VMAN or a VLAN.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports collisions

```
show ports {mgmt | port_list | tag tag} collisions {no-refresh | refresh }
```

Description

Displays real-time collision statistics.

Syntax Description

| | |
|-------------------|---|
| mgmt | Specifies the management port. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |
| no-refresh | Specifies a static snapshot of data. |
| refresh | Continuous refresh of output. |

Default

Real-time statistics.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, statistics are displayed for all ports. To clear the counters, use the `clear counters ports` command. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

Example

The following command displays real-time collision statistics on ports 1 and 2 on a switch:

```
show ports 1-2 collisions
```

Following is sample output from this command:

```
Port Collision Monitor
Port      Link      Collision Histogram
State 1    2    3    4    5    6    7    8    9    10   11   12   13   14   15   16
=====
1      A      0    0    0    0    0    0    0    0    0    0    0    0    0    0    0
2      R      0    0    0    0    0    0    0    0    0    0    0    0    0    0    0
=====
Link State: A-Active R-Ready, NP-Port not present, L-Loopback
```

The numbers 1 to 16 represent the number of collisions encountered prior to successfully transmitting the packet; this is applicable only for half-duplex links.

History

This command was first available in ExtremeXOS 10.1.

The no-refresh variable was added in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports configuration

```
show ports {mgmt | port_list | tag tag} configuration {no-refresh | refresh}
```

Description

Displays port configuration statistics, in real time or snapshot.

Syntax Description

| | |
|-------------------|---|
| mgmt | Specifies the management port. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |
| no-refresh | Specifies a static snapshot of data. |
| refresh | Specifies a continuous refresh of output. |

Default

Real-time statistics.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, configuration statistics are displayed for all ports. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

This command displays port configuration, which includes:

- Virtual router.
- Port state.
- Link state.
- Autonegotiation information.
- Link speed.
- Duplex mode.
- Flow control.
- Load sharing information.
- Link media information.

Note

On 10 Gbps ports, the Media Primary column displays NONE when no module is installed, and SR, LR, or ER depending on the module installed when there is one present. Combination ports display Autonegotiation, Link speed, and Duplex mode information only for the current primary medium.

Example

The following command displays the port configuration for all ports on a switch:

```
# show port configuration no-refresh
Port Configuration
Port      Virtual  Port  Link  Auto  Speed      Duplex  Flow  Load  Media
```

```

```

History

This command was first available in ExtremeXOS 10.1.

The Port not present and Media variables were added in ExtremeXOS 11.2.

The no-refresh variable was added in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

This command was updated to include flags that indicate the summary status of a non-Extreme optical device in ExtremeXOS 15.4.

The **refresh** keyword was added in ExtremeXOS 16.1.

Flag (L) to show port disabled due to lack of port speed license (applies to ExtremeSwitching X870-96x-8c switches only).

Flag (#) to show that LRM/MACsec adapter is connected to a port was added in ExtremeXOS 30.1.

Mismatched port compatibility indication was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports congestion

```
show ports port_list congestion {no-refresh | refresh} {port-number}
```

Description

Displays the port egress congestion statistics (dropped packets) for the specified ports on the front panel.

Syntax Description

| | |
|--------------------|---|
| <i>port_list</i> | Specifies one or more slots and ports. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |
| port-number | Displays port number instead of display string. |

Default

Displays the port congestion statistics for all ports in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, you can clear the counters or page up or down through the list of ports.

Note

If you are displaying congestion statistics in real time and another CLI session resets the counters for a port you are monitoring, the counters displayed in your session for that port are also reset.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

Note

Packets can be dropped at multiple locations along the path through the hardware. The per-port congestion counters count all dropped packets for all ports.

If you do not specify a port number or range in the command, dropped packet counts are displayed for all ports.

Note

To display the congestion statistics for the QoS profiles on a port, use the `show ports port_list qosmonitor {congestion} {no-refresh}` command.

Note

On a V300 bridge port extender (BPE) port, neither `show ports port_list qosmonitor {congestion} {no-refresh | refresh} {port-number}` nor `show ports port_list congestion {no-refresh | refresh} {port-number}` increments when there is egress congestion. Instead, you can view egress congestion using `show ports {port_list | stack-ports stacking-port-list} rxerrors {no-refresh | refresh}` on the ingress port (upstream port in many cases).

Example

The following example shows the packets dropped due to congestion for all ports in real time:

```
# show ports congestion
Port Congestion Monitor
Port      Link      Packet
State     Drop
=====
1:1       R         0
1:2       R         0
1:3       A         96
1:4       R         0
2:1       R         0
2:2       A        28513
2:3       R         0
2:4       R         0
2:5       R         0
2:6       R         0
```

```

2:7      R      0
2:8      R      0
3:1      R      0
3:2      R      0
3:3      R      0
3:4      R      0
=====
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->clear counters  U->page up  D->page down  ESC->exit

```

The following example shows a snapshot display of the packets dropped due to congestion for all ports:

```

# show ports congestion no-refresh
Port      Link      Packet
State     Drop
=====
1:1      R      0
1:2      R      0
1:3      A      96
1:4      R      0
2:1      R      0
2:2      A      28513
2:3      R      0

2:8      R      0
3:1      R      0
3:2      R      0
3:3      R      0
3:4      R      0
5:1      R      0
=====
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback

```

History

This command was first available in ExtremeXOS 12.2.2.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports eee

```
show ports port_list eee {no-refresh | refresh } { port-number }
```

Description

Displays the EEE statistics for the specified ports.

Syntax Description

| | |
|--------------------|---|
| ports | Specifies ports, or slots and ports, for which EEE information appears. |
| <i>port_list</i> | Optionally, specifies the list of ports, or slots and ports, for which EEE information appears. |
| no-refresh | Page-by-page display without continuous refresh. |
| refresh | Continuous refresh of output. |
| port-number | Displays port number instead of display string. |

Default

N/A.

Usage Guidelines

This command shows various EEE statistics for the specified ports.

Example

The following command displays EEE information:

```
show ports 3,4 eee
Port EEE Statistics Monitor                               Sat Dec 29 04:10:53 2012
Port   Link EEE      Rx      Rx      Tx      Tx
      State State  Events  Duration (uS)  Events  Duration (uS)
=====
3      A    E           1      4515403         1      4515460
4      A    E           1      4515948         1      4515966
=====

> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
EEE State: E-Enabled, D-Disabled, NA-Not Available
0->Clear Counters  U->page up  D->page down  ESC->exit
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support EEE.

show ports flow-control

```
show ports port_list flowcontrol {rx-pauses} {tx-pauses} {no-refresh |
refresh}
```

Description

Displays the pause control frames received or transmitted.

Syntax Description

| | |
|-------------------|--|
| rx-pauses | Displays pause control frames received. |
| tx-pauses | Displays pause control frames transmitted. |
| no-refresh | Specifies a static snapshot of data. |
| refresh | Specifies a continuous refresh of output. |

Default

By default, the pause control frames received are displayed.

Usage Guidelines

If you do not specify a port number or range of ports, the system displays information for all ports.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command. If you do not specify the no-refresh option, the display refreshes until you press **[ESC]**.

Example

The following example displays the flow control for ports 1, 5, and 9.

```
# show ports 1,5,9 flow-control
Flow Control Frame Monitor                               Sat Aug 18 19:35:12 2012
Port      Pause   PFC0   PFC1   PFC2   PFC3   PFC4   PFC5   PFC6   PFC7
          RcvS   RcvS   RcvS   RcvS   RcvS   RcvS   RcvS   RcvS   RcvS
=====
1          -     -     -     - 1234567 1234567     - 1234567     -
5          -     -     -     - 1234567 1234567     - 1234567     -
16:104 1234567     -     -     -     -     -     -     -     -
=====
">" Name truncated, "-" rx-pause not enabled, "." Counter not available
Spacebar->Toggle screen 0->Clear counters U->Pageup D->Pagedown ESC->exit
```

Note

Use the **[spacebar]** to toggle this real-time display for all ports from received frames to transmitted frames, in that order.

History

This command was first available in ExtremeXOS 15.6.2.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is supported on all platforms.

show port forward-error-correction

```
show port port_list forward-error-correction {refresh | no-refresh }
      port-number
```

Description

Shows the IEEE Forward Error Correction (FEC) Clause 74 or 91 status of the port(s).

Syntax Description

| | |
|---------------------------------|---|
| <i>port_list</i> | List of ports to show FEC modes status on. |
| forward-error-correction | Specifies port FEC mode status. |
| refresh | Specifies a continuous refresh of output. |
| no-refresh | Specifies a static snapshot of data. |
| port-number | Displays port number instead of display string. |

Default

N/A.

Example

The following example shows the FEC status for port 1:

```
show port 1 forward-error-correctionPort Forward-Error-Correction Status Monitor
Port      Link   Forward-Error-Correction
          State State          Clause
=====
1         R     NA             CL74
=====
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback
Forward-Error-Correction State: E-Enabled, D-Disabled, NA-Not Available
Clause: CL74-(Clause 74), CL91-(Clause 91), Unknown
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on the ExtremeSwitching X670-G2, X465, X590, X690, X695, X870, and 5520 series switches.

show ports group

```
show ports group {port_group}
```

Description

This command displays port group information.

Syntax Description

| | |
|-------------------------|--------------------------------|
| <code>port_group</code> | Specifies the port group name. |
|-------------------------|--------------------------------|

Default

N/A.

Usage Guidelines

None.

Example

```
# show ports group fldGroupA
Group Name                Ports
-----
fldGroupA                 1-3

#show ports group
Group Name                Ports
-----
qosGroupA                 1-10
qosGroupB                 11-20
ingMeterGrpA             1-20
fldGroupA                 1-20
grp45678901234567890123456789012 3-24
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show port information

```
show port {mgmt |port_list | tag tag} information {detail}
```

Description

Displays detailed system-related information.

Syntax Description

| | |
|------------------|---|
| mgmt | Specifies the management port. |
| <i>port_list</i> | Specifies one or more ports of slots and ports. |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |
| detail | Specifies detailed port information. |

Default

N/A.

Usage Guidelines

This command displays information, including the following:

- Port number
- Port configuration
 - Virtual router
 - Type of port
 - LRM/MACsec Adapter port state:
 - Initializing
 - Initialization failed
 - Configuring
 - Configuration failed
 - Upgrading MCU firmware
 - Upgrading PHY firmware
 - Ready
 - Operational
 - Admin state
 - Link state and speed
 - Link Up/Down Transition
 - VLAN configuration
 - STP configuration
 - Trunking, or load sharing
 - EDP
 - ELSM (disabled; or if enabled, the ELSM link state is shown as well)
 - Load balancing
 - Learning
 - Link-flap detection status
 - Egress flooding

- Jumbo frames
- Link port up/down traps
- Port isolation status
- QoS profiles
- VMAN status
- Smart Redundancy status
- SRP status
- Additional platform-specific information
- Port partition information
- IEEE Forward Error Correction (FEC) Clause 74 or 91 modes status

If you do not specify a port number, range of ports, or tag value, detailed system-related information is displayed for all ports. The data is displayed in a table format.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

The **detail** parameter is used to provide more specific port information. The data is called out with written explanations versus displayed in a table format.

Note

The keyword **detail** displays slightly different information depending on the platform and configuration you are working with.

The link filter counter displayed with the detail keyword is calculated at the middle layer on receiving an event. The link filter up indicates the number of link transitions from down to up at the middle layer filter.

Example

The following command displays port system-related information on a switch:

```
# show ports 25 information
Port          Flags          Link          ELSM/
              State         MACsec       OAM/
              State         State        Link Num   Num   Num   Jumbo  QOS   Load
              State         State        UPS STP  VLAN  Proto   Size  profile Master
=====
25            Em-----fMB-S-x- active    - / -/up   3   0   1   1   9216 none
=====
> indicates Port Display Name truncated past 8 characters
Flags : a - Load Sharing Algorithm address-based,
        b - Rx and Tx Flow Control Enabled, B - Broadcast Flooding Enabled,
        D - Port Disabled, e - Extreme Discovery Protocol Enabled,

STP cfg:

Protocol:
Trunking: Load sharing is not enabled.

EDP: Enabled
ELSM: Disabled

```

```
Ethernet OAM:          Disabled
MACsec:              Disabled
Learning:            Enabled
Link-Flap Detection: Disabled
Unicast Flooding:    Enabled
Multicast Flooding:  Enabled
Broadcast Flooding:  Enabled
```

History

This command was first available in ExtremeXOS 10.1.

Information on ingress rate shaping was added in ExtremeXOS 11.0.

Network Login, Smart Redundancy, and rate limiting were added in ExtremeXOS 11.1.

Information on unicast, multicast, and broadcast flooding; the Port not present parameter; and autopolarity status were added in ExtremeXOS 11.2.

The netlogin parameters were added in ExtremeXOS 11.3.

The output command was modified in ExtremeXOS 12.1 so that when learning is disabled with the disabled learning port command, a new w flag appears in the output.

Link Ups and Link Downs information was added to the output and the tag value was added to the command syntax in ExtremeXOS 12.4.4.

Industrial Temperature detail added to Type field in ExtremeXOS 15.1.2.

Note

The Industrial Temperature detail is only displayed only when detail is used. Without it, the output is compressed and the optic type is not displayed.

The show output was enhanced to display the SNMP ifMib ifAlias accessible string size information.

The show output was updated to include the current status of non-Extreme optical devices in ExtremeXOS 15.4.

Link-flap detection information was added in ExtremeXOS 22_1.

Available Port Partitions was added to show port speed licensing information for ExtremeSwitching X870-96x-8c switches in ExtremeXOS 22.2.

IEEE Forward Error Correction (FEC) Clause 74 or 91 modes status was added in ExtremeXOS 22.3.

MACsec flag (S) and LRM/MACsec adapter in the detail **Type** field was added in ExtremeXOS 30.1.

LRM/MACsec Adapter port state information was added in ExtremeXOS 30.4.

Mismatched port compatibility indication was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports ip-fix

```
show ports {port_list } ip-fix {no-refresh | refresh}
```

Description

Displays IPFIX information on specified port(s).

Syntax Description

| | |
|-------------------|---|
| <i>port_list</i> | Specifies the port(s). |
| no-refresh | Specifies a static page by page display of the data without auto-refresh. |
| refresh | Specifies a continuous refresh of output. |

Default

N/A.

Usage Guidelines

Use this command to display IPFIX information regarding the global state, flow record count, and which ports are IPFIX enabled.

Example

The following command displays IPFIX information for port 3:1:

```
show port 3:1 ip-fix no-refresh
```

Following is sample output:

```
# show port 3:1 ip-fix no
Port IPFIX Metering
Port  Link  IPFIX          Byte      Pkt Flow Record  Premature State
State Count          Count      Count      Exports
=====
3:1   A    E              0          0          0          0
=====
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback
IPFIX State: D-Disabled E-Enabled
IPFIX Enabled on Port(s): 3:1
```

Flow Record Count—how many flow records have been sent from this port.

Premature Exports—the result of a hash bucket being full and the hardware having to export a flow prematurely to make room for a new flow.

History

This command was first available in ExtremeXOS 12.5.

The tag value was added in ExtremeXOS 12.4.4.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on only ExtremeSwitching X460-G2 series switches.

show ports link-flap-detection

```
show ports [port_list | all] link-flap-detection [disabled-ports |
configuration | counters {refresh | no-refresh}]
```

Description

Displays the link-flap detection status for ports.

Syntax Description

| | |
|-----------------------|---|
| ports | Physical ports. |
| <i>port_list</i> | List of ports that you want to see link-flap detection information. |
| all | Shows link-flap detection information for all ports in the system. |
| disabled-ports | Displays ports disabled due to excessive link flapping. |
| configuration | Displays link-flap detection configuration information: link-flap detection enabled status, link-flap detection actions enabled, threshold value, interval value. |
| counters | Displays counters related to link flapping. |
| refresh | Continuous refresh of output (default). |
| no-refresh | Page by page display without continuous refresh. |

Default

Output is refreshed by default.

Examples

The following example shows link-flap detection configuration for all ports:

```
show ports all link-flap-detection configuration
Maximum threshold for interval of 10 seconds : 200
```

```

Port      Link-Flap Actions  Threshold  Interval  Disable Time
          Detection                    (secs)    (secs)
=====
1         E          D--        20         6          200
2         E          D--        20         6          200
3         D          D-T        20 indefinitely until-cleared
4         E          D-T        20         5          200
5         D          D-T        20         5          200
6         D          D-T        10         5          300
...
=====
> indicates Port Display Name truncated past 8 characters
Link-Flap Detection: (E) Enabled, (D) Disabled
Actions: (D) Disable port, (L) Generate log, (T) Generate SNMP trap

```

The following example shows link-flap detection counter information for all ports:

```

show ports all link-flap-detection counters
Port Link-Flap Detection Counters
Port      Port      Current  Total      Time  Threshold
          State Link Flaps Link Flaps  Elapsed Exceeded
          (secs)
=====
1         E          0         0          0         0
2         E          0         0          0         0
3         D          0         0          0         0
4         D F        21        21         4         1
=====
> indicates Port Display Name truncated past 8 characters
Port State: E-Enabled, D-Disabled, F-Disabled by link-flap detection
0->Clear Counters  U->page up  D->page down  ESC->exit

```

The following example shows ports disabled due to excessive link flapping:

```

show ports all link-flap-detection disabled-ports
Ports disabled due to excessive link flapping
Disabled      Remaining
Port(s)      Disable Time
              (secs)
=====
1            until-cleared
4            150
=====
> indicates Port Display Name truncated past 15 characters

```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports link-scan

```
show ports link-scan {slot [slot | all]}
```

Description

Use this command to display the link scan attributes for polling port status.

Syntax Description

| | |
|-------------|----------------------------------|
| slot | Slot number (default all slots). |
| <i>slot</i> | Specifies the slot number. |
| all | Configures all slots. |

Default

All slots.

Usage Guidelines

None.

Example

```
# show ports link-scan
Slot      Interval (ms)
-----
 1         50 (default)
 2         300
 3         50 (default)
 4         50 (default)
 5
 6
 7
 8         200
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports packet

```
show ports {mgmt | port_list | tag tag} packet {no-refresh | refresh}
```

Complete

Displays a snapshot or real-time histogram of packet statistics.

Syntax Description

| | |
|-------------------|---|
| mgmt | Specifies the management port. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |
| no-refresh | Specifies a static snapshot of data. |
| refresh | Specifies a continuous refresh of output. |

Default

Real-time statistics.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, the system displays information for all ports; if you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command. To clear the counters, use the `clear counters ports` command.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

The following packet statistics are displayed:

- Port number
- Link state
- Packet size

Example

The following command displays packet statistics ports 1 through 8 on a switch:

```
show ports 1-8 packet
```

Following is sample output from this command:

```

Port   Link      Packet Sizes
State  0-64    65-127   128-255  256-511  512-1023  1024-1518  Jumbo
=====
 1  R        0        0         0         0         0         0         0
 2  R        0        0         0         0         0         0         0
 3  R        0        0         0         0         0         0         0
 4  R        0        0         0         0         0         0         0
 5  R        0        0         0         0         0         0         0
 6  R        0        0         0         0         0         0         0
 7  R        0        0         0         0         0         0         0
 8  R        0        0         0         0         0         0         0
=====
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback

```

History

This command was first available in ExtremeXOS 10.1.

The Port Not Present variable was added in ExtremeXOS 11.2.

The **no-refresh** variable was added in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports partition-template

```
show ports partition-template {slot [ slot | all ] }
```

Description

This command shows the bandwidth usage of the six uplink ports (49, 53, 57, 61, 65, 69) of the ExtremeSwitching X690 series switches.

Syntax Description

| | |
|---------------------------|---|
| partition-template | Specifies showing the bandwidth usage of the ExtremeSwitching X690 series switches' uplink ports. |
| slot | Specifies a slot number. |
| <i>slot</i> | Designates the slot number. |
| all | Shows partition for all of the six uplink ports (default). |

Default

If you do not designate slots, all slots are shown.

Usage Guidelines

ExtremeSwitching X690 series switches allow 400Gbps of combined I/O bandwidth for the six uplink ports (49, 53, 57, 61, 65, 69). If all of these uplink ports are configured to use their maximum capacity (49, 53 can operate at 40G; and 57, 61, 65, and 69 can operate at 100G), they can exceed the total allowed bandwidth.

The default port partition template configures the six ports as two 100G and four 40G ports. This default uses all six ports within the available total I/O bandwidth. You can also create a configuration of four 100G uplink ports. In this configuration, two QSFP ports, 49 and 53, are unused so as not to exceed the total allowed I/O bandwidth. Unused ports appears as "NP" (not present).

Example

The following example shows the bandwidth usage of the six uplink ports on an ExtremeSwitching X690 switch:

```
show ports partition-template all
Slot   Current Partition Template
-----
  1     4x100G
        49-52: NP, 53-56: NP, 57-60: 100G, 61-64: 100G, 65-68: 100G, 69-72: 100G

Slot   Configured Partition Template
-----
  1     4x100G
        49-52: NP, 53-56: NP, 57-60: 100G, 61-64: 100G, 65-68: 100G, 69-72: 100G
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on the ExtremeSwitching X690 series switches.

show ports protocol filter

```
show ports [port_list | all] protocol filter {detail}
```

Description

Displays the protocol filtering configuration and status.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Displays port list, separated by a comma (,) or dash (-). |
| all | Displays all ports. |
| detail | Displays detailed configuration and status. |

Default

Displays all protocol filters.

Usage Guidelines

Use this command to display the protocol filtering configuration and status.

Example

The following example displays the filtering configuration and status for ports 1-4:

```
# show ports 1-4 protocol filter
Port Protocol   Destination      Protocol Id  Field  Field  Field  Packets
#   Filter Name Address          Type  Value  Offset Value  Mask  Filtered
-----
1   my_list      01:80:C2:00:00:02 etype 0x8902   14   03:04  FF:FF
2300
      01:80:C2:00:00:00 snap 0x4041           5000
      01:80:C2:00:00:00 snap 0x4041   16   01:02> FF:FF> 5000
2   lacp         01:80:C2:00:00:02 etype 0x8902   14   01     FF     3200
3   (none)
4   (none)

> indicates that the value was truncated to the column size in the output. Use the
"detail" option to see the complete value.
```

The following example displays output for the show ports protocol filter detail command:

```
show ports 1-4 protocol filter detail
Port 1
  Protocol Filter Name: my_list
  Destination Address : 01:80:C2:00:00:02
  Protocol Id Type    : etype
  Protocol Id Value   : 0x8902
  Field Offset        : 14
  Field Value         : 03:04
  Field Mask          : FF:FF

  Field Value         : 01
  Field Mask          : FF
  Packets Filtered    : 3200

Port 3
  Protocol Filter Name: (none)

Port 4
  Protocol Filter Name: (none)
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports qosmonitor

```
show ports port_list qosmonitor {ingress | egress} {bytes | packets}
      {no-refresh | refresh} {port-number}
```

Description

Displays egress traffic counts or ingress traffic counts for each [QoS](#) profile on the specified ports.

Syntax Description

| | |
|--------------------|---|
| <i>port_list</i> | Specifies one or more slots and ports. |
| egress | Specifies the display of egress traffic counts. Default. |
| bytes | Specifies to display ingress or egress traffic counts in bytes. |
| packets | Specifies to display ingress or egress traffic counts in packets. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |
| port-number | Displays port number instead of display string. |

Default

Displays egress packet counts in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, the spacebar toggles the display between QoS traffic counts in either packets or bytes.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

If you do not specify a port number or range of ports when displaying ingress or egress traffic counts, traffic counts are displayed for all ports.

Example

The following example shows the egress packet counts for the specified ports:

```
# show ports 1:1-1:2 qosmonitor
Qos Monitor Req Summary                               Thu Mar  2 10:58:23 2006

=====
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

The ingress information was added in ExtremeXOS 11.0.

Also, you must specify the ports in ExtremeXOS 11.0.

The **egress** and **no-refresh** keywords were added in ExtremeXOS 11.3.

The **bytes** and **packets** keywords, as well as the toggling functionality, were added in ExtremeXOS 11.4.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports qosmonitor {congestion}

```
show ports port_list qosmonitor {congestion} {no-refresh | refresh}
        {port-number}
```

Description

Displays egress packet counts or dropped-traffic counts for each *QoS* profile on the specified ports.

Syntax Description

| | |
|--------------------|---|
| <i>port_list</i> | Specifies one or more slots and ports. |
| congestion | Specifies the display of packets dropped at ingress due to port congestion. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |
| port-number | Displays port number instead of display string. |

Default

Displays egress packet counts in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, the spacebar toggles the display between egress packet counts and ingress dropped-packet counts.

Note

This command does not work properly if another CLI session is displaying congestion statistics in real time.

If you specify the **no-refresh** parameter, the system displays a snapshot of the data at the time you issue the command.

The dropped packet display is limited to the 8 most-significant digits.

When you display the packet counts for a port, this action configures the hardware to monitor that port. If the switch was previously configured to monitor a different port, the counters are reset for the new port. If the selected port is the last port displayed on the switch, the counters are not reset.

Note

On a V300 bridge port extender (BPE) port, neither `show ports port_list qosmonitor {congestion} {no-refresh | refresh} {port-number}` nor `show ports port_list congestion {no-refresh | refresh} {port-number}` increments when there is egress congestion. Instead, you can view egress congestion using `show ports {port_list | stack-ports stacking-port-list} rxerrors {no-refresh | refresh}` on the ingress port (upstream port in many cases).

Example

The following example shows the egress packet counts for the specified ports:

```
# show ports 2:1, 3:6 qosmonitor
Qos Monitor Req Summary                               Thu Mar  2 10:58:23 2006
Port      QP1      QP2      QP3      QP4      QP5      QP6      QP7      QP8
Pkt       Pkt       Pkt       Pkt       Pkt       Pkt       Pkt       Pkt
Xmts      Xmts      Xmts      Xmts      Xmts      Xmts      Xmts      Xmts
=====
2:1        0         0         0         0         0         0         0         0
3:6        0         0         0         0         0         0         0         0
=====
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

The next example shows the dropped packet counts for the specified ports:

```
# show ports 2:1, 3:6 qosmonitor congestion
QoS Monitor Req Summary                               Thu Jun 12 01:17:14 2008

Pkt       Pkt       Pkt       Pkt       Pkt       Pkt       Pkt       Pkt
Cong      Cong      Cong      Cong      Cong      Cong      Cong      Cong
=====
2:1        0         0         0         0         0         0         0         0
3:6      8745         0        129         0         0         0         0         0
=====
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

You must specify the ports in ExtremeXOS 11.0.

The no-refresh keyword was added in ExtremeXOS 11.3.

The congestion keyword was added in ExtremeXOS 12.2, and the toggling functionality was modified to switch between egress packets and dropped packets.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports rate-limit flood

```
show ports { port_list | port_group | tag tag } rate-limit flood {out-
actions | out-of-profile {disabled-ports}} {no-refresh | refresh}
```

Description

Displays rate-limit discard statistics.

Syntax Description

| | |
|-----------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>port_group</i> | Port group name. |
| tag | Display ports in VMAN/VLANs with this IEEE 802.1Q or 802.1ad tag |
| <i>tag</i> | Tag ID between 1 and 4095. |
| rate-limit | Displays rate-limit discard statistics. |
| flood | Flood traffic. |
| out-actions | Display out-of-profile actions. |
| out-of-profile | Display rate-limit out-of-profile status. |
| disabled-ports | Display ports that have been disabled due to out-of-profile status. |
| no-refresh | Specifies a static snapshot of data. |
| refresh | Specifies a continuous refresh of output. |

Default

N/A.

Usage Guidelines

This command displays the per port ingress rate-limit flood traffic counter as well as information about received packets that have not been discarded due to rate-limiting.

It is used to show the results of the `configure ports port_list rate-limit flood [broadcast | multicast | unknown-destmac] [no-limit | pps]` command.

Note

As part of the system health check, the system polls the Rate-limit Flood Counters every 5 minutes and looks for non-zero counters on a port. A HAL.RateLimit.Info log message is logged when this is first detected on a port to alert the user that something in the network has triggered the rate limiting to occur. The message is not be logged again unless the counters are cleared.

Example

Following is sample out put from this command:

```
* switch # show ports rate-limit flood
Port Rate-Limit Discard Monitor                               Wed Oct  8 13:15:00 2008
Port   Link      Rx Pkt   Rx Byte   Rx Pkt   Rx Pkt   Flood Rate
State  Count    Count    Bcast    Mcast    Exceeded
=====
```

```

1      A      0      0      0      0      0
2      A      0      0      0      0      0
3      R      0      0      0      0      0
4      R      0      0      0      0      0
5      R      0      0      0      0      0
6      R      0      0      0      0      0
7      R      0      0      0      0      0
8      R      0      0      0      0      0
9      R      0      0      0      0      0
10     R      0      0      0      0      0
11     R      0      0      0      0      0
12     R      0      0      0      0      0
13     R      0      0      0      0      0

```

> indicates Port Display Name truncated past 8 characters
 Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback

The following examples use the **out-actions** and **out-of-profile** keywords:

```
# show ports rate-limit flood out-actions
```

| Port | Flood Type | Out-actions | | |
|-------|------------------|-------------|------|---------|
| | | Log | Trap | Disable |
| 1 | Unknown Dest MAC | On | On | Off |
| 1 | Broadcast | On | On | Off |
| 1 | Multicast | On | On | Off |
| 2 | Unknown Dest MAC | On | Off | On |
| 2 | Broadcast | On | Off | On |
| 2 | Multicast | On | Off | On |
| . . . | | | | |

```
# show ports rate-limit flood out-of-profile
```

| Port | Flood Type | Status | Counter |
|-------|------------------|----------------|------------|
| 1 | Unknown Dest MAC | Out of profile | 1234567890 |
| 1 | Broadcast | Ok | 0 |
| 1 | Multicast | Ok | 0 |
| 2 | Unknown Dest MAC | Ok | 0 |
| 2 | Broadcast | Out of profile | 12345 |
| . . . | | | |

```
# show ports rate-limit flood out-of-profile disabled-ports
Disabled
```

| Port | Flood Type | Status | Counter |
|-------|------------|----------------|---------|
| 2 | Broadcast | Out of profile | 12345 |
| . . . | | | |

History

This command was first available in ExtremeXOS 12.2.

The *port-group*, **out-actions**, **out-of-profile**, **disabled-ports**, and **refresh** options were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports redundant

```
show ports redundant
```

Description

Displays detailed information about redundant ports.

Syntax

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays information on software-controlled redundant ports on the switch:

```
show ports redundant
```

Following is sample output from this command:

```
Primary: *1:1           Redundant: 3:1, Link on/off option: OFF
Flags: (*)Active, (!) Disabled, (g) Load Share Group
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports rxerrors

```
show ports {port_list | stack-ports stacking-port-list} rxerrors {no-
refresh | refresh}
```

Description

Displays real-time receive error statistics. The switch automatically refreshes the output unless otherwise specified.

Syntax Description

| | |
|---------------------------|--|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>stacking-port-list</i> | Specifies one or more stacking ports or slots. Applies to SummitStack and the ExtremeSwitching series switches only. |

| | |
|-------------------|---|
| no-refresh | Specifies that auto-refresh is disabled. The output provides a real-time snapshot of the receive errors at the time the command is issued. This setting is not saved. |
| refresh | Specifies a continuous refresh of output. |

Default

The switch automatically refreshes the output.

Usage Guidelines

If you do not specify a port number or range of ports, receive error statistics are displayed for all ports.

If you do not specify the no-refresh parameter, the switch automatically refreshes the output (this is the default behavior).

If you specify the no-refresh parameter, the output provides a snapshot of the real-time receive error statistics at the time you issue the command and displays the output in page-by-page mode (this was the default behavior in ExtremeXOS 11.2 and earlier). This setting is not saved; therefore, you must specify the no-refresh parameter each time you want a snapshot of the port receive errors.

This status information may be useful for your technical support representative if you have a network problem.

Collected Port Receive Error Information

The switch collects the following port receive error information:

- Port Number.
- Link State—The current state of the link. Options are:
 - Active (A)—The link is present at this port.
 - Ready (R)—The port is ready to accept a link.
 - Loopback (L)—The port is in Loopback mode.
- Receive Bad CRC Frames (RX CRC)—The total number of frames received by the port that were of the correct length, but contained a bad FCS value.
- Receive Oversize Frames (RX Over)—The total number of good frames received by the port greater than the supported maximum length of 1,522 bytes.
- Receive Undersize Frames (RX Under)—The total number of frames received by the port that were less than 64 bytes long.
- Receive Fragmented Frames (RX Frag)—The total number of frames received by the port were of incorrect length and contained a bad FCS value.
- Receive Jabber Frames (RX Jabber)—The total number of frames received by the port that was of greater than the support maximum length and had a Cyclic Redundancy Check (CRC) error.
- Receive Alignment Errors (RX Align)—The total number of frames received by the port that occurs if a frame has a CRC error and does not contain an integral number of octets.
- Receive Frames Lost (RX Lost)—The total number of packets dropped due to the memory queue being full.

Port Monitoring Display Keys

For information about the available port monitoring display keys, see the `show ports statistics` command.

Note

On a V300 bridge port extender (BPE) port, neither `show ports port_list qosmonitor {congestion} {no-refresh | refresh} {port-number}` nor `show ports port_list congestion {no-refresh | refresh} {port-number}` increments when there is egress congestion. Instead, you can view egress congestion using this command on the ingress port (upstream port in many cases).

Example

The following command displays receive error statistics for all ports on the switches with auto-refresh enabled (the default behavior):

```
show ports rxerrors
```

The following is sample truncated output from this command:

```
Tue Jul 5 15:07:13 UTC 2005
Port Rx Error Monitor Tue Jul 5 15:07:13 UTC 2005
Port Link Rx Rx Rx Rx Rx Rx Rx Rx Rx

=====
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters U->page up D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

The link state information was updated to include NP-Port not present in ExtremeXOS 11.2.

Support for the auto-refresh functionality and the no-refresh parameter were added in ExtremeXOS 11.3. Auto-refresh continually updates the display. The no-refresh parameter takes a real-time snapshot of the display at the time you issue the command.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports sharing

```
show ports port_list sharing distribution configuration
```

Description

Displays port load-sharing groups, or LAGs.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Output from this command displays the following information:

- Config Master—The port that is configured as the master logical port of the link aggregation group (LAG). This number is also the LAG group ID.
- Current Master—In LACP, this is the port that is currently the LAG group ID, or master logical port for the LAG.
- Agg Control—This is the aggregation control for the specified LAG; it can be either static, LACP or health-check. In LACP, it is the aggregation control for the specified LAG.
- Min Active—The minimum number of active links that must be up for the trunk to remain up.
- Ld Share Algorithm—The algorithm used for the link aggregation. The available link aggregation algorithms vary among platforms; see the [ExtremeXOS 31.3 User Guide](#) for more information.
- Ld Share Group—The specific ports that belong to each LAG, or the port numbers in the trunk. A port can belong to only one LAG, either static or dynamic.
- Agg Mbr—In LACP, this shows whether the port has been added to the aggregator or not; it will be either Y for yes or - for no.
- Link State—This is the current status of the link.
- Link Up transitions—Number of times the link has cycled through being up, then down, then up.
- LAG distribution mode—Displays the configured distribution mode and distribution port lists for LAGs.

Example

Following is sample output displaying link aggregation on a switch:

```
show port sharing
Load Sharing Monitor
Config      Current Agg      Min      Ld Share      Ld Share      Agg      Link      Link Up

Number of load sharing trunks: 2
```

History

This command was first available in ExtremeXOS 10.1.

The LACP feature was added in ExtremeXOS 11.3.

The Health Check LAG was added in ExtremeXOS 12.1.3.

The round-robin algorithm was added in ExtremeXOS 12.5.

Support for the Min Active parameter was added in ExtremeXOS 15.7.1.

Custom hash seed information was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports stack-ports congestion

```
show ports stack-ports stack_port_list congestion {no-refresh | refresh}
port-number
```

Description

Displays the stacking port congestion statistics (dropped packets) for the specified ports on the front panel.

Syntax Description

| | |
|------------------------|--|
| <i>stack_port_list</i> | Specifies one or more stacking ports. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |
| port-number | Displays port number instead of display string in the output of the command. |

Default

Displays the port congestion statistics for all ports in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, you can clear the counters or page up or down through the list of ports.

Note

If you are displaying congestion statistics in real time and another CLI session resets the counters for a port you are monitoring, the counters displayed in your session for that port are also reset.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

Note

Packets can be dropped at multiple locations along the path through the hardware. The per-port congestion counters count all dropped packets for all ports.

If you do not specify a port number or range in the command, dropped packet counts are displayed for all ports.

Note

To display the congestion statistics for the [QoS](#) profiles on a stack port, use the `show ports stack-ports stack_port_list qosmonitor congestion {no-refresh | refresh} {port-number}` command.

Example

The following example shows the packets dropped due to congestion for all ports in real time:

```
# show ports stack-ports congestion
Port Congestion Monitor                               Fri Apr 21 13:02:37 2017
Port      Link      Packet
          State     Drop
-----
1:1       R         0
1:2       R         0
1:3       A         96
```

```

1:4      R      0
2:1      R      0
2:2      A      28513
2:3      R      0
2:4      R      0
2:5      R      0
2:6      R      0
2:7      R      0
2:8      R      0
3:1      R      0
3:2      R      0
3:3      R      0
3:4      R      0
=====
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->clear counters  U->page up  D->page down  ESC->exit

```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports stack-ports qosmonitor

```

show ports stack-ports stack_port_list qosmonitor {no-refresh | refresh}
           {port-number}

```

Description

Displays traffic counts for each QoS profile on the specified stacking ports.

Syntax Description

| | |
|------------------------|--|
| <i>stack_port_list</i> | Specifies one or more stacking ports. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |
| port-number | Displays port number instead of display string in the output of the command. |

Default

Displays packet counts in real-time.

If you do not specify a port number or range of ports, traffic counts appear for all ports.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, the space bar changes the display from QoS traffic counts in either packets or bytes.

If you specify the no-refresh option, you see a snapshot of the data at the time you issued the command.

Example

The following example shows the packet counts for ports 1:1 and 1:2:

```
# show ports stack-ports 1:1-1:2 qosmonitor
Qos Monitor Req Summary                               Fri Apr 21 10:58:23 2017
Port      QP1      QP2      QP3      QP4      QP5      QP6      QP7      QP8
Pkt       Pkt       Pkt       Pkt       Pkt       Pkt       Pkt       Pkt
Xmts      Xmts      Xmts      Xmts      Xmts      Xmts      Xmts      Xmts
=====
1:1        0         0         0         0         0         0         0         0
1:2        0         0         0         0         0         0         0         0
=====
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports stack-ports qosmonitor congestion

```
show ports stack-ports stack_port_list qosmonitor congestion {no-refresh
| refresh} {port-number}
```

Description

Displays packet counts or dropped-traffic counts for each QoS profile on the specified stacking ports.

Syntax Description

| | |
|------------------------|--|
| <i>stack_port_list</i> | Specifies one or more stacking ports. |
| congestion | Specifies the display of packets dropped due to port congestion. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Specifies a continuous refresh of output. |
| port-number | Displays port number instead of display string in the output of the command. |

Default

Displays packet counts in real-time.

If you do not specify a port number or range of ports, traffic counts appear for all ports.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, the space bar changes the display from packet counts and dropped-packet counts.

Note

This command does not work properly if another CLI session is displaying congestion statistics in real time.

If you specify the no-refresh option, you see a snapshot of the data at the time you issued the command.

The dropped packet display is limited to the 8 most-significant digits.

When you display the packet counts for a port, this action configures the hardware to monitor that port. If the switch was previously configured to monitor a different port, the counters are reset for the new port. If the selected port is the last port displayed on the switch, the counters are not reset.

Example

The following example shows the dropped packet counts for ports 2:1 and 3:6:

```
# show ports 2:1, 3:6 qosmonitor congestion
QoS Monitor Req Summary                               Fri Apr 21 01:17:14 2017
Port   QP1     QP2     QP3     QP4     QP5     QP6     QP7     QP8
Pkt    Pkt     Pkt     Pkt     Pkt     Pkt     Pkt     Pkt
Cong   Cong    Cong    Cong    Cong    Cong    Cong    Cong
=====
2:1    0        0        0        0        0        0        0        0
3:6    8745    0        129     0        0        0        0        0
=====
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters U->Page up D->Page down ESC->exit
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports statistics

```
show ports {port_list | stack-ports stacking-port-list} statistics {no-  
refresh | refresh}
```

Description

Displays real-time port statistic information. The switch automatically refreshes the output unless otherwise specified.

Syntax Description

| | |
|---------------------------|--|
| <i>stacking-port-list</i> | Specifies one or more stacking slots and ports. Applies to SummitStack and the ExtremeSwitching series switches only. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| no-refresh | Specifies that auto-refresh is disabled. The output provides a real-time snapshot of the port statistics at the time the command is issued. This setting is not saved. |
| refresh | Specifies a continuous refresh of output. |

Default

The switch automatically refreshes the output.

Usage Guidelines

If you do not specify a port number or range of ports, statistics are displayed for all ports.

If you do not specify the no-refresh parameter, the switch automatically refreshes the output (this is the default behavior).

If you specify the no-refresh parameter, the output provides a snapshot of the real-time port statistics at the time you issue the command and displays the output in page-by-page mode (this was the default behavior in ExtremeXOS 11.2 and earlier). This setting is not saved; therefore, you must specify the no-refresh parameter each time you want a snapshot of the port statistics.

Jumbo frame statistics are displayed for switches only that are configured for jumbo frame support.

This status information may be useful for your technical support representative if you have a network problem.

Collected Port Statistics

The switch collects the following port statistic information:

- Port Number.
- Link State—The current state of the link. Options are:
 - Active (A)—The link is present at this port.
 - Ready (R)—The port is ready to accept a link.

- Loopback (L)—The port is in Loopback mode.
- Transmitted Packet Count (Tx Pkt Count)—The number of packets that have been successfully transmitted by the port.
- Transmitted Byte Count (Tx Byte Count)—The total number of data bytes successfully transmitted by the port.
- Received Packet Count (RX Pkt Count)—The total number of good packets that have been received by the port.
- Received Byte Count (RX Byte Count)—The total number of bytes that were received by the port, including bad or lost frames. This number includes bytes contained in the Frame Check Sequence (FCS), but excludes bytes in the preamble.
- Received Broadcast (RX Bcast)—The total number of frames received by the port that are addressed to a broadcast address.

Note

On switches, when a broadcast jumbo frame is sent, the RX Bcast counter is not updated. The RX Pkt counter is updated to reflect the received broadcast jumbo frames.

- Received Multicast (RX Mcast)—The total number of frames received by the port that are addressed to a multicast address.

Port Monitoring Display Keys

The following table describes the keys used to control the display that appears if auto-refresh is enabled (the default behavior).

Table 45: Port Monitoring Display Keys with Auto-Refresh Enabled

| Key(s) | Description |
|--------|--------------------------------------|
| U | Displays the previous page of ports. |
| D | Displays the next page of ports. |
| [Esc] | Exits from the screen. |
| 0 | Clears all counters. |

The following table describes the keys used to control the display that appears if you auto-refresh is disabled.

Table 46: Port Monitoring Displays Keys with Auto-Refresh Disabled

| Key | Description |
|---------|----------------------------------|
| Q | Exits from the screen. |
| [Space] | Displays the next page of ports. |

Example

The following command displays port statistics for all ports on switches with auto-refresh enabled (the default behavior):

```
show ports statistics
```

The following is truncated sample output from this command:

```
Port Statistics
Port          Link      Tx Pkt    Tx Byte    Rx Pkt    Rx Byte   Rx      Rx

7            R         0         0         0         0        0        0
8            R         0         0         0         0        0        0
9            R         0         0         0         0        0        0
10           R         0         0         0         0        0        0
11           R         0         0         0         0        0        0
12           R         0         0         0         0        0        0
13           R         0         0         0         0        0        0
14           R         0         0         0         0        0        0
15           R         0         0         0         0        0        0
16           R         0         0         0         0        0        0
17           R         0         0         0         0        0        0
=====
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters  U->page up  D->page down  ESC->exitPort Statistics
```

History

This command was first available in ExtremeXOS 10.1.

The link state information was updated to include NP-Port not present in ExtremeXOS 11.2.

Support for the auto-refresh functionality and the no-refresh parameter were added in ExtremeXOS 11.3. Auto-refresh continually updates the display. The no-refresh parameter takes a real-time snapshot of the display at the time you issue the command.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports transceiver information detail

```
show ports {port_list | tag tag} transceiver information detail
```

Description

Displays detailed information about the optical transceiver.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies the port number(s). |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |

Default

N/A.

Usage Guidelines

Digital Diagnostic Monitoring Interface (DDMI) provides critical system information about the installed optical modules. Use this command to monitor the condition of XFP, SFP, and SFP+ optical transceiver modules.

The tag value may be associated with either a VMAN or a VLAN.

If you try to execute this command on one of the ports in the port list that is non-compliant with DDMI, the following error message is displayed and the command does not go through:

```
Port 3:1 This command is not supported on this port. All ports and
transceiver of the ports requested in the command need to support DDMI.
```

If you try to execute this command on one of the ports in the port list on which the transceiver is non-compliant with DDMI, the following error message is displayed:

```
Port 3:1 This media/transceiver does not support enhanced digital
diagnostic monitoring interface (DDMI). All ports and transceiver of the
ports requested in the command need to support DDMI.
```

Example

```
# show port 2:* conf

Press <SPACE> to continue or <Q> to quit:

```

Note

In `show ports transceiver information` output, the Rx/Tx power values shown may be +/- 3dB from the actual value due to the limitation of SFP and the accuracy depends on SFP vendor. For accurate power measurement, it is recommended to use a power meter.

History

This command was first available in ExtremeXOS 12.4.

Support for the ExtremeSwitching switches was added in ExtremeXOS 12.5.

The tag value was added in ExtremeXOS 12.4.4.

Support for SFP and SFP+ optics was added in ExtremeXOS 12.5.3.

Show output was updated in 15.3.

Show output was updated to include the current status of non-Extreme optical devices in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports transceiver information

```
show ports {port_list | tag tag} transceiver information
```

Description

Displays basic information about the optical transceiver.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies the port number(s). |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |

Default

N/A.

Usage Guidelines

Digital Diagnostic Monitoring Interface (DDMI) provides critical system information about the installed optical modules. Use this command to monitor the condition of XFP, SFP, and SFP+ optical transceiver modules.

The tag value may be associated with either a VMAN or a VLAN.

If you try to execute this command on one of the ports in the port list that is non-compliant with DDMI, the following error message is displayed and the command does not go through:

```
Port 3:1 This command is not supported on this port. All ports and
transceiver of the ports requested in the command need to support DDMI.
```

If you try to execute this command on one of the ports in the port list on which the transceiver is non-compliant with DDMI, the following error message is displayed:

```
Port 3:1 This media/transceiver does not support enhanced digital
diagnostic monitoring interface (DDMI). All ports and transceiver of the
ports requested in the command need to support DDMI.
```

For more detailed information, use the [show ports transceiver information detail](#) command.

Example

The following display shows output for port 1:1-2:

```
# sh port 1:1-2 transceiver information
Port      Temp      TxPower  RxPower  TxBiasCurrent  Voltage-Aux1  Voltage-Aux2
(Celcius) (dBm)    (dBm)    (mA)      (Volts)        (Volts)
=====
1:1       30.60    -25.20   -18.70    0.40           5.09          5.07
1:2       30.60    -25.20   -18.70    0.40           5.09          N/A
=====
N/A indicates that the parameter is not applicable
to the optics connected to the port
```

The following display shows output for port 25:

```
# sh ports 25 transceiver information
Port      Temp      TxPower  RxPower
TxBiasCurrent  Voltage-Aux1  Voltage-Aux2
(mA)          (Celsius)    (dBm)        (dBm)
(Volts)
=====
25          32.00        -3.35        -2.68
7.67        3.35        N/A
=====
```

Note

In `show ports transceiver information` output, the Rx/Tx power values shown may be +/- 3dB from the actual value due to the limitation of SFP and the accuracy depends on SFP vendor. For accurate power measurement, it is recommended to use a power meter.

History

This command was first available in ExtremeXOS 12.4.

Support for the ExtremeSwitching switches was added in ExtremeXOS 12.5.

The tag value was added in ExtremeXOS 12.4.4.

Support for SFP and SFP+ optics was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports txerrors

```
show ports {port_list | stack-ports stacking-port-list} txerrors {no-
refresh | refresh}
```

Description

Displays real-time transmit error statistics. The switch automatically refreshes the output unless otherwise specified.

Syntax Description

| | |
|---------------------------|--|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>stacking-port-list</i> | Specifies one or more stacking slot ports for display. Applies to SummitStack and ExtremeSwitching series switches only. |
| no-refresh | Specifies that auto-refresh is disabled. The output provides a real-time snapshot of the transmit errors at the time the command is issued. This setting is not saved. |
| refresh | Specifies a continuous refresh of output. |

Default

The switch automatically refreshes the output.

Usage Guidelines

If you do not specify a port number or range of ports, error statistics are displayed for all ports.

If you do not specify the no-refresh parameter, the switch automatically refreshes the output (this is the default behavior).

If you specify the no-refresh parameter, the output provides a snapshot of the real-time transmit error statistics at the time you issue the command and displays the output in page-by-page mode (this was the default behavior in ExtremeXOS 11.2 and earlier). This setting is not saved; therefore, you must specify the no-refresh parameter each time you want a snapshot of the port transmit errors.

This status information may be useful for your technical support representative if you have a network problem.

Collected Port Transmit Error Information

The switch collects the following port transmit error information:

- Port Number.
- Link State—The current state of the link. Options are:
 - Active (A)—The link is present at this port.
 - Ready (R)—The port is ready to accept a link.
 - Loopback (L)—The port is in Loopback mode.
- Transmit Collisions (TX Coll)—The total number of collisions seen by the port, regardless of whether a device connected to the port participated in any of the collisions.
- Transmit Late Collisions (TX Late Coll)—The total number of collisions that have occurred after the port's transmit window has expired.

- Transmit Deferred Frames (TX Deferred)—The total number of frames that were transmitted by the port after the first transmission attempt was deferred by other network traffic.
- Transmit Errored Frames (TX Errors)—The total number of frames that were not completely transmitted by the port because of network errors (such as late collisions or excessive collisions).
- Transmit Lost Frames (TX Lost)—The total number of transmit frames that do not get completely transmitted because of buffer problems (FIFO underflow).
- Transmit Parity Frames (TX Parity)—The bit summation has a parity mismatch.

Port Monitoring Display Keys

For information about the available port monitoring display keys, see the `show ports statistics` command.

Example

The following command displays transmit error statistics for all ports on an ExtremeSwitching switch:

```
# show ports txerrors
```

The following is a truncated sample output from this command:

```
Port Tx Error Monitor                               Tue Jul  5 15:07:13 UTC 2005
Port      Link      Tx      Tx      Tx      Tx      Tx      Tx
State     Coll      Late coll  Deferred  Errors  Lost      Parity
=====
1         R         0         0         0         0         0         0
2         R         0         0         0         0         0         0
3         R         0         0         0         0         0         0
4         R         0         0         0         0         0         0
5         R         0         0         0         0         0         0
6         R         0         0         0         0         0         0
7         R         0         0         0         0         0         0
8         R         0         0         0         0         0         0
9         R         0         0         0         0         0         0
10        R         0         0         0         0         0         0
11        R         0         0         0         0         0         0
12        R         0         0         0         0         0         0
13        R         0         0         0         0         0         0
14        R         0         0         0         0         0         0
15        R         0         0         0         0         0         0
16        R         0         0         0         0         0         0
17        R         0         0         0         0         0         0
=====
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters  U->page up  D->page down  ESC->exitPort Tx Error
```

History

This command was first available in ExtremeXOS 10.1.

The link state information was updated to include NP-Port not present in ExtremeXOS 11.2.

Support for the auto-refresh functionality and the no-refresh parameter were added in ExtremeXOS 11.3. Auto-refresh continually updates the display. The no-refresh parameter takes a real-time snapshot of the display at the time you issue the command.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ports utilization

```
show ports {mgmt | port_list | tag tag | stack-ports stacking-port_list}
          utilization {bandwidth | bytes | packet}
```

Description

Displays real-time port utilization information. The total utilization displays as real-time information, constantly refreshing, and the parameter displays show a snapshot of the activity on the port when you issue the command.

Syntax Description

| | |
|---------------------------|--|
| mgmt | Specifies the management port. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| <i>tag</i> | Specifies an 802.1Q or 802.1ad tag value. |
| <i>stacking-port_list</i> | Specifies one or more stacking slots and ports. |
| bandwidth | Specifies port utilization as percentage of bandwidth. |
| bytes | Specifies port utilization in bytes per second. |
| packet | Specifies port utilization in packets per second. |

Default

N/A.

Usage Guidelines

The software continuously monitors port utilization and calculates bandwidth as a function of each port's maximum link capacity.

The total utilization display presents real-time statistics. Use the *spacebar* to toggle the real-time displayed information for packets, bytes, and bandwidth in that order. When you use a parameter (packets, bytes, or bandwidth) with the command, the display for the specified type shows a snapshot per port when you issued the command. When the show ports utilization command is run with the

bandwidth, bytes, or packets options, the command may need to be repeated a few times in order for the ExtremeXOS software to gather enough statistics to calculate appropriate values.

If you do not specify a port number, range of ports, or tag value, port utilization information is displayed for all ports.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

Example

The following command displays utilization statistics for port 1 on a stand-alone switch:

```
show ports 1 utilization
```

The following example shows sample output from the show ports utilization packets command:

```
Link Utilization Averages                               Mon Oct  6 22:38:25 2008
Port   Link   Rx           Peak Rx           Tx           Peak Tx
State  pkts/sec  pkts/sec     pkts/sec     pkts/sec

Spacebar->toggle screen U->page up D->page down ESC->exit

```

History

This command was first available in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches. The stack-ports option is available only on SummitStack.

show ports vlan statistics

```
show ports {port_list} vlan statistics {no-refresh | refresh}
```

Description

Displays *VLAN* statistics at the port level.

Syntax Description

| | |
|-------------------|--|
| <i>port_list</i> | Specifies one or more ports or slots and ports. Can be one or more port numbers. May be in the form: 1, 2, 3-5, 1:*, 1:5, 1:6-1:8. |
| no-refresh | Specifies that there is no continuous refresh. The prompt comes back to the user after fetching statistics once. |
| refresh | Continuous refresh of output. |

Default

N/A.

Usage Guidelines

This command is used in conjunction with the `configure ports [port_list|all] monitor vlanvlan_name {rx-only | tx-only}` command.

Example

The following command displays statistics for the ports 1-2 on node 5:

```
show ports 5:1-2 vlan stats
Displays the vlan statistics in a real time countinuous refresh mode or no-refresh mode.
# show ports 5:1-2 vlan stat
Port VLAN Statistics                               Wed Mar 28 10:52:59 2007
Port   Vlan      Rx Frames      Rx Byte      Tx Frame      Tx Byte
Count      Count          Count          Count
=====
5:1     Default  318750522     20400046784     318750588     20400051672
5:2     Default  292811491     18739948736     292811975     18739980504
0->Clear Counters  U->page up  D->page down  ESC->exit
```

For ports that do not support transmit statistics, a '-' will be displayed. For ports that do not support transmit byte counters, a '-' will be displayed for that row and column. Similarly, configuration using rx-only or tx-only will result in the display of "-"s in the appropriate rows and columns.

History

This command was first available in ExtremeXOS 12.0.

The **refresh** keyword was added in ExtremeXOS 16.1.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2, X440-G2, X465, X590, X620, X690, , X695, X870, 5420, 5520 series switches.

show ports wred

```
show ports port_list wred ecn {no-refresh | refresh}
```

Description

Displays WRED and Explicit Congestion Notification (ECN) statistics for the specified ports or all ports.

Syntax Description

| | |
|-------------------|--|
| <i>port_list</i> | Specifies a list of slots and ports to display. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8. |
| no-refresh | Specifies a static snapshot of data instead of the default dynamic display. |
| refresh | Continuous refresh of output. |
| ecn | Displays ECN statistics. |

Default

N/A.

Usage Guidelines

If no port or port list is specified, this command displays the WRED statistics for all ports. If WRED is not configured on a port, the statistics for that port display as 0.

The drop counters in the display represent packets that were dropped based on the WRED congestion avoidance algorithm. The Green Pkt Drop column counts in-profile TCP and non-TCP packets that have been dropped. The Red Pkt Drop column counts out-of-profile TCP and non-TCP packets that have been dropped.

Note

The values in the Yellow Pkt Drop column are always 0 in this release because the yellow traffic color is not supported at this time.

Example

The following example displays the WRED statistics for port list 2:1-9:

```
# show ports 2:1-9 wred no-refresh
Port WRED Stats Monitor
=====
Port      Link      Green      Yellow      Red
State     Pkt Drop  Pkt Drop  Pkt Drop
=====
2:1       A         0          0          0
2:2       R         0          0          0
2:3       R         0          0          0
2:4       R         0          0          0
2:5       R         0          0          0
```

```

2:6      R      0      0      0
2:7      R      0      0      0
2:8      R      0      0      0
2:9      R      0      0      0
=====
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback

```

The following example shows ECN statistics for port 2:

```

# show ports 2 wred ecn no-refresh
Port WRED ECN Statistics Monitor
Port      Link      Packets
          State     Marked
=====
2         R         0
=====
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback

```

The following example shows ECN statistics for all ports:

```

# show ports wred ecn no-refresh
Port WRED ECN Statistics
Port      Link      Packets
          State     Marked
=====

34        NP         0
=====
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback

```

History

This command was first available in ExtremeXOS 12.7.

The **refresh** keyword was added in ExtremeXOS 16.1.

The **ecn** keyword was added in ExtremeXOS 22.3.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2, X435, X465, X590, X620, X690, X695, X870, 5520 series switches.

show power

```
show power {ps_num} {detail}
```

Description

Displays the current status of the installed power supplies.

Syntax Description

| | |
|---------------|--|
| <i>ps_num</i> | Specifies the slot number of the installed power supply. |
| detail | The detail option is reserved for future use. |

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the health of the power supplies.

This status information may be useful for your technical support representative if you have a network problem.

The switch collects the following power supply information:

- State—Indicates the current state of the power supply. Options are:
 - Empty—There is no power supply installed.
 - Power Failed—The power supply has failed.
 - Powered Off—The power supply is off.
 - Powered On—The power supply is on and working normally.
- Disabled for net power gain—Indicates that the power supply is disabled in order to maximize the total available system power.
- Configured ON—Indicates that the user requested to enable a disabled power supply regardless of the affect on the total available system power.

- Configured ON when present—Indicates that the power supply slot is currently empty, but the user requested to enable the power supply regardless of the affect on the total available system power.
- Internal Power Supply (PowerSupply 1 information)—The ExtremeSwitching switches come with one power supply pre-installed at the factory. The ExtremeSwitching power supply is not user-replaceable; therefore, the part information display indicates internal power supply.
- External Power Supply (PowerSupply 2-4 information)—Displays information about the optional External Power System (EPS) that allows you to add a redundant power supply to the ExtremeSwitching series switches to protect against a power supply failure.

The ExtremeSwitching series switches include Power Usage, which is only an estimate for the input power consumed. SummitStack displays the supplies associated to each active node that is present in a slot. The supplies are represented with flags that describe whether the supply is providing power, has failed, or is providing no power, or if the supply has had its 48v power output automatically turned off because two or three external power supplies are available. For more information, see [show power \(Stack Nodes Only\)](#).

In ExtremeXOS 10.1 and earlier, use the `show power supplies {detail}` command to view detailed health information about the power supplies.

In ExtremeXOS 22.5 and later, the **detail** option shows external power supply fan airflow direction. This is only applicable for switches that support such power supplies:

- ExtremeSwitching X440-G2—all models
- ExtremeSwitching X450-G2—non-PoE models
- ExtremeSwitching X620-8t-2x and X620-10x
- ExtremeSwitching 5520—all models

Bridge Port Extenders (BPEs)

Power supply information for bridge port extenders (BPEs) does not appear in this command. Use the `show vpx bpe {slot slot_num} {environment}` command instead.

Example

The following command displays the status of the power supplies installed:

```
# show power
```

The following sample output assumes that you have not installed an EPS:

```
PowerSupply 1 information:
State:           Powered On
PartInfo:        Internal Power Supply
PowerSupply 2 information:
State:           Empty
```

The following sample output assumes that you have installed an EPS:

```
PowerSupply 1 information:
State:           Powered On
PartInfo:        Internal Power Supply
PowerSupply 2 information:
```

```
State:          Powered On
PartInfo:       External Power Supply
```

The following sample output assumes a connection to an external EPS-C with three EPS-600LS modules installed:

```
# show power
PowerSupply 1 information:
State:          Powered Off
PartInfo:       Internal Power Supply
Input:          0.00 V AC
PowerSupply 2 information:
State:          Powered On
PartInfo:       External Power Supply
Input:          0.00 V AC
PowerSupply 3 information:
State:          Powered On
PartInfo:       External Power Supply
Input:          0.00 V AC
PowerSupply 4 information:
State:          Powered On
PartInfo:       External Power Supply
Input:          0.00 V AC
```

For stacking systems, the power detail display is enhanced as follows:

```
# show power
PSU-1 or PSU-2 or
Internal External External External Power
Slots Type PSU PSU PSU PSU Usage
-----
Slot-1 P - - - 113.88 W
Slot-2
Slot-3
Slot-4
Slot-5
Slot-6
Slot-7
Slot-8
Flags : (P) Power available, (F) Failed or no power,
(O) 48V powered off when 2 or 3 external PSUs are powered on,
(-) Empty
System Power Usage : 120 W
* Slot-1 Stack.2 # show power detail
Slot-1 PowerSupply 1 information:
State : Powered On
PartInfo : PSSF751301A- 1022A-40459 800382-00-01
Power Usage : 113.88W
Output 1 : 18.63 V, 4.37 A
Output 2 : 3 V, 3 A
Slot-1 PowerSupply 2 information:
State : Empty
System Power Usage : 120 W
```

The following example shows power detail:

```
# show power detail

PowerSupply 1 information:
State : Powered On
PartInfo : Internal PSU-1 1402E-41506 800386-00-06
Input : 121.06 V AC
Output 1 : 12.01 V, 4.12 A (12V/300W Max)
```

```
Power Usage      : 66.86 W
AirFlow Direction : Front To Back
```

History

This command was first available in an ExtremeXOS 10.1.

The syntax for this command was modified in ExtremeXOS 11.0 from `show powersupplies` to `show power {ps_num} {detail}`.

Power supply fan airflow direction information was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show power (Stack Nodes Only)

```
show power
```

Description

Displays the number of power modules present and providing power in each slot.

Syntax Description

This command has no arguments or variables.

Default

Default value

Usage Guidelines

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches. However, it produces completely different output on a stack. The following table describes the flags that appear when this command is executed on an active node.

Table 47: Flag Descriptions for the show power Command

| Power Supply | Flag | Meaning |
|--------------------|------|-------------------------------------|
| Internal | F | Failed or no Power. |
| Internal | P | Power available. |
| Internal | O | 48V powered off (48p Summits only). |
| External (non 48P) | - | Empty. |

Table 47: Flag Descriptions for the show power Command (continued)

| Power Supply | Flag | Meaning |
|---------------------|------|--|
| External (non 48P) | F | Failed or no power. |
| External (non 48P) | P | Power available. |
| External (non 48P) | | Power supply can never occupy this position. |
| External (48P only) | - | Empty or no power to all PSUs present. |
| External (48P only) | F | Failed or no power (at least 1 PSU has power). |
| External (48P only) | P | Power available. |

All ExtremeSwitching series switches accept an external power chassis that holds only one power supply. For ExtremeSwitching series switches, the External PSU columns are left blank.

For slots without active nodes, the slot number appears and the remainder of the row is blank.

Example

The following are sample displays for this command:

```
# show power
Internal  External  External  External
Slots   Type      PSU       PSU       PSU       PSU
-----
Slot-1 X           F         P
Slot-2 X           P         -
Slot-3 X           -         P
Slot-4 X           P         P
Slot-5 X           P         -
Slot-6 X           -         P
Slot-7 X           P         P         F         -
Slot-8 X           P         -
Flags : (P) Power available, (F) Failed or no power,
(O) 48V powered off when 2 or 3 external PSU are powered on,
(-) Empty
Slot-2 Stack.41 #
Slot-2 Stack250.4 # show power

Slot-2 X           P         -
Slot-3 X           P         -
Slot-4 X           P         P
Slot-5 X           P         -
Slot-6 X           O         P         P         F
Slot-7
Slot-8 X           P         -
Flags : (P) Power available, (F) Failed or no power,
(O) 48V powered off when 2 or 3 external PSUs are powered on,
(-) Empty
Slot-2 StackX #
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches. However, the output described in this section is available only on nodes configured for the SummitStack feature.

show private-vlan

```
show private-vlan
```

Description

Displays information about all the PVLANS on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

If the PVLAN is incomplete because it does not have a network or any subscriber VLAN configured, [INCOMPLETE] appears next to the PVLAN name.

