Document conventions

The document conventions describe text formatting conventions, command syntax conventions, and important notice formats used in Brocade technical documentation.

Notes, cautions, and warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

NOTE

A Note provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An Attention statement indicates a stronger note, for example, to alert you when traffic might be interrupted or the device might reboot.

CAUTION

A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

A Danger statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Text formatting conventions

Text formatting conventions such as boldface, italic, or Courier font may be used to highlight specific words or phrases.

Format	Description
bold text	Identifies command names. Identifies keywords and operands. Identifies the names of GUI elements.
<i>italic text</i>	Identifies text to enter in the GUI. Identifies emphasis. Identifies variables.
Courier font	Identifies document titles. Identifies CLI output.

Format	Description
	Identifies command syntax examples.

Command syntax conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
<i>italic text</i>	Identifies a variable.
value	In Fibre Channel products, a fixed value provided as input to a command option is printed in plain text, for example, <code>--show WWN</code> .
[]	Syntax components displayed within square brackets are optional. Default responses to system prompts are enclosed in square brackets.
{ x y z }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options. In Fibre Channel products, square brackets may be used instead for this purpose.
x y	A vertical bar separates mutually exclusive elements.
< >	Nonprinting characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, <code>member[member...]</code> .
\	Indicates a "soft" line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

Brocade resources

Visit the Brocade website to locate related documentation for your product and additional Brocade resources.

White papers, data sheets, and the most recent versions of Brocade software and hardware manuals are available at www.brocade.com.

Product documentation for all supported releases is available to registered users at MyBrocade.

Click the **Support** tab and select **Document Library** to access documentation on MyBrocade or www.brocade.com. You can locate documentation by product or by operating system.

Release notes are bundled with software downloads on MyBrocade. Links to software downloads are available on the MyBrocade landing page and in the Document Library.

Document feedback

Quality is our first concern at Brocade, and we have made every effort to ensure the accuracy and completeness of this document. However, if you find an error or an omission, or you think that a topic needs further development, we want to hear from you. You can provide feedback in two ways:

- Through the online feedback form in the HTML documents posted on www.brocade.com
- By sending your feedback to documentation@brocade.com

Provide the publication title, part number, and as much detail as possible, including the topic heading and page number if applicable, as well as your suggestions for improvement.

Contacting Brocade Technical Support

As a Brocade customer, you can contact Brocade Technical Support 24x7 online or by telephone. Brocade OEM customers should contact their OEM/solution provider.

Brocade customers

For product support information and the latest information on contacting the Technical Assistance Center, go to www.brocade.com and select **Support**.

If you have purchased Brocade product support directly from Brocade, use one of the following methods to contact the Brocade Technical Assistance Center 24x7.

Online	Telephone
<p>Preferred method of contact for non-urgent issues:</p> <ul style="list-style-type: none"> • Case management through the MyBrocade portal. • Quick Access links to Knowledge Base, Community, Document Library, Software Downloads and Licensing tools 	<p>Required for Sev 1-Critical and Sev 2-High issues:</p> <ul style="list-style-type: none"> • Continental US: 1-800-752-8061 • Europe, Middle East, Africa, and Asia Pacific: +800-AT FIBREE (+800 28 34 27 33) • Toll-free numbers are available in many countries. • For areas unable to access a toll-free number: +1-408-333-6061

Brocade OEM customers

If you have purchased Brocade product support from a Brocade OEM/solution provider, contact your OEM/solution provider for all of your product support needs.

- OEM/solution providers are trained and certified by Brocade to support Brocade® products.
- Brocade provides backline support for issues that cannot be resolved by the OEM/solution provider.
- Brocade Supplemental Support augments your existing OEM support contract, providing direct access to Brocade expertise. For more information, contact Brocade or your OEM.
- For questions regarding service levels and response times, contact your OEM/solution provider.

About this document

- Supported hardware and software.....9
- Using the Network OS CLI9
- What's new in this document..... 10

Supported hardware and software

In those instances in which procedures or parts of procedures documented here apply to some switches but not to others, this guide identifies exactly which switches are supported and which are not.

Although many different software and hardware configurations are tested and supported by Brocade Communications Systems, Inc. for Network OS, documenting all possible configurations and scenarios is beyond the scope of this document.

The following hardware platforms are supported by this release of Network OS:

- Brocade VDX 2741
- Brocade VDX 2746
- Brocade VDX 6740
 - Brocade VDX 6740-48
 - Brocade VDX 6740-64
- Brocade VDX 6740T
 - Brocade VDX 6740T-48
 - Brocade VDX 6740T-64
 - Brocade VDX 6740T-1G
- Brocade VDX 6940-36Q
- Brocade VDX 6940-144S
- Brocade VDX 8770
 - Brocade VDX 8770-4
 - Brocade VDX 8770-8

To obtain information about a Network OS version other than this release, refer to the documentation specific to that version.

Using the Network OS CLI

For complete instructions and support for using the Brocade Network OS command line interface (CLI), refer to the *Brocade Network OS Command Reference*.

What's new in this document

The following table includes descriptions of changes to this guide for the Network OS 7.1.0 software release.

TABLE 1 Changes in Network OS Troubleshooting Guide, 7.1.0

Feature	Description	Described in
Script to trace IP Fabric data path	A script enables you to trace the data path through the IP Fabric network and check the integrity of "route-programming" in VDX devices along the path.	Tracing the data path with a script on page 66
Deprecation of fabric cluster mode	References to "fabric cluster mode" have been removed. Logical chassis cluster is now the only supported mode.	Various sections

Troubleshooting procedures

- [Troubleshooting overview](#)..... 11
- [Troubleshooting standard issues](#).....20
- [Using troubleshooting and diagnostic tools](#)..... 56

Troubleshooting overview

This chapter provides tips and procedures for troubleshooting issues that may occur while operating a Brocade switch running Network OS. It also introduces some of the common troubleshooting tools.

Gathering troubleshooting information

The first step in any successful troubleshooting is to gather the appropriate information (including *supportSave* data). For details refer to [Using a troubleshooting methodology](#) on page 12 and [Capturing supportSave data](#) on page 11.

Capturing supportSave data

Capturing *supportSave* data is key to successful troubleshooting. The **copy support** command not only runs diagnostic commands, but also gathers core dumps, trace files, and other relevant data. In the same action, the command also copies all this information to a remote host. Once on the remote host, your switch provider can proceed to analyze the problem. Meanwhile, your switch can be returned to production with minimal downtime.

To capture supportSave data, complete the following steps:

1. Log in to the switch.
2. In privileged EXEC mode, enter the **copy support** command to capture the supportSave data.

The **copy support** command has options to copy the supportSave files to a remote server using FTP or SCP, or you can save to a local USB device. You can use the command in a single command line, or in interactive mode.

The following example uses the single command line mode to copy the supportSave files to a remote host using FTP.

```
switch# copy support ftp host 10.38.33.131 user admin directory 108
Password: *****
```

The following example uses the interactive form of the command and FTP:

```
switch# copy support-interactive
Server Name or IP Address: 10.38.33.131
Protocol (ftp, scp): ftp
User: admin
Password: *****
Directory: /home/admin/support
VCS support [y/n]? (y): y
```

Using information resources

The following information is helpful for incident investigation and resolution when you contact your switch-support provider:

- A network diagram and topology information
- A record of the steps and events leading to the incident

- Lists of applications, management agents, and scripts running at the time of the incident
- supportSave files
- Output from the **show media** command if the issue is related to SFP transceivers
- Outputs from any commands run while attempting to troubleshoot the problem yourself
- Any network traces captured using Wireshark software or other network analyzer.
- Terminal Access Controller Access-Control System (TACACS) server version if the issue is related to TACACS.

Using a troubleshooting methodology

Once all relevant information is collected, success is improved significantly with a sound troubleshooting approach.

This section outlines a methodology for troubleshooting issues. It introduces steps that you might consider using, depending on the issue in question.

1. Check whether the switch has all of the relevant licenses:
 - Available licenses are: POD1, POD2, 10G Port Upgrade, 40G Port Upgrade, FCoE, Layer 3, and Advanced Features.
 - After adding or modifying a POD or port upgrade license, re-enable the ports.
2. Verify the topology and switch configuration as conveyed by the switch
3. Enter the **copy support** command.
4. Run other relevant show commands (for example, **show logging raslog**) to look for clues or triggers of the reported failure.
5. Check the utilization of various resources.
 - a) Enter the **show process cpu** command to determine CPU use.
 - b) Enter the **show process me** command to determine memory use.
 - c) Enter the **show mac-address-table count** command to determine the number of MAC addresses used.
 - d) Enter the **show fabric route topology** command to determine the number of routes.
 - e) Enter the **show fabric all** command to determine the number of VCS Fabric nodes.
 - f) Enter the **show media** command to investigate any optics issues.

6. Conduct data-path fabric continuity tests:
 - a) Issue pings from and to the end-stations or devices.
 - b) Check the counters in the output of the **show interface** command to detect if packets are coming in or are being dropped as errors.
 - c) Verify that optics used are Brocade-certified. Enter the **show media interface** command and verify that the Vendor name field shows "Brocade." Check also that the Tx and Rx Power fields are not zero.
 - d) Verify that the MAC address table learns the MAC addresses.
 - e) If the switch is part of a VCS Fabric cluster, verify that the MAC address tables are synchronized properly across all Brocade VDX switches in the cluster.
 - f) Check whether LLDP reports neighbors.
 - g) Check the Ethernet Name Server (ENS) functionality by ensuring that the MAC address table reports MAC addresses learned from other VCS Fabric switches.
 - h) Use the **l2tracert** command for validating the data-path fabric continuity. This command helps identify where the packets are being dropped within the fabric.

The command prompts for some basic and allows you to choose to enter some extended parameters. Currently supported basic parameters include:

- Source Address (SA) and Destination Address (DA) of dynamically learned MAC addresses
- VLAN
- Edge routing bridge (RBridge) ID

Currently supported extended parameters include:

- Protocol type (IP)
- Source and destination IP addresses
- IP protocol type (recommend TCP)
- Source and destination port numbers

The purpose of IP parameters is to provide a way to make the traceroute packet traverse a specific ECMP link.

CAUTION

The following step affects configuration and should be used with care.

7. To track certain flows within the fabric, use permit ACLs and monitor the hit increments.

Understanding troubleshooting hotspots

This section provides relevant background information and best practices guidance related to features of Network OS where problems have been reported. With this guidance, you should be able to avoid many potential problems.

Licensing

When a licensed feature does not work, one likely cause is that the license has not been installed correctly. Follow the guidelines and procedures in the *Network OS Software Licensing Guide* to ensure your features are licensed properly and those licenses installed correctly.

For license recovery procedures, refer to the *Network OS Software Licensing Guide*.

STP interoperability with Brocade MLX or other switches

- To use the Spanning Tree Protocol (STP) in a network with Brocade MLX switches, or switches from other vendors such as Juniper or Cisco, you may have to configure the interface to send BPDUs to the shared spanning tree MAC address 0100.0ccc.cccd. Without this setting, the RPVST/PVST root bridge is not recognized on VLANs other than VLAN 1.

To interoperate with MLX switches or other vendors' switches, enter the following command in interface configuration mode:

```
switch(config-if-te-0/1)# spanning-tree bpdu-mac 0100.0ccc.cccd
```

- If a Brocade IP switch has a VLAN is configured with tagged ports and Rapid Spanning Protocol (RSTP) is enabled under the VLAN (PVST), then BPDUs from the tagged ports received by the Brocade VDX switch will be dropped if pvst-mode is not configured under the ports that are in the VLAN and connected to the Brocade VDX switches.

The following example shows a configuration on a Brocade IP switch with tagged ports and RSTP enabled under the VLAN:

```
vlan 2
tagged ethe 1/24 ethe 2/1 to 2/2
router-interface ve 2
rstp priority 100
```

If the conditions are met, then all the ports should have pvst-mode configured so that tagged BPDUs pass through the Brocade VDX switch. If pvst-mode is not enabled, enable it as follows:

```
Brocade(config)# interface ethernet 2/1
Brocade(config-if-2/1)# pvst-mode
```

Load balancing distribution

Understanding issues related to load balancing requires some basic knowledge of the criteria used by load balancing algorithms. The table below provides details for each feature that provides load balancing.

TABLE 2 Load balancing algorithms

Feature	Algorithm
ECMP IP	<p>Paths are selected on the basis of a hash derived from the following parameters:</p> <ul style="list-style-type: none"> Source MAC address Destination MAC address VID IP protocol Source IP address Destination IP address Layer 4 source port Layer 4 destination port <p>You can configure the hashing fields using the fabric-ecm load-balance and fabric-ecmp load-balance-hash-swap commands.</p> <p>For related recovery procedures, refer to ECMP not load balancing as expected on page 26.</p>
ECMP FCoE	<p>Paths are selected on the basis of a hash derived from the following parameters:</p> <ul style="list-style-type: none"> Input Port ID Source MAC address Destination MAC address VID FID SID

TABLE 2 Load balancing algorithms (continued)

Feature	Algorithm
	<ul style="list-style-type: none"> • DID • OXID
LACP	Provides adaptive load balancing based on up to seven criteria (7-tuple), depending upon what fields are available in the frame.
Brocade trunk	Provides equal packet load balancing (round-robin) among member links.

Static assignment of the routing bridge ID

Duplicate routing bridge (RBridge) IDs are a common source of error when a switch is added to an Ethernet fabric. Before adding a switch to an Ethernet fabric, you must assign it a unique RBridge ID. If the new switch is to be added to an existing VCS Fabric cluster, it must be assigned the same VCS ID as other switches in the cluster. Once the switch is added, the principal routing bridge performs the negotiation in the control plane to include the new switch and rebuild the fabric. The data plane remains unaffected.

Procedures for recovering from duplicate routing IDs are provided in [RBridge ID is duplicated](#) on page 49.

FSPF route change

When the Fabric Shortest Path First (FSPF) algorithms select a new route, a temporary disruption of traffic can occur. This behavior is normal as the old path is first deleted and then the new path is programmed. Such path changes can occur when FSPF calculates a new shortest route, or when the current path is down.

vLAG overview

You should be aware of the following aspects of the vLAG feature before troubleshooting vLAG problems:

- Multicast (BUM) traffic in vLAG
- Edge-port feature requirements
- Failover

Multicast traffic in vLAG

Flooding traffic always goes through a primary link of the vLAG. You should consider this restriction when provisioning bandwidth for most traffic. This link is marked with an asterisk (*) in the output of the **show port-channel** command.

```
switch# show port-channel 38
LACP Aggregator: Po 38
Aggregator type: Standard
Admin Key: 0038 - Oper Key 0038
Partner System ID - 0x8000,01-e0-52-00-20-00
Partner Oper Key 0038
Member ports:
Link: Te 0/13 (0x180D0102) sync: 1
Link: Te 0/14 (0x180E0103) sync: 1 *
```

Edge-port feature requirements for vLAG

LACP can be configured on edge ports only with either Brocade or Standard types. If Brocade is chosen, so that Link Reset (LR) primitives are exchanged properly, make sure that the edge peering device is a Brocade Converged Network Adapter (CNA), a standalone Brocade VDX switch, or a Brocade VDX 8000 series switch.

Failover and vLAG

For the fast failover convergence requirements, Brocade recommends using the **vlag ignore-split** command, which enables sub-second failover times. This command is included in all port-channel configurations.

When planning to deploy this feature in production, use care to prevent a "split-brain" scenario, in which vLAG members detach from each other. Brocade recommends having more than one interswitch link (ISL) between the vLAG member switches and physically routing them through separate conduits and cable trays. Secondly, Brocade strongly recommends using topologies that are certified by Brocade.

NOTE

Brocade does not recommend using vLAG failover in a network with Cisco or Juniper switches that are connected using copper. Brocade has observed greater than one-second failover times in networks with this hardware.

vLAG and split-brain

The following topics discuss the split-brain scenario and how to mitigate it.

Understanding "split-brain"

A split-brain can occur when the end-hosts or edge switches are connected to two separate cluster switches by way of a vLAG (using LACP). The end-devices perceive those two cluster switches as one switch because they have the same system ID advertised in LACP.

Under rare conditions, when all the ISLs between the two cluster switches are broken and both the cluster switches continue to advertise the same system ID to their LACP partner, a "segmented fabric" or "split-brain" condition exists, where the end-host or edge switch might not detect this segmentation and could continue to treat both the vLAG switches as one switch.

ATTENTION

This condition can cause packet duplication or unexpected packet loss.

Traffic protection during split-brain conditions

By default, Network OS has a capability to recover gracefully from the split-brain scenario. When all the ISLs between the VDX cluster switches go down, the switch with the lower RBridge ID uses LACP to inform the edge-switch partner that it has segmented out of the port-channel. It does this by changing its advertised system ID. When the edge switch learns a different system ID on one of its members, it removes this member from that port-channel, and continues to function with only one vLAG member — the switch with the higher RBridge ID. The other vLAG member switch still has the link up, but remains segmented out of the original port-channel (sync: 0). This capability prevents duplication of packets or potential packet drops resulting from a split-brain scenario.