Example

The following example output displays all the PVLANS on the switch:

```
# show private-vlan
-----
Name          VID  Protocol Addr          Flags          Proto  Ports  Virtual
Active router
/Total
-----

(l) MPLS Enabled, (m) IPmc Forwarding Enabled, (n) IP Multinetting Enabled,
(N) Network LogIn vlan, (o) OSPF Enabled, (p) PIM Enabled,
(P) EAPS protected vlan, (r) RIP Enabled,
(T) Member of STP Domain, (V) VPLS Enabled, (v) VRRP Enabled
Total number of PVLAN(s) : 3

```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show private-vlan name

```
show {private-vlan} name
```

Description

Displays information about the specified PVLAN.

Syntax Description

| | |
|-------------|---|
| <i>name</i> | Specifies the name of the PVLAN to display. |
|-------------|---|

Default

N/A.

Usage Guidelines

If the PVLAN is incomplete because it does not have a network or any subscriber VLAN configured, [INCOMPLETE] appears next to the PVLAN name.

Example

The following example output displays information for the companyx PVLAN:

```
# show private-vlan "Engineering"
-----
Name          VID  Protocol Addr      Flags          Proto  Ports  Virtual
Active router
/Total
-----
Engineering
Network VLAN:
-Engr1        10  -----
ANY          4 /5  VR-Default
Non-Isolated Subscriber VLAN:
-ni1          400 -----
ANY          1 /1  VR-Default
-ni2          401 -----
ANY          1 /1  VR-Default
Isolated Subscriber VLAN:
-il           500 -----
ANY          1 /1  VR-Default
-----
Flags : (C) EAPS Control vlan, (d) NetLogin Dynamically created VLAN,
(D) VLAN Admin Disabled, (E) ESRP Enabled, (f) IP Forwarding Enabled,
(i) ISIS Enabled, (I) IP Forwarding lpm-routing Enabled, (L) Loopback Enabled,
(l) MPLS Enabled, (m) IPmc Forwarding Enabled, (n) IP Multinetting Enabled,
(N) Network LogIn vlan, (o) OSPF Enabled, (p) PIM Enabled,
(P) EAPS protected vlan, (r) RIP Enabled,
(T) Member of STP Domain, (V) VPLS Enabled, (v) VRRP Enabled
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show process

```
show process {name} {detail} {description} {slot slotid}
```

Description

Displays the status of the ExtremeXOS processes.

Syntax Description

| | |
|--------------------|--|
| <i>name</i> | Specifies the name of the process. |
| detail | Specifies more detailed process information. |
| description | Describes the name of all of the processes or the specified process running on the switch. |
| <i>slotid</i> | Specifies the slot number of a node in a stack topology. |

Default

N/A.

Usage Guidelines

The ExtremeXOS process manager monitors all of the XOS processes. The process manager also ensures that only version-compatible processes are started.

Using this command without the optional keywords displays summary process information. When you specify the slot keyword, summary information is displayed for that particular slot only.

The `show process` and `show process slot slotid` commands display the following information in a tabular format:

- Process Name—The name of the process.
- Version—The version number of the process. Options are:
 - Version number—A series of numbers that identify the version number of the process. This is helpful to ensure that you have version-compatible processes and if you experience a problem.
 - Not Started—The process has not been started. This can be caused by not having the appropriate license or for not starting the process.
- Restart—The number of times the process has been restarted. This number increments by one each time a process stops and restarts.
- State—The current state of the process. Options are:
 - No License—The process requires a license level that you do not have. For example, you have not upgraded to that license, or the license is not available for your platform.
 - Ready—The process is running.
 - Stopped—The process has been stopped.
- Start Time—The current start time of the process. Options are:
 - Day/Month/Date/Time/Year—The date and time the process began. When a process terminates and restarts, the start time is also updated.
 - Not Started—The process has not been started. This can be caused by not having the appropriate license or for not starting the process.
- Group—The process control group to which the process belongs to. Options are:
 - EXOS—The process belongs to “EXOS” process control group.
 - Other—The process belongs to “Other” process control group.
 - Kernel—The process belongs to “root” process control group.

When you specify the **detail** keyword, more specific and detailed process information is displayed.

The `show process detail` and `show process slot slotid` commands display the following information in a multi-tabular format:

- Detailed process information
- Memory usage configurations
- Recovery policies
- Process statistics
- Resource usage

This status information may be useful for your technical support representative if you have a network problem.

Depending on the software version running on your switch or your switch model, additional or different process information might be displayed.

You may find it useful to capture the process information under normal operating conditions to establish a baseline. By having a baseline, if you experience a problem, you and your technical support representative can more easily identify the problem.

SummitStack Only

When you run the command with out any parameters:

- From the stack manager or backup node, the stack displays the status of the ExtremeXOS processes running on the master node and the back-up node in the Active Topology.
- From a standby node, the stack displays the status of the ExtremeXOS processes running on the standby node and the master node in the Active Topology.

Example

The following is sample output from an ExtremeSwitching switch:

```
# show process
```

| Process Name | Version | Restart | State | Start Time | Group |
|--------------|----------|---------|-------|--------------------------|--------|
| aaa | 3.0.0.4 | 0 | Ready | Sat Dec 11 22:42:28 2021 | EXOS |

History

This command was first available in an ExtremeXOS 10.1.

The **description** keyword was added in ExtremeXOS 11.2.

Added in ExtremeXOS 15.7, the Version field will be overloaded to contain “User” if the process is a user created process.

Process group information was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show process group

```
show process group {[exos | other]}
```

Description

This command shows the configured settings and statistics for the process groups.

Syntax Description

| | |
|--------------|---|
| exos | Shows configured settings and statistics for the "EXOS" process group. |
| other | Shows configured settings and statistics for the "other" process group. |

Default

If you do not select a process group ("EXOS" or "Other"), information for both process groups appears.

Example

The following example shows information about both the "exos" and "other" process groups:

```
# show process group
  Number of processes          : 72
CPU
  Limit                       : 90 %
  Current utilization          : 1.2 %
  Maximum utilization          : 29.1 %
Memory
  Upper Limit                  : 95 %
  Current utilization          : 3.9 %
  Maximum utilization          : 3.9 %
  Number of processes killed by EPM : 0
Other:
  Number of processes          : 1
CPU
  Limit                       : 10 %
  Current utilization          : 0.0 %
  Maximum utilization          : 0.0 %
Memory
  Upper Limit                  : 5 %
  Current utilization          : 0.0 %
  Maximum utilization          : 0.0 %
  Number of processes killed by EPM : 0
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show protocol

```
show protocol {filter} {filter_name} {detail}
```

Description

Displays protocol filter definitions and the complete protocol configuration.

Syntax Description

| | |
|---------------|--|
| filter | Displays a protocol filter. |
| <i>name</i> | Displays a protocol filter name. |
| detail | Displays protocol information in detail. |

Default

Displays all protocol filters.

Usage Guidelines

Displays the defined protocol filter(s) with the types and values of its component protocols.

Example

The following is an example of the command's output:

```
# show protocol
Protocol Filter Name   Protocol   Id       Destination   Field   Field   Field
                       Type       Value    Address       Offset  Value   Mask
-----
IP                     etype     0x0800
                       etype     0x0806
ANY                    ANY       0xffff
ipx                    etype     0x8137
IPv6                   etype     0x86dd
lacp                   etype     0x8809   01:80:C2:00:00:02>  14     01     FF
mpls                   etype     0x8847
appletalk              snap      0x809b
                       snap      0x80f3

> indicates that the value was truncated to the column size in the output.
Use the "detail" option to see the complete value.
```

The following example displays the `show protocol detail` command:

```
show protocol detail
Protocol Filter Name   : appletalk
  Protocol Id Type    : snap
  Protocol Id Value   : 0x809b
  Destination Address:
  Field Offset       :
  Field Value        :
  Field Mask         :

  Protocol Id Type    : snap
  Protocol Id Value   : 0x80f3
  Destination Address:
  Field Offset       :
  Field Value        :
  Field Mask         :

Protocol Filter Name   : lacp
  Protocol Id Type    : etype
  Protocol Id Value   : 0x8809
  Destination Address: 01:80:C2:00:00:02
  Field Offset       : 14
  Field Value        : 01
  Field Mask         : FF

# show protocol filter "lacp" detail
Protocol Filter Name   : lacp
  Protocol Id Type    : etype
  Protocol Id Value   : 0x8809
  Destination Address: 01:80:C2:00:00:02
  Field Offset       : 14
  Field Value        : 01
  Field Mask         : FF
```

History

This command was first available in ExtremeXOS 10.1.

The **filter** and **detail** keywords were added in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show qosprofile

```
show qosprofile {ingress | egress} [ports [port_list | all | port_group]
| NULL]
```

Description

Displays QoS information on the switch.

Syntax Description

| | |
|-------------------|--------------------------------|
| ports | Specifies to show ports. |
| <i>port_list</i> | Specifies a list of ports. |
| <i>port_group</i> | Specifies the port group name. |
| all | Specifies all ports. |
| NULL | NULL. |

Default

Displays egress QoS information for all ports.

Usage Guidelines

The displayed QoS profile information differs depending on the platform you are running on. The following section shows examples for different platforms.

Example

The display varies depending on your platform.

The following shows the information that appears when you omit the optional port parameter:

```
# show qosprofile
QP1  Weight = 1      Max Buffer Percent = 100
QP2  Weight = 1      Max Buffer Percent = 100
QP8  Weight = 1      Max Buffer Percent = 100
```

The following example shows how the display appears when the switch is configured for weighted-round-robin mode and some QoS profiles are configured for strict priority mode:

```
# show qosprofile
QP1  Weight = 1      Max Buffer Percent = 100
QP2  Weight = 1      Max Buffer Percent = 100
QP3  Weight = 1      Max Buffer Percent = 100
QP5  Strict-Priority Max Buffer Percent = 100
QP8  Strict-Priority Max Buffer Percent = 100
```

When you add the optional port parameter, the switch displays the following sample output:

```
Switch.6 # show qosprofile ports 1:1-2
Port: 1:1
QP1  MinBw = 20% MaxBw = 50% MaxBuf = 100%
QP8  MinBw = 0%  MaxBw = 100% MaxBuf = 1000%
Port: 1:2
QP1  MinBw = 0%  MaxBw = 100% MaxBuf = 100%
QP8  MinBw = 0%  MaxBw = 100% MaxBuf = 100%
```

Note

This last sample output is not available on the XGS2 ports.

When you add the optional port group, the switch displays the following sample output:

```
# show qosprofile ports qosGroupA

Group: qosGroupA
Ports: 1-3
QP1  MinBw =    0% MaxBw      = 100% MaxBuf = 100% Weight = 1
QP3  MinBw =    0% MaxBw      = 34% MaxBuf = 100% Weight = 1
QP4  MinBw =    0% MaxBw      = 10% MaxBuf = 100% Weight = 1
QP5  MinBw =    0% MaxBw      = 1% MaxBuf = 100% Weight = 1
QP8  MinBw =    0% MaxBw      = 100% MaxBuf = 100% Weight = 1
```

History

This command was first available in ExtremeXOS 10.1.

The ingress information was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show qosscheduler

```
show qosscheduler {ports [ port_list | port_group | all ]}
```

Description

This command displays the scheduling algorithm that the switch uses to service [QoS](#) profiles for port lists or groups.

Syntax Description

| | |
|-------------------|-----------------------------------|
| qosscheduler | Get the QoS scheduling algorithm. |
| ports | Ports to display. |
| <i>port_list</i> | Port list. |
| <i>port_group</i> | Port group name. |
| all | All. |

Default

N/A.

Usage Guidelines

Use this command to display the scheduling algorithm the switch uses to service QoS profiles for port lists or groups.

Example

```
# show qoscheduler ports "qosGroupA"

Group Name           : qosGroupA
Ports                : 1-3
Configured Scheduler : weighted-deficit-round-robin

# show qoscheduler ports 1-4,7
Port  Configured Scheduler
-----
1     weighted-round-robin
2     weighted-deficit-round-robin
3     strict-priority
4     strict-priority
7     weighted-round-robin
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show radius

```
show radius {mgmt-access | netlogin} {primary | secondary | index}
```

Description

Displays the current RADIUS client configuration and statistics.

Syntax Description

| | |
|--------------------|--|
| mgmt-access | Specifies configuration and statistics for the switch management RADIUS authentication server. |
| netlogin | Specifies configuration and statistics for the network login RADIUS authentication server. |
| primary | Primary server. |
| secondary | Secondary server. |
| <i>index</i> | RADIUS server index. |

Default

N/A.

Usage Guidelines

If you do not specify a keyword, configuration details related to both management and network login are displayed. The output from this command displays the status of RADIUS and RADIUS accounting (enabled or disabled) and the primary and secondary servers for RADIUS and RADIUS accounting.

Use the **mgmt-access** keyword to display only RADIUS configuration details related to management access.

Use the **netlogin** keyword to only RADIUS configuration details related to network login.

Example

The following sample output displays the current RADIUS client configuration and statistics for both management and network login:

```
#show radius
Radius Algorithm: standard
Radius Retries: 3
RADIUS dynamic-authorization: disabled
Switch Management Radius: enabled
Switch Management Radius server connect time out: 3 seconds *
Switch Management Radius Accounting: disabled *
Switch Management Radius Accounting server connect time out: 3 seconds *
Netlogin Radius: enabled
Netlogin Radius server connect time out: 3 seconds *
Netlogin Radius Accounting: disabled *
Netlogin Radius Accounting server connect time out: 3 seconds *

Primary Switch Management Radius server: Status: Active
  host name      :
  IP address     : 10.51.1.150
  Server IP Port: 1812
  Client address: 10.50.130.152 VR-Mgmt)
  Retries        : Not Set (Using Default Retry value)
  Timeout        : Not Set (Using Default Timeout value)
  shared secret  : @~|ioBnao`ox#s
Access Requests : 0           Access Accepts      : 0
Access Rejects  : 0           Access Challenges : 0
Access Retransmits: 0         Client timeouts   : 0
Bad authenticators: 0         Unknown types     : 0
Round Trip Time : 0

Radius server    : 1001 Status: Active
  host name      :
  IP address     : 10.51.1.150
  Server IP Port: 1812
  Client address: 10.50.130.152 VR-Mgmt)
  Retries        : Not Set (Using Default Retry value)
  Timeout        : Not Set (Using Default Timeout value)
  Realm          : Any
  shared secret  : @~|ioBnao`ox#s
Access Requests : 11          Access Accepts      : 5
Access Rejects  : 1           Access Challenges : 0
Access Retransmits: 4         Client timeouts   : 5
Bad authenticators: 0         Unknown types     : 0
Round Trip Time : 0
```

History

This command was first available in ExtremeXOS 10.1.

The **mgmt-access** and **netlogin** keywords were added in ExtremeXOS 11.2.

The **primary** and **secondary** keywords, and *index* variable were added in ExtremeXOS 16.1

This command was updated to show dynamic authorization status in ExtremeXOS 22.1

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show radius-accounting

```
show radius-accounting {mgmt-access | netlogin} {primary | secondary |
  index}
```

Description

Displays the current RADIUS accounting client configuration and statistics.

Syntax Description

| | |
|--------------------|--|
| mgmt-access | Specifies configuration and statistics for the switch management RADIUS accounting server. |
| netlogin | Specifies configuration and statistics for the network login RADIUS accounting server. |
| primary | Primary RADIUS accounting server. |
| secondary | Secondary RADIUS accounting server. |
| <i>index</i> | RADIUS accounting server index. |

Default

N/A.

Usage Guidelines

If you do not specify a keyword, configuration details related to both management and network login are displayed. The output from this command displays information about the status and configuration of RADIUS accounting.

Use the **mgmt-access** keyword to display only RADIUS accounting configuration details related to management access.

Use the **netlogin** keyword to display only RADIUS accounting configuration details related to network login.

Example

The following sample output displays RADIUS accounting client configuration and statistics for both management and network login:

```
#show radius-accounting
Radius Algorithm: standard
Radius Retries: 3
Switch Management Radius: enabled
Switch Management Radius server connect time out: 3 seconds *
Switch Management Radius Accounting: disabled *
Switch Management Radius Accounting server connect time out: 3 seconds *
Netlogin Radius: enabled
Netlogin Radius server connect time out: 3 seconds *
Netlogin Radius Accounting: disabled *
Netlogin Radius Accounting server connect time out: 3 seconds *

Primary Switch Management Radius server: Status: Active
  host name      :
  IP address     : 10.51.1.150
  Server IP Port : 1812
  Client address : 10.50.130.152 VR-Mgmt)
  Retries        : Not Set (Using Default Retry value)
  Timeout        : Not Set (Using Default Timeout value)
  shared secret  : @~|ioBnao`ox#s
Access Requests : 0           Access Accepts      : 0
Access Rejects  : 0           Access Challenges   : 0
Access Retransmits: 0         Client timeouts    : 0
Bad authenticators: 0         Unknown types      : 0
Round Trip Time : 0

Radius server    : 1001 Status: Active
  host name      :
  IP address     : 10.51.1.150
  Server IP Port : 1812
  Client address : 10.50.130.152 VR-Mgmt)
  Retries        : Not Set (Using Default Retry value)
  Timeout        : Not Set (Using Default Timeout value)
  Realm          : Any
  shared secret  : @~|ioBnao`ox#s
Access Requests : 11           Access Accepts      : 5
Access Rejects  : 1           Access Challenges   : 0
Access Retransmits: 4         Client timeouts    : 5
Bad authenticators: 0         Unknown types      : 0
Round Trip Time : 0
```

History

This command was first available in ExtremeXOS 10.1.

The **mgmt-access** and **netlogin** keywords were added in ExtremeXOS 11.2.

The **primary** and **secondary** keywords, and *index* variable were added in ExtremeXOS 16.1

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show radius dynamic-authorization

```
show radius dynamic-authorization index
```

Description

Displays the current *RADIUS* client dynamic-authorization status.

Syntax Description

| | |
|--------------|----------------------|
| <i>index</i> | RADIUS server index. |
|--------------|----------------------|

Default

N/A.

Example

The following sample output displays the current RADIUS dynamic-authorization status:

```
# show radius dynamic-authorization
RADIUS dynamic-authorization: disabled
```

Example

The following sample output displays the NAS-IP Address requirement set to require (default).

```
# show radius dynamic-authorization
RADIUS dynamic-authorization: enabled
RADIUS TLS TCP Timeout: default
RADIUS TLS OCSP: on

RADIUS DynAuth server: 1 Status is Active
  host name      :
  IP address     : 10.51.1.181
  Server IP Port: 3799
  Protocol       : UDP
  Client address: 10.50.97.80 (VR-Mgmt)
  shared secret  : # $LG11P/fwCjVyH1LlEqSeBrbGr/EXKQ==
  NAS-IP        : Require
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show rip

```
show rip
```

Description

Displays *RIP* specific configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIP specific configuration:

```
# show rip
```

The following is sample output from this command:

```
# show rip
RIP Routing      : Disabled           Operational status: Down
Split Horizon    : Enabled           Poison Reverse    : Enabled
Triggered Updates: Enabled         Aggregation      : Disabled
Update Interval  : 30                Route Timeout     : 180
Garbage Timeout  : 120               Router Alert      : Disabled
Originate Default: Disabled
Sys Import-Policy: None
Redistribute:
Protocol  Status   Cost  Tag  Policy
-----
Direct    Disabled 0     0    none
Static    Disabled 0     0    none
OSPFIntra Disabled 0     0    none
OSPFInter Disabled 0     0    none
OSPFExt1  Disabled 0     0    none
OSPFExt2  Disabled 0     0    none
E-BGP     Disabled 0     0    none
I-BGP     Disabled 0     0    none
ISISL1    Disabled 0     0    none
ISISL2    Disabled 0     0    none
```

```
ISISL1Ext  Disabled  0    0  none
ISISL2Ext  Disabled  0    0  none
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge or Base license or higher as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show rip interface vlan

```
show rip interface vlan vlan_name
```

Description

Displays *RIP* specific statistics and configuration for a *VLAN* in detail.

Syntax Description

| | |
|------------------|------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
|------------------|------------------------|

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIP specific statistics for the VLAN accounting:

```
# show rip interface vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge or Base license or higher as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show rip interface

```
show rip interface {detail}
```

Description

Displays *RIP*-specific configuration and statistics for all VLANs.

Syntax Description

| | |
|---------------|-----------------------------|
| detail | Specifies detailed display. |
|---------------|-----------------------------|

Default

Show summary output for all interfaces.

Usage Guidelines

Summary includes the following information per interface:

- *VLAN* name.
- IP address and mask.
- interface status.
- packets transmitted.
- packets received.
- number of triggered updates.
- cost.

Detail includes the following per interface:

- VLAN name.
- IP address and mask.
- tx mode.
- rx mode.
- cost.
- peer information (for each peer).
 - age.
 - version.
 - received packets.
 - received updates.
 - received bad packets.
 - received bad routes.
- in policy.
- out policy.
- trusted gateway policy.
- packets transmitted.

- sent triggered updates.
- packets received.
- bad packets received.
- bad routes received.

Example

The following command displays the RIP configuration for all VLANs:

```
# show rip interface
```

The following is sample output from this command:

```
# show rip interface
VLAN      IP Address      Flags Sent      Rcvd      Triggered Cost
Packets  Packets  Updates
Flags: (f) Interface Forwarding Enabled, (i) Interface RIP Enabled
(n) Multinetted VLAN, (r) Router RIP Enabled
```

The following command displays RIP-specific statistics for all VLANs:

```
# show rip interface detail
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge or Base license or higher as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show rip memory

```
show rip memory {detail | memoryType}
```

Description

Displays *RIP* specific memory usage.

Syntax Description

| | |
|-------------------|---|
| detail | Displays detail information. |
| <i>memoryType</i> | Specifies the memory type usage to display. |

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIP specific memory for TEST:

```
# show rip memory test
```

The following is sample output from this command:

```
# show rip memory test
RIP Memory Information
-----
Bytes Allocated: 0          AllocFailed: 0
Current Memory Utilization Level: GREEN
Memory Utilization Statistics
-----
Memory Statistics for TEST
-----
Size      64      80      96      256     384     512     768     1024    2048    40
96 18432
-----
--
Alloced      0      0      0      0      0      0      0      0      0      0
0 0
AllocedPeak  0      0      0      0      0      0      0      0      0      0
0 0
AllocSuccess 0      0      0      0      0      0      0      0      0      0
0 0
FreeSuccess  0      0      0      0      0      0      0      0      0      0
0 0
AllocFail    0      0      0      0      0      0      0      0      0      0
0 0
FreeFail     0      0      0      0      0      0      0      0      0      0
0 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge or Base license or higher as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show rip routes

```
show rip routes {detail} {network ripNetworkPrefix}
```

Description

Displays routes advertised by *RIP*.

Syntax Description

| | |
|-------------------------|--|
| detail | Displays all available information from the RIP routing table. |
| <i>ripNetworkPrefix</i> | Specifies the route prefix for the routes to show. |

Default

N/A.

Usage Guidelines

The routes displayed include all routes advertised by RIP, including routes exported from the system routing table and originated by other protocols, for example [BGP](#).

Example

The following command displays a summary of RIP specific routes for the networks 10.0.0.0/8:

```
# show rip routes network 10.0.0.0/8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge or Base license or higher as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ripng

```
show ripng
```

Description

Displays [RIPng](#) global configuration and runtime information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIPng global configuration and runtime information:

```
show ripng
```

The following is sample output from this command:

```
RIPng Routing      : Disabled
Aggregation       : Disabled
Update Interval   : 30                Route Timeout      : 180
Garbage Timeout   : 120
Originate Default: Disabled
Sys Import-Policy: None
Redistribute:
Protocol          Status   Cost Tag   Policy
-----
Direct            Disabled 0 0      none
Static            Disabled 0 0      none
Ospf3-intra       Disabled 0 0      none
Ospf3-inter       Disabled 0 0      none
Ospf3-extern1    Disabled 0 0      none
Ospf3-extern2    Disabled 0 0      none
IsisL1            Disabled 0 0      none
IsisL2            Disabled 0 0      none
IsisL1Ext         Disabled 0 0      none
IsisL2Ext         Disabled 0 0      none
bgp                Disabled 0 0      none
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ripng interface

```
show ripng interface {detail | vlan vlan-name | tunnel tunnel-name}
```

Description

Displays *RIPng*-specific configuration and statistics for the specified interface.

Syntax Description

| | |
|--------------------|--|
| detail | Specifies detailed display. |
| <i>vlan-name</i> | Specifies an IPv6 configured <u>VLAN</u> . |
| <i>tunnel-name</i> | Specifies an IPv6 tunnel. |

Default

Show summary output for all interfaces.

Usage Guidelines

Displays the RIPng interface configuration and runtime information. If no interface is specified, only the summary data for all the configured interfaces is displayed. If an interface is specified, only the data for that interface is displayed in detail. If the keyword detail is specified, detailed data for all interfaces is displayed.

Example

The following command displays the RIPng configuration summary for all interfaces:

```
show ripng interface
```

The following is sample output from this command:

| VLAN | IP Address | Flags | Sent Packets | Rcvd Packets | Triggered Updates | Cost |
|------|------------|--------------|-----------------|-----------------|----------------------|------|
| v1 | 22cc::3 | /64 rif-pst | 106349 | 106349 | 3 | 15 |
| v2 | 22bb::1 | /64 rif-pst | 106349 | 106095 | 3 | 1 |
| v3 | 2abc::1 | /120 rif-pst | 106351 | 0 | 4 | 1 |
| v4 | 3ffe::1 | /64 rif-pst | 106349 | 139124 | 3 | 1 |

Flags: (f) Interface Forwarding Enabled, (i) Interface RIPng Enabled
 (n) Multinetted Interface, (r) Router RIPng Enabled
 (p) Poison Reverse Enabled, (s) Split Horizon Enabled
 (t) Triggerred Update Enabled.

The following command displays RIPng-specific statistics for the VLAN v1:

```
show ripng interface v1
```

The following is sample output from this command:

| | | | |
|---------------------|---|--------------------|--------------|
| VLAN | : v1 | Interface | : 22cc::3/64 |
| Router RIPng | : Enabled | Cost | : 15 |
| Input Policy | : None | Output Policy | : None |
| Trusted GW Policy | : gw6 | Poison Reverse | : Enabled |
| Split Horizon | : Enabled | Triggerred Updates | : Enabled |
| Rcvd Packets | : 106358 | Sent Packets | : 106358 |
| Sent Trig. Updates | : 3 | Rcvd Bad Packets | : 0 |
| Rcvd Bad Routes | : 0 | | |
| Neighbor Addresses | : fe80::201:30ff:fe94:f400 | | |
| Interface Addresses | : 22cc::3/64, fe80::280:c8ff:feb9:2855/64 | | |

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show ripng routes

```
show ripng routes {detail} {network ripngNetworkPrefix}
```

Description

Displays all matching routes in the *RIPng* routing database.

Syntax Description

| | |
|---------------|--|
| detail | Displays all available information from the RIPng routing table. |
| ipv6-prefix | Specifies the route prefix for the routes to show. |
| prefix-length | Specifies the address mask of the IPv6 prefix. |

Default

N/A.

Usage Guidelines

The routes displayed include all routes advertised by RIPng, including routes exported from the system routing table and originated by other protocols, for example *OSPFv3* (also called redistributed routes).

Example

The following command displays a summary of RIPng specific routes:

```
show ripng routes
```

The following is sample output from this command:

```
Network                Next Hop                Mtr VLAN
*> 2aaa::/64           fe80::201:30ff:fef4:5ca0%v1  2  v1
*                      fe80::201:30ff:fe94:f400%v2  2  v2
*> 2bbb::/64           fe80::201:30ff:fef4:5ca0%v1  2  v1
*                      fe80::201:30ff:fe94:f400%v2  3  v2
*> 2ccc::/64           (local)                  1  (direct)
*                      fe80::201:30ff:fef4:5ca0%v1  2  v1
*                      fe80::201:30ff:fe94:f400%v2  3  v2
*> 2ddd::/64           (local)                  1  (direct)
*                      fe80::201:30ff:fe94:f400%v2  2  v2
```

The following command displays the detailed RIPng route information:

```
show ripng routes detail
```

The following is sample output from this command:

```
IPv6 RIPng routing table entry for 2aaa::/64
Paths: (2 available, best #1)
  fe80::201:30ff:fe94:5ca0%v1 from fe80::201:30ff:fe94:5ca0%v1 (v1)
    Metric 2, tag 0, timeout in 02:38, valid, best
  fe80::201:30ff:fe94:f400%v2 from fe80::201:30ff:fe94:f400%v2 (v2)
    Metric 2, tag 0, timeout in 02:44, valid
IPv6 RIPng routing table entry for 2bbb::/64
Paths: (2 available, best #1)
  fe80::201:30ff:fe94:5ca0%v1 from fe80::201:30ff:fe94:5ca0%v1 (v1)
    Metric 2, tag 0, timeout in 02:38, valid, best
  fe80::201:30ff:fe94:f400%v2 from fe80::201:30ff:fe94:f400%v2 (v2)
    Metric 3, tag 0, timeout in 02:44, valid
IPv6 RIPng routing table entry for 2ccc::/64
Paths: (3 available, best #1)
  Local from direct
    Metric 1, tag 0, no timeout, valid, best
  fe80::201:30ff:fe94:5ca0%v1 from fe80::201:30ff:fe94:5ca0%v1 (v1)
    Metric 2, tag 0, timeout in 02:38, valid
  fe80::201:30ff:fe94:f400%v2 from fe80::201:30ff:fe94:f400%v2 (v2)
    Metric 3, tag 0, timeout in 02:44, valid
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show rmon memory

```
show rmon memory {detail | memoryType}
```

Description

Displays RMON specific memory usage and statistics.

Syntax Description

| | |
|-------------------|---|
| detail | Displays detailed information. |
| <i>memoryType</i> | Specifies the type of memory usage and statistics to display. |

Default

N/A.

Usage Guidelines

If you do not specify the detailed keyword or enter a specific RMON memory type, the output contains usage information for all memory types.

Example

The following command displays RMON memory statistics:

```
show rmon memory
```

The following is sample output from this command:

```

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show router-discovery

```
show router-discovery {ipv6} {vlan vlan_name}
```

Description

Displays the router discovery settings.

Syntax Description

| | |
|------------------------|--|
| <code>vlan_name</code> | Specifies an IPv6 configured <u>VLAN</u> . |
|------------------------|--|

Default

N/A.

Usage Guidelines

If no VLAN is specified, the settings are displayed for all IPv6 configured VLANs.

Example

The following example displays router discovery settings for the VLAN "top_floor":

```
# show router-discovery vlan top_floor
Router Advertisements disabled on vl
Router Advertisements are sent only with VRRP's Virtual LLA: On
Minimum/Maximum Interval: 200 / 600
Managed / Other Info Flags: Off / Off
Link MTU: 0
Reachable Time: 0
Retrans Timer: 0
Current Hop Limit: 64
Default Lifetime: 1800
Number of Prefixes: 1, Prefix List:
Valid Preferred
Prefix Lifetime Auto Lifetime OnLink
2001:db8::1/64
2592000 On 604800 On
```

History

This command was first available in ExtremeXOS 11.2.

Router advertisements sent only with VRRP's virtual LLA information added in ExtremeXOS 31.3.

Platform Availability

This command is available on all platforms that support the Advanced Edge License as shown in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

NEW! show rtep l2pt

```
show [[{vlan} vlan_name vman_name] [{vxlan {vr vr_name} rtep
    rtep_ipv4}]] l2pt {detail}
```

Description

Displays the RTEP L2PT configuration and status of a service.

Syntax Description

| | |
|------------------|---|
| vlan | Specifies the <u>VLAN</u> configuration. |
| <i>vlan_name</i> | Specifies the VLAN name. |
| vxlan | Specifies Virtual eXtensible LAN. |
| vr | Specifies Virtual Router. |
| <i>vr_name</i> | Specifies the Virtual Router Name. If not specified, the VR of the current command context is used. |
| rtep | Specifies Remote Tunnel End Point. |
| <i>rtep_ipv4</i> | Specifies the Remote Tunnel End Point IPv4 address. |
| l2pt | Specifies Layer 2 protocol tunneling. |
| detail | Specifies to show L2PT configuration and status in detail. |

Default

N/A.

Usage Guidelines

Use this command to display the RTEP L2PT configuration and status of a service.

Example

The following example illustrates the `show rtep l2pt` command with RTEP IP address as 2.2.2.2 of VxLAN service Interface:

```
# show vlan tenant vxlan rtep 2.2.2.2 l2pt
Interface                                     Profile Name
-----
VR-Default:2.2.2.2                            l2pt-none
```

The following is an example of the `show rtep l2pt` command:

```
# show vlan tenant l2pt
Interface                               Profile Name
-----
15                                       l2pt-user
VR-Default:2.2.2.2                       l2pt-none
```

The following example illustrates the `show rept l2pt detail` command with RTEP IP address as 2.2.2.2 of VxLAN service Interface:

```
# show vlan tenant vxlan rtep 2.2.2.2 l2pt detail
VXLAN RTEP: VR-Default:2.2.2.2
  L2PT Profile Name      : l2pt-none

  DSCP                   : 50
  DSCP Replace           : Yes
  Packets Transmitted    : 0
  Packets Received       : 0
```

The following example illustrates the `show rtep l2pt detail` command:

```
# show vlan tenant l2pt detail
Port 15
  L2PT Profile Name      : l2pt-user

  Protocol Filter Name   : cdp
  Destination Address    : 01:00:0c:cc:cc:cc
  Protocol Id Type       : snap
  Protocol Id Value      : 0x2000
  Field Offset           :
  Field Value            :
  Field Mask             :
  Action                  : Tunnel
  CoS                    :
  DSCP                   : 50
  DSCP Replace           : Yes
  Packets Transmitted    : 10956
  Packets Received       : 11492

VXLAN RTEP: VR-Default:2.2.2.2
  L2PT Profile Name      : l2pt-none

  Protocol Filter Name   : cdp
  Destination Address    : 01:00:0c:cc:cc:cc
  Protocol Id Type       : snap
  Protocol Id Value      : 0x2000
  Field Offset           :
  Field Value            :
  Field Mask             :
  Action                  : None
  CoS                    :
  DSCP                   : 50
  DSCP Replace           : Yes
```

```
Packets Transmitted: 0
Packets Received   : 0
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is supported on the ExtremeSwitching X670-G2, X465, X590, X690, X695, X870, 5520 series switches, and stacks with X465, X590, X670-G2, X690, X695, X870, 5520 slots only.

show script output autoexec

```
show script output autoexec
```

Description

Shows the results of executing the autoexec script.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to show results when a autoexec.xsf file is executed. The file is not executed when a default.xsf file has been executed.

The CLI script file autoexec.xsf is executed after the configuration has been loaded. Its purpose is to run some commands after every reboot. It can also be used to revert to the original configuration following changes made by UPM executed persistent commands.

Example

This command shows the results of executing the autoexec script:

```
show script output autoexec
```

When there is no autoexec.xsf file, there is no response.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show script output default

```
show script output default
```

Description

Shows the results of executing default.xsf on bootup.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show results when a default.xsf file is loaded.

An existing default.xsf file is executed if the switch comes up in an unconfigured state because the configuration file is missing, or the configuration file cannot be determined due to a corrupt NVRAM or other problems. This returns the switch to some basic configuration. When default.xsf is executed, the show switch command shows default.xsf as the booted configuration file.

Example

This command shows the results of executing the autoexec script:

```
show script output default
```

When there is no default.xsf file, there is no response.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show security

```
show security [fips-mode | python]
```

Description

Use this command to show FIPS mode and external Python scripting support status.

Syntax Description

| | |
|------------------|--|
| fips-mode | Shows specifically FIPS mode status. |
| python | Shows specifically external Python scripting support status. |

Default

N/A

Usage Guidelines

If you select neither keyword option (FIPS/Python), you see status information for both.

For both FIPS mode or Python, two values appear:

- **Current**—shows the current active setting.
- **Configured**—show the setting that only takes effect after reboot.

Example

The following example shows both FIPS and Python scripting status:

```
# show security
FIPS Mode (current)      : Off
FIPS Mode (configured)  : On
Python (current)        : Off
Python (configured)     : On
```

The following example shows only Python scripting status:

```
# show security python
Python (current)        : Off
Python (configured)     : Off
```

History

This command was first available in ExtremeXOS 21.1.

External Python scripting support status was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show session

```
show session [{detail} {sessID}] [history]
```

Description

Displays the currently active Telnet and console sessions communicating with the switch.

Syntax Description

| | |
|----------------|--|
| detail | Specifies more detailed session information. |
| <i>sessID</i> | Specifies a session ID number. |
| history | Displays a list of all sessions. |

Default

N/A.

Usage Guidelines

The `show session` command displays the username and IP address of the incoming Telnet session, whether a console session is currently active, and the login time. Each session is numbered.

Beginning with ExtremeXOS 11.2, the switch accepts IPv6 connections. If the incoming session is from an IPv6 address, the show session output indicates IPv6.

You can specify the following options to alter the session output:

- `detail`—The output for all current sessions is displayed in a list format.
- `sessID`—The output for the specified session is displayed in a list format.
- `history`—Displays a list of current and previous sessions, including the user, type of session, location, and start and end time of the session.

The `show session` command fields are defined in the following table.

Table 48: Show Command Field Definitions

| Field | Definition |
|------------|---|
| # | Indicates session number. |
| Login Time | Indicates login time of session. |
| User | Indicates the user logged in for each session. |
| Type | Indicates the type of session, for example: console, Telnet, HTTP, HTTPS. |

Table 48: Show Command Field Definitions (continued)

| Field | Definition |
|----------|--|
| Auth | Indicates how the user is logged in (local, <i>RADIUS</i> , TACACS+, sshKey, x509v3). |
| CLI Auth | Indicates the type of authentication (RADIUS and TACACS) if enabled. |
| Location | Indicates the location (IP address) from which the user logged in. The output also indicates if the location is an IPv6 address. |

Example

The following command displays the active sessions on the switch:

```
show session
```

The following is sample output from this command:

```
CLI
#      Login Time                User      Type   Auth   Auth Location
=====
1      Thu Apr 28 20:16:56 2005 admin    console local   dis    serial
*2     Thu Apr 28 23:36:20 2005 admin    ssh2   local   dis    3001::20d:88ff:fec5:ad40
3      Fri Apr 29 11:14:27 2005 admin    telnet local   dis    10.255.44.55
```

The following command displays a list of current and previous sessions on the switch:

```
show session history
```

The following is sample output from this command:

```
Session History:
admin                console   serial
Mon Jun 21 09:19:00 2004
Mon Jun 21 10:00:16 2004
admin                console   serial
Tue Jun 22 07:28:11 2004
Tue Jun 22 11:46:48 2004
admin                console   serial
Wed Jun 23 10:05:44 2004
Wed Jun 23 14:11:47 2004
admin                console   serial
Thu Jun 24 07:07:25 2004
Thu Jun 24 07:08:55 2004
admin                console   serial
Thu Jun 24 13:30:07 2004 Active
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sflow configuration

```
show sflow {configuration}
```

Description

Displays the current sFlow configuration.

Syntax Description

| | |
|----------------------|-----------------------------------|
| configuration | Displays the sFlow configuration. |
|----------------------|-----------------------------------|

Default

N/A.

Usage Guidelines

This command displays the sFlow configuration of your system.

The following fields are displayed:

- Global Status—sFlow is globally enabled or disabled.
- Polling interval—How often the hardware is polled for statistics, in seconds.
- Sampling rate—Packets are sampled, on average, once for every rate-number of packets.
- Maximum cpu sample limit—Maximum number of packets per second sampled before sample throttling takes effect.
- Agent IP—IP address inserted into the sFlow data packets to identify the sFlow switch.
- Collectors—To which IP address and port, and from which virtual router, the sFlow packets are sent.
- Port Status—Enabled or disabled for statistics gathering.
- Port Sample-rate—Shows the sampling rate configured for the port and the actual rate if CPU throttling has taken effect.
- Port Subsampling factor—for details, see the command [configure sflow max-cpu-sample-limit](#) on page 1267.

Example

To display the sFlow configuration on your system, use the following command:

```
show sflow
```

The following is an example of the show sflow configuration command :

```
SFLOW Global Configuration
Global Status: enabled
Polling interval: 20
Sampling rate: 8192
Maximum cpu sample limit: 2000
SFLOW Configured Agent IP: 0.0.0.0
Operational Agent IP: 10.127.11.88
Collectors

SFLOW Port Configuration
Port  Status              Sample-rate          Subsampling          Sflow-type
      Config / Actual      factor              Ingress / Egress
5:21  enabled                8192 / 8192        1                    Disabled / Enabled
```

History

This command was first available in an ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sflow hardware-utilization

```
show sflow hardware-utilization {slot [slot_num | all]}
```

Description

Displays sFlow hardware table utilization statistics.

Syntax Description

| | |
|-----------------------------|--|
| hardware-utilization | Specifies showing hardware table utilization statistics. |
| slot | Specifies selecting slots. |
| <i>slot_num</i> | Specifies which slots to show statistics for. |
| all | Specifies showing statistics for all slots. |

Default

N/A.

Usage Guidelines

This command displays sFlow hardware table utilization statistics for your system.

Example

The following example shows sFlow hardware table utilization statistics.

```
# show sflow hardware-utilization
sFlow Hardware Table Utilization Statistics

Resource Type          Current    Maximum    % Util.
-----
MAC Entries            3         73727      0
Host Entries           4         73728      0
IPv4 Entries           0         73728      0
IPv6 Entries           2         36864      0
Long IPv6 Entries      0         2048       0
Total Routes           11        8192       0
IPv4 Neighbors         5         N/A        N/A
IPv6 Neighbors         0         N/A        N/A
IPv4 routes            3         N/A        N/A
IPv6 routes            3         N/A        N/A
ECMP Next Hops         2         1023       0
ACL Ingress Entries    42        10752      0
ACL Ingress Counters   0         233472     0
ACL Ingress Meters     0         12288      0
ACL Ingress Slices     0         12         0
ACL Egress Slices      0         4          0

Legend: N/A - Maximum not defined in published sFlow structure.
        Also see IP usage in 'show iproute reserved-entries statistics'.
```

History

This command was first available in ExtremeXOS 22.5.

Ability to select slots in a stack was added in ExtremeXOS 22.6.

Legend explaining N/A entries was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sflow statistics

```
show sflow statistics
```

Description

Displays sFlow statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays sFlow statistics for your system.

The following fields are displayed:

- Received frames—Number of frames received on sFlow enabled ports.
- Sampled Frames—Number of packets that have been sampled by sFlow.
- Transmitted Frames—Number of UDP packets sent to remote collector(s).
- Broadcast Frames—Number of broadcast frames received on sFlow enabled ports.
- Multicast Frames—Number of multicast frames received on sFlow enabled ports.
- Packet Drops—Number of samples dropped.

Example

To display sFlow statistics for your system, use the following command:

```
show sflow statistics
```

The output from this command is similar to the following:

```
SFLOW Statistics
Received frames      : 1159044921
Sampled Frames      : 104944
Transmitted Frames  : 10518
Broadcast Frames    : 0
Multicast Frames    : 1055652
Packet Drops        : 0
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sharing

```
show {port port_number} sharing {detail}
```

Description

Displays general loading sharing information.

Syntax Description

| | |
|--------------------|---|
| port | View load sharing information for a specific port. |
| <i>port_number</i> | View load sharing information for a specific port. |
| detail | Show details for the specified ports in the load sharing group. |

Default

N/A.

Example

The following example shows load sharing information for the switch:

```
# show sharing
show sharing
Load Sharing Monitor
Config      Current Agg      Min   Ld Share  Dist  Ld Share  Agg Link  Link Up
Master      Master  Control Active Algorithm Flags Group    Mbr State Transitions
=====
  1:91   1:91   Static    1   L3_L4    A    1:91    Y    A    1
=====
Link State: A-Active, D-Disabled, R-Ready, NP-Port not present, L-Loopback
Minimum Active: (<) Group is down. # active links less than configured minimum
Load Sharing Algorithm: (L2) Layer 2 address based, (L3) Layer 3 address based
                      (L3_L4) Layer 3 address and Layer 4 port based
                      (custom) User-selected address-based configuration
Custom Algorithm Configuration: ipv4 L3-and-L4, xor
Custom Hash Seed: Switch MAC address (0x969C3CE2)
Distribution Flags:
  A - All: Distribute to all members,
  L - Local Slot: Distribute to members local to ingress slot,
  P - Port Lists: Distribute to per-slot configurable subset of members,
  R - Resilient Hashing enabled.
Number of load sharing trunks: 1
```

History

This command was first available in ExtremeXOS 11.0.

Custom hash seed information was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sharing distribution port-based

```
show sharing distribution port port-based {ports port_list}
```

Description

Displays the load sharing distribution to member ports in the group specified by *port* for traffic received on ports in *port_list*.

Syntax Description

| | |
|------------------|--|
| ports | Specifies the group of member ports to display for the load sharing. |
| <i>port_list</i> | Specifies the group of ports from which traffic is received. |

Default

N/A.

Usage Guidelines

Use this command to display the load sharing distribution to member ports in the group specified by *port* for traffic received on ports in *port_list*. The selected member ports displayed are the results of the calculation using the keys for the ports in the *port_list*, and the list of aggregator ports for the load sharing group. This command serves as port-based load sharing calculator for convenience.

Example

The following output shows the egress member ports selected for distribution in a load sharing group with master port 5:1, and aggregator ports 5:1 and 6:1 for packets received on ports 1:1-1:8, with default keys as shown.

```
# show sharing port-based keys ports 1:1-8
1:1: 0   1:2: 1   1:3: 2   1:4: 3   1:5: 4   1:6: 5   1:7: 6   1:8: 7
# show sharing distribution 5:1 port-based keys ports 1:1-8
1:1 -> 5:1
1:2 -> 6:1
1:3 -> 5:1
1:4 -> 6:1
1:5 -> 5:1
1:6 -> 6:1
1:7 -> 5:1
1:8 -> 6:1
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sharing health-check

```
show sharing health-check
```

Description

Displays the configured health check LAGs on a switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the health-check LAGs that have been configured on the switch.

Example

The following is sample output from this command:

```
# show sharing health-check
Member  Agg Admin Track          Track
Group   Port  Mbr State IP Addr          TCP Port Miss Freq State  Dn  Up
=====

2:21*   Y   En  192.1.1.2         80          10   3   Up    0   1
=====
Member Port Flags: (*)Active, (!) Disabled
```

History

This command was first available in ExtremeXOS 12.13.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sharing port-based keys

```
show sharing port-based keys {ports port_list}
```

Description

Displays the load sharing key values for all ports in the *port_list*. These values may be either default values, or configured values.

Syntax Description

| | |
|------------------|---|
| ports | Specifies the ports for the load sharing. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

N/A.

Usage Guidelines

Use this command to display the health-check LAGs that have been configured on the switch.

Example

```
X460G2-24p-24hp.1 # show sharing port-based keys
 1: 0   2: 1   3: 2   4: 3   5: 4   6: 5   7: 6   8: 7
 9: 8  10: 9  11: 10  12: 11  13: 12  14: 13  15: 14  16: 15
17: 0  18: 1  19: 2  20: 3  21: 4  22: 5  23: 6  24: 7
25: 8  26: 9  27: 10  28: 11  29: 12  30: 13  31: 14  32: 15
33: 0  34: 1  35: 2  36: 3  37: 4  38: 5  39: 6  40: 7
41: 8  42: 9  43: 10  44: 11  45: 12  46: 13  47: 14  48: 15
49: 0  50: 1  51: 2  52: 3
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show slot

```
show slot {slot {detail} | detail }
```

Description

Displays the slot-specific information.

Syntax Description

| | |
|-------------------|---|
| <code>slot</code> | Specifies a slot on a SummitStack or bridge port extender (BPE) bridge port extender (BPE) slot assignment. |
| detail | Specifies detailed port information. |

Default

N/A.

Usage Guidelines

The `show slot` command displays the following information:

- The slot number.
- The type of switch installed in the slot.
- The type of switch configured for the slot.
- The state of the switch, whether the power is down, if the switch is operational, if a diagnostic being run, if there is a mismatch between the slot configuration and the switch in the slot.
- The number of ports on the switch.
- The current number of times the switch has been restarted after a failure and the configured restart-limit.

Note

You may see slightly different information displayed depending on the platform and configuration you are using.

If you do not specify a slot number, information for all slots is displayed.

The display also includes a notice of insufficient power, should that arise.

The `show slot` command displays the following states, among others:

- Down
- Power ON
- Powered OFF
- Booting
- Initializing
- VLAN sync
- FDB sync
- ACL sync
- RT sync
- Operational

The output of this command displays eight rows. If a node in the Active Topology is not assigned a slot number, the state of the slot is shown as Empty. A node that shows as a slot has successfully joined the active topology. This means ExtremeXOS software can communicate with this node and does not mean that the node has been successfully brought up. The card state in the display indicates whether the slot

was successfully started. If the card state is Operational, then the node is being used in the stack to carry user data as configured.

The output of the command displays the slot number, type of the ExtremeSwitching in that slot, state of the slot, and the number of ports.

The number of ports does not include the stacking links. It includes the option card ports regardless of whether the option card is installed.

This command is not available on ExtremeSwitching series switches operating in non-stacking mode.

Example

The following example displays switch information for all slots in a stack:

```
* Slot-7 Stack.1 # show slot
Slots      Type                Configured           State      Ports
-----
Slot-1     SummitX              SummitX              Operational 26
Slot-2     X                    X                    Operational 50
Slot-3     X                    X                    Operational 26
Slot-4     SummitX              SummitX440           Operational 26
Slot-5     X                    X                    Operational 26
Slot-6     X                    X                    Operational 26
Slot-7     X                    X                    Operational 26
Slot-8     Empty                Empty                Empty        0
```

The following example displays switch information for a specific slot on the stack:

```
* Slot-7 Stack.91 # show slot 1 detail

```

History

This command was first available in ExtremeXOS 10.1.

This command was first available on SummitStack in ExtremeXOS 12.0.

Slot description (name) information was added in ExtremeXOS 22.5.

Platform Availability

This command is available only on SummitStacks and in VPEX mode.

show slpp guard

```
show slpp guard {ports port_list} {disabled-ports}
```

Description

Shows Simple Loop Protection Protocol (SLPP) Guard status for selected ports or all SLPP Guard-disabled ports.

Syntax Description

| | |
|-----------------------|--|
| slpp | Specifies configuring SLPP. |
| guard | Specifies disabling a port as soon as an SLPP PDU is received. |
| ports | Specifies selecting ports that you want to see SLPP Guard status on. |
| <i>port_list</i> | Selects the ports that you want to see SLPP Guard status on. |
| disabled-ports | Specifies showing information about ports disabled by SLPP Guard. |

Default

N/A.

Usage Guidelines

SLPP is an application that detects loops in a Split Multi-link Trunking (SMLT) network. SLPP Guard is a complementary feature that helps prevent loops in networks by administratively disabling an edge port if a switch receives an SLPP PDU from an SMLT network.

This command shows SLPP Guard status about selected ports (**ports** option) or shows all ports that have been disabled by SLPP Guard (**disabled-ports** option).

Example

The following example shows SLPP guard status for ports 15, 16, 31, 61, and 62

```
# show slpp guard ports 15 16 31 61 62
Port          SLPP Guard  State      Timeout    Age    Last Time Disabled
-----
15            Enabled     Disabled   300        46    Thu May 17 12:30:27 2018
16            Enabled     Monitoring 300        NA    NA
31            Enabled     Disabled   300        218   Thu May 17 12:10:27 2018
61            Enabled     Disabled   300        205   Thu May 17 12:20:27 2018
62            Enabled     Disabled   None       NA    Thu May 17 12:35:27 2018
=====
State:
  Disabled:   Port disabled due to SLPP PDU received.
  Monitoring: Listening for SLPP PDU.
  None:       Port is down.
SLPP Guard Ethertype : 0xefef
```

The following example shows SLPP Guard-disabled ports:

```
# show slpp guard disabled-ports
Port          SLPP Guard  State      Timeout    Age    Last Time Disabled
-----
15            Enabled     Disabled   300        46    Thu May 17 12:30:27 2018
31            Enabled     Disabled   300        218   Thu May 17 12:10:27 2018
61            Enabled     Disabled   300        205   Thu May 17 12:20:27 2018
62            Enabled     Disabled   None       NA    Thu May 17 12:35:27 2018
=====
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmp

```
show snmp [get | get-next] object_identifier
```

Description

Displays the contents of an *SNMP* MIB object.

Syntax Description

| | |
|--------------------------|---|
| <i>object_identifier</i> | Specifies the object identifier for an SNMP MIB object. |
|--------------------------|---|

Default

N/A.

Usage Guidelines

Use the get option to establish an index into the SNMP MIB. After the get option is executed, you can use the get next option to step through the MIB objects.

Example

The following gets the contents of SNMP object 1.3.6.1.2.1.1.5.0:

```
show snmp get 1.3.6.1.2.1.1.5.0
system.5.0 = BD-12804
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmp notification-log entry

```
show snmp notification-log [ default | name hex hex_name ] entry
entry_index
```

Description

Displays a detailed summary of notification log configuration and status, as well as global configuration and status.

Syntax Description

| | |
|----------------|--------------------------------|
| default | The default log. |
| <i>name</i> | Specifies the name of the log. |

| | |
|--------------------|--|
| <i>entry</i> | Specifies the index of an entry to be displayed in detail. |
| hex | Provide value in hexadecimal. |
| <i>hex_name</i> | Name of the log in hexadecimal. |
| <i>entry_index</i> | Specifies the entry index. |

Default

Disabled.

Usage Guidelines

Use this command to display in detail the contents of a single entry from a notification log.

Example

The following example displays a detailed summary of *nmslog2* **entry** 452.

```
show snmp notification-log nmslog2 entry 452
Index      : 452
Date       : 05/09/2013
Time       : 08:45:12.41
Context    : VR-Default
OID        : 1.3.6.1.6.3.1.1.5.3

Variables:OID      : 1.3.6.1.2.1.1.3.0
Type        : Time Ticks
Value       : 86090700

OID        : 1.3.6.1.2.1.1.1.0
Type       : Octet String
Value      : 45:78:74:72:65:6d:65:58:4f
```

History

This command was first available in ExtremeXOS 15.5.

The **default** and **hex** keywords and *hex_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmp notification-log name

```
show snmp notification-log [default | name | hex hex_name]
```

Description

Displays a detailed summary of notification log configuration and status, as well as global configuration and status.

Syntax Description

| | |
|-----------------|---------------------------------|
| default | The default log. |
| <i>name</i> | Specifies the name of the log. |
| hex | Provide value in hexadecimal. |
| <i>hex_name</i> | Name of the log in hexadecimal. |
| | |

Default

Disabled.

Usage Guidelines

Use this command to display in detail the configuration and status of a notification log, as well as a summary of its contents.

Example

The following example displays a detailed summary of nmslog2.

```
show snmp notification-log nmslog2
Name                : nmslog2
Filter Profile      : filter1

-----

```

History

This command was first available in ExtremeXOS 15.5.

The **default** and **hex** keywords and *hex_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmp notification-log

```
show snmp notification-log
```

Description

Displays a summary of notification log configuration and status, as well as global configuration and status.

Syntax Description

This command has no keywords or variables.

Default

Disabled.

Usage Guidelines

Use this command to display a summary of notification log configuration and status, as well as global configuration and status.

Example

The following example displays log configuration and status:

```
show snmp notification-log
Global Entry Limit : 10000
System Managed Size : 1500
Global Age Out      : None
Notifications Logged: 2100
Notifications Bumped: 300
Notification Logs   :

nmslog1              filter1            EFAV      0        0
nmslog2              filter1            DMAN      600     0
-----
Flags: Admin Status: (D) Disable, (E) Enabled.
      Oper Status:  (F) No Filter, (M) Admin Disabled, (U) Up.
      Entry Status: (A) Active,   (I) Inactive, (T) Not Ready.
      Storage Type: (N) Non Volatile, (O) Other, (P) Permanent, (R) Read
Only,
                        (V) Volatile.
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmp traps bfd

```
show snmp traps bfd
```

Description

This command displays session up/down trap reception for BFD.

Syntax Description

| | |
|-------|--|
| snmp | Configure <i>SNMP</i> specific settings. |
| traps | Configure SNMP Trap generation settings. |
| bfd | BFD-specific traps. |

Default

Not applicable.

Usage Guidelines

Use this command to display SNMP trap reception for BFD session up/down.

Example

The following command displays SNMP Trap configuration for BFD:

```
#show snmp traps bfd
SNMP Traps for Session Down      : Enabled
SNMP Traps for Session Up       : Enabled
SNMP Traps Batch Delay          : 1000 ms
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show snmp traps configuration

```
show snmp traps configuration
```

Description

Shows the current state of whether SNMP traps are set to occur when switch configurations are changed/saved.

Default

N/A

Example

The following example shows whether SNMP traps are set to occur when switch configurations are changed/saved:

```
# show snmp traps configuration
SNMP Traps for configuration change      : Disabled
SNMP Traps for configuration save       : Enabled
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches..

show snmp vr_name

```
show snmp {vr} vr_name
```

Description

Displays the *SNMP* configuration and statistics on a virtual router.

Syntax Description

| | |
|----------------------|-------------------------------|
| <code>vr_name</code> | Specifies the virtual router. |
|----------------------|-------------------------------|

Default

N/A.

Usage Guidelines

Use this command to display the SNMP configuration and statistics on a virtual router.

Example

The following command displays configuration and statistics for the virtual router *VR-Default*:

```
show snmp vr VR-Default
```

Following is sample output for the command:

```
x670.54 # show snmp vr "VR-Default"
SNMP access                : Enabled
SNMP ifMib ifAlias size    : Default
SNMP Traps                 : Enabled
SNMP TrapReceivers        :
  Destination              Source IP Address      Flags
  10.120.91.48 /162        32.1.0.2                2ET

2001:2001:2001:2001:2001:2001:2004 /16200 2ET
2334:0:0:0:0:0:2 /11555 2ET
Flags:  Version: 1=v1 2=v2c 3=v3
        Mode: S=Standard E=Enhanced
        Notification Type: T=Trap I=Inform

SNMP stats:  InPkts 0      OutPkts 0      Errors 0      AuthErrors 0
             Gets 0      GetNexts 0     Sets 0       Drops 0
SNMP traps:  Sent 0      AuthTraps Enabled
```

History

This command was first available in ExtremeXOS 12.4.2.