When a member switch is reloaded

Reloading the switch with the lower RBridge ID has no impact.

When the switch with the higher RBridge ID is reloaded, the other vLAG member perceives all of its ISLs as down. Though this is *not* a real split-brain scenario, the switch with the lower RBridge ID may not be able to differentiate, and thus would inform the partner about a changed system ID. The partner edge switch would detect two events:

- The system ID on one link changes.
- The other interface goes down.

In such a case, LACP will renegotiate and reform the port-channel, which could flap the port-channel, impacting traffic momentarily. The same effect could occur when the switch boots up and joins the fabric again.

Thus, if the switch with the higher RBridge ID is reloaded, the potential impact could be a port-channel flap that can momentarily disrupt traffic. Notice that this effect does not occur when the switch with the lower RBridge ID is reloaded.

Avoiding traffic disruption during switch reload

Network OS switches offer flexibility to the user by providing a special vLAG **ignore-split** option that you can configure for the logical port-channel. This option should be configured on both vLAG member ports.

Configuring this option prevents the switch with the lower RBridge ID from changing its system ID, so both switches will continue to advertise the same system ID. This action prevents the partner edge switch from detecting a change when one of the member switches is reloaded and the traffic is handled gracefully.

Using the vLAG ignore-split option

To use the vLAG **ignore-split** option, redundancy should be built around ISLs to prevent a situation in which all ISLs are broken at the same time. Brocade recommends using multiple ISLs, and routing those ISLs through different physical paths or conduits to eliminate the possibility of accidental damage to all links at the same time.

Principal routing bridge availability

If a new principal routing bridge is introduced into a working VCS Fabric cluster, or if the principal routing bridge is lost and a new switch must be elected, the fabric is rebuilt from the control-plane viewpoint, whereas the data plane continues to forward traffic without disruption. The primary responsibilities of the principal routing bridge in a VCS Fabric are:

- RBridge ID allocation
- Ownership of virtual management IP address
- Keeping the configuration database synchronized

Brocade trunks

Brocade trunking is the only aggregation method that works using ISLs. Brocade ISL trunks are formed automatically with other switches using Line Reset (LR) primitives signaling with the peer switch. For a successful trunk formation, all ports must be part of the same trunk group and must be configured at the same speed. The trunk is turned on by default.

The table below shows the allocation of port numbers to trunk groups for Brocade VDX switches.

TABLE 3 Trunk groups

Brocade platform	Trunk groups	No. of trunk groups per platform
VDX 6740 series	<ul style="list-style-type: none"> • 1-15 • 16-32 • 33-40; 49-50 • 41-48; 51-52 	4
VDX 6940-36Q	<ul style="list-style-type: none"> • 1-9 • 10-18 • 19-27 • 28-36 	4
VDX 6940-144S (Middle of Row [MoR])	<ul style="list-style-type: none"> • 1-24; 61-72 • 25-48; 73-84 • 85-96 • 103-108 	6 (considering TG-3/TG-3A; and TG-4/TG-4A as distinct trunk groups)

TABLE 3 Trunk groups (continued)

Brocade platform	Trunk groups	No. of trunk groups per platform
	<ul style="list-style-type: none"> • 49-60 • 97-102 	
VDX 8770 (with VDX LC48x1G line card)	<ul style="list-style-type: none"> • 1-8 • 9-16 • 17-24 • 25-32 • 33-40 • 41-48 	6 per 1G blade
VDX 8770 (with VDX LC48x10G line card)	<ul style="list-style-type: none"> • 1-8 • 9-16 • 17-24 • 25-32 • 33-40 • 41-48 	6 per 10G blade
VDX 8770 (with VDX LC12x40G line card)	<ul style="list-style-type: none"> • 1-2 • 3-4 • 5-6 • 7-8 • 9-10 • 11-12 	6 per 40G blade
VDX 2741	<ul style="list-style-type: none"> • 29-36 • 37-44 • 45-46 • 47-48 	3
VDX 2746	<ul style="list-style-type: none"> • 43-50 • 51-56 • 57-58 	3

NOTE

Brocade trunks are not supported over 1-Gbps links.

To utilize the advantages of Brocade trunking between VDX switches, Brocade recommends having at least a two-member trunk and multiple ECMP paths. Brocade also recommends routing the cables in a trunk through separate conduits to ensure connectivity in case a conduit is accidentally cut.

NIC teaming with vLAG

NIC teaming permits link aggregation between server and switch. It can be one of two types: active/passive model or active/active model. For the active/passive model, you may not need to configure a LAG on the switch side, as unique MAC addresses will be seen on only one link.

For the active/active model, the same MAC address may appear on both the links terminating on a switch (or pair of switches). In such a case, you must configure a LAG on the switch side.

Selecting the MTU

Always set the switch MTU to the maximum host MTU plus 100 bytes. This method is recommended because the definition of MTU sometimes varies among different vendors. If the switch MTU is set to the same as the connected host MTU, packets could be dropped.

Avoiding oversubscription

Under certain congestion conditions, you may observe incrementing packet drops representing "tail-drops" in the output of the **show qos rcv-queue interface tengigabitethernet** command, as shown underlined in the following example:

```
switch# show qos rcv-queue interface tengigabitethernet 5/0/1
Interface TenGigabitEthernet TenGigabitEthernet 5/0/1
In-use 0 bytes, Total buffer 144144 bytes
0 packets dropped
-----
CoS      In-use   Max
      Bytes   Bytes
-----
0         0       18018
1         0       18018
2         0       18018
3         0       18018
4         0       18018
5         0       18018
6         0       18018
7         0       18018
```

In such conditions, you must first identify the bottleneck, and then take action to mitigate the congestion.

Identifying the congestion bottleneck

To identify the bottleneck in the Brocade VDX network, enter the **show interface** command at various locations, and identify interfaces with incrementing TX and RX discards. Depending upon the TX or RX discards, the congestion could be anywhere downstream.

Mitigating the congestion

Try the following actions to mitigate congestion:

- Increase bottleneck bandwidth.
 - Add more links to the LAG and ECMP paths.
 - Use higher-speed interfaces.
- Implement flow control on the bottleneck and on neighboring devices.
- Implement QoS congestion management schemes.
 - Classify, mark, and prioritize critical traffic.
 - Modify scheduling schemes. Consider and compare the effects of using strict priority or deficit weighted round-robin (DWRR) scheduling schemes.

For the flow control solution, enable flow control either on the ports receiving the traffic from end-devices (servers or personal computers) and the connected end-device itself, or enable flow control on the port-channel as shown in the following example.

```
switch(conf-if-te-1/0/24)# interface port-channel 100
switch(config-Port-channel-100)# qos flowcontrol tx on rx on
```

Once flow control is enabled, enter the **show qos rcv-queue interface tengigabitethernet** command again and check the output. It should no longer be reporting packet drops. If the packet drops continue or the ingress rate is considerably lower than expected, contact your switch support provider for further investigation.

We recommend enabling asymmetric flow control with Brocade VDX switches. For any two adjacent devices, one device should have Rx ON and Tx OFF, while the other device should have Rx OFF and Tx ON.

Refer to the “Congestion control and queuing” section of the *Brocade Network OS Layer 2 Switching Configuration Guide* for further details about congestion control.

ACL limits issues

If you keep within the supported limits of ACL usage as shown in the table below, you are unlikely to run into system limits issues. ACLs should instantiate quickly and correctly.

TABLE 4 ACL limits per switch in VCS mode

System resource	Brocade VDX 6740 series Brocade VDX 6940 series Brocade VDX 2741 Brocade VDX 2746	Brocade VDX 8770
MAC (L2) ACLs created	512	2048
IPv4 (L3) ACLs created	512	2048
IPv6 (L3) ACLs created	512	2048
Number of rules per ACL	256	2048
Total number of rules in all ACLs	30K	30K
ACL name length	63 characters	63 characters
Range of ACL sequence numbers	From 0 through 4294967290	From 0 through 4294967290

As you approach or exceed combinations of these limits, you might encounter slow instantiation of ACL rules.

Delays of several minutes can occur in the instantiation of ACL rules and counters if the number of ACLs or VLANs is excessive.

To display the hardware instantiation status (Active/Partial/In Progress/Inactive), run the **show access-list** command .

Troubleshooting standard issues

This section describes some potential problems you may encounter and suggestions on how to investigate or resolve each issue.

If these steps do not lead to resolution of the problem, prepare a case for your switch provider, as described in [Contacting Brocade Technical Support](#) on page 7.

AMPP is not working

Configuring Brocade Automatic Migration of Port Profiles (AMPP) is complex. For details on configuring AMPP, refer to the “Configuring AMPP” section of the *Brocade Network OS Layer 2 Switching Configuration Guide*.

Problems encountered while using AMPP are usually the result of configuration errors in the port-profile itself, errors in the associated virtual machine (VM) configuration, or compatibility problems between the host adapters and AMPP. Specifically, AMPP problems can be caused by the following conditions:

- A port-profile configuration does not exist on the target switch or does not contain a basic switchport and VLAN configuration. Refer to [Verifying the port-profile configuration](#) on page 21.
- The VM MAC address does not appear in the MAC address table. Refer to [Verifying the VM MAC address](#) on page 21.

- The port-profile is not activated or is not associated with the correct MAC address. Refer to [Verifying the port-profile state](#) on page 22.
- The VM kernel MAC addresses are not associated correctly with the port-profile on the respective switches. Refer to [Verifying the VM kernel MAC addresses](#) on page 22.
- The VM and its associated hosts do not share a common storage device. Refer to [Verifying a shared storage device](#) on page 22.
- The port-profile was learned on a nonprofiled VLAN. Refer to [Verifying the status of a learned profiled MAC address](#) on page 22.
- A conflicting port-profile is applied to the same interface. Refer to [Verifying that port profiles do not conflict](#) on page 23.
- The Ethernet Name Server is not functioning correctly. Refer to [Verifying the Ethernet Name Server](#) on page 23.
- An ESX host has an incompatible network adapter or driver installed. Refer to [Verifying an ESX host](#) on page 23.

Verifying the port-profile configuration

A valid port-profile must exist on the target switch. It must contain a basic switchport and VLAN configuration.

1. In the privileged EXEC mode, enter the **show running-config port-profile** command to verify that the port-profile configuration exists on the target switch, and that it contains a basic switchport and VLAN configuration.

```
switch# show running-config port-profile
port-profile default
vlan-profile
switchport
switchport mode trunk
switchport trunk allowed vlan all
switchport trunk native-vlan 1
!
!
port-profile pp1
vlan-profile
!
!
port-profile pp2
vlan-profile
!
!
```

2. If the port-profile configuration does not exist or is missing the required switchport or VLAN configuration, create the port-profile as described in the “Configuring AMPP profiles” section of the *Brocade Network OS Layer 2 Switching Configuration Guide*.

Verifying the VM MAC address

For the correct functioning of AMPP, the MAC address for the VM and its associated hosts must appear in the MAC address table.

1. Enter the **show mac-address-table** command to verify that the VM MAC addresses appear in the switch MAC address table.

```
switch# show mac-address-table
VlanId  Mac-address      Type      State      Ports
1       0000.0010.0001   Static    Inactive   Te 4/0/3
1       0000.0010.0002   Static    Inactive   Te 4/0/3
Total MAC addresses : 2
```

2. If a VM MAC address is not present, contact your switch support provider for further investigation and provide this data.

Verifying the port-profile state

For the correct functioning of AMPP, the port-profile must be active and must be associated with the correct MAC address.

1. Enter the **show port-profile status** command to verify that the port-profile is activated and is associated with the correct MAC address.

```
switch# show port-profile status
Port-Profile  PPID  Activated  Associated MAC  Interface
pp1           1      No        None           None
pp2           2      No        None           None
```

2. Correct any misconfigurations as follows:

- If the port-profile is not activated, enter the **port-profile profile-name activate** command to activate it.
- If the port-profile is not associated with a MAC address, enter the **port-profile port-profile-name static** command to perform the association.

```
switch(config)# port-profile PP3 static 0050.5600.10030
```

- If the port-profile is associated with the wrong MAC address, enter the **no port-profile port-profile-name static** command to break the association with the incorrect MAC address, and then reassociate the port with the correct MAC address.

```
switch(config)# no port-profile PP3 static 0050.5600.10020
switch(config)# port-profile PP3 static 0050.5600.10030
```

Refer to the "Configuring a new port-profile" section of the *Brocade Network OS Layer 2 Switching Configuration Guide* for details about activating a port-profile and associating a port-profile with a MAC address.

Verifying the VM kernel MAC addresses

Confirm that the virtual machine (VM) kernel MAC addresses are also associated with the port-profile on the respective switches. If not, perform the association as described in [Verifying the port-profile configuration](#) on page 21.

Verifying a shared storage device

Confirm that the VM and its associated hosts are sharing a storage device. If not, then reconfigure the VM and hosts to share a storage device.

Verifying the status of a learned profiled MAC address

For correct functioning of AMPP, the MAC address must be learned from a valid source— a profiled VLAN. This procedure determines whether a MAC address was learned from a valid source.

Enter the **show mac-address-table port-profile** command to check the status on learned profiled MAC addresses.

```
switch# show mac-address-table port-profile
Legend: Untagged(U), Tagged (T), Not Forwardable(NF) and Conflict(C)
VlanId  Mac-address  Type      State      Port-Profile  Ports
1       0050.5679.5351 Dynamic   Active     Profiled(U)   Te 111/0/10
1       0050.567b.7030 Dynamic   Active     Profiled(U)   Te 111/0/12
1       005a.8402.0000 Dynamic   Active     Profiled(T)   Te 111/0/24
1       005a.8402.0001 Dynamic   Active     Profiled(NF)  Te 111/0/24
1       005a.8402.0002 Dynamic   Active     Not Profiled  Te 111/0/24
1       005a.8402.0003 Dynamic   Active     Not Profiled  Te 111/0/24
1       005a.8402.0004 Dynamic   Active     Not Profiled  Te 111/0/24
(output truncated)
Total MAC addresses : 17
```

Check for and investigate MAC addresses identified in the output as "Not Profiled."

Verifying that port profiles do not conflict

1. Enter the **show port-profile name pp1_name name pp2_name validate** command to validate whether multiple port-profiles applied on an interface can co-exist without conflict.

```
switch# show port-profile name pp1 name pp2 validate
Port-Profile          Port-Profile          Conflicts
-----
pp1
vlan-profile          vlan-profile          No
qos-profile           qos-profile           No
security-profile      security-profile      No
```

2. If a conflict exists, reconfigure one of the port-profiles to avoid the conflict.

Refer to the e "Configuring AMPP" section of the *Brocade Network OS Layer 2 Switching Configuration Guide* for information about the rules for co-existence.

Verifying the Ethernet Name Server

AMPP requires each VCS Fabric switch in the cluster have the same view of the MAC address table. Any differences in the view indicate a failure of the Ethernet Name Server (ENS). Refer to [ENS not working correctly](#) on page 26 for details.

Verifying an ESX host

Verify that each ESX host has the correct Converged Network Adapter (CNA) installed with appropriate drivers, and does not use the Cisco Nexus 1000V software switch, as that switch might send out specially crafted packets.

CID card is corrupted

In the case of a corrupted CID card, perform the following steps.

1. Link the **wwncardshow** command to survey the extent of the damage. (This does not have to be done for single boards.)

```
switch# ln -s /fabos/cliexec/em /fabos/bin/wwncardshow
```

2. Display the wwncardshow data.

```

switch# wwncardshow ipdata
packet count is 2
++ Wwn Card IP Data ++
Type Num Field Address Mask Cfg/Zone
-----
CP 0 Eth IP: 255.255.255.255 255.255.255.255
CP 1 Eth IP: 255.255.255.255 255.255.255.255
Chassis GW IP: 255.255.255.255
LicID: 10:00:00:ff:ff:ff:ff:ff enet cfg
Name: VDX 6710-54 Gen# : -1/0
Sw 0 Eth IP: 10.17.10.84 255.255.240.0
FC IP: 0.0.0.0 0.0.0.0
GW IP: 10.17.0.1
WWN: 10:00:00:05:33:14:b2:70
Name: swd77 Gen# : 0/0
Sw 1 Eth IP:
FC IP:
GW IP:
WWN: 10:00:00:05:33:14:b2:71
Name: Gen# : 0/0

```

Items that are FFs, 255s, or zeros are unacceptable. Only the first two groups count, and the items that must be correct are the following:

- The CP Eth IP entries. They need valid data only if that CP/MM is present.
- The chassis LicID entry.
- The Sw 0 Eth IP entry.
- The Sw 0 GW IP entry.
- The Sw 0 WWN entry.

3. To correct the CP Eth IP entries, run **ipaddrset -cp x**, where x is 0 for MM1 and 1 for MM2, and put in correct data at the prompts. Then run **ipaddrset -chassis** and enter the correct data as needed.

Sometimes, if the entries have enough 255/0xFFs in them, running **ipaddrset** does not update the values properly, in which case you have to run **test_sysmod** to clear a couple of entries.

4. To correct Sw 0 WWN, enter **wwn -d626 xx:xx:xx:xx:xx:xx:xx** with the correct wwn value. The system must be rebooted for the change to take effect (at the prompt or manually).
5. To correct chassis LicID, you need the test_sysmod tool. Mount a filesystem (if necessary get eth0 up manually with ifconfig, or set the gateway first).

```

switch# run test_sysmod
test_sysmod

```

6. At the first menu, enter 11 for WWN testing, then 2 for copy WWN to LID, and then enter 1 to confirm. Perform a **Ctrl+C** to exit.
7. The system must be rebooted for the change to take effect. Exit test_sysmod with **Ctrl+C**.

If you have lost both the WWN and license ID, then you must perform step 4 first. If you do not know the value, it is available in the MAC address in the boot environment variables (for pizza boxes only).

This value can be entered in the **wwn** command by inserting 10:00: before the MAC value).

8. Finally, if you can't correct the IP addresses, there is one more option in test_sysmod that can help. At the main menu, enter 11 for WWN testing and then 1 for clear WWN IP data entry, then 0, 1, 2, or 3 for entries that had a lot of FFs. If you clear all of the entries that are corrupted with FFs, you should be able to run **ipaddrset** to restore the real addresses.
9. Reboot the switch in order for the change to take effect and make the **ipaddrset** command available.

Verifying SEEPROM data

1. To verify the SEEPROM, copy the `test_symod` file to `/fabos/bin` as `test_sysmod`, and select option **10** for i2c and option **27** to Verify FRU Seeprom. The test begins automatically.
2. Use the offset of `0x6a4c`, as that is where the IP table starts (size 256), but any offset (and size less than or equal to 256) will access that device.

Clearing the Boot PROM password

After you complete the procedure [Obtaining the Boot PROM recovery password](#) on page 41, the BootPROM password is set. To avoid needing the Boot PROM password during future password-recovery operations, you can reset the Boot PROM password.

To reset the Boot PROM password, perform the following steps:

1. Connect to the serial console port of the switch.
2. Manually reboot the switch.
3. When prompted to stop AutoBoot, press **ESC**.

NOTE

If the **ESC** key is not effective during reboot, turn the power off and back on, and then try again. If the **ESC** key is still not effective, check the serial console cable. If the cable is connected correctly, then the unit must be returned for service or repair.

The Boot PROM menu is displayed with the following options:

Start system.	Used to reboot the system.
Recover password.	Used to generate a character string for your support provider to recover the Boot PROM password. ATTENTION Use this feature only when directed by technical support personnel.
Enter command shell.	Used to enter the command shell to reset all passwords on the system.

```
Checking system RAM - press any key to stop test
Checking memory address: 00100000
System RAM test terminated by keyboard
set_bootstatus: BS_LOAD_OS, platform_idx = 6
Hit ESC to stop autoboot: 0
```

- ```
1) Start system.
2) Recover password.
3) Enter command shell.
```

Option?

4. Enter 3 at the prompt to open the command shell.
5. At the prompt, enter the Boot PROM password.

```
password: *****
=>
```

6. To reset the password, enter the **resetpw** command.

```
=> resetpw
.
.
Done
```

- To allow the switch to continue booting up, enter the **reset** command.

```
=> reset
do_reset: PERFORM HARD RESETi
The system is coming up, please wait...
```

When the boot-up process is finished, the Boot PROM password is gone.

## CPU use is unexpectedly high

Unexpectedly high CPU use is usually the result of a process consuming a large percentage of available CPU cycles. It can prevent access to the switch by Telnet or make an ISL nonfunctional.

If you suspect high CPU use, complete the following steps.

- In privileged EXEC mode, enter the **show process cpu** command to determine which process is causing the high CPU reading.
- Shut down the corresponding interface or delete the configuration suspected of causing the high CPU use.

## ECMP not load balancing as expected

Equal cost multipath (ECMP) routing increases throughput by balancing traffic across multiple routes that tie for best cost. If you suspect that traffic is not being balanced as expected, complete the following steps.

- In privileged EXEC mode, enter the **show fabric route topology** command to display whether ECMP routes are expected.

```
switch# show fabric route topology
Total Path Count: 1
Src Dst Out Out Nbr Nbr
RB-ID RB-ID Index Interface Hops Cost Index Interface BW Trunk

66 1 124 Fi 66/0/4 1 500 129 Fi 1/-1/-1 32G Yes
```

If the output shows multiple equal-cost paths between the source and destination switches, then ECMP load balancing is expected.

- Check the interface utilization to verify whether it matches with the expected number of flows.
- Enter the **l2traceroute** command to investigate whether Layer 2, Layer 3, and Layer 4 flows hash to separate ECMP links.

To avoid disruption of operation inherent in ECMP, the correctly functioning Brocade routing strategy routes a specific flow along one deterministic route. Additional flows take available equal-cost routes. This step verifies whether this flow hashing strategy is functioning correctly.

For details about using the **l2traceroute** command, refer to [Using Layer 2 traceroute](#) on page 56.

## ENS not working correctly

The Ethernet Name Server (ENS) is working correctly when the content of MAC address tables is the same among switches in the same VCS Fabric cluster. Perform the following checks to ensure that ENS is working correctly:

- Check that the fabric membership information is what you expect. Refer to [Verifying the fabric](#) on page 27.
- Ensure that MAC addresses are not moving among ports. Refer to [Checking for MAC address movement among ports](#) on page 27.
- Ensure that no edge port has an external loopback. Refer to [Verifying edge ports have no external loopback](#) on page 27.

## Verifying the fabric

Enter the **show fabric all** command and ensure that information about all switches in the VCS Fabric cluster is displayed.

```
switch# show fabric all
VCS Id: 1
Config Mode: Local-Only
Rbridge-id WWN IP Address Name

 1 50:00:51:E4:44:40:0E:04 0.0.0.0 "fcr_fd_1"
 2 50:00:51:E4:44:50:0F:09 0.0.0.0 "fcr_xd_2_128"
 60 10:00:00:05:33:5F:EA:A4 10.24.81.65 "switch"
 66 10:00:00:05:33:67:26:78 10.24.81.66 >"switch"
The Fabric has 4 Rbridge(s)
```

## Checking for MAC address movement among ports

MAC address movement from port to port occurs when the same source address is detected on multiple ports. This condition is sometimes known as "MAC address flapping."

To check for MAC address flapping, enter the **show mac-address-table** command multiple times and check the output.

## Verifying edge ports have no external loopback

Physically check for extended loopback.

## Fabric does not form correctly

Some problems you might encounter when configuring zones include potential Fibre Channel router issues. For a more detailed discussion of possible Fibre Channel issues, refer to the *Fabric OS Troubleshooting and Diagnostics Guide*.

Some of the following problems may contribute to the zone not forming correctly:

- A Brocade VDX switch gets isolated when an RBridge ID matches the front domain ID or translate domain ID in a mixed network. Refer to [Recovering an isolated switch in a mixed FCoE fabric](#) on page 27.
- A "FID over-subscribed" message occurs during attempts to connect a backbone fabric to an edge fabric. Refer to [Recovering from FID oversubscription](#) on page 28.
- A "FID conflict" message occurs during attempts to connect a backbone fabric to an edge fabric. Refer to [Recovering from Fabric ID conflict](#) on page 28.
- Interfabric link (IFL) traffic does not flow over the intended link. Refer to [Rebalancing traffic over multiple IFLs](#) on page 28.
- Zone merge was expected to be blocked following reboot, but was not blocked. Refer to [Blocking zone merge after reboot](#) on page 29.
- Stale translate domains exist in an edge fabric. Refer to [Removing stale translate domains](#) on page 29.

## Recovering an isolated switch in a mixed FCoE fabric

In an FCoE fabric that spans Network OS switches and Fabric OS switches, a Network OS switch with an RBridge ID that matches a front phantom domain ID or translate phantom domain ID of a connecting Fibre Channel router can become isolated.

FCoE connectivity across the Fibre Channel link between VCS Fabric clusters and Fibre Channel routers uses domain IDs to identify switches. Within a VCS Fabric cluster, a domain ID is the same as an RBridge ID. When you connect to a Fibre Channel router, the Fibre Channel router service in the Fibre Channel fabric emulates virtual phantom Fibre Channel domains in the FCoE fabric. Each Fibre Channel router-enabled switch emulates a single front phantom domain and each FC fabric is represented by a translate phantom domain.

To recover an isolated Network OS switch, complete the following steps.

1. Disable all FC routers that connect to the VCS Fabric cluster.
2. Reboot the isolated Network OS switch.
3. Re-enable all disabled FC routers.
4. To prevent switch isolation, follow these steps on each FC router that attaches to a VCS Fabric cluster.
  - a) Enter the **portCfgExPort -d** Fabric OS command to set a unique front phantom domain ID.
  - b) Enter the **fcrXlateConfig importedFID exportedFID preferredDomainID** command to set a unique translate phantom domain ID.

Refer to the *Fabric OS Command Reference* for details about the **portCfgExPort** and **fcrXlateConfig** commands.

### Recovering from FID oversubscription

A "FID over-subscribed" message occurs when different Fibre Channel backbones attempt to connect to the same edge fabric using different Fabric IDs (FIDs). When you assign a FID to the edge fabric (**portCfgExPort -f** command), you must use the same FID as any other Fibre Channel backbone that connects to the edge fabric.

To resolve this problem, complete the following steps.

1. On the Fibre Channel router on the backbone with the errant FID configured, disable the EX\_Port.
2. Enter the **portCfgExPort -f** command to configure the EX\_Port with the same FID as the EX\_Port on the other Fibre Channel router that connects to the same edge fabric.
3. Re-enable the EX\_Port.

Refer to "Configuring an IFL for both edge and backbone connections" in the *Fabric OS Administrator's Guide* for details.

### Recovering from Fabric ID conflict

The "FID conflict" message occurs when a backbone fabric connects to two or more edge fabrics that have the same Fabric ID (FID). Every edge fabric that a Fibre Channel router connects to must have a Fabric ID configured for the EX\_Port that is unique on that Fibre Channel backbone. This error is most likely to occur when an edge fabric temporarily splits, causing it to appear as two edge fabrics with the same Fabric ID. This symptom might occur during VCS Fabric or Fibre Channel fabric upgrade, or as a result of a Brocade VDX or Fibre Channel switch reboot or crash.

Problem resolution depends on the cause of the problem. If the error is due to a temporary split, the problem will go away when the fabrics merge again.

If the problem is not due to a temporary fabric split, the most likely cause is misconfiguration. In this case, enter the **portCfgExPort -f** command to reconfigure one of the EX\_Ports with a unique fabric ID.

### Rebalancing traffic over multiple IFLs

If traffic across multiple interfabric links (IFLs) between a Fibre Channel router and an edge fabric is not balanced as you intended, it may be because the Fibre Channel router cannot determine an FSFP path from the Fibre Channel backbone to the target in the edge fabric. It uses all paths.

To direct the traffic the way you intend, on the FC router, use the **fcrRouterPortCost** command to configure a cost for each IFL. Traffic will flow across the lowest-cost IFL.

1. Connect to the FC router and log in using an account with admin permissions.
2. Disable the EX\_Port.

3. Enter the **fcrRouterPortCost** command to configure the link cost.

Set the cost to 1000 if you want the link to carry traffic during normal operation. If you want the link to not carry traffic under normal operation, set the cost to 10000 (ten thousand) and set the cost of at least one other link to 1000. The default value is 1000, which you get when you enter a value of 0.

4. Re-enable the port.

For details about the **fcrRouterPortCost** command, refer to the *Fabric OS Command Reference*.

## Blocking zone merge after reboot

To be sure of blocking zone merge following a switch reboot, enter the **no fabric isl enable** command to disable the ISL between neighboring Brocade VDX switches.

### CAUTION

Brocade recommends that you do *not* use the shutdown command. If you use the shutdown command, then following switch reboot, the zone merge could happen before the shutdown command is replayed by the running configuration.

To block zone merge following reboot, follow these steps on each ISL port.

1. In global configuration mode, enter the **interface tengigabitethernet** (or **interface gigabitethernet**) command to enter interface configuration mode.
2. Enter the **no fabric isl enable** command.

## Removing stale translate domains

A translate domain becomes stale when the edge fabric it represents becomes unreachable. By default, the stale translate domain is not deleted until the local edge fabric is rebuilt.

To delete a stale translate domain and avoid the disruption caused by rebuilding the local edge fabric, complete the following steps.

1. Connect to the Fibre Channel router and log in using an account with admin permissions.
2. On the FC router, enter the **fcrXlateConfig --show stalexd** command to list any stale translate domains.
3. Enter the **fcrXlateConfig --delete stalexd** command to delete the stale translate domain.

Refer to the *Fabric OS Command Reference* for details about the **fcrXlateConfig** command.

## FCoE devices unable to log in

The inability to log in from a device connected through FCoE is usually because either the port or LLDP has been incorrectly configured. Potential reasons include:

- The default profile map has not been applied correctly. Refer to [Verifying the default profile map](#) on page 30.
- Required TLVs have not been advertised under LLDP. Refer to [Verifying TLVs](#) on page 31.

## Verifying CNA login

If CNAs are not logging into the switch, perform the following procedure.

1. Check that the physical port is provisioned for FCOE.

```
switch# show fcoe interface ethernet | include "1/0/5"
TenGigaBitEthernet 1/0/5 default
```

2. If the physical port is not provisioned, provision the interface for FCOE.
3. If the CNA is still not logging in, check that the logical FCOE interface is online by using the **show running-config interface fcoe** command, as in the following example:

```
switch# show running-config interface fcoe
interface Fcoe 1/11/1
no shutdown
!
interface Fcoe 1/11/2
no shutdown
!
interface Fcoe 1/11/3
no shutdown
!
interface Fcoe 1/11/4
no shutdown
!
interface Fcoe 1/11/5
no shutdown
!
interface Fcoe 1/11/6
no shutdown
!
interface Fcoe 1/11/7
no shutdown
```

4. Remove the FCOE provisioning and re-provision the physical interface.
5. If that does not work, execute the **shut** command, and then the **no shut** command on the FCOE logical interface.
6. If it still fails, collect the *supportSave* information and contact support. Refer also to [Gathering troubleshooting information](#) on page 11, which provides information about Network OS supportSave files.

### Verifying the default profile map

1. In privileged EXEC mode, enter **show running-config interface tengigabitethernet** followed by the interface ID to determine whether the default profile map has been applied to the interface.

```
switch# show running-config interface tengigabitethernet 5/0/1
interface TenGigabitEthernet 5/0/1
 fcoeport default
 shutdown
```

2. If the default profile map has not been applied to the interface, or the initiator and target do not share the same VLAN ID, in interface configuration mode, enter **fcoeport default** to apply it.

```
switch(conf-if-te-0/1)# fcoeport default
```

This command not only applies the default profile map, but also associates the initiator and target with the same VLAN ID.

## Verifying TLVs

The following TLVs —**dcbx-fcoe-app-tlv**, **dcbx-fcoe-logical-link-tlv**, and **dcbx-tlv**— must be advertised under LLDP or FCoE devices will not be able to log in.

1. In the privileged EXEC mode, enter the **show running-config protocol lldp** command to verify that the required TLVs are advertised.

```
switch# show running-config protocol lldp
protocol lldp
advertise dcbx-fcoe-app-tlv
advertise dcbx-fcoe-logical-link-tlv
advertise dcbx-tlv
```

2. If any of the required TLVs is missing, in protocol configuration mode, enter the corresponding **advertise** command.

```
switch# configure terminal
switch(config)# protocol lldp
switch(config-lldp)# advertise dcbx-fcoe-app-tlv
switch(config-lldp)# advertise dcbx-fcoe-logical-link-tlv
switch(config-lldp)# advertise dcbx-tlv
```

## Heavy disk utilization

If FWDL and reboot taking longer than expected it may be due to heavy disk utilization.

It is recommended for the customers to check their disk utilization using the **dir** command and determine if their disk utilization exceeds 60% of total disk space.

If it exceeds 60% of the total disk space, Brocade recommends that you reduce the disk utilization by using the **capture copy-support** and **clear support** commands to delete the existing core files.

If the disk utilization does not reduce to less than 60%, prepare a case for your switch provider, as described in [Contacting Brocade Technical Support](#) on page 7.

## ISL does not come up on some ports

The failure of an Inter-SwitchLink (ISL) between two switches in a VCS Fabric cluster can occur for various reasons:

- The ISL configuration is segmented or disabled. Refer to [Verifying the status of ISLs](#) on page 32.
- There are duplicate switch IDs or inconsistency in specifying the VCS ID. Refer to [Verifying VCS ID and RBridge IDs](#) on page 33.
- LLDP is not reporting its neighbors. Refer to [Verifying LLDP](#) on page 34.
- An overloaded CPU fails to generate keepalive packets. Refer to [Checking for CPU overload](#) on page 34.