The SNMP ifMib ifAlias size status was added in ExtremeXOS 15.3.

The output was modified to display SNMPv3 notification targets and the notification type in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 access

```
show snmpv3 access {[[hex hex_group_name] | group_name]}
```

Description

Displays SNMPv3 access rights.

Syntax Description

| | |
|-------------------|---|
| hex | Specifies that the value to follow is to be supplied as a colon separated string of hex octets. |
| <i>group_name</i> | Specifies the name of the group to display. |

Default

N/A.

Usage Guidelines

The `show snmpv3 access` command displays the access rights of a group. If you do not specify a group name, the command will display details for all the groups.

This command displays the SNMPv3 vacmAccessTable entries.

Example

The following command displays all the access details:

```
show snmpv3 access
```

The following is sample output from this command:

```
switch # show snmpv3 access
Group Name      : admin
```

```
Context Prefix :

```

The following command displays the access rights for the group group1:

```
show snmpv3 access group1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 community

```
show snmpv3 community
```

Description

Displays information about *SNMP* community strings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays information about and status of the SNMP community on the switch. This information is available to Administrator Accounts.

Example

The following command displays the community:

```
show snmpv3 community
```

The following is sample output from this command:

```
switch # show snmpv3 community
Community Index   : private
Community Name    : private
Security Name     : vlv2c_rw
Context EngineID  : 80:00:07:7c:03:00:04:96:27:b6:7b
Context Name      :
Transport Tag     :
Storage Type      : NonVolatile
Row Status        : Active
Community Index   : public
Community Name    : public
Security Name     : vlv2c_ro
Context EngineID  : 80:00:07:7c:03:00:04:96:27:b6:7b
Context Name      :
Transport Tag     :
Storage Type      : NonVolatile
Row Status        : Active
Total num. of entries in snmpCommunityTable : 2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 context

```
show snmpv3 context
```

Description

Displays information about the SNMPv3 contexts on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the entries in the View-based Access Control Model (VACM) context table (VACMContextTable).

Example

The following command displays information about the SNMPv3 contexts on the switch:

```
show snmpv3 context
```

The following is sample output from this command:

```
VACM Context Name :  
Note : This Version Supports one global context ("")
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 counters

```
show snmpv3 counters
```

Description

Displays SNMPv3 counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The `show snmpv3 counters` command displays the following SNMPv3 counters:

- `snmpUnknownSecurityModels`.
- `snmpInvalidMessages`.
- `snmpUnknownPDUHandlers`.
- `usmStatsUnsupportedSecLevels`.
- `usmStatsNotInTimeWindows`.
- `usmStatsUnknownUserNames`.
- `usmStatsUnknownEngineIDs`.
- `usmStatsWrongDigests`.
- `usmStatsDecryptionErrors`.

Issuing the command `clear counters` resets all counters to zero.

Example

The following command displays all the SNMPv3 counters:

```
show snmpv3 counters
```

The following is sample output from this command:

```
snmpUnknownSecurityModels      : 0
snmpInvalidMessages            : 0
snmpUnknownPDUHandlers         : 0
usmStatsUnsupportedSecLevels    : 0
usmStatsNotInTimeWindows       : 0
usmStatsUnknownUserNames       : 0
usmStatsUnknownEngineIDs       : 0
usmStatsWrongDigests           : 0
usmStatsDecryptionErrors       : 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 engine-info

```
show snmpv3 engine-info
```

Description

Displays information about the SNMPv3 engine on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The following show engine-info output is displayed:

- Engine-ID—Either the ID auto generated from MAC address of switch, or the ID manually configured.
- Engine Boots—Number of times the agent has been rebooted.
- Engine Time—Time since agent last rebooted, in centiseconds.
- Max. Message Size—Maximum *SNMP* Message size supported by the Engine (8192).

Example

The following command displays information about the SNMPv3 engine on the switch:

```
show snmpv3 engine-info
```

The following is sample output from this command:

```
SNMP Engine-ID       : 80:0:7:7c:3:0:30:48:41:ed:97 'H'  
SNMP Engine Boots   : 1  
SNMP Engine Time    : 866896  
SNMP Max. Message Size : 8192
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 extreme-target-addr-ext

```
show snmpv3 extreme-target-addr-ext [[hex hex_addr_name] | addr_name]
```

Description

Displays information about SNMPv3 target addresses enhanced or standard mode.

Syntax Description

| | |
|----------------------|--|
| <i>hex_addr_name</i> | Specifies an identifier for the target address. The value is to be supplied as a colon separated string of hex octets. |
| <i>addr_name</i> | Specifies a string identifier for the target address. |

Default

N/A.

Usage Guidelines

Use this command to display entries in the SNMPv3 extremeTargetAddressExtTable.

Example

The following command displays the entry for the target address named A1:

```
show snmpv3 extreme-target-addr-ext A1
```

The following is sample output from this command:

```
x670.26 # show snmpv3 extreme-target-addr-ext

Target Addr Name      : v1v2cNotifyTAddr1
Mode                  : Enhanced
IgnoreMPModel         : No
UseEventComm          : Yes

Target Addr Name      : v1v2cNotifyTAddr2
Mode                  : Enhanced
IgnoreMPModel         : No
UseEventComm          : Yes

Total num. of entries in extremeTargetAddrExtTable : 2
```

History

This command was first available in ExtremeXOS 10.1.

The hex_addr_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 filter

```
show snmpv3 filter {[hex hex_profile_name] | profile_name} {{subtree}
  object_identifier}
```

Description

Displays the filters that belong a filter profile.

Syntax Description

| | |
|--------------------------|---|
| <i>hex_profile_name</i> | Specifies the filter profile to display. The value is to be supplied as a colon separated string of hex octets. |
| <i>profile_name</i> | Specifies the filter profile to display in ASCII format. |
| <i>object_identifier</i> | Specifies a MIB subtree. |

Default

N/A.

Usage Guidelines

Use this command to display entries from the snmpNotifyFilterTable. If you specify a profile name and subtree, you will display only the entries with that profile name and subtree. If you specify only the profile name, you will display all entries for that profile name. If you do not specify a profile name, then all the entries are displayed.

Example

The following command displays the part of filter profile prof1 that includes the MIB subtree 1.3.6.1.4.1:

```
show snmpv3 filter prof1 subtree 1.3.6.1.4.1
```

The following is sample output from this command:

```
Profile Name      : prof1
Subtree           : 1.3.6.1.4.1
Mask              :
Type              : Included
Storage Type      : NonVolatile
Row Status        : Active
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 filter-profile

```
show snmpv3 filter-profile {[[hex hex_profile_name] | profile_name]}
  {param [[hex hex_param_name] | param_name]}
```

Description

Displays the association between parameter names and filter profiles.

Syntax Description

| | |
|-------------------------|---|
| <i>hex_profile_name</i> | Specifies the filter profile name. The value is to be supplied as a colon separated string of hex octets. |
| <i>profile_name</i> | Specifies the filter profile name in ASCII format. |
| <i>hex_param_name</i> | Specifies the parameter name. The values is to be supplied as a colon separated string of hex octets. |
| <i>param_name</i> | Specifies the parameter name in ASCII format. |

Default

N/A.

Usage Guidelines

Use this command to display the snmpNotifyFilterProfileTable. This table associates a filter profile with a parameter name. The parameter name is associated with target addresses, and the filter profile is associated with a series of filters, so, in effect, you are associating a series of filters with a target address.

Example

The following command displays the entry with filter profile prof1 with the parameter name P1:

```
show snmpv3 filter-profile prof1 param P1
```

The following is sample output of this command:

```
Filter Profile Params Name : p1
Name                       : prof1
Storage Type               : NonVolatile
Row Status                 : Active
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name and hex_param_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 group

```
show snmpv3 group {[hex hex_group_name] | group_name} {user [hex
  hex_user_name] | user_name}}
```

Description

Displays the user name (security name) and security model association with a group name.

Syntax Description

| | |
|-----------------------|---|
| <i>hex_group_name</i> | Specifies the group name to display. The value is to be supplied as a colon separated string of hex octets. |
| <i>group_name</i> | Specifies the group name to display. The value is to be supplied in ASCII format. |
| <i>hex_user_name</i> | Specifies the user name to display. The value is to be supplied as a colon separated string of hex octets. |
| <i>user_name</i> | Specifies the user name to display. The value is to be supplied in ASCII format. |

Default

N/A.

Usage Guidelines

The `show snmpv3 group` command displays the details of a group with the given group name. If you do not specify a group name, the command will display details for all the groups.

This command displays the SNMPv3 vacmSecurityToGroupTable.

Example

The following command displays information about all groups for every security model and user name:

```
show snmpv3 group
```

The following is sample output from this command:

```
switch # sh snmpv3 group
Group Name      : v1v2c_ro
Security Name   : v1v2c_ro
Security Model  : snmpv1
Storage Type    : NonVolatile
```

```

Row Status      : Active
Group Name      : vlv2c_rw
Security Name   : vlv2c_rw
Security Model  : snmpv1
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : vlv2c_ro
Security Name   : vlv2c_ro
Security Model  : snmpv2c
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : vlv2c_rw
Security Name   : vlv2c_rw
Security Model  : snmpv2c
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : admin
Security Name   : admin
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initial
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialmd5
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialsha
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialmd5Priv
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialshaPriv
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Total num. of entries in vacmSecurityToGroupTable : 10

```

The following command shows information about the group testgroup and user name testuser:

```
show snmpv3 group testgroup user testuser
```

The following is sample output from this command:

```

Group Name      : testgroup
Security Name   : testuser
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active

```

History

This command was first available in ExtremeXOS 10.1.

The `hex_group_name` and `hex_user_name` parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 mib-view

```
show snmpv3 mib-view {[[hex hex_view_name] | view_name] {subtree
  object_identifier}}
```

Description

Displays a MIB view.

Syntax Description

| | |
|--------------------------|---|
| <i>hex_view_name</i> | Specifies the name of the MIB view to display. The value is to be supplied as a colon separated string of hex octets. |
| <i>view_name</i> | Specifies the name of the MIB view to display. The value is to be supplied in ASCII format. |
| <i>object_identifier</i> | Specifies the object identifier of the view to display. |

Default

N/A.

Usage Guidelines

The `show snmpv3 mib-view` command displays a MIB view. If you do not specify a view name, the command will display details for all the MIB views. If a subtree is not specified, then all subtrees belonging to the view name will be displayed.

This command displays the SNMPv3 vacmViewTreeFamilyTable.

Example

The following command displays all the view details:

```
show snmpv3 mib-view
```

The following is sample output from this command:

```
switch # sh snmpv3 mib-view
View Name      : defaultUserView
MIB Subtree    : 1
Mask           :
View Type      : Included
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultUserView
MIB Subtree    : 1.3.6.1.6.3.16
Mask           :
View Type      : Excluded
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultUserView
MIB Subtree    : 1.3.6.1.6.3.18
Mask           :
View Type      : Excluded
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultUserView
MIB Subtree    : 1.3.6.1.6.3.15.1.2.2.1.4
Mask           :
View Type      : Excluded
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultUserView
MIB Subtree    : 1.3.6.1.6.3.15.1.2.2.1.6
Mask           :
View Type      : Excluded
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultUserView
MIB Subtree    : 1.3.6.1.6.3.15.1.2.2.1.9
Mask           :
View Type      : Excluded
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultAdminView
MIB Subtree    : 1
Mask           :
View Type      : Included
Storage Type   : NonVolatile
Row Status     : Active
View Name      : defaultNotifyView
MIB Subtree    : 1
Mask           :
View Type      : Included
Storage Type   : NonVolatile
Row Status     : Active
Total num. of entries in vacmViewTreeFamilyTable : 8
```

The following command displays a view with the view name Review and subtree 1.3.6.1.2.1.1:

```
show snmpv3 mib-view Review subtree 1.3.6.1.2.1.1
```

History

This command was first available in ExtremeXOS 10.1.

The `hex_view_name` parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 notify

This command displays the `snmpNotifyTable`.

```
show snmpv3 notify {[[hex hex_notify_name] | notify_name]}
```

Description

Displays the notifications that are set.

Syntax Description

| | |
|------------------------|---|
| <i>hex_notify_name</i> | Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets. |
| <i>notify_name</i> | Specifies the parameter name associated with the target. The value is to be supplied in ASCII format. |

Default

N/A.

Usage Guidelines

Use this command to display entries from the SNMPv3 `snmpNotifyTable`. This table lists the notify tags that the agent will use to send notifications (traps).

If no notify name is specified, all the entries are displayed.

Example

The following command displays the notify table entries:

```
show snmpv3 notify
```

The following is sample output from this command:

```
# show snmpv3 notify
Notify Name      : defaultNotify
Tag              : defaultNotify
Type             : Trap
Storage Type     : NonVolatile
Row Status       : Active
Notify Name      : xyz
```

```

Tag           : xyz1
Type          : Inform
Storage Type  : NonVolatile
Row Status    : Active
Total entries in snmpNotifyTable : 2

```

History

This command was first available in ExtremeXOS 10.1.

The `hex_notify_name` parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 target-addr

```
show snmpv3 target-addr {[hex hex_addr_name] | addr_name}
```

Description

Displays information about SNMPv3 target addresses.

Syntax Description

| | |
|----------------------|--|
| <i>hex_addr_name</i> | Specifies an identifier for the target address. The value is to be supplied as a colon separated string of hex octets. |
| <i>addr_name</i> | Specifies a string identifier for the target address. |

Default

N/A.

Usage Guidelines

Use this command to display entries in the SNMPv3 `snmpTargetAddressTable`. If no target address is specified, the entries for all the target addresses will be displayed.

To view the source IP address, use the `show management` command.

Example

The following command displays the entry for the target address named A1:

```
show snmpv3 target-addr A1
```

The following is sample output from this command:

```
x670.25 # show snmpv3 target-addr

Target Addr Name      : v1v2cNotifyTAddr1
TDomain               : 1.3.6.1.6.1.1
TAddress              : 10.120.91.48, 162
TMask                 :
Timeout               : 1500
Retry Count           : 3
Tag List              : defaultNotify
Params                : v1v2cNotifyParam1
Storage Type          : NonVolatile
Row Status             : Active

Target Addr Name      : v1v2cNotifyTAddr2
TDomain               : 1.3.6.1.6.1.1
TAddress              : 2001:0:0:0:0:0:5, 162
TMask                 :
Timeout               : 1500
Retry Count           : 3
Tag List              : defaultNotify
Params                : v1v2cNotifyParam2
Storage Type          : NonVolatile
Row Status             : Active

Total num. of entries in snmpTargetAddrTable : 2
```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 11.0 to display a list of tags if more than one was configured and to display the timeout value for the entry in the snmpTargetAddrTable. This command was also modified to support the hex_addr_name parameter.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 target-params

```
show snmpv3 target-params {[hex hex_target_params] | target_params}
```

Description

Displays the information about the options associated with the parameter name.

Syntax Description

| | |
|--------------------------|--|
| <i>hex_target_params</i> | Specifies the parameter to display. The value is to be supplied as a colon separated string of hex octets. |
| <i>target_params</i> | Specifies the parameter name to display. The value is to be supplied in ASCII format. |

Default

N/A.

Usage Guidelines

Use this command to display entries from the SNMPv3 snmpTargetParamsTable. This table specifies the message processing model, security level, security model, and the storage parameters for messages to any target addresses associated with a particular parameter name.

If no parameter name is specified, all the entries are displayed.

Example

The following command displays the target parameter entry named P1:

```
show snmpv3 target-params P1
```

The following is sample output from this command:

```
Target Params Name      : p1
MP Model                : snmpv2c
Security Model          : snmpv2c
User Name               : testuser
Security Level          : No-Authentication No-Privacy
Storage Type            : NonVolatile
Row Status               : Active
```

History

This command was first available in ExtremeXOS 10.1.

The *hex_target_params* parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show snmpv3 user

```
show snmpv3 user {[[hex hex_user_name] | user_name]}
```

Description

Displays detailed information about the user.

Syntax Description

| | |
|----------------------|--|
| <i>hex_user_name</i> | Specifies the user name to display. The value is to be supplied as a colon separated string of hex octets. |
| <i>user_name</i> | Specifies the user name to display. The value is to be supplied in ASCII format. |

Default

N/A.

Usage Guidelines

The `show snmpv3 user` command displays the details of a user. If you do not specify a user name, the command will display details for all the users. The authentication and privacy passwords and keys will not be displayed.

The user entries in SNMPv3 are stored in the USMUserTable, so the entries are indexed by EngineID and user name.

Example

The following command lists all user entries:

```
show snmpv3 user
```

The following is sample output from this command:

```
switch # sh snmpv3 user
Engine-ID      : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name     : admin
Security Name  : admin
Authentication : HMAC-MD5
Privacy       : DES
Storage Type   : NonVolatile
Row Status    : Active
Engine-ID      : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name     : initial
Security Name  : initial
Authentication : No-Authentication
Privacy       : No-Privacy
Storage Type   : NonVolatile
Row Status    : Active
Engine-ID      : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name     : initialmd5
Security Name  : initialmd5
Authentication : HMAC-MD5
Privacy       : No-Privacy
Storage Type   : NonVolatile
Row Status    : Active
```

```
Engine-ID      : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'  
User Name     : initialsha  
Security Name  : initialsha  
Authentication : HMAC-SHA  
Privacy       : No-Privacy  
Storage Type   : NonVolatile  
Row Status    : Active  
Engine-ID     : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'  
User Name     : initialmd5Priv  
Security Name  : initialmd5Priv  
Authentication : HMAC-MD5  
Privacy       : DES  
Storage Type   : NonVolatile  
Row Status    : Active  
Engine-ID     : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'  
User Name     : initialshaPriv  
Security Name  : initialshaPriv  
Authentication : HMAC-SHA  
Privacy       : DES  
Storage Type   : NonVolatile  
Row Status    : Active  
Total num. of entries in usmUserTable : 6
```

The following command lists details for the specified user, testuser:

```
show snmpv3 user testuser
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sntp-client

```
show sntp-client
```

Description

Displays the DNS configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Displays configuration and statistics information of *SNTP* client.

Example

The following command displays the SNTP configuration:

```
show sntp-client
```

The following is sample output from this command:

```
SNTP client is enabled
SNTP time is valid
Primary server: 172.17.1.104
Secondary server: 172.17.1.104
Query interval: 64
Last valid SNTP update: From server 172.17.1.104, on Wed Oct 30 22:46:03 2003
SNTPC Statistics:
Packets transmitted:
to primary server:          1
to secondary server:       0
Packets received with valid time:
from Primary server:       1
from Secondary server:     0
from Broadcast server:     0
Packets received without valid time:
from Primary server:       0
from Secondary server:     0
from Broadcast server:     0
Replies not received to requests:
from Primary server:       0
from Secondary server:     0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ssh2

```
show ssh2
```

Description

Shows all SSHv2 configuration information, including the ciphers/MACs that are enabled, and Diffie-Hellman minimal supported group.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows all SSHv2 configuration information:

```
SSH module configuration details:
SSH Access           : Disabled
Key validity         : Invalid
Key type             : RSA 2048
TCP port             : 22
VR                   : all
Access profile       : not set
Secure Mode          : Off
Diffie-Hellman Groups : 18 (8192 bits)
Max Auth Tries       : 3
Idle time            : 60 minutes
Rekey Interval       : 4096 MB and no time limit
Ciphers              : aes128-cbc, 3des-cbc, aes192-cbc, aes256-cbc, rijndael-
cbc@lysator.liu.se, aes128-ctr, aes192-ctr, aes256-ctr, chacha20-poly1305@openssh.com
Macs                 : hmac-md5-etm@openssh.com, hmac-sha1-etm@openssh.com, hmac-
sha2-256-etm@openssh.com, hmac-sha2-512-etm@openssh.com, hmac-sha1-96-etm@openssh.com,
hmac-md5-96-etm@openssh.com, hmac-md5, hmac-sha1, hmac-sha2-256, hmac-sha2-512, hmac-
sha1-96, hmac-md5-96
Public key algorithms : ssh-rsa, ssh-dss, x509v3-sign-rsa, x509v3-sign-dss
Login grace timeout   : 100 seconds
```

History

This command was first available in ExtremeXOS 22.1.

Information about rekey interval and public key algorithms was first available in ExtremeXOS 22.3.

Information about key type was added in ExtremeXOS 22.5.

Information about the login grace timeout period was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ssh2 ciphers macs

```
show ssh2 {ciphers | macs}
```

Description

Displays configured SSHv2 ciphers and Message Authentication Codes (MACs).

Syntax Description

| | |
|----------------|---------------------------|
| ciphers | Shows configured ciphers. |
| macs | Shows configured MACs. |

Default

N/A.

Example

The following example shows all MACs that are enabled:

```
# show ssh2 macs
Macs: hmac-md5-etm@openssh.com, hmac-sha1-etm@openssh.com,
hmac-sha2-256-etm@openssh.com, hmac-sha2-512-etm@openssh.com, hmac-sha1-96-
etm@openssh.com,
hmac-md5-96-etm@openssh.com, hmac-md5, hmac-sha1, hmac-sha2-256,
hmac-sha2-512, hmac-sha1-96, hmac-md5-96
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ssh2 private-key

```
show ssh2 private-key
```

Description

Displays the ssh2 server's private key.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the ssh server's private key which can be used to configure the key later or on another switch by using the `configure ssh2 key {pregenerated}` command. The key is saved in the switch's EEPROM.

To erase the key from the EEPROM, use the `unconfigure` switch command.

History

This command was first available in ExtremeXOS 12.1.

This command was added to ExtremeXOS 11.6 SR, and ExtremeXOS 12.0 SR.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show sshd2 user-key

```
show sshd2 user-key {key_name {users}}
```

Description

Displays the user names bound to a key.

Syntax Description

| | |
|-----------------|---------------------------------------|
| <i>key_name</i> | Specifies the name of the public key. |
| users | Specifies the name of the users. |

Default

N/A.

Usage Guidelines

This command displays the names of the users that are bound to a public key.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ssl

```
show ssl {[trusted-ca | ojsp-signature-ca] [file_name | all]}
        {manufacturing}{certificate | detail}
```

Description

Displays the secure socket layer (SSL) configuration.

Syntax Description

| | |
|--------------------------|--|
| manufacturing | Shows manufacturer-installed certificates. |
| trusted-ca | Shows trusted CA certificates. |
| ojsp-signature-ca | Shows OCSP signature CA certificates. |
| <i>file_name</i> | Prints specified certificate file. |
| all | Prints all certificates. |
| certificate | Prints the certificate. |
| detail | Displays detailed SSL information. |

Default

N/A.

Usage Guidelines

This command displays the following information:

- HTTPS port configured. This is the port on which the clients will connect.
- Length of the RSA key (the number of bits used to generate the private key).
- Basic information about the stored certificate.

Example

The `show ssl` command displays the SSL configuration. The following is sample output from this command:

```
HTTPS Port Number: 443
Private Key matches with the Public Key in certificate. (or Private key does not match
with the Public Key in the certificate)
RSA Key Length: 1024
Certificate:
Data:
Version: 1 (0x0)
Serial Number: 6 (0x6)
Signature Algorithm: md5WithRSAEncryption
Issuer: C=AU, O=CryptSoft Pty Ltd, CN=Test CA (1024 bit)
Validity
Not Before: Oct 16 22:31:03 2000 GMT
Not After : Jan 14 22:31:03 2003 GMT
```

```
Subject: C=AU, O=CryptSoft Pty Ltd, CN=Server test cert (512 bit)
Manufacturing certificate: Not present
```

History

This command was first available in the ExtremeXOS 11.2.

The **trusted-ca** and **ocsp-signature-ca** options were added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show ssl csr

```
show ssl csr
```

Description

Shows the generated certificate signing request (CSR).

Syntax Description

| | |
|------------|--|
| ssl | Specifies SSL (Secure Sockets Layer). |
| csr | Specifies showing the CSR (certificate signing request). |

Default

N/A.

Example

The following example shows the generated CSR:

```
# show ssl csr
-----BEGIN CERTIFICATE REQUEST-----
MIIC3TCCAcUCAQIwZcxZAJBgNVBAYTA1VTMQ0wCwYDVQQKDARFWFRSMREwDwYD

```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show stack-ports debounce

```
show stack-ports {port-list} debounce
```

Description

This command displays the current debounce time configured in stack-ports.

Syntax Description

| | |
|-------------------------------|---------------------------------------|
| <code><i>port_list</i></code> | Specifies one or more stacking ports. |
|-------------------------------|---------------------------------------|

Default

N/A.

Usage Guidelines

Use this command to view the current debounce time configured in stack-ports. Specifying the stack-port allows to view the debounce time for particular stack-port alone.

Example

The following example displays the output of the `show stack-ports 1:1 1:2 debounce` command:

```
Stack  Debounce  
Port   Time (ms)  
-----  
1:1     0  
1:2     0
```

History

This command was first available in ExtremeXOS 15.3.4.

Platform Availability

This command is available on all stackable switches.

show stacking

```
show stacking
```

Description

The show stacking command shows a summary of the nodes in the stack topology.

The show stacking command shows all nodes that are in the stack topology.

Syntax Description

This command has no arguments or variables.

Default

There is no default value for this command.

Usage Guidelines

The asterisk (*) that precedes the node MAC address indicates the node on which this command is being executed, that is, the node to which the user is logged in.

The node MAC address is the address that is factory assigned to the stackable.

The slot number shown is the number currently in use by the related node. Since slot number configuration only takes effect during node initialization, a change in configured value alone does not cause a change to the slot number that is in use. Slot numbers show as hyphen (-) characters on nodes that have stacking disabled.

The Stack State shows the state values.

The Role is one of the following: Master, Backup, Standby, or *none*.

In a ring topology, the node on which this command is executed is always the first node displayed. The order of the nodes shown in the display is the order of their physical connection in the ring.

Even though the stack topology can be a ring, the active topology can simultaneously be a daisy chain because it is only a proper subset of the stack topology. If the node on which this command is executed is not active, the line

```
Active Topology is a ____
```

is replaced by the line

```
This node is not in an Active Topology.
```

The daisy chain topology is displayed in the order of physical connection. The master node detects the two nodes in the stack topology that have only one operating link, and these nodes become the ends of the stack. Such nodes always display at the top and bottom of the output.

It is possible for a node to be in Stabilizing or Waiting state and still be in the active topology. This is because it is possible for an active node to move to these states when a topology change is detected. Once a node becomes active, the node remains an active node until it reboots or an overflow condition occurs.

The Flags have the following definitions:

- The C flag indicates that the related node is a candidate for membership of the same active topology to which the node on which the command is executed would belong.
- The A flag indicates that the related node is an active node in the active topology of which the node on which the command is run is also a candidate node. Being an active node is necessary but not sufficient for presence of the node in a slot. Once the node has fully initialized, the active node appears as Present in the show slot display.
- The O flag indicates that the related node is probably an active node in an active topology for which the node on which this command is being run is not a candidate.

The O flag is useful for the case where there is an inhibited link or a disabled or failed node that separates two active topologies. One active topology may contain the local node, and all other nodes in this active topology do not have the O flag set. All nodes that are members of an active topology that is separated by an inhibited link from the active topology that contains the local node have only the O flag set. All possibly active nodes have the O flag set if the local node is not a member of any active topology. For any node for which the O flag is set, the C and A flags are not set and vice-versa.

The following information is displayed:

- Stack Topology is a ring or daisy-chain.
- Active Topology is a ring or daisy-chain (or This node is not in an Active Topology.).
- For each node:
 - Node MAC address (factory assigned).
 - Slot number in use.
 - Stack State:
 - Disabled - Node is not configured for stacking.
 - Failed - Node can't come up in the stack because it has a duplicate slot number.
 - Overflow - The node has detected that there are more nodes in the stack topology than are allowed.
 - Listening - Initial state when attempting to join the stack. The node is checking to see if its configured slot number duplicates that of another node. The node cannot be an active node in this state.
 - Stabilizing - Node is waiting until it sees no new topology changes. The node may or may not be an active node in this state.
 - Waiting - Topology has stabilized, if the active topology is to be a ring, and stacking link blocking is being performed. The node may or may not be an active node in this state.
 - Active - The node is an active node and is fully programmed to operate in the active topology.
- Node role (master, backup, standby, or other transient node state).

- Flags describing the node's membership in the active topology.
- Whether or not the node is this node, that is, the node on which the command is run.

Example

The following example shows the output of show stacking command:

```
Slot-1 Stack.30 # show stacking
Stack Topology is a Ring
Active Topology is a Daisy-Chain
Node MAC Address      Slot  Stack State  Role      Flags
-----
*00:04:96:26:60:DD  1      Stabilizing  Master    CA-
00:04:96:26:60:EE  4      Stabilizing  Standby   C--
00:04:96:26:60:FF  -      Disabled     Master    ---
00:04:96:26:60:AA  -      Disabled     Master    ---
00:04:96:26:60:88  -      Disabled     Master    ---
00:04:96:26:60:99  -      Disabled     Master    ---

Slot-1 Stack.31 #
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show stacking configuration

```
show stacking configuration
```

Description

Shows how the nodes are configured in a stack topology. The configured values shown are the ones actually stored in the remote nodes at the time you issue this command.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Some stacking parameters do not take effect until the next restart, the configured values and the values currently being used are both shown. Specifically, this applies to the slot number, whether or not stacking is enabled, the master-capable configuration, the license level restriction, and the stack MAC configuration.

The only parameters that take effect without a reboot are the node priority and the alternate management IP subnetwork and gateway.

The Stack MAC in use line can display the following values:

- If the command is executed on the master node:
 - *none* if there is no stack MAC configured.
 - The stack MAC configured on the master node.
- If the command is executed on a non-master node:
 - *unknown*. The stack MAC address is only known by the executing master node. In this case, the M and m flags are not set. The i flag is set if there is a stack MAC configured locally.

Identified with the asterisk, the current node is the one on which the `show stacking configuration` command is executed.

A node identified with the ? character indicates that timely attempts to fetch the configuration information from the node have failed. There are two possible reasons for this display:

- Communications with the node have been lost, in which case the node will probably be removed from the stack topology shortly.
- The node is too busy to respond in time.

A row that displays the ? indicator shows the last values that were received from the node. If no values were ever received, all configured values show as not configured (-) or *none*. The node MAC address and the slot number that is currently in use are still displayed.

Example

The following example shows the stacking configuration for a switch:

```
Slot-1 Stack.2 # show stacking configuration
Stack MAC in use: 02:04:96:26:6b:ed
Node          Slot      Alternate      Alternate
MAC Address   Cfg Cur  Prio Mgmt IP / Mask  Gateway      Flags      Lic
-----
*00:04:96:26:6b:ed 1    1    Auto <none>          <none>      CcEeMm--- --
00:04:96:34:d0:b8 2    2    Auto <none>          <none>      CcEeMm--- --
* - Indicates this node
Flags: (C) master-Capable in use, (c) master-capable is configured,
(E) Stacking is currently Enabled, (e) Stacking is configured Enabled,
(M) Stack MAC in use, (m) Stack MACs configured and in use are the same,
(N) Stack link protocol Enhanced in use, (n) Stack link protocol Enhanced configured,
(i) Stack MACs configured and in use are not the same or unknown,
(-) Not in use or not configured
License level restrictions: (C) Core, (A) Advanced edge, or (E) Edge in use,
(c) Core, (a) Advanced edge, or (e) Edge configured,
(-) Not in use or not configured
```

The following example shows the stacking configuration for a ExtremeSwitching 5520 series switch:

```
# show stacking configuration
Stack MAC in use: 02:04:96:f1:b8:00
Node          Slot          Alternate          Alternate
MAC Address   Cfg Cur Prio Mgmt IP / Mask   Gateway          Flags          Lic
-----
*00:04:96:f1:b8:00 1  -   Auto <none>          <none>          -c----iNn -b
* - Indicates this node
Flags:  (C) master-Capable in use, (c) master-capable is configured,
        (E) Stacking is currently Enabled, (e) Stacking is configured Enabled,
        (M) Stack MAC in use, (m) Stack MACs configured and in use are the same,
        (i) Stack MACs configured and in use are not the same or unknown,
        (N) Enhanced protocol is in use, (n) Enhanced protocol is configured,
        (-) Not in use or not configured
License level restrictions: (B) Base, or (P) Premier in use,
        (b) Base, or (p) Premier configured,
        (-) Not in use or not configured
```

History

This command was first available in ExtremeXOS 12.0.

Licensing information specific to ExtremeSwitching 5520 series switches was added in ExtremeXOS 31.1.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show stacking detail

```
show stacking {node-address node_address | slot slot_number} detail
```

Description

This command displays information about a specified node.

Syntax Description

| | |
|---------------------|--|
| <i>node_address</i> | Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command. |
| <i>slot_number</i> | Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command. |

Default

N/A.

Usage Guidelines

If no node is specified, the output is generated for all nodes in the stack topology. If the specified node does not exist, an error message appears. The slot parameter is available only for active nodes in the same active topology as the node on which the command is run. The node-address parameter is always available.

Current information represents stacking states and configured values that are currently in effect. Configured information is that which takes effect at node reboot only. Thus, differences between values in use and values configured can be seen here. The advantages of this command over the [show stacking configuration](#) command is that the values in use and the configured values are fully expanded without the need for flags. You can also see the port state information of the node(s).

The roles values are: Master, Backup, Standby, and *none*.

License level restrictions can be Edge, Advanced Edge, or Core.

If one of the fields in the example below is missing on your switch, your switch does not support the feature that the field represents.

Example

The following is a sample output of this command:

```
Slot-1 Stack.33 # show stacking slot 1 detail
Stacking Node 00:04:96:26:6b:ec information:
Current:
Stacking           : Enabled
Role               : Master
Priority           : Automatic
Slot number        : 1
Stack state        : Active
Master capable?    : Yes
Stacking protocol  : Enhanced
License level restriction : <none>
In active topology? : Yes
Factory MAC address : 00:04:96:26:6b:ec
Stack MAC address   : 02:04:96:26:6b:ec
Alternate IP address : <none>
Alternate gateway   : <none>
Stack Port 1:
State              : Operational
Blocked?           : No
Control path active? : Yes
Selection          : Alternate (23)
Stack Port 2:
State              : Operational
Blocked?           : Yes
Control path active? : Yes
Selection          : Native
Configured:
Stacking           : Enabled
Master capable?    : Yes
Slot number        : 1
Stack MAC address   : 02:04:96:26:6b:ec
Stacking protocol  : Enhanced
License level restriction : <none>
Stack Port 1:
```

```

Selection          : Alternate (23)
Stack Port 2:
Selection          : Native

```

The following example shows the stacking information for a ExtremeSwitching 5520 series switch node:

```

# show stacking detail
Stacking Node 00:04:96:f1:b8:00 information:
  Current:
    Stacking          : Disabled
    Role              : Master
    Priority           : Automatic
    Slot number       : N/A
    Stack state       : Disabled
    Master capable?   : N/A
    Stacking protocol : Enhanced
    License level restriction : Base
    In active topology? : No
    Factory MAC address : 00:04:96:f1:b8:00
    Stack MAC address  : N/A
    Alternate IP address : <none>
    Alternate gateway  : <none>
    Stack Port 1:
      State           : Link down
      Blocked?        : No
      Control path active? : No
    Stack Port 2:
      State           : Link Down
      Blocked?        : No
      Control path active? : No
  Configured:
    Stacking          : Disabled
    Master capable?   : Yes
    Slot number       : 1
    Stack MAC address  : 02:04:96:f1:b8:00
    Stacking protocol : Enhanced
    License level restriction : Base

```

History

This command was first available in ExtremeSwitching 12.0.

The Stacking protocol and Stack Port Selection fields were added in ExtremeSwitching 12.5.

Licensing information specific to ExtremeSwitching 5520 series switches was added in ExtremeXOS 31.1.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show stacking stack-ports

```
show stacking stack-ports
```

Description

This command displays the port states of each node in the stack topology and the connections between the nodes.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The slot number shown is the slot number in use on stacking enabled nodes. If the node does not have stacking enabled, a hyphen character (-) is shown instead of a number.

The Port and Node MAC Address field values in the command display identify a particular stacking port. Each node MAC address appears twice in two consecutive rows in the output because each node has two stacking ports. On all platforms, the ports are labeled with the values 1 or 2. The order in which stacking ports appear in the display is the order in which they are physically connected.

The Select field indicates whether the stacking port is using a native stacking port or an alternate 10Gbps Ethernet port. If a number appears in this column, it represents the port number printed on the switch for a 10 Gbps Ethernet port. For more information, see the description for the [configure stacking-support stack-ports](#) command.

The Port State field for each port shows one of the following states:

- Link Down – port is not receiving a signal.
- No Neighbor – the port is receiving a signal but it is not identifying a stack neighbor.
- Overflow – 17 nodes (or more) are physically connected to this port.
- Inhibited – When you connected the link, active topologies were detected on both sides, and at least one slot number was duplicated. The stack merge is blocked.
- Operational – the port is operational in the stack. This is a necessary but insufficient condition for the port to be used for control path or user data. For example, a node with stacking Failed state may still show its port states as Operational.

The Flags field contains the following flag definitions:

- C - The control path is active on this port. Note that the user data path over the stack links follows the control path.
- B - The port is blocked from transmitting traffic that is to be flooded to multiple non-stacking ports. This flag is only set in an active ring topology on two adjacent ports. In the example below, the active topology is a daisy chain, so no ports are blocked.

Identified with the asterisk, the current node is the one on which the show stacking command was executed. The stack topology is shown in a particular order. In a ring topology, the current node is always the first node, the next node is the node connected to the port 2 of the first node, and the last

node is the node connected to the port 1 of the current node. In a daisy chain, the order shown depends on the connection of the node on which the command executes:

- The first node is the one at the far end of the daisy-chain connected to the current node port 1.
- The last node is the one at the far end of the daisy-chain connected to the current node port 2.
- The previous node is the one at the near end of the daisy-chain connected to the current node port 1.
- The next node is the one at the near end of the daisy-chain connected to the current node port 2.
- If there is no node connected to the current node port 1, the current node is the first node.
- If there is no node connected to the current node port 2, the current node is the last node.

The port speed is the unidirectional speed of the port.

Note

Some VIM names include speed ratings which are 4 times the unidirectional stacking port speed. For example, the actual stacking port speed for VIM1-SummitStack512 is 128 Gbps. The 512 Gbps rating for the VIM is the unidirectional rate X 2 (bidirectional) X 2 (ports).

Example

The following example shows the command output for a stack that is operating in a ring and uses both native and alternate stack ports:

```
Slot-1 Stack.9 # show stacking stack-ports
Stack Topology is a Ring
Slot Port Select Node MAC Address Port State Flags Speed
-----
*1 1 23 00:04:96:26:6b:ec Operational C- 10G
*1 2 Native 00:04:96:26:6b:ec Operational CB 64G
2 1 Native 00:04:96:18:7d:e8 Operational CB 64G
2 2 24 00:04:96:18:7d:e8 Operational C- 10G
3 1 23 00:04:96:27:c5:12 Operational C- 10G
3 2 Native 00:04:96:27:c5:12 Operational C- 64G
4 1 Native 00:04:96:26:6b:34 Operational C- 64G
4 2 24 00:04:96:26:6b:34 Operational C- 10G
* - Indicates this node
Flags: (C) Control path is active, (B) Port is Blocked
Slot-1 Stack.10 #
```

The following example shows the command output for stacks that use the 512 Gbps stacking ports:

```
Slot-1 Stack.2 # show stacking stack-ports
Stack Topology is a Ring
Slot Port Select Node MAC Address Port State Flags Speed
-----
*1 1 Native 00:04:96:35:8b:a5 Operational C- 128G
*1 2 Native 00:04:96:35:8b:a5 Operational C- 128G
```

```

2  2  Native 00:04:96:35:a8:b0 Operational C- 128G
2  1  Native 00:04:96:35:a8:b0 Operational C- 128G

```

Note

Although the VIM1-SummitStack512 option card has four physical ports, the physical ports are grouped into two pairs, forming two logical ports. The `show stacking stack-ports` command displays the status of the logical ports.

History

This command was first available in ExtremeXOS 12.0.

The Select column was added in ExtremeXOS 12.5.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show stacking-support

```
show stacking-support
```

Description

This command displays the configured and current states of configuration options configured on the local node with the `stacking-support` keyword.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The display parameters are described in the following table:

| Display Item | Description |
|-------------------|---|
| Stack Port column | Displays rows for Stack Port 1 and Stack Port 2. |
| Native column | Indicates whether the switch has native stack ports. A Yes entry indicates that the switch has native stacking ports. A No entry indicates that no native stacking ports are present. An asterisk indicates that the native stack port is selected. |

| Display Item | Description |
|-------------------|---|
| Alternate column | Displays the port numbers for data ports that can operate as alternate stack ports. A No entry indicates that there are no data ports that can operate as alternate stacking ports. An asterisk indicates that the data port number is selected as an alternate stack port. |
| Configured column | Indicates the configured state for stack ports 1 and 2, which can be Native or Alternate. This column also indicates the configured state of stacking-support option. For platform configurations with dual-purpose hardware (that supports stack ports or data ports), this column displays either Enabled (stack ports enabled) or Disabled (stack ports disabled, data ports active). For platform configurations without dual-purpose hardware, this column displays N/A, which indicates that stacking-support option cannot be disabled on this switch. This is the configuration that becomes active the next time the switch boots if the stacking-support option is enabled. For more information, see the enable stacking-support and disable stacking-support commands. |
| Current column | Indicates the selection that is currently in effect for stack ports, which can be Native, Alternate, or N/A. N/A indicates that the port selection is not applicable to this switch hardware configuration. The column also indicates the current operating state of the stacking-support option, which can be Enabled, Disabled, or N/A. An N/A entry indicates that no option card is present. This is the configuration that is active now. |

Example

The following example shows the stack port selection and stacking-support option configuration after the unconfigure stacking-support command has been executed and before a subsequent reboot has been initiated:

```
# show stacking-support
Stacking Support Settings
Stack   Available Ports
Port    Native  Alternate  Configured  Current
-----  -
1       Yes *   23         Native      Native
2       Yes    24 *      Native      Alternate
stacking-support:      Disabled   Enabled
auto-discovery:        Enabled   Disabled
Flags: * - Current stack port selection
NOTE: This node must be rebooted before the configured settings will
take effect.
```

The following example shows that the stacking-support option is disabled and will remain disabled when the switch reboots:

```
# show stacking-support
Stacking Support Settings
Stack   Available Ports
Port    Native  Alternate  Configured  Current
-----  -
1       No     S3         Native      N/A
2       No     S4         Native      N/A
```

```
stacking-support:      Disabled   Disabled
auto-discovery:       Enabled   Enabled
Flags: * - Current stack port selection
```

The following example shows the configured and current pseudo native stack port type:

```
# show stacking-support

Stack   Available Ports
Port    Native  Alternate  Configured   Current
-----  -
1       Yes *   47         Native (V160) Native (V80)
2       Yes *   48         Native       Native (V320)
stacking-support:    Enabled   Enabled
auto-discovery:      Enabled   Enabled

Flags: * - Current stack port selection
```

History

This command was first available in ExtremeXOS 12.5.

Ability to show configured and current pseudo native stack port type (V160, V320, V400) was added in ExtremeXOS 30.1.

The V80 option was removed in ExtremeXOS 30.2.

Stacking auto-discovery information was added in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support alternate stack port selection or permit disabling of the stacking-support option.

show stpd ports blocked-ports

```
show stpd stpd_name ports {port_list} {blocked-ports}
```

Description

Displays all blocked ports in Spanning Tree.

Syntax Description

| | |
|----------------------|---|
| <i>stpd_name</i> | Specifies an <i>STPD</i> name on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| blocked-ports | Displays only blocked ports. |

Default

N/A

Usage Guidelines

None.

Example

The following example displays the blocked Spanning Tree ports:

```
show stpd r1 blocked-ports

Port      VLAN
-----
1:1       v123456789012345678901234567890, v1234567890123456789012345678901,
          v1234567890123456789012345678901

Number of Blocked Ports : 3
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show stpd ports counters

```
show stpd stpd_name ports {port_list} counters
```

Description

Displays all counters for Spanning Tree.

Syntax Description

| | |
|------------------|---|
| <i>stpd_name</i> | Specifies an <i>STPD</i> name on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| counters | Displays counters for the specified port. |

Default

N/A

Usage Guidelines

None.

Example

The following example displays the counters for port 10:10 in *STP* domain r1:

```
show stpd r1 ports 10:10 counters

Port 10:10
-----
Disputed BPDU           : 0
Invalid BPDU            : 0
Message Expiration      : 0
STP BPDU Rx             : 0
STP BPDU Tx             : 0
STP TCN BPDU Rx        : 0
STP TCN BPDU Tx        : 0
STP TC BPDU Rx         : 0
STP TC BPDU Tx         : 0
RST BPDU Rx            : 0
RST BPDU Tx            : 0
RST TC BPDU Rx         : 0
RST TC BPDU Tx         : 0
MST BPDU Rx            : 1287
MST BPDU Tx            : 4
MST CIST TC BPDU Rx    : 2
MST CIST TC BPDU Tx    : 2
Forward Transitions Count : 1
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show stpd ports non-forwarding-reason

```
show stpd stpd_name ports {port_list} { non-forwarding-reasons }
```

Description

Displays the reasons for placing a port in a non-forwarding state.

Syntax Description

| | |
|-------------------------------|---|
| <i>stpd_name</i> | Specifies an <i>STPD</i> name on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| non-forwarding-reasons | Displays only reasons for placing a port in a non-forwarding state. |

Default

N/A

Usage Guidelines

Ports can be placed in the non-forwarding state for the following reasons:

- Placed in listening state because it is in dispute.
- Not been placed in a non-forwarding state due to any exceptional condition.
- Placed in listening or blocking state by the Loop Protect feature.
- Placed in listening state by the Loop Protect feature, but this condition may be normal because the link partner does not support Loop Protect.
- Placed in blocking state because a loopback condition has been detected.
- Unknown non-forwarding reason.

Example

The following example displays the non-forwarding reasons on port 1:10 in *STP* domain r1:

```
show stpd r1 ports 1:10 non-forwarding-reason
```

| Port | Reason |
|------|---|
| 1:1 | Placed in listening state because it is in dispute. |
| 1:2 | Not been placed in a non-forwarding state due to any exceptional condition. |
| 1:3 | Placed in listening or blocking state by the Loop Protect feature. |
| 1:4 | Placed in listening state by the Loop Protect feature, but this condition may be normal because the link partner does not support Loop Protect. |
| 1:5 | Placed in blocking state because a loopback condition has been detected. |
| 1:6 | Unknown non-forwarding reason. |

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show stpd

```
show stpd {stpd_name | detail}
```

Description

Displays *STPD* settings on the switch.

Syntax Description

| | |
|------------------|---|
| <i>stpd_name</i> | Specifies an STPD on the switch. |
| detail | Specifies that STPD settings should be shown for each STPD. |

Default

N/A.

Usage Guidelines

If you specify the command without any options, the following STPD information appears:

- Name—The name of the STPD.
- Tag—The StpdID of the domain, if configured.
- Flags—The following flags communicate information about the current state of the STPD:
 - (C) Topology Change—A network topology change has occurred in the network.
 - (D) Disable—The STPD is disabled.
 - (E) Enable—The STPD is enabled.
 - (R) Rapid Root Failover—The STPD has been configured for rapid root failover.
 - (T) Topology Change Detected—The STPD has detected a change in the network topology.
 - (M) MSTP CIST—The STPD has been configured for MSTP, and the STPD is the common and internal spanning tree.
 - (I) MSTP MSTI—The STPD has been configured for MSTP, and the STPD is a multiple instance spanning tree.
- Ports—The number of ports that are part of the STPD.
- Bridge ID—The MAC addresses of the switch.
- Designated Root—The MAC address of the switch that is the designated root bridge.
- Rt Port—The root port.
- Rt Cost—The path cost to the root port.
- Total Number of STPDs—The total number of STPDs configured on the switch.
- STP Flush Method—The method used to flush the FDB during a topology change.

If you have an MSTP region and associated spanning trees configured on the switch, the command also displays the following global MSTP information:

- MSTP Region—The name of the MSTP region configured on the switch.
- Format Identifier—The number used by BPDUs to communicate within an MSTP region.
- Revision Level—This number is reserved for future use.
- Digest—The MD5 digest value.
- Common and Internal Spanning Tree (CIST)—The name of the CIST that controls the connectivity of interconnecting MSTP regions.
- Total number of MST Instances (MSTI)—The number of MSTIs running in the MSTP region.

If you use the show stpd command and specify the name of an STPD, in addition to the data previously described, the command displays more detailed information about the STPD. If you specify the detail option, the switch displays the same type of information for all of the STPDs configured on the switch.

The additional output includes the following:

- STPD mode of operation.
- Autobind mode.
- Active VLANs.
- Bridge priority mode.
- Timer information.
- Topology change information.

If you have MSTP configured, the command also displays the following information:

- Bridge role.
- CIST root.
- CIST regional root.
- MSTI instances.
- Master port (Displayed only on MSTI STPDs).

If your STPD has the same name as another component, for example a VLAN, we recommend that you specify the identifying keyword as well as the name. If you do not specify the stpd keyword, an error message similar to the following is displayed:

```
%% Ambiguous command: "show Test"
```

In this example, to view the settings of the STPD Test, enter show stpd Test.

If your STPD has a name unique only to that STPD, the keyword stpd is optional.

Example

The following command displays the STPD settings on a switch that has MSTP configured:

```
# show stpd
```

The following is sample output from this command:

```
MSTP Global Configuration:
MSTP Region Name       : 00049651acd7
MSTP Format Identifier  : 0

History

This command was first available in ExtremeXOS 10.1.

Information about MSTP was added in ExtremeXOS 11.4.

Description was added in ExtremeXOS 12.4.4.

MSTP Digest, topology change information, and trap information were added in ExtremeXOS 15.7.1.

Bridge priority mode information added in ExtremeXOS 22.1.

Send IGMP/MLD query suppression status added in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show stpd ports

```
show {stpd} stpd_name ports {[detail | port_list {detail}]}
```

Description

Displays the *STP* state of a port.

Syntax Description

| | |
|------------------|--|
| <i>stpd_name</i> | Specifies an <i>STPD</i> name. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
| detail | Specifies more detailed information about one or more ports of the <i>STPD</i> . |

Default

N/A.

Usage Guidelines

This command displays the following:

- STPD port configuration.
- STPD port encapsulation mode.
- STPD path cost.
- STPD priority.
- STPD state (root bridge, and so on).
- Port role (root designated, alternate and so on).
- STPD port state (forwarding, blocking, and so on).
- Configured port link type.
- Operational port link type.
- Edge port settings (inconsistent behavior, edge safeguard setting).
- Restricted role (enabled, disabled).
- *MSTP* port role (internal or boundary).
- Active port role.

To display more detailed information for one or more ports in the specified *STPD*, including participating VLANs, specify the **detail** option.

If you have *MSTP* configured and specify the detail option, this command displays additional information:

- *MSTP* internal path cost.
- *MSTP* timers.

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If you do not specify the stpd keyword, an error message similar to the following is displayed:

```
%% Ambiguous command: "show Test ports"
```

In this example, to view all of the port settings of STPD Test, enter `show stpd Test ports`.

If your STPD has a name unique only to that STPD, the keyword `stpd` is optional.

Example

The following command displays the state of ports 1, 2, and 4 on an STPD named `s1`:

```
show stpd s1 ports
```

The following is sample output from this command:

```
Port  Mode  State      Cost  Flags      Priority Port ID Designated Bridge
1      EMISTP DISABLED 200000 e?pp-w---t 128      8001    00:00:00:00:00:00:00:00
2      EMISTP DISABLED 200000 e?pp-w---- 128      8002    00:00:00:00:00:00:00:00
4      EMISTP DISABLED 200000 e?pp-w---- 128      8004    00:00:00:00:00:00:00:00
Total Ports: 3
```

```
----- Flags: -----

g = edgeport safe guard bpdu restrict configured but inactive only dot1w, mstp
9:                B = Boundary, I = Internal
10:               r = Restricted Role, t = active role

```

History

This command was first available in ExtremeXOS 10.1.

Information about MSTP was added in ExtremeXOS 11.4.

Information about BPDU Restrict was added in ExtremeXOS 12.4.

Information about active role was added in ExtremeXOS 12.5.

Information about reflection BPDU status was added in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show switch

```
show switch {detail}
```

Description

Displays the current switch information.

On a SummitStack, this command displays the Master and Backup node information if executed on the Master, and displays the current node and the Master node information if executed on any other node.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The show switch command displays:

- sysName, sysLocation, sysContact.
- MAC address.
- System type.
- System health check.
- Recovery mode.
- Watchdog state.
- Secure Boot (trusted delivery) status (5420 and 5520 only):
 - UBOOT Image Verified

Note

If the UBOOT image verification fails during boot-up, the switch halts and enters the Recovery Boot Loader.

- Current date, time, system boot time, and time zone configuration.
- Any scheduled reboot information.
- System up time.
- Master and Backup information (available only on SummitStack).
- Current state (available only on stand-alone switches).
 - OPERATIONAL.
 - OPERATIONAL (OverHeat).
 - FAILED.
- Software image information (primary/secondary image and version).
- Configuration information (primary/secondary configuration and version).
- If locally administered MAC address generation is enabled (see [enable switch locally-administered-address](#) on page 2383).
- Software version information.

This information may be useful for your technical support representative if you have a problem.

On a SummitStack, the System UpTime may be useful when manually resolving the dual master situation. For more information, see *Eliminating a Dual Master Situation Manually* section in the [ExtremeXOS 31.3 User Guide](#).

Depending on the software version running on your switch, additional or different switch information may be displayed.

On a stack or Extended Edge Switching topology, the following additional information is available:

- System Type.
- System UpTime.
- Details of master and backup, or current node and master, including any loss of synchronicity with the primary, and which process is out of sync.

Example

Output from this command on the standalone ExtremeSwitching series switch looks similar to the following:

```

History

This command was first available in ExtremeXOS 10.1.

This command was updated to support stacking in ExtremeXOS 12.0 and the System Type was added to the output from this version.

Automatic configuration save information was added in ExtremeXOS 22.2.

Locally administered per-port MAC address information was added in ExtremeXOS 22.3.

System port name pattern information added in ExtremeXOS 30.1.

Solid State Storage Device SSD-120 information was added in ExtremeXOS 30.3.

Secure Boot (trusted delivery) status information and additional process out-of-sync information for stacks and Extended Edge Switching was added for ExtremeSwitching 5520 series switches in ExtremeXOS 31.1, and for ExtremeSwitching 5420 series switches in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show switch bluetooth

```
show switch bluetooth [statistics | inventory]
```

Description

Displays Bluetooth device-related information.

Syntax Description

| | |
|-------------------|--|
| switch | Designates showing information for the switch. |
| bluetooth | Designates showing information about Bluetooth devices. |
| statistics | Shows Bluetooth statistics. |
| inventory | Shows Bluetooth inventory (model number, serial number, etc.). |

Default

N/A.

Usage Guidelines

Using this command without the **statistics** shows:

- If Bluetooth is enabled on the switch.
- Switch MAC address.

- Switch name.
- Is Bluetooth discovery enabled.
- Is Bluetooth pairing enabled.
- List of Bluetooth devices:
 - Device MAC address.
 - Device name.
 - Device type (PC, phone, etc.)
 - Is the device paired.
 - Is the device trusted.
 - Is the device blocked.
 - Is the device paired.

To enable Bluetooth capabilities, use the enable **switch bluetooth {discovery | pairing }** command.

To disable Bluetooth capabilities, use the disable **switch bluetooth {discovery | pairing }** command.

Example

The following example shows Bluetooth information for a switch:

```
# show switch bluetooth
Bluetooth      : Enabled
  Address      : 00:04:96:9a:46:48
  Name         : X450G2-24p-G4
  Discovery    : Enabled
  Pairing      : Enabled
```

| Bluetooth Address | Device Name | Device Type | Paired | Trusted | Blocked | Connected |
|-------------------|-------------|-------------|--------|---------|---------|-----------|
| 00:00:00:00:00:02 | Device1 | PC | Yes | Yes | No | Yes |
| 00:00:00:00:00:03 | Device2 | Phone | Yes | No | No | No |

The following example shows Bluetooth statistics:

```
# show switch bluetooth statistics
Bluetooth      Rx      Tx      Rx      Err      Tx      Rx      Tx
Address        Bytes  Bytes  Events  Events  Cmd    ACL    ACL
-----
00:04:96:9a:46:48  50    100    10      10      10     15     15
```

The following example shows Bluetooth inventory:

```
# show switch bluetooth inventory
Bluetooth
Address      Manufacturer      Model      Model #      Serial
#            Description
-----
5C:F3:70:8B:E4:11 Broadcom_Corp    BCM20702A0    21e8
Broadcom_Corp_BCM20702A0_5CF3708 usb_device
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on the ExtremeSwitching X465, 5420, and 5520 series switches.

show switch boot-menu

```
show switch boot-menu
```

Description

Shows the boot menu timeout duration.

Syntax Description

| | |
|------------------|--|
| boot-menu | Specifies showing the boot menu configuration. |
|------------------|--|

Default

The default is 5 seconds.

Usage Guidelines

To configure the boot menu delay time, use the command `configure switch boot-menu delay [default | seconds]`.

Example

The following example shows the boot menu delay time:

```
# show switch boot-menu
Current boot menu configurations:

Delay before automatic boot: 5 seconds
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is only available on the ExtremeSwitching X465, X590, X690, X870 series switches.

show switch management

```
show switch management
```

Description

Shows management information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Example

The following example shows switch management information:

```
# show switch management

CLI idle timeout           : Enabled (20 minutes)
CLI max number of login attempts : 3
CLI max number of sessions  : 8
CLI paging                 : Enabled
CLI space-completion       : Disabled (this session only)
CLI configuration logging   : Disabled (without expansion)
CLI journal size           : 100
CLI password prompting only : Disabled
CLI display moved-keywords  : Hidden
CLI moved-keywords hidden release: 31.1
CLI RADIUS cmd authorize tokens : 2
CLI scripting               : Disabled (this session only)
CLI scripting error mode    : Ignore-Error (this session only)
CLI persistent mode        : Persistent (this session only)
CLI prompting               : Enabled (this session only)
CLI screen size             : 24 Lines 80 Columns (this session only)
CLI refresh                  : Enabled
CLI history expansion       : Disabled
Image integrity checking    : On (Valid)
Current system port notation : slot:port
Telnet access                : Enabled (tcp port 23 vr all)
                             : Access Profile : not set
SSH access                    : Disabled (Key invalid, tcp port 22 vr all)
                             : Secure-Mode      : Off
                             : Access Profile : not set
SSH2 idle time                : 60 minutes
SSH2 rekey interval          : 4096 MB and no time limit
Web access                    : Enabled (tcp port 80)
                             : Access Profile : not set
Total Read Only Communities  : 0
Total Read Write Communities : 0
RMON                           : Disabled
SNMP access                    : Enabled
                             : Access Profile : not set
SNMP Notifications            : Enabled
SNMP Notification Receivers   : None
SNMP stats:      InPkts 0      OutPkts 0      Errors 0      AuthErrors 0
                  Gets  0      GetNexts 0     Sets  0      Drops  0
```

```
SNMP traps:      Sent    0      AuthTraps Enabled
SNMP inform:     Sent    0      Retries    0      Failed 0
```

History

This command was first available in ExtremeXOS 10.1.

Image integrity check information was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show switch mounts

```
show switch mounts
```

Description

Displays whether a USB 2.0 storage device is present on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

This command shows whether a removable USB storage device is present on the switch:

```
# show switch mounts
```

The following output appears.

If you do not have a removable storage device installed:

```
Memory storage is not present.
```

If only one USB is supported and present:

```
Memory storage is present.
```

When two USBs are supported and present:

```
Memory storage is present in USB-1.
Memory storage is present in USB-2.
```

History

This command was first available in ExtremeXOS 11.0.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

The **memorycard** keyword was deprecated and replaced with the keyword **mounts** in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show switch usb

```
show switch usb
```

Description

Shows the status (enabled or disabled) of the switch's USB port.

Syntax Description

| | |
|------------|-------------------------------|
| usb | Specifies USB port on switch. |
|------------|-------------------------------|

Default

N/A.

Usage Guidelines

The `enable/disable switch usb` commands require a reboot to take effect. This is reflected in the output of this show command:

```
# show switch usb
USB port: Enabled
# disable switch usb
This setting will take effect at the next system reboot.
# show switch usb
USB port: Enabled (Disabled after the next reboot)Or in the same output, you can
add:"After disabling usb using 'disable switch usb' output will be like this:# show
switch usbUSB port: Enabled (Disabled after the next reboot)
```

Example

The following example shows the switch's USB port status:

```
# show switch usb
USB port: Enabled
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show system

```
show system
```

Description

This command displays the aggregated output of the following commands:

- `show switch`
- `show version`
- `show temperature`
- `show power`
- `show fans`
- `show odometers`

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the collected output of individual system commands.

Example

```
# show system

show switch
SysName:          5520-24W-EXOS
```

```

```

History

This command was first available in ExtremeXOS 16.1.

Solid State Storage Device SSD-120 information was added in ExtremeXOS 30.3.