## Verifying the status of ISLs

If any port looks suspicious, begin by checking the status of ISLs.

1. On the switches at each end of the broken link, in privileged EXEC mode, enter the **show fabric isl** command to view the status of ISL connections. Here we look at switch1.

```
switch1# show fabric isl
Rbridge-id: 2 #ISLs: 2
Src Src Nbr Nbr
Index Interface Index Interface Nbr-WWN BW Trunk Nbr-Name

1 Te 2/0/1 1 Te 3/0/1 10:00:00:05:1E:CD:7A:7A 10G Yes "switch1"
2 Te 2/0/2 ? Te ?/?/? ??:??:??:??:??:??:?? (segmented - incompatible)
26 Te 2/0/26 56 Te 25/0/56 10:00:00:05:33:40:2F:C9 60G Yes "Edget12r31_25"
34 Te 2/0/34 58 Te 26/0/58 10:00:00:05:33:41:1E:B7 40G Yes "Edget12r32_26"
```

Ports on which the ISL link is broken appear with the text "(segmented - incompatible)." Ports for which the ISL configuration is disabled do not appear in the output.

2. To examine the peer, switch2, enter the **show fabric islports** command to gather more information about the status of suspect ports.

```
switch2# show fabric islports
Name: switch2
Type: 107.4
State: Online
Role: Fabric Subordinate
VCS Id: 10
Config Mode: Local-Only
Rbridge-id: 11
WWN: 10:00:00:05:33:6d:7f:77
FCF MAC: 00:05:33:6d:7f:77
Index Interface State Operational State

1 Te 11/0/1 Up ISL 10:00:00:05:33:00:77:80 "switch" (upstream) (Trunk Primary)
2 Te 11/0/2 Down
3 Te 11/0/3 Down
4 Te 11/0/4 Up ISL (Trunk port, Primary is Te 11/0/1)
5 Te 11/0/5 Down
6 Te 11/0/6 Down
7 Te 11/0/7 Down
8 Te 11/0/8 Down
9 Te 11/0/9 Down
10 Te 11/0/10 Down
11 Te 11/0/11 Up ISL 10:00:00:05:1e:00:50:00 "switch" (Trunk Primary)
121 Fi 11/0/1 Up LS ISL 50:00:53:37:b6:93:5e:02 "fcr_fd_160" (downstream) (Trunk Primary)
122 Fi 11/0/2 Up LS ISL (Trunk port, Primary is Fi 11/0/1)
123 Fi 11/0/3 Down
124 Fi 11/0/4 Down
125 Fi 11/0/5 Down
126 Fi 11/0/6 Down
127 Fi 11/0/7 Down
```

3. If the state of the corresponding port is "Down" (your network will vary), enable the port with the **no shutdown** command.

```
switch2# configure terminal
Entering configuration mode terminal

switch(config)# interface tengigabitethernet 11/0/9
switch(conf-if-te-11/0/9)# no shutdown
```

4. If the port state is "Up", but the ISL is segmented (see Step 1), examine the Operational State string for further clues to the reason for the segmentation.

Refer to the *Brocade Network OS Command Reference* for details about the **show fabric islports** command and help in interpreting the Operational State string for a segmented ISL.

## Verifying VCS ID and RBridge IDs

For the ISL to function correctly, the following criteria must be true:

- Both switches must have the same VCS ID.
- Each switch must have a unique RBridge ID.

To check the criteria, complete the following steps.

1. Enter the **show vcs** command on each switch.
2. Depending on the output, proceed as follows:
  - If the **show vcs** command indicates that the VCS ID is not the same on each switch, enter the **vcs vcsid** command to correct the VCS ID on the switch that is in error.

```
switch1# show vcs
Config Mode : Local-Only
VCS ID : 1
Total Number of Nodes : 1
Rbridge-Id WWN Management IP VCS Status Fabric Status

66 >10:00:00:05:33:67:26:78* 10.24.81.66 Online Online
cz41-h06-m-r2
```

```
switch2# show vcs
Config Mode : Local-Only
VCS ID : 2
Total Number of Nodes : 1
Rbridge-Id WWN Management IP VCS Status Fabric Status

66 >10:00:00:05:33:67:26:78* 10.24.81.77 Online Online
cz41-h06-m-r2
```

```
switch2# vcs vcsid 1
```

- If both switches have the same RBridge ID, enter the **vcs rbridge-id** command to change the RBridge ID to a unique value.

```
switch1# show vcs
Config Mode : Local-Only
VCS ID : 1
Total Number of Nodes : 1
Rbridge-Id WWN Management IP VCS Status Fabric Status

66 >10:00:00:05:33:67:26:78* 10.24.81.66 Online Online
cz41-h06-m-r2
```

```
switch2# show vcs
Config Mode : Local-Only
VCS ID : 1
Total Number of Nodes : 1
Rbridge-Id WWN Management IP VCS Status Fabric Status

66 >10:00:00:05:33:67:26:78* 10.24.81.66 Online Online
cz41-h06-m-r2
```

```
switch2# vcs rbridge-id 77
```

## Verifying LLDP

When ISLs are functioning correctly, the **show lldp neighbors** command reports on each neighbor switch in the VCS Fabric cluster.

1. Enter the **show lldp neighbors** command to verify that LLDP reports on all of its neighbors.

```
switch1# show lldp neighbors
Local Intf Dead Interval Remaining Life Remote Intf Chassis ID Tx Rx
Te 66/0/55 120 106 port1 0005.1e78.f004 20300 19914
Te 66/0/60 120 108 port0 0005.1e55.16c8 20300 19911
```

2. If neighbors are missing, you will need to perform further debugging or contact your switch support provider.

## Checking for CPU overload

An abnormally high CPU load can cause an ISL to malfunction. Use the **show process cpu** command as described in [CPU use is unexpectedly high](#) on page 26 to troubleshoot an overloaded CPU.

## License is not properly installed

If a licensed feature is not functioning, a probable reason is that the license for that feature has not been installed correctly. Either the license was not installed, or it was installed and a required system reboot was not performed.

If you are unable to connect an FCoE device or unable to use Fibre Channel ports on a Brocade VDX switch, it is likely that the FCoE license is not installed.

If you suspect a license is not properly installed, complete the following steps.

1. In privileged EXEC mode, enter the **show license** command to display the currently installed licenses.

```
switch# show license
rbridge-id: 66
xx
FCoE Base license
Feature name:FCOE_BASE
License is valid
```

2. If the FCoE or DPOD license appears in the **show license** command output, but the feature does not work for the expected ports, the probable cause is that the affected ports were not re-enabled after installing the license.

### NOTE

After adding an FCoE or DPOD license, you must disable and re-enable all affected ports.

You can disable and then enable each affected port, or you can enter the **chassis disable** command followed by the **chassis enable** command to re-enable the entire chassis.

```
switch# chassis disable
switch# chassis enable
```

- If the license does not appear in the **show license** command output, then it was not installed. In privileged EXEC mode, enter the **license add licstr** command to install the license. For FCoE and DPOD licenses, you must also disable and enable the switch or port.

```
switch# license add licstr "*B
slSETgzTgeVGUDeQR4WIFRx7mmXODdSwENoRGENAmX3Ca3uHeZgXK0b, jzxyzfzKLrMsPN8C1SxvDQRRT8VyuULyyKTO0ryU6qm4s
1jjiSAeV, COoedzCx1v6ycQgnYMeSVp#"
License Added [*B
slSETgzTgeVGUDeQR4WIFRx7mmXODdSwENoRGENAmX3Ca3uHeZgXK0b, jzxyzfzKLrMsPN8C1SxvDQRRT8VyuULyyKTO0ryU6qm4s
1jjiSAeV, COoedzCx1v6ycQgnYMeSVp#]
For license change to take effect, please disable/enable port or switch...
switch# chassis disable
switch# chassis enable
```

## Need to recover password for Brocade VDX switches

Use these procedures to recover access to your switch when normal access to the admin account has been lost.

### CAUTION

Because of the complexity of these procedures, we highly recommend that you contact support for guidance, especially for recovering the root password. The recovery steps must be followed exactly as presented below. Any variation in the procedure might cause unpredictable results.

There are several methods for recovering passwords on a Brocade Network OS switch. The correct approach depends on the accounts to which you have access. The table below lists the procedures and conditions under which you would use each procedure to recover passwords. These procedures apply to all versions of Network OS firmware across all Network OS platforms, except where noted.

| Account access availability                                                                                                                               | Use these procedures                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Access to admin account</li> </ul>                                                                                 | Use normal password management procedures.                                                                                                                |
| <ul style="list-style-type: none"> <li>No access to admin account</li> <li>Access to root account</li> </ul>                                              | <a href="#">Recovering the admin password by using the root account</a> on page 40                                                                        |
| <ul style="list-style-type: none"> <li>No access to admin account</li> <li>No access to root account</li> <li>Access to boot PROM interface</li> </ul>    | <a href="#">Recovering the root password for Brocade VDX switches</a> on page 36                                                                          |
| <ul style="list-style-type: none"> <li>No access to admin account</li> <li>No access to root account</li> <li>No access to boot PROM interface</li> </ul> | <a href="#">Obtaining the Boot PROM recovery password</a> on page 41 and <a href="#">Recovering the root password for Brocade VDX switches</a> on page 36 |

If you still have access to the admin account, you can change the admin account password or change passwords on user accounts by using normal password-management procedures. Refer to the “Managing User Accounts” section of the *Brocade Network OS Security Configuration Guide*.

Even if you have lost access to the admin account but you do have access to the root account, you can use the root account to reset passwords for the root, admin, and user accounts. Refer to [Recovering the admin password by using the root account](#) on page 40. Once you have reset the admin account password, you can use that account to set user login passwords.

If you do not have access to the root account, you can use the Boot PROM method. Refer to [Recovering the root password for Brocade VDX switches](#) on page 36 in this section. If the password is set on the boot PROM and is unknown, contact your switch service provider for a boot PROM recovery string to regain access to the switch. Refer to [Obtaining the Boot PROM recovery password](#) on page 41 in this section.

Try the factory default passwords before proceeding in case any are still in effect. The following table lists the default passwords for Network OS switches.

| Account | Default password |
|---------|------------------|
| root    | fibranne         |
| admin   | password         |
| user    | password         |

**NOTE**

When connected through a serial cable to the console, always save the output by using the capture functionality under Windows, or the script functionality for UNIX or Linux.

### Recovering the root password for Brocade VDX switches

This procedure must be performed from the serial interface console.

**CAUTION**

Enter commands at the Boot PROM interface exactly as shown. Commands entered incorrectly at the Boot PROM interface can render your switch unstable or unusable. To recover, you would need to seek help from your switch service provider or return your switch to the factory for repair.

You can use this procedure if you need to recover passwords on a device for which the root account is not accessible. If the root account is accessible, use [Recovering the admin password by using the root account](#) on page 40 instead.

To use this procedure, you must have access to the Boot PROM interface; that is, its password must be available or not set. If you do not have access to the Boot PROM interface, use [Obtaining the Boot PROM recovery password](#) on page 41 before using this procedure.

This section provides detailed procedures for performing password recovery in addition to a quick reference for advanced users who need only a reminder of the basic steps:

- [Recovering the root password for Brocade VDX switches: Quick reference](#) on page 39
- [Recovering the root password for Brocade VDX switches: Detailed procedure](#) on page 36

### Recovering the root password for Brocade VDX switches: Detailed procedure

Use this procedure if you do not have access to the root account.

To reset the root password to its factory default value on a Brocade VDX switch, set a password for the admin account, and then restore nondefault user accounts, follow these steps:

You may need to disable the root account using the **no root enable** command.

1. Connect to the serial console port of the switch.
2. Manually reboot the switch.

- When prompted to stop AutoBoot, press **ESC**.

**NOTE**

If the **ESC** key is not effective during reboot, turn the power off and back on, and then try again. If the **ESC** key is still not effective, check the serial console cable. If the cable is connected correctly, then the unit must be returned for service or repair.

The Boot PROM menu is displayed with the following options:

|                     |                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Start system        | Used to reboot the system.                                                                                                                                                                      |
| Recover password    | Used to generate a character string for your support provider to recover the Boot PROM password.<br><br><b>ATTENTION</b><br>Use this feature only when directed by technical support personnel. |
| Enter command shell | Used to enter the command shell to reset all passwords on the system.                                                                                                                           |

```
Checking system RAM - press any key to stop test
Checking memory address: 00100000
System RAM test terminated by keyboard
set_bootstatus: BS_LOAD_OS, platform_idx = 6
Hit ESC to stop autoboot: 0
```

- Start system.
- Recover password.
- Enter command shell.

Option?

- Enter 3 at the prompt to open the command shell.
- If prompted, enter the Boot PROM password and press **Enter**.

**NOTE**

The Boot PROM has a password only if one has been defined. If you are prompted to enter a new Boot PROM password, make sure that it is at least 8 characters long. Do not select this option unless specifically instructed to do so by support personnel.

- Append "S" to the boot arguments so that the switch boots into single-user mode, by entering the following at the prompt:  
**=> setenv bootargs "root=/dev/sda1 rootfstype=ext4 quiet S"**
- Enter the **printenv** command to verify the change.

```
=> printenv
AutoLoad=yes
LoadIdentifiers=Fabric Operating System;Fabric Operating System
OSLoadOptions=quiet
OSRootPartition=sda2;sda1
SkipWatchdog=yes
autoreset_mac=true
baudrate=9600
bootargs=root=/dev/sda1 rootfstype=ext4 quiet S
bootcmd=execute_internal_bootcmd
(output truncated)
```

- Enter the **saveenv** command to save the changes.

```
=> saveenv
Saving Environment to Flash.....Done
```

9. Enter the **reset** command to bring up the device in single-user mode

```
=> reset
BootROM version: 1.0.48
Copyright (C) 2011 Brocade Communication.

CPU0: P4080E, Version: 2.0, (0x82080020)
(output truncated)
```

10. Enter the **mount** command with the following parameters to remount the root partition as read/write capable.

```
sh-2.04# mount -vo remount,rw,noatime /
/dev/root on / type ext4 (rw,noatime)
```

11. Mount the secondary partition.

Examine the output of the **printenv** command in Step 7, to check which partition the root points to in the boot arguments (bootargs = root setting). If the root partition is sda2, then use **sda1** in this command. If the root partition is sda1, then use **sda2**.

```
sh-2.04# mount /dev/sda2 /mnt
```

12. Enter the **passwddefault** command to reset the root password to the factory default value or the **/sbin/passwddefault -f** (to reset the root password and forcefully enable the root account).

```
sh-2.04# /sbin/passwddefault -f
```

**NOTE**

For Network OS, the **passwddefault -f** command restores the passwords of factory default accounts to their default values, removes non-default user accounts that are present, and enables the root account (if it is disabled). Error messages seen during the execution of that command (applicable to Network OS 3.0.0) should be ignored.

In a dual management-module (MM) chassis, enter the **passwddefault** command on the standby MM for password recovery.

13. Reset the boot arguments by removing the "S".

```
sh-2.04# bootenv bootargs "root=/dev/sda1 rootfstype=ext4 quiet"
```

14. Reboot the switch by using the **partman -r** command.

```
sh-2.04# partman -r
```

15. Log in to the switch by using the serial interface or Telnet. Use the factory default accounts (root/admin/user).

16. Start the Network OS command line.

```
switch:root> noscli

SECURITY WARNING: The default password for at least
one default account (root, admin and user) have not been changed.

Welcome to the Brocade Network Operating System Software
admin connected from 127.0.0.1 using console on switch
```

17. Enter global configuration mode.

```
switch# configure terminal
Entering configuration mode terminal
switch(config)#
```

18. Use the following syntax of the **username** command to reset passwords for the admin or user accounts, or for any other nondefault users.

```
username account-name password new-password
```

The following example resets the admin password to the default value of "password."

```
switch(config)# username admin password password
```

19. To restore the non-default user accounts, perform the following steps:

- a) Copy the running-config to a file.

```
switch: copy running-config flash://running-config.cfg
2012/07/09-11:51:21, [DCM-1108], 4930, M2, INFO, VDX8770-4, Running
configuration file has been uploaded successfully to the remote location.
```

- b) Run the following command to apply the default configuration to the switch.

```
switch# copy default-config startup-config
```

- c) Enter **y** to reboot the switch.

```
switch# reload
Are you sure you want to reload the switch? [y/n]:y
The system is going down for reload NOW !!
```

- d) Copy the file saved in Step 19a to the running-config.

```
switch# copy flash://running-config.cfg running-config
Loading.
2012/07/09-12:08:13, [DCM-1105], 5456, M2, INFO, VDX8770-4, Copy of the
downloaded config file to the current running-config has completed
successfully on this node.
```

The password recovery procedure is now complete. You can now use normal password-management procedures from the admin account.

### Recovering the root password for Brocade VDX switches: Quick reference

Advanced users who need only a reminder of the basic steps can use this quick reference to recover passwords.

You may need to disable the root account using the **no root enable** command.

1. Press **ESC** during reboot.

#### NOTE

If the **ESC** key is not effective during reboot, turn the power off and back on, and then try again. If the **ESC** key is still not effective, check the serial console cable. If the cable is not connected correctly, then the unit must be returned for service or repair.

2. Choose option **3**.

3. Enter the following commands in sequence:
  - a) **setenv bootargs "root=/dev/sda1 rootfstype=ext4 quiet S"**
  - b) **saveenv**
  - c) **reset**
  - d) **mount -vo remount,rw,noatime /**
  - e) **mount /dev/sda1 /mnt**  
For Step 3e, choose the root partition that was not set as root in Step 3a.
  - f) **/sbin/passwddefault** (to recover the default accounts password) or **/sbin/passwddefault -f** (to recover the default accounts password and forcefully enable the root account)
  - g) **bootenv bootargs "root=/dev/sda1 rootfstype=ext4 quiet"**
  - h) **partman -r**
4. Log in as root and enter the following commands in sequence:
  - a) **noscli**
  - b) **configure**
  - c) **username name password new-password**
5. Restore nondefault user accounts.

### Recovering the admin password by using the root account

Use this procedure if you have lost access to the admin account, but you do have access to the root account.

To reset any account password from the root account, follow these steps:

#### NOTE

For a non-secured system, you can use the serial interface or Telnet. For a secure system, you can use the serial interface or secure Telnet.

1. Open a CLI session to the switch.
2. Log in as root.
3. At the prompt, enter the **noscli** command to start the Network OS command line.

```
switch:root> noscli
```

4. Enter global configuration mode.

```
switch# configure terminal
Entering configuration mode terminal
switch(config)#
```

5. Use the following syntax of the **username** command to reset passwords for the admin or user accounts, or for any other nondefault users.

```
username account-name password new-password
```

The following example resets the admin password to the default value of "password."

```
switch(config)# username admin password password
```

You can now use the admin account to manage the admin and user passwords by using normal password-management procedures.

**ATTENTION**

Keep a hard copy of your switch passwords in a secure location.

**Obtaining the Boot PROM recovery password**

Use this procedure when you do not have the Boot PROM password.

This procedure obtains a Boot PROM recovery password. It does not reset the Network OS passwords on the switch. Once the Boot PROM password has been recovered, you must go through the Boot PROM command shell to reset the Network OS passwords on the switch.

This procedure explains how to gather the information you need to send to your switch support provider in order to get a Boot PROM recovery password. Once you have received the Boot PROM recovery password, and gained access to the Boot PROM, you must reset the passwords by using [Recovering the root password for Brocade VDX switches](#) on page 36.

After completing this procedure, the Boot PROM password will be set. To avoid having to obtain a Boot PROM recovery password for future password-recovery operations, you can choose to reset the Boot PROM password as described in [Clearing the Boot PROM password](#) on page 25.

To obtain the Boot PROM recovery password from your switch support provider, perform the following steps:

1. Connect to the serial console port of the switch.
2. Manually reboot the switch.
3. When prompted to stop AutoBoot, press **ESC**.

**NOTE**

If the **ESC** key is not effective during reboot, turn the power off and back on, and then try again. If the **ESC** key is still not effective, check the serial console cable. If the cable is connected correctly, then the unit must be returned for service or repair.

The Boot PROM menu is displayed with the following options:

|                      |                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Start system.        | Used to reboot the system.                                                                                                                                                                      |
| Recover password.    | Used to generate a character string for your support provider to recover the Boot PROM password.<br><br><b>ATTENTION</b><br>Use this feature only when directed by technical support personnel. |
| Enter command shell. | Used to enter the command shell to reset all passwords on the system.                                                                                                                           |

```

Checking system RAM - press any key to stop test
Checking memory address: 00100000
System RAM test terminated by keyboard
set_bootstatus: BS_LOAD_OS, platform_idx = 6
Hit ESC to stop autoboot: 0

```

- 1) Start system.
- 2) Recover password.
- 3) Enter command shell.

Option?

- Enter 2 at the prompt. A character string is displayed, highlighted in the following example.

```

1) Start system.
2) Recover password.
3) Enter command shell.

Option? 2
Send the following string to Customer Support for password recovery:
/uaSLR1raCqT3FTogy0ZjA==

```

- Send the character string to your switch support provider to obtain a Boot PROM recovery password.

**CAUTION**

Do not reboot the switch at this point. Doing so will cause the password recovery string to change.

- As prompted, perform the appropriate steps to set the Boot PROM password if it was not set.

```
Recovery password is NOT set. Please set it now.
```

- When prompted, enter the Recovery Password that is generated from your support provider, and reenter it when prompted.

```

Enter the supplied recovery password.
Recovery Password: YnfG9DDr1FMDVknM0RkPtg== < Supplied by your support provider

Re-enter Recovery Password: YnfG9DDr1FMDVknM0RkPtg==

```

- When prompted with "New password:", enter a new Boot PROM password, and reenter it when prompted.

```

New password: xxx
Re-enter new password: xxx

```

The switch reboots.

**ATTENTION**

Record the new password for future reference.

You are now ready to record passwords as described in [Recovering the root password for Brocade VDX switches](#) on page 36.

## Packets are dropped in hardware

This section discusses how to troubleshoot problems in which loss of packets occurs in all traffic, on specific traffic flows, in specific types of traffic, consistently, or intermittently. Dropped packets could occur for many reasons, including the following:

- High latency in an end device. Refer to [Verifying packets dropped because of high-latency end device](#) on page 42.
- Broken data path. Refer to [Verifying the data path](#) on page 45.
- Noise on an optical line caused by too many CRC errors, packet errors, or NIC interoperability errors. Refer to [Checking for noise on an optical line](#) on page 47.

### *Verifying packets dropped because of high-latency end device*

Packets can sometimes be dropped because of buffer overrun within the fabric caused by end devices taking longer to respond than expected. For example, an overloaded disk array can cause such latency, as can a host that does not process data as quickly as expected. Devices that stop receiving data for an extended period of time can cause excessive latency.

The ultimate solution to these problems is to fix the end device itself. However, some adjustments to the switch and fabric configuration can help to reduce the problem.

To detect and relieve congestion and dropped packets resulting from latency in end devices, complete the following steps:

1. Enter the **show lldp neighbors detail** command to check under "DCBX TLVs" that the end device is DCB-ready and confirm that the end device is also advertising its DCB capabilities.

```
switch# show lldp neighbors detail
Neighbors for Interface Te 66/0/55

```

6. Reconfigure QoS. Refer to the “Configuring QoS” section of the *Brocade Network OS Layer 2 Switching Configuration Guide* for detailed information.

## Verifying the data path

This procedure checks whether fabric continuity might be the reason for dropped packets.

### NOTE

The E1MG-SX-OM and E1MG-LX-OM modules are not supported by Network OS. Despite being Brocade products, these modules will return the error ‘Optic is not Brocade qualified, optical monitoring is not supported’ and must be replaced with a supported module.

1. Enter the **ping** command to test for a complete path to the end device

```
switch# ping dest-address 10.24.81.2
PING 10.24.81.2 (10.24.81.2): 56 octets data
64 octets from 10.24.81.2: icmp_seq=0 ttl=128 time=9.4 ms
64 octets from 10.24.81.2: icmp_seq=1 ttl=128 time=0.3 ms
64 octets from 10.24.81.2: icmp_seq=2 ttl=128 time=0.3 ms
64 octets from 10.24.81.2: icmp_seq=3 ttl=128 time=0.3 ms
64 octets from 10.24.81.2: icmp_seq=4 ttl=128 time=0.3 ms
--- 10.24.81.2 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.3/2.1/9.4 ms
```

2. Enter the **show interface** command to display whether packets are coming in or are dropped as errors. Specifically, examine the output fields shown underlined in the following example.

```
switch# show interface tengigabitethernet 66/0/60
TenGigabitEthernet 66/0/60 is up, line protocol is up (connected)
Hardware is Ethernet, address is 0005.3367.26d8
 Current address is 0005.3367.26d8
 Pluggable media present
 Interface index (ifindex) is 283874428169
 MTU 2500 bytes
 LineSpeed Actual : 10000 Mbit
 LineSpeed Configured : Auto, Duplex: Full
 Flowcontrol rx: off, tx: off
 Last clearing of show interface counters: 22:07:59
 Queueing strategy: fifo
 Receive Statistics:
 15254 packets, 1395269 bytes
 Unicasts: 10641, Multicasts: 2637, Broadcasts: 1976
 64-byte pkts: 10874, Over 64-byte pkts: 3294, Over 127-byte pkts: 117
 Over 255-byte pkts: 969, Over 511-byte pkts: 0, Over 1023-byte pkts: 0
 Over 1518-byte pkts(Jumbo): 0
 Runts: 0, Jabbers: 0, CRC: 0, Overruns: 0
 Errors: 0, Discards: 0
 Transmit Statistics:
 12633 packets, 1155963 bytes
 Unicasts: 18, Multicasts: 12615, Broadcasts: 0
 Underruns: 0
 Errors: 0, Discards: 0
 Rate info:
 Input 0.000128 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 0.000000 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Time since last interface status change: 1d00h40m
```

- Enter the **show media interface** command to check that the optics used are Brocade-certified. Verify the Vendor Name field, shown underlined in the following example, reads BROCADE. If the Vendor Name field shows anything other than BROCADE, replace the optics with Brocade-certified optics.

Check also the TX Power and RX Power fields to ensure they are not zero.

```
switch# show media interface tengigabitethernet 66/0/60
Interface TenGigabitEthernet 66/0/60
Identifier 13 QSFP
Connector 7 LC
Transceiver 0000000000000002 40_GB/s Long_dist
Name lw
Encoding 5 IEEE 802.3ab
Baud Rate 103 (units 100 megabaud)
Length 9u 10 (units km)
Length E-50u 0 (units 2 meters)
Length 50u 0 (units 1 meters)
Length 62.5u 0 (units 1 meters)
Length Cu 0 (units 1 meter)
Vendor Name BROCADE
Vendor OUI 00:05:1e
Vendor PN 57-1000263-01
Vendor Rev A
Wavelength 26020(units 0.05 nm)
Options 0001
BR Max 12
BR Min 216
Serial No LDF113390001CBS
Date Code 130928
Optical Monitor yes
Temperature 35 Centigrade
Voltage 3304.6 (mVolts)
Current 38.544 (mAmps)
TX Power N/A
RX Power 2.7 (uWatts)
```

- Enter the **show mac-address-table** command to verify that the MAC address table learns new values.

The new MAC address should appear here.

```
switch# show mac-address-table
VlanId Mac-address Type State Ports
1002 0efc.0042.7300 FPMA Active Te 66/0/55
1002 0efc.0042.7302 FPMA Active Te 66/0/55
1002 0efc.0042.7800 FPMA Active Te 66/0/60
Total MAC addresses : 3
```

- Enter the **show lldp neighbors** command to verify that LLDP reports all neighbors.

```
switch# show lldp neighbors
Local Intf Dead Interval Remaining Life Remote Intf Chassis ID Tx Rx
Te 66/0/55 120 101 port1 0005.1e78.f004 3000 2948
Te 66/0/60 120 117 port0 0005.1e55.16c8 2999 2945
```

If the output does not show all neighbors, contact your switch support provider.

- Enter the **show mac-address-table** command to verify the Ethernet Name Service functionality and to detect whether MAC addresses learned from other VCS Fabric switches are present.

Enter this command on other switches in the fabric to ensure that those switches can detect this MAC address.

```
switch# show mac-address-table
VlanId Mac-address Type State Ports
1002 0efc.0042.7300 FPMA Active Te 66/0/55
1002 0efc.0042.7302 FPMA Active Te 66/0/55
1002 0efc.0042.7800 FPMA Active Te 66/0/60
Total MAC addresses : 3
```

7. Enter the **l2tracert** command to validate the data-path fabric continuity.
  - Enter dynamically learned source MAC address and destination MAC address for the data path.
  - Among the extended commands, use IP, SIP, DIP, TCP, Src Port, and Dest Port commands.
  - Enter the IP command parameters to ensure that the traceroute packet traverses a specific ECMP link.

For details on using the **l2tracert** command, refer to [Using Layer 2 traceroute](#) on page 56.

## Checking for noise on an optical line

Excessive noise on an optical line can result in dropped packets because of excessive CRC errors, NIC interoperability errors, or other conditions.

1. Enter the **show interface** command and check the output for CRC errors or TX discards; examine the fields shown underlined in the following example.

```
switch# show interface tengigabitethernet 66/0/55
TenGigabitEthernet 66/0/55 is up, line protocol is up (connected)
Hardware is Ethernet, address is 0005.3367.26d3
 Current address is 0005.3367.26d3
Pluggable media present
Interface index (ifindex) is 283874100484
MTU 2500 bytes
LineSpeed Actual : 10000 Mbit
LineSpeed Configured : Auto, Duplex: Full
Flowcontrol rx: off, tx: off
Last clearing of show interface counters: 21:51:35
Queueing strategy: fifo
Receive Statistics:
 15433457505 packets, 32164575799774 bytes
 Unicasts: 15433454934, Multicasts: 2571, Broadcasts: 0
 64-byte pkts: 11357, Over 64-byte pkts: 242664576, Over 127-byte pkts: 0
 Over 255-byte pkts: 0, Over 511-byte pkts: 0, Over 1023-byte pkts: 0
 Over 1518-byte pkts(Jumbo): 15190781568
 Runts: 0, Jabbers: 0, CRC: 0, Overruns: 0
 Errors: 0, Discards: 0
Transmit Statistics:
 21456965161 packets, 32549136821934 bytes
 Unicasts: 15313174675, Multicasts: 6143790486, Broadcasts: 0
 Underruns: 0
 Errors: 0, Discards: 0
Rate info:
 Input 3345.136864 Mbits/sec, 200572 packets/sec, 33.45% of line-rate
 Output 3386.493904 Mbits/sec, 281345 packets/sec, 33.86% of line-rate
Time since last interface status change: 1d00h24m
```

2. If errors are reported in the previous step, check the SFP transceiver and cable on the local switch and on the peer switch at the other end of the cable.
  - a) Enter the **show media interface** command on each switch and check the Vendor Name field to check that the optics are Brocade-certified. If the Vendor Name field shows anything other than BROCADE, replace the optics with Brocade-certified optics.  
  
Replace any non-Brocade SFP transceiver.
  - b) Try replacing the SFP transceiver.
  - c) Try replacing the cable.

## Ping fails

If pings do not successfully traverse the switch, try the following operations.

1. Trace the packet flow and check whether ARP or ICMP packets are getting dropped.
2. Trace which direction is failing by using interface statistics.
3. Locate the device that is dropping the packets.
4. Look for any error counters incrementing on that device.
5. Check the MAC address table to determine whether the MAC addresses are learned on the correct port or port-channel.

## QoS configuration causes tail drops

Tail-drop queueing is the most basic form of congestion control. Normal operation is first-in, first-out (FIFO) until all buffers are exhausted. After that, new frames are dropped.

For the Brocade VDX 6740 series and the Brocade VDX 6940 series, you can check for ingress tail-drop at run time by issuing the **show qos rcv-queue interface <port>** command. You can check for egress tail-drops by running the **show qos tx-queue interface <port>** command. You can configure rcv-queue and tx-queue globally per rbridge level by using the **qos rcv-queue limit** and **qos tx-queue limit** commands. For more information, refer to the *Network OS Command Reference*. You can adjust these two global qos buffer values to the same egress port and source of congestion.

## QoS is not marking or treating packets correctly

Use the Switched Port Analyzer (SPAN) feature to mirror the ingress and egress ports to check that QoS is marking and treating packets correctly. Refer to the “Configuring Switched Port Analyzer” section of the *Brocade Network OS Layer 2 Switching Configuration Guide* for details.

If the traffic is not marked properly, check whether the ingress/egress traffic on the port is applied with port-based QoS configuration or flow-based QoS configuration. In flow-based QoS, check if the traffic is applied with RBridge-level flow-based QoS or port-level flow-based QoS. Port-level flow-based QoS takes precedence over system-level or RBridge-level flow-based QoS.

## RBridge ID is duplicated

Switches with the same RBridge ID cannot coexist in the same VCS Fabric. Any attempt to add a switch with the same RBridge ID as an existing cluster switch will fail. The ISL between the two switches will not be formed; it will be segmented.

### NOTE

To view RBridge overlap, enter the **show fabric islports** or **show logging raslog** commands.