Secure Boot (trusted delivery) status information (5520 only) was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show tacacs

```
show tacacs
```

Description

Displays the current TACACS+ configuration and statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- TACACS+—The current state of TACACS+, enabled or disabled.
- TACACS+ Authorization—The current state of TACACS+ authorization, enabled or disabled.
- TACACS+ Accounting—The current state of TACACS+ accounting, enabled or disabled.
- TACACS+ Server Connect Timeout—The amount of time configured to detect and recover from a TACACS+ server failure.
- Primary TACACS+ Server—Describes information about the primary TACACS+ server, including:
 - The name of the primary TACACS+ server.
 - The IP address of the primary TACACS+ server.
 - The TCP port to use to contact the primary TACACS+ server.
 - The IP address and VR used by the switch.
 - The shared secret configured for the primary TACACS+ server.
- Secondary TACACS+ Server—Contains the same type of output as the primary TACACS+ server for the secondary TACACS+ server, if configured.
- TACACS+ Acct Server Connect Timeout—The amount of time configured to detect and recover from a TACACS+ accounting server failure.
- TACACS+ Accounting Server parameters, if configured. Contains the same type of output as the TACACS+ server for the TACACS+ accounting server(s), if configured.

Example

The following command displays TACACS+ client configuration and statistics:

```
show tacacs
```

The following is sample output from this command:

```
TACACS+: enabled
TACACS+ Authorization: enabled
TACACS+ Accounting : enabled
TACACS+ Server Connect Timeout sec: 3
Primary TACACS+ Server:
Server name      :
IP address       : 10.201.31.238
Server IP Port: 49
Client address: 10.201.31.65 (VR-Default)
Shared secret   : qijxou
Secondary TACACS+ Server:
Server name      :
IP address       : 10.201.31.235
Server IP Port: 49
Client address: 10.201.31.65 (VR-Default)
Shared secret   : qijxou
TACACS+ Acct Server Connect Timeout sec: 3
Primary TACACS+ Accounting Server:
```

```
Server name      :
IP address       : 10.201.31.238
Server IP Port   : 49
Client address   : 10.201.31.65 (VR-Default)
Shared secret    : qijxou
Secondary TACACS+ Accounting Server:
Server name      :
IP address       : 10.201.31.235
Server IP Port   : 49
Client address   : 10.201.31.65 (VR-Default)
Shared secret    : qijxou
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show tacacs-accounting

```
show tacacs-accounting
```

Description

Displays the current TACACS+ accounting client configuration and statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- TACACS+ Accounting—The current state of TACACS+ accounting, enabled or disabled.
- TACACS+ Accounting Server Connect Timeout—The amount of time configured to detect and recover from a TACACS+ server failure.
- Primary TACACS+ Accounting Server—Describes information about the primary TACACS+ accounting server, including:
 - The name of the primary TACACS+ accounting server.
 - The IP address of the primary TACACS+ accounting server.
 - The TCP port to use to contact the primary TACACS+ accounting server.

- The IP address and VR used by the switch.
- The shared secret configured for the primary TACACS+ accounting server.
- Secondary TACACS+ Accounting Server—Contains the same type of output as the primary TACACS+ accounting server for the secondary TACACS+ accounting server, if configured.

Example

The following command displays TACACS+ accounting client configuration and statistics:

```
show tacacs-accounting
The following is sample output of this command:
TACACS+ Accounting : enabled
TACACS+ Acct Server Connect Timeout sec: 3
Primary TACACS+ Accounting Server:
Server name      :
IP address       : 10.201.31.238
Server IP Port: 49
Client address: 10.201.31.85 (VR-Default)
Shared secret    : qijxou
Secondary TACACS+ Accounting Server:Not configured
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show time

```
show time {detail}
```

Description

Shows the current time on the switch.

Syntax Description

| | |
|---------------|--|
| detail | In addition to the current time, this option shows boot time, time zone, and the clock source. |
|---------------|--|

Default

N/A.

Usage Guidelines

The date, time, time zone abbreviation, and offset from UTC appear in the following format:
 <weekday_abbreviation> <month_abbreviation> <day_of_month> <HH:MM:SS> <timezone>(UTC<+|-><utc_offset>) <year>

If the **detail** option is selected, the following appears in the presented format:

```
Current Time: <current_time>
Boot Time: <boot_time>
Timezone: <DST_status> <GMT_offset> <timezone_name>
          <DST_in_effect>
          <DST_begin>
          <DST_end>
Source: [Local | NTP | SNTP] <ntp_peer_mode> <sntp_ntp_address>
```

<ntp_peer_mode> is only valid when the source is NTP. <ntp_peer_mode> can be any of the following:

- Symmetric Active
- Symmetric Passive
- Client, Server
- Broadcast Server
- Control, Private
- Broadcast Client

<sntp_ntp_address> is the peer address when source is NTP. <sntp_ntp_address> is the server address when source is SNTP.

The source is determined as follows:

If SNTP is enabled and active, SNTP is assumed to be the clock source. Otherwise, if NTP peer mode is not zero (unspecified) and the peer address is not 0.0.0.0, NTP is assumed to be the clock source. Otherwise, the clock source is local.

Example

The following example shows detailed time information on the switch:

```
# show time detail
Current Time:    Wed Oct 25 03:43:22 2017
Boot Time:      Sat Oct 21 04:12:53 2017
Timezone:       [Auto DST Disabled] GMT Offset: 0 minutes, name is UTC.
Source:         Local
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show tech-support

```
show tech-support {all | area | {{bundle bundle_name} {monitor
  num_iterations} {interval seconds}} {detail} {logto [file]}
```

Description

Displays the output of various show commands to assist in monitoring and troubleshooting the switch; use only in conjunction with Extreme Networks Technical support.

Syntax Description

| | |
|-----------------------|---|
| all | Indicates all available show command output to be displayed. |
| <i>area</i> | Specifies one tech support area. For example, if you want to view <i>STP</i> information, enter <i>stp</i> . |
| detail | Specifies more detailed information. |
| logto [file] | Instructs the switch to log the show tech-support output into a file located in the switch's internal memory. The default file name is <i>show_tech.log.tgz</i> . |
| bundle | Selects collecting debug commands for specified functional areas. |
| <i>bundle_name</i> | Specifies the debug bundle name. |
| monitor | Selects executing a debug bundle multiple times. |
| <i>num_iterations</i> | Specifies the number of times to execute the debug bundle. |
| interval | Specifies setting the interval between successive executions of the debug bundle. |
| <i>seconds</i> | Sets the delay in seconds between successive intervals. The default is 300s. |

Default

The default interval between multiple executions of a debug bundle is 300s.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support personnel to view your switch configurations and to troubleshoot the switch.

The `show tech-support` command displays the output of the following commands, among others:

- `ls /usr/local/tmp`
- `show bootprelay`
- `show configuration`
- `show dhcp-client state`
- `show diagnostics`

- `show management`
- `show memory`
- `show odometers`
- `show policy`
- `show port rxerror`
- `show port txerror`
- `show power`
- `show power budget`
- `show power controller`
- `show process`
- `show radius`
- `show session`
- `show switch`
- `show tacacs`
- `show version`
- `show vlan`

Information about the following areas is also displayed, among others:

- `aaa`
- `bootp`
- `cli`
- `stp`

If you enter the detail keyword, the following show output is displayed, among others:

- `show log`
- `show log configuration`
- `show log counters all`
- `show process detail`

This information can be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch, the configurations running on your switch, and the type of switch you have, additional or different show command and configuration output may be displayed.

Debug bundles are JSON files that provide predefined modules to common problems that can be executed when an issue occurs. You can search for a bundle that best matches your issue, and then execute that relevant bundle that matches your problem. For a list of bundles, use the command `show tech-support help`, or view information about this feature in the *Troubleshooting* chapter in the [ExtremeXOS 31.3 User Guide](#).

Example

The following example collects debugging information using a debug bundle named "l3" to run 5 times:

```
# show tech-support bundle l3 monitor 5
```

History

This command was first available in ExtremeXOS 10.1.

The command name and command syntax was modified in ExtremeXOS Release 15.4 from `show tech` to `show tech-support`.

Fabric attach mapping information was added in ExtremeXOS 22.4.

Debug bundle information was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show tech-support collector

```
show tech-support collector { hostname | ip_address}
```

Description

This command displays tech-support configuration and report status.

Syntax Description

| | |
|-------------------|--|
| <i>hostname</i> | Specifies the host name of the collector. |
| <i>ip_address</i> | Specifies the IPv4 address of the collector. |

Default

NA.

Usage Guidelines

This commands displays tech-support configuration and report status, such as last report stats, when the next cyclic report is sent if report frequency daily is configured, and when the next one time report is sent if one time report is scheduled with `run tech-support in hours` command. If you do not specify a hostname or IP address, this command displays configuration and report status for all existing collectors; otherwise it displays configuration and report status for the specified collector.

Example

The following is an example of the show output:

```
Tech Support Collector:    Enabled

Report Collector:        10.5.2.107
  TCP Port:              9998
  Virtual Router:        VR-Mgmt
  Source IP Addr:        10.66.24.234
  SSL:                   Off
  Report Mode:           Automatic
  Report Data Set:       Summary
  Report Frequency:      Error-detected AND Daily at 0:00

```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show temperature

```
show temperature
```

Description

This command displays the current temperature of the power supply controllers and the switch.

On a stack, the command displays the current temperature of the switches in each slot.

Syntax Description

This command has no arguments or variables

Default

N/A.

Usage Guidelines

Depending on the software version running on your switch or your switch model, additional or different temperature information might be displayed.

Use this command to display the temperature in Celsius and the current status of the standalone switch or all switches in a stack.

Bridge Port Extenders (BPEs)

Temperature information for bridge port extenders (BPEs) does not appear in this command. Use the `show vpep bpe {slot slot_num} {environment}` command instead.

Example

The following is sample output from a SummitStack of 8 nodes:

```
Slot-3 Stack.1 # show temperature
Field Replaceable Units          Temp (C)   Status   Min  Normal  Max
-----
Slot-1          :
Slot-2          : SummitX          34.50    Normal  -10   0-54   59
Slot-3          : SummitX          36.50    Normal  -10   0-66   67
Slot-4          :
Slot-5          :
Slot-6          :
Slot-7          :
Slot-8          :
Slot-3 Stack.2 #
```

History

This command was first available in an ExtremeXOS 10.1.

Information about the power controller(s), a component status column, and the minimum, normal, and maximum temperature ranges of the components was added to the output in ExtremeXOS 11.0.

Support for stacking was added to output in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show tunnel

```
show [{tunnel} {tunnel_name} | tunnel {vr [vrname | all]}] {payload-vr
  payload_vrname} {detail}
```

Description

Displays system tunnel information for a specified tunnel or for all tunnels.

Syntax Description

| | |
|-----------------------|---|
| <i>tunnel_name</i> | Specifies a tunnel name. |
| vr | Specifies showing tunnel information by VR. |
| <i>vrname</i> | Specifies showing tunnel information for a specific VR by name. The default is the context VR. |
| all | Specifies showing tunnels for all VRs. |
| payload-vr | Specifies showing tunnel information for payload VRs. |
| <i>payload_vrname</i> | Specifies showing tunnel information for a specific payload VR by name. If not specified, all tunnel payload VRs are shown. |
| detail | Shows detailed information for a tunnel. |

Default

If not specified, the VR of current command context is used.

If not specified, all tunnel payload VRs are shown.

Usage Guidelines

The **tunnel** keyword is optional only when you specify a valid IPv6-in-IPv4 or IPv6-to-IPv4 tunnel name. The Total tunnels count in the display represents all tunnels on the switch.

Example

The following example displays system tunnel information for all tunnels:

```
# show tunnel
Name                               Type                               Flags
tunfour                            6in4 10.20.30.40 => 10.10.10.10   U
mytun                              GRE 1.1.1.2 => 1.1.1.1
Utunfive2                          6to4 10.20.30.40 => *.*.*.*      D
Total tunnels: 3
Flags: (U) Up / (D) Down / (a) Administratively Disabled
       (S) System Disabled (incompatible hardware)
```

The following example displays system tunnel information for tunnel "tunfour":

```
# show "tunfour"
Name                Type                Flags
tunfour             6in4 10.20.30.40 => 10.10.10.10  U
Total tunnels: 2
Flags: (U) Up / (D) Down
```

The following example shows detailed information about tunnel "mytun1":

```
# show tunnel mytun1 detail
Tunnel Name : mytun
Tunnel Type : GRE
Flags : Administratively Disabled
Source Address : 1.1.1.1
Destination Address : 1.1.1.2
IPv4 Forwarding : Enabled
Virtual Router (VR) : vr-transport
Payload VR : vr-tenant
Interface Address : 2.0.0.1/24
```

History

This command was first available in ExtremeXOS 11.2.

Options to specify VR/payload VR and detailed tunnel information were added in ExtremeXOS 31.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show twamp endpoint

```
show twamp endpoint {ipaddress ip {port udp_port}}
```

Description

This command displays the endpoint configured values, run-time data, and test session information.

Syntax Description

| | |
|------------------|--|
| ipaddress | The endpoint IP address, either IPv4 or IPv6. |
| <i>ip</i> | Specifies the endpoint IP address. |
| port | Specifies the endpoint port. |
| <i>udp-port</i> | The UDP port the endpoint will listen on; range is 1025 – 65535. |

Default

N/A.

Usage Guidelines

None.

Example

```
# show twamp endpoint ipaddress 19.1.1.100 port 5000

TWAMP Endpoint

Endpoint Information
  Local Address:          19.1.1.100  Listening Port:          5000
  Received Packets:      7948        Transmitted Packets:    7948
  Active Sessions:       5

Session created on Thu Nov 13 15:41:49 2014
  Peer Address:          19.1.1.2    Port:                   11001
  Sequence Number:      1575        Last recv'd packet:    84ms

Session created on Thu Nov 13 15:41:49 2014
  Peer Address:          19.1.1.2    Port:                   11002
  Sequence Number:      1555        Last recv'd packet:    16ms

Session created on Thu Nov 13 15:41:49 2014
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show twamp reflector

```
show twamp reflector
```

Description

This command displays the configured values and run-time information of the Session-Reflector and its endpoints.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

```
# show twamp reflector
TWAMP Session-Reflector Enabled

Session Information
  Used: 165 of 200
  Timeout: 300 seconds
```

| Endpoints | Port | Sessions | Rx Packets | Tx Packets |
|------------|------|----------|------------|------------|
| 19.1.1.100 | 5000 | 5 | 3091 | 3091 |
| 19.1.1.100 | 5001 | 40 | 5521 | 5521 |
| 19.1.1.100 | 5002 | 40 | 4728 | 4728 |
| 19.1.1.100 | 5003 | 40 | 3916 | 3916 |
| 18.1.1.100 | 5000 | 40 | 9266 | 9266 |

```
Displayed 5 endpoints
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

Object Missing

This object is not available in the repository.

show upm event

```
show upm event event-type
```

Description

Displays UPM events of the specified type.

Syntax Description

| | |
|-------------------|---|
| <i>event-type</i> | Displays events of the specified type for all profiles. Valid values for event-type are: device-detect, device-remove, user-authenticate, user-unauthenticated. |
|-------------------|---|

Default

N/A.

Usage Guidelines

Use this command to display the following types of events:

- device-detect
- device-remove
- user-authenticate
- user-unauthenticated

Example

The following command displays device-detect events:

```
show upm event device-detect
```

The output of the command is similar to the following:

```
-----
UPM Profile           PortList
-----
profile1              3
-----
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show upm history

```
show upm history {profile profile-name | event upm-event | status [pass
| fail] | timer timer-name | detail}
```

Description

Displays (in a tabular column) a list of UPM profile events executed on the switch.

Syntax Description

| | |
|---|---|
| <i>profile-name</i> | Displays UPM events for the specified profile. |
| <i>upm-event</i> | Displays UPM events that were triggered by the specified event. |
| status [pass fail] | Displays UPM events that meet the specified status, which is either pass or fail. |

| | |
|-------------------|---|
| <i>timer-name</i> | Displays UPM events that were triggered by the specified timer. |
| detail | Displays additional detail on UPM events. |

Default

N/A.

Usage Guidelines

This is useful for trouble shooting and testing.

Example

The following example shows what appears when no UPM events have been triggered:

```
# show upm history
-----
Exec   Event/           Profile           Port Status Time Launched
Id     Timer/ Log filter
-----
-----
Number of UPM Events in Queue for execution: 0
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show upm history exec-id

```
show upm history exec-id number
```

Description

Displays information about an instance of a UPM profile executed on the switch.

Syntax Description

| | |
|---------------|--|
| <i>number</i> | Specifies the execution identifier for the event you want to view. |
|---------------|--|

Default

N/A.

Usage Guidelines

To view the execution identifiers for which you can display information, enter the show upm history command.

Example

The following example shows information for the event identified as 8006:

```
# show upm history exec 8006
UPM Profile: p1
Event: User Request      , Time run: 2006-10-18 11:56:15
Execution Identifier: 8006      Execution Status: Pass
Execution Information:
1 # enable cli scripting
2 # set var EVENT.NAME USER-REQUEST
3 # set var EVENT.TIME 1161172575
4 # set var EVENT.PROFILE p1
5 # enable por 1:1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show upm profile

```
show upm profile name
```

Description

Displays a list of the UPM profiles on the system and some of their configuration information, or the contents of a specified profile.

Syntax Description

| | |
|-------------|---|
| <i>name</i> | Displays the contents of the specified profile. |
|-------------|---|

Default

N/A.

Usage Guidelines

To see a list of all UPM profiles on a switch, use the command without the name option. The resulting display shows the names of the profiles on the system and their status, active or disabled.

Use the name option to see the contents of a specific profile.

Example

The output of the command is similar to the following:

```
* BD-8808.36 # show upm profile
=====
UPM Profile Events Ports Flags
=====
p1 UPM Timer(t1) e
p1 device detect 1:1 e
p2 e
=====
Number of UPM Profiles: 2
Number of UPM Events in Queue for execution: 0
Flags: d - disabled, e - enabled
Event name: log-message(Log filter name) - Truncated to 20 chars
* BD-8808.37 # show upm profile "p1"
Created at : 2010-04-11 04:07:41
Last edited at : 2010-04-11 04:07:41
*****Profile Contents Begin*****
ena por 1:1
*****Profile Contents Ends*****
Profile State: Enabled
Profile Maximum Execution Time: 30
Events and ports configured on the profile:
=====
Event                               Port list/Log filter
=====
device-detect                        1:1
device-undetect                      :
user-authenticated                   :
user-unauthenticated                 :
=====
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show upm timers

```
show upm timers
```

Description

Displays a list of the UPM timers on the system and some of their configuration information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to see a list of all UPM timers on a switch. The resulting display shows timer configurations, the associated profile, and flags to indicate the timer status. Flags are defined below:

- a - active
- d - disabled
- p - periodic

Example

This command displays UPM timer configuration:

```
show upm timers
```

The output of this command is similar to the following:

```
* BD-8808.43 # show upm timers
Current Time: 2006-10-16 14:03:55
-----
UPM Profile Flags Next Execution
Timer Name time
-----
t1 p1 ep 2006-10-16 14:04:00 (Every 10 secs)
timerA
-----
Flags: e - Profile is enabled, d: Profile is disabled
o -Timer is non-periodic, p - Timer is periodic
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show var

```
show var {varname}
```

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: [enable cli scripting {permanent}](#).

Description

Displays the current session variables or the named variable.

Syntax Description

| | |
|----------------|--|
| <i>varname</i> | Displays the variable specified, if present. |
|----------------|--|

Default

N/A.

Usage Guidelines

Use this command to see the list of current session variables. The display includes the variable name and value.

Example

The output of this command is similar to the following:

```
Switch.7 # show var
-----
Count : 4
-----

-----
variableName          variableValue
-----
CLI.SESSION_TYPE      serial
CLI.USER              admin
STATUS                0
x                     66
-----
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show version

```
show version {detail | process name | images {partition partition}
```

Description

Displays the hardware serial and version numbers, the software version currently running on the switch, and (if applicable) the software version running on the power controllers.

Syntax Description

| | |
|------------------|---|
| detail | Specifies display of platform name. |
| process | Specifies display of all of the processes on the switch. |
| <i>name</i> | Specifies display of a specific process on the switch. |
| images | Specifies the display of installed images. |
| <i>partition</i> | Specifies display of a specific partition (primary or secondary). |

Default

N/A.

Usage Guidelines

The following describes the information displayed when you execute the show version or show version detail commands:

- Part Number—A collection of numbers and letters that make up the part number of the switch.
- Serial Number—A collection of numbers and letters that make up the serial number of the switch.

Note

For information about the physical location of the serial number on your switch, refer to the section that describes your specific switch model in the hardware documentation.

- Image—The ExtremeXOS software version currently running on the switch. If you have two software images downloaded on the switch, only the currently running ExtremeXOS version information is displayed. The information displayed includes the major version number, minor version number, a specific patch release, and the build number. The software build date is also displayed.
- BootROM—The BootROM version currently running on the switch. For ExtremeSwitching 5520 series switches only, the BootROM version on both partitions appears.
- FPGA—The field-programmable gate array firmware version currently running on the switch (ExtremeSwitching X440-G2, X465, and X620 only).

- PLD—The programmable logic device firmware version currently running on the switch (ExtremeSwitching X440-G2, X465, and X620 only).
- Certified Version—Shows the OpenSSL FIPS and Linux versions built with the ExtremeXOS image.

Depending on the model of your switch and the software running on your switch, different version information may appear.

If you use the process option, you see the following information about the processes running on the switch:

- Process Name—The name of the process.
- Version—The version number of the process.
- BuiltBy—The name of the software build manager.
- Link Date—The date the executable was linked.

Example

The following command displays the hardware and software versions currently running on the switch:

```
# show version
Switch          : 800992-01-03 2011G-00108 Rev 03 BootROM: 2.2.1.3   IMG: 31.1.0.631

Image   : ExtremeXOS version 31.1.0.631 by release-manager
         on Tue Sep 1 13:58:24 EDT 2020
BootROM : Default 2.2.1.3 Alternate 2.2.1.3
Diagnostics :
Certified Version : EXOS Linux 4.14.170, Extreme Networks FIPS Object Module 2.0.16a
Build Tools Version : exos-arm64-sdk-3.0.3.1.0
```

The following example shows SSD-120 device information:

```
# show version
Slot-1          : 800908-00-01 1847F-10076 Rev 01 IMG: 30.3.0.453
VIM5-4XE-1     : 800910-00-01 1845F-10106 Rev 01
XN-SSD-001-120-1: 800954-00-02 1917F-10030 Rev 02

Image   : ExtremeXOS version 30.3.0.453 by release-manager
         on Thu Jul 11 11:52:10 EDT 2019
Diagnostics :
Certified Version : EXOS Linux 4.14.123, Extreme Networks FIPS Object Module 2.0.16m
```

History

This command was first available in ExtremeXOS 10.1.

Solid State Storage Device SSD-120 information was added in ExtremeXOS 30.3.

BootROM version for ONIE switches (which do not have a BootROM) appears as "N/A" for compatibility with Chalet in ExtremeXOS 30.4.

BootROM version for both partitions was added in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show virtual-network

```
show virtual-network {vn_name | vxlan vni vni | [vlan vlan_name | vman vman_name] }
```

Description

Shows the virtual networks that have been created.

Syntax Description

| | |
|------------------|---|
| <i>vn_name</i> | Alphanumeric string identifying the virtual network. |
| vxlan | Displays VXLAN virtual networks. |
| vni | A unique 24-bit Virtual Network Identifier that is used in the VXLAN header to encapsulate tenant frames. |
| <i>vni</i> | Virtual Network Identifier value between 1 and 16,777,215. |
| vlan | Specifies <u>VLAN</u> . |
| <i>vlan_name</i> | Name of the tenant VLAN. |
| vman | Specifies VMAN. |
| <i>vman_name</i> | Name of the tenant VMAN. |

Default

N/A.

Usage Guidelines

When no option is specified a summary output of all virtual networks appears. You can also query the switch using the virtual network name, VXLAN VNI or the tenant VLAN/VMAN name. With each of these options, detailed information about the virtual networks appears.

Example

The following example shows all virtual networks:

```
# show virtual-network
Virtual Network      Encap      ID      Flags      Tenant VLAN
                    Encap      ID      Encap      Role (Replicator)
                    Flags
-----
vn_blue              VXLAN      101020  T-         tenant-blue
                    LRX
vniname1             VXLAN      101021  T-         tenant-1
                    LRX
vniname2             VXLAN      101021  T-         tenant-2
                    LRX
```

```

          VXLAN    101022  LRX                               Leaf (192.168.111.211)
vniwithveryveryveryveryverylongname  T-          tenant-3
          VXLAN    101023  LRX                               Leaf
=====

              (X) Exclude Tag
-----

Total number of Virtual Networks   : 3
Local Endpoints                    : 1.1.1.121 (VR-Default)
Network Ports [VXLAN]              : 1-128
Dynamic Virtual Networks           : Off
Multicast Group Range              : 232.1.1.0/255.255.255.0
[OR]
Multicast Group Range              : None

```

When multicast group is not configured, [OR] configured on a virtual network, [OR] automatically assigned:

```

# show virtual-network VNET1
Name                : VNET1
Created By          : CLI,
Tenant VLAN         : v100
Local Endpoint      : 4.4.4.4
Flooding            : Multicast
Group IP            : None
[OR]
Group IP            : 232.1.1.1
[OR]
Group IP            : 232.1.1.1(Auto-assigned)
                    == VXLAN Information ==
VNI                 : 1 (0.0.1)
Group IP            :
Inner Tag           : Exclude
Remote Endpoints    : 1.1.1.1 (VR-Default)
                    : 2.2.2.2 (VR-Default)
                    : 3.3.3.3 (VR-Default)
                    : 232.1.1.1 (VR-Default)
                    == End VXLAN Information ==

```

History

This command was first available in ExtremeXOS 21.1.

VMAN option added in ExtremeXOS 22.1.

Dynamic virtual networks and dynamic VLAN information was added in ExtremeXOS 30.3.

Flag for dynamically created VRs (D) was added in ExtremeXOS 30.4.

Assisted replication information added in ExtremeXOS 31.1.

Multicast Group Range added in ExtremeXOS 31.2.

Platform Availability

This command is supported on the ExtremeSwitching X670-G2, X465, X590, X690, X695, X870, 5420, 5520 series switches, and stacks with X465, X590, X670-G2, X690, X695, X870, 5420, 5520 slots only.

show virtual-network remote-endpoint vxlan

```
show virtual-network {vn_name} remote-endpoint vxlan {vni vni}
    {ipaddress ipaddress {vr vr_name}}
```

Description

Use this command to show the remote-endpoints that have been created.

Syntax Description

| | |
|------------------|---|
| <i>vn_name</i> | Display remote endpoints only for the specified Virtual Network string. |
| vni | A unique 24-bit Virtual Network Identifier that is used in the VXLAN header to encapsulate tenant frames. |
| <i>vni</i> | Virtual Network Identifier value between 1 and 16777215. |
| ipaddress | IP address of the remote endpoint. |
| <i>ipaddress</i> | A remote endpoint IP address |

Default

N/A.

Usage Guidelines

When no VXLAN name or VNI is specified a summary output of all remote endpoints appears. You need to supply the virtual network name or VXLAN VNI to query the remote endpoints associated to a specific virtual network. To display detailed information about a specific remote-endpoint, use the **ipaddress** option.

Example

```
# show virtual-network remote-endpoint vxlan
IP Address Virtual Router Next Hops Virtual Active/Total Networks
=====
200.1.1.1 VR-Default 2/2 2
200.1.1.2 VR-Default 2/2 1
200.1.1.3 VR-Default 2/2 1
200.1.1.4 VR-Default 2/2 1
200.200.200.200 VR-Default 0/0 0
=====
Total number of Remote Endpoints : 5

# show virtual-network vxlan
remote-endpoint ipaddress 3.3.3.3
```

```

IP Address      : 3.3.3.3                VRF : VR-Default

                == End Virtual Network Associations ==

```

History

This command was first available in ExtremeXOS 21.1.

Information about the remote endpoint's administrative state was added in ExtremeXOS 22.4.

Platform Availability

This command is supported on the ExtremeSwitching X670-G2, X465, X590, X690, X695, X870, 5420, 5520 series switches, and stacks with X465, X590, X670-G2, X690, X695, X870, 5420, 5520 slots only.

show virtual-network statistics

```

show virtual-network { vn_name | remote-endpoint vxlan { ipaddress
    ipaddress } { vr vr_name } } statistics { no-refresh }

```

Description

Use this command to display statistics (byte/packet counters) on a Virtual Network remote endpoint.

Syntax Description

| | |
|-------------------|---|
| <i>vn_name</i> | Display statistics only for the specified Virtual Network string. |
| ipaddress | IP address of the remote endpoint. |
| <i>ipaddress</i> | A remote endpoint IP address. |
| no-refresh | Page by page display without auto-refresh. |

Default

VR-Default.

Usage Guidelines

N.A.

Example

To show statistics on an existing Virtual Network remote endpoint:

```
# show virtual-network remote-endpoint vxlan ipaddress
10.10.10.146 statistics
VXLAN Statistics Tue Oct 13 13:40:32 2015
Virtual-Network Rx Total Rx Byte Tx Total Tx Byte
Remote-endpoint Frames Count Frames Count
=====
10.10.10.146 0 0 53496 0
=====
0->Clear Counters U->page up D->page down ESC->exit
```

To show statistics on all existing Virtual Network remote endpoints:

```
# show virtual-network remote-endpoint vxlan statistics
VXLAN Statistics Tue Oct 13 13:42:51 2015
Virtual-Network Rx Total Rx Byte Tx Total Tx Byte
Remote-endpoint Frames Count Frames Count
=====
10.10.10.146 0 0 53496 0
10.10.10.148 7870 928660 0 0
100.99.1.202 0 0 6917 816206
=====
0->Clear Counters U->page up D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching X670-G2, X465, X590, X690, X695, X870, 5420, 5520 series switches, and stacks with X465, X590, X670-G2, X690, X695, X870, 5420, 5520 slots only.

show virtual-router

```
show virtual-router {name}
```

Description

Displays information about VRs and VRFs.

Syntax Description

| | |
|-------------|------------------------------------|
| <i>name</i> | Specifies the name of a VR or VRF. |
|-------------|------------------------------------|

Default

N/A.

Usage Guidelines

The output display differs for the following options:

- `show virtual-router`—displays information about all VRs and VRFs.
- `show virtual-router vr_name`—displays information about a user VR or [VR-Default](#).
- `show virtual-router vrf_name`—displays information about the named VRF.

Example

The following example displays the VR and VRF configurations on the switch:

```
# show virtual-router
-----
Virtual          Number of   Number of   Flags
Router           VLANs      Ports
-----
VR-Control       0           0           -----S46
VR-Default       32          18          boprimORS46
xvr              1           0           b-----F46

```

History

A command similar to this command was available in ExtremeXOS 10.1 (`show vr`).

This command was first available in ExtremeXOS 11.0.

Support for non-VPNVRFs was added in ExtremeXOS 12.5.

The show output for **max-gateways** was added in ExtremeXOS 15.3.

The "L" flag was added to signify local-only VRs in ExtremeXOS 22.6.

The "D" flag was added to show if a VR is created dynamically in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan

```
show vlan {virtual-router vr-name}
```

```
show [ { vlan } vlan_name | vlan vlan_list ] {ipv4 | ipv6}
show vlan [tag tag | detail] {ipv4 | ipv6}
show vlan ports
```

Description

Displays information about one or all VLANs.

Syntax Description

| | |
|------------------|---|
| <i>vr-name</i> | Specifies a VR name for which to display summary information for all VLANs. If no VR name is specified, the software displays summary information for all VLANs in the current VR context. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. On switches that do not support user-created VRs, all VLANs are created in <i>VR-Default</i> and cannot be moved. |
| <i>vlan_name</i> | Specifies a <u>VLAN</u> name for which to display detailed VLAN information. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs to display detailed VLAN information. |
| <i>tag</i> | Specifies the 802.1Q tag of a VLAN for which to display detailed VLAN information. |
| detail | Specifies that detailed information should be displayed for all VLANs. |
| ipv4 | Specifies IPv4. |
| ipv6 | Specifies IPv6. |
| ports | Displays VLAN ports information. |

Default

Summary information for all VLANs on the device.

Usage Guidelines

Note

To display IPv6 information, you must issue either the `show vlan detail` command or `show vlan` command with the name of the specified VLAN.

Unlike many other VLAN-related commands, the keyword **vlan** is required in all forms of this command except when requesting information for a specific VLAN.

Use the command `show vlan` to display summary information for all VLANs. It shows various configuration options as a series of flags (see the example below). VLAN names, descriptions, and protocol names may be abbreviated in this display.

Use the command `show vlan detail` to display detailed information for all VLANs. This displays the same information as for an individual VLAN, but shows every VLAN, one-by-one. After each VLAN display you can elect to continue or quit.

Protocol **none** indicates that this VLAN was configured with a user-defined protocol that has subsequently been deleted.

Note

The switches display the Mgmt VLAN in *VR-Mgmt*.

When an IPv6 address is configured for the VLAN, the system may display one of the following two address types in parentheses after the IPv6 address:

- Tentative
- Duplicate

Note

For information about IPv6 address types, see the [ExtremeXOS 31.3 User Guide](#).

You can display additional useful information on VLANs configured with IPv6 addresses by issuing the `show ipconfig ipv6 vlan vlan_name` command.

When a displayed VLAN is part of a PVLAN, the display includes the PVLAN name and type (which is network, non-isolated subscriber, or isolated subscriber).

When the displayed VLAN is configured for VLAN translation, the display provides translation VLAN information. If the displayed VLAN is a translation VLAN, a list of translation VLAN members appears. If the displayed VLAN is a member VLAN, the display indicates the translation VLAN to which the member VLAN belongs.

Ports that are dynamically added by MVRP are indicated by the symbol "H".

Example

The following example shows information about VLAN "vlan1":

```
# show vlan vlan1
VLAN Interface with name host created by user
  Admin State:           Enabled      Tagging:Untagged (Internal tag 4094)
  Description:           None
  Virtual router:        VR-Default
  IP Anycast:             Enabled
  IPv4 Forwarding:       Enabled
  IPv4 MC Forwarding:    Disabled
  Primary IP:            60.1.1.1/24
  Secondary IPs:         70.1.1.1/24
  Anycast IP:            80.1.1.1/24
  IPv6 Forwarding:       Disabled
  IPv6 MC Forwarding:    Disabled
  IPv6:                  None
  STPD:                  None
  Protocol:              Match all unfiltered protocols
  Loopback:              Disabled
  NetLogin:              Disabled
  QosProfile:            None configured
  Egress Rate Limit Designated Port: None configured
```

```
Flood Rate Limit QosProfile:      None configured
Suppress ARP:      Disabled
Suppress ND:      Disabled
Proxy ARP:      Entry required
Ports: 0.          (Number of active ports=0)
```

The following sample output shows general VLAN status:

```
# show vlan
Untagged ports auto-move: Off
-----
---

(N) Network Login VLAN, (o) OSPF Enabled, (O) Virtual Network Overlay,
(p) PIM Enabled, (P) EAPS protected VLAN, (r) RIP Enabled,
(R) Sub-VLAN IP Range Configured, (s) Sub-VLAN, (S) Super-VLAN,
(t) Translation VLAN or Network VLAN, (T) Member of STP Domain,
(v) VRRP Enabled, (V) VPLS Enabled, (W) VPWS Enabled,
(Y) Policy Enabled

```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 information was added in ExtremeXOS 11.2.

The netlogin information was added in ExtremeXOS 11.3.

The VR and administratively enabled/disabled information was added in ExtremeXOS 11.4.

The **tag** option was added in ExtremeXOS 12.4.4.

The OpenFlow status feature was added in ExtremeXOS 15.3.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Showing the "untagged ports auto-move" status was added in ExtremeXOS 22.1.

Proxy ARP for reachable routes information added in ExtremeXOS 22.4.

Flag added for dynamically added by Fabric Attach information in ExtremeXOS 22.5.

Flag added for dynamically added by NetLogin information in ExtremeXOS 22.5.

Flag added for policy enabled in ExtremeXOS 22.5.

IP anycast status was added in ExtremeXOS 30.6.

IP anycast IP address information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan description

```
show vlan description
```

Description

Displays a list of VLANs and VLAN descriptions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays the descriptions for all VLANs:

```
# show vlan description
-----
Name           VID  Description
-----
ctrl1          11   Control Vlan
ctrl2          102  Control Vlan 2
Default        1
v1             60   vlan 1
vplsVlan       3296 L2 VPN to home office
-----
Total number of VLAN(s) : 5
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan dhcp-config

```
show {vlan} vlan_name dhcp-config
```

Description

Displays the *DHCP* server's configuration for the specified *VLAN*.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies the VLAN of the DHCP server of interest. |
|------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following sample output displays the configuration of the DHCP server for the VLAN test:

```
#show vlan test dhcp-config
  DHCP Address Range           : 10.10.10.100->10.10.10.200
  Netlogin Lease Timer         : Not configured (Default =
10 seconds)
  DHCP Lease Timer             : Not configured (Default =
7200 seconds)
  Primary DNS Server           : 1.1.1.1
  Secondary DNS Server         : 2.2.2.2
  Ports DHCP Enabled           : 23
```

History

This command was first available in ExtremeXOS 11.0.

The output is modified to show primary and secondary DNS servers in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan dhcp-address-allocation

```
show {vlan} vlan_name dhcp-address-allocation
```

Description

Displays the *DHCP* server's address allocation on a specified *VLAN*.

Syntax Description

| | |
|------------------------|--|
| <code>vlan_name</code> | Specifies the VLAN of the DHCP server of interest. |
|------------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the configuration of the DHCP for the VLAN corp:

```
show vlan corp dhcp-address-allocation
```

The following is sample output from this command:

```
=====
IP                MAC                State      Lease Renewal Time
=====
10.0.0.2         00:02:03:04:05:00  Offered   0000:00:10
10.0.0.3         00:08:03:04:05:00  Assigned  0000:59:09
10.0.0.4         ee:1c:00:04:05:00  Assigned  0000:59:09
=====
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan dynamic-vlan

```
show vlan dynamic-vlan
```

Description

Displays the configuration related to dynamically created VLANs.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays configuration related to dynamically created VLANs.

```
# sh vlan dynamic-vlan
Uplink Ports      : 12-15, 18-20
#
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan eaps

```
show {vlan} vlan_name eaps
```

Description

Displays the EAPS configuration (control, partner, or not added to an EAPS domain) of a specific VLAN.

Syntax Description

| | |
|------------------|------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
|------------------|------------------------|

Default

N/A.

Usage Guidelines

Use this command to see if the specified VLAN is associated with an EAPS domain.

The output of this command displays whether the VLAN is a control or partner VLAN for an EAPS domain. This command also displays if the VLAN is not a member of any EAPS domain.

If a VLAN is a partner VLAN for more than one EAPS domain, all of the EAPS domains that the VLAN is a partner of appears in the output.

Example

The following sample output displays the EAPS configuration for the control VLAN orange in EAPS domain eaps1:

```
#show vlan orange eaps

Vlan is Control in following EAPS domain:
eaps1
```

The following sample output displays the EAPS configuration for the protected VLAN purple in EAPS domain eaps1:

```
#show vlan purple eaps

Vlan is Protected in following EAPS domain(s):eaps1
```

The following sample output displays information about the VLAN default not participating in EAPS:

```
#show vlan default eaps

Vlan has not been added to any EAPS domain
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan fabric attach assignments

```
show [{vlan} vlan_name | vlan {vlan_id}] fabric attach assignments
```

Description

Displays VLAN to Network Service Identifier (NSI) information.

| | |
|------------------|---|
| vlan | Specifies VLAN. |
| <i>vlan_name</i> | Specifies the name of the VLAN to show NSI information about. |
| <i>vlan_id</i> | Specifies the ID of the VLAN to show NSI information about. |

Default

Not specifying a VLAN shows all VLAN to NSI assignment information.

Usage Guidelines

When an assignment is first received by the proxy, it is marked as "Pending". Mappings that are sent to the FA server are updated with the status returned by the server; either "Active" or "Rejected".

Example

The following example shows all VLAN to NSI assignment information:

```
# show vlan fabric attach assignments
Fabric Attach Mode: Server
VLAN  VLAN Name                                     Type      ISID/NSI  Status
-----
4012  NSI_4012Salem                                     Dynamic   4012      Active
   10  NSI-31247Salem                                    Static    31247     Pending
1234  NSI-1234-SanJose                                  Dynamic   1234      Rejected
1012  NSI-101010_RDU                                    Static    101010    Active
```

History

This command was first available in ExtremeXOS 22.4.

The option **mapping** was changed to **assignments** in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan l2pt

```
show [vlan | vman] vlan_name {ports port_list} l2pt {detail}
```

Description

Displays the L2PT configuration and status of a service.

Syntax Description

| | |
|-------------------------------|--|
| vlan | Displays <u>VLAN</u> configuration. |
| vman | Displays VMAN configuration. |
| <i>vlan_name</i> | Specifies a VLAN name. |
| ports <i>port_list</i> | Displays the ports and port list separated by a comma (,) or dash (-). |
| detail | Displays the L2PT configuration and status in detail. |

Default

Disabled.

Usage Guidelines

Use this command to display the L2PT configuration and status of a service.

Example

The following is an example of the `show vman ports l2pt` command:

```
# show vman cust2 ports 1:2,1:7 l2pt

Interface      L2PT Profile Name
-----
1:2            my_l2pt_prof
1:7            (none)
```

The following example illustrates the `show vman l2pt ports detail` command:

```
show l2vpn vpls cust1 l2pt

Interface      L2PT Profile Name
-----
123.112.111.111 my_other_l2pt_prof

# show vman cust2 ports 1:2,1:7 l2pt

Interface      L2PT Profile Name
-----
1:2            my_l2pt_prof
1:7            (none)

# show vman cust2 ports 1:2,1:7 l2pt detail

Port 1:2
  L2PT Profile Name      : my_l2pt_profile

  Field Mask             :
  Action                 : Tunnel
  CoS                    : 7
  DSCP                   : 50
  DSCP Replace           : Yes
  Packets Transmitted    : 500
  Packets Received       : 500
```

```
Port 1:7
L2PT Profile Name      : (none)
```

History

This command was first available in ExtremeXOS 15.5.

Support for DSCP was introduced in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan security

```
show [ {vlan} vlan_name | vlan vlan_list] security
```

Description

Displays the MAC limit-learning and lock-learning information for the specified VLAN.

Syntax Description

| | |
|------------------|-------------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs. |

Default

N/A.

Usage Guidelines

The switch displays the following information:

- Port—Indicates the port on which the MAC address has been learned.
- Limit—Indicates that there is either a limited or unlimited amount of learned entries.
- State—Indicates that the current FDB entries for the port are permanent, no additional entries are learned, or that the port allows unlimited, dynamic learning.
- Learned—Specifies the number of learned entries.
- Blackholed—Specifies the number of blackholed entries.
- Locked—Specifies the number of locked entries.

Example

The following sample output displays the security setting of the *DHCP* server for the VLAN blue:

```
#show vlan blue security
Port      Limit      State      Learned      Blackholed  Locked
24        Unlimited Unlocked   0             0           0
```

History

This command was first available in ExtremeXOS 11.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan statistics

```
show [{vlan} vlan_name |vlan vlan_list]statistics {no-refresh |refresh}
```

Description

Displays *VLAN* statistics at the VLAN level.

Syntax Description

| | |
|------------------------|--|
| <code>vlan_name</code> | Specifies to display VLAN statistics from the VLAN with this name. |
| <code>vlan_list</code> | Specifies a VLAN list of IDs. |
| no-refresh | Specifies that there is no continuous refresh. The prompt comes back to the user after fetching statistics once. |

Default

N/A.

Usage Guidelines

This command displays statistics based on the sum of the statistics for individual ports. Use it to display the VLAN statistics monitored using the `configure ports [port_list|all] monitor vlan vlan_name | vlan_list {rx-only | tx-only}` command.

Example

The following command displays VLAN statistics:

```
# show vlan statistics
Vlan              Rx Total              Rx Byte              Tx
```

| Total | Tx Byte | Count | Count |
|---------|----------|-------|--------|
| Frames | Frames | Count | |
| Default | 30251013 | | |
| 7326296 | | 22034 | 901840 |

If the VLAN contains ports that do not support a certain type of VLAN statistic, such as transmit statistics or byte counters, then a dash character (-) will be displayed in that column.

History

This command was first available in ExtremeXOS 12.0.

Support for ExtremeSwitching series switches was added in ExtremeXOS 12.5.

The **no-refresh** keyword was removed in ExtremeXOS 16.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vlan stpd

```
show [ {vlan} vlan_name | vlan vlan_list] stpd {blocked-ports}
```

Description

Displays the *STP* configuration of the ports assigned to a specific *VLAN*.

Syntax Description

| | |
|------------------|-------------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs. |

Default

N/A.

Usage Guidelines

If you have a VLAN that spans multiple *STPDs*, use this command to display the STP configuration of the ports assigned to that specific VLAN.

This command displays the following:

- STPD port configuration.
- STPD port mode of operation.
- STPD path cost.
- STPD priority.
- STPD state (root bridge, etc.).
- Port role (root designated, alternate etc.).
- STPD port state (forwarding, blocking, etc.).
- Configured port link type.
- Operational port link type.

If your VLAN has the same name as another component, for example an STPD, Extreme Networks recommends that you specify the identifying keyword as well as the name. If you do not specify the vlan keyword, the switch displays an error message similar to the following:

```
%% Ambiguous command: "show Test stpd"
```

In this example, to view the STPD state of VLAN Test, enter `show vlan Test stpd`.

If you enter a VLAN name that is not associated with an STPD or does not exist, the switch displays an error message similar to the following:

```
Failed to find vlan 'vlan1' or it has no STP domains configured on it
```

If this happens, check to make sure you typed the correct name of the VLAN and that the VLAN is associated with an STPD.

If your VLAN has a name unique only to that VLAN, the keyword `vlan` is optional.

Example

The following sample output displays the spanning tree configurations for the VLAN Default:

```
#show vlan default stpd
s0(enabled) Tag: (none) Ports: 8 Root/P/C: 80:00:00:01:30:94:79:00/-----/0
Port  Mode  State  Cost  Flags  Priority  Port ID  Designated Bridge

8:          B = Boundary, I = Internal
```

History

This command was first available in ExtremeXOS 10.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vm

```
show vm {vm_name | detail}
```

Description

Shows the operational status of Integrated Application Hosting (IAH) guest virtual machines (VMs).

Syntax Description

| | |
|----------------|--|
| vm | Designates a virtual machine. |
| <i>vm_name</i> | Specifies the VM name to add show information about. |
| detail | Specifies showing detailed information. |

Default

N/A.

Usage Guidelines

The IAH feature requires the Solid State Storage Device SSD-120.

Example

The following example shows information for VM "TPVM":

```
# show vm TPVM
VM Name: TPVM
  State:      Running
  Memory size: 4096 MB
  CPUs:      2
  Auto-start: Enabled
  VNC:       127.0.0.1:2 (Port 5902)
    Disk: vda
      Source: /mnt/vmstorage/TPVM/TPVM.img
      Disk bus type:      virtio
      Allocated size in bytes: 34359738368 (32.00 GB)
      Physical size in bytes: 4199288832 (3.91 GB)
      Read requests:     15947
      Bytes read:        349533184
      Write requests:    330
```

```

        Bytes written:          4293632
Network interfaces:
    Attached switch ports:    33-34
CPU utilization:
User:          10.00%
  System:      30.00%
Memory utilization:
Used:          0.05 GB
  Available:   3.95 GB

```

The following example shows information for multiple VMs:

```

# show vm
S A Name                               |--Memory (GB)--| |----CPU-----| Ports
                               Total  Used Avail  #   Sys% User%
-----
* E TPVM                            4.00  0.05  3.95  2  10.00 30.00 33,34,Mgmt
  D tpvm2                             4.00   N/A   N/A   2   N/A   N/A   None

Status:          (*) Running
Auto-start:      (D) Disabled, (E) Enabled.

```

History

This command was first available in ExtremeXOS 30.3.

Clarifications were made to memory and CPU usage information in ExtremeXOS 30.5.

Disk bus type information was added in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show vm guest interfaces

```
show vm vm_name guest interfaces
```

Description

Shows the interfaces of a running guest virtual machine (VM).

Syntax Description

| | |
|-------------------|---|
| vm | Designates a virtual machine. |
| <i>vm_name</i> | Specifies the VM name to show interfaces for. |
| guest | Specifies guest OS viewpoint. |
| interfaces | Specifies interfaces and addresses. |

Default

N/A.

Usage Guidelines

The Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

For this command to work, qemu guest agent must be running on the guest VM.

Example

The following example shows the interfaces for VM "vm1":

```
# show vm vm1 guest interfaces
Name          MAC address          Protocol  Address
-----
lo            00:00:00:00:00:00    ipv4      127.0.0.1/8
-             -                    ipv6      ::1/128
ens8          52:54:00:d4:88:59    ipv4      10.68.13.7/24
-             -                    ipv6      fe80::5054:ff:fed4:8859/64
ens6          00:11:88:fe:ab:75    ipv4      192.168.1.5/24
-             -                    ipv6      fe80::211:88ff:fefe:ab75/64
ens7          00:11:88:fe:ab:76    ipv4      192.168.0.5/24
-             -                    ipv6      fe80::211:88ff:fefe:ab76/64
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show vm virtual-interface

```
show vm vm_name virtual-interface {vf_name}
```

Description

Displays virtual interfaces of a VM (virtual machine).

Syntax Description

| | |
|--------------------------|---|
| vm | Designates a virtual machine. |
| <i>vm_name</i> | Specifies the VM name to show information about. |
| virtual-interface | Specifies showing information about a virtual interface. |
| <i>vf_name</i> | Specifies virtual interface name. If you do not specify a name, all virtual interfaces are shown. |

Default

If you do not specify a name, all virtual interfaces are shown.

Usage Guidelines

N/A.

Example

The following example shows virtual interfaces for VM "vm1":

```
# show vm vm1 virtual-interface
Insight  VLAN
VF Name      Port      Id  MAC Address
-----
vf-user11    33        11  52:54:00:d5:7c:2d
vf-user12    33        12  52:54:00:bb:47:a9
VF1-33       33        22  52:54:00:25:96:e2
VF1-34       34        N/A 52:54:00:2b:3c:e8
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the [ExtremeXOS 31.3 Feature License Requirements](#).

show vman

```
show vman {vman_name | vman_list} {ipv4 | ipv6}
```

```
show vman [tag tag | detail] {ipv4 | ipv6}
```

Description

Displays information about one or all VMANs.

Note

The information displayed for this command depends on the platform and configuration you are using.

Syntax Description

| | |
|------------------------|---|
| <code>vman_name</code> | Specifies that information is displayed for the specified VMAN. |
| <code>vman_list</code> | Specifies the vman list. |
| <code>tag</code> | Specifies a VMAN using the 802.1Q tag. |

| | |
|---------------|--|
| detail | Specifies that all information is displayed for each VMAN. |
| ipv4 | Specifies IPv4. |
| ipv6 | Specifies IPv6. |

Default

Summary information for all VMANs on the switch.

Usage Guidelines

None.

Example

The following example displays a list of all the VMANs on the switch:

```
# show vman
-----
Name          VID  Protocol Addr          Flags          Proto  Ports  Virtual
Active router
/Total
-----
le1           4091 -----a      ANY    2 / 2  VR-Default
le2           4090 -----a      ANY    0 / 0  VR-Default
vml           4089 -----      ANY    0 / 0  VR-Default
-----
Flags : (a) Learning Domain (C) EAPS Control vlan, (E) ESRP Enabled,
(f) IP Forwarding Enabled, (i) ISIS Enabled, (I) IP Forwarding lpm-routing Enabled,
(L) Loopback Enabled, (m) IPmc Forwarding Enabled,
(n) IP Multinetting Enabled, (N) Network LogIn vlan,
(o) OSPF Enabled, (p) PIM Enabled,
(P) EAPS protected vlan, (r) RIP Enabled, (T) Member of STP Domain,
(v) VRRP Enabled, (B) 802.1ah Backbone VMAN, (S) 802.1ah Service VMAN
Total number of vman(s) : 3
```

The following example displays information on a single VMAN named vman1:

```
# show vman vman1
VMAN Interface with name vman1 created by user
Admin State:    Enabled          Tagging:        802.1Q Tag 100
Virtual router: VR-Default
IPv4 Forwarding: Disabled
IPv6 Forwarding: Disabled
IPv6:           None
STPD:           None
Protocol:       Match all unfiltered protocols
Loopback:       Disabled
NetLogin:       Disabled
QosProfile:     None configured
Egress Rate Limit Designated Port: None configured
Flood Rate Limit QosProfile:      None configured
Ports:         2.          (Number of active ports=0)
Tag:           *1,          *2
CEP:           *3: CVID 20-29
               *4: CVID 10-19 translate 20-29
               *5: CVID 10-19 translate 20-29,CVID 30
Flags:         (*) Active, (!) Disabled, (g) Load Sharing port
               (b) Port blocked on the vlan, (m) Mac-Based port
```

```
(a) Egress traffic allowed for NetLogin
(u) Egress traffic unallowed for NetLogin
(t) Translate VLAN tag for Private-VLAN
(s) Private-VLAN System Port, (L) Loopback port
(x) VMAN Tag Translated port
(G) Multi-switch LAG Group port
```

The Port CVID output was added in the display of `show vman vlan_name | detail` in ExtremeXOS 15.3.2:

```
VMAN Interface with name vml created by user
Admin State: Enabled           Tagging:           802.1Q Tag 1000
Description: None
Virtual router: VR-Default
IPv4 Forwarding: Disabled
IPv6 Forwarding: Disabled
IPv6:           None
STPD:           None
Protocol:       Match all unfiltered protocols
Loopback:       Disabled
NetLogin:       Disabled
QosProfile:     None configured
Egress Rate Limit Designated Port: None configured
Flood Rate Limit QosProfile:     None configured
Ports:         3.           (Number of active ports=3)
  Untag:        *21: Port CVID 5,
                *24: Port CVID 7,
  Tag:          *22
Flags:         (*) Active, (!) Disabled, (g) Load Sharing port
                (b) Port blocked on the vlan, (m) Mac-Based port
                (a) Egress traffic allowed for NetLogin
                (u) Egress traffic unallowed for NetLogin
                (t) Translate VLAN tag for Private-VLAN
                (s) Private-VLAN System Port, (L) Loopback port
                (x) VMAN Tag Translated port
                (G) Multi-switch LAG Group port
```

The `show vman detail` command shows all the information shown in the `show vman vlan_name` command, but displays information for all configured VMANs.

History

This command was first available in ExtremeXOS 11.0.

Information on IEE 802.1ah was added in ExtremeXOS 11.4.

The **tag** option was added in ExtremeXOS 12.4.4.

Port CVID output was added in ExtremeXOS 15.3.2.

The `vman_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vman eaps

```
show {vman} vman_name eaps
```

Description

Displays the *EAPS* domains to which the VMAN belongs.

Syntax Description

| | |
|------------------|---|
| <i>vman_name</i> | Specifies the name of the VMAN for which EAPS information is to be displayed. |
|------------------|---|

Default

N/A.

Usage Guidelines

None.

Example

The following example displays a list of EAPS domains for the campus1 VMAN:

```
show vman campus1 eaps
```

History

This command was first available in ExtremeXOS 11.0.

Information on IEE 802.1ah was added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vman ethertype

```
show vman ethertype
```

Description

Displays the ethertype information and secondary ethertype port_list for VLANs, VMANs and PBBNs

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example shows the command output on switches that support only VMANs:

```
vMan ethertype: 0x88a8
```

The following example shows the command output on switches that support PBBNs:

```
# show vman ethertype
vman ethertype : 0x88a8
bvlan ethertype: 0x88b5
```

The following example shows the command output when a secondary ethertype is configured with ports information:

```
# show vman ethertype
Vman Primary ethertype   : 0x9100
Vman Secondary ethertype : 0x8100
BVlan ethertype         : 0x88b5
Secondary ethertype ports : 6:2g 6:3
```

The letter g in the port list indicates that the port is a [LAG/Trunk](#) port, the details of which can be seen using the show port sharing command.

History

This command was first available in ExtremeXOS 11.0.

Information on IEE 802.1ah was added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vm-tracking

```
show vm-tracking
```

Description

Displays the *XNV* feature configuration and the authenticated VM information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the XNV configuration and the authenticated VMs:

```
* Switch.51 # sh vm-tracking

-----
VM Tracking Global Configuration
-----
VM Tracking                : Enabled
VM Tracking authentication order: nms vm-map local
VM Tracking nms reauth period  : 0 (Re-authentication disabled)
VM Tracking blackhole policy   : none
-----

Port                        : 1:20
VM TRACKING                 : ENABLED

MAC                          Flags
  APC  IP Address  Type  Value
-----
-----
00:00:00:00:00:11 LBI    255.255.255.255  VM

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vm-tracking local-vm

```
show vm-tracking local-vm {mac-address mac}
```

Description

Displays one or all of the VM entries in the local VM database.

Syntax Description

| | |
|------------|--|
| <i>mac</i> | Specifies the MAC address of a VM database entry that you want to display. |
|------------|--|

Default

N/A.

Usage Guidelines

If you do not enter a MAC address with this command, the command displays all entries in the local VM database.

Example

The following command displays the local database VMs:

```
# show vm-tracking local-vm

MAC Address      IP Address      Type      Value
-----
00:00:00:00:00:21      VM
                        VLAN Tag      100
```

```

                VR Name      VR-Default
                VPP          vpp1
-----
Number of Local VMs: 1

```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vm-tracking network-vm

```
show vm-tracking network-vm
```

Description

Displays all of the VM entries in the network VM database.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the configuration for all entries in the network VM database:

```

# show vm-tracking network-vm

MAC Address      IP Address      Type      Value
-----
00:00:00:00:00:11  192.168.100.200  VM        KVM-VM-#101
                  VPP            vpp300
00:01:02:03:04:06  192.168.100.201  VM        VM #200
                  VPP            vpp201

Number of Network VMs: 2

```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vm-tracking nms

```
show vm-tracking nms server {primary | secondary}
```

Description

Displays the *RADIUS* client configuration and operating statistics for one or both NMS servers.

Syntax Description

| | |
|-----------------------------------|---|
| primary secondary | Specifies whether you are displaying the primary or secondary NMS server information. |
|-----------------------------------|---|

Default

If you do not specify primary or secondary, the default action is to display both the primary and secondary NMS server configurations.

Usage Guidelines

None.

Example

The following command displays the RADIUS client information for the primary and secondary NMS servers:

```
# show vm-tracking nms server
VM Tracking NMS (RADIUS): enabled
VM Tracking Radius server connect time out: 3 seconds
Primary VM Tracking NMS server:
Server name      :
IP address       : 10.127.5.221
Server IP Port   : 1812
Client address   : 10.127.10.173 (VR-Mgmt)
Shared secret    : pmckmtpq
Access Requests  : 0                Access Accepts      : 0
Access Rejects   : 0                Access Challenges    : 0
Access Retransmits: 0                Client timeouts     : 0
Bad authenticators: 0                Unknown types       : 0
Round Trip Time  : 0
Secondary VM Tracking NMS server:
Server name      :
IP address       : 10.127.5.223
```

```

Server IP Port: 1812
Client address: 10.127.10.173 (VR-Mgmt)
Shared secret : rjgueogu
Access Requests : 0           Access Accepts      : 0
Access Rejects  : 0           Access Challenges   : 0
Access Retransmits: 0         Client timeouts     : 0
Bad authenticators: 0         Unknown types       : 0
Round Trip Time : 0

```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vm-tracking port

```
show vm-tracking port port_list
```

Description

Displays the *XNV* feature configuration for the specified port and information for all VMs authenticated on the port.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
|------------------|---|

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the XNV configuration for port 1:20 and the authenticated VMs:

```

# sh vm-tracking port 1:20
-----
      VM Tracking Global Configuration
-----
VM Tracking                               : Enabled
VM Tracking authentication order          : nms vm-map local
VM Tracking nms reauth period             : 0 (Re-authentication disabled)
VM Tracking blackhole policy              : none
-----

```

```

Port : 1:20
VM Tracking : Enabled
VM Tracking Dynamic VLAN : Enabled

      Flags
MAC      AP      IP Address      Type      Value
-----
00:00:00:00:00:11 LBI      255.255.255.255 VM
                                VLAN Tag      100
                                VR Name      VR-Default
                                VPP          lvpp1
                                IEP
                                EEP
-----
Flags :

All Ingress and Egress, E - All Egress, I - All Ingress
Type :
IEP - Ingress Error Policies      EEP - Egress Error Policies

Number of Network VMs Authenticated: 0
Number of Local VMs Authenticated : 1
Number of VMs Authenticated : 1

```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vm-tracking repository

```
show vm-tracking repository {primary | secondary}
```

Description

Displays the FTP file synchronization configuration for NVPP and VM MAP files.

Syntax Description

| | |
|-----------------------------------|---|
| primary secondary | Specifies whether you are displaying the primary or secondary FTP server configuration. |
|-----------------------------------|---|

Default

If you do not specify primary or secondary, the default action is to display both the primary and secondary FTP server configurations.

Usage Guidelines

None.

Example

The following command displays the configuration for the primary and secondary FTP servers:

```
# show vm-tracking repository
Primary VM-Map FTP server:
Server name:
IP address      : 10.100.1.200
VR Name        : VR-Mgmt
Refresh-interval: 600 seconds
Path Name      : /pub (default)
User Name      : anonymous (default)
Secondary vm-map FTP server: Unconfigured
Last sync      : 16:35:15      Last sync server : Primary
Last sync status : Successful
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vm-tracking vpp

```
show vm-tracking vpp {vpp_name}
```

Description

Displays the configuration of one or all VPPs.

Syntax Description

| | |
|-----------------|--|
| <i>vpp_name</i> | Specifies the name of an existing local VPP. |
|-----------------|--|

Default

All.

Usage Guidelines

You can only specify local VPPs with this command. If you do not enter a VPP name with this command, the command displays all local and network VPPs.