1. On any switch in the functioning VCS Fabric, enter the **show vcs** command to display the RBridge IDs for all the switches in the Fabric.

```
device# show vcs

device Mode : Distributed
VCS Mode : Logical Chassis
VCS ID : 10
VCS GUID : 6990c885-efa2-4b27-bb46-669d2d4d79f1
Total Number of Nodes : 3
Rbridge-Id WWN Management IP VCS Status Fabric Status HostName

2 10:00:00:05:33:E6:BD:00 10.24.84.203 Online Online sw0
3 >10:00:00:05:33:65:63:64* 10.24.83.99 Maintenance Online sw0
4 10:00:00:27:F8:86:C2:45 10.24.83.97 Offline Unknown sw0
```

2. On the new switch, enter the **show vcs** command to determine its RBridge ID.

```
newswitch# show vcs
Config Mode : Local-Only
VCS ID : 1
Total Number of Nodes : 1
Rbridge-Id WWN Management IP Status HostName

2 >10:00:00:05:33:13:B3:5A* 10.24.84.41 Online switch1
```

3. If the new switch has the same RBridge ID as any switch in the existing cluster, on the new switch, in privileged EXEC mode, enter the **vcs rbridge-id** command to change its RBridge ID to a unique value.

```
newswitch# vcs rbridge-id 23
```

## SNMP MIBs report incorrect values

If SNMP MIBs report incorrect values, complete the following steps.

1. Ensure you are using a supported MIB browser.
2. Ensure that the issue is seen consistently.
3. Ensure that the SNMP configuration is correct.
4. If the MIB browser is supported, the SNMP configuration is correct, and you still see the issue consistently, contact your switch support provider.

## SNMP traps are missing

If SNMP traps are missing, complete the following procedure.

1. Ensure that the correct SNMP configuration is enabled. Refer to the "Configuring SNMP" section of the *Brocade Network OS Administration Guide* for details.
2. Ensure that the SNMP host is reachable.

3. If the problem still persists, contact your switch support provider.

As a workaround, set a trap configuration for syslog messages.

## Telnet operation into the switch fails

Assuming a correct IP address and correct login credentials, failure to access the switch using Telnet could be for one of the following reasons:

- The management port is down. Refer to [Verifying the status of the management port](#) on page 50 for details.
- Access to the management interface is denied by an ACL. Refer to [Checking for a deny ACL](#) on page 50 for details.
- The switch CPU is overloaded. Refer to [Checking for overloaded CPU](#) on page 50 for details.

### Verifying the status of the management port

1. On the system console, enter the **show system** command to check the status of the management port, shown underlined in the following example.

```
switch# show system
Stack MAC : 00:05:33:67:26:78
 -- UNIT 0 --
Unit Name : switch
Switch Status : Online
Hardware Rev : 107.4
TengigabitEthernet Port(s) : 60
Up Time : up 1 day, 2:52
Current Time : 23:40:50 GMT
NOS Version :
Jumbo Capable : yes
Burned In MAC : 00:05:33:67:26:78
Management IP : 10.24.81.66
Management Port Status : UP
 -- Power Supplies --
PS1 is faulty
PS2 is OK
 -- Fan Status --
Fan 1 is Ok
Fan 2 is Ok
Fan 3 is Ok
```

2. If the status of the management port is DOWN, enter the **interface management** command to configure the management port correctly. Refer to the “Configuring Ethernet management interfaces” section of the *Brocade Network OS Administration Guide*.
3. If the problem persists, contact your switch support provider.

### Checking for a deny ACL

On the system console, enter the **show running-config ip access-list** command and check the output to determine whether an ACL is denying access to the management port.

### Checking for overloaded CPU

An overloaded switch CPU can prevent Telnet access. Refer to [CPU use is unexpectedly high](#) on page 26.

## Traffic is not being forwarded

If the traffic is not being forwarded, perform the following steps:

1. Check for db packet capture. Below are the commands to enable and view a capture.

```
db 8/0/1 rte enable capture all
db 8/0/1 rte start capture
db 8/0/1 rte show capture
```

After the **start capture** command, the system sends a stream and performs **show capture**. This displays most of the capture information:

- a) It shows all the fields resolved — whether it is trap, drop, or fwd.
- b) It shows the packet itself.
- c) It shows the Routing Engine (RTE) Layer 2 history, as in the result of the Layer 2 table hit or miss.
- d) It shows the RTE Layer 3 history, as in the result of the Layer 3 table hit or miss. If Layer 2 table has a success and Layer 3 table failed, then check for routing issues.

For example, in the entry for trap (Ping to box), the Routed fields should display `Ipv4Rtd` and the entries hit. For a TRAP hit, it should display `trape:1` (Bit set to 1 to indicate packet is trapped).

- e) Packet Capture displays the last four packets, Make sure those are the fwd packets (for example, check for SA DA MAC, pkttyp:0806).

```
db 8/0/1 rte enable capture all
db 8/0/1 rte start capture
db 8/0/1 rte show capture
```

- f) If the FWD and packets are not being forwarded, then it is an ASIC problem. If it is a DROP, proceed to the next step.
2. If result is DROP:
    - a) Execute the **show ip route** command. If the route is not present, then it is an RTM issue.
    - b) Execute the **show arp command**. If ARP is not resolved for the corresponding next hop, then it is an ARP issue. If it is VLAN along with ARP, MAC should be resolved. If MAC is not resolved then it is an L2SYS issue.
    - c) If step **2b** passes, enter the **debug show ip lpm** command to display the routes in hardware, and verify that the corresponding destination ARP address is present. If it is not present, then it is an L3FWD issue. Collect the information from **debug show ip lpm**, attach the file `/tmp/fib_wlv_ioctl`, along with supportSave data and contact support. Specify that it failed in this step.

Refer also to [Gathering troubleshooting information](#) on page 11, which provides information about Network OS supportSave files.

- d) If step **2c** passes and traffic is still dropping, then it is an ASIC issue.

### NOTE

For additional information about packet capture, refer to [Using the packet capture utility](#) on page 65.

## Trunk member not used

If you suspect that one or more members of a trunk are not being used, complete the following steps.

**NOTE**

The E1MG-SX-OM and E1MG-LX-OM modules are not supported by Network OS. Despite being Brocade products, these modules will return the error 'Optic is not Brocade qualified, optical monitoring is not supported' and must be replaced with a supported module.

1. Enter the **show running-config interface** command to determine which interfaces have trunking enabled.

```
switch# show running-config interface
interface Management 66/0
 no ip address dhcp
 ip address 10.24.81.66/20
 ip route 0.0.0.0/0 10.24.80.1
 ipv6 address ""
 no ipv6 address autoconfig
!
interface TenGigabitEthernet 66/0/1
 fabric isl enable
 fabric trunk enable
 no shutdown
!
interface TenGigabitEthernet 66/0/2
 fabric isl enable
 fabric trunk enable
 no shutdown
!
interface TenGigabitEthernet 66/0/3
 fabric isl enable
 fabric trunk enable
 no shutdown
!
 (output truncated)
```

2. Verify the status of the ISL port and link.
  - a) Enter the **show fabric isl** command to verify whether the ISL is up.
  - b) Enter the **show fabric islports** command to examine the status of each port.

Refer to [Verifying the status of ISLs](#) on page 32 for details and corrective action.

- Enter the **show interface** command for each trunk link and examine the rate information to check for an equal distribution of traffic on the interfaces in the trunk. The rate information is shown underlined in the following example.

```
switch# show interface tengigabitethernet 66/0/12
TenGigabitEthernet 66/0/12 is up, line protocol is down (link protocol down)
Hardware is Ethernet, address is 0005.3367.26a8
 Current address is 0005.3367.26a8
 Pluggable media not present
 Interface index (ifindex) is 283871281409
 MTU 2500 bytes
 LineSpeed Actual : Nil
 LineSpeed Configured : Auto, Duplex: Full
 Flowcontrol rx: off, tx: off
 Last clearing of show interface counters: 1d00h42m
 Queueing strategy: fifo
 Receive Statistics:
 0 packets, 0 bytes
 Unicasts: 0, Multicasts: 0, Broadcasts: 0
 64-byte pkts: 0, Over 64-byte pkts: 0, Over 127-byte pkts: 0
 Over 255-byte pkts: 0, Over 511-byte pkts: 0, Over 1023-byte pkts: 0
 Over 1518-byte pkts(Jumbo): 0
 Runts: 0, Jabbers: 0, CRC: 0, Overruns: 0
 Errors: 0, Discards: 0
 Transmit Statistics:
 0 packets, 0 bytes
 Unicasts: 0, Multicasts: 0, Broadcasts: 0
 Underruns: 0
 Errors: 0, Discards: 0
 Rate info:
 Input 0.000000 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Output 0.000000 Mbits/sec, 0 packets/sec, 0.00% of line-rate
 Time since last interface status change: 1d03h16m
```

- Having found a trunk member that carries no traffic while the other trunk members are busy, from the same **show interface** command output, check the interface status, configuration, and error statistics.
  - If the interface is disabled, enable it with the **no shutdown** command.
  - If misconfiguration is apparent, refer to [Trunk member not used](#) for information on how to configure fabric trunks.
  - If you notice significant errors in the error statistics counters, depending on the error, check the SFP transceiver and cable on the local switch and on the peer switch at the other end of the cable.
    - Enter the **show media interface** command on each switch and check the Vendor Name field to check that the optics are Brocade-certified. If the Vendor Name field shows anything other than BROCADE, replace the optics with Brocade-certified optics.
    - Replace any non-Brocade SFP transceiver.
    - Try replacing the SFP transceiver.
    - Try replacing the cable.

## Upgrade fails

If a failure occurs during firmware upgrade, complete the following steps.

- Revert to the previous firmware version.
- Contact your switch support provider to evaluate whether retrying the upgrade is appropriate.

## VCS Fabric cannot be formed

A VCS Fabric can fail to form for several reasons.

The VCS Fabric configuration is incorrect. The following configuration issues will prevent the VCS Fabric from forming:

- The VCS ID on the constituent switches is not the same.
- Multiple switches have the same RBridge ID.
- ISL ports that connect the switches are not up.

### *Verifying the VCS Fabric configuration*

To verify the VCS Fabric configuration, complete the following steps.

1. Enter the **show vcs** command on each switch to verify that the VCS ID on all switches is the same and the RBridge ID on each switch is different.
2. Enter the **show fabric isl** command to verify whether the ISL is up.  
If ISL is down, refer to [ISL does not come up on some ports](#) on page 31.
3. Enter the **show fabric islports** command to examine the status of each port.

## vLAG cannot be formed

A vLAG trunk can fail to form for several reasons:

- The link between the VCS Fabric switches does not exist. Refer to [Verifying the link between the VCS Fabric switches](#) on page 54.
- A bad connection causes abnormal reception or transmission of LACPDUs. Refer to [Verifying LACPDUs](#) on page 55.
- Port-channel numbers are not the same on the VCS Fabric switches. Refer to [Verifying the vLAG configuration](#) on page 55.
- The peer switches are not configured in the same LACP mode (static or dynamic). Refer to [Verifying the LACP mode of each switch](#) on page 55.
- A 1-Gbps port-channel has been upgraded to Network OS 2.1.x or later. Refer to [Explicitly setting the speed for a 1-Gbps port-channel](#) on page 55.

### *Verifying the link between the VCS Fabric switches*

The link between switches could be broken for various reasons:

- A port is not activated.
- The ISL is segmented.
- The VCS Fabric is not properly formed.
- The CPU is overload.

Refer to [ISL does not come up on some ports](#) on page 31 for details on detecting and correcting the problem.

## Verifying LACPDUs

LACPDUs should be transmitted and received on both ends of the vLAG. This procedure verifies whether that is happening, and also checks for PDU errors.

1. On both switches, enter the **show lacp counter** command to verify that LACPDUs are transmitted and received, and there are no error PDUs.

```
switch# show lacp counter 10
% Traffic statistics
Port LACPDU Marker Pckt err
 Sent Recv Sent Recv Sent Recv
% Aggregator Po 10 1000000
Te 0/1 65 0 0 0 0 0
Te 0/2 64 0 0 0 0 0
Te 0/3 64 0 0 0 0 0
Te 0/4 0 0 0 0 0 0
```

In this case, LACPDUs are being transmitted by the switch, but none are being received.

2. If the output shows that LACPDUs are not being transmitted and received correctly, or packet errors are showing, contact your switch support provider.

## Verifying the vLAG configuration

The port-channel number must be the same across all vLAG member switches, or the vLAG will not form.

1. On each vLAG member switch, in privileged EXEC mode, enter the **show port-channel summary** command.

```
switch# show port-channel summary
Static Aggregator: Po 15
Aggregator type: Standard
Member ports:
Te 0/6
Te 0/7
Te 0/14
Te 0/15
...
switch2# show port-channel summary
switch2#
```

2. If the port-channel does not appear on both switches, on the switch where it does not appear, in global configuration mode, enter the **interface port-channel** command to create the port-channel.

```
switch2(config)# interface port-channel 15
```

Refer to the “Configuring Link Aggregation” chapter of the *Brocade Network OS Layer 2 Switching Configuration Guide* for details.

## Verifying the LACP mode of each switch

A vLAG must be configured either statically on both ends of the vLAG, or dynamically on both ends of the vLAG. Refer to “Configuring Link Aggregation” chapter of the *Brocade Network OS Layer 2 Switching Configuration Guide* for details.

## Explicitly setting the speed for a 1-Gbps port-channel

To set the port speed to 1 Gbps, complete the following steps.

1. In interface configuration mode, shut down the port-channel.

```
switch(config-Port-channel-2)# shutdown
```

2. Set the port-channel speed to 1 Gbps.

```
switch(config-Port-channel-2)# speed 1000
```

3. Re-enable all port members in the port-channel.

```
switch(config-Port-channel-2)# no shutdown
```

## Zoning conflict needs resolution

In case a zoning conflict is encountered, you must make sure that the zoning configuration is consistent on the fabrics. Zone conflicts can be analyzed by running the **show running-config zoning** command on the fabrics and examining the information in the outputs.

After examining the outputs, you can choose to resolve zone conflicts by using the **zoning enabled-configuration cfg-action cfg-disable** command, followed by the **zoning enabled-configuration cfg-action cfg-clear** command, on the incorrectly configured segmented fabric. Then enter the **zoning enabled-configuration cfg-action cfg-save** command, followed by the **shut** and **no shut** commands, on one of the ISL ports that connects the fabrics. This causes a merge, making the fabric consistent with the correct configuration.

### ATTENTION

Be careful when using the **zoning enabled-configuration cfg-action cfg-clear** command, because it deletes the defined configuration.

If you start a zone transaction from CLI-Session1 and then try to perform a zone modification from CLI-Session2, the CLI-Session2 zone transaction is not allowed, as CLI-Session2 is not the owner of the open transaction. If CLI-Session1 logs out, this ends the open transaction and aborts any current zone modifications. CLI-Session2 is then able to perform zone modifications. Therefore, the zone transaction locking mechanism works on a single switch from the CLI perspective and there is no dangling transaction.

## Using troubleshooting and diagnostic tools

This section describes the various troubleshooting and diagnostic tools available with Network OS and provides some guidelines for their use .

Refer also to [Gathering troubleshooting information](#) on page 11, which provides information about Network OS supportSave files.

## Using Layer 2 traceroute

TRILL OAM provides the **l2traceroute** command to verify the fabric path continuity. When the **l2traceroute** command is used with extended options, it provides granular control over the Layer 2 path that a Layer 2 traceroute packet takes.

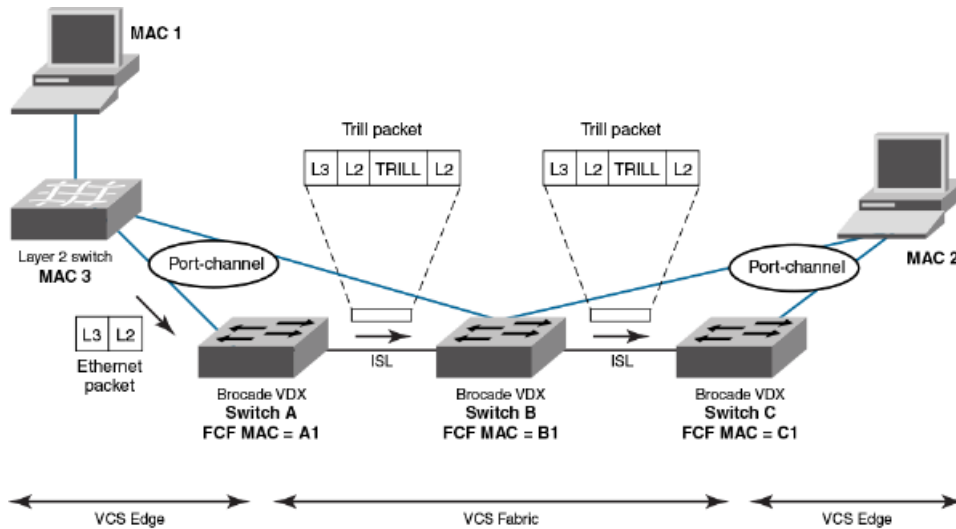

### *Layer 2 traceroute packets*

To use the Layer 2 traceroute tool, you need to understand the structure of the Layer 2 traceroute packet when observed on the wire, when it is a request frame, and when it is a response frame.

The figure below shows what a normal Layer 2 packet looks like when traversing through an Ethernet fabric, without Layer 2 traceroute applied.

FIGURE 1 Normal Layer 2 packet traversing a VCS fabric

In the figure above, an Ethernet packet arrives from MAC 1 at the VCS fabric edge. TRILL header information is added while the packet passes through the VCS fabric. The TRILL information is removed on leaving the VCS fabric, and a regular Ethernet packet arrives at MAC 2. The table below shows the Layer 2 packet header details.

TABLE 5 Packet header details — Layer 2 packet traverses VCS fabric

| Ethernet packet                | TRILL packet — first hop                                                                                                                                                                                                                                   | TRILL packet — second hop                                                                                                                                                                                                                                  |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L2 DA = MAC 2<br>L2 SA = MAC 1 | Outer L2 DA = B1<br>Outer L2 SA = A1<br>Outer 802.1q tag<br>Outer etype = TRILL<br>TRILL destination RBridge ID = C<br>TRILL source RBridge ID = A<br>TRILL flags<br>Inner L2 DA = MAC 2<br>Inner L2 SA = MAC 1<br>Inner 802.1q tag<br>Inner etype = 0x800 | Outer L2 DA = C1<br>Outer L2 SA = B1<br>Outer 802.1q tag<br>Outer etype = TRILL<br>TRILL destination RBridge ID = C<br>TRILL source RBridge ID = B<br>TRILL flags<br>Inner L2 DA = MAC 2<br>Inner L2 SA = MAC 1<br>Inner 802.1q tag<br>Inner etype = 0x800 |

When viewing packets while using the **l2tracert** command, notice the TRILL OAM header information added to the packets as they traverse the VCS Fabric. Starting the trace on Switch A, TRILL OAM first verifies path continuity with its immediate neighbor, in this case Switch B. It does this as shown in the figure below, by sending a Layer 2 traceroute request packet with the time-to-live (TTL) TRILL attribute set to 1. Switch B replies with reachability information regarding the next hop.

FIGURE 2 Verifying path continuity with immediate neighbor

The table below shows the packet header information for the request and response. The added TRILL OAM information is shown in bold.

TABLE 6 Packet header details with Layer 2 traceroute – first hop

| Traceroute request packet header                                                                                                                                                                                                                                                                         | Traceroute reply packet header                                                                                                                                                                                                                                                                                                    |

Having successfully exchanged packets with the immediate neighbor (Switch B) and established the reachability of Switch C, the Layer 2 traceroute feature issues another request with TTL set to 2. Switch B decrements the TTL count and forwards the packet to Switch C, which returns a response to Switch A. Refer to the figure below.

FIGURE 3 Verifying path continuity— second hop TTL count

The table below shows the packet header information for the request and response packets. Information specific to the Layer 2 traceroute feature is show in **bold**.

TABLE 7 Packet header details with Layer 2 traceroute – second hop

| Traceroute request – first hop (TTL = 2)                                                                                                                                                                                                                             | Traceroute request – second hop (TTL = 1)                                                                                                                                                                                                                            | Traceroute reply                                                                                                                                                                                                                                                                |

## Tracing a route with the `l2tracert` command

In the following example, the `l2tracert` command verifies the path between port 3/0/1 (source MAC address 0050.5685.0003) and port 2/0/9 (destination MAC address 0024.3878.3720).

1. enter the `show mac-address-table` command to display all known MAC addresses in the network.

```
device# show mac-address-table

VlanId Mac-address Type State Ports
----- -
100 0024.3878.e720 Dynamic Active Po 11
100 0050.5685.0001 Dynamic Active Po 1
101 0000.0000.0003 Dynamic Active Po 1
101 0024.3878.e720 Dynamic Active Po 11
101 0050.5685.0003 Dynamic Active Po 1
Total MAC addresses : 5
```

From the output, choose the source and destination MAC address:

- Source MAC address: 0050.5685.0003
- Destination MAC address: 0024.3878.e720

2. Enter the `l2tracert` command.

```
device# l2tracert
Source mac address : 0050.5685.0003
Destination mac address : 0024.3878.e720
Vlan [1-3962] : 101
Edge rbridge-id [1-239] : 3
Extended commands [Y/N]? : y
Protocol Type [IP] : IP
Source IP address : 101.101.101.10
Destination IP address : 101.101.101.101
IP Protocol Type [TCP/UDP] : TCP
Source port number [0-65535] : 3000
Dest port number [0-65535] : 22
Rbridge Ingress Egress Rtt (usec)
----- -
3 Te 3/0/1(std-lag, Po 1) Te 3/0/20(isl) 0
2 Te 2/0/20(isl) Te 2/0/9(std-lag, Po 11) 34041
```

Be advised of the following points:

- The MAC addresses used should be present in the MAC address-table (dynamic or static).
- Make use of IP parameters to influence path selection.

## Using show commands

The table below lists some `show` commands that are often used for troubleshooting. Refer to the *Brocade Network OS Command Reference* for details of all `show` commands.

**TABLE 8** show commands used for troubleshooting

| Command group   | Commands                                                                                                  | Specific fields or purpose |
|-----------------|-----------------------------------------------------------------------------------------------------------|----------------------------|

## Using debug and system diagnostic commands

Diagnostic commands, such as "debug" and "show system internal" commands, are developed and intended for specialized troubleshooting. Brocade recommends that you work closely with Brocade technical support in executing such commands and interpreting their results.

### General overview

You can perform the following operations related to debugging features:

- To enable debugging on a feature, use the **debug** command in privileged EXEC mode.

```
device# debug feature required-keywords
```

- To check whether debugging is enabled on a feature, use the **show debug** command in privileged EXEC mode.

```
device# show debug feature
```

- To disable debugging, use the **no debug** command.

```
device# no debug feature required-keywords
```

Use caution when debugging in real time on a production switch, because real-time debugging is CPU-intensive.

Brocade recommends checking the command output on a lab switch first, and then if the output looks acceptable, enable it on the production switch to get more data. In addition, to reduce CPU load, Brocade recommends using keywords such as **events** and **summary** that limit the extent of debugging rather than more comprehensive options such as **detail** and **all**.

Debugging operations are used mainly for debugging control plane protocols such as LACP and LLDP. For example, to view received LLDP packets on the console, use the following command:

```
device# debug lldp packets all rx
```

If the switch is accessed through Telnet, enable logging using a terminal monitor.

The following are the most frequently used debug commands:

- **debug lldp packets interface [ rx | tx | both ]**
- **debug lacp pdu [ rx | tx ]**
- **debug spanning-tree bpdu [ rx | tx ]**
- **debug dot1x packet**

### Enhanced debugging

In addition, you can use a variety of commands to debug the status of various hardware components and processes, such as the following:

- Buffer-pool queue (BPQ) drops on ingress ports, with mapping of BPQs to particular protocol functions
- ASIC counters for a variety of internal functions (not limited to MAC addresses)
- Packet drops with granularity (Packet-drops as summations of multiple events do not indicate true causes.)

These commands are also supported by supportSave. The results are collected at least three times back-to-back for offline analysis.

The following table lists some of the commands that report counter status for ASICs and software components. For **show interface stats cpu** and additional **show system internal** commands, refer to the *Brocade Network OS Command Reference*.

| Command                                                    | Description                                                                      |
|------------------------------------------------------------|----------------------------------------------------------------------------------|
| <code>show system internal ASIC counter blk</code>         | Displays packet-count for block-level packet transfer between ASIC blocks.       |
| <code>show system internal ASIC counter interface</code>   | Displays nonzero MAC counters for a specified Ethernet interface.                |
| <code>show system internal ASIC counter mem blk</code>     | Displays memory-error count for block-level packet transfer between ASIC blocks. |
| <code>show system internal ASIC counter drop-reason</code> | Displays the count of dropped packets, sorted by with drop reasons.              |

## Using SPAN port and traffic mirroring

In certain instances, you may need to examine packets in transit across links to understand the traffic pattern on a specific port. In such situations, Switched Port Analyzer (SPAN) can be configured to copy the traffic (with the desired direction) on the specific Ethernet port to a mirror port where a sniffing device is connected. You can then analyze the packets captured by the sniffing device.

```
device(config)# monitor session 1
device(conf-mon-sess-1)# source tengigabitethernet 1/0/10 destination tengigabitethernet 2/3/15 direction
both

device# show monitor 1
Session :1
Description :Test SPAN Session
State :Enabled
Source interface : 1/0/10 (Up)
Destination interface : 1/0/15 (Up)
Direction :Both
```

Note the following guidelines:

- The source port cannot be an ISL port.
- The destination port cannot be an ISL, Layer 2, Layer 3, QoS, ACL, 802.1x, LAG member, LLDP, or port-profile port.
- Only edge ports are eligible for mirroring.

## Using hardware diagnostics

The following diagnostic types currently exist:

- Power-on self-test (POST)
- Offline diagnostics

Online diagnostics are not currently supported on Brocade VDX switches.

### Using POST diagnostics

POST is run on bootup and the results are stored. Use the `show diag post results` command to view the stored results.

To enable POST diagnostics, enter the `diag post rbridge-id rbridge-id enable` command. POST diagnostics are enabled by default.

### Using offline diagnostics

Before proceeding, note the following Caution:

**CAUTION**

Offline diagnostics — otherwise known as system verification tests — are disruptive tests that check the individual hardware components thoroughly and report the findings. You must disable the chassis before running these tests. Do not run production traffic during this time.

Enter the **diag systemverification** command to run the entire set of offline diagnostics. This command can take up to two hours to finish, so Brocade recommends the less disruptive **diag systemverification short** command, which typically takes 10 to 15 minutes. Alternatively, you can run subsets of the offline commands that check various parts of the hardware. The table below shows the complete list of supported offline commands.

**TABLE 9** Offline diagnostic commands

| Offline diagnostic command     | Purpose                                                                                  |
|--------------------------------|------------------------------------------------------------------------------------------|
| <b>diag burninerrclear</b>     | Clears the errors that are stored in the nonvolatile storage during the burn-in process. |
| <b>diag clearerror</b>         | Clears the diagnostics failure status.                                                   |
| <b>diag portledtest</b>        | Runs various action modes on the port LEDs and validates the functionality.              |
| <b>diag portloopbacktest</b>   | Sends frames between various ASICs on the switch and validates the ASIC functionality.   |
| <b>diag setcycle</b>           | Configures all the parameters required for the system verification test.                 |
| <b>diag systemverification</b> | Runs a combination of various hardware diagnostic tests.                                 |
| <b>diag turboramtest</b>       | Performs a turbo static RAM (SRAM) test of the ASIC chips.                               |

The table below lists the show commands that provide output from offline diagnostics.

**TABLE 10** Offline diagnostic show commands

| Show offline diagnostic command | Purpose                                                                        |
|---------------------------------|--------------------------------------------------------------------------------|
| <b>show diag burninerrshow</b>  | Displays the errors that are stored in the nonvolatile storage during burn-in. |
| <b>show diag burninstatus</b>   | Displays the diagnostics burn-in status.                                       |
| <b>show diag setcycle</b>       | Displays the current values used in system verification.                       |
| <b>show diag status</b>         | Displays the currently running diagnostics tests.                              |

For details of the commands listed in these tables, refer to the *Brocade Network OS Command Reference*.

## Viewing routing information

The **show fabric route pathinfo** command displays routing and statistical information from a source port index on the local switch to a destination port index on another switch in the same VCS Fabric cluster, a different VCS Fabric cluster, a connected Fabric OS backbone fabric, or Fabric OS edge fabric. This routing information describes the full path that a data stream travels between these ports, including all intermediate switches.

The routing and statistics information are provided by every switch along the path, based on the current routing table information and statistics calculated continuously in real time. Each switch represents one hop.

Use the **show fabric route pathinfo** command to display routing information from a source port on the local switch to a destination port on another switch. The command output describes the exact data path between these ports, including all intermediate switches.

To use the **show fabric route pathinfo** command across remote fabrics, you must specify both the VCS ID (or Fabric ID) and the RBridge ID (or domain ID) of the remote switch. When obtaining path information across remote fabrics, the destination switch must be identified by its RBridge ID or domain ID. Identifying the switch by name or WWN is not accepted.

For details about the **show fabric route pathinfo** command, refer to the *Brocade Network OS Command Reference*.

## Using the packet capture utility

When a packet is received at a switch's source port, it is routed through the switch to the destination port. If a problem occurs, SPAN or sFlow are commonly used. However, SPAN requires a network analyzer, and sFlow requires a collector.

The Network OS packet capture utility is a built-in sniffing mechanism that uses the pcap API to capture packets destined to the CPU. The results can then be displayed by means of a show command or exported as a .pcap file for offline analysis by means of a tool such as Wireshark. Packets from multiple interfaces can be captured simultaneously, and the capture is rate-limited to prevent overloading the CPU.

There are two ways to view the results of packet capture:

- By using the appropriate debug and show commands on the target switch.
- By viewing the results in an automatically generated file.

The following table lists packet capture commands for both IPv4 and IPv6.

**TABLE 11** Packet capture commands

| Command                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>capture packet interface</b>      | <p>Captures IPv4 packets destined toward the CPU, as well as transit packets if a trap is enabled by means of ACL logging.</p> <p><b>NOTE</b><br/>This command can provide significant help in debugging, especially for Layer 2 TRILL and Layer 3 packets. Up to 100 packets per interface can be captured. Once the buffer is filled, the oldest packets are replaced with the most recent. Captured packets are stored in a circular buffer, and they are also written to an automatically generated <code>pktcapture.pcap</code> file, which can store up to 1500 KB of data in flash memory (the equivalent of approximately 10 KB packets, each having an average size of 100 bytes). Once this file is full, it is saved as <code>*_old.pcap</code> and data are written to a new <code>pktcapture.pcap</code> file.</p> |
| <b>debug ipv6 packet</b>             | <p>Enables IPv6 packet capture on an interface or all interfaces.</p> <p><b>NOTE</b><br/>The packets are stored in either circular or linear buffers, with up to 20-56 packets stored per switch. Once the .pcap file is full, the file-rotation technique is used to manage incoming data by wrapping it in a circular buffer. Up to 1500 KB of data can be stored in flash memory. This represents 11180 of packets having an average size of 130 bytes. This feature is also supported on virtual Ethernet interfaces.</p>                                                                                                                                                                                                                                                                                                   |
| <b>debug ipv6 icmpv6</b>             | Enables the capture of IPv6 packets related to Internet Control Message Protocol (ICMP) version 6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>show capture packet interface</b> | Displays information about captured IPv4 packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>show debug ipv6 packet</b>        | Displays IPv6 packets captured through the packet capture utility on an interface or all interfaces, as well as the packet capture configuration on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

For command details, refer to the *Brocade Network OS Command Reference*.

Note the following limitations:

- Support is provided only on physical interfaces (gigabit Ethernet), not on logical interfaces. To capture packets on logical interfaces, first enable the capture on the corresponding physical interfaces.

- Support for capturing transit traffic requires ACL logging.
- Packets that are dropped in the ASIC cannot be captured.

#### CAUTION

Capturing packets over multiple sessions and over long durations can affect system performance.

## Tracing the data path with a script

The `ipfabric-ingressNode-debugv2.py` script enables you to trace the data path through the IP Fabric network and thoroughly check the integrity of the “route-programming” in VDX devices along the data path.

The `ipfabric-ingressNode-debugv2.py` script makes debugging easier by providing a single command to trigger investigation of the data-path. The script scans the Ingress, Spine, and Egress nodes.

#### NOTE

The `ipfabric-ingressNode-debugv2.py` script functions under Network OS version 7.0.1a or later only. The `ipfabric-ingressNode-debugv2.py` script supports a traditional leaf-spine IP-Fabric topology only.

The `ipfabric-ingressNode-debugv2.py` script systematically runs through debugging steps and verifies vital data. However, it is not a replacement for the **copy-support** command.

The script involves the following debugging elements:

- Validating underlay Layer 3 infrastructure for Leaf and Spine
- BGP peering between leaf and spine for EVPN advertisements of MAC and ARP
- BGP operational state and contents (EVPN & VRF)
- Overlay tunnels between the Leaf Nodes (VLAN to VNI mapping)
- Control plane packet tracing
- Programming of the routes in the VDX platform ASICs
- VCS LAG Partner

For a given traffic flow, the script checks various software and hardware layers on the Ingress Leaf Node, and considers the following flow cases of packet tracing:

- Layer 2 Forwarding
- Asymmetric Routing
- Local Peering
- Symmetric Routing

For Layer 3 routed traffic flow, the MAC DA in the input should be populated with the appropriate Router MAC (such as VE MAC, Anycast MAC, or VRRP vMAC).