Example

The following command displays the configuration of all VPPs:

```
# show vm-tracking vpp
VPP Name                               Type                               Value
-----
nvpp1                                   origin                            network
                                       counters                          ingress-only
                                       VLAN Tag                          200
                                       VR Name                           VR-Default
                                       ingress                            ingLocal1.pol(1)
                                                                     ingLocal2.pol(2)
                                       egress                            egrLocal1.pol(1)
                                                                     egrLocal2.pol(2)

lvpp1                                    origin                            local
                                       counters                          egress-only
                                       VLAN Tag                          100
                                       VR Name                           VR-Default
                                       ingress                            ing1.pol(1)
                                       egress                            egr1.pol(1)
                                                                     egr2.pol(2)

Number of Local VPPs   : 1
Number of Network VPPs: 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

show vpex

```
show vpex
```

Description

Shows the status of Extended Edge Switching VPEX mode, auto-configuration (partial automation) and Zero Touch Provisioning (ZTP) (full automation) status, ring re-balancing status, and if applicable, switch port to bridge port extender (BPE) slot assignments.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

For ZTP (full automation) status, the following states can appear:

- **Initializing**—Initializing.
- **Searching for BPEs**—Extended Edge Switching-capable switch (CB) is detected and system is waiting for a BPE to be attached in order to continue, or for the configuration to be saved in order to finish. The CB can remain in this state indefinitely.
- **Searching for MLAG Peer**—Extended Edge Switching-capable switch (CB) is detected and system is looking for an MLAG peer. The CB can remain in this state for up to four minutes.
- **Nothing Provisioned - Existing configuration present**—Full automation is not running because it has detected an existing configuration.
- **Nothing Provisioned - Disabled**—Full automation is disabled by running the `terminate vpex ztp` command or by Extreme Management Center.
- **Provisioning Complete**—Full automation has finished creating the Extended Edge Switching configuration.

Example

The following example shows VPEX mode, auto-configuration, automatic upgrading, and ring rebalancing are enabled, and that switch port 1:20 is attached to a BPE assigned to slot number 100:

```
# show vpex
Virtual Port Extender:  Enabled
Auto-Configuration:    Enabled
Auto-Upgrade:         Enabled
Ring rebalancing:     Auto
Zero Touch Provisioning: Nothing Provisioned - Existing configuration present

Cascade
Port/MLAG Id  Slot
=====
1:20          100
```

The following example shows that VPEX mode is disabled:

```
# show vpex
Virtual Port Extender:  Disabled
```

History

This command was first available in ExtremeXOS 22.5.

Auto-configuration status information was added in ExtremeXOS 22.6.

Ring re-balancing and Zero Touch Provisioning (ZTP) information was added in ExtremeXOS 22.7.

Automatic upgrading status was added in ExtremeXOS 30.5.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex bpe

```
show vpex bpe
```

Description

Shows attached bridge port extender's (BPE's) cascade port, slot assignment number, and MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example shows two BPEs attached to ports 111 and 102:51 assigned to slots 102 and 103, respectively:

| Slot | Cascade Port/MLAG Id | Model | PE MAC Address | Description |
|------|----------------------|----------------|-------------------|-------------|
| 102 | 111 | V400-48t-10GE4 | d8:84:66:f2:a4:3f | none |
| 103 | 102:51 | V400-48t-10GE4 | d8:84:66:f2:a8:98 | none |

History

This command was first available in ExtremeXOS 22.5.

MLAG ID information was added in ExtremeXOS 22.7.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex bpe cpu-utilization

```
show vpex bpe {slot slot_num} cpu-utilization
```

Description

Displays the CPU utilization on the specified bridge port extenders BPE(s).

Syntax Description

| | |
|------------------------|--|
| vpex | Specifies VPEX. |
| bpe | Specifies BPE. |
| slot | Specifies a specific BPE by slot number. |
| <i>slot_num</i> | Specifies a specific BPE by slot number. |
| cpu-utilization | Specifies showing CPU information. |

Default

N/A.

Example

The following example shows CPU information for all BPEs attached to the control bridge (CB):

```
# show vpex bpe cpu-utilization
Slot: 100 Cascade Port: 1:44 MAC: d8:84:66:88:98:06
CPU Utilization:
  5 seconds: 28 %
  1 minute: 16 %
  5 minutes: 16 %

Slot: 101 Cascade Port: 1:45 MAC: d8:84:66:88:98:07
CPU Utilization:
  5 seconds: 29 %
  1 minute: 17 %
  5 minutes: 18 %
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex bpe environment

```
show vpex bpe {slot slot_num} {environment}
```

Description

Shows power supply, temperature, and fan status for bridge port extenders (BPE).

Syntax Description

| | |
|--------------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| bpe | Bridge port extender (BPE). |
| slot | Specifies a specific port extender by slot number. |
| <i>slot_num</i> | Specifies a specific port extender by slot number. |
| environment | Specifies port extender environment information, including PSU, fan, and temperature information. |

Default

N/A.

Example

The following example shows environment information for all BPEs attached to the switch. In this case, there are two BPEs: one attached on port 1:45 and assigned to slot 100, and another attached on port 1:45 and assigned to slot 101:

```
# show vpex bpe environment

BPE Environment Information

Cascade Port: 1:41  Slot: 100  MAC: d8:84:66:88:98:74
  Description: Floor1
  Serial #:      800879-00-00 1716A042010
  Main PSU:     Powered On
  Backup PSU:   Empty
  Fan-1:       Operational at 5434 RPM
  Sensor-1:    Operational      Temp: Normal
  Sensor-2:    Operational      Temp: Normal
  Sensor-3:    Operational      Temp: Normal
  Sensor-4:    Operational      Temp: Normal
Cascade Port: 1:45  Slot: 101  MAC: d8:84:66:88:97:fa
  Description: Floor2
  Serial #:      00.00.01 1705D-10009
  Main PSU:     Powered On
  Backup PSU:   Empty
  Fan-1:       Operational at 10621 RPM
  Sensor-1:    Operational      Temp: Normal
  Sensor-2:    Operational      Temp: Normal
  Sensor-3:    Operational      Temp: Normal
  Sensor-4:    Operational      Temp: Normal
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex bpe statistics

```
show vpex bpe {slot slot_num} {statistics} {detail}
```

Description

Shows bridge port extender (BPE) statistics.

Syntax Description

| | |
|-------------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| bpe | Bridge port extender (BPE). |
| slot | Specifies a specific BPE by slot number. |
| <i>slot_num</i> | Specifies a specific BPE by slot number. |
| statistics | Specifies BPE statistics information and control plane protocol. |
| detail | Shows detailed BPE statistics information and control plane protocol. When detail is excluded, only non-zero statistics appear; when detail is included, non-zero and zero statistics appear. |

Default

N/A.

Usage Guidelines

This command displays information on a per-BPE basis (cascade ports can be LAG members). If the **detail** option is not used, only non-zero counts appear.

Example

The following example shows non-detailed statistics information for all BPEs. In this case, there is only one BPE attached at port: 1:45 and assigned to slot 100:

```
# show vpex bpe statistics
BPE Statistics

BPE: d8:84:66:88:98:2b   Cascade Port: 1:45   Slot: 100
Description: Floor1

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex bpe version detail

```
show vpex bpe { slot slot_num} version detail
```

Description

Displays detailed bridge port extender (BPE) image information for the specified BPE(s).

Syntax Description

| | |
|-----------------------|--|
| vpex | Specifies Virtual Port Extenders (VPEX). |
| bpe | Specifies BPE. |
| slot | Specifies a specific BPE by slot number. |
| <i>slot_num</i> | Specifies a specific BPE by slot number. |
| version detail | Specifies detailed image version information for the specified BPEs. |

Default

N/A.

Example

The following example show detailed image version information for all attached BPEs:

```
# show vpex bpe version detail

BPE Version Information

Cascade Port: 1:47 Slot: 100 MAC: d8:84:66:88:98:02
Active-image:
  Version:      1.0.0.35
  Date:         12-Jun-2017
  Time:         11:15:03
  MD5 Digest:  2bec22a139c0e0d243d9eed192ce54e4
Inactive-image:
  Version:      1.0.0.32
  Date:         24-May-2017
  Time:         19:07:31
  MD5 Digest:  04a0e44f58a9e0810ea16fc034bea462

Cascade Port: 1:45 Slot: 101 MAC: d8:84:66:88:98:05

```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex ports

```
show vpex ports {ports_list}
```

Description

Shows information about the bridge port extender (BPE) attached to the specified cascade ports.

Syntax Description

| | |
|------------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| ports | Specifies the cascade port attached to the BPE. |
| <i>port_list</i> | Specifies the cascade port attached to the BPE. |

Default

If you do not specify any ports, information for all cascade ports appears.

Usage Guidelines

The following information appears:

- Port number
- Cascade port
- Ext slot
- Slot identifier for the attached BPE
- Port state
- Link state
- PECSP MAC address
- PE MAC address
- CSPOpen and Loc (local) Rem (remote) status— a value of 1 indicates that a CSP Open request has been sent and acknowledged.
- CSP role flags— when using two CBs with MLAG, the flags indicate which node is performing the role of master (M) and backup (B)

In a redundant CB configuration, the M flag in the output of this command indicates the CB occupying the master role.

Example

The following example shows information for BPEs attached to all cascade ports:

```
# show vpex ports
Port      Cascade Ext  Port  Link  PECSP          PE          CSPOpen
#         Port   Slot State State MAC Address    MAC Address  Loc Rem  Flags

History

This command was first available in ExtremeXOS 22.5.

Ring topology support was added in ExtremeXOS 22.7

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex ports ecp statistics

```
show vpex ports {port_list} ecp statistics
```

Description

Shows bridge port extender (BPE) Edge Control Protocol (ECP) counter information.

Syntax Description

| | |
|-------------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| ports | Specifies the cascade port attached to the BPE. |
| <i>port_list</i> | Specifies the cascade port attached to the BPE. |
| ecp | Edge Control Protocol. |
| statistics | Specifies showing ECP counter information. |

Default

If you do not specify any ports, information for all cascade ports appears.

Example

The following example shows ECP counter information for BPEs attached to all cascade ports. In this case, there is only one attached BPE on cascade port 1:47:

```
# show vpex ports ecp statistics
Port   RxPkt  RxAck  RxReq  RxSeq  TxPkt  TxAck  TxReq  TxSeq  RxErr  TxErr
=====
1:47   52     0      0     590   52     26     26     26     0      0
=====
Flags   : (*) Active,
        (!) Administratively disabled,
        (A) Auto-calculated timer value
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

show vpex ports statistics

```
show vpex ports {port_list} {statistics} {detail}
```

Description

Shows bridge port extender (BPE) statistics information on an individual per-cascade port basis.

Syntax Description

| | |
|-------------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| ports | Specifies the cascade port attached to the BPE. |
| <i>port_list</i> | Specifies the cascade port attached to the BPE. |
| statistics | Specifies BPE statistics information on a per-port basis. |
| detail | Shows detailed BPE statistics information. The detail option shows zero and non-zero counters; when detail is omitted, only non-zero counters appear. |

Default

N/A.

Usage Guidelines

This command displays information on an individual port basis (cascade ports can be LAG members). If the **detail** option is not used, only non-zero counts appear.

Example

The following example shows non-detailed BPE statistics for all cascade ports:

```
# show vpex ports statistics

Port: 1:45 BPE: d8:84:66:88:97:fb Cascade Port: 1:45 Slot: 100 [LAG]

This command is available on the ExtremeSwitching X670-G2, X465, X590, X690, 5420, 5520 series switches.

show vpex topology

```
show vpex topology { port port_num } {summary | detail}
```

Description

In an Extended Edge Switching environment, shows the bridge port extender (BPE) topology that is connected to the specified native cascade port.

Syntax Description

| | |
|-----------------|--|
| vpex | Specifies Virtual Port Extender (VPEX). |
| port | Specifies topology information for VPEX slots attached to a specified native VPEX cascade port on the controlling bridge (CB). |
| <i>port_num</i> | Specifies the native VPEX cascade port number. |
| summary | Includes connected VPEX slot numbers only. Default behavior when port is not specified. |
| detail | Selects including VPEX slot interconnections. Default behavior when port is specified. |

Default

If a port is not specified, then summary (connected VPEX slot numbers only) information appears by default; if a port is specified, then detailed (VPEX slot interconnections) information appears by default.

Usage Guidelines

If a port is not entered or **summary** is selected, all topologies appear (summary mode). Only the native cascade port or MLAG and a list of slots appear in summary mode.

If a port is entered or **detail** is selected, detailed mode information appears. For a ring topology, the command shows both cascades that form a ring, including the dynamically created cascade ports and assigned backup roles. Thus the BPE in each cascade appears twice, one in each cascade.

Severed rings also appear as a pair of cascades with all upstream or cascade ports not being identified as backup. The cascades also indicate that the BPE has been dynamically created (configured) in its position in the cascade. If a native cascade port is not specified, then all topologies appear. Otherwise, only the topology connected to the CB's cascade port appears.

Possible ring states:

- Idle—Ring has been detected, but its configuration has not yet started.
- Init—The new ring is being defined. Dynamic cascade ports required for the redundancy provided by the ring feature are being created.
- Configuring—The ring is being brought up.
- Complete—Ring is fully operational and ready for recovery should a connection be severed.
- Severed—The ring is operating as two cascades.
- Rebalancing—The data plane of a ring is being rebalanced.

For slots configured using virtual MLAG, instead of the native cascade port, the MLAG ID appears.

Example

The following example shows an 8-BPE ring that is formed with two MLAGs. The configured cascades were equal in length. In this case the ring was previously formed, but is now severed. MLAG 10 contains only local native cascade port 1:3. MLAG 11 contains only a native cascade port on the remote MLAG switch. Only slots that exist on the data plane portions of the long cascade remnants after the severance appear:

```
# show vpex topology port 1:3

Topology: Ring (severed)

Native cascade port 1:3 (MLAG id 10)
  Upstream Cascade Cascade
  Slot Port Port Flags Slot
  ---- -
  108 49 50 109
  109 49 50 S 110
  ---- -

MLAG peer "vpexpeer" id 11
  Upstream Cascade Cascade
  Slot Port Port Flags Slot
```

```

-----
115 49      50          114
114 49      50          113
113 49      50          112
112 49      50          d   111
111 50      49          d   110
110 50      40          dS  109
-----

```

* - Port is a member of a load sharing group
Flags: (b) Backup Upstream Port, (B) Backup Cascade Port,
(c) Common ring link on this BPE
(d) Dynamically Created Cascade Port,
(E) Empty slot, (S) Severed ring link on this BPE.

The following example is a summary display of all topologies:

```

# show vpex topology

Topology: Ring (Complete)
  Native cascade port 1:1
    Slots: 100, 101, 102, 103, 104, 105, 106, 107
  Native cascade port 1:2
    Slots: 107, 106, 105, 104, 103, 102, 101, 100

Topology: Ring (Severed)
  Native cascade port 1:3 (MLAG id 10)
    Slots: 108, 109
  MLAG ID 11
    Slots: 115, 114, 113, 112, 111, 110

Topology: Cascade
  Native cascade port 1:4
    Slots: 116, 117, 118, 119, 120

```

History

This command was first available in ExtremeXOS 22.7.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420 (no ring support), 5520 series switches.

show vpls

```
show vpls {{vpls_name}} {peer ipaddress} {detail} | summary}
```

Note

This command has been replaced with the following command: `show l2vpn {vpls {{vpls_name}} | vpws {{vpws_name}} {peeripaddress} {detail} | summary}`. This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Displays VPLS and H-VPLS configuration and status information.

Syntax Description

| | |
|------------------|---|
| <i>vpls_name</i> | Displays information for the specified vpls. |
| <i>ipaddress</i> | Specifies a VPLS peer for which to display information. |
| detail | Displays additional information in comprehensive detail format. |

Default

N/A.

Usage Guidelines

The `show vpls` command (without any optional parameters) displays all currently configured VPLS instances for the switch. The summarized list of VPLS instances is displayed in alphabetical order based on the *vpls_name*. Peers are displayed in the reverse of the order they were added.

When you specify a VPLS peer, the display includes a list of all PWs established to the peer, the PW status and PW ID, and information about each VPLS to which this peer belongs.

The `show 12vpn` command describes the display fields that appear when this command is entered with the **detail** option.

Table 49: Selected show vpls Field Definitions

| Field | Definition |
|-----------------------|--|
| VPLS Name | VPLS instance or domain name. |
| VPN ID | Virtual Private Network identifier. |
| Source Address | Source IP address. |
| VCCV Status | Virtual Circuit Connectivity Verification (VCCV) feature status, which is either Enabled or Disabled . |
| VCCV Interval Time | Displays the configured VCCV interval time. |
| VCCV Fault Multiplier | Displays the configured VCCV fault multiplier. |
| Redundancy Type | Displays the configured VPLS redundancy type, which is EAPS , ESRP , or None . |
| Service Interface | Displays a <u>VLAN</u> or VMAN interface name. |
| Admin State | Displays the administrative state of the VPLS, which is either Enabled or Disabled . |
| Oper State | Displays the operational state of the VPLS, which is either Enabled or Disabled . |
| MTU | Displays the maximum transmission unit (MTU) size for the VPLS. |

Table 49: Selected show vpls Field Definitions (continued)

| Field | Definition |
|------------------|---|
| Ethertype | Displays the ethertype for the service interface. |
| .1q tag | Displays the 802.1q priority tag for the VPLS. |
| Peer IP | Displays the IP address for the VPLS peer. |
| PW State | <p>PW State represents the state, or status, of a PW. The possible PW state values are:</p> <ul style="list-style-type: none"> • UP—The PW is fully operational and installed in hardware. Traffic is forwarded over PW and VPLS service VLAN/VMAN. • Down—The PW is not operational and is not installed in hardware. This only happens when the VPLS instance is disabled, VPLS service is disabled, or there is no service VLAN assigned to the VPLS. No traffic is forwarded. • Sgnl—The PW is in a signalling state. The PW is not operational, and no traffic is forwarded. This can occur for a number of reasons, including: No LDP adjacency to peer, No transport LSP to peer, No VC LSP to peer. • Remote peer not configuredReady—The PW has been signalled, but it has not been installed in hardware. Traffic is not forwarded. The PW can be in a Ready state for a number of reasons, including: <ul style="list-style-type: none"> ◦ The VPLS instance is configured for <i>EAPS</i> redundancy, and the EAPS shared port associated with this VPLS instance is Connected. ◦ The VPLS instance is configured for <i>ESRP</i> redundancy, and the ESRP domain associated with this VPLS instance is Slave. ◦ The service VLAN associated with this VPLS instance is down. ◦ The remote peer has signalled that it has a fault (remote PW status). The remote peer may have a fault due to its service VLAN being down. |
| PW Uptime | PW Uptime is the elapsed time that the PW has been in the UP state. |
| PW Installed | PW Installed is a flag to indicate whether the PW is installed in hardware or not. If the PW is in the UP state, this field is True, otherwise, this field is False. |
| Local PW Status | <p>Local PW Status displays the VC status of the local PW. The values are:</p> <ul style="list-style-type: none"> • No Faults—No faults detected. • PW-Tx—Local PSN-facing PW transmit fault. This is set if there is a problem with the VPLS transport LSP. • PW-Rx—Local PSN-facing PW receive fault. This is set if there is a problem with the VPLS transport LSP. • Att-Tx—Local attachment circuit transmit fault. This is set if there is a problem with the VPLS service VLAN. • Att-Rx—Local attachment circuit receive fault. This is set if there is a problem with the VPLS service VLAN. • Not Forwarding—The local PW is not forwarding. Look for more information in the PW State field. For example, if VPLS is configured for EAPS redundancy, the Local PW Status is Not Forwarding and the PW State is Ready whenever the EAPS Shared Port state is Connected. |
| Remote PW Status | Remote PW Status is the VC status of the remote PW. The values for this field are the same values as for Local PW Status. |

Table 49: Selected show vpls Field Definitions (continued)

| Field | Definition |
|---------------|---|
| PW Mode | PW Mode describes how the PW was configured. The values are: <ul style="list-style-type: none"> Core-to-Core—This VPLS instance is a core node, and the other end of the PW connects to a core node. Core-to-Spoke—This VPLS instance is a core node, and the other end of the PW connects to a spoke node. This is for HVPLS. Spoke-to-Core—This VPLS instance is a spoke node, and the other end of the PW connects to a core node. This is for HVPLS. |
| Transport LSP | Transport LSP is the LSP that is used to forward frames over the PW. When an LDP LSP is used as a transport, the display shows LDP LSP (Not configured). If an RSVP LSP is used, the name of the RSVP LSP being used as a transport LSP is displayed. An RSVP LSP can be specified as the LSP to use during VPLS configuration. |
| Next Hop I/F | Displays the interface name for the next hop router. |
| Next Hop Addr | Displays the interface IP address for the next hop router. |
| PW Rx Label | Receive label for the VPLS PW. |
| PW Rx Pkts | Total packets received on the VPLS PW. |
| PW Rx Bytes | Total bytes received on the VPLS PW. |
| Tx Label | Transmit label for the LSP. |
| PW Tx Label | Transmit label for the VPLS PW. |
| PW Tx Pkts | Total packets transmitted on the VPLS PW. |
| PW Tx Bytes | Total bytes transmitted on the VPLS PW. |

Example

The following shows the display that appears when you enter the command without the **detail** option:

```
Switch.38 # show vpls

History

This command was first available in ExtremeXOS 11.6.

This command was updated to display flags for H-VPLS spoke nodes and protected VPLS and H-VPLS in ExtremeXOS 12.1.

The output for this command was modified in ExtremeXOS 12.2.2.

The output for this command was modified in ExtremeXOS 15.4 to display LSP sharing information.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show vpls peer l2pt

```

show {l2vpn} [vpls vpls_name | vpws] vpws_name] {peer ipaddress} l2pt
  {detail}

```

Description

Displays the VPLS peer L2PT configuration and status of a service.

Syntax Description

| | |
|------------------|--|
| l2vpn | Specifies the Layer 2 Virtual Private Network. |
| vpls | Specifies the Virtual Private LAN Service over MPLS. |
| <i>vpls_name</i> | Specifies the VPLS VPN. |
| vpws | Specifies the Virtual Private Wire Service over MPLS. |
| <i>vpws_name</i> | Specifies the VPWS VPN. |
| peer | Specifies the peer. |
| <i>ipaddress</i> | Specifies the IPv4 address. |
| l2pt | Specifies Layer 2 protocol configuration. |
| detail | Specifies to show L2PT configuration and status in detail. |

Default

Disabled.

Usage Guidelines

Use this command to display the L2PT configuration and status of a service.

Example

The following is an example of the `show vpls peer l2pt` command:

```
# show l2vpn vpls cust1 l2pt

Interface          L2PT Profile Name
-----
123.112.111.111   my_other_l2pt_prof
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show vrrp

```
show vrrp {virtual-router {vr_name}} {detail}
```

Description

Displays VRRP configuration information for all VRRP VLANs.

Syntax Description

| | |
|----------------|--|
| <i>vr_name</i> | Specifies a virtual router (VR) for which to display VRRP information. |
| detail | Specifies more detailed VRRP information. |

Default

N/A.

Usage Guidelines

The following table describes the significant fields and values that can appear when you enter the different forms of this command:

| Field | Description |
|--------------------------------|--|
| Advertisement Interval | Indicates the configured advertisement interval. |
| Authentication | If configured, identifies the VRRP simple password. |
| FR | Shows if Fabric Routing is enabled. |
| HM | Shows if Host Mobility is enabled. |
| IPv6 Router Advertisement Mask | IPv6 router advertisement mask. |
| Master Mac Address | The MAC address of the master VRRP router. |
| P | Indicates that the VRRP <i>VLAN</i> is configured for preempt mode, which controls whether a higher priority backup router preempts a lower priority master. |
| Preempt | Indicates that the VRRP <i>VLAN</i> is configured for preempt mode, which controls whether a higher priority backup router preempts a lower priority master. |
| Pri Priority | The priority value of the VRRP <i>VLAN</i> . |
| State | The current state of the VRRP router. The state includes the following: Init—The VRRP router is in the initial state. Backup—The VRRP router is a backup router. Master—The VRRP router is the master router. |
| T | Indicates the configured advertisement interval. |
| TP | Indicates the number of tracked pings. |
| TR | Indicates the number of tracked routes. |
| Tracked IP Routes | If configured, displays the IP address and subnet mask of the tracked route(s). |
| Tracked Pings | If configured, displays the: Target IP address you are pinging. Number of seconds between pings to the target IP address. Number of misses allowed before this entry is considered to be failing. |
| Tracked VLANs | If configured, displays the name of the tracked <i>VLAN</i> (s). |
| Tracking Mode | Indicates the VRRP tracking mode, which is either ALL or ANY. |
| TV | Indicates the number of tracked <i>VLAN</i> s. |

| Field | Description |
|--------------------------------------|--|
| Virtual IP Addr Virtual IP Addresses | If configured, the virtual IPv4 or IPv6 address associated with the VRRP VLAN. |
| Virtual Link-Local Address | Virtual IPv6 link local address configured on the interface. |
| VLAN | The name of the VRRP VLAN. |
| VLAN Name | The name of the VRRP VLAN and whether VRRP is enabled or disabled on the VLAN. The enable/disable state appears as follows: En—VRRP is enabled on this VLAN.Ds—VRRP is disabled on this VLAN. |
| VRID | The VRRP Router Identification number for the VRRP instance. |
| VRRP | The enabled/disabled state of VRRP on the VLAN. |

Example

The following shows VRRP information for the current VR context:

```
# show vrrp
          Virtual          Master
VLAN Name VRID Pri IP Address      State MAC Address      TP/TR/TV/P/T    /FR/G/HM
tenant(En) 0001 255 10.1.1.1      INIT 00:00:5e:00:01:01  0 0 0 Y 1      N N N
tenant(Ds) 0002 100 NONE          INIT NONE          0 0 0 Y 1      N N Y

En-Enabled, Ds-Disabled, Pri-Priority, T-Advert Timer, P-Preempt
TP-Tracked Pings, TR-Tracked Routes, TV-Tracked VLANs, FR-Fabric Routing,
G-Group, HM-Host Mobility
```

The following example displays detailed VRRP status information for the current VR context:

```
# show vrrp detail
VLAN: vlan23 VRID: 1 VRRP: Disabled State: INIT
Virtual Router: VR-Default
Priority: 100(backup) Advertisement Interval: 1 sec
Version: v3-v2 Preempt: Yes Preempt Delay: 0 sec
Virtual IP Addresses:
Accept mode: Off Group : ExtremeNet(Enabled)
Host-Mobility: On
Host-Mobility Excluded-Ports:
Checksum: Include pseudo-header
Tracking mode: ALL
Tracked Pings: -
Tracked IP Routes: -
Tracked VLANs: -
Fabric Routing: Off
```

History

This command was first available in ExtremeXOS 10.1.

Support for virtual routers was added in ExtremeXOS 12.0.

Support for IPv6 was added in ExtremeXOS 12.7.

Support for VRRP groups added in ExtremeXOS 22.2.

Host mobility information added in ExtremeXOS 22.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show vrrp group

```
show vrrp group group_name
```

Description

This command shows VRRP group status.

Syntax Description

| | |
|-------------------|---|
| group | Form a group of VRRP VRs to operate in high-scale mode. |
| <i>group_name</i> | Specifies the VRRP group name. |

Default

None.

Example

The following example shows VRRP group information for group "ExtremeNet":

```
show vrrp group ExtremeNet
Group Name: ExtremeNet      Group Status : Enabled

      Virtual      Master
VLAN Name VRID Pri IP Address      State MAC Address      TP/TR/TV/P/T      /FR
Primary-VR:
  v1(En) 0001 225 100.0.0.100      MSTR 00:00:5e:00:01:01 0 0 0 Y 1      Y
Secondary-VR(s):
  v10(En) 0001 225 100.10.0.100      MSTR 00:00:5e:00:01:01 0 0 0 N 40      Y
  v11(En) 0001 200 100.11.0.100      MSTR 00:00:5e:00:01:01 0 0 0 N 40      Y

En-Enabled, Ds-Disabled, Pri-Priority, T-Advert Timer, P-Preempt,
TP-Tracked Pings, TR-Tracked Routes, TV-Tracked VLANs, FR- Fabric Routing

Total number of member VRs of group : 3
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show vrrp vlan

```
show vrrp [ {vlan} vlan_name | vlan vlan_list] {stats}
```

Description

Displays VRRP information for a particular VLAN.

Syntax Description

| | |
|------------------|---|
| <i>vlan_name</i> | Specifies the VRRP VLAN. |
| <i>vlan_list</i> | Specifies the VRRP VLAN list of IDs. |
| stats | Specifies statistics for a particular VLAN. |

Default

N/A.

Usage Guidelines

Depending on the software version running on your switch or your switch model, additional or different VRRP information might be displayed.

If you specify the command without the stats keyword, the following VRRP information appears:

- VLAN—The name of the VRRP VLAN.
- VRID—The VRRP Router Identification number for the VRRP instance.
- VRRP—The enabled/disabled state of VRRP on the VLAN.
- State—The current state of the VRRP router. The state includes the following:
 - Init—The VRRP router is in the initial state.
 - Backup—The VRRP router is a backup router.
 - Master—The VRRP router is the master router.
- Priority—The priority value of the VRRP VLAN.
- Advertisement Interval—Indicates the configured advertisement interval.
- Preempt—Indicates that the VRRP VLAN is configured for preempt mode, which controls whether a higher priority backup router preempts a lower priority master.
- Fabric-routing—If configured IP forwarding capability for VRRP Backup routers is enabled
- Host-mobility—Exportable Host Route learning via ARP/ND on the specified VLAN and VRID
- Host-Mobility Exclude-Ports—If configured these ports will not generate host-route
- Checksum—Include or exclude pseudo header for IPv4 address family

- Authentication—If configured, identifies the VRRP simple password.
- Virtual IP Addresses—If configured, the virtual IP address associated with the VRRP VLAN.
- Tracked Pings—If configured, displays the:
 - Target IP address you are pinging.
 - Number of seconds between pings to the target IP address.
 - Number of misses allowed before this entry is considered to be failing.
- Tracked IP Routes—If configured, displays the IP address and subnet mask of the tracked route(s).
- Tracked VLANs—If configured, displays the name of the tracked VLAN(s).

If you specify the stats keyword, you see counter and statistics information for the specified VRRP VLAN.

Example

The following example displays configuration information for the specified VRRP VLAN:

```
# show vrrp vlan v1
VLAN: v1          VRID: 1          VRRP: Disabled State: INIT
Virtual Router: VR-Default
Priority: 100(backup) Advertisement Interval: 1 sec
Version: v2       Preempt: Yes     Preempt Delay: 0 sec
Authentication: simple-password key: none
Virtual IP Addresses:
Accept mode: Off
Host-Mobility: Off
Host-Mobility Exclude-Ports:
Tracking mode: ALL
Tracked Pings: -
Tracked IP Routes: -
Tracked VLANs: -
Fabric Routing: Off

* indicates a tracking condition has failed
```

The following example displays statistics for VLAN vrrp-1:

```
#show vrrp vlan v1 stats

VLAN v1, VR ID 1

VRID Errors           : 0   Authentication Type Mismatch : 0
Version Errors       : 0   Invalid Authentication Type  : 0
Checksum Errors      : 0   Authentication Failures      : 0
TTL Errors           : 0   Advertisement Interval Errors : 0
Packet Length Errors : 0   Address List Errors          : 0
Advertisements GotV3 DropV2 : 0
Advertisements Accepted : 0   Priority Zero Packets Received : 0
Become Master        : 0   Priority Zero Packets Sent    : 0
```

History

This command was first available in ExtremeXOS 10.1.

The `vlan_list` variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

show wredprofile

```
show wredprofile {ports [port_list | all]}
```

Description

Displays WRED configuration data for the specified ports or all ports.

Syntax Description

| | |
|------------------------|--|
| <code>port_list</code> | Specifies a list of slots and ports to display. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8. |
| <code>all</code> | Specifies that this command applies to all ports on the device. |

Default

N/A.

Usage Guidelines

If no port or port list is specified, this command displays the default WRED configuration values.

Example

The following example displays the WRED settings for port 2:

```
# show wredprofile ports 2

Port: 2
WRED configuration parameters
=====
QoS      Packet      Min      Max      Max      Avg.
Profile  Type        Color    Thresh   Thresh   Drop-Rate  Weight  ECN
=====
QP1     TCP         Green    100%    100%    100%      4%     Off
QP1     TCP         Red      100%    100%    100%      4%     Off
QP1     non-TCP    Any      100%    100%    100%      4%     Off
QP1     non-TCP    Red      100%    100%    100%      4%     Off

QP5     TCP         Green    100%    100%    100%      5%     On
QP5     TCP         Red      100%    100%    100%      5%     On
QP5     non-TCP    Any      100%    100%    100%      5%     On
QP5     non-TCP    Red      100%    100%    100%      5%     On

QP8     TCP         Green    100%    100%    100%      4%     Off
```

History

This command was first available in ExtremeXOS 12.7.

ECN column added in ExtremeXOS 22.3.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2, X435, X465, X590, X620, X690, X695, X870, 5520 series switches.

show xml-notification configuration

```
show xml-notification configuration {target}
```

Description

Displays the configuration of the Web server target.

Syntax Description

| | |
|---------------|--|
| <i>target</i> | Specifies an alpha numeric string that identifies the configured target. |
|---------------|--|

Default

N/A.

Usage Guidelines

Use this command to display information about the configuration of the Web server target. If a target is not specified, all configured targets are displayed.

Example

The following command displays the configuration of the configured targets:

```
show xml-notification configuration
```

The following is sample output from this command:

```
Target Name          : sqa
**Server URL         : http://10.255.129.22:8080/xos/webservice (VR-Mgmt)
Server User Name     : admin
Enabled              : yes
Queue Size           : 100
Connection Status    : connected
Configured Modules   : ems,idmgr
Target Name          : epi
**Server URL         : http://10.255.59.6:8080/xos/webservice (VR-Finance)
Server User Name     : admin
Enabled              : yes
```

```

Queue Size           : 100
Connection Status    : connected
Configured Modules   : ems
Target Name          : test3
**Server URL         : https://10.120.91.64:8443/xos/webservice (VR-Mgmt)
Server User Name     : admin
Enabled              : yes
Queue Size           : 100
Connection Status    : not connected
Configured Modules   : ems
Target Name          : testingcorrect
**Server URL         : http://10.66.254.211:8080/xos/webservice (VR-Mgmt)
Server User Name     : admin
Enabled              : no
Queue Size           : 100
Connection Status    : not connected
Configured Modules   : idMgr,ems

```

Note

When a particular VR has been specified in the configuration process, that VR is displayed next to the URL. When no VR is specified since the parameter is optional, the default VR supplied by the XML client is VR-Mgmt. When you are using a version released before the virtual router option was added, VR-Mgmt is displayed.

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

show xml-notification statistics

```
show xml-notification statistics {target}
```

Description

Displays statistics for of the Web server target.

Syntax Description

| | |
|---------------|--|
| <i>target</i> | Specifies an alpha numeric string that identifies the configured target. |
|---------------|--|

Default

N/A.

Usage Guidelines

Use this command to display the connection status, enable status and event statistics of the Web server target. If a target is not specified, all configured targets are displayed.

Example

The following command displays statistics for all of the configured targets:

```
show xml-notification statistics
```

The following is sample output from this command:

```
Target Name           : epi
Server URL            : http://10.255.129.22:8080/xos/webservice
Server Queue Size    : 100
Enabled               : yes
Connection Status     : connected
Events Received       : 450
Connection Failures   : 0
Events Sent Success   : 450
Events Sent Fail      : 0
Events Dropped        : 0
Target Name           : epi
Server URL            : http://10.255.59.6:8080/xos/webservice
Server Queue Size    : 100
Enabled               : yes
Connection Status     : fail
Events Received       : 31
Connection Failures   : 3
Events Sent Success   : 2
Events Sent Fail      : 29
Events Dropped        : 0
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

ssh2

```
ssh2 {cipher cipher} {mac mac} {port portnum} {compression [on | off]}
     {user username} {username} [host | ipaddress] {remote command} {vr
vr_name}
```

Description

Initiates an SSH2 client session to a remote SSH2 server.

Syntax Description

| | |
|-----------------------|---|
| <i>cipher</i> | Specifies the name of the cipher. Possible values are: <ul style="list-style-type: none"> • aes128-cbc • aes128-ctr • aes192-cbc • aes192-ctr • aes256-cbc • aes256-ctr • chacha20-poly1305@openssh.com • rijndael-cbc@lysator.liu.se |
| <i>mac</i> | Specifies the name of the Message Authentication Code. Possible values are: <ul style="list-style-type: none"> • hmac-md5 • hmac-md5-96 • hmac-md5-96-etm@openssh.com • hmac-md5-etm@openssh.com • hmac-sha1 • hmac-sha1-96 • hmac-sha1-96-etm@openssh.com • hmac-sha1-etm@openssh.com • hmac-sha2-256 • hmac-sha2-256-etm@openssh.com • hmac-sha2-512 • hmac-sha2-512-etm@openssh.com |
| <i>portnum</i> | Specifies the TCP port number to be used for communicating with the SSH2 client. The default is port 22. |
| on | Specifies that the data is to be compressed. |
| off | Specifies that compression is not to be used. This is the default. |
| <i>username</i> | Specifies a login name for the remote host, as an alternate to the <code>username@host</code> parameter. Can be omitted if it is the same as the username on the switch. |
| <i>host</i> | Specifies the name of the remote host. |
| <i>ipaddress</i> | Specifies the IP address of the remote host. |
| <i>remote command</i> | Specifies a command to be passed to the remote system for execution. The switch does not support remote commands. The option is only valid if the remote system is a system, such as a UNIX workstation, that accepts remote commands. |
| <i>vr_name</i> | Specifies the virtual router. The default virtual router is <i>VR-Mgmt</i> . Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |

Default

The default settings for SSH2 parameters are as follows:

- cipher—the full cipher list
- mac—the full Message Authentication Code list
- port—22
- compression—off
- vr_name—VR-Mgmt

Usage Guidelines

SSH2 does not need to be enabled on the switch in order to use this command.

Typically, this command is used to establish a secure session to a remote switch. You are prompted for your password. Once you have logged in successfully, all ExtremeXOS command you enter are executed on the remote switch. When you terminate the remote session, commands will then resume being executed on the original switch.

Host Name, User Name, and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name, user name, or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted for host and user names
- Underscore (_) Permitted for host and user names
- Colon (:) Permitted for host names and remote IP addresses
- At symbol (@) Permitted only for user names

When naming the host, creating a user name, or configuring the IP address, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)

- Underscore (_)
- Slash (/)

When naming a remote file, remember the requirements listed above.

Example

The following example establishes an SSH2 session on switch engineering1:

```
# ssh2 admin@engineering1
```

The following example establishes an SSH2 session with the switch named X460-G2 over TCP port 2050 with compression enabled:

```
# ssh2 compression on port 2050 admin@X460-G2
```

History

This command was first available in ExtremeXOS 11.2.

Changes to **cipher**, as well as the addition of **mac**, were first available in ExtremeXOS 15.7.1.

Ciphers and MACs that are unsupported in OpenSSH 8.1p1 were removed in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms with the SSH2 module installed.

start orchestration mlag

```
start orchestration mlag peer_name
```

Description

Ensures configuration consistency between controlling bridges (CBs) in a redundant CB environment with bridge port extenders (BPEs) or MLAG peers.

Syntax Description

| | |
|----------------------|--|
| orchestration | Specifies entering orchestration mode in redundant controlling bridges environments. |
| mlag | Multi-switch link aggregation group. |
| <i>peer_name</i> | Name of the MLAG peer controlling bridge (switch). |

Default

N/A.

Usage Guidelines

With redundant CBs attached to each BPE, the associated extended port configuration must be identical on each controlling bridge. To reduce the configuration complexity and to minimize the risk of inconsistency, you can use orchestration mode so that any configuration commands are now checkpointed to the MLAG peer switch. Before entering orchestration mode, ensure that any configuration parameters (connecting ports for the BPEs, VLAN names, numbers etc.) are the same for both CBs.

After entering this orchestration mode, like the existing virtual-router mode, the configuration prompt changes indicating that commands issued are within this context:

```
(orchestration bottom) X670G2-48x-4q.4 #
```

Note

MLAG peer checkpoint status must be 'up' to enter orchestration mode.

Note

Enabling orchestration mode on both MLAG peers at same time is not recommended. If orchestration mode is enabled on both MLAG peers and you execute commands on both switches at same time, the switch may abort execution of the command.

Example

The following example enables orchestration mode on the controlling bridge (switch) with its MLAG peer "bottom":

```
# start orchestration mlag "bottom"
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

start process

```
start process name {msm slot}
```

Description

Starts the specified process on the switch. Used to restart a process after it has been terminated.

Syntax Description

| | |
|-------------|---|
| <i>name</i> | Specifies the name of the process to start. You can start the following processes: bgp, eaps, exsshd, isis, lldp, netLogin, netTools, ospf, snmpMaster, snmpSubagent, telnetd, tftpd, vrrp, xml |
| <i>slot</i> | On a SummitStack, specifies the node's slot number. The number is a value from 1 to 8. |

Default

N/A.

Usage Guidelines

Use this command after you have stopped a process and you want to restart it. To stop a process, use the `terminate process` command.

You are unable to start a process that is already running. If you try to start a currently running process, an error message similar to the following appears:

```
Error: Process telnetd already exists!
```

Depending on the software version running on your switch and the type of switch you have, you can restart different or additional processes. To see which processes you can restart, enter `start process` followed by [Tab]. The switch displays a list of available processes.

To display the status of ExtremeXOS processes on the switch, including how many times a process has been restarted, use the `show process {name} {detail} {description} {slotslotid}` command.

You can also use the `start process` command when upgrading a software modular package. For more information, see the section *Upgrading a Modular Software Package* in the [ExtremeXOS 31.3 User Guide](#).

SummitStack Only

You can issue this command only from the master node. If you issue this command from any other node, the following message appears:

```
Error: Processes created by user can only be started on the primary node slot.
```

Note

After you stop a process, do not change the configuration on the switch until you start the process again. A new process loads the configuration that was saved prior to stopping the process. Changes made between a process termination and a process start are lost, and error messages can result when you start the new process.

Example

The following restarts the process tftpd:

```
start process tftpd
```

History

This command was first available in ExtremeXOS 11.0.

Support for restarting the Link Layer Discovery Protocol (lldp), Open Shortest Path First (ospf), and network login (netLogin) processes was added in ExtremeXOS 11.3.

Support for restarting the Border Gateway Protocol (bgp) was added in ExtremeXOS 11.4.

Support for restarting netTools was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

start vm

```
start vm vm_name
```

Description

Starts a virtual machine (VM) process.

Syntax Description

| | |
|----------------|-----------------------------------|
| vm | Designates starting a vm process. |
| <i>vm_name</i> | Specifies the VM name. |

Default

N/A.

Usage Guidelines

The effect of this command is not persistent. The initial VM state after boot is determined by the VM's enabled/disabled configuration state.

To stop a VM process, use the command `stop vm vm_name [forceful | graceful]`.

The Extreme Insight feature requires the Solid State Storage Device SSD-120.

Example

The following example starts the VM process "vm1":

```
# start vm vm1
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Extreme Insight for Guest VMs feature and have a Core license installed. For a list of platforms that support the Insight feature and for information about licenses, see the [ExtremeXOS 31.3 Feature License Requirements](#).

stop orchestration

```
stop {orchestration}
```

Description

Exits orchestration mode, which is a mode used in a redundant controlling bridges environment with bridge port extenders (BPE) or [MLAG](#) peers.

Syntax Description

| | |
|----------------------|---|
| orchestration | Specifies exiting orchestration mode in redundant controlling bridges environments with MLAG peers. |
|----------------------|---|

Default

N/A.

Usage Guidelines

After exiting this mode, the configuration prompt changes indicating that commands issued are no longer within this context. See the following example.

Example

The following example exits orchestration mode:

```
(orchestration mlag peer) X460G2-24t-10G4.2 # stop orchestration
X460G2-24t-10G4.2 #
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

stop vm

```
stop vm vm_name [forceful | graceful]
```

Description

Stops a virtual machine (VM) process.

Syntax Description

| | |
|-----------------|--|
| vm | Designates stopping a vm process. |
| <i>vm_name</i> | Specifies the VM name. |
| forceful | Forcefully terminates the VM. |
| graceful | Gracefully shutdowns the VM if possible (default). |

Default

By default, the VM is shutdown gracefully, if possible.

Usage Guidelines

The effect of this command is not persistent. The initial VM state after boot is determined by the VM's enabled/disabled configuration state. A VM is forcefully stopped if it does not shutdown gracefully within 60 seconds

To start a VM process, use the command `start vm vm_name`.

The Extreme Integrated Application Hosting (IAH) feature requires the Solid State Storage Device SSD-120.

Example

The following example stops the VM process "vm1" forcefully:

```
# stop vm vm1 forcefully
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Extreme IAH feature and have a Core license installed. For a list of platforms that support the IAH feature and for information about licenses, see the [ExtremeXOS 31.3 Feature License Requirements](#).

suspend vm

```
suspend vm vm_name
```

Description

Suspends a virtual machine (VM).

Syntax Description

| | |
|----------------|-----------------------------------|
| vm | Specifies a VM. |
| <i>vm_name</i> | Specifies the VM name to suspend. |

Default

N/A.

Usage Guidelines

Suspending a VM pauses, or freezes, the CPU state of the guest VM. The VM remains in an active state, and committed resources (such as memory and ports) remain committed. This state is not persistent across switch reboots or the virtMgr process restarts. Such events function as "power off resets" to the guest operating system.

To resume the VM, use the `resume vm vm_name` command.

Example

The following example pauses the VM "vm1":

```
# suspend vm vm1
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core license installed. For a list of platforms that support the IAH feature and for information about licenses, see the [ExtremeXOS 31.3 Feature License Requirements](#).

synchronize

```
synchronize {slot slotid}
```

Description

The synchronize command replicates all saved images and configurations from the master node to the backup or target node on a SummitStack.

Syntax Description

| | |
|---------------|---|
| <i>slotid</i> | Specifies the target node that has to be synchronized with the master node. If the slotid is omitted, the target is the backup node. Note: This parameter is available only with SummitStack. |
|---------------|---|

Default

If you do not specify a node, the backup node is synchroized with the master.

Usage Guidelines

Note

You cannot synchronize a master switch running a version earlier than ExtremeXOS 22.2 to a target node running ExtremeXOS 22.2 or later. The command fails and the following error message appears: `Error: the target slot's partitions are not compatible with the Master's for synchronize.`

This command:

- Reboots the backup node or target node to prepare it for synchronizing with the master node.
- Performs a binary copy of the master node to the backup or target node, including the primary and secondary software images, all configurations and policies, and temporary files.
- Reboots the backup or target node after replication is complete.

During a synchronization, half of the switch fabric is lost. When the master node finishes replicating its configurations and images to the backup or target node, the full switch fabric is restored.

To use this command, make sure your SummitStack is running ExtremeXOS 12.0 or later.

When you install a different backup node, you are not prompted to synchronize the images and the configurations from the master. If not synchronized, the backup node uses its image and the master's configuration. This image/configuration mismatch will likely cause the switch to operate differently after failover. Use the `synchronize` command to replicate all saved images and configurations from the master to the backup node.

If you have not saved your runtime configuration, you are prompted to save it when you use this command. A message similar to the following appears:

```
Do you want to save configuration changes to primary.cfg? (y or n)
```

Enter `y` to save the configuration and continue with synchronizing the nodes. Enter `n` to cancel the operation. If you enter `y`, messages similar to the following appear:

```
Saving configuration on primary ..... done! Synchronizing configuration to backup ..
done!
```

After the configuration has been saved and replicated to the backup node, synchronization begins.

After the initial reboot, if the backup node is not available or does not respond within 120 seconds, the synchronize operation fails.

Use the `show switch {detail}` command to verify that the backup node is in sync with the master node.

While using the command `synchronize {slot slot-number}` if the slot number is provided, that slot is the target of the synchronize operation. If the slot number is not provided, the backup node is synchronized. This command can be executed only on the master node.

The synchronize command preserves the following stacking configurations on the target node:

- slot number
- master-capable configuration
- alternate IP address, subnetwork mask, and default gateway
- priority
- license restriction

Thus a synchronized node comes up in the same place in the active topology that it occupied before the synchronize command was issued.

If the synchronizing switch cannot determine the stacking support configuration on the target switch, the following message is displayed:

```
Error: Information for the target switch is temporarily unavailable. Please retry the command.
```

Example

The following example assumes you have already saved your runtime configuration. Using `synchronize` replicates all saved images and configurations from the master node to the backup node.

After you enter the command, status messages similar to the following appear:

```
# synchronize
Synchronize will reboot the backup, then overwrite all code images
and configs with a copy from the master.
Synchronize currently requires ExtremeXOS version 11 or greater on
the backup
DO NOT interrupt synchronize, the backup may become unbootable!
OK to continue? (y/n) Yes
Rebooting Backup...
NOTE: The command line is locked during synchronize
synchronizing...
synchronizing nvram...
synchronizing nvram...
synchronizing nvram...
synchronizing nvram...
synchronizing nvram...
synchronizing XOS...
[=====] 100% XOS
Synchronize complete - rebooting backup ...
```

History

This command was first available in ExtremeXOS 11.0.

The slot parameter was added to support SummitStack in ExtremeXOS 12.0.

Platform Availability

This command is available only on SummitStacks.

synchronize stacking

```
synchronize stacking {node-address node_address | slot slot_number}
```

Description

This command copies certain NVRAM based configuration parameters to the target node.

Syntax Description

| | |
|---------------------|--|
| <i>node_address</i> | Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command. |
| <i>slot_number</i> | Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command. |

Default

N/A.

Usage Guidelines

This command synchronizes the following NVRAM-based parameters:

- Stacking mode.
- Stack MAC address.
- Failsafe account and password.
- Failsafe account access point permissions (whether the failsafe account is allowed over the stacking links, console port, or management port).
- The selected partition.

These parameters are copied from the executing node's NVRAM to the target node's NVRAM.

Example

Example for the synchronize stacking command output:

```
Slot-2 Stack.3 > synchronize stacking slot 3
Are you sure you want to synchronize the specified slot with this slot's stacking
```

```

configuration? (y/n) Yes
Synchronized configuration will take effect at the next reboot of the specified node(s).
Slot-2 Stack.4 >
Slot-2 Stack.4 > synchronize stacking node 00:04:96:27:87:10
Are you sure you want to synchronize the specified node with this node's stacking
configuration? (y/n) Yes
Synchronized configuration will take effect at the next reboot of the specified node(s).
Slot-2 Stack.5 >
Slot-2 Stack.5 > synchronize stacking
Are you sure you want to synchronize all remote nodes with this node's stacking
configuration? (y/n) Yes
Synchronized configuration will take effect at the next reboot of the specified node(s).
Slot-2 Stack.6 >

```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

telnet slot

```
telnet slot slot-number {no-auto-login}
```

Description

Allows you to Telnet from any source node to any other target node when both nodes are in the same active topology.

Syntax Description

| | |
|----------------------|--|
| <i>slot-number</i> | Specifies the number of a slot that is currently occupied by the intended target node. |
| no-auto-login | Blocks auto-login. You are prompted for login credentials. Without using this option, after you are logged on to one slot (node), you can Telnet to another slot with the same user credentials. |

Default

N/A.

Usage Guidelines

After the target node accepts the related TCP connection, when using Telnet to connect to another node, you are not prompted for your user name or password. You are logged in to the same account (with corresponding rights) with which you accessed the originating slot.

If the failsafe account is used, user ID and password authentication takes place on the specified node. Otherwise, authentication takes place on the master node, regardless of the source and target nodes used.

Telnet must be enabled on the SummitStack for this command to function.

Example

The following command accesses the node in slot 2:

```
Slot-1 Stack.3 # telnet slot 2
Entering character mode
Escape character is '^]'.

telnet session telnet0 on /dev/ptyb0

ExtremeXOS

This product is protected by one or more US patents listed at http://
www.extremenetworks.com/patents along with their foreign counterparts.
=====

You are connected to a Backup node. Only a limited command set is supported.
You may use "telnet slot <slot_number>" to connect to the Master node to access
the full set of commands.
Press the <tab> or '?' key at any time for completions.
Remember to save your configuration changes.

Slot-2 Stack.1 >
```

History

This command was first available in ExtremeXOS 12.0.

Automatic user authentication from the source node to the target node added in ExtremeXOS 22.3.

The **no-auto-login** option was added in ExtremeXOS 22.5.

Platform Availability

This command is available only on SummitStack.

telnet

```
telnet {vr vr_name} [host_name | remote_ip] {port}
```

Description

Allows you to Telnet from the current command-line interface session to another host.

Syntax Description

| | |
|------------------|---|
| vr | Specifies use of a virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>vr_name</i> | Specifies the name of the virtual router. |
| <i>host_name</i> | Specifies the name of the host. |
| <i>remote_ip</i> | Specifies the IP address of the host. |
| <i>port</i> | Specifies a TCP port number. The default is port 23. |

Default

- Telnet—enabled.
- Virtual router—Uses all virtual routers on the switch for outgoing Telnet requests.
- Port—23.

Usage Guidelines

Only VT100 emulation is supported.

Before you can start an outgoing Telnet session, you need to configure the switch IP parameters. To open a Telnet connection, you must specify the host IP address or the host name of the device you want to connect to. Check the user manual supplied with the Telnet facility if you are unsure of how to do this. Although the switch accepts IPv6 connections, you can only Telnet from the switch to another device with an IPv4 address.

You must configure DNS in order to use the *host_name* option.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Virtual Router Requirements

The `vr_name` option specifies the name of the virtual router. The valid virtual router names at system boot-up are [VR-Mgmt](#), [VR-Control](#), and [VR-Default](#); however, you can only Telnet on VR-Mgmt and VR-Default. In ExtremeXOS 10.1, the valid virtual routers are VR-0, VR-1, and VR-2 respectively, and Telnet used VR-0 by default. For more information about virtual routers, see [Virtual Routers](#).

Example

The following command starts a Telnet client communication to the host at IP address 123.45.67.8:

```
telnet 123.45.67.8
```

The following command starts a Telnet client communication with a host named sales:

```
telnet sales
```

History

This command was first available in ExtremeXOS 10.1.

Support for the following virtual routers was added in ExtremeXOS 11.0: VR-Mgmt and VR-Default.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

terminate process

```
terminate process name [forceful | graceful]
```

Description

Terminates the specified process on the switch.

Syntax Description

| | |
|-----------------|--|
| <i>name</i> | Specifies the name of the process to terminate. You can terminate the following processes: bgp, eaps, exsshd, isis, lldp, netLogin, netTools, ntp, ospf, ospfv3, snmpMaster, snmpSubagent, telnetd, thttpd, tftpd, vrrp, and xmld. |
| forceful | Specifies a forceful termination. |
| graceful | Specifies a graceful termination. |

Default

N/A.

Usage Guidelines

If recommended by Extreme Networks Technical Support personnel, you can stop a running process.

The forceful option quickly terminates a process on demand. Unlike the graceful option, the process is immediately shutdown without any of the normal process cleanup. The status of the operation is displayed on the console. After a successful forceful termination of a process, a message similar to the following appears:

```
Forceful termination success for snmpMaster
```

The graceful option terminates the process by allowing it to close all opened connections, notify peers on the network, and other types of process cleanup. After this phase, the process is finally terminated. After a successful graceful termination of a process, a message similar to the following appears:

```
Successful graceful termination for snmpSubagent
```

Note

In a stack, starting, restarting, or terminating user-created processes in any node other than the primary node is not allowed.

Example

The following initiates a graceful termination of the process tftpd:

```
terminate process tftpd graceful
```

History

This command was first available in ExtremeXOS 11.0.

Support for terminating the Link Layer Discovery Protocol (lldp), network login (netLogin), and Open Shortest Path First (ospf) processes was added in ExtremeXOS 11.3.

Support for terminating the Border Gateway Protocol (bgp) and Ethernet Automatic Protection Switching (eaps) processes was added in ExtremeXOS 11.4.

Support for terminating the MultiProtocol Label Switch (mpls) and Virtual Router Redundancy Protocol (vrrp) processes was added in ExtremeXOS 11.6.

Support for terminating netTools was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

terminate vpex ztp

```
terminate vpex ztp
```

Description

Prevents automatic configuration of Extended Edge Switching topologies.

Syntax Description

| | |
|-------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| ztp | Zero Touch Provision (ZTP). Automated process for configuring Extended Edge Switching topologies. |

Default

If you do not run this command, automatic configuration (ZTP) occurs when an unconfigured controlling bridge (CB) (new, out of the shipping box, or manually unconfigured) is rebooted with attached bridge port extenders (BPEs).

Usage Guidelines

This command allows you to prevent automatic configuration from running. Automatic configuration is re-enabled after rebooting or running the `restart process ztpstack` command.

Note

Alternatively, to prevent automatic configuration from running on Extended Edge Switching topologies, you can perform some configuration on the CB prior to attaching BPEs or have a `default.xsf` (or other similar file) file in place.

To view the automatic configuration (ZTP) status, use the `show vpex` command.

Example

The following example prevents automatic configuration from running:

```
# terminate vpex ztp
```

One of the following messages appears:

```
VPEX ZTP successfully terminated. Allow up to 15 seconds for the status to be reflected
in the "show vpex" output.
VPEX ZTP not running. No need to terminate.
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

tftp

```
tftp [ ip-address | host-name ] { -v vr_name } { -b block_size } [ -g |
  -p ] [ -l local-file { -r remote-file } | -r remote-file { -l local-
  file } ]
```

Description

Allows you to TFTP from the current command line interface session to a TFTP server.

Syntax Description

| | |
|--------------------|--|
| <i>ip-address</i> | Specifies the IP address of the TFTP server. |
| <i>host-name</i> | Specifies the name of the remote host. |
| <i>vr_name</i> | Specifies the name of the virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>block_size</i> | Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65,000 bytes. Default is 14,00 bytes. |
| -g | Gets the specified file from the TFTP server and copies it to the local host. |
| -p | Puts the specified file from the local host and copies it to the TFTP server. |
| <i>local-file</i> | Specifies the name of the file (configuration file, policy file) on the local host. |
| <i>remote-file</i> | Specifies the name of the file on the remote host. |

Default

If you do not specify a virtual router, [VR-Mgmt](#), and then [VR-Default](#) (if needed), is used.

If you do not specify otherwise, the switch downloads or uploads the file from the switch local file system (`/usr/local/tmp`).

If you do not specify block size, the default value is 14,00 bytes.

Usage Guidelines

NetASCII and mail file type formats are not supported.

TFTP Server Requirements

Extreme Networks recommends using a TFTP server that supports blocksize negotiation (as described in [RFC 2348](#), TFTP Blocksize Option) to enable faster file downloads and larger file downloads. If the TFTP server does not support blocksize negotiation, the file size is limited to 32MB. Older TFTP servers

that do not support blocksize negotiation have additional implementation limits that may decrease the maximum file size to only 16MB, which may be too small to install ExtremeXOS images.

If your TFTP server does not support blocksize negotiation, the switch displays a message similar to the following when you attempt a get (-g) or put (-p) operation:

```
Note: The blocksize option is not supported by the remote TFTP server.  
Without this option, the maximum file transfer size is limited to 32MB.  
Some older TFTP servers may be limited to 16MB file.
```

Using TFTP

Use TFTP to download a previously saved configuration file or policy file from the TFTP server to the switch. When you download a file, this command does not automatically apply it to the switch. You must specify that the downloaded file be applied to the switch. For example, if you download a configuration file, run the `use configuration` command to apply the saved configuration on the next reboot. You must run the `reboot` command to activate the new configuration. If you download a policy file, run the `refresh policy` command to reprocess the text file and update the policy database.

You also use TFTP to upload a saved configuration file or policy file from the switch to the TFTP server.

If your download from the TFTP server to the switch is successful, the switch displays a message similar to the following:

```
Downloading megtest2.cfg to switch... done!
```

If your upload from the switch to the TFTP server is successful, the switch displays a message similar to the following:

```
Uploading megtest1.cfg to TFTPHost ... done!
```

Up to eight active TFTP sessions can run on the switch concurrently.

You must configure DNS in order to use the `host_name` option.

Host Name and Remote IP Address Character Restrictions

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

Local and Remote File Name Character Restrictions

When specifying a local or remote file name, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)

- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) permitted only for remote files

Virtual Router Requirements

The `vr_name` option specifies the name of the virtual router. The valid virtual router names at system boot-up are VR-Mgmt, VR-Control, and VR-Default; however, you can only TFTP on VR-Mgmt and VR-Default. In ExtremeXOS 10.1, the valid virtual routers are VR-0, VR-1, and VR-2 respectively. For more information about virtual routers, see the *Virtual Routers* chapter in the [ExtremeXOS 31.3 User Guide](#).

Internal Memory and Core Dump Files

Core dump files have a `.gz` file extension. The file name format is: `core.process-name.pid.gz` where `process-name` indicates the name of the process that failed and `pid` is the numerical identifier of that process.

If you configure and enable the switch to send core dump (debug) information to internal memory, specify the internal-memory file path `/usr/local/tmp` to transfer those files from internal memory to a TFTP server.

If the switch has not saved any debug files, you cannot transfer other files to or from internal memory. For example if you attempt to transfer a configuration file from the switch to the internal memory, the switch displays a message similar to the following:

```
Update: Error: tftp transfer to /usr/local/tmp is not allowed.
```

For information about configuring and sending core dump information, see the `configure debug core-dumps [off | directory_path] save debug tracefiles directory_path` and commands.

For more detailed information about core dump files, see [Troubleshooting](#).

Other Useful Commands

On the ExtremeSwitching series switches and SummitStack, use the `download bootrom` command to upgrade the BootROM. This command utilizes TFTP to transfer the BootROM image file from your TFTP server to the switch. Only upgrade the BootROM when asked to do so by an Extreme Networks technical representative. For more information about this command, see `download bootrom`.

To upgrade the image, run the `download image` command. This command uses TFTP to transfer the software image file from your TFTP server to the switch. For more information about this command, see `download image`.

Example

The following example downloads the configuration file named `XOS1.cfg` from the TFTP server with an IP address of 10.123.45.67:

```
# tftp 10.123.45.67 -v "VR-Default" -g -r XOS1.cfg
```

The following example uploads the configuration file named `XOS2.cfg` to the TFTP server with an IP address of 10.123.45.67:

```
# tftp 10.123.45.67 -v "VR-Default" -p -r XOS2.cfg
```

The following example downloads a policy file to a USB storage device:

```
# tftp 10.1.2.3 -g -l /usr/local/ext/test.pol -r august23.pol
```

History

This command was first available in ExtremeXOS 10.1.

The memory card option was added in ExtremeXOS 11.1.

The internal-memory option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Path name support added in ExtremeXOS 15.5.1.

Block size support was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

tftp get

```
tftp get [ ip-address | host-name ] { vr vr_name } { block-size
block_size } remote-file local-file } { force-override }
```

Description

Allows you to use TFTP from the current command line interface session to copy the file from a TFTP server and copy it to a local host, including the switch, internal memory card, compact flash card, or USB 2.0 storage device.

Syntax Description

| | |
|-------------------|--|
| <i>host-name</i> | Specifies the name of the remote host. |
| <i>ip-address</i> | Specifies the IP address of the TFTP server. |

| | |
|------------------------|--|
| <i>vr_name</i> | Specifies the name of the virtual router. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>block_size</i> | Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65000 bytes. |
| <i>local_file</i> | Specifies the name of the file (configuration file, policy file) on the local host. |
| force-overwrite | Specifies the switch to automatically overwrite an existing file. |

Default

If you do not specify a virtual router, *VR-Mgmt*, and then *VR-Default* (if needed), is used. If you transfer a file with a name that already exists on the system, the switch prompts you to overwrite the existing file.

If you do not specify the internal memory card or a removable storage device, the switch downloads or uploads the file from the switch local file system.

If you do not specify block size, the default value is 1400 bytes.

Usage Guidelines

NetASCII and mail file type formats are not supported.

By default, the switch prompts you to overwrite an existing file. For example, if you have a file named test.cfg on the switch and download a file named test.cfg from a TFTP server, the switch displays a message similar to the following:

```
test.cfg already exists, do you want to overwrite it? (y/n)
```

Enter *y* to download the file and overwrite the existing file. Enter *n* to cancel this action.

If you successfully download the file, the switch displays a message similar to the following:

```
Downloading test.cfg to switch... done!
```

If you cancel this action, the switch displays a message similar to the following:

```
Tftp download aborted.
```

If you specify the force-overwrite parameter, the switch automatically overwrites an existing file. For example, if you have a file named test.cfg on the switch and download a file named test.cfg from a TFTP server, the switch automatically overrides the existing file. If you successfully download the file, the switch displays a message similar to the following:

```
Downloading test.cfg to switch... done!
```

This command was introduced to simplify using TFTP to transfer configuration, policy, and if configured, core dump files from the switch to the TFTP server. You can continue to use the original `tftp` command introduced in ExtremeXOS 10.1.

For more information about TFTP, including:

- TFTP server requirements.
- How to use TFTP.
- Host name and remote IP address character restrictions.
- Local and remote filename character restrictions.
- Virtual router requirements.
- Internal memory and core dump files.
- Other useful commands.

See the `tftp` command.

Example

The following command retrieves and transfers the file `test.pol` from a TFTP server with an IP address of 10.1.2.3 and renames the file `august23.pol` when transferred to a removable storage device:

```
tftp get 10.1.2.3 vr "VR-Mgmt" test.pol /usr/local/ext august23.pol
```

The following command retrieves the configuration file named `meg-upload.cfg` from a TFTP server with an IP address of 10.10.10.10:

```
tftp get 10.10.10.10 vr "VR-Mgmt" meg_upload.cfg
```

History

This command was first available in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Pathname support for local files was added in ExtremeXOS 15.5.1.

Block size support was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

tftp put

```
tftp put [ ip-address | host-name] {vr vr_name} {block-size  
block_size}local-file { remote-file}
```

Description

Allows you to use TFTP from the current command line interface session to copy the file from the local host, including the switch, internal memory card, compact flash card, or USB 2.0 storage device and put it on a TFTP server.

Syntax Description

| | |
|--------------------|--|
| <i>host-name</i> | Specifies the name of the remote host. |
| <i>ip-address</i> | Specifies the IP address of the TFTP server. |
| <i>vr_name</i> | Specifies the name of the virtual router. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>block_size</i> | Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65000 bytes. |
| <i>local-file</i> | Specifies the name of the file (configuration file, policy file) on the local host. |
| <i>remote-file</i> | Specifies the name of the file on the remote host. |

Default

If you do not specify a virtual router, *VR-Mgmt*, and then *VR-Default* (if needed), is used.

If you do not specify a virtual router, VR-Mgmt, and then VR-Default (if needed), is used.

If you do not specify the internal memory card or a removable storage device, the switch downloads or uploads the file from the switch local file system.

If you do not specify block size, the default value is 1400 bytes.

Usage Guidelines

This command is supported by IPv4 only.

NetASCII and mail file type formats are not supported.

This command was introduced to simplify using TFTP to transfer configuration, policy, and if configured, core dump files from the switch to the TFTP server. You can continue to use the original `tftp` command introduced in ExtremeXOS 10.1.

For more information about TFTP, including:

- TFTP server requirements.
- How to use TFTP.
- Host name and remote IP address character restrictions.
- Local and remote filename character restrictions.
- Virtual router requirements.
- Internal memory and core dump files.
- Other useful commands.

See the `tftp` command.

Example

The following command transfers a saved, not currently used configuration file named XOS1.cfg from the switch to the TFTP server:

```
tftp put 10.123.45.67 vr "VR-Mgmt" XOS1.cfg
```

History

This command was first available in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Block size support was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

top

top

Description

Displays real-time CPU utilization information by process.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show the percentage of CPU processing devoted to each process, sampled every 5 seconds.

You can change the display by typing a character while the display is active. The following table displays the supported commands.

Table 50: TOP Interactive Command Display Options

| Key | Action |
|--------------|--|
| P | Sort process list by CPU utilization |
| T | Sort process list by time usage |
| N | Sort process list by number (process ID) |
| M | Sort process list by memory usage |
| q [Ctrl] + c | Exit the top program |

For more detailed information about the top command including display options, command fields, and command usage, please refer to your UNIX documentation.

Example

The following command displays the real-time CPU utilization information by process:

```
top
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

traceroute

```
traceroute {vr vrid} {ipv4 host} {ipv6 host} {t1l number} {from from}
  {[port port] | icmp}
```

Description

Enables you to trace the routed path between the switch and a destination endstation.

Syntax Description

| | |
|----------------------------|--|
| vr | Specifies a virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>vrid</i> | Specifies which virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| ipv4 | Specifies IPv4 transport. |
| ipv6 | Specifies IPv6 transport. |
| <i>host</i> | Specifies the host of the destination endstation. |
| t <i>ttl number</i> | Configures the switch to trace up to the time-to-live number of the switch. |
| f <i>from from</i> | Uses the specified source address in the <i>ICMP</i> packet. If not specified, the address of the transmitting interface is used. |
| p <i>port port</i> | Specifies the UDP port number. |
| i <i>icmp</i> | Configures the switch to send ICMP echo messages to trace the routed path between the switch and a destination endstation. |

Default

N/A.

Usage Guidelines

Use this command to trace the routed path between the switch and a destination endstation.

Each router along the path is displayed.

Example

The following example enables the traceroute function to a destination of 123.45.67.8:

```
traceroute 123.45.67.8
```

The following is sample output that displays when the traceroute fails:

```
traceroute to 10.209.10.37, 30 hops max
 1  0.0.0.0                                * !u          * !u          * !u
--- Packet Response/Error Flags ---
(*) No response, (!N) ICMP network unreachable, (!H) ICMP host unreachable,
(!P) ICMP protocol unreachable, (!F) ICMP fragmentation needed,
(!S) ICMP source route failed, (!u) Transmit error, network unreachable,
(!f) Transmit error, fragmentation needed, (!t) General transmit error
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 variable was added in ExtremeXOS 11.2.

The display when the command fails was added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

traceroute mac port

```
traceroute mac mac {up-end-point} port port {domain} domain_name
                {association} association_name {t1 t1}
```

Description

Allows you to send out a Link Trace Message (LTM) for the specified MA from the MEP configured on the port for the specified MAC address to the end of the MA.

Syntax Description

| | |
|-------------------------|---|
| <i>mac</i> | Enter the unique system MAC address on the port configured as a MEP for the specified MA. Enter this value in the format XX:XX:XX:XX:XX:XX. |
| up-end-point | Use this keyword to force the LTM to be send from an UP MEP if both a DOWN MEP and an UP MEP are configured on the same port. |
| <i>port</i> | Enter the port number of the MEP from which you are issuing the LTM. |
| domain | Enter this keyword. |
| <i>domain_name</i> | IEEE 802.1ag or ITU-T Y.1731 association name. |
| association | Enter this keyword. |
| <i>association_name</i> | Enter the name of the association from which you are issuing the ping. |
| t1 | Enter this keyword. |
| <i>t1</i> | Enter the upper limit of MIPs the LTM can pass prior to reaching its destination. |

Default

TTL default value is 64.

Usage Guidelines

Use this command to send an LTM from the MEP on the port for the given MAC address. If no MEP is configured on the port, the system returns an error message.

If both an UP and DOWN MEP are configured on the same port, the system uses the DOWN MEP. If you want to use the UP MEP in this situation, enter the up-end-point keyword. After you issue the command, the system prints out the route the LTM message took.

Each MIP along the route passes the LTM along only in the direction of the path and sends a packet back to the originating MAC notifying that it passed the LTM. If the destination MAC type is configured as unicast on the association to which this MEP belongs to, link trace replies will not be received from any of the MIPs configured on the intermediate switches. If there is a MIP on the switch that originated the trace route, the MIP sends a link trace reply.

Example

The following commands send an LTM:

1. A trace route invoked from a customer device CE1 to another customer device CE3 connected through an *MPLS* cloud (MTU1 -' PE1 'PE3), where a VPLS MIP is configured to encode a system-name, will have a response as follows:

```
(debug) Switch # traceroute mac 00:04:96:28:02:15 port 1 "extr_cfm5" "extr_ma"
Send out Link Trace Message(LTM), collecting responses [press Ctrl-C to abort].

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

traceroute mpls lsp

```

traceroute mpls lsp [lsp_name | any host | prefix ipNetmask] {reply-mode
  [ip | ip-router-alert]} {{from from} {ttl ttl} {next-hop hopaddress}}

```

Description

Traces the path an LSP takes for the specified FEC.

Syntax Description

| | |
|------------------------|---|
| <i>lsp_name</i> | Specifies the LSP on which to send the <i>MPLS</i> echo request. |
| any | Allows the echo request to be sent over any available LSP. |
| <i>host</i> | Specifies the FEC using an ipaddress or hostname. |
| prefix | Specifies a prefix. |
| <i>ipNetmask</i> | Specifies the prefix address. |
| reply-mode | Specifies the reply mode for the MPLS echo response. |
| ip | Requests an IP UDP reply packet. This is the default mode. |
| ip-router-alert | Requests an IP UDP reply packet with the IP Router Alert option. |
| <i>from</i> | Specifies the IP address to be used as the source address in the MPLS echo request. |
| <i>ttl</i> | Specifies the starting TTL hop value. The range is from 1 - 30. The default is 1. |
| <i>hopaddress</i> | Specifies the next-hop address. |

Default

The maximum time-to-live value is 30 seconds.

Usage Guidelines

This command traces the path an LSP takes for the specified FEC. The `traceroute` command, with the `mpls` keyword option, works by repeatedly sending an MPLS echo request (or “MPLS Ping”). The TTL value is incremented for each successive MPLS echo request sent. The sending LSR waits 5 seconds before sending the next MPLS echo request. This operation continues until either the egress LSR for the FEC is reached, the maximum TTL value is reached, or the operation is interrupted. For each response received, the following information is displayed on the console:

- IP address of the replying LSR
- Return code
- Indication of an MPLS echo reply timeout if no response was received

The FEC can be specified using the `ipaddress` or `hostname` via the `host` parameter. If the optional `next-hop` is specified, the MPLS echo request is sent along the LSP that traverses the specified node. This option is useful for tracing a specific LSP when multiple LSPs exist to the specified FEC. The `lsp` keyword may be used to specify a named LSP to trace. The selected LSP is specified by the `lsp_name` parameter. The `any` keyword indicates that the switch can trace any available LSP to the specified host.

The optional `reply-mode` keyword is used to specify the reply mode for the MPLS echo response. When the `ip` option is specified, the MPLS echo reply is routed back to the sender in a normal IPv4 packet. When the `ip-router-alert` option is specified, the MPLS echo reply is routed back to the sender in an IPv4 packet with the Router Alert IP option set. Additionally, if the `ip-router-alert` option is specified and the reply route is via an LSP, the Router Alert Label is pushed onto the top of the label stack. If the `reply-mode` is not specified, the `reply-mode ip` option applies.

The optional `ttl` keyword specifies the starting TTL value in the MPLS echo request packet. Within each router along the path, the TTL value is decremented. When the TTL value reaches zero, the LSR drops the packet and replies with a TTL-expired `ICMP` message. The originating LSR responds by displaying the hop for which the TTL expired. To discover all hops to a destination, the originating router repeats the MPLS echo request and increments the TTL start value by one each time until the destination is reached. The maximum TTL is 30, so the `traceroute` command terminates if the destination is not reached in 30 hops.

If the `ttl` keyword is omitted, the starting TTL value is 1. If you specify a larger starting TTL value, initial hops are excluded from the `traceroute` display. For example, if you specify a start TTL value of 5, the TTL value does not decrement to 0 at the first four routers, so the fifth hop router is the first to appear in the `traceroute` command display.

The `from` keyword is used to specify the source IP address used in the MPLS echo request. This is the IP address used by the target LSR to send the MPLS echo reply. If not specified, the `OSPF` router ID is used.

Example

The following example shows a sample display for the `traceroute` command:

```
# traceroute mpls lsp prefix 11.100.100.10/32
traceroute to 11.100.100.10, 30 hops max
 1  11.100.100.8                5 ms      5 ms      2 ms
 2  11.100.100.10              2 ms      1 ms      2 ms
```

```
# traceroute mpls lsp lsp598
traceroute to lsp598, 30 hops max
 1  11.100.100.5           6 ms           1 ms           5 ms
 2  11.100.100.9           3 ms           2 ms           2 ms
 3  11.100.100.8           3 ms           4 ms           3 ms
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unalias

```
unalias alias_name -a
```

Description

Deletes aliases for ExtremeXOS commands.

Syntax Description

| | |
|-------------------|---|
| <i>alias_name</i> | Specifies the alias name to be deleted. |
| -a | Deletes all aliases. |

Default

N/A

Usage Guidelines

To see a list of your current aliases, use the command [alias](#) on page 90 with no arguments.

When using this command, you can auto-complete an alias name by typing part of the name, and then pressing **[Tab]**.

Example

The following example deletes all aliases:

```
unalias -a
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure access-list

```
unconfigure access-list policy_name {any | ports port_list | vlan
vlan_name} {ingress | egress}
```

Description

Removes a policy file ACL from the specified interface.

Syntax Description

| | |
|--------------------|---|
| <i>policy_name</i> | Specifies the ACL policy name. The name can be from 1-32 characters long. |
| <i>port_list</i> | Specifies the ingress or egress port list on which the ACL is applied. |
| <i>vlan_name</i> | Specifies the <u>VLAN</u> on which the ACL is applied. |
| ingress | Remove the ACL for packets entering the switch on this interface. |
| egress | Remove the ACL for packets leaving the switch from this interface |

Default

The default direction is ingress.

Usage Guidelines

This command removes ACLs that are contained in ACL policy files. To remove dynamic ACLs, use the following command:

```
configure access-list delete ruleName [ any | vlanvlan_name |
portsport_list | all] {ingress | egress}
```

To remove all non-dynamic ACLs from all interfaces, do not specify any ports or VLANs.

Example

The following command removes the ACL from port 1:2:

```
unconfigure access-list ports 1:2
```

The following command removes the ACLs from ports 1:2-6:3 and 7:1:

```
unconfigure access-list ports 1:2-6:3,7:1
```

The following command removes the wildcard ACL:

```
unconfigure access-list any
```

The following command removes all ACLs from all the interfaces, including the wildcard ACL:

```
unconfigure access-list
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was first available in ExtremeXOS 11.0.

The egress option was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

The egress options are available on all platforms.

unconfigure avb

```
unconfigure avb
```

Description

This command is a macro command that can be used to unconfigure all AVB protocols globally on the switch. It is equivalent to issuing the following four commands:

```
unconfigure mvrp
```

```
unconfigure msrp
```

```
unconfigure network-clock gtp
```

```
unconfigure mrp ports all
```

Syntax Description

| | |
|------------|----------------------|
| avb | Audio Video Bridging |
|------------|----------------------|

Default

N/A.

Usage Guidelines

Example

Use this command to unconfigure all AVB protocols globally on the switch.

```
unconfigure avb
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

unconfigure banner

```
unconfigure banner { after-login | before-login }
```

Description

Unconfigures a specified banner from CLI screens.

Syntax Description

| | |
|---------------------|--|
| after-login | Specifies the banner that is displayed after login. |
| before-login | Specifies the banner that is displayed before login. |

Default

N/A.

Usage Guidelines

Use this command to unconfigure one of two different types of banners:

- CLI session before login.
- CLI session after login.

If no optional parameters are specified, all configured banners are erased. To delete a specific banner, the before-login or after-login keyword must be used.

Banners can also be cleared by configuring a banner with only a <ret> or \n character.

Example

The following command clears the after-login banner, Welcome to the switch:

```
unconfigure banner after-login [Return]
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bfd vlan

```
unconfigure bfd vlan vlan_name
```

Description

Unconfigures BFD settings from a specified *VLAN*.

Syntax Description

| | |
|------------------|--------------------------|
| <i>vlan_name</i> | Specifies the VLAN name. |
|------------------|--------------------------|

Default

N/A.

Usage Guidelines

Use this command to unconfigure BFD settings from a specified VLAN.

Example

The following command unconfigures the BFD settings on the VLAN named vlan1:

```
# unconfigure bfd vlan vlan1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5520 series switches.

unconfigure bootprelay dhcp-agent information check

```
unconfigure bootprelay dhcp-agent information check
```

Description

Disables *DHCP* relay agent option (option 82) checking.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

In some instances, a DHCP server may not properly handle a DHCP request packet containing a relay agent option. Use this command to disable the switch from preventing DHCP reply packets with invalid or missing relay agent options from being forwarded to the client.

To enable this check, use the following command:

```
configure bootprelay dhcp-agent information check
```

Example

The following example disables the DHCP relay agent option check:

```
unconfigure bootprelay dhcp-agent information check
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootprelay dhcp-agent information circuit-id port-information

```
unconfigure bootprelay dhcp-agent information circuit-id port-
information ports [port_list | all]
```

Description

Configures the circuit ID sub-option that identifies the specified ports to use the default value.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies a list of one or more ports that are to be configured to use the default value. |
| all | Specifies that all ports are to be configured to use the default value. |

Default

The port_info is encoded as ((slot_number * 1000) + port_number). For example, if the *DHCP* request is received on port 3:12, the default circuit ID port_info value is 3012. On non-slot-based switches, the default circuit ID port_info value is simply the port number.

Usage Guidelines

None.

Example

The following example configures port 1:3 to use the default circuit ID port information value:

```
unconfigure bootprelay dhcp-agent information circuit-id port-information ports 1:3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootprelay dhcp-agent information circuit-id vlan-information

```
unconfigure bootprelay dhcp-agent information circuit-id vlan-
information {vlan} [vlan_name|all]
```

Description

Configures the circuit ID sub-option that identifies the specified VLANs to use the default value.

Syntax Description

| | |
|------------------|---|
| <i>vlan_name</i> | Names a VLAN to be configured to use the default value. |
| all | Specifies that all VLANs are to be configured to use the default value. |

Default

N/A.

Usage Guidelines

None.

Example

The following example configures VLAN "blue" to use the default VLAN information for the circuit ID sub-option:

```
unconfigure bootprelay dhcp-agent information circuit-id vlan-information blue
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootprelay dhcp-agent information option

```
unconfigure bootprelay dhcp-agent information option
```

Description

Disables the DHCP relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

To enable the DHCP relay agent option (option 82), use the following command:

```
configure bootrelay dhcp-agent information option
```

Example

The following example disables the DHCP relay agent option:

```
unconfigure bootrelay dhcp-agent information option
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootrelay dhcp-agent information policy

```
unconfigure bootrelay dhcp-agent information policy
```

Description

Unconfigures the *DHCP* relay agent option (option 82) policy.

Syntax Description

This command has no arguments or variables.

Default

Replace.

Usage Guidelines

Use this command to unconfigure the policy for the relay agent.

Example

The following example unconfigures the DHCP relay agent option 82 policy:

```
unconfigure bootrelay dhcp-agent information policy
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootprelay dhcp-agent information remote-id

```
unconfigure bootprelay dhcp-agent information remote-id {vr vrid}
```

Description

Configures the remote ID sub-option to the default value.

Syntax Description

| | |
|-------------|---|
| <i>vrid</i> | Specifies the VR on which to configure the remote ID sub-option to the default value. |
|-------------|---|

Default

The switch MAC address.

Usage Guidelines

None.

Example

The following example configures the remote ID sub-option to use the default value on the current VR:

```
configure bootprelay dhcp-agent information remote-id
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootprelay dhcp-agent source-vlan

```
unconfigure bootprelay dhcp-agent source-vlan {vr vrid}
```

Description

Unconfigures the source VLAN to use as the source IP address in the BOOTPreplay packet.

Syntax Description

| | |
|--------------------|--|
| bootprelay | Specifies BOOTPrelay agent information option. |
| dhcp-agent | Specifies DHCP agent. |
| source-vlan | Specifies unconfiguring the source loopback VLAN to use as the source IP address in the giaddr field when BOOTPrelay is used for anycast VLAN. |
| vr | Specifies unconfiguring the VLAN on the specific virtual router ID. |
| <i>vrid</i> | Specifies the virtual router ID. |

Default

If you do not specify a VR, the unconfiguring occurs on VR-Default.

Usage Guidelines

To view the selected source VLAN, use the command `show bootprelay configuration {ipv4 | ipv6} {{vlan vlan_name } | {vr vr_name}}`.

Example

The following example unconfigures the VLAN to use as the source IP address in the BOOTPrelay packet on vr "vr1":

```
# unconfigure bootprelay dhcp-agent source-vlan vr vr1
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure bootprelay include-secondary

```
unconfigure bootprelay {ipv4 | ipv6} {vlan} vlan_name include-secondary
```

Description

Removes the specified smart relay configuration that was specified at the VLAN level.

Syntax Description

| | |
|--------------------------|---|
| ipv4 | Specifies unconfiguring the DHCPv4 BOOTP Relay service (default). |
| ipv6 | Specifies unconfiguring the DHCPv6 BOOTP Relay service. |
| vlan | Unconfigures BOOTP relay for a specified VLAN. |
| <i>vlan_name</i> | Specifies the VLAN name. |
| include-secondary | Removes the include-secondary configuration for the specified VLAN. |

Default

IPv4 is the default relay service.

Usage Guidelines

Use this command to remove the specified smart relay configuration that was specified at the VLAN level.

Example

The following command removes DHCPv4 BOOTP Relay service, and removes the **include-secondary** configuration for the VLAN "vlan 100":

```
unconfigure bootprelay ipv4 vlan vlan_100 include-secondary
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure cfm domain association end-point transmit-interval

```
unconfigure cfm domain domain_name association association_name {ports
  port_list end-point [up | down]} transmit-interval
```

Description

Unconfigures the CCM interval of the association or MEP to the default interval.

Syntax Description

| | |
|-------------------------|--|
| <i>domain_name</i> | Specifies the domain associated with the MA. |
| <i>association_name</i> | IEEE 802.1ag or ITU-T Y.1731 association name. |

| | |
|------------------|--|
| <i>port_list</i> | Specifies the ports to unconfigure. |
| up | Enter this variable if you are changing the time interval for sending a CCM on an UP MEP. |
| down | Enter this variable if you are changing the time interval for sending a CCM on a DOWN MEP. |

Default

1000 ms.

Usage Guidelines

Use this command to revert the CCM interval of either the association or the MEP back to the default CCM interval.

Example

The following command changes the interval the UP MEP (previously configured on port 2:4) uses to send CCM messages on the 350 association in the finance domain to the default of 1000 ms:

```
unconfigure cfm domain finance association 350 ports 2:4 end-point up transmit-interval
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure cos-index

```
unconfigure cos-index cos_index [{qosprofile} {ingress-meter} {replace-tos}]
```

Description

This command removes the cos-index from the configuration when no attribute is entered or if the last one is unconfigured.

Syntax Description

| | |
|-------------------|-------------------------------|
| <i>cos_index</i> | Class of Service index value. |
| qosprofile | QoS profile. |

| | |
|----------------------|-----------------------------|
| ingress-meter | Ingress rate-limiter meter. |
| replace-tos | Replace TOS value. |

Default

N/A.

Usage Guidelines

Use this command to remove the cos-index from the configuration.

Example

```
unconfigure cos-index 50
unconfigure cos-index 51 qosprofile ingress-meter replace-dotlp
unconfigure cos-index 52 qosprofile
unconfigure cos-index 52 ingress-meter
unconfigure cos-index 52 replace-dotlp
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure diffserv examination

```
unconfigure diffserv examination
```

Description

Disables DiffServ traffic groups.

Syntax Description

N/A.

Default

Disabled.

Usage Guidelines

Use this command to disable DiffServ code point examination.

Example

The following command disables DiffServ code point examination:

```
unconfigure diffserv examination
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure diffserv replacement

```
unconfigure diffserv replacement
```

Description

Resets all DiffServ replacement mappings to the default values.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to reset all DiffServ replacement mappings to default values.

Example

The following command resets the DiffServ replacement mappings to their default values:

```
unconfigure diffserv examination
```

History

This command was first available in ExtremeXOS 11.0.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure eaps port

```
unconfigure eaps eapsDomain [primary | secondary] port
```

Description

Sets the specified port's internal configuration state to INVALID.

Syntax Description

| | |
|-------------------|---|
| <i>eapsDomain</i> | Specifies the name of an <i>EAPS</i> domain. |
| primary | Specifies that the primary port should be unconfigured. |
| secondary | Specifies that the secondary port should be unconfigured. |

Default

N/A.

Usage Guidelines

Unconfiguring an EAPS port sets its internal configuration state to INVALID, which causes the port to appear in the Idle state with a port status of Unknown when you use the `show eaps detail` command to display the status information about the port.

To prevent loops in the network, the switch displays by default a warning message and prompts you to unconfigure the specified EAPS primary or secondary ring port. When prompted, do one of the following:

- Enter `y` to unconfigure the specified port.
- Enter `n` or press [Return] to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the `configure eaps config-warnings off`.

Example

The following command unconfigures this node's EAPS primary ring port on the domain `eaps_1`:

```
unconfigureeapseaps_1primary port
```

The switch displays the following warning message and prompts you to confirm this action:

WARNING: Unconfiguring the Primary port from the EAPS domain could cause a loop in the network! Are you sure you want to unconfigure the Primary EAPS Port? (y/n)

Enter y to continue and unconfigure the EAPS primary ring port. Enter n to cancel this action.

The switch displays a similar warning message if you unconfigure the secondary EAPS port.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure eaps shared-port link-id

```
unconfigure eaps shared-port ports link-id
```

Description

Unconfigures an *EAPS* link ID on a shared port on the switch.

Syntax Description

| | |
|--------------|--|
| <i>ports</i> | Specifies the port number of the Common Link port. |
|--------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the link ID on shared port 1:1.

```
unconfigure eaps shared-port 1:1 link-id
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure eaps shared-port mode

```
unconfigure eaps shared-port ports mode
```

Description

Unconfigures the [EAPS](#) shared port mode.

Syntax Description

| | |
|--------------|--|
| <i>ports</i> | Specifies the port number of the Common Link port. |
|--------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the shared port mode on port 1:1:

```
unconfigure eaps shared-port 1:1 mode
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure elrp-client

```
unconfigure elrp-client {vlan_name | dynamic-vlans}
```

Description

Disables a pending one-shot or periodic ELRP request for the specified *VLAN* or for all dynamic VLANs.

Syntax Description

| | |
|----------------------|---|
| <i>vlan_name</i> | Specifies a VLAN name. |
| dynamic-vlans | Removes all ELRP configuration options for dynamically created VLANs. |

Default

N/A.

Usage Guidelines

This command disables a pending one-shot or periodic ELRP request for the specified VLAN or dynamic VLANs.

To start one-time, non-periodic ELRP packet transmission on specified ports of a VLAN using a particular count and interval, use one of the following commands:

- [configure elrp-client one-shot](#) on page 454
- [run elrp](#) on page 2472

To configure periodic transmission of ELRP packets, use the [configure elrp-client periodic](#) command.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the [enable elrp-client](#) command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the [disable elrp-client](#) command to globally disable the ELRP client.

Example

The following command disables a pending ELRP request on VLAN elrp1:

```
unconfigure elrp-client elrp1
```

History

This command was first available in ExtremeXOS 11.1.

The **dynamic-vlans** option was added in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure elrp-client disable ports

```
unconfigure elrp-client disable-ports
```

Description

Deletes an ELRP exclude port list.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to remove an ELRP exclude port list.

Example

The following example removes the existing ELRP exclude port list:

```
unconfigure elrp-client disable-port
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure erps cfm

```
unconfigure {erps} ring-name cfm
```

Description

Unconfigure the CFM maintenance association for the ERPS ring.

Syntax Description

| | |
|------------------|--|
| <i>ring-name</i> | Alphanumeric string that identifies the ERPS ring. |
|------------------|--|

Default

N/A.

Usage Guidelines

Use this command to unconfigure connectivity fault management (CFM) for the ERPS ring.

Example

The following command unconfigures connectivity fault management on an ERPS ring named “ring1”:

```
unconfigure erps ring1 cfm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps neighbor-port

```
unconfigure erps ring-name neighbor-port
```

Description

Delete the ring protection link (RPL) neighbor configuration for the *ERPS* ring.

Syntax Description

| | |
|------------------|--|
| <i>ring-name</i> | Alphanumeric string that identifies the ERPS ring. |
|------------------|--|

Default

N/A.

Usage Guidelines

See Description.

Example

The following command deletes RPL neighbor configuration for the ERPS ring named “ring1”:

```
unconfigure erps ring1 neighbor-port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps notify-topology-change

```
unconfigure {erps} ring-name notify-topology-change {eaps} domain_name
```

Description

Delete an ERPS sub-ring from the EAPS domain.

Syntax Description

| | |
|--------------------|--|
| <i>ring-name</i> | Alphanumeric string identifying the ERPS sub-ring. |
| <i>domain_name</i> | Alphanumeric string identifying the EAPS domain. |

Default

N/A.

Usage Guidelines

Use this command to delete an ERPS sub-ring from the EAPS domain.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps protection-port

```
unconfigure erps ring-name protection-port
```

Description

Delete ring protection link (RPL) owner configuration for the *ERPS* ring.

Syntax Description

| | |
|------------------|--|
| <i>ring-name</i> | Alphanumeric string that identifies the ERPS ring. |
|------------------|--|

Default

N/A.

Usage Guidelines

Use this command to delete ring protection link (RPL) owner configuration for the ERPS ring.

Example

The following command deletes RPL owner configuration on an ERPS ring named "ring1":

```
unconfigure erps ring1 protection-port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps ring-ports west

```
unconfigure erps ring-name ring-ports west
```

Description

Delete ring ports on the *ERPS* ring.

Syntax Description

| | |
|------------------|--|
| <i>ring-name</i> | Alphanumeric string that identifies the ERPS ring. |
| west | Delete the ring port on the west port of the switch. |

Default

N/A.

Usage Guidelines

Use this command to delete ring ports on the ERPS ring. Ring ports are the ports of the switch that connect it to the ERPS ring. This command deletes the ring port on the west port of the switch.

Note

On unconfiguring the west port, the node is treated as an interconnected node.

Example

The following command deletes the ring ports on the west port of the switch for an ERPS ring named “ring1”:

```
unconfigure erps ring1 ring-ports west
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure icmp

```
unconfigure icmp
```

Description

Resets all *ICMP* settings to the default values.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example resets all ICMP settings to the default values.

```
unconfigure icmp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure igmp

```
unconfigure igmp
```

Description

Resets all *IGMP* settings to their default values and clears the IGMP group table.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets all IGMP settings to their default values and clears the IGMP group table:

```
unconfigure igmp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure identity-management list-precedence

```
unconfigure identity-management list-precedence
```

Description

This command allows you to restore the order of list-precedence to factory defaults. The default list-precedence is: greylist blacklist whitelist.

Syntax Description

This command has no arguments or variables.

Default

greylist, blacklist, whitelist.

Usage Guidelines

Use this command to restore the order of list-precedence to factory defaults. The default list-precedence is: greylist blacklist whitelist.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure identity-management

```
unconfigure identity-management {[[database memory-size] | [stale-entry  
aging-time] | [ports] | [kerberos snooping {aging time}]]}
```

Description

Sets the specified identity management configuration parameter to the default values.

Syntax Description

| | |
|-------------------------------------|--|
| database memory-size | Sets the identity management database size to the default value. |
| stale-entry aging-time | Sets the stale-entry aging-time to the default value. |
| ports | Removes all ports from the identity management port list. |
| kerberos snooping aging time | Sets the kerberos snooping aging time to the default value (none). |

Default

N/A.

Usage Guidelines

If no configuration parameters are specified, all configuration parameters are set to the default values.

Example

The following command sets all identity management configuration parameters to the default values:

```
* Switch.4 # unconfigure identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure igmp snooping vlan ports set join-limit

```
unconfigure igmp snooping {vlan} vlan_name ports port_list set join-  
limit
```

Description

Removes the join limit set on VLAN ports.

Syntax Description

| | |
|------------------------|---|
| <code>vlan_name</code> | Specifies a VLAN name. |
| <code>port_list</code> | Specifies one or more ports or slots and ports. |

Default

No limit.

Usage Guidelines

None.

Example

The following command removes the join limit for port 2:1 in the Default VLAN:

```
unconfigure igmp snooping "Default" ports 2:1 set join-limit
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *IGMP* snooping feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure igmp ssm-map

```
unconfigure igmp ssm-map {{vr} vr-name}
```

Description

Unconfigures all SSM mappings on the virtual router.

Syntax Description

| | |
|----------------------|---|
| <code>vr-name</code> | Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context. |
|----------------------|---|

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes all *IGMP*-SSM mappings on the virtual router "xyz":

```
unconfigure igmp ssm-map vr xyz
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

NEW! unconfigure inline-power classification

```
unconfigure inline-power classification ports port_list
```

Description

This command configures *PoE* port-level classification power-up mode for Extreme Networks PoE devices that do not support 802.3bt when connecting to switches with 60W/90W PoE ports. ExtremeSwitching platforms support per-port basis configuration.

Syntax Description

| | |
|-----------------------|---------------------------------------|
| classification | Classification power-up mode. |
| ports | Specifies the port. |
| <i>port_list</i> | Port list separated by a comma or - . |

Default

N/A.

Usage Guidelines

This command restores port-level classification power-up mode to default based on port type.

Example

```
# show inline-power configuration ports 20-26
Port  Config  Operator  Limit  Priority  Detection  Classification
```

| Label | Enabled | Power | Priority | Platform | Platform |
|---------|---------|-------------------------|----------|----------------------------|---------------|
| 20 N | Enabled | 60000 mW | Low | 802.3af-only | 802.3pre-bt |
| 21 N | Enabled | 60000 mW | Low | 802.3af-only | 802.3bt-type3 |
| 22 N | Enabled | 60000 mW | Low | 802.3af-only | 802.3bt-type3 |
| 23 N | Enabled | 45000 mW | Low | 2-point legacy-and-802.3af | 802.3bt-type3 |
| 24 N | Enabled | 60000 mW x435-port10 | Low | 802.3af-only | 802.3at |
| 25 N | Enabled | 90000 mW | Low | 4-point legacy-and-802.3af | 802.3pre-bt |
| 26 N | Enabled | 90000 mW | Low | 802.3af-only | 802.3bt-type3 |

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

- ExtremeSwitching 5520-12MW-36W—ExtremeXOS 31.1 and later.

unconfigure inline-power detection ports

```
unconfigure inline-power detection ports [port_list | all]
```

Description

This command unconfigures *PoE* device detection mode for ExtremeSwitching series switches and SummitStacks. ExtremeSwitching platforms support per-port basis configuration.

Syntax Description

| | |
|------------------|---------------------------------------|
| <i>port_list</i> | Port list separated by a comma or - . |
| all | All ports. |

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure inline-power disconnect-precedence

```
unconfigure inline-power disconnect-precedence
```

Description

Unconfigures the disconnect precedence setting and returns the switch to the default disconnect precedence value of deny port.

Syntax Description

This command has no arguments or variables.

Default

Deny-port.

Usage Guidelines

You configure this parameter for the entire switch; you cannot configure this per slot or per port.

Unconfigures the *PoE* disconnect precedence previously set for the switch and returns the disconnect precedence to the default value of deny port. Deny port denies power to the next PD that requests inline power from the slot when the inline power budget for the switch or slot is reached, regardless of the inline power port priority.

Example

The following command resets the switch to the PoE disconnect precedence value, which is deny port:

```
unconfigure inline-power disconnect-precedence
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in [Extreme Networks PoE Devices](#).

unconfigure inline-power operator-limit ports

```
unconfigure inline-power operator-limit ports [all | port_list]
```

Description

Unconfigures the *PoE* operator limit setting and resets the power limit allowed for PDs connected to the specified ports to the default values.

Syntax Description

| | |
|------------------|--|
| all | Specifies all ports. |
| <i>port_list</i> | Specifies one or more slots and ports. |

Default

PoE—15400 mW.

PoE+—30000 mW.

Usage Guidelines

This command unconfigures any previously configured operator limit for the specified ports. It resets the maximum power that any PD can draw to 15400 mW for PoE and 30000 mW for PoE+.

Example

The following command resets the limit on ports 3 to 6 on a switch to the default value of 15400 mW:

```
unconfigure inline-power operator-limit ports 3-6
```

History

This command was first available in ExtremeXOS 11.1.

PoE+ was added in ExtremeXOS 12.5.

Platform Availability

This command is available on the PoE devices listed in [Extreme Networks PoE Devices](#).

unconfigure inline-power priority ports

```
unconfigure inline-power priority ports [all | port_list]
```

Description

Unconfigures the *PoE* priority on the specified ports, and returns the ports to the default PoE port priority value of low.

Syntax Description

| | |
|------------------|---|
| all | Specifies all ports. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

Low.

Usage Guidelines

Use this to reset the PoE port priority on specified ports on switches to the default value of low.

If there are multiple ports on the switch at the same priority level (either configured, or by default) and one of the ports must have power withdrawn because of excessive power demands, those ports with the lower port number are powered first. The higher port numbers have power withdrawn first in the case of equal PoE port priorities.

Example

The following command resets the PoE priority on ports 4 - 6 to low:

```
unconfigure inline-power priority ports 4-6
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in [Extreme Networks PoE Devices](#).

unconfigure inline-power usage-threshold

```
unconfigure inline-power usage-threshold
```

Description

Unconfigures the inline power usage alarm threshold and returns threshold to the default value of 70%.

Syntax Description

This command has no arguments or variables.

Default

70.

Usage Guidelines

This command unconfigures the *PoE* usage threshold setting for initiating *SNMP* event and EMS messages and returns the switch's inline power usage threshold for to 70%. The system initiates an event and message once that percentage of the budgeted power is being used.

On stand-alone switches, this PoE threshold applies to the entire switch.

The system generates an additional SNMP event and EMS message once the power usage falls below the threshold again; once the condition clears.

Example

The following command resets the inline power usage alarm threshold to 70%:

```
unconfigure inline-power usage-threshold
```

History

This command was first available in ExtremeXOS 11.1

Platform Availability

This command is available on the PoE devices listed in [Extreme Networks PoE Devices](#).

unconfigure iparp

```
unconfigure iparp
```

Description

Resets the following to their default values:

- IP ARP timeout
- Maximum ARP entries
- Maximum ARP pending entries
- ARP checking
- ARP refresh

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example resets IP ARP timeout to its default value:

```
unconfigure iparp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-fix

```
unconfigure ip-fix
```

Description

Unconfigures IPFIX globally.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure IPFIX globally by removing all port and collector configuration and disabling IPFIX on all ports.

Example

The following command removes all IPFIX configuration:

```
unconfigure ip-fix
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-fix flow-key

```
unconfigure ip-fix flow-key
```

Description

Unconfigures IPFIX flow key configuration and resets to the default.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to remove the flow-key settings that were configured using the following commands and reset to all the available keys:

```
configure ip-fix flow-key ipv4
```

```
configure ip-fix flow-key ipv6
```

```
configure ip-fix flow-key nonip
```

Example

The following command removes IPFIX flow key settings:

```
unconfigure ip-fix flow-key
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-fix ip-address

```
unconfigure ip-fix ip-address
```

Description

Unconfigures the collector settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the collector settings and reset to the default.

Example

The following command returns to the default:

```
unconfigure ip-fix ip-address
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-fix ports

```
unconfigure ip-fix ports port_list
```

Description

Unconfigures IPFIX on a port or group of ports.

Syntax Description

| | |
|------------------------|----------------------|
| <code>port_list</code> | Specifies the ports. |
|------------------------|----------------------|

Default

N/A.

Usage Guidelines

Use this command to unconfigure IPFIX on a port or group of ports. This restores the configuration to the defaults for those ports. The global enable/disable of IPFIX is not affected by this command.

Example

The following command unconfigures IPFIX on port 2:

```
unconfigure ip-fix ports 2
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-fix ports flow-key mask

```
unconfigure ip-fix ports port_list flow-key mask
```

Description

Unconfigures the IPv4 and IPv6 masks.

Syntax Description

| | |
|------------------------|----------------------|
| <code>port_list</code> | Specifies the ports. |
|------------------------|----------------------|

Default

N/A.

Usage Guidelines

Use this command to remove masks for the IPv4 and IPv6 source and destination address fields on ports. These masks were defined using one or more of the following commands:

```
configure ip-fix ports flow-key ipv4 mask ipaddress
```

```
configure ip-fix ports flow-key ipv6 mask ipaddress
```

Example

The following command removes a mask on port 2:1:

```
unconfigure ip-fix ports 2:1 flow-key mask
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-fix source ip-address

```
unconfigure ip-fix source ip-address
```

Description

Unconfigures the source IP address used to communicate to the collector.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the source ipaddress and reset to the default.

Example

The following command returns to the default:

```
unconfigure ip-fix source ip-address
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure iproute priority

```
unconfigure iproute {ipv4} priority [all | blackhole | bootp | ebgp |
  ibgp | icmp | isis | isis-level-1 | isis-level-1-external | isis-
  level-2 | isis-level-2-external | mpls | ospf-as-external | ospf-
  extern1 | ospf-extern2 | ospf-inter | ospf-intra | rip | static |
  evpn] {vr vrname}
```

Description

Unconfigures the priority for all IP routes from one or all route origin types.

Syntax Description

| | |
|------------------------------|---|
| all | Specifies all route origins. |
| blackhole | Specifies the blackhole route. |
| bootp | Specifies BOOTP. |
| ebgp | Specifies E- <i>BGP</i> routes. |
| ibgp | Specifies I-BGP routes. |
| icmp | Specifies <i>ICMP</i> . |
| isis | Specifies IS-IS and applies only to blackhole routes installed for summary addresses. |
| isis-level-1 | Specifies IS-IS Level 1 routing. |
| isis-level-1-external | Specifies IS-IS Level 1 External routing. |
| isis-level-2 | Specifies IS-IS Level 2 routing. |
| isis-level-2-external | Specifies IS-IS Level 2 External routing. |
| mpls | Specifies <i>MPLS</i> routing. |
| ospf-as-external | Specifies <i>OSPF</i> as External routing. |
| ospf-extern1 | Specifies OSPF External 1 routing. |

| | |
|---------------------|------------------------------------|
| ospf-extern2 | Specifies OSPF External 2 routing. |
| ospf-inter | Specifies OSPFInter routing. |
| ospf-intra | Specifies OSPFIntra routing. |
| rip | Specifies <i>RIP</i> . |
| static | Specifies static routes. |
| evpn | Specifies EVPN routes. |
| <i>vrname</i> | Specifies a VR or VRF name. |

Default

N/A.

Usage Guidelines

Unconfiguring the IP route priorities sets the priority back to its default priority.

Default Route Priorities

The following table lists the default priorities that apply after you run this command.

Table 51: Relative Route Priorities

| Route Origin | Priority |
|--------------|----------|
| Direct | 10 |
| MPLS | 20 |
| Blackhole | 50 |
| Static | 1100 |
| HostMobility | 1150 |
| ICMP | 1200 |
| EVPN | 1698 |
| Autopeering | 1699 |
| EBGP | 1700 |
| IBGP | 1900 |
| OSPFIntra | 2200 |
| OSPFInter | 2300 |
| IS-IS | 2350 |
| IS-IS L1 | 2360 |
| IS-IS L2 | 2370 |
| RIP | 2400 |
| OSPFAsExt | 3100 |

Table 51: Relative Route Priorities (continued)

| Route Origin | Priority |
|-----------------|----------|
| OSPF External 1 | 3200 |
| OSPF External 2 | 3300 |
| IS-IS L1 Ext | 3400 |
| IS-IS L2 Ext | 3500 |
| BOOTP | 5000 |

Example

The following example returns the IP route priority for all route origins to the default values:

```
# unconfigure iproute priority all
```

History

This command was first available in ExtremeXOS 12.1.2.

The **evpn** option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure iproute ipv6 priority

```
unconfigure iproute ipv6 priority [all | blackhole | icmp | isis | isis-
level-1 | isis-level-1-external | isis-level-2 | isis-level-2-
external | ospfv3-as-external | ospfv3-extern1 | ospfv3-extern2 |
ospfv3-inter | ospfv3-intra | ripng | static] {vr vr_name}
```

Description

Resets the priority for all IPv6 routes from one or all route origin types to the default values.

Syntax Description

| | |
|---------------------|---|
| all | Specifies all route origins. |
| blackhole | Specifies the blackhole route. |
| icmp | Specifies <i>ICMP</i> . |
| isis | Specifies IS-IS and applies only to blackhole routes installed for summary addresses. |
| isis-level-1 | Specifies IS-IS Level 1 routing. |

| | |
|------------------------------|--|
| isis-level-1-external | Specifies IS-IS Level 1 External routing. |
| isis-level-2 | Specifies IS-IS Level 2 routing. |
| isis-level-2-external | Specifies IS-IS Level 2 External routing. |
| ospfv3-as-external | Specifies <i>OSPF</i> as External routing. |
| ospfv3-extern1 | Specifies OSPF External 1 routing. |
| ospfv3-extern2 | Specifies OSPF External 2 routing. |
| ospf3-inter | Specifies OSPFInter routing. |
| ospf3-intra | Specifies OSPFIntra routing. |
| ripng | Specifies <i>RIP</i> . |
| static | Specifies static routes. |
| <i>vr_name</i> | Specifies a VR or VRF name. |

Default

N/A.

Usage Guidelines

The following table lists the default values that apply after you enter this command.

Default Route Priorities

| Route Origin | Priority |
|---------------------|----------|
| Direct | 10 |
| BlackHole | 50 |
| Static | 1100 |
| ICMP | 1200 |
| OSPF3Intra | 2200 |
| OSPF3Inter | 2300 |
| IS-IS L1 | 2360 |
| IS-IS L2 | 2370 |
| RIPg | 2400 |
| <i>OSPFv3</i> ASExt | 3100 |
| OSPFv3 Extern1 | 3200 |
| OSPFv3 Extern2 | 3300 |
| IS-IS L1 Ext | 3400 |
| IS-IS L2 Ext | 3500 |

Example

The following example returns the IPv6 route priority for all route origins to the default values:

```
unconfigure iproute ipv6 priority all
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure ip-security dhcp-snooping information check

```
unconfigure ip-security dhcp-snooping information check
```

Description

Disables the *DHCP* relay agent option (option 82) checking in the server-originated packets.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command disables the checking of the server-originated packets for the presence of option 82 so the packets will be forwarded normally.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-security dhcp-snooping information circuit-id port-information ports

```
unconfigure ip-security dhcp-snooping information circuit-id port-  
information ports [port_list | all]
```

Description

Unconfigures the port information portion of the circuit ID.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies the port(s) for which port information of the circuit-ID is unconfigured. |
| all | Specifies all ports. |

Default

The default is all.

Usage Guidelines

This command unconfigures the port information portion of the circuit ID string for the indicated ports thereby restoring it to the default (ifIndex value).

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-security dhcp-snooping information circuit-id vlan-information

```
unconfigure ip-security dhcp-snooping information circuit-id vlan-  
information [dynamic | {vlan} vlan_name | all]
```

Description

Unconfigures the VLAN info portion of the circuit ID of a VLAN.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies the VLAN for which VLAN information of the circuit-ID is unconfigured. |
| all | Specifies all VLANs. |
| dynamic | Configuration options for dynamically created VLANs. |

Default

The default is all.

Usage Guidelines

This command unconfigures the VLAN information portion of the circuit ID of a VLAN, restoring it to the default.

History

This command was first available in ExtremeXOS 12.1.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-security dhcp-snooping information option

```
unconfigure ip-security dhcp-snooping information option
```

Description

Disables the *DHCP* relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command disables the DHCP relay agent option (option 82), which is inserted into client-originated DHCP packets before they are forwarded to the server.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-security dhcp-snooping information policy

```
unconfigure ip-security dhcp-snooping information policy
```

Description

Unconfigures the *DHCP* relay agent option (option 82) policy.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command unconfigures the DHCP relay agent option information policy to the default value of replace.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ip-security dhcp-snooping information remote-id

```
unconfigure ip-security dhcp-snooping information remote-id
```

Description

Removes the *DHCP* relay agent remote ID.

Syntax Description

This command has no arguments or variables.

Default

After using this command, or if the remote ID has not been configured, the default remote ID is the switch's MAC address.

Usage Guidelines

This command removes the remote ID set by the `configure ip-security dhcp-snooping information remote-id [system-name | remote-id_info]` command. After running this command, or if the remote ID has never been configured, the default remote ID is the switch's MAC address. However, this default (MAC address) name does not appear in the `show ip-security dhcp-snooping information remote-id` command.

Example

The following command removes the DHCP remote ID:

```
# unconfigure ip-security dhcp-snooping information remote-id
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

Object Missing

This object is not available in the repository.

unconfigure isis area

```
unconfigure isis area area_name {level [1|2]}
```

Description

This command resets most configurable parameters for the specified router process to the default values.

Syntax Description

| | |
|--------------------|--|
| <i>area_name</i> | Specifies the router process to be unconfigured. |
| level [1 2] | Specifies either level 1 or level 2. |

Default

N/A.

Usage Guidelines

This command does not delete interfaces from the router process, but it does disable them. The system ID and IS type are not changed. Where appropriate, the default values apply to level 1, level 2, and both IPv4 and IPv6.

Example

The following command resets the area configuration parameters for areax:

```
unconfigure isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure isis vlan

```
unconfigure isis [vlan all | {vlan} vlan_name] {level [1|2]}
```

Description

This command resets all configurable interface parameters to the defaults on one or all [VLANs](#).

Syntax Description

| | |
|--------------------|--|
| vlan all | Unconfigures IS-IS for all VLANs. |
| <i>vlan_name</i> | Specifies a single VLAN for which IS-IS is unconfigured. |
| level [1 2] | Specifies either level 1 or level 2. |

Default

N/A.

Usage Guidelines

None.

Example

The following command resets IS-IS configuration parameters for SJvlan:

```
unconfigure isis SJvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core or Premier license as described in the [**ExtremeXOS 31.3 Feature License Requirements**](#) document.

unconfigure l2vpn dot1q ethertype

```
unconfigure l2vpn [vpls vpls_name | vpws vpws_name] dot1q ethertype
```

Description

Resets the ethertype setting for the specified VPLS or VPWS.

Syntax Description

| | |
|------------------|---|
| <i>vpls_name</i> | Identifies the VPLS within the switch (character string). |
| <i>vpws_name</i> | Identifies the VPWS within the switch (character string). |

Default

N/A.

Usage Guidelines

The setting is changed back to the value displayed in the `show dot1q` command.

The `l2vpn` keyword is introduced in ExtremeXOS Release 12.4 and is required when resetting the ethertype for a VPWS. For backward compatibility, the **l2vpn** keyword is optional when resetting the

ethertype for a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command changes the ethertype setting for the specified VPLS to the value displayed in the `show dot1q` command:

```
unconfigure l2vpn vpls my_vpls dot1q ethertype
```

History

This command was first available in ExtremeXOS 11.6.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure l2vpn vpls redundancy

```
unconfigure {l2vpn} vpls vpls_name redundancy [eaps | esrp | stp]
```

Description

Disassociates the VPLS instance from [EAPS](#), an [ESRP](#) domain, or [STP](#).

Syntax Description

| | |
|------------------|---|
| <i>vpls_name</i> | Specifies the VPLS for which you are removing protection. |
| eaps | Disassociates the VPLS instance from EAPS. |
| esrp | Disassociates the VPLS instance from the ESRP domain. |
| stp | Disassociates the VPLS instance from STP. |

Default

Redundancy disabled.

Usage Guidelines

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4. For backward compatibility, the **l2vpn** keyword is optional. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command disassociates the VPLS instance from ESRP:

```
unconfigure l2vpn vpls vpls1 redundancy esrp
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** keyword and the **STP** option were added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure ldap domains

```
unconfigure ldap domains
```

Description

This command deletes all LDAP domains, and thereby all LDAP servers and other LDAP configurations done for those domains.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to delete all LDAP related configuration from the switch.

Example

The following command deletes all LDAP configurations, LDAP servers and LDAP domains.

```
Switch.25 # unconfigure ldap domains
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure lldp

```
unconfigure lldp {ports [all | port_list]}
```

Description

Leaves *LLDP* enabled and configured; restores the LLDP timer default values.

Syntax Description

| | |
|------------------|---|
| all | Specifies all ports on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

N/A.

Usage Guidelines

When you issue the global `unconfigure lldp`, only the LLDP timers are reset to default values. All the configured TLVs remain on the ports remain, and LLDP remains enabled.

When you use the keyword `ports`, the TLVs for each port are returned to the five default TLVs. LLDP remains enabled.

Example

The following command restores LLDP factory default TLVs for ports 1:4 to 1:8:

```
unconfigure lldp ports 1:4 - 1:8
```

History

This command was first available in ExtremeXOS 11.2.

The keyword `port` was changed to `ports` in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure log filter

```
unconfigure log filter filter_name
```

Description

Resets the log filter to its default values; removes all filter items.

Syntax Description

| | |
|--------------------|--|
| <i>filter_name</i> | Specifies the log filter to unconfigure. |
|--------------------|--|

Default

N/A.

Usage Guidelines

If the filter name specified is DefaultFilter, this command restores the configuration of DefaultFilter back to its original settings.

If the filter name specified is not DefaultFilter, this command sets the filter to have no events configured and therefore, no incidents will pass. This is the configuration of a newly created filter that was not copied from an existing one.

See the [delete log filter](#) command for information about deleting a filter.

Example

The following command sets the log filter myFilter to stop passing any events:

```
unconfigure log filter myFilter
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available all platforms.

unconfigure log target format

```
unconfigure log target [console | memory-buffer | nvram | session |  
syslog [all | ipaddress {udp-port {udp_port}} | ipPort | ipaddress  
tls-port {tls_port} ] {vr vr_name} {local0...local7}] format
```

Description

Resets the log target format to its default values.

Syntax Description

| | |
|--------------------------|---|
| console | Specifies the console display format. |
| memory-buffer | Specifies the switch memory buffer format. |
| nvrnm | Specifies the switch NVRAM format. |
| session | Specifies the current session (including console display) format. |
| syslog | Specifies a syslog target format. |
| all | Specifies all remote syslog servers. |
| <i>ipaddress</i> | Specifies the syslog IP address. |
| <i>ipPort</i> | Specifies the UDP port number for the syslog target. |
| tls_port | Specifies remote Syslog server Transport Layer Security (TLS) for connection type. |
| <i>tls_port</i> | TLS port number. |
| <i>vr_name</i> | Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| local0 ... local7 | Specifies the local syslog facility. |
| format | Specifies that the format for the target will be reset to the default value. |

Default

When a target format is unconfigured, it is reset to the default values.

The following defaults apply to console display, memory buffer, NVRAM, and session targets:

- timestamp—hundredths
- date—mm-dd-yyyy
- severity—on
- event-name—condition
- host-name—off
- sequence-number—off
- process-name—off
- process-id—off
- source-line—off

The following defaults apply to syslog targets (per RFC 3164):

- `timestamp—seconds`
- `date—mmm-dd`
- `severity—on`
- `event-name—none`
- `host-name—off`
- `sequence-number—off`
- `process-name—off`
- `process-id—off`
- `source-line—off`

Usage Guidelines

Use this command to reset the target format to the default format.

Example

The following command sets the log format for the target session (the current session) to the default:

```
unconfigure log target session format
```

History

This command was first available in ExtremeXOS 10.1.

The **udp-port** parameter was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure meter

```
unconfigure meter metername ports [port_group | port_list ]
```

Description

This command allows the unconfiguring a per-port meter for one set of ports but not another.

Syntax Description

| | |
|-------------------|--|
| ports | Meter configuration is applicable to ports in the specified port_group or port_list. |
| <i>port_group</i> | Port group name. |
| <i>port_list</i> | Port list separated by a comma. |

Default

N/A.

Usage Guidelines

With global meters, there is no need for an unconfigure command as the user can simply delete the global meter to remove the configuration. However, the per-port meters are created by default (e.g. ingmeter0, ingmeter1...) and cannot be deleted. This command allows the unconfiguring a per-port meter for one set of ports but not another.

Example

```
unconfigure meter ingmeter1 ports ingMtrGrpA
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure mlag peer interval

```
unconfigure mlag peer peer_name interval
```

Description

Unconfigures the length of time between health check hello packets.

Syntax Description

| | |
|------------------|---|
| <i>peer_name</i> | Specifies an alpha numeric string identifying the <u>MLAG</u> peer. |
|------------------|---|

Default

The interval default is 1000 milliseconds.

Usage Guidelines

Use this command to unconfigure the length of time between health check hello packets exchanged between MLAG peer switches and reset to the default.

Example

The following command unconfigures the interval on the switch101 peer. switch:

```
# unconfigure mlag peer switch101 interval
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

unconfigure mlag peer ipaddress

```
unconfigure mlag peer peer_name ipaddress
```

Description

Unconfigures an MLAG peer switch IP address from an MLAG structure.

Syntax Description

| | |
|------------------|--|
| <i>peer_name</i> | Specifies an alpha numeric string identifying the MLAG peer. |
|------------------|--|

Default

N/A.

Usage Guidelines

Use this command to disassociate an MLAG peer structure with an MLAG peer switch IP address.

Example

The following command disassociates the MLAG peer structure switch101 with the MLAG peer switch IP address:

```
# unconfigure mlag peer switch101 ipaddress
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

unconfigure mld

```
unconfigure mld
```

Description

Resets all MLD settings to their default values and clears the MLD group table.

Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets all MLD settings to their default values and clears the MLD group table:

```
unconfigure mld
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure mld ssm-map

```
unconfigure mld ssm-map {{vr}vr_name }
```

Description

Deletes all MLD SSM Mapping entries on a VR.

Syntax Description

| | |
|--------------------------|------------------------------------|
| vr <i>vr_name</i> | Specifies the virtual router name. |
|--------------------------|------------------------------------|

Default

Disabled.

Usage Guidelines

Use this command to delete all MLD SSM Mapping entries on a specified VR.

Example

The following command deletes MLD SSM mapping on VR1:

```
unconfigure mld ssm-map vr vr1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure mpls exp examination

```
unconfigure mpls exp examination [all | {{value} value}]
```

Description

Resets the QoS profile assigned to the EXP value back to the default QoS profile.

Syntax Description

| | |
|--------------|---|
| <i>value</i> | Specifies the EXP value whose QoS profile is reset. |
|--------------|---|

Default

The QoS profile matches the EXP value + 1.

Usage Guidelines

This command resets the QoS profile assigned to the EXP value (defined by the value keyword and argument) back to the default QoS profile. If the **all** option is specified, all EXP values are reset back to their default QoS profiles. By default, the QoS profile matches the EXP value + 1. That is, EXP value of 0 is mapped to QoS profile qp1, EXP value of 1 is mapped to QoS profile qp2, etc. This configuration has switch-wide significance.