If the script encounters any suspicious discrepancies, it displays an “Alert” message, but does not take recovery actions.

The `ipfabric-ingressNode-debugv2.py` script is built to be run on Leaf Nodes of the IP fabric that may be running on the Brocade VDX 6740 and Brocade VDX 6940.

The `ipfabric-ingressNode-debugv2.py` script only supports IPv4 and accepts a layer-2 port as an ingress interface. It does not support the flow through the ingress routed port on the leaf.

The `ipfabric-ingressNode-debugv2.py` script is executed using the **execute-script** command in privileged EXEC mode. Refer to the *Brocade Network OS Command Reference* for complete details about the **execute-script** command.

The following example displays a typical data trace output for this script.

```

device# execute-script ipfabric-ingressNode-debugv2.py 50eb.1a81.0857 0067.6866.0010 72.1.77.2/24
62.1.66.2/24 6201

INPUT PARAMETERS:
=====

DA = 50eb.1a81.0857 , SA = 0067.6866.0010 , DIP = 72.1.77.2 , SIP = 62.1.66.2 , Ingress Vlan = 6201

DERIVING & VERIFYING FROM INPUT PARAMETERS:
=====

VDX Platform Model: 6740
Management Interface IP Addresses: ['10.20.234.67/21']

Verified the Vlan is valid & active..further checks..
VE MAC Address = 50eb.1a81.0857
VE Interface config: Anycast IP configured: 62.1.66.1/24 Anycast MAC configured: 0000.6768.0001
Extracting vrf, vni, VE information.....<please wait>..
Appended list of VRF Import RT configured for this VRF: 6610:6210,7710:7200

DERIVED PARAMETERS:
=====

Interface VE IP Address = 62.1.66.1, VRF = vrf10, Int VE MAC addr (My DA list) = ['50eb.1a81.0857',
'0000.6768.0001']
L3VNI = 7200 , L3VNI VE = 7200 VRF Import L3-RT configured for this VRF:
6610:6210,7710:7200
Comment: Flow classified as L3FWD as DA:50eb.1a81.0857 is in MYDA List:['50eb.1a81.0857',
'0000.6768.0001']

VERIFYING MY-DA PROGRAMMED IN HW:
=====

VE MAC programmed in HW 50eb1a810856 matches that in Software 50eb1a810856 ..proceeding
DEBUG: Constructed Anycast MAC programmed for VDX6740 in HW = 000067680001
VE Anycast MAC 000067680001 programmed in HW matches that in Software 000067680001 ..proceeding

CHECK FOR DIP IN LOCAL NODE TO CLASSIFY FLOW:
=====

Route found for DIP: 72.1.77.2
SYMMETRIC ROUTING: It is an EVPN Route with Egress Port VE 7200 being the same as VRF L3VNI VE 7200
ECMP Route 1 : 72.1.77.0/24 EVPN Ve 7200 Bi
DEBUG: 2 Byte AS = 122

CHECKING VNI SYNC BETWEEN HW & SW
=====

Verified the VNI programmed in Software for VLAN 7200 is same as programmed in Hardware

IDENTIFYING THE EVPN BGP PEERS:
=====

Checking BGP table for Peering:
Total Number of BGP Peers (including non-eVPN peers): 3

Details about eVPN BGP peers:
eVPN Local BGP Peering IP: 67.67.67.67 / eVPN Remote BGP Peering IP: 122.122.122.122
eVPN Local BGP Peering IP: 67.67.67.67 / eVPN Remote BGP Peering IP: 125.125.125.125

SYMMETRIC FLOW VERIFICATION:
=====

Output derived from show ip route detail:
Path 1 : GW MAC Address: 0005.3365.377b Tunnel Interface: Tu 61441

```

Path 2 : GW MAC Address: 0005.3365.3633 Tunnel Interface: Tu 61441

SYMMETRIC RTG: CHECKING THE BGP VRF TABLES:

Checking BGP VRF table for the Route existence:

Route FOUND in the BGP VRF Table:  
BGP Best Route: \*>i 72.1.77.0/24 77.77.77.77  
Non-best Route: \*i 72.1.77.0/24 77.77.77.77

Checking BGP EVPN table for the Route Properties:

Route FOUND in BGP EVPN table..checking further..

Checking BGP EVPN table for the RT values:

Ingress-Node RT string 6610:6210,7710:7200, MATCHES the route RT list ['7710:7200', '122:7200']  
...so should be imported into the VRF on Ingress-Node

Egress VNI carried in the route = 7200

Verified the Route VNI 7200 matches the VNI for the tunnel VLAN 7200

(A) CHECK ROUTE-TABLE IN SOFTWARE:72.1.77.2 (DIP check in VRF Routing Table)

Step1: Checking Software Routing Table .....

Route found for DIP: 72.1.77.2  
Number of ECMP Paths: 2  
ECMP Route 1 : 72.1.77.0/24 EVPN Ve 7200 200/0  
ECMP Route 2 : EVPN Ve 7200 Bi  
Routes found in following Modules / Slots / Linecards: [0]  
Next-hop Egress Interfaces for this prefix: ['Ve7200', 'Ve7200']

(B) CHECK ROUTE-TABLE IN SLOT: 72.1.77.2

Step2: Checking if route is programmed in specific Hardware Slots .....

Number of Slots = 0  
Module 0: RIB Route programmed in Hardware : Yes

(C) CHECK ROUTE-TABLE IN HARDWARE: 72.1.77.2

Step3: Checking the hardware LPM & NHOP for required slots.....

CHECKING HARDWARE FOR MODULE: 0  
(i) Module 0: LPM Entry FOUND in Hardware for Prefix 72.1.77.0/24  
Module 0 LPM: Egress Interfaces registered in Hardware: ['vlan0.7200', 'vlan0.7200']  
Less specific (Subnet) prefix programmed as TRAP in HW ..no further nhop checks

LOG-MSG: Reference to NH Entry NOT found in LPM table in Hardware / ASIC, ... possibly due to conversational behavior

CHECK FOR TUNNEL STATES TOWARDS EGRESS NODE:

Tunnels associated in SOFTWARE for the vlan 7200 on this Rbridge:  
Tunnel 1 = Tu 61441  
Tunnel 2 = Tu 61443

Tunnels associated in HARDWARE for the vlan 7200 on this Rbridge:

Found following tunnels associated with this vlan in HARDWARE  
Tunnel 61441 Tunnel 61443  
Number of Tunnels programmed in HW are same as in Software

Total list of Tunnels that are Operationally UP on this Rbridge:

Tunnel Number : 61441 Source IP: 66.66.66.66 Destination IP: 77.77.77.77 Oper State : up  
Tunnel Number : 61442 Source IP: 66.66.66.66 Destination IP: 54.54.54.54 Oper State : up

Tunnel Number : 61443 Source IP: 66.66.66.66 Destination IP: 71.71.71.71 Oper State : up

\*\*\*LOG-MSG: All Operationally UP tunnels are NOT associated with the vlan 7200

QUICK GLANCE SUMMARY OF INGRESS NODE FLOW STRUCTURE:

=====

FLOW Information:

```
Flow Forward Type : 13fwd-symmetric
Flow DIP : 72.1.77.2
Flow Ingress Vlan : 6201
Flow Ingress VE VRF : vrf10
Flow Egress Vlan : 7200
Flow Egress VE VRF : vrf10
Flow Egress Vlan VNI : 7200
```

-----

BGP Derived Information:

```
Flow VRF Import L3 RT : 6610:6210,7710:7200
Flow VRF Import L2 RT : None
Flow IP Route found in BGP VRF Table : 72.1.77.0/24
Flow IP Route found in BGP EVPN Table : 72.1.77.0/24
Flow MAC Route found in BGP MAC-VRF Table : N/A
Flow ARP Route found in BGP MAC-VRF Table : N/A
Flow Egress LeafNodes VTEP IP : 77.77.77.77
Flow SpineNodes IP's : ['122.122.122.122', '125.125.125.125']
```

-----

RIB Derived Information:

```
Flow IP Route found in RIB : 72.1.77.0/24
Flow Egress Interface : Tu 61441
Flow Egress Node Gateway MAC Address : ['0005.3365.377b', '0005.3365.3633']
```

-----

TUNNEL Information: ( Tu 61441 )

```
Flow Egress Int Tunnel SrcIP : 66.66.66.66
Flow Egress Int Tunnel DestIP : 77.77.77.77
```

-----

HARDWARE Programming:

```
Flow IP ROUTE L3 LPM Fwding Decision : ['Trap']
Flow IP ROUTE L3 LPM NH HW Fwding Decision : ['None']
Flow ARP L3 EXM Fwding Decision : N/A
Flow ARP L3 EXM NH HW Fwding Decision : N/A
Flow L2 HW Fwding Entry : []
```

-----

CHECK ALERTS:

```
Programming Consistency in SW & HW : True
Number of Alerts found : 0
```

=====

Paste the below string on following Spine neighbor nodes for further tracing the packet path:

Reference Format: execute-script ipfabric-spineNode-debugv<x>.py <DIP> <DIP-prefix> <ingressNode-bgpPeerIP> <egress-vlan> <fwd-type> <destn-Leaf-Node-IP's> <egressVNI> <MAC-Address> <tunnel-sip> <tunnel-dip> <RT>

# TACACS+ Accounting Exceptions

- TACACS+ command-accounting limitations..... 71
- Unsupported Network OS command line interface commands..... 71

## TACACS+ command-accounting limitations

TACACS+ command accounting is subject to the following limitations:

- A number of Network OS CLI commands are not supported by TACACS+ accounting; refer to [Unsupported Network OS command line interface commands](#) on page 71 for a listing of unsupported operational and configuration commands.

## Unsupported Network OS command line interface commands

The following table lists the Network OS CLI commands that are not supported in privileged EXEC mode.

**TABLE 12** Unsupported Network OS CLI commands in privileged EXEC mode

| Command name                     | Command Description                                                  |
|----------------------------------|----------------------------------------------------------------------|
| <b>cipherset</b>                 | Configures FIPS-compliant secure ciphers for LDAP and SSH.           |
| <b>clear</b>                     | Clears the specified parameter.                                      |
| <b>clear arp</b>                 | Clears Address Resolution Protocol (ARP) configuration data.         |
| <b>clear counters</b>            | Clears statistics from the switch.                                   |
| <b>clear dot1x</b>               | Clears IEEE 802.1X Port-Based Access Control configuration data.     |
| <b>clear fcoe</b>                | Clears FCoE configuration data.                                      |
| <b>clear ip</b>                  | Clears Internet Protocol (IP) configuration data.                    |
| <b>clear lacp</b>                | Clears Link Aggregation Control Protocol (LACP) configuration data.  |
| <b>clear lldp</b>                | Clears Link Layer Discovery Protocol (LLDP) configuration data.      |
| <b>clear mac-address-table</b>   | Clears the MAC address table.                                        |
| <b>clear mcagt</b>               | Clears the MCAGT agent.                                              |
| <b>clear policy-map-counters</b> | Clears the policy map counters.                                      |
| <b>clear sflow</b>               | Clears sFlow configuration data.                                     |
| <b>clear spanning-tree</b>       | Clears Spanning Tree Protocol (STP) configuration data.              |
| <b>clear vrrp</b>                | Clears Virtual Router Redundancy Protocol (VRRP) configuration data. |
| <b>configure</b>                 | Configures access mode.                                              |
| <b>copy</b>                      | Copies data.                                                         |
| <b>debug</b>                     | Sets debugging options.                                              |
| <b>delete</b>                    | Delete a specified file.                                             |
| <b>dir</b>                       | Displays a directory listing.                                        |
| <b>dot1x</b>                     | Executes IEEE 802.1X Port-Based Access Control options.              |
| <b>exit</b>                      | Exits to the top level and optionally runs a command.                |
| <b>fips</b>                      | Executes FIPS-related operations.                                    |

**TABLE 12** Unsupported Network OS CLI commands in privileged EXEC mode (continued)

| Command name                            | Command Description                                                |
|-----------------------------------------|--------------------------------------------------------------------|
| <b>help</b>                             | Provides help information.                                         |
| <b>history</b>                          | Configures the size of the history log.                            |
| <b>logout</b>                           | Terminates the current login session.                              |
| <b>mac-rebalance</b>                    | Rebalances MAC on a port channel                                   |
| <b>ping</b>                             | Executes the <b>ping</b> command.                                  |
| <b>quit</b>                             | Terminates the current session.                                    |
| <b>rename</b>                           | Renames a file.                                                    |
| <b>reload</b>                           | Reboots the system.                                                |
| <b>resequence</b>                       | Re-orders a list.                                                  |
| <b>send</b>                             | Sends a message to terminal of one or all users.                   |
| <b>terminal</b>                         | Configures terminal properties.                                    |
| <b>show arp</b>                         | Displays the Address Resolution Protocol (ARP) configuration.      |
| <b>show bpdu-drop</b>                   | Displays the Bridge Protocol Data Unit (BPDU) drop configuration.  |
| <b>show cee maps</b>                    | Displays CEE maps.                                                 |
| <b>show cipherset</b>                   | Displays ciphers for LDAP and SSH.                                 |
| <b>show cli</b>                         | Displays CLI session parameters.                                   |
| <b>show clock</b>                       | Displays the date and time settings.                               |
| <b>show diag</b>                        | Displays diagnostic information.                                   |
| <b>show dot1x</b>                       | Displays IEEE 802.1X Port-Based Access Control configuration data. |
| <b>show edge-loop-detection globals</b> | Displays system-wide Edge-Loop-Detection status information.       |
| <b>show fcoe login</b>                  | Displays the FCoE CNA Login information.                           |
| <b>show file</b>                        | Displays the contents of a file.                                   |
| <b>show history</b>                     | Displays command history.                                          |
| <b>show interface</b>                   | Displays interface status and configuration.                       |
| <b>show ip</b>                          | Displays Internet Protocol (IP) information.                       |
| <b>show lacp counter</b>                | Displays Link Aggregation Control Protocol (LACP) counters.        |
| <b>show lldp</b>                        | Displays Link Layer Discovery Protocol (LLDP) configuration data   |
| <b>show monitor</b>                     | Displays interface status and configuration.                       |
| <b>show netconf-state</b>               | Displays NETCONF statistics.                                       |
| <b>show ntp</b>                         | Displays the active NTP server.                                    |
| <b>show parser dump</b>                 | Displays a parser dump.                                            |
| <b>show policy-map</b>                  | Displays the configured rate-limiting policy maps.                 |
| <b>show port</b>                        | Displays port parameters.                                          |
| <b>show port-channel</b>                | Displays the port-channel configuration.                           |
| <b>show port-profile</b>                | Displays the port profile configuration                            |
| <b>show qos</b>                         | Display the Quality of Service (QoS) configuration.                |
| <b>show running-config</b>              | Displays the running configuration.                                |
| <b>show sflow</b>                       | Displays the sFlow configuration.                                  |
| <b>show spanning-tree</b>               | Displays the Spanning Tree Protocol configuration.                 |
| <b>show ssm</b>                         | Displays the switch services subsystem.                            |
| <b>show startup-db</b>                  | Displays the startup configuration.                                |

**TABLE 12** Unsupported Network OS CLI commands in privileged EXEC mode (continued)

| Command name                  | Command Description                                           |
|-------------------------------|---------------------------------------------------------------|
| <b>show storm-control</b>     | Displays storm control configuration.                         |
| <b>show statistics</b>        | Displays accounting information.                              |
| <b>show system</b>            | Displays runtime system information.                          |
| <b>show rmon</b>              | Displays the Remote Monitoring Protocol (RMON) configuration. |
| <b>show vcs</b>               | Displays VCS information.                                     |
| <b>show vlan</b>              | Displays the VLAN configuration                               |
| <b>show mac-address-table</b> | Displays the MAC address table.                               |
| <b>show startup-config</b>    | Displays the contents of the startup-configuration file.      |
| <b>show zoning</b>            | Displays zoning information.                                  |
| <b>traceroute</b>             | Executes the <b>traceroute</b> command.                       |

The following table lists the Network OS CLI commands that are not supported in global configuration mode.

**TABLE 13** Unsupported Network OS CLI commands in global configuration mode

| Command name   | Command Description                                                 |
|----------------|---------------------------------------------------------------------|
| <b>abort</b>   | Aborts the current configuration session.                           |
| <b>diag</b>    | Manages diagnostic commands.                                        |
| <b>do</b>      | Executes an operational command while in global configuration mode. |
| <b>end</b>     | Terminates the current configuration session.                       |
| <b>exit</b>    | Exits from the current mode.                                        |
| <b>help</b>    | Provides help information.                                          |
| <b>pwd</b>     | Displays the current mode path.                                     |
| <b>service</b> | Performs password encryption services.                              |
| <b>top</b>     | Exits to the top level and optionally runs a command.               |
| <b>no vlan</b> | Disables VLAN configuration.                                        |

# Supported NTP Regions and Time Zones