Example

Use the following command to restore the QoS profile of EXP value 5 to its default setting:

```
unconfigure mpls exp examination value 5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure mpls exp replacement

```
unconfigure mpls exp replacement [all | {{qosprofile} qosprofile}]
```

Description

Resets the EXP value assigned to the [QoS](#) profile back to the default EXP value.

Syntax Description

| | |
|-------------------|--|
| <i>qosprofile</i> | Specifies the QoS profile whose EXP replacement value is unconfigured. |
|-------------------|--|

Default

The EXP value matches the QoS profile -1.

Usage Guidelines

This command resets the EXP value assigned to the QoS defined by *qosprofile* back to the default EXP value. If the **all** option is specified, all QoS profiles are reset back to their default EXP values. By default, the EXP value matches the QoS profile - 1. That is, QoS profile qp1 is mapped to EXP value of 0, QoS profile qp2 is mapped to EXP value of 1, etc. This configuration has switch-wide significance.

Example

Use the following command to restore all EXP values to their default setting:

```
unconfigure mpls exp replacement all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure mpls vlan

```
unconfigure mpls {{vlan} vlan_name}
```

Description

Resets [MPLS](#) configuration parameters to the default settings. This command does not delete the [VLAN](#) from MPLS.

Syntax Description

| | |
|------------------------|---|
| <code>vlan_name</code> | Specifies the VLANs for which MPLS is unconfigured. |
|------------------------|---|

Default

N/A.

Usage Guidelines

This command resets all MPLS configuration parameters for the specified VLAN to their default values. It does not delete the VLAN from MPLS. These parameters include the enable state for LDP and RSVP-TE, the bandwidth reserved for RSVP-TE LSPs, RSVP-TE timers, and the RSVP-TE metric. MPLS does not have to be disabled to unconfigure a specific VLAN.

Example

The following command resets MPLS configuration parameters to the default settings for a single VLAN:

```
unconfigure mpls vlan boone
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure mpls

```
unconfigure mpls
```

Description

Resets *MPLS* configuration parameters to the default settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command deletes all VLANs from MPLS and resets all MPLS configuration parameters to their default values. The parameters that are reset include the LSR ID, all LDP-specific settings, all RSVP-TE-specific settings, all RSVP-TE reserved bandwidth, and all EXP Qos Profile mappings. MPLS must be disabled to unconfigure MPLS.

Note

MPLS must be disabled to globally unconfigure MPLS.

Example

The following command resets MPLS configuration parameters to the default settings:

```
unconfigure mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure mrp ports timers

```
unconfigure mrp ports [port_list | all] {timers {refresh} {join} {leave}
  {leave-all} {periodic}}
```

Description

Unconfigure MRP timers, or only reset the MRP timer values to default if the **timer** keyword is specified.

Syntax Description

| | |
|------------------|---|
| mrp | Multiple Registration Protocol. |
| ports | Ports on which MRP timers are to be configured. |
| all | All ports. |
| timers | Multiple Registration Protocol timers. |
| refresh | Timer value to use in place of regular leave timer, only in cases when leave-all is received or sent. |
| join | The time interval to delay sending MRP advertisements. |
| leave | The time interval to wait in the leaving state before transitioning to the empty state. |
| leave-all | The time interval used to control the frequency of "leave all" messages. |
| periodic | The time interval between two periodic events. |

Default

The default values for join, leave, leave-all, are 200, 600, and 10000, respectively. The default values for join, leave, leave-all, periodic and extended-refresh timers are 200, 600, 10000, 1000, and 0 milliseconds, respectively.

Usage Guidelines

Use this command to unconfigure MRP timers, or only reset the MRP timer values to default if the **timer** keyword is specified. If none of the timers are specified, this command resets all three timers to the default values. The default values for the join, leave, and leave-all timers are 200, 600, and 10000 ms respectively.

Example

```
unconfigure mrp ports all
unconfigure mrp ports all timers
unconfigure mrp ports all timers join
```

History

This command was first available in ExtremeXOS 15.3.

The **extended-refresh** and **periodic timer** options were added in 15.3.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure msdp sa-cache-server

```
unconfigure msdp sa-cache-server {vr vrname}
```

Description

Removes the *MSDP SA* cache server.

Syntax Description

| | |
|---------------|---|
| <i>vrname</i> | Specifies the name of the virtual router on which the MSDP cache server is configured. If a virtual router name is not specified, it is extracted from the current CLI context. |
|---------------|---|

Default

By default, the router does not send SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member simply waits to receive SA messages, which eventually arrive.

Usage Guidelines

Use this command to remove the MSDP SA cache server you specified with the `configure msdp sa-cache-server` command.

Example

The following command removes the MSDP SA cache server:

```
unconfigure msdp sa-cache-server
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure msrp

```
unconfigure msrp {ports [port_list | all]}
```

Description

Disables MSRP and removes all configuration. If a list of ports is specified, MSRP is disabled and the related configuration is removed only on the ports and the system-wide MSRP configuration stays intact.

Syntax Description

| | |
|------------------|--|
| msrp | Multiple Stream Registration Protocol. |
| <i>port_list</i> | List of ports in the switch. |
| all | All the ports in the switch. |

Default

N/A.

Usage Guidelines

Use this command to disable MSRP and remove all configuration. If a list of ports is specified, MSRP is disabled and the related configuration is removed only on the ports and the system-wide MSRP configuration stays intact.

Example

```
unconfigure msrp
unconfigure msrp ports all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support the AVB feature and that have an AVB feature pack license installed. To see which platforms support AVB and for information about obtaining a license, see the [ExtremeXOS 31.3 Feature License Requirements](#).

unconfigure mstp region

```
unconfigure mstp region
```

Description

Unconfigures the *MSTP* region on the switch and returns all MSTP settings to their default values.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Before you unconfigure an MSTP region, we recommend that you disable all active STPDs in the region. This includes the CIST and any active MSTIs.

After you issue this command, all of the MSTP settings return to their default values, as described below:

- **Region Name**—This indicates the name of the MSTP region. In the Extreme Networks implementation, the maximum length of the name is 32 characters and can be a combination of alphanumeric characters and underscores (_).
- **Format Selector**—This indicates a number to identify the format of MSTP BPDUs. The default is 0.
- **Revision Level**—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

Example

The following command unconfigures the MSTP region on the switch:

```
unconfigure mstp region
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure mvrp stpd

```
unconfigure mvrp stpd
```

Description

Resets the MVRP *STP* domain.

Syntax Description

| | |
|-------------|--|
| mvrp | Multiple <i>VLAN</i> Registration Protocol. |
| stpd | The STP domain the VLAN is to be associated with. All ports of the domain will be advertised when this VLAN is registered. |

Default

s0.

Usage Guidelines

Use this command to reset the STP domain associated with a particular VLAN or all VLANs to default. If a VLAN is specified, the specific VLAN will be associated to the default STP, which is configured using the `configure mvrp stpd stpd_name default` command. If VLAN is not specified, all VLANs are associated to STP domain s0.

Example

The following example illustrates the `unconfigure mvrp stpd` command:

```
unconfigure mvrp stpd
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure mvrp tag

```
unconfigure mvrp tag vlan_tag
```

Description

Resets all MVRP settings for the given *VLAN* id. The *STP* domain, the registrar state machine settings, applicant state machine settings for the given VLAN are reset to default values.

Syntax Description

| | |
|-----------------|--------------------------------------|
| mvrp | Multiple VLAN Registration Protocol. |
| <i>vlan_tag</i> | The 802.1Q VLAN ID. |

Default

N/A.

Usage Guidelines

Use this command to reset all MVRP settings for the given VLAN id. The STP domain, the registrar state machine settings, and the applicant state machine settings for the given VLAN are reset to default values. All dynamically added ports of the VLAN are removed. If the VLAN was created dynamically, it is removed. If VLAN is not specified, MVRP settings for all VLANs are reset and the dynamic VLAN creation feature is reset to “enabled”.

Example

The following example shows unconfiguring an MVRP:

```
unconfigure mvrp tag 100
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure mvrp

```
unconfigure mvrp
```

Description

Unconfigures MVRP on a switch and all MVRP port and bridge settings.

Syntax Description

| | |
|-------------|---|
| mvrp | Multiple <i>VLAN</i> Registration Protocol. |
|-------------|---|

Default

N/A.

Usage Guidelines

Use this command to unconfigure MVRP on a switch. This command unconfigures all MVRP port and bridge settings.

Example

The following command unconfigures MVRP:

```
unconfigure mvrp
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure neighbor-discovery cache

```
unconfigure neighbor-discovery cache {vr vr_name}
```

Description

Resets the neighbor-discovery cache configuration parameters to their default values.

Syntax Description

| | |
|----------------|------------------------|
| <i>vr_name</i> | Specifies a VR or VRF. |
|----------------|------------------------|

Default

IPv6 neighbor timeout: 20 minutes

Maximum IPv6 neighbor entries: 1024

Maximum IPv6 neighbor pending entries: 1024

IPv6 neighbor refresh: Enabled

Usage Guidelines

None.

Example

The following example resets the neighbor-discovery cache configuration:

```
unconfigure neighbor-discovery cache
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure netlogin

```
unconfigure netlogin [idle-timeout | session-timeout] {dot1x | mac |
web-based | convergence-endpoint}
```

Description

Use this command to reset the maximum number of consecutive seconds an authenticated session may be idle before termination of the session to the default value of 300 seconds.

Syntax Description

| | |
|-----------------------------|--|
| idle-timeout | Clear timeout for an idle session. |
| session-timeout | Clear timeout for an active session. |
| dot1x | IEEE 802.1X Port-based network access control. |
| mac | MAC authentication. |
| web-based | Web-based authentication. |
| convergence-endpoint | Convergence-endpoint authentication. |

Default

300

Usage Guidelines

If no authentication type is specified, the idle timeout value is returned to 300 seconds for all authentication types.

Example

```
unconfigure netlogin idle-timeout mac
```

History

This command was first available in ExtremeXOS 16.1.

The **convergence-endpoint** option was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin allowed-refresh-failures

```
unconfigure netlogin allowed-refresh-failures
```

Description

Restores the number refresh failures to the default value.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command allows you to restore the number of refresh failures allowed to the default value of 0.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin authentication database-order

```
unconfigure netlogin [mac | web-based] authentication database-order
```

Description

Restores the default order of database authentication protocols to use.

Syntax Description

| | |
|------------|--|
| mac | Specifies the MAC address to add. |
| mask | Specifies the number of bits to use for the mask. |
| default | Specifies the default entry. |
| encrypted | Used to display encrypted form of password in configuration files. Do not use. |
| password | Specifies the password to send for authentication. |
| ports | Specifies the port or port list to use for authentication. |

Default

By default, the authentication order is RADIUS, local-user database.

Usage Guidelines

Use this command to restore the default configuration order for the database authentication protocols. For details, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

Example

The following command sets the database authentication order to RADIUS, local user database for MAC-based authentication:

```
unconfigure netlogin mac authentication database-order
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin authentication failure vlan

```
unconfigure netlogin authentication failure vlan vlan_name {ports
    port_list}
```

| | |
|------------------|---|
| <i>vlan_name</i> | Specifies the name of the authentication failure <u>VLAN</u> . |
| <i>port_list</i> | Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports. |

Description

Disables authentication failure VLAN on network login enabled ports.

Syntax Description

Default

N/A.

Usage Guidelines

Use this command to disable authentication failure VLAN on network login enabled ports. When a supplicant fails authentication, it is moved to the authentication failure vlan and is given limited access until it passes the authentication.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin authentication service-unavailable vlan

```
unconfigure netlogin authentication service-unavailable vlan vlan_name
    {ports port_list}
```

Description

Unconfigures authentication service unavailable VLAN on network login enabled ports.

Syntax Description

| | |
|------------------|---|
| <i>vlan_name</i> | Specifies the name of the authentication service-unavailable VLAN. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports. |

Default

Defaults to all network login enabled ports.

Usage Guidelines

This command unconfigures authentication service unavailable VLAN on the specified network login enabled ports. Authentication service unavailable VLAN is unconfigured on all the network login enabled ports, if no port is specifically mentioned.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin banner

```
unconfigure netlogin banner
```

Description

Unconfigures the network login page banner.

Syntax Description

This command has no arguments or variables.

Default

The default banner is the Extreme Networks logo.

Usage Guidelines

Use this command to unconfigure a netlogin banner.

After the command is issued, the configured banner specified is no longer displayed.

Example

The following command unconfigures the network login page banner:

```
unconfigure netlogin banner
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin dot1x guest-vlan

```
unconfigure netlogin dot1x guest-vlan {ports port_list | vlan_name}
```

Description

Unconfigures the guest VLAN feature for 802.1X authentication.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports included in the guest VLAN. |
| <i>vlan_name</i> | Specifies all ports included in the guest VLAN. |

Default

N/A.

Usage Guidelines

Use this command to unconfigure the guest VLAN for 802.1X authentication.

If you do not specify one or more ports or the VLAN name, this command unconfigures all of the 802.1X ports configured for the guest VLAN feature.

If you specify one or more ports, this command unconfigures the specified 802.1X ports for the guest VLAN feature.

If you specify the VLAN name, this command unconfigures all of the 802.1X ports configured for the specified guest VLAN.

Example

The following command unconfigures the guest VLAN feature for 802.1X authentication:

```
unconfigure netlogin dot1x guest-vlan
```

History

This command was first available in ExtremeXOS 11.2.

The ports option was added in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin local-user security-profile

```
unconfigure netlogin local-user user-name security-profile
```

Description

Clears a previously associated security profile.

Syntax Description

| | |
|------------------|--|
| <i>user-name</i> | Specifies the name of an existing local network login account. |
|------------------|--|

Default

N/A.

Usage Guidelines

Use this command to clear any previously associated security profiles on the switch.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin ports

```
unconfigure netlogin ports [all | port_list] [allowed-users | authentication mode]
```

Description

Use this command to clear multiple authentication properties for one or more ports.

Syntax Description

| | |
|-----------------------|---|
| all | Unconfigure all ports in the system. |
| <i>port_list</i> | List of ports to unconfigure. |
| allowed-users | Number of users allowed per port. |
| authentication | Unconfigure port authentication settings. |
| mode | Port authentication mode. |

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin session-refresh

```
unconfigure netlogin session-refresh
```

Description

Restores the session refresh value to the default.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command allows you to restore the session refresh to the default value of 180 seconds.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure netlogin vlan

```
unconfigure netlogin vlan
```

Description

Unconfigures the VLAN for network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command unconfigures the VLAN used for unauthenticated clients. One VLAN needs to be configured per VR. To change the VLAN, network login needs to be disabled.

Example

The following command unconfigures the network login VLAN:

```
unconfigure netlogin vlan
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure network-clock gtp ports

```
unconfigure network-clock gtp ports [port_list | all]
```

Description

Restores all configuration parameters on the specified ports to their default values. This command does not disable gTP on the ports.

Syntax Description

| | |
|------------------------|---|
| <code>port_list</code> | Specifies one or more of the switch's physical ports. |
| all | Specifies all of the switch's physical ports. |

Default

N/A.

Usage Guidelines

Use this command to restore all configuration parameters on the specified ports to their default values.

Example

```
# unconfigure network-clock gtp ports all
# unconfigure network-clock gtp ports 1,2
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure network-clock sync-e clock-source

```
unconfigure network-clock sync-e clock-source unconfigure network-clock
sync-e clock-source
```

Description

Unconfigures the Ethernet clock-source that is configured.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the clock-source which was previously configured as source-1 or source-2.

Example

The following command unconfigures the Sync-E clock source configured earlier:

```
# unconfigure network-clock sync-e clock-source
```

History

This Command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available only on the ExtremeSwitching X460-G2 series switches.

unconfigure network-clock sync-e

```
unconfigure network-clock sync-e [port port]
```

Description

Unconfigures synchronous Ethernet on a particular port to be a source 1 or source 2 for synchronizing clock.

Syntax Description

| | |
|-------------|------------------------------------|
| source-1 | Source 1 external input clock |
| source-2 | Source 2 external input clock |
| port | port |
| <i>port</i> | 100Mbps/1G port Copper/Fiber Ports |

Default

N/A.

Usage Guidelines

Use this command to unconfigure SyncE on a particular port.

Example

The following command unconfigures SyncE as a primary master on port 2:

```
# unconfigure network-clock sync-e port 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on only on the ExtremeSwitching X460-G2 series switches.

unconfigure ospf

```
unconfigure ospf {vlan vlan-name | area area-identifier}
```

Description

Resets one or all *OSPF* interfaces to the default settings.

Syntax Description

| | |
|------------------------|-------------------------------|
| <i>vlan-name</i> | Specifies a <u>VLAN</u> name. |
| <i>area-identifier</i> | Specifies an OSPF area. |

Default

N/A.

Usage Guidelines

ExtremeXOS OSPF allows you to change certain configurable OSPF parameters on the fly. This command selectively resets the configurable parameters to their default values. Following is the list of parameters whose values will be reset to their defaults:

- Interface
 - Hello interval.
 - Dead interval.
 - Transmit delay.
 - Retransmit interval.
 - Priority.
 - Cost.
 - OSPF graceful restart helper mode.
- Area
 - All the parameters of interfaces associated with this area.
 - Inter-Area-Prefix_LSA Filter.
 - AS-External-LSA Filter.
- OSPF Global
 - All parameters of all areas in this OSPF domain.
 - SPF delay interval.

- Interface cost metric table.
- Route redistribution.
- OSPF graceful restart.

Example

The following command resets the OSPF interface to the default settings on the VLAN accounting:

```
unconfigure ospf accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure ospfv3

```
unconfigure ospfv3 {area area_identifier | vlan vlan_name | tunnel
tunnel_name}
```

Description

Resets one or all [OSPFv3](#) interfaces to the default settings.

Syntax Description

| | |
|------------------------|---|
| <i>area_identifier</i> | Specifies an OSPFv3 area, a four-byte, dotted decimal number. |
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN . |
| <i>tunnel_name</i> | Specifies an IPv6 tunnel. |

Default

N/A.

Usage Guidelines

ExtremeXOS OSPFv3 allows you to change certain configurable OSPFv3 parameters on the fly. This command selectively resets the configurable parameters to their default values. The following is the list of parameters whose values will be reset to their defaults:

- Interface:
 - Hello Interval.
 - Dead Interval.

- Transmit Delay.
- Retransmit Interval.
- Priority.
- Cost.
- Area:
 - All the parameters of Interfaces associated with this area.
 - Inter-Area-Prefix-LSA Filter.
 - AS-External-LSA Filter.
- OSPFv3 Global:
 - SPF Delay interval.
 - Interface Cost metric Table.
 - Route Redistribution.

Example

The following command resets the OSPFv3 interface to the default settings on the VLAN accounting:

```
unconfigure ospfv3 accounting
```

The following command unconfigures the parameters of the area 0.0.0.1 (and all its associated interfaces):

```
unconfigure ospfv3 area 0.0.0.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Base license, or higher, as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure pim

```
unconfigure pim {ipv4 | ipv6} {vlan vlan_name | tunnel tunnel_name | ssm  
range | border}
```

Description

Resets all PIM settings on an IPv4 or IPv6 module, or on one or all [VLANs](#), to their default values.

Syntax Description

| | |
|--------------------|---|
| ipv4 | Specifies the IPv4 module from which PIM is to be unconfigured. |
| ipv6 | Specifies the IPv6 module from which PIM is to be unconfigured. |
| <i>vlan_name</i> | Specifies the VLAN from which PIM is to be unconfigured. |
| tunnel | Specifies the tunnel which PIM is to be unconfigured. |
| <i>tunnel_name</i> | Specifies the tunnel name. |
| border | Specifies the border. |

Default

If no VLAN is specified, the configuration is reset for all PIM interfaces.

Usage Guidelines

If you unconfigure PIM globally using the `unconfigure pim {ipv4|ipv6}` command, you also unconfigure PIM-SSM, removing PIM-SSM range and SSM setting for PIM all interfaces. Static RP configuration is not removed in this case.

Example

The following command resets all PIM settings on the VLAN accounting:

```
unconfigure pim vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** and **ipv6** keywords were added, giving an option to support this functionality in IPv6 as well, in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure pim border

```
unconfigure pim {ipv4 | ipv6} {vlan} vlan_name border
```

Description

Unconfigures a PIM VLAN that has been configured as a border VLAN, which is used to demarcate a PIM domain.

Syntax Description

| | |
|------------------|---|
| ipv4 | Configures PIM functionality on IPv4 router interfaces. |
| ipv6 | Configures PIM functionality on IPv6 router interfaces. |
| <i>vlan_name</i> | Specifies a VLAN name. |

Default

By default, no PIM VLANs are configured as border VLANs.

Usage Guidelines

A PIM-SM domain is created by limiting the reach of PIM BSR advertisements. When a border VLAN is configured, PIM BSR advertisements are not forwarded out of the PIM VLAN. Use the `unconfigure pim border` command to remove the border functionality of the specified PIM VLAN.

Example

The following command unconfigures a PIM border on a VLAN called "vlan_border":

```
unconfigure pim vlan_border border
```

History

This command was first available in ExtremeXOS 12.0.

The IPv6 configuration option was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure pim ssm range

```
unconfigure pim {ipv4 | ipv6} ssm range
```

Description

Unconfigures the range of multicast addresses for PIM SSM.

Syntax Description

| | |
|-------------|---|
| ipv4 | Configures PIM functionality on IPv4 router interfaces. |
| ipv6 | Configures PIM functionality on IPv6 router interfaces. |

Default

By default, no SSM range is configured.

Usage Guidelines

Initially, no range is configured for SSM. After a range is configured, you can remove the range with the `unconfigure pim ssm range` command.

When no range is configured for PIM SSM, the switch does not use PIM SSM for any multicast groups.

Example

The following command removes the PIM SSM range:

```
unconfigure pim ssm range
```

History

This command was first available in ExtremeXOS 11.4.

The **ipv4** and **ipv6** keywords were added, giving an option to support this functionality in IPv6 as well, in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure policy all-rules

```
unconfigure policy all-rules
```

Description

Use this command to remove all admin and classification rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to remove all admin and classification rules.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy app-signature group name

```
unconfigure policy app-signature group group [name name | custom]
```

Description

Deletes a user-defined policy application signature.

Syntax Description

| | |
|----------------------|--|
| app-signature | Configures application signature specific settings. |
| group | Configures application signature group-specific settings. |
| <i>group</i> | Specifies the group name. |
| name | Configures application signature display name-specific settings. |
| <i>name</i> | Specifies the display name assigned to the application signature. |
| custom | Removes all custom signature information from the specified group. |

Default

N/A.

Usage Guidelines

The application signature groups are pre-defined (built-in), and additional ones cannot be created. There are pre-defined values for application signature names and patterns as well, and these cannot be modified or deleted.

Example

The following example removes all custom signature information from the group "E-commerce":

```
# unconfigure policy app-signature group "E-commerce" custom
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy autoclear

```
unconfigure policy autoclear interval
```

Description

Disables the automatic clearing of rule usage statistics.

Syntax Description

| | |
|------------------|---|
| autoclear | Designates setting parameters for auto-clearing the policy rule usage statistics. |
| interval | Designates disabling automatic clearing of rule usage statistics. |

Default

N/A.

Usage Guidelines

If you have configured Syslog and/or trap actions to notify you when a policy rule is used by using the following command: `configure policy rule profile_index [{app-signature group group name name} | ether ether | icmp6type icmp6type | icmptype icmptype | ip6dest ip6dest | ipdestsocket ipdestsocket | ipfrag | ipproto ipproto | ipsourcesocket ipsourcesocket | iptos iptos | ipttl ipttl | macdest macdest | macsource macsource | port port | tcpdestportIP tcpdestportIP | tcpsourceportIP tcpsourceportIP | udpdestportIP udpdestportIP | udpsourceportIP udpsourceportIP] {mask mask } {port-string [port_string | all]} {storage-type [non-volatile | volatile]} {drop | forward} {syslog syslog} {trap trap} {cos cos } {mirror-destination control_index} {clear-mirror} , this command disables automatic clearing of rule usage statistics.`

To view the auto-clear interval, use the following command:

```
show policy autoclear interval
```

Example

The following example disables automatic clearing of rule usage statistics:

```
# unconfigure policy autoclear interval
# show policy autoclear interval
Stats autoclear interval DISABLED.
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy captive-portal

```
unconfigure policy captive-portal web-redirect redirect_index server
server_id
```

Description

This command unconfigures a particular captive portal server. This disables the server from being used by an existing policy profile.

Syntax Description

| | |
|-----------------------|---|
| web-redirect | Unconfigures web-redirect. |
| <i>redirect_index</i> | Specifies the web redirect index (range = 1-10). |
| server | Unconfigures a server for the web redirect index. |
| <i>server_id</i> | Specifies the server ID to disable. |

Default

N/A

Example

The following example unconfigures a particular captive portal server (index 2) in web-redirect (index 1):

```
unconfigure policy captive-portal web-redirect 1 server 2
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy captive-portal listening

```
unconfigure policy captive-portal listening [ socket_list | all ]
```

Description

This command removes previously defined L4 listening ports (sockets).

Syntax Description

| | |
|--------------------|--|
| listening | Configures captive portal HTTP listening ports (up to three L4 ports). |
| <i>socket_list</i> | List of L4 listening ports that you want removed, separated by commas (for example: 80,8080,2000). |
| all | Removes all listening L4 ports. |

Default

N/A

Example

The following example removes captive portal L4 listening ports 80 and 8080:

```
# unconfigure policy captive-portal listening 80,8080
```

The following example removes all defined captive portal L4 listening ports:

```
# unconfigure policy captive-portal listening all
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy convergence-endpoint all

```
unconfigure policy convergence-endpoint all
```

Description

This command unconfigures Convergence End Point (CEP) settings back to their factory default.

Syntax Description

This command has no arguments or variables.

Default

N/A

Example

The following example clears all CEP settings and restores the factory default:

```
# unconfigure policy convergence-endpoint all
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy convergence-endpoint index

```
unconfigure policy convergence-endpoint index [cisco | lldp-med]
```

Description

This command unconfigures a global default policy index for a Convergence End Point (CEP) detection type.

Syntax Description

| | |
|-----------------|--|
| cisco | Unconfigures Cisco detection type only. |
| lldp-med | Unconfigures <u>LLDP</u> -MED detection type only. |

Default

N/A

Example

The following example removes the default policy for Cisco type CEPs:

```
# unconfigure policy convergence-endpoint index cisco
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy invalid action

```
configure policy invalid action
```

Description

This command removes the actions configured to be taken for an invalid policy.

Default

N/A

Example

The following command removes the actions configured to be taken for an invalid policy:

```
unconfigure policy invalid action
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy mactable

```
unconfigure policy mactable [ response | vlan_list ]
```

Description

Use this command to clear a VLAN to policy mapping table entry or to reset the mactable response to the default value of policy mode.

Syntax Description

| | |
|------------------------|---|
| <code>mactable</code> | Clear VLAN ID - Policy Profile mappings table. |
| response | Specifies that the response should be reset to the default value of policy. |
| <code>vlan_list</code> | Specifies the VLAN ID or range of IDs (1 to 4094) to clear. |

Default

N/A.

Example

This example resets the policy mappings table response to the default value of policy.

```
unconfigure policy mactable response
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy profile

```
unconfigure policy profile [all | profile_index]
```

Description

Use this command to delete a policy profile entry.

Syntax Description

| | |
|----------------------------|---|
| <code>profile</code> | Clear policy profile entries. |
| all | Clear all policy profiles. |
| <code>profile_index</code> | Specifies the index number of the policy profile entry to be deleted. Valid values are 1 to 1023. |

Default

N/A.

Example

This example shows how to delete policy profile 8:

```
unconfigure policy profile 8
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy rule

```
unconfigure policy rule [ profile_index] [all-pid-entries ] | [[ether |
icmp6type | icmptype | ip6dest | ipdestsocket | ipfrag | ipproto |
ipsourcesocket | iptos | ipttl | macdest | macsource | port |
tcpsourceportIP | udpsourceportIP | tcpdestportIP | udpdestportIP ]
{app-signature} [all-traffic-entries | data] {mask mask} {port-string
port_string|all}}
```

Description

Use this command to delete one or all policy classification rule entries.

Syntax Description

See [configure policy rule](#) on page 1163 for a full list of syntax descriptions.

| | |
|----------------------------|--|
| all-pid-entries | Clear all entries associated with this Policy ID. |
| all-traffic-entries | Clear all entries associated with this traffic rule. |
| <i>data</i> | Data corresponding to rule-type option. |
| app-signature | Clears configured application signatures. |

Default

When applicable, data, mask, and port-string must be specified for individual rules to be cleared.

Example

This example shows how to delete all classification rule entries associated with policy profile 1 from all ports:

```
unconfigure policy rule 1 all-pid-entries
```

History

This command was first available in ExtremeXOS 16.1.

ICMP and ICMPv6 rule types added in ExtremeXOS 22.5.

The **app-signature** option was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy syslog

```
unconfigure policy syslog {machine-readable} {extended-format} {every-time}
```

Description

Resets Syslog parameters for policy rules to their default settings.

Syntax Description

| | |
|-------------------------|--|
| syslog | Designates unconfiguring selected Syslog parameters for policy rules. |
| machine-readable | Clears the control for device formatting of rule usage messages to the default setting of disabled (decimal format). |
| extended-format | Clears the control for extended rule usage message formatting to the default setting of disabled (not extended). |
| every-time | Sets the Syslog message sent on rule usage to the default of on first usage only (disabled). |

Default

By default, Syslog messages are only sent on first use of a rule.

By default, **extended-format** and **machine-readable** are disabled (not extended and in decimal format).

Usage Guidelines

This command allows you to reset parameters to their defaults for Syslog messages that are sent when a policy rule is used as set up in the command `configure policy rule profile_index` `[{app-signature group group name name} | ether ether | icmp6type icmp6type | icmptype icmptype | ip6dest ip6dest | ipdestsocket ipdestsocket | ipfrag | ipproto ipproto | ipsourcesocket ipsourcesocket | iptos iptos | ipttl ipttl | macdest macdest | macsource macsource | port port | tcpdestportIP tcpdestportIP | tcpsourceportIP]`

```

tcpsourceportIP | udpdestportIP udpdestportIP | udpsourceportIP
udpsourceportIP ] {mask mask } {port-string [ port_string | all]}
{storage-type [non-volatile | volatile]} {drop | forward} {syslog
syslog} {trap trap} {cos cos } {mirror-destination control_index}
{clear-mirror} .

```

Example

The following clears the setting for when Syslog messages are sent when a rule is used to the default of only on first rule usage:

```
#unconfigure policy syslog every-time
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure policy vlanauthorization

```
unconfigure policy vlanauthorization [{port port_list } | all ]
```

Description

This command clears VLAN Authorization to the default state for a specific port, list of ports, or all ports.

Syntax Description

| | |
|------------------|---|
| port | Specifies ports to clear VLAN Authorization to default state. |
| <i>port_list</i> | List of ports to clear to default state. |
| all | Clear all VLAN Authorization state to default. |

Default

N/A.

Usage Guidelines

None.

Example

This example shows how to clear VLAN Authorization for all ports:

```
x450G2-48t-10G4.3 # unconfigure policy vlanauthorization all
```

This example shows how to clear VLAN Authorization for ports 1:1-4:

```
x450G2-48t-10G4.3 # unconfigure policy vlanauthorization port 1:1-4
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure port description-string

```
unconfigure ports port_list description string
```

Description

Unconfigures a description string setting.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
|------------------|---|

Default

N/A.

Usage Guidelines

Use this command to unconfigure a port description.

Example

The following command unconfigures the port description string:

```
unconfigure ports 1:3
```

History

This command was available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ports display string

```
unconfigure ports port_list display-string
```

Description

Clears the user-defined display string from one or more ports.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports or slots and ports. |
|------------------|---|

Default

N/A.

Usage Guidelines

This command removes the display string that you configured using the `configure ports display-string` command.

Example

The following command clears the user-defined display string from port 4 on a switch:

```
unconfigure ports 4 display-string
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ports link-flap-detection

```
unconfigure ports [port_list | all] link-flap-detection {interval}  
                {threshold} {disable-time}
```

Description

Sets interval, threshold (maximum number of link down events), and disable time to defaults for link-flap detection.

Syntax Description

| | |
|----------------------------|---|
| ports | Physical ports. |
| <i>port_list</i> | List of ports to set link-flap detection characteristics back to defaults upon. |
| all | Sets link-flap detection characteristics to defaults on all ports in the system. |
| link-flap-detection | Specifies link-flap detection. |
| interval | Resets the time interval for collecting link-flap events to the default of 5 seconds. |
| threshold | Resets the number of link-flap events tolerated before action is taken to the default of 10. |
| disable-time | Resets the time period a port remains disabled after excessive link flapping to the default of 300 seconds. |

Default

N/A

Example

The following example resets the link-flap detection interval and threshold to their defaults on ports 1-4.

```
unconfigure ports 1-4 link-flap-detection interval threshold
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ports monitor vlan

```
unconfigure ports [port_list | all] monitor vlan [ vlan_name |  
  vlan_list ]
```

Description

Stops counting VLAN statistics on a port or group of ports.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies one or more ports. May be in the form: 1, 2, 3-5, 2:5, 2:6-2:8. |
| <i>vlan_name</i> | Specifies a VLAN name. |
| <i>vlan_list</i> | Specifies a list of VLANs. |

Default

N/A.

Usage Guidelines

None.

Example

The following command removes monitoring for ports on a supported switch on the VLAN named accounting:

```
# unconfigure ports 1-6 monitor vlan accounting
```

History

This command was first available in ExtremeXOS 12.0.

Support for SummitStack and ExtremeSwitching series switches was added in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure ports redundant

```
unconfigure ports port_list redundant
```

Description

Clears a previously configured software-controlled redundant port.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | This refers to the primary port of the redundant pair and specifies one or more ports or slots and ports. |
|------------------|---|

Default

N/A.

Usage Guidelines

The list of port numbers or the port display string specifies the primary port(s).

Example

The following command unconfigures a software-controlled redundant port on a switch:

```
unconfigure ports 3 redundant
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure process group

```
unconfigure process group
```

Description

This command restores the default settings for memory and CPU limits for both the "EXOS" and "Other" process groups.

Syntax Description

N/A.

Default

None.

Usage Guidelines

If one of the process groups is already consuming more memory than the default limit, an error may appear and the command may not execute successfully:

```
Warning: Unable to restore memory limits to default values. One or both of the groups are already consuming more memory than their default limits (95% for "EXOS" and 5% for "Other"). CPU limits have been restored to their default values.
```

Example

The following example restores the default memory and CPU limits of the process control groups:

```
unconfigure process group
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure qosprofile

```
unconfigure qosprofile {ports [port_list|all]}
```

Description

Returns the rate-shaping parameters for all QoS profiles on the specified ports to the default values.

Syntax Description

| | |
|------------------|---|
| <i>port_list</i> | Specifies the ports on which to unconfigure QoS profiles. |
| all | Specifies that this command applies to all ports on the device. |

Default

The default values for egress bandwidth on all supported platforms are:

- Minimum bandwidth—0%
- Maximum bandwidth—100%

The default values for egress priority and ingress QoS profiles differ by platform as described in the following sections.

The default values for the two default egress QoS profiles (QP1 and QP8) are:

- Maximum buffer—100% (as set by the `configure qosprofile` command)
- Maximum buffer override—100% (as set by the `configure qosprofile` command)
- Weight—1
- WRED—See the `configure qosprofile wred` command description.

Usage Guidelines

None.

Example

The following command resets the QoS profiles for all ports to default settings:

```
unconfigure qosprofile
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

The egress and ports parameters are available only on all platforms.

unconfigure qosprofile wred

```
unconfigure qosprofile wred {ports [port_list | all]}
```

Description

Removes the WRED configuration for all QoS profiles on the specified port or all ports.

Syntax Description

| | |
|------------------|--|
| <i>port_list</i> | Specifies a list of slots and ports from which the WRED configuration is removed. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8. |
| all | Specifies that this command applies to all ports on the device. |

Default

N/A.

Usage Guidelines

None.

Example

The following example removes the WRED configuration for port 3:

```
# unconfigure qosprofile wred port 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on the ExtremeSwitching X450-G2, X460-G2, X670-G2, X435, X465, X590, X620, X690, , X695, X870, 5420, 5520 series switches.

unconfigure qoscheduler ports

```
unconfigure qoscheduler ports [port_list | port_group | all]
```

Description

When a port or PortGroup has not been configured for per-port scheduling, it uses the global scheduling algorithm. If a port or PortGroup has been configured with per-port scheduling, this command removes the per-port scheduling and the port/PortGroup will use the global scheduling algorithm.

Syntax Description

| | |
|-------------------|------------------|
| <i>port_list</i> | Port list. |
| <i>port_group</i> | Port group name. |
| all | All ports. |

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

All platforms.

unconfigure radius

```
unconfigure radius {mgmt-access | netlogin} {server [primary | secondary] }
```

Description

Unconfigures the *RADIUS* client configuration.

Syntax Description

| | |
|--------------------|---|
| mgmt-access | Specifies the switch management RADIUS authentication server. |
| netlogin | Specifies the network login RADIUS authentication server. |

| | |
|------------------|---|
| primary | Unconfigures the primary RADIUS server. |
| secondary | Unconfigures the secondary RADIUS server. |

Default

Unconfigures both primary and secondary servers for management and network login.

Usage Guidelines

If you do not specify any keywords, this command unconfigures both the primary and secondary servers for management and network login.

The following list describes the available keywords:

- **mgmt-access**—Use this keyword to unconfigure only the server(s) for management functions.
- **netlogin**—Use this keyword to unconfigure only the server(s) for network login.
- **primary**—Use this keyword to specify only the primary RADIUS sever.
- **secondary**—Use this keyword to specify only the secondary RADIUS server.

Example

The following command unconfigures the secondary RADIUS server settings for both management and network login:

```
unconfigure radius server secondary
```

The following command unconfigures the secondary RADIUS server settings for only network login:

```
unconfigure radius netlogin server secondary
```

The following command unconfigures all RADIUS server settings for only management functions:

```
unconfigure radius mgmt-access
```

History

This command was first available in ExtremeXOS 10.1.

The **mgmt-access** and **netlogin** keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure radius-accounting

```
unconfigure radius-accounting {mgmt-access | netlogin} {server [primary
| secondary]}
```

Description

Unconfigures the *RADIUS* accounting server configuration.

Syntax Description

| | |
|--------------------|---|
| mgmt-access | Specifies the switch management RADIUS accounting server. |
| netlogin | Specifies the network login RADIUS accounting server. |
| primary | Unconfigures the primary RADIUS accounting server. |
| secondary | Unconfigures the secondary RADIUS accounting server. |

Default

Unconfigures both the primary and secondary accounting servers for management and network login.

Usage Guidelines

If you do not specify any keywords, this command unconfigures both the primary and secondary accounting servers for management and network login.

The following list describes the available keywords:

- **mgmt-access**—Use this keyword to unconfigure only the accounting server(s) for management functions.
- **netlogin**—Use this keyword to unconfigure only the accounting server(s) for network login.
- **primary**—Use this keyword to specify only the primary RADIUS accounting sever.
- **secondary**—Use this keyword to specify only the secondary RADIUS accounting server.

Example

The following command unconfigures the secondary RADIUS accounting server settings for both management and network login:

```
unconfigure radius-accounting server secondary
```

The following command unconfigures the secondary RADIUS accounting server settings for only network login:

```
unconfigure radius-accounting netlogin server secondary
```

The following command unconfigures all RADIUS accounting server settings for only management functions:

```
unconfigure radius-accounting mgmt-access
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure radius-accounting server

```
unconfigure radius-accounting [server index]
```

Description

This command removes the *RADIUS* server configuration for a given server. Having *index* be in its own setting is done to remove the possibility to set the mgmt-access or netlogin setting prior to index.

Syntax Description

| | |
|---------------|---------------------------------|
| server | RADIUS accounting server. |
| <i>index</i> | RADIUS accounting server index. |

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure radius server

```
unconfigure radius {dynamic-authorization [server index]}
```

Description

This command removes the *RADIUS* server configuration for a given server. Having *index* be in its own setting is done to remove the possibility to set the mgmt-access or netlogin setting prior to index.

Syntax Description

| | |
|------------------------------|----------------------------------|
| server | RADIUS server. |
| <i>index</i> | RADIUS server index. |
| dynamic-authorization | Specifies dynamic-authorization. |

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

The **dynamic-authorization** keyword was added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure rip

```
unconfigure rip {vlan vlan-name | all}
```

Description

Resets all *RIP* parameters to the default for all *VLANs* or for the specified VLAN.

Syntax Description

| | |
|------------------|------------------------|
| <i>vlan-name</i> | Specifies a VLAN name. |
|------------------|------------------------|

Default

All.

Usage Guidelines

Does not change the enable/disable state of the RIP settings.

Example

The following command resets the RIP configuration to the default for the VLAN finance:

```
# unconfigure rip finance
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge or Base license or higher as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure ripng

```
unconfigure ripng {vlan vlan-name | tunnel tunnel-name | vlan all |  
tunnel all}
```

Description

Resets *RIPng* parameters to the default value.

Syntax Description

| | |
|--------------------|---|
| <i>vlan-name</i> | Specifies an IPv6 configured VLAN . |
| <i>tunnel-name</i> | Specifies an IPv6 tunnel. |
| all | Specifies either all IPv6 configured VLANs or all IPv6 tunnels. |

Default

N/A.

Usage Guidelines

Issuing the command unconfigure ripng resets all the interfaces and the global configuration to the defaults, and disables RIPng, as that is the default.

Example

The following command resets the RIPng configuration to the default for the VLAN finance:

```
unconfigure rip finance
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure sflow

```
unconfigure sflow
```

Description

Resets all the sFlow values to the default values.

Syntax Description

This command has no arguments or variables.

Default

The default values for sFlow are as follows:

- sFlow agent IP address—0.0.0.0.
- sampling frequency—sample one every 8192 packets.
- polling interval—20 seconds.
- maximum CPU sample limit—2000 samples per second.

sFlow is unconfigured and disabled on all ports.

Usage Guidelines

This command resets sFlow values to the default values, and removes any port configurations, and any sFlow collectors configured on the switch.

Example

The following command unconfigures sFlow:

```
unconfigure sflow
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure sflow agent

```
unconfigure sflow agent
```

Description

Resets the sFlow agent's IP address to the default value.

Syntax Description

This command has no arguments or variables.

Default

The default IP address is 0.0.0.0.

Usage Guidelines

This command resets the sFlow agent IP address to its default value.

Example

The following command resets the agent IP back to the management IP address:

```
unconfigure sflow agent
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure sflow collector

```
unconfigure sflow collector {ipaddress} ipaddress {port udp-port-number}  
  {vr vr_name}
```

Description

Unconfigures the sFlow collector.

Syntax Description

| | |
|------------------------|--|
| <i>ipaddress</i> | Specifies the IP address of the collector to reset. |
| <i>udp-port-number</i> | Specifies the UDP port. |
| <i>vr_name</i> | Specifies which virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |

Default

The following values are the defaults for this command:

- UDP port number—6343
- Virtual router—[VR-Mgmt](#) (previously called VR-0)

Usage Guidelines

This command allows you to reset the specified sFlow collector parameters to the default values.

Both the commands `unconfigure ports monitor vlan` and `unconfigure sflow collector` will reset the collector parameters to the default.

Example

The following command removes the collector at IP address 192.168.57.1:

```
unconfigure sflow collector ipaddress 192.168.57.
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure sflow ports

```
unconfigure sflow ports port_list
```

Description

Removes the specified ports from the sFlow configuration, and stops sampling them.

Syntax Description

| | |
|------------------------|---|
| <code>port_list</code> | Specifies one or more ports or slots and ports. |
|------------------------|---|

Default

N/A.

Usage Guidelines

This command removes the specified ports from the sFlow configuration, and stops sampling them.

Example

The following command unconfigures sFlow on the ports 2:5-2:7:

```
unconfigure sflow ports 2:5-2:7
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure slot

```
unconfigure slot slot
```

Description

Clears a slot of a previously assigned switch type.

Syntax Description

| | |
|-------------------|---|
| <code>slot</code> | Specifies a slot (node) on a SummitStack. |
|-------------------|---|

Default

N/A.

Usage Guidelines

If you issue the `unconfigure ports wan-phy` command on a slot containing a switch with any ports configured for software-controlled redundancy, this command wipes away all software-controlled redundancy on both ports; both ports return to normal. Refer to the [ExtremeXOS 31.3 User Guide](#) for more information on software-controlled redundant ports.

Example

The following command clears node (slot) 4 of a previously assigned switch type:

```
unconfigure slot 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on SummitStack.

unconfigure ssl certificate

```
unconfigure ssl certificate [trusted-ca | ocsp-signature-ca] [file_name
| all ]
```

Description

Removes a trusted CA certificate or OCSP response signature CA certificate from the switch.

Syntax Description

| | |
|--------------------------|---|
| trusted-ca | Specifies trusted CA certificates. Removes the CA certificate file(s) from folder <code>/config/ssl/trusted_ca_certs/</code> . |
| ocsp-signature-ca | Specifies OCSP signature CA certificates. Removes the signature CA file(s) from folder <code>/config/ssl/signature_ca_certs/</code> . |
| <i>file_name</i> | Specifies a single CA certificate file for removal. |
| all | Specifies all CA certificate files for removal. |

Default

None.

Example

The following example removes all trusted CA certificates from the switch:

```
unconfigure ssl certificate trusted-ca all
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure stacking

```
unconfigure stacking {node-address node_address | slot slot_number}
```

Description

This command resets most stacking parameters to the default or unconfigured values.

Syntax Description

| | |
|---------------------|--|
| <i>node_address</i> | Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command. |
| <i>slot_number</i> | Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command. |

Default

N/A.

Usage Guidelines

Run this command from any node. If you do not specify a target node, the stacking parameters on all nodes are reset.

This command resets the stacking parameters shown in the following table.

Table 52: Stacking Configuration Items, Time of Effect and Default Value

| Configuration Item | Takes Effect | Default Value |
|--------------------|--------------|---------------|
| Stacking Mode | At boot time | Disabled |
| Slot Number | At boot time | 1 |
| Master-Capable | At boot time | Yes |

Table 52: Stacking Configuration Items, Time of Effect and Default Value (continued)

| Configuration Item | Takes Effect | Default Value |
|----------------------|-------------------------|----------------|
| License Restriction | At boot time | Not Configured |
| Priority | At next master election | Automatic |
| Alternate IP Address | Immediately | Not Configured |
| Stack MAC | At boot time | Not Configured |

This command does not reset the stacking parameters configured with the following commands that use the stacking-support keyword:

- configure stacking-support
- `disable stacking-support`
- `enable stacking-support`

Example

To unconfigure the stacking parameters of all nodes in the stack topology:

```
unconfigure stacking
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure stacking alternate-ip-address

```
unconfigure stacking {node-address node_address | slot slot_number}
alternate-ip-address
```

Description

Removes the configured alternate management IP address from the specified node.

If no node is specified, the alternate management IP address is removed from every node. The change takes effect immediately for all nodes operating in stacking mode.

Syntax Description

| | |
|---------------------|---|
| <i>node_address</i> | Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the <code>show stacking</code> command. |
| <i>slot_number</i> | Specifies the slot number of the target active node. To view the slot numbers, enter the <code>show stacking</code> command. |

Default

N/A.

Usage Guidelines

Run this command from any node.

Example

To unconfigure stacking alternate-ip-address on a node:

```
unconfigure stacking node-address 00:04:96:26:6b:ed alternate-ip-address
```

To unconfigure the stacking alternate IP address configured on the active node in slot 4:

```
unconfigure stacking slot 4 alternate-ip-address
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure stacking license-level

```
unconfigure stacking {node-address node_address | slot slot_number}  
license-level
```

Description

This command removes a previously configured license level restriction.

Syntax Description

| | |
|---------------------------|---|
| <code>node_address</code> | Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the <code>show stacking</code> command. |
| <code>slot_number</code> | Specifies the slot number of the target node. To view the slot numbers, enter the <code>show stacking</code> command. |

Default

N/A.

Usage Guidelines

If no node is specified, the licensing restriction is removed from all nodes in the stack topology.

After the command is executed, the following message appears:

```
This command will take effect at the next reboot of the specified node(s).
```

Example

To unconfigure the stacking license level on a node:

```
unconfigure stacking node-address 00:04:96:26:6b:ed license-level
```

To unconfigure the stacking license level configured on slot 4:

```
unconfigure stacking slot 4 license-level
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure stacking-support

```
unconfigure stacking-support
```

Description

This command resets the stacking parameters configured with commands that use the stacking-support keyword.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Run this command from the local node on which you want to reset stacking-support parameters.

This command resets the stacking parameters configured with the following commands that use the stacking-support keyword:

- configure stacking-support
- `disable stacking-support`
- `enable stacking-support`

Example

To unconfigure the stacking-support parameters on the local node, use the following command:

```
unconfigure stacking-support
The stacking-support configuration has been reset.
The defaults will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms that support alternate stack port selection or permit disabling of the stacking-support option.

unconfigure stpd ports link-type

```
unconfigure stpd stpd_name ports link-type port_list
```

Description

Returns the specified port to the factory default setting of broadcast link.

Syntax Description

| | |
|------------------|---|
| <i>stpd_name</i> | Specifies an <i>STPD</i> name on the switch. |
| <i>port_list</i> | Specifies one or more ports or slots and ports. |

Default

All ports are broadcast link types.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, you must enter the `stpd` keyword to specify the STPD. If your STPD has a name unique only to that STPD, the keyword `stpd` is optional.

If the switch operates in 802.1D mode, any configured port link type will behave the same as the broadcast link type.

In an MSTP environment, configure the same link types for the CIST and all MSTIs.

Example

The following command configures slot 2, ports 1 through 4 to return to the factory default of broadcast links in STPD s1:

```
unconfigure stpd s1 ports link-type 2:1-2:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure stpd

```
unconfigure stpd {stpd_name}
```

Description

Restores default STP values to a particular STPD or all STPDs.

Syntax Description

| | |
|------------------|---------------------------------------|
| <i>stpd_name</i> | Specifies an STPD name on the switch. |
|------------------|---------------------------------------|

Default

N/A.

Usage Guidelines

If you create an STPD with a unique name, the keyword `stpd` is optional.

Use this command to restore default STP values to a particular STPD. If you want to restore default STP values on all STPDs, do not specify a spanning tree name.

Example

The following command restores default values to an STPD named `Backbone_st`:

```
unconfigure stpd backbone_st
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure switch

```
unconfigure switch {all | erase [all | nvram]}
```

Description

Returns the switch configuration to its factory default settings and reboots the switch.

Syntax Description

| | |
|--------------------|--|
| all | Specifies that the entire configuration should be changed to the default values, including the management IP address, failsafe account, and SummitStack-specific parameters, and the switch rebooted. |
| erase all | All data such as loaded ExtremeXOS images (both partitions), configuration files, policy files, non-volatile memory content, and switch settings are overwritten. This renders the switch inoperable until you perform a bootrom rescue. The operation reboots the system automatically to complete the erasure. The entire operation may take up to 20 minutes (it could take longer if an SSD device is attached). Do not disconnect the power during this time. |
| erase nvram | Data in non-volatile memory such as selected configuration, selection image partition, log messages are overwritten. Switch boots up with primary image. Any unsaved configuration changes are lost and the switch reboots. |

Default

N/A.

Usage Guidelines

Use `unconfigure switch` to reset the configuration to factory defaults, but without erasing the configuration. This preserves users account information, date and time settings, SummitStack configuration, and so on.

Include the parameter **all** to clear the entire current configuration, including all switch and SummitStack parameters, and reboot using the last used image and factory default configuration.

The command `unconfigure switch all` does not clear licensing information. The license cannot be disabled after it is enabled on the switch.

To remove all virtual machines (VMs) and their installation files, use the command with the **all** option:

Note

If you do not use the **all** option, VMs/install files are not removed.

For SummitStack only.

The **all** option also resets all stacking-specific parameters to defaults. To reset only the stacking-specific parameters to defaults, enter the `unconfigure stacking` command.

Beginning with ExtremeXOS 12.5, stacking support and stacking port selection are reset only on the local node. When stacking support of any kind is supported on the platform, the following message is added to the output that is shown on the console after this command has been confirmed:

```
Stacking-support will be unconfigured on this node only.
```

Example

The following command preserves the entire current configuration (but does not reload the current configuration after the switch reboots) and reboots the switch or SummitStack using the last specified saved image and factory default configuration:

```
unconfigure switch all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure tacacs

```
unconfigure tacacs {server [primary | secondary]}
```

Description

Unconfigures the TACACS+ server configuration.

Syntax Description

| | |
|------------------|--|
| primary | Unconfigures the primary TACACS+ server. |
| secondary | Unconfigures the secondary TACACS+ server. |

Default

Unconfigures both the primary and secondary TACACS+ servers.

Usage Guidelines

None.

Example

The following command unconfigures all TACACS+ servers settings:

```
unconfigure tacacs
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure tacacs-accounting

```
unconfigure tacacs-accounting {server [primary | secondary]}
```

Description

Unconfigures the TACACS+ accounting server configuration.

Syntax Description

| | |
|------------------|---|
| primary | Unconfigures the primary TACACS+ accounting server. |
| secondary | Unconfigures the secondary TACACS+ accounting server. |

Default

Unconfigures both the primary and secondary TACACS+ accounting servers.

Usage Guidelines

None.

Example

The following command unconfigures all TACACS+ accounting servers settings:

```
unconfigure tacacs-accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure trusted-ports trust-for dhcp-server

```
unconfigure trusted-ports [ports | all] trust-for dhcp-server
```

Description

Unconfigures, disables one or more *DHCP* trusted ports.

Syntax Description

| | |
|--------------|--------------------------------------|
| <i>ports</i> | Specifies one or more trusted ports. |
| all | Specifies all trusted ports. |

Default

N/A.

Usage Guidelines

Use this command to disable one or more DHCP trusted ports.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted ports if configured, use the following command:

```
show ip-security dhcp-snooping {vlan} vlan_name
```

To display any violations that occur, including those on DHCP trusted ports if configured, use the following command:

```
show ip-security dhcp-snooping violations {vlan} vlan_name
```

Example

The following command unconfigures ports 2:2 and 2:3 as trusted ports:

```
unconfigure trusted-ports 2:2-2:3 trust-for dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure tunnel

```
unconfigure tunnel tunnel_name ipaddress ipv6_address_mask
```

Description

Unconfigures an IPv6 address/prefix route from a tunnel.

Syntax Description

| | |
|--------------------------|---|
| <i>tunnel_name</i> | Specifies an IPv6 tunnel. |
| <i>ipv6_address_mask</i> | Specifies an IPv6 address / IPv6 prefix length. |

Default

N/A.

Usage Guidelines

Use this command to unconfigure an IPv6 address/prefix route from the specified tunnel.

Example

The following example unconfigures the 6in4 tunnel "link39" with the address 2001:db8::1111/64

```
unconfigure tunnel link39 2001:db8::1111/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.`ss="- topic/ph "/>`

unconfigure upm event

```
unconfigure upm event upm-event profile profile-name ports port_list
```

Description

Unconfigures the event from the specified profile and port list.

Syntax Description

| | |
|---------------------|---|
| <i>upm-event</i> | Specifies the type of event to be unconfigured. |
| <i>profile-name</i> | Specifies the profile from which the event is unconfigured. |
| <i>port-list</i> | Unconfigures the UPM profile from the specified port list. |

Default

N/A.

Usage Guidelines

This command removes an event from the specified profile and port list.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure upm timer

```
unconfigure upm timer timer-name profile profile-name
```

Description

Removes a UPM profile from a UPM timer.

Syntax Description

| | |
|---------------------|---|
| <i>timer-name</i> | Unconfigures the specified UPM timer and deactivates any running timer. |
| <i>profile-name</i> | Removes the specified profile from the UPM timer. |

Default

N/A.

Usage Guidelines

Use this command to unconfigure a timer setting. This command does not delete the timer.

Note

The specified timer is stopped by this command, even if it has been activated.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan description

```
unconfigure {vlan} vlan_name description
```

Description

Removes the description for the specified VLAN.

Syntax Description

| | |
|------------------------|--------------------------|
| <code>vlan_name</code> | Specifies the VLAN name. |
|------------------------|--------------------------|

Default

N/A.

Usage Guidelines

None.

Example

The following example removes the description from VLAN vlan1:

```
unconfigure vlan vlan1 description
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vlan dhcp

```
unconfigure vlan vlan_name dhcp
```

Description

Unconfigure all the *DHCP* configuration information for the specified *VLAN*.

Syntax Description

| | |
|------------------------|--|
| <code>vlan_name</code> | Specifies the VLAN on which to unconfigure DHCP. |
|------------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the DHCP server for the VLAN temporary:

```
unconfigure temporary dhcp
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vlan dhcp-address-range

```
unconfigure vlan vlan_name dhcp-address-range
```

Description

Unconfigure the *DHCP* address range information for the specified *VLAN*.

Syntax Description

| | |
|------------------|--|
| <i>vlan_name</i> | Specifies the VLAN on which to unconfigure DHCP. |
|------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the DHCP address range for the VLAN temporary:

```
unconfigure temporary dhcp-address-range
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vlan dhcp-options

```
unconfigure {vlan} vlan_name dhcp-options {[ default-gateway | dns-
server {primary | secondary} | wins-server]}
```

Description

Unconfigure the *DHCP* option information for the specified *VLAN*.

Syntax Description

| | |
|------------------------|--|
| <i>vlan_name</i> | Specifies the VLAN on which to unconfigure DHCP. |
| default-gateway | Specifies the router option. |
| dns-server | Specifies the Domain Name Server (DNS) option. |
| primary | Specifies the primary DNS option. |
| secondary | Specifies the secondary DNS option. |
| wins-server | Specifies the NetBIOS name server (NBNS) option. |

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the DHCP options for the VLAN temporary:

```
unconfigure temporary dhcp-options
```

History

This command was first available in ExtremeXOS 11.0.

The primary and secondary DNS options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vlan ipaddress

```
unconfigure [ {vlan} vlan_name | vlan vlan_list] ipaddress
```

Description

Removes the IP address of the *VLAN* or a VMAN. With no parameters, the command removes the primary IPv4 address on the specified VLAN. Using the IPv6 parameters, you can remove specified IPv6 addresses from the specified VLAN.

Syntax Description

| | |
|--------------------------|---|
| <i>vlan_name</i> | Specifies a VLAN or VMAN name. |
| <i>vlan_list</i> | Specifies a VLAN list of IDs. |
| <i>ipv6_address_mask</i> | Specifies an IPv6 address using the format of IPv6-address/prefix-length, where IPv6 is the 128-bit address and the prefix length specifies the number of leftmost bits that comprise the prefix. |

Default

Removes the primary IPv4 address from the specified VLAN or VMAN.

Usage Guidelines

Note

With IPv6, you cannot remove the last link local IPv6 address until all global IPv6 addresses are removed. For *MLAG* configurations, you cannot remove an IP address from a VLAN until after you delete the MLAG peer.

Example

The following command removes the primary IPv4 address from the VLAN "accounting":

```
unconfigure vlan accounting ipaddress
```

The following command removes an IPv6 addresses from the VLAN "finance":

```
unconfigure vlan finance ipaddress 3ffe::1
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 parameters were added in ExtremeXOS 11.2.

The `vlan_list` option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vlan router-discovery

```
unconfigure vlan vlan_name router-discovery {ipv6}
```

Description

Unconfigures all the router-discovery parameters and resets them to their respective default values.

Syntax Description

| | |
|------------------------|--|
| <code>vlan_name</code> | Specifies an IPv6 configured <u>VLAN</u> . |
|------------------------|--|

Default

N/A.

Usage Guidelines

Each of the router-discovery parameters is set to the default value. For example, the default-lifetime parameter is set to 1800 seconds. The default value for each of the router-discovery parameters is listed in the corresponding `configure vlan router-discovery` command description.

Example

The following example unconfigures all the router-discovery parameters for the VLAN `top_floor`:

```
unconfigure vlan top_floor router-discovery
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery default-lifetime

```
unconfigure vlan vlan_name router-discovery {ipv6} default-lifetime
```

Description

Unconfigures the router lifetime value sent in router discovery advertisements on the [VLAN](#).

Syntax Description

| | |
|------------------------|------------------------------------|
| <code>vlan_name</code> | Specifies an IPv6 configured VLAN. |
|------------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the default-lifetime parameter to the default value of 1800 seconds.

Example

The following command unconfigures the default-lifetime for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery default-lifetime
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery hop-limit

```
unconfigure vlan vlan_name router-discovery {ipv6} hop-limit
```

Description

Unconfigures the current hop limit value sent in router discovery advertisements on the [VLAN](#).

Syntax Description

| | |
|------------------------|------------------------------------|
| <code>vlan_name</code> | Specifies an IPv6 configured VLAN. |
|------------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the hop-limit parameter to the default value of 64.

Example

The following example unconfigures the current hop limit for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery hop-limit
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery link-mtu

```
unconfigure vlan vlan_name router-discovery {ipv6} link-mtu
```

Description

Unconfigures the link MTU value sent in router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------|------------------------------------|
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN. |
|------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the **link-mtu** parameter to the default value of 0.

Example

The following example unconfigures the link MTU for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery link-mtu
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery managed-config-flag

```
unconfigure vlan vlan_name router-discovery {ipv6} managed-config-flag
```

Description

Unconfigures the managed address configuration flag value sent in router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------|------------------------------------|
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN. |
|------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the managed-config-flag parameter to the default value off.

Example

The following example unconfigures the managed address configuration flag for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery managed-config-flag
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery max-interval

```
unconfigure vlan vlan_name router-discovery {ipv6} max-interval
```

Description

Unconfigures the maximum time between unsolicited router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------------|------------------------------------|
| <code>vlan_name</code> | Specifies an IPv6 configured VLAN. |
|------------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the max-interval parameter to the default value of 600 seconds.

Example

The following example unconfigures the max-interval for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery max-interval
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery min-interval

```
unconfigure vlan vlan_name router-discovery {ipv6} min-interval
```

Description

Unconfigures the minimum time between unsolicited router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------------|------------------------------------|
| <code>vlan_name</code> | Specifies an IPv6 configured VLAN. |
|------------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the min-interval parameter to the default value of (max-interval × .33 seconds).

Example

The following example unconfigures the min-interval for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery min-interval
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery other-config-flag

```
unconfigure vlan vlan_name router-discovery {ipv6} other-config-flag
```

Description

Unconfigures the other stateful configuration flag value sent in router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------|------------------------------------|
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN. |
|------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the other-config-flag parameter to the default value off.

Example

The following example unconfigures the other stateful configuration flag for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery other-config-flag
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery reachable-time

```
unconfigure vlan vlan_name router-discovery {ipv6} reachable-time
```

Description

Unconfigures the reachable time value in router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------|------------------------------------|
| <i>vlan_name</i> | Specifies an IPv6 configured VLAN. |
|------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the reachable-time parameter to the default value of 30,000 milliseconds.

Example

The following example unconfigures the reachable time for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery reachable-time
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan router-discovery retransmit-time

```
unconfigure vlan vlan_name router-discovery {ipv6} retransmit-time
```

Description

Unconfigures the retransmit time value in router discovery advertisements on the VLAN.

Syntax Description

| | |
|------------------------|------------------------------------|
| <code>vlan_name</code> | Specifies an IPv6 configured VLAN. |
|------------------------|------------------------------------|

Default

N/A.

Usage Guidelines

This command sets the retransmit-time parameter to the default value of 1000 milliseconds.

Example

The following example unconfigures the retransmit time for the VLAN "top_floor":

```
unconfigure vlan top_floor router-discovery retransmit-time
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vlan subvlan-address-range

```
unconfigure vlan vlan_name subvlan-address-range
```

Description

Unconfigures subVLAN address ranges on each subVLAN to prohibit the entry of IP addresses from hosts outside of the configured range.

Syntax Description

| | |
|------------------------|---------------------------|
| <code>vlan_name</code> | Specifies a subVLAN name. |
|------------------------|---------------------------|

Default

N/A.

Usage Guidelines

This command removes a subVLAN address range. There is no error checking to prevent the configuration of overlapping subVLAN address ranges between multiple subVLANs. Doing so can result in unexpected behavior of ARP within the superVLAN and associated subVLANs.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vlan udp-profile

```
unconfigure vlan vlan_name udp-profile
```

Description

Removes any UDP forwarding profile from a VLAN.

Syntax Description

| | |
|------------------|------------------------|
| <i>vlan_name</i> | Specifies a VLAN name. |
|------------------|------------------------|

Default

No UDP profiles are associated with the VLAN.

Usage Guidelines

None.

Example

The following example removes any UDP forwarding profile from the VLAN "to-sales":

```
unconfigure vlan to-sales udp-profile
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vman ethertype

```
unconfigure vman ethertype {secondary}
```

Description

Restores the default primary VMAN ethertype value of 0x88A8 or deletes the secondary ethertype value.

Syntax Description

| | |
|------------------|--|
| secondary | Deletes the secondary ethertype value. |
|------------------|--|

Default

If the secondary option is not specified, it restores the default primary VMAN ethertype value of 0x88a8.

Usage Guidelines

When you enter this command without the secondary option, the primary VMAN ethertype returns to the default value of 0x88A8. If you specify the secondary option, the secondary VMAN ethertype value is deleted (no value is assigned).

Note

Before unconfiguring the secondary VMAN ethertype, any secondary VMAN port must be changed to the primary VMAN ethertype; otherwise the command fails.

Example

The following example restores the primary VMAN ethertype to the default value:

```
unconfigure vman ethertype
```

The following example deletes the secondary VMAN ethertype:

```
unconfigure vman ethertype secondary
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vm-tracking local-vm

```
unconfigure vm-tracking local-vm mac-address mac [name | ip-address |
vpp | vlan-tag]
```

Description

Unconfigures the parameters associated with a local VM database entry to be used for VM MAC local authentication.

Syntax Description

| | |
|-------------------|--|
| <i>mac</i> | Specifies the MAC address for the local VM database entry you want to unconfigure. |
| name | Removes the name configured for the VM database entry. |
| ip-address | Removes the IP address configured for the VM database entry. |
| vpp | Removes the VPP configured for the VM database entry. |
| vlan-tag | Removes the <u>VLAN</u> tag configured for the VM database entry. |

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the IP address configuration for the VM entry specified by the MAC address:

```
# unconfigure vm-tracking local-vm mac-address 00:E0:2B:12:34:56 ip-address
```

History

This command was first available in ExtremeXOS 12.5.

The ingress-vpp and egress-vpp options were replaced with the vpp option in ExtremeXOS 12.6.

The VLAN-tag option was added in ExtremeXOS 15.3.

Platform Availability

This command is available on the ExtremeSwitching X440-G2,X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

unconfigure vm-tracking nms

```
unconfigure vm-tracking nms {server [primary | secondary]}
```

Description

Removes the configuration for one or both NMS servers.

Syntax Description

| | |
|-----------------------------------|---|
| primary secondary | Specifies the whether you are unconfiguring the primary or secondary NMS. |
|-----------------------------------|---|

Default

N/A.

Usage Guidelines

If you do not specify primary or secondary, this command removes the configuration for both NMS servers.

Example

The following command removes the configuration for the secondary NMS server:

```
# unconfigure vm-tracking nms server secondary
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2,X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

unconfigure vm-tracking repository

```
unconfigure vm-tracking repository {primary | secondary}
```

Description

Removes the configuration for FTP file synchronization for NVPP and VM MAP files.

Syntax Description

| | |
|-----------------------------------|--|
| primary secondary | Specifies the whether you are unconfiguring the primary or secondary FTP server. |
|-----------------------------------|--|

Default

If you do not specify primary or secondary, the default action is to remove both the primary and secondary FTP server configurations.

Usage Guidelines

None.

Example

The following command removes the configuration for the primary and secondary FTP servers:

```
# unconfigure vm-tracking repository
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

unconfigure vm-tracking vpp vlan-tag

```
unconfigure vm-tracking vpp vpp_name vlan-tag
```

Description

Unconfigures the VLAN tag of VPP.

Syntax Description

| | |
|-----------------|------------------------------|
| <i>vpp_name</i> | Specifies a name of the VPP. |
|-----------------|------------------------------|

Default

N/A.

Usage Guidelines

Use this command to unconfigure the VLAN tag of VPP.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on the ExtremeSwitching X440-G2,X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vm-tracking vpp

```
unconfigure vm-tracking vpp vpp_name
```

Description

Removes the association of a policy or [ACL](#) rule to an LVPP.

Syntax Description

| | |
|-----------------|---|
| <i>vpp_name</i> | Specifies the name of an existing LVPP. |
|-----------------|---|

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the configuration of LVPP vpp1:

```
# unconfigure vm-tracking vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the ExtremeSwitching X440-G2,X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, 5520 series switches.

unconfigure vpex

```
unconfigure vpex ports port_list slot
```

Description

Allows you to disassociate a bridge port extender (BPE) from a slot number assignment.

Syntax Description

| | |
|------------------|--|
| vpex | Specifies Virtual Port Extender (VPEX). |
| ports | Specifies switch ports attached to BPEs. |
| <i>port_list</i> | Specifies switch ports attached to BPEs. Must be in the format <i>slot:port</i> . Note: If the switch port is a LAG, the port specified must be the master port. |
| slot | Specifies the BPE slot assignment. |

Default

N/A.

Usage Guidelines

The behavior of this command is similar to removing slots within a chassis. After executing this command, the BPE no longer occupies the slot number assignment.

Example

The following example removes the slot number assignment from a BPE attached to switch port 1:23:

```
# unconfigure vpex ports 1:23 slot
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

unconfigure vpex mlag-id peer

```
unconfigure vpex mlag-id mlag_id slot
```

Description

In an Extended Edge Switching topology, removes the bridge port extender (BPE) slot assignment applied to an *MLAG* identifier on the specified MLAG peer when the port connected to the BPE is physically connected to the MLAG peer switch.

Syntax Description

| | |
|----------------|---|
| vpex | Specifies Virtual Port Extender (VPEX). |
| mlag-id | Specifies a unique MLAG identifier of the MLAG port attached to the bridge port extender (BPE). |
| <i>mlag_id</i> | Specifies the MLAG identifier value of the MLAG port attached to the BPE. Range is 1-65,000. |
| slot | Specifies unconfiguring the slot identifier for the attached BPE. |

Default

N/A.

Usage Guidelines

The configure **vpex mlag-id mlag_id peer peer_name slot slot_num** command allows the MLAG peer that does not have a port in the specified MLAG to declare a Extended Edge Switching slot on that MLAG. This command enables you to unconfigure a previously declared slot on that MLAG.

Example

The following example unconfigures the slot previously declared on MLAG "11":

```
# unconfigure vpex mlag-id 11 slot
```

History

This command was first available in ExtremeXOS 22.7.

Platform Availability

This command is available on the ExtremeSwitching X670-G2 , X465 , X690, X590, 5420, 5520 series switches.

unconfigure vpls dot1q ethertype

```
unconfigure vpls vpls_name dot1q ethertype
```

Note

This command has been replaced with the following command: `unconfigure l2vpn [vpls vpls_name | vpwsvpws_name] dot1q ethertype`.

This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Unconfigures the ethertype setting for the VPLS specified by *vpls_name*.

Syntax Description

| | |
|------------------|--|
| <i>vpls_name</i> | Identifies the VPLS within the switch (character string) |
|------------------|--|

Default

N/A

Usage Guidelines

This command unconfigures the ethertype setting for the VPLS specified by *vpls_name*. The setting is changed back to the value displayed in the `show dot1q` command.

Example

The following command changes the ethertype setting for the specified VPLS to the value displayed in the `show dot1q` command:

```
unconfigure vpls my_vpls dot1q ethertype
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vpls snmp-vpn-identifier

```
unconfigure vpls vpls_name snmp-vpn-identifier
```

Description

Removes an [SNMP](#) VPN identifier for traps from the specified VLPLS.

Syntax Description

| | |
|------------------|--|
| <i>vpls_name</i> | Specifies the VPLS for which you are removing the identification string. |
|------------------|--|

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the identifier for SNMP VPN traps on VPLS vpls1:

```
unconfigure vpls vpls1 snmp-vpn-identifier
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support [MPLS](#) as described in the [ExtremeXOS 31.3 Feature License Requirements](#) document.

unconfigure vr description

```
unconfigure vr name description
```

Description

Removes a description for the specified VR or VRF.

Syntax Description

| | |
|-------------|---|
| <i>name</i> | Specifies the name of a user VR or a VRF. |
|-------------|---|

Default

No description.

Usage Guidelines

None.

Example

The following example removes a description for the VRF "corporate":

```
unconfigure vr corporate description
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vr rd

```
unconfigure vr vrf_name rd
```

Description

This command removes the configuration for a VPN VRF RD.

Syntax Description

| | |
|-----------------|----------------------------------|
| <i>vrf_name</i> | Specifies the name of a VPN VRF. |
|-----------------|----------------------------------|

Default

N/A.

Usage Guidelines

None.

Example

The following examples unconfigure RDs using the two of the supported formats:

```
unconfigure vr corporate-extreme rd
unconfigure vr corporate-guest rd
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure vr vpn-id

```
unconfigure vr vrf_name vpn-id
```

Description

This command removes the configuration for a globally unique identifier for a VPN VRF.

Syntax Description

| | |
|-----------------|----------------------------------|
| <i>vrf_name</i> | Specifies the name of a VPN VRF. |
|-----------------|----------------------------------|

Default

N/A.

Usage Guidelines

None.

Example

The following example removes VPN ID ac:9f3c8 from the VRF "corporate-extreme":

```
unconfigure vr corporate-extreme vpn-id
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

unconfigure xml-notification

```
unconfigure xml-notification
```

Description

Unconfigures the XML notification client.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the XML client process including the associated log target configuration.

Example

The following command unconfigures the xml-notification client:

```
unconfigure xml-notification
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

uninstall image

```
uninstall image fname partition {msm slotid} {reboot}
```

On a SummitStack, use:

```
uninstall image fname partition {slot slot number} {reboot}
```

Description

Uninstalls an ExtremeXOS software package. Also uninstalls a VOSS image when staged for installation on the next reboot.

Syntax Description

| | |
|------------------|---|
| <i>fname</i> | Specifies the software package to uninstall. |
| <i>partition</i> | Specifies which partition the package was installed to: primary or secondary. Select primary to remove it from the primary partition and secondary to remove it from the secondary partition. |
| <i>slotid</i> | On a SummitStack, the slot number specifies the node on which the BootROM image should be uninstalled. |
| reboot | Reboots the switch after the package is uninstalled. |

Default

N/A.

Usage Guidelines

Use this command to uninstall a software package previously installed on the switch.

Use this command to uninstall a VOSS image when staged for installation on the next reboot.

```
* (NOS Change to VOSS after Reboot) 5420F-16MW-32P-4XE-EXOS.3 # uninstall image
Uninstalling VOSS image...
Image uninstalled successfully
* (Beta) 5420F-16MW-32P-4XE-EXOS.4 #
```

If a VOSS image is not staged, the same command would yield the following error:

```
* (Beta) 5420F-16MW-32P-4XE-EXOS.4 # uninstall image
Uninstalling VOSS image...
Error: No other Network Operating System image has been staged for auto-install
* (Beta) 5420F-16MW-32P-4XE-EXOS.4 #
```

When you uninstall a software package, the switch prompts you to save your changes to your currently active configuration file:

```
Uninstallation of the EXOS module Do you want to save configuration changes to
primary.cfg? (y or n)
```

Enter *y* to save the changes to your configuration file. Enter *n* to not save the changes to your configuration file.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local and remote filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements previously described.

SummitStack Only

You can issue this command only from a Master node.

Example

```
# uninstall image *switch-ntp.xmod secondary
```

History

This command was first available in ExtremeXOS 11.0.

The slot parameter was added to support SummitStack in ExtremeXOS 12.0.

Platform Availability

This command is available on the ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

uninstall license file

```
uninstall license file filename [{revoke revocation_file} | withhold ]
    {slot slot}
```

Description

Uninstalls a license key file on ExtremeSwitching 5420 and 5520 series switches.

Syntax Description

| | |
|------------------------|---|
| file | Specifies providing the license key file. |
| <i>filename</i> | Specifies the name of the license key file. |
| slot | For stacks and Extended Edge Switching, specifies uninstalling the license key file from a slot. |
| <i>slot</i> | For stacks and Extended Edge Switching, specifies the slot to uninstall the license key file from. |
| revoke | Specifies generating a revocation certificate to release the license entitlement and invalidate the license key. |
| <i>revocation_file</i> | Specifies the file name (with <code>.rvk</code> extension) to store the revocation certificate in. |
| withhold | Specifies retaining the license entitlement for subsequent re-installation with the original license file. If the original license file is not available, use the revoke option. |

Default

N/A.

Usage Guidelines

This command disables and uninstalls the feature license contained in the RMS license file. Only files with `.lic` extension are accepted..

The **revoke** option invalidates the feature license and generates a revocation certificate, which is the first step to release the license entitlement back to the license entitlement manager (LEM), whereas the **withhold** option retains the license entitlement with the switch, and thus, the original license can be used to reinstall the feature license. If the specified file name (for `revocation_file`) does not have an `.rvk` extension, it is automatically appended.

If you use this command to disable and remove the license, this removes the configuration capability of related features. However, the functionality continues to work until the next reboot.

To install a license, use the command `install license file filename {slot slot}`.

To uninstall a specific license product, use the command `uninstall license product product_name [revoke revocation_file | withhold] {slot slot}`

To view the licenses installed on your switch, use the `show licenses {[slot slot |all]} {detail}` command.

Example

The following example uninstalls the license with filename `mylicense.lic`, so that it can be re-installed on the switch at a future date:

```
# uninstall license file mylicense.lic withhold
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on the ExtremeSwitching 5420 and 5520 series switches.

uninstall license product

```
uninstall license product product_name [revoke revocation_file |  
withhold] {slot slot}
```

Description

Disables and uninstalls specific license products, such as MAC Security (MACsec), for ExtremeSwitching 5420 and 5520 series switches.

Note

licMgr does not recognize PRD-5000-MACSEC feature license on ExtremeSwitching 5420 series switches.

Syntax Description

| | |
|------------------------|---|
| product | Specifies uninstalling a particular license product. |
| <i>product_name</i> | Selects the specific license product to uninstall. |
| slot | For stacks and Extended Edge Switching, specifies uninstalling the license feature from a slot. |
| <i>slot</i> | For stacks and Extended Edge Switching, specifies the slot to uninstall the license feature from. |
| revoke | Specifies generating a revocation certificate to release the license entitlement and invalidate the license key. |
| <i>revocation_file</i> | Specifies the file name (with <code>.rvk</code> extension) to store the revocation certificate in. |
| withhold | Specifies retaining the license entitlement for subsequent re-installation with the original license file. If the original license file is not available, use the revoke option. |

Default

N/A.

Usage Guidelines

This command uninstalls a specific feature license product. This command effectively disables the specified feature.

To view the license products installed on your switch, use the `show licenses {[slot slot | all]} {detail}` command with the **detail** option.

The **revoke** option invalidates the feature license and generates a revocation certificate, which is the first step to release the license entitlement back to the license entitlement manager (LEM), whereas the **withhold** option retains the license entitlement with the switch, and thus, the original license can be used to reinstall the feature license. If the specified file name (for *revocation_file*) does not have an `.rvk` extension, it is automatically appended.

To install a license, use the following command `install license file filename {slot slot}`.

Example

The following example removes the MACsec (PRD-5000-MACSEC) license product from a switch: and generate a revocation certificate (macsec_lic.rvk) to release the license entitlement and invalidate the license key:

```
# uninstall license product PRD-5000-MACSEC revoke macsec_lic.rvk
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on the ExtremeSwitching 5420 and 5520 series switches.

upload configuration

```
upload configuration [hostname | ipaddress] filename {vr vr-name}
                 {block-size block_size}
```

Description

Uploads the current configuration in ASCII format to a TFTP server on your network.

Syntax Description

| | |
|-------------------|---|
| <i>hostname</i> | Specifies the hostname of the TFTP server where you want to download the configuration file. You must have DNS enabled. |
| <i>ipaddress</i> | Specifies the IP address of the TFTP server where you want to download the configuration file. |
| <i>filename</i> | Specifies a user-defined name for the configuration file. You must use the .xsf file extension when naming an ASCII-formatted configuration file. |
| <i>vr-name</i> | Specifies the name of the virtual router. By default the switch uses <i>VR-Mgmt</i> for this command. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>block_size</i> | Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65000 bytes. |

Default

Uploads the current configuration in ASCII format immediately to a TFTP server.

The default value of **block-size** is 1400 bytes.

Usage Guidelines

Specify the `ipaddress` or `hostname` parameters to upload the current, active configuration file from the switch to a TFTP server on the network. Use of the `hostname` parameter requires that DNS be enabled.

The uploaded ASCII file retains the CLI format. This allows you to do the following:

- Modify the configuration using a text editor, and later download a copy of the file to the same switch or to one or more different switches.
- Send a copy of the configuration file to Extreme Networks Technical Support for problem-solving purposes.

This command is not applicable to XML-based configurations. Those files use the `.cfg` file extension.

If you want to view your configuration in ASCII format, use the `.xsf` file extension (known as the XOS script file) when you save the configuration file on the switch. This saves the XML-based configuration in an ASCII format readable by a text editor.

If you successfully upload the active configuration to the network TFTP server, the switch displays a message similar to the following:

```
Uploading meg_upload_config1.xsf to 10.10.10.10 ... done!
```

If the switch displays a timeout error message similar to the following:

```
failed! Error: timeout
```

Make sure you entered the correct host name or IP address of the TFTP server

If the switch displays an unreachable network error similar to the following:

```
failed! Error: Network is unreachable
```

Make sure you entered the correct virtual router. By default the switch uses VR-Mgmt for this command.

Summary of Steps

The following summary only describes the CLI involved to transfer the configuration and load it on the switch; it is assumed that you know how to modify the configuration file with a text editor. As previously described, to use these commands, use the `.xsf` file extension. These steps are not applicable to configurations that use the `.cfg` file extension.

To work with an ASCII-formatted configuration file, complete the following tasks:

- Upload the configuration to a network TFTP server using the following command:

```
upload configuration [hostname | ipaddress] filename {vr vr-name}  
{block-size block_size}
```

After the configuration file is on the TFTP server, use a text editor to the desired changes.

- Download the configuration from the TFTP server to the switch using one of the following commands:

```
tftp [host-name | ip-address] -g -r remote-file
```

```
tftp get [host-name | ip-address]remote-file
```

- Verify the configuration file is on the switch using the following command:

```
ls
```

- Load and restore the new configuration file on the switch using the following command:

```
load script filename {arg1} {arg2} ... {arg9}
```

- Save the configuration to the configuration database so the switch can reapply the configuration after switch reboot using the following command:

```
save configuration {primary | secondary | existing-config | new-config}
```

When you save the configuration file, the switch automatically adds the .cfg file extension to the filename. This saves the ASCII configuration as an XML-based configuration file.

The following describes the steps in more detail.

Uploading the ASCII Configuration File To a TFTP Server

To upload the current switch configuration as an ASCII-based file to the TFTP server, use the `upload configuration` command and save the configuration with the .xsf file extension.

For example, to transfer the current switch configuration as an ASCII-based file named `meg_upload_config1.xsf` to the TFTP server with an IP address of 10.10.10.10, do the following:

```
upload configuration 10.10.10.10 meg_upload_config1.xsf
```

If you successfully upload the configuration to the TFTP server, the switch displays a message similar to the following:

```
Uploading meg_upload_config1.xsf to 10.10.10.10 ... done!
```

Downloading the ASCII Configuration File to the Switch

To download the configuration from the TFTP server to the switch, use the `tftp` command. For example, to retrieve the configuration file named `meg-upload_config1.xsf` from a TFTP server with an IP address of 10.10.10.10, you can use one of the following commands:

```
tftp 10.10.10.10 -g -r meg_upload_config1.xsf  
tftp get 10.10.10.10 meg_upload_config1.xsf
```

If you successfully download the configuration to the switch, the switch displays a message similar to the following:

```
Downloading meg_upload_config1.xsf to switch... done!
```

Verifying that the ASCII Configuration File is on the Switch

To confirm that the ASCII configuration file is on the switch, use the `ls` command. The file with an .xsf extension is the ASCII configuration.

The following sample output contains an ASCII configuration file:

```
-rw-r--r-- 1 root 0 98362 Nov 2 13:53 Nov022005.cfg
-rw-r--r-- 1 root 0 117136 Dec 12 12:56 epicenter.cfg
-rw-r--r-- 1 root 0 68 Oct 26 11:17 mcastgroup.pol
-rw-r--r-- 1 root 0 21203 Dec 13 15:40 meg_upload_config1.xsf
-rw-r--r-- 1 root 0 119521 Dec 6 14:35 primary.cfg
-rw-r--r-- 1 root 0 96931 Nov 11 11:01 primary_11_11_05.cfg
-rw-r--r-- 1 root 0 92692 Jul 19 16:42 secondary.cfg
```

Loading the ASCII Configuration File

After downloading the configuration file, you must load the new configuration on the switch. To load and restore the ASCII configuration file, use the `load script filename {arg1} {arg2} ... {arg9}` command. After issuing this command, the ASCII configuration quickly scrolls across the screen.

The following is an example of the type of information displayed when loading the ASCII configuration file:

```
script.meg_upload_config1.xsf.389 # enable snmp access
script.meg_upload_config1.xsf.390 # enable snmp traps
script.meg_upload_config1.xsf.391 # configure mstp region purple
script.meg_upload_config1.xsf.392 # configure mstp revision 3
script.meg_upload_config1.xsf.393 # configure mstp format 0
script.meg_upload_config1.xsf.394 # create stpd s0
```

Instead of entering each command individually, the script runs and loads the CLI on the switch.

Saving the Configuration

After you load the configuration, save it to the configuration database for use by the switch. This allows the switch to reapply the configuration after a switch reboot. To save the configuration, use the `save configuration {primary | secondary | existing-config | new-config}` command.

When you save the configuration file, the switch automatically adds the .cfg file extension to the filename. This saves the ASCII configuration as an XML-based configuration file.

You can use any name for the configuration. For example, after loading the file meg_upload_config1.xsf, you need to save it to the switch. To save the configuration as configuration1.cfg, do the following:

```
save configuration configuration1
```

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)

- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) Permitted only for remote files

When naming a remote file, remember the requirements previously described.

Example

The following command uploads the current switch configuration as an ASCII-based file named configbackup.xsf to the TFTP server with an IP address of 10.10.10.10:

```
upload configuration 10.10.10.10 configbackup.xsf
```

If you successfully upload the configuration to the TFTP server, the switch displays a message similar to the following:

```
Uploading configbackup.xsf to 10.10.10.10 ... done!
```

History

This command was first available in ExtremeXOS 11.4.

Block size support was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

upload debug

```
upload debug [hostname | ipaddress] {{vr} vr_name} {block-size
  block_size}
```

Description

Uploads debug information files to a tftp server.

Syntax Description

| | |
|-------------------|---|
| <i>hostname</i> | Specifies the host name of the TFTP server to which the debug files will be uploaded to. |
| <i>ipaddress</i> | Specifies the IP address of the TFTP server to which the debug files will be uploaded to. |
| <i>vr_name</i> | Specifies the name of the virtual router. |
| <i>block_size</i> | Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65000 bytes. |

Default

By default, the virtual router *VR-Mgmt* will be used.

If you do not specify block size, the default value is 1400 bytes.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support personnel to troubleshoot the switch.

Use this command to copy, upload debug information (for example, core, trace, show tech-support, configuration, and policy files) to the specified TFTP server.

Progress messages are displayed that indicate the file being copied and when the copying is finished. Depending on your platform, the switch displays a message similar to the following:

```
The following files on have been uploaded: Tarball Name: TechPubsLab_C_09271428.tgz ./
primary.cfg
```

You can also use this command in conjunction with the `show tech-support` command. Prior to uploading debug information files, the switch prompts you with the following message to run the `show tech` command with the logto file option:

```
Do you want to run show tech logto file first? (y/n)
```

Enter y to run the `show tech-support` command before uploading debug information. If you enter y, the `show_tech.log.tgz` file is included during the upload. Enter n to upload debug information without running the `show tech` command.

After you upload the debug information, you should see a compressed TAR file, which contains the debug information.

The TAR file naming convention is:

```
<SysName>_{<slot#>|A|B}I|C>_<Current Time>.tgz
```

where <Current Time> = mmddhhmm (month (01-12), day (01-31), hour (0-24), minute (00-59)).

Example

The following command uploads debug files to a network TFTP server:

```
upload debug 10.10.10.10
```

History

This command was first available in ExtremeXOS 11.6.

Block size support was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

upload dhcp-bindings

```
upload dhcp-bindings
```

Description

Upload the DHCP bindings immediately on demand.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This commands enables the functionality to allow you to upload DHCP bindings on demand.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

upload log

```
upload log [ ipaddress | hostname ] {vr vr_name} {block-size block_size}
          filename {messages [ memory-buffer | nvram ] } {severity severity
          {only}} {match regex} {chronological}
```

Description

Uploads the current log messages to a TFTP server.

Syntax Description

| | |
|----------------------|---|
| <i>ipaddress</i> | Specifies the ipaddress of the TFTP server. |
| <i>hostname</i> | Host name of server to send log information to. |
| <i>vr_name</i> | Specifies the virtual router that can reach the TFTP server. Note: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS 31.3 Feature License Requirements document. |
| <i>block_size</i> | Specifies the data block size, excluding TFTP header. Data block size ranges from 24-65000 bytes. |
| <i>filename</i> | Specifies the file name for the log stored on the TFTP server. |
| messages | Specifies the location from which to display the log messages. |
| memory-buffer | Show messages stored in volatile memory. |
| nvr am | Show messages stored in NVRAM. |
| <i>severity</i> | Specifies the minimum severity level to display (if the keyword only is omitted). |
| only | Specifies that only the specified severity level is to be displayed. |
| <i>regex</i> | Specifies a regular expression. Only messages that match the regular expression will be displayed. |
| chronological | Specifies uploading log messages in ascending chronological order (oldest to newest). |

Default

The following defaults apply:

- **messages**—memory buffer.
- **severity**—none (displays everything stored in the target).
- **match**—no restriction.
- **chronological**—if not specified, show messages in order from newest to oldest.

If you do not specify block size, the default value is 1400 bytes.

Usage Guidelines

This command is similar to the `show log` command, but instead of displaying the log contents on the command line, this command saves the log to a file on the TFTP server you specify. For more details on most of the options of this command, see the command `show log`.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-) Permitted only for host names.
- Underscore (_) Permitted only for host names.
- Colon (:).

When naming or configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z).
- Numerals (0-9).
- Period (.).
- Dash (-).
- Underscore (_).
- Slash (/).

When naming a local or remote file, remember the requirements listed above.

Example

The following command uploads messages with a critical severity to the filename `switch4critical.log` on TFTP server at `10.31.8.25`:

```
upload log 10.31.8.25 switch4critical.log severity critical
```

The following command uploads messages with warning, error, or critical severity to the filename switch4warn.log on TFTP server at 10.31.8.25:

```
upload log 10.31.8.25 switch4warn.log severity warning
```

History

This command was first available in ExtremeXOS 10.1.

Block size support was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

use configuration

```
use configuration file-name
```

Description

Configures the switch to use a previously saved configuration on the next reboot.

Syntax Description

| | |
|------------------|---|
| <i>file-name</i> | Specifies an existing user-defined configuration file name (displays a list of available user-defined configuration files). |
|------------------|---|

Default

N/A.

Usage Guidelines

Note

When the switch boots up after executing this command, examine the log to determine if a subsequent save and reboot of the switch or slot is necessary for the configuration to be correctly applied.

In rare cases, this command requires a second reboot for all configuration settings to take effect. This is because certain configuration settings are required for hardware initialization and are stored in the switch's non-volatile storage, as well as the configuration file. These settings include: configure forwarding internal-tables and configure ports partition. Therefore, when the configuration file selected by this command has different values for the above settings, a message is logged explaining that a save and reboot are required.

XML-based configuration files have a .cfg file extension. When you enter the name of the file in the CLI, the system automatically adds the .cfg file extension.

Do not use this command with ASCII-formatted configuration files. Those configuration files have an .xsf file extension. For more information about using and saving ASCII-formatted configuration files see the `upload configuration [hostname |ipaddress] filename {vr vr-name }` and the `load script filename {arg1} {arg2} ... {arg9}` commands.

There is no special significance to the primary and secondary configurations. They are just conveniences to specify the files primary.cfg and secondary.cfg.

When you configure the switch to use a previously saved configuration, the switch displays the following message:

```
The selected configuration file is now "<file-name>.cfg". By default,
this file will be used for saving the configuration which will take
effect after the next switch reboot.
```

You can create a new configuration file by saving your current switch configurations and using that file on the next reboot. For example, to create a new configuration named test1 based on your current CLI session and switch configurations, use the following command:

```
save configuration test1
```

Tracking and Displaying Switch Configuration Files

To keep track of your configuration file names, use the `ls` command to display the files saved on your switch. Files with the .cfg extension are configuration files. In addition, you can see a list of available configuration files when you use the `use configuration` command.

The following is sample output from this command (“test” and “XOS1” are the names of the user-created and defined configurations):

```
exsh.1 # use configuration
primary      Primary configuration file
secondary    Secondary configuration file
<file-name>  Configuration file name
"test" "XOS1"
```

You can also use the `ls` command to display a list of the current configuration and policy files in the system.

Displaying the Active Configuration

To view the currently active, running configuration, use the `show switch` command.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements listed above.

Example

The following command specifies that the next reboot should use the saved configuration file named XOS1.cfg:

```
use configuration XOS1
```

The following command specifies that the next reboot should use the configuration saved in the primary partition:

```
use configuration primary
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

use image

```
use image {partition} partition {slot slotid}
```

Description

Configures the switch to use a saved image on the next reboot.

Syntax Description

| | |
|------------------|---|
| <i>partition</i> | Specifies which image to use on the next reboot, the one stored on the primary partition, or the one stored on the secondary partition. |
| <i>slotid</i> | On a SummitStack, the slotid specifies the node on which the BootROM image is selected. |

Default

The currently booted image.

Usage Guidelines

This command specifies which image to use on the next reboot. Two images can be stored, one on the primary partition, one on the secondary partition. To view your current (active) partition and the selected partition for the next reboot or installation, use the following command: `show switch`

Output from this command includes the selected and booted images and if they are in the primary or the secondary partition. Primary indicates the saved image in the primary partition; secondary indicates the saved image in the secondary partition.

SummitStack Only

You can issue this command only from a Master node. The image to use is stored in NVRAM on all target nodes.

If a slot number is not provided, the partition is selected on all nodes in the Active Topology.

Example

Using TFTP

The following command configures the switch to use the image stored in the primary partition on the next reboot:

```
use image partition primary
```

A message similar to the following is displayed:

```
To take effect of partition change please reboot the switch!
```

History

This command was first available in ExtremeXOS 10.1.

The **slot** parameter was added to support SummitStack in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

virtual-router

```
virtual-router {vr-name}
```

Description

Changes the VR context.

Syntax Description

| | |
|----------------------|-------------------------------|
| <code>vr-name</code> | Specifies the name of the VR. |
|----------------------|-------------------------------|

Default

N/A.

Usage Guidelines

Use this command to change the VR context for subsequent commands. When you issue the command, the prompt changes to reflect the VR domain. Configuration commands for Layer 3 routing protocols, creating VLANs, and deleting VLANs apply only to the current VR context.

Use this command with no name, or use the name "VR-Default" to return to the default configuration domain.

Under a VR configuration domain, any VR commands are applied only to that VR. The VR commands consist of all the BGP, OSPF, PIM, and RIP commands, and the commands listed in the following table.

Table 53: VR Commands

| |
|---|
| <code>[enable disable] ipforwarding</code> |
| <code>clear iparp</code> |
| <code>clear counters iparp⁷</code> |
| <code>configure iparp⁷</code> |
| <code>configure iparp [add delete]⁷</code> |
| <code>[enable disable] iparp⁷</code> |
| <code>show iparp⁷</code> |
| <code>configure iproute [add delete]⁷</code> |
| <code>show iproute⁷</code> |
| <code>show ipstats⁷</code> |
| <code>rtlookup</code> |
| <code>create [vlan vman] vlan-name</code> |
| <code>[enable disable] igmp</code> |
| <code>[enable disable] igmp snooping⁷</code> |
| <code>[enable disable] ipmcf forwarding</code> |
| <code>show igmp</code> |

⁷ Other commands are available with these listed.

Table 53: VR Commands (continued)

| |
|---------------------------------|
| show igmp snooping |
| show igmp group |
| show igmp snooping cache |
| [enable disable] mld |
| [enable disable] mld snooping |
| show mld |
| show mld snooping |
| show mld group |

The VR context simplifies configuration because you do not have to specify the VR for each individual protocol configuration command. The current VR context is indicated in the CLI prompt.

For example, if you wish to configure OSPF for the user VR `vr-manufacturing`, you would change the VR context to that of `vr-manufacturing`. All the subsequent OSPF commands would apply to that VR, unless the context is changed again.

A VR is identified by a name (up to 32 characters long). The name must be unique among the `VLAN` and VR names on the switch. For backward compatibility, you cannot name a virtual router `VR-0`, `VR-1`, or `VR-2`. VR names are case insensitive.

When a new VR is created, by default, no ports are assigned, no VLAN interface is created, and no support for any routing protocols is added.

Example

The following example changes the VR context to "vr-acme":

```
virtual-router vr-acme
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

watch

```
watch command {difference} {count count} {interval interval}
```

Description

Runs a selected show command at a repeated interval.

Syntax Description

| | |
|-------------------|--|
| <i>command</i> | Specifies the command. Must be enclosed in double quotes. |
| difference | Shows the difference between successive iterations if numerical values have changed in the output. |
| count | Specifies the number of times to run the command. |
| <i>count</i> | Range is 1-4,294,967,295. The default is 3. |
| interval | Specifies the time between command iterations. |
| <i>interval</i> | The interval in seconds. Range is 1-4,294,967,295. The default is 5. |

Default

The *count* default is 3.

The *interval* default is 5.

Usage Guidelines

This command runs the integrated Python script `watch.py` to run the specified show command periodically and display the output accordingly. In the script, CLI paging is disabled so that user input is not needed, and CLI refreshing is disabled so that the keyword **no-refresh** is not needed in auto-refreshing commands.

Example

The following example runs the `show ports` command for port 11 runs 15 times with an interval of 30 seconds:

```
# watch "show ports 11 statistics port-number no-refresh" count 15 interval 30
Port      Link      Tx Pkt    Tx Byte    Rx Pkt     Rx Byte    Rx Pkt     Rx

```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

WHILE ... DO

WHILE (***_expression***) DO

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: [enable cli scripting {permanent}](#).

Description

Executes a code block while the specified condition is true.

Syntax Description

| | |
|--------------------------|--|
| <i>expression</i> | Specifies the condition for which the statements should be executed while the condition is true. |
| <i>statements</i> | Set of statements to be executed while the condition is true. |

Default

N/A.

Usage Guidelines

This command is usually followed by statements to be executed while the condition is true and the entire construct is terminated by an ENDWHILE command.

The *_expression* must be enclosed in parentheses.

Nesting is supported up to five levels. An error message is displayed if there is incorrect nesting of WHILE conditions. An error message is displayed if a user tries to execute more than five WHILE conditions.

Ctrl-C can be used to break out of a WHILE loop(s). Breaking out of any number of WHILE loops always clears all the WHILE loops .

The operators mentioned in [Using Operators](#) can be used in an *_expression* in a WHILE condition.

You can insert comments by using a number sign (#).

Example

This example creates 10 VLANs, named x1 to x10:

```
set var x 1

WHILE ($x <= 10) DO
  create vlan v$x
  set var x ($x + 1)
ENDWHILE
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching X435, X440-G2, X450-G2, X460-G2, X465, X590, X620, X670-G2, X690, X695, X870, 5420, and 5520 series switches.

Glossary

ACL

An Access Control List is a mechanism for filtering packets at the hardware level. Packets can be classified by characteristics such as the source or destination MAC, IP address, IP type, or QoS queue. Once classified, the packets can be forwarded, counted, queued, or dropped.

ad hoc mode

An 802.11 networking framework in which devices or stations communicate directly with each other, without the use of an AP.

ARP

Address Resolution Protocol is part of the TCP/IP suite used to dynamically associate a device's physical address (MAC address) with its logical address (IP address). The system broadcasts an ARP request, containing the IP address, and the device with that IP address sends back its MAC address so that traffic can be transmitted.

ATM

Asynchronous Transmission Mode is a start/stop transmission in which each character is preceded by a start signal and followed by one or more stop signals. A variable time interval can exist between characters. ATM is the preferred technology for the transfer of images.

BGP

Border Gateway Protocol is a router protocol in the IP suite designed to exchange network reachability information with BGP systems in other autonomous systems. You use a fully meshed configuration with BGP.

BGP provides routing updates that include a network number, a list of ASs that the routing information passed through, and a list of other path attributes. BGP works with cost metrics to choose the best available path; it sends updated router information only when one host has detected a change, and only the affected part of the routing table is sent.

BGP communicates within one AS using Interior BGP (IBGP) because BGP does not work well with IGP. Thus the routers inside the AS maintain two routing tables: one for the IGP and one for IBGP. BGP uses exterior BGP (EBGP) between different autonomous systems.

BSS

Basic Service Set is a wireless topology consisting of one access point connected to a wired network and a set of wireless devices. Also called an infrastructure network. See also [*IBSS \(Independent Basic Service Set\)*](#).

CDP

Cisco Discovery Protocol is a proprietary Data Link Layer protocol that shares information about other directly connected Cisco equipment, such as operating system versions and IP addresses.

Chalet

Chalet is a web-based user interface for setting up and viewing information about a switch, removing the need to enter common commands individually in the CLI.

CHAP

Challenge-Handshake Authentication Protocol is one of the two main authentication protocols used to verify a user's name and password for PPP Internet connections. CHAP is more secure because it performs a three-way handshake during the initial link establishment between the home and remote machines. It can also repeat the authentication anytime after the link has been established.

CLI

Command Line Interface. The CLI provides an environment to issue commands to monitor and manage switches and wireless appliances.

CoS

Class of Service specifies the service level for the classified traffic type.

Data Center Connect

DCC, formerly known as DCM (Data Center Manager), is a data center fabric management and automation tool that improves the efficiency of managing a large virtual and physical network. DCC provides an integrated view of the server, storage, and networking operations, removing the need to use multiple tools and management systems. DCC automates VM assignment, allocates appropriate network resources, and applies individual policies to various data objects in the switching fabric (reducing VM sprawl). Learn more about DCC at <http://www.extremenetworks.com/product/data-center-connect/>.

DHCP

Dynamic Host Configuration Protocol allows network administrators to centrally manage and automate the assignment of IP addresses on the corporate network. DHCP sends a new IP address when a computer is plugged into a different place in the network. The protocol supports static or dynamic IP addresses and can dynamically reconfigure networks in which there are more computers than there are available IP addresses.

DoS attack

Denial of Service attacks occur when a critical network or computing resource is overwhelmed so that legitimate requests for service cannot succeed. In its simplest form, a DoS attack is indistinguishable from normal heavy traffic. ExtremeXOS software has configurable parameters that allow you to defeat DoS attacks.

DSSS

Direct-Sequence Spread Spectrum is a transmission technology used in Local Area Wireless Network (LAWN) transmissions where a data signal at the sending station is combined with a higher data rate bit sequence, or chipping code, that divides the user data according to a spreading ratio. The chipping code is a redundant bit pattern for each bit that is transmitted, which increases the signal's resistance to interference. If one or more bits in the pattern are damaged during transmission, the original data can

be recovered due to the redundancy of the transmission. (Compare with *FHSS (Frequency-Hopping Spread Spectrum)*.)

EAP-TLS/EAP-TTLS

EAP-TLS Extensible Authentication Protocol - Transport Layer Security. A general protocol for authentication that also supports multiple authentication methods, such as token cards, Kerberos, one-time passwords, certificates, public key authentication and smart cards.

IEEE 802.1x specifies how EAP should be encapsulated in LAN frames.

In wireless communications using EAP, a user requests connection to a WLAN through an access point, which then requests the identity of the user and transmits that identity to an authentication server such as RADIUS. The server asks the access point for proof of identity, which the access point gets from the user and then sends back to the server to complete the authentication.

EAP-TLS provides for certificate-based and mutual authentication of the client and the network. It relies on client-side and server-side certificates to perform authentication and can be used to dynamically generate user-based and session-based WEP keys.

EAP-TTLS (Tunneled Transport Layer Security) is an extension of EAP-TLS to provide certificate-based, mutual authentication of the client and network through an encrypted tunnel, as well as to generate dynamic, per-user, per-session WEP keys. Unlike EAP-TLS, EAP-TTLS requires only server-side certificates.

(See also *PEAP (Protected Extensible Authentication Protocol)*.)

EAPS

Extreme Automatic Protection Switching is an Extreme Networks-proprietary version of the Ethernet Automatic Protection Switching protocol that prevents looping Layer 2 of the network. This feature is discussed in RFC 3619.

ECMP

Equal Cost Multi Paths is a routing algorithm that distributes network traffic across multiple high-bandwidth OSPF, BGP, IS-IS, and static routes to increase performance. The Extreme Networks implementation supports multiple equal cost paths between points and divides traffic evenly among the available paths.

EDP

Extreme Discovery Protocol is a protocol used to gather topology information about neighboring Extreme Networks switches.

ELRP

Extreme Loop Recovery Protocol is an Extreme Networks-proprietary protocol that allows you to detect Layer 2 loops.

EMS

The Event Management System is an Extreme Networks-proprietary system that saves, displays, and filters events, which are defined as any occurrences on a switch that generate a log message or require action.

ERPS

Ethernet Ring Protection Switching provides fast protection and recovery switching for Ethernet traffic in a ring topology. It also ensures that the Ethernet layer remains loop-free. It is defined in ITU/T G.8032.

ESRP

Extreme Standby Router Protocol is an Extreme Networks-proprietary protocol that provides redundant Layer 2 and routing services to users.

Extreme Defender for IoT

Extreme Defender for IoT provides unique in-line security for mission critical and/or vulnerable IoT devices. Placed between the IoT device and the network, the Defender for IoT solution helps secure and isolate IoT devices protecting them from internal and external hacking attempts, viruses, malware and ransomware, DDoS attacks, and more. Designed to be simple and flexible, Defender for IoT can be deployed over any network infrastructure to enable secure IoT management without significant network changes.

The solution is comprised of the Extreme Defender Application Software and the Defender Adapter (SA201) or AP3912i access point. ExtremeCloud Appliance is the supported platform for the Extreme Defender Application.

For more information, see <https://www.extremenetworks.com/product/extreme-defender-for-iot/>.

Extreme Management Center

Extreme Management Center (Management Center), formerly Netsight™, is a web-based control interface that provides centralized visibility into your network. Management Center reaches beyond ports, VLANs, and SSIDs and provides detailed control of individual users, applications, and protocols. When coupled with wireless and Identity & Access Management products, Management Center becomes the central location for monitoring and managing all the components in the infrastructure. Learn more about Management Center at <http://www.extremenetworks.com/product/management-center/>.

ExtremeAnalytics

ExtremeAnalytics™, formerly Purview™, is a network powered application analytics and optimization solution that captures and analyzes context-based application traffic to deliver meaningful intelligence about applications, users, locations, and devices. ExtremeAnalytics provides data to show how applications are being used. This can be used to better understand customer behavior on the network, identify the level of user engagement, and assure business application delivery to optimize the user experience. The software also provides visibility into network and application performance allowing IT to pinpoint and resolve performance issues in the infrastructure whether they are caused by the network, application, or server. Learn more about ExtremeAnalytics at <http://www.extremenetworks.com/product/extremeanalytics/>.

ExtremeCloud Appliance

The ExtremeCloud Appliance, the newest addition to the Smart OmniEdge portfolio, is a next generation orchestration application offering all the mobility services required for modern unified access deployments. The ExtremeCloud Appliance extends the simplified workflows of the ExtremeCloud public cloud application to on-prem/private cloud deployments.

The ExtremeCloud Appliance includes comprehensive critical network services for wireless and wired connectivity, wireless device secure onboarding, distributed and centralized data paths, role-based

access control through the Application Layer, integrated location services, and IoT device onboarding through a single platform.

Built on architecture with the latest technology, the embedded operating system supports application containers that enable future expansion of value added applications for the unified access edge. Learn more about ExtremeCloud Appliance at <https://www.extremenetworks.com/product/extremecloud-appliance/>.

ExtremeCloud

ExtremeCloud is a cloud-based network management Software as a Service (SaaS) tool. ExtremeCloud allows you to manage users, wired and wireless devices, and applications on corporate and guest networks. You can control the user experience with smarter edges – including managing QoS, call admission control, secure access policies, rate limiting, multicast, filtering, and traffic forwarding, all from an intuitive web interface. Learn more about ExtremeCloud at <http://www.extremenetworks.com/product/extremecloud/>.

ExtremeCloud™ IQ

ExtremeCloud™ IQ is an industry-leading and visionary approach to cloud-managed networking, built from the ground up to take full advantage of the Extreme Networks end-to-end networking solutions. ExtremeCloud IQ delivers unified, full-stack management of wireless access points, switches, and routers and enables onboarding, configuration, monitoring, troubleshooting, reporting, and more. Using innovative machine learning and artificial intelligence technologies, ExtremeCloud IQ analyzes and interprets millions of network and user data points, from the network edge to the data center, to power actionable business and IT insights, and deliver new levels of network automation and intelligence. Learn more about ExtremeCloud IQ at <https://www.extremenetworks.com/support/documentation/extremecloud-iq/>.

ExtremeControl

ExtremeControl, formerly Extreme Access Control™ (EAC), is a set of management software tools that use information gathered by a hardware engine to control policy to all devices on the network. The software allows you to automate and secure access for all devices on the network from a central dashboard, making it easier to roll out security and identity policies across the wired and wireless network. Learn more about ExtremeControl at <https://www.extremenetworks.com/product/extremecontrol/>.

ExtremeSwitching

ExtremeSwitching is the family of products comprising different switch types: **Modular** (X8 and 8000 series [formerly BlackDiamond] and S and K series switches); **Stackable** (X-series and A, B, C, and 7100 series switches); **Standalone** (SSA, X430, and D, 200, 800, and ISW series); and **Mobile Backhaul** (E4G). Learn more about ExtremeSwitching at <http://www.extremenetworks.com/products/switching-routing/>.

ExtremeWireless

ExtremeWireless products and solutions offer high-density WiFi access, connecting your organization with employees, partners, and customers everywhere they go. The family of wireless products and solutions includes APs, wireless appliances, and software. Learn more about ExtremeWireless at <http://www.extremenetworks.com/products/wireless/>.

ExtremeXOS

ExtremeXOS, a modular switch operating system, is designed from the ground up to meet the needs of large cloud and private data centers, service providers, converged enterprise edge networks, and everything in between. Based on a resilient architecture and protocols, ExtremeXOS supports network virtualization and standards-based SDN capabilities like VXLAN gateway and OpenStack Cloud orchestration. ExtremeXOS also supports comprehensive role-based policy. Learn more about ExtremeXOS at <http://www.extremenetworks.com/product/extremexos-network-operating-system/>.

FDB

The switch maintains a database of all MAC address received on all of its ports and uses this information to decide whether a frame should be forwarded or filtered. Each forwarding database (FDB) entry consists of the MAC address of the sending device, an identifier for the port on which the frame was received, and an identifier for the VLAN to which the device belongs. Frames destined for devices that are not currently in the FDB are flooded to all members of the VLAN. For some types of entries, you configure the time it takes for the specific entry to age out of the FDB.

FHSS

Frequency-Hopping Spread Spectrum is a transmission technology used in Local Area Wireless Network (LAWN) transmissions where the data signal is modulated with a narrowband carrier signal that 'hops' in a random but predictable sequence from frequency to frequency as a function of time over a wide band of frequencies. This technique reduces interference. If synchronized properly, a single logical channel is maintained. (Compare with *DSSS (Direct-Sequence Spread Spectrum)*.)

IBSS

An IBSS is the 802.11 term for an ad hoc network. See *ad hoc mode*.

ICMP

Internet Control Message Protocol is the part of the TCP/IP protocol that allows generation of error messages, test packets, and operating messages. For example, the ping command allows you to send ICMP echo messages to a remote IP device to test for connectivity. ICMP also supports traceroute, which identifies intermediate hops between a given source and destination.

IGMP

Hosts use Internet Group Management Protocol to inform local routers of their membership in multicast groups. Multicasting allows one computer on the Internet to send content to multiple other computers that have identified themselves as interested in receiving the originating computer's content. When all hosts leave a group, the router no longer forwards packets that arrive for the multicast group.

LAG

A Link Aggregation Group is the logical high-bandwidth link that results from grouping multiple network links in link aggregation (or load sharing). You can configure static LAGs or dynamic LAGs (using the LACP).

LLDP

Link Layer Discovery Protocol conforms to IEEE 802.1ab and is a neighbor discovery protocol. Each LLDP-enabled device transmits information to its neighbors, including chassis and port identification, system name and description, VLAN names, and other selected networking information. The protocol also specifies timing intervals in order to ensure current information is being transmitted and received.

MD5

Message-Digest algorithm is a hash function that is commonly used to generate a 128-bit hash value. It was designed by Ron Rivest in 1991. MD5 is officially defined in RFC 1321 - The MD5 Message-Digest Algorithm.

MIC

Message Integrity Check (or Code), also called 'Michael', is part of WPA and TKIP. The MIC is an additional 8-byte code inserted before the standard 4-byte ICV appended in by standard WEP to the 802.11 message. This greatly increases the difficulty in carrying out forgery attacks.

Both integrity check mechanisms are calculated by the receiver and compared against the values sent by the sender in the frame. If the values match, there is assurance that the message has not been tampered with.

MLAG

The Multi-switch Link Aggregation Group feature allows users to combine ports on two switches to form a single logical connection to another network device. The other network device can be either a server or a switch that is separately configured with a regular LAG (or appropriate server port teaming) to form the port aggregation.

MPLS

Multiprotocol Label Switching speeds up network traffic. When forwarding packets, the Layer 2 (Switching) label is used to avoid complex destination lookups in the routing table. MPLS uses Label Switched Paths (LSPs) to establish the network path. The packet will be labeled so that service providers can decide the best way to keep traffic flowing. The Multiprotocol Label Switching Transport Profile (MPLS-TP) extensions to MPLS are designed to meet service provider requirements and are used as a network layer technology in transport networks. MPLS-TP gives service providers a reliable packet-based technology that is based on circuit-based transport networking. MPLS-TP is expected to be a low cost level 2 technology (if the limited profile is implemented in isolation) that will provide QoS, end-to-end OAM and protection switching.

MSDP

Multicast Source Discovery Protocol is used to connect multiple multicast routing domains. MSDP advertises multicast sources across Protocol Independent Multicast-Sparse Mode (PIM-SM) multicast domains or Rendezvous Points (RPs). In turn, these RPs run MSDP over TCP to discover multicast sources in other domains.

MSTI

Multiple Spanning Tree Instances control the topology inside an MSTP region. An MSTI is a spanning tree domain that operates within a region and is bounded by that region; and MSTI does not exchange BPDUs or send notifications to other regions. You can map multiple VLANs to an MSTI; however, each VLAN can belong to only one MSTI. You can configure up to 64 MSTIs in an MSTP region.

MSTP

Multiple Spanning Tree Protocol, based on IEEE 802.1Q-2003 (formerly known as IEEE 892.1s), allows you to bundle multiple VLANs into one STP topology, which also provides enhanced loop protection and better scaling. MSTP uses RSTP as the converging algorithm and is compatible with legacy STP protocols.

NetLogin

Network login provides extra security to the network by assigning addresses only to those users who are properly authenticated. You can use web-based, MAC-based, or IEEE 802.1X-based authentication with network login. The two modes of operation are campus mode and ISP mode.

netmask

A netmask is a string of 0s and 1s that mask, or screen out, the network part of an IP address, so that only the host computer part of the address remains. A frequently-used netmask is 255.255.255.0, used for a Class C subnet (one with up to 255 host computers). The ".0" in the netmask allows the specific host computer address to be visible.

OSPF

An interior gateway routing protocol for TCP/IP networks, Open Shortest Path First uses a link state routing algorithm that calculates routes for packets based on a number of factors, including least hops, speed of transmission lines, and congestion delays. You can also configure certain cost metrics for the algorithm. This protocol is more efficient and scalable than vector-distance routing protocols. OSPF features include least-cost routing, ECMP routing, and load balancing. Although OSPF requires CPU power and memory space, it results in smaller, less frequent router table updates throughout the network. This protocol is more efficient and scalable than vector-distance routing protocols.

OSPFv3

Open Shortest Path First version 3 is one of the routing protocols used with IPV6 and is similar to OSPF.

PEAP

Protected Extensible Authentication Protocol is an IETF draft standard to authenticate wireless LAN clients without requiring them to have certificates. In PEAP authentication, first the user authenticates the authentication server, then the authentication server authenticates the user. If the first phase is successful, the user is then authenticated over the SSL tunnel created in phase one using EAP-Generic Token Card (EAP-GTC) or Microsoft Challenged Handshake Protocol Version 2 (MSCHAP V2). (See also [EAP-TLS/EAP-TTLS](#).)

PoE

The Power over Ethernet standard (IEEE 802.3af) defines how power can be provided to network devices over existing Ethernet connections, eliminating the need for additional external power supplies.

QoS

Quality of Service is a technique that is used to manage network resources and guarantee a bandwidth relationship between individual applications or protocols. A communications network transports a multitude of applications and data, including high-quality video and delay-sensitive data such as real-time voice. Networks must provide secure, predictable, measurable, and sometimes guaranteed services. Achieving the required QoS becomes the secret to a successful end-to-end business solution.

RADIUS

RADIUS is a client/server protocol and software that enables remote access servers to communicate with a central server to authenticate dial-in users and authorize their access to the requested system or service. RADIUS allows a company to maintain user profiles in a central database that all remote servers can share. It provides better security, allowing a company to set up a policy that can be applied at a single administered network point. With RADIUS, you can track usage for billing and for keeping network statistics.

RIP

This IGP vector-distance routing protocol is part of the TCP/IP suite and maintains tables of all known destinations and the number of hops required to reach each. Using Routing Information Protocol, routers periodically exchange entire routing tables. RIP is suitable for use only as an IGP.

RIPng

Routing Information Protocol Next Generation is one of the routing protocols used with IPv6 and is similar to RIP.

SNMP

Simple Network Management Protocol is a standard that uses a common software agent to remotely monitor and set network configuration and runtime parameters. SNMP operates in a multivendor environment, and the agent uses MIBs, which define what information is available from any manageable network device. You can also set traps using SNMP, which send notifications of network events to the system log.

SNTP

Simple Network Time Protocol is used to synchronize the system clocks throughout the network. An extension of NTP, SNTP can usually operate with a single server and allows for IPv6 addressing.

SSL

Secure Socket Layer is a protocol for transmitting private documents using the Internet. SSL works by using a public key to encrypt data that is transferred over the SSL connection. SSL uses the public-and-private key encryption system, which includes the use of a digital certificate.

STP

Spanning Tree Protocol, defined in IEEE 802.1d, used to eliminate redundant data paths and to increase network efficiency. STP allows a network to have a topology that contains physical loops; it operates in bridges and switches. STP opens certain paths to create a tree topology, thereby preventing packets from looping endlessly on the network. To establish path redundancy, STP creates a tree that spans all of the switches in an extended network, forcing redundant paths into a standby, or blocked, state.

STP allows only one active path at a time between any two network devices (this prevents the loops) but establishes the redundant links as a backup if the initial link should fail. If STP costs change, or if one network segment in the STP becomes unreachable, the spanning tree algorithm reconfigures the STP topology and re-establishes the link by activating the standby path.

STPD

Spanning Tree Domain is an STP instance that contains one or more VLANs. The switch can run multiple STPDs, and each STPD has its own root bridge and active path. In the Extreme Networks implementation of STPD, each domain has a carrier VLAN (for carrying STP information) and one or more protected VLANs (for carrying the data).

syslog

A protocol used for the transmission of event notification messages across networks, originally developed on the University of California Berkeley Software Distribution (BSD) TCP/IP system implementations, and now embedded in many other operating systems and networked devices. A device generates a messages, a relay receives and forwards the messages, and a collector (a syslog server) receives the messages without relaying them.

syslog uses the UDP as its underlying transport layer mechanism. The UDP port that has been assigned to syslog is 514. (RFC 3164)

VLAN

The term VLAN is used to refer to a collection of devices that communicate as if they are on the same physical LAN. Any set of ports (including all ports on the switch) is considered a VLAN. LAN segments are not restricted by the hardware that physically connects them. The segments are defined by flexible user groups you create with the CLI.

VR-Control

This virtual router is part of the embedded system in Extreme Networks switches. VR-Control is used for internal communications between all the modules and subsystems in the switch. It has no ports, and you cannot assign any ports to it. It also cannot be associated with VLANs or routing protocols. (Referred to as VR-1 in earlier ExtremeXOS software versions.)

VR-Default

This virtual router is part of the embedded system in Extreme Networks switches. VR-Default is the default VR on the system. All data ports in the switch are assigned to this VR by default; you can add and delete ports from this VR. Likewise, VR-Default contains the default VLAN. Although you cannot delete the default VLAN from VR-Default, you can add and delete any user-created VLANs. One instance of each routing protocol is spawned for this VR, and they cannot be deleted. (Referred to as VR-2 in earlier ExtremeXOS software versions.)

VR-Mgmt

This virtual router is part of the embedded system in Extreme Networks switches. VR-Mgmt enables remote management stations to access the switch through Telnet, SSH, or SNMP sessions; and it owns the management port. The management port cannot be deleted from this VR, and no other ports can be added. The Mgmt VLAN is created VR-Mgmt, and it cannot be deleted; you cannot add or delete any other VLANs or any routing protocols to this VR. (Referred to as VR-0 in earlier ExtremeXOS software versions.)

VRRP

The Virtual Router Redundancy Protocol specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. The VRRP router controlling the IP address(es) associated with a virtual router is called the master router, and forwards packets sent to these IP addresses. The election process provides dynamic failover in the forwarding responsibility should the master router become unavailable. In case the master router fails, the virtual IP address is mapped to a backup router's IP address; this backup becomes the master router. This allows any of the virtual router IP addresses on the LAN to be used as the default first-hop router by end-hosts. The advantage gained from using VRRP is a higher availability default path without requiring configuration of dynamic routing or router discovery protocols on every host. VRRP is defined in RFC 2338.

VXLAN

VXLAN is a network virtualization technology that leverages existing Layer 3 infrastructures to create tenant overlay networks. VXLAN addresses the requirements of a multi-tenant data center network infrastructure by:

- Increasing virtual network scalability to 16 million instances. This allows for tenant VLAN (Virtual LAN) isolation whereby multiple tenants can manage their own VLAN/VMAN and MAC address spaces.
- Adding an encapsulation that effectively hides VM MAC addresses from the physical network that results in physical networking devices to have smaller MAC and IP table sizes.

- Allowing for Layer 2 adjacency across IP networks by which DC network operators protect their investment in their current infrastructure. Additionally operators can distribute traffic loads across links efficiently using Layer 3 ECMP.

XNV

Extreme Network Virtualization is an ExtremeXOS feature that enables the software to support VM port movement, port configuration, and inventory on network switches.
